Groundwater Sampling and Analysis Results
Ewing Township Industrial Land
Former Delphi Interior and Lighting Systems Division
1445 Parkway Avenue
Ewing, New Jersey
NJDEP SRP PI No. 011336
ISRA Case No. E97070

Dear Jill Monroe:

On behalf of Revitalizing Auto Communities Environmental Response (RACER) Trust, Haley & Aldrich, Inc. has prepared the following summary of the results of the Per- and Polyfluoroalkyl Substances (PFAS) groundwater and surface water sampling for the Ewing Township Industrial Land site (Site) located at 1445 Parkway Avenue in Ewing, New Jersey (**Figure 1**).

The PFAS sampling event was conducted to address New Jersey Department of Environmental Protection's (NJDEP's) request on 14 July 2021 for additional PFAS-compound evaluation in groundwater. The NJDEP identified that:

> *"Chromium plating operations took place at the facility. Chromium and hexavalent chromium are COCs in ground water at the site and indicative of releases associated with former plating operations."*

Due to the potential for PFAS use in chromium plating operations prior to the introduction of Maximum Achievable Control Technology standards in 1995 and cessation of chromium plating operations at the Site around the same time frame, the NJDEP identified that additional evaluation was needed regarding the potential presence of PFAS-compounds in groundwater and surface water at the Site.

Specifically, the goals of the sampling program were to:

- Determine the potential presence of PFAS constituents in groundwater or surface water at upgradient locations, locations in the vicinity of former plating production or waste management areas, and downgradient locations at the Site;
- If the PFAS constituents are detected, identify if the constituents are related to potential on- or off-Site releases; and
- Determine whether further investigation is warranted due to on-Site related releases.

Surface and groundwater samples were collected from 33 existing groundwater monitoring wells, two surface water locations, and three storm sewer/French drain manholes during the period of 12 to 17 October 2023. Groundwater samples were collected utilizing low-flow sampling techniques; surface water and storm sewer samples were collected utilizing grab sampling techniques from the air-water interface.

The results of the sampling activities are presented in the following report and generally indicated the following:

- PFAS constituents were detected in all on-Site groundwater, surface water and stormwater sampling locations.
- The majority of the detections were above New Jersey Groundwater Quality Standards (GWQS), with the only exception being MW-89, where PFAS constituents were detected below criteria.
- Perfluorooctanesulfonic acid (PFOS) dominated the detected constituents in many locations, with the highest locations 100 times the applicable GWQS.
- The highest PFAS concentrations, notably PFOS, were detected on the upgradient side of the Site in bedrock groundwater, at MW-92A (1,610 nanograms per liter), indicating an off-Site source(s) impacting the Ewing Site.
- PFAS fingerprints are consistent across the entire upgradient side of the Site.
- PFOS dominated detections in the upgradient center portion of the Site, typically centered around MW-92A in bedrock, appears to migrate into and across the Site in the bedrock.
- No distinct pattern is apparent in the plating areas or sludge drying beds, with PFOS concentrations in all process related areas lower than upgradient locations. Rather, consistent with the Site Conceptual Model, off-Site PFOS in bedrock groundwater migrates through the Site and ultimately appears to contribute to shallow overburden/weathered bedrock zones along Gold Run as bedrock groundwater discharges to this surface water feature.
- A general PFAS constituent mix, with less PFOS, is present in upgradient stormwater. A similar pattern is also present in upgradient shallow overburden/weathered bedrock zones on the north, western, and eastern sides of the Site and surface water from Gold Run. This indicates a connection between stormwater and the shallow overburden/weathered bedrock zones and Gold Run.

- This general PFAS pattern matches closely to what is observed in the former Naval Air Warfare Center (NAWC) data for storm sewer immediately south of the NAWC site.
- PFAS constituents were also detected in MW-15 and MW-34R on the east side of Gold Run, which is considered a hydraulic boundary. The PFAS detections exhibit a mix of PFAS constituents, with concentrations in the upgradient well, MW-15, slightly higher than in MW-34R, adjacent to the remediated drum burial area.
- Additional constituents were analyzed including metals (chromium and nickel), semi-volatiles organic compounds (1,4 dioxane), and volatile organic compounds. Exceedances of GWQS were observed in FDMH-4, with detections in FDMH-1, FDMH-2, and FDMH-4.

The PFAS results, with some of the highest PFOS detections on the upgradient property boundaries, indicated on-Site groundwater and surface water contamination from an off-Site source(s). The PFAS groundwater data presented herein clearly indicate the PFAS source is located upgradient of the Ewing Site and is not related to former manufacturing activities at the Site. This conclusion is further supported by the trichloroethylene data that also indicates an upgradient, off-Site source. Consequently, no further investigation is warranted for PFAS on the RACER Ewing Site and RACER plans to report the on-Site groundwater and surface water contamination from an off-Site source to the NJDEP Hotline. The PFAS findings in relation to other potential off-Site constituents such as trichloroethene and 1,1-dichloroethene will be discussed further in the upcoming Groundwater Remedial Action Report.

If you have any questions or require additional information, please contact us.

Sincerely yours,
HALEY & ALDRICH, INC.

1. Introduction

As presented in the Per- and Polyfluoroalkyl Substances (PFAS) Groundwater Sampling and Analysis Sampling and Analysis Plan (SAP) dated 25 September 2023 for the Ewing Township Industrial Land site (Site) /Former Delphi Interior and Lighting Systems Division (former General Motors) located at 1445 Parkway Avenue, Ewing Township, New Jersey (**Figure 1**), the goal of this groundwater sampling event was to address New Jersey Department of Environmental Protection's (NJDEP's) request on 14 July 2021 for additional PFAS-compound evaluation in groundwater. The NJDEP identified that:

> *"Chromium plating operations took place at the facility. Chromium and hexavalent chromium are COCs in ground water at the site and indicative of releases associated with former plating operations."*

Due to the potential for PFAS use in chromium plating operations prior to introduction of Maximum Achievable Control Technology standards in 1995 and cessation of chromium plating operations at the Site around the same time frame, the NJDEP identified that additional evaluation was needed regarding the potential presence of PFAS-compounds at the Site.

Specifically, the goals of the sampling program were to:

- Determine the potential presence of PFAS constituents in groundwater or surface water at upgradient locations, locations in the vicinity of former plating production or waste management areas, and downgradient locations at the Site;
- If the PFAS constituents are detected, identify if the constituents are related to potential on- or off-Site releases; and
- Determine whether further investigation is warranted due to on-Site related releases.

1.1 SCREENING VALUES

The screening values are used as a means of identifying a potentially significant release to the environment and whether the field investigation adequately characterized these potential releases for each environmental medium. The following presents a summary of the screening values used during the field investigation.

- Groundwater:
  - New Jersey Groundwater Quality Standards (GWQS; 1 June 2020)
    - Perfluorononanoic acid (PFNA) – 13 nanograms per liter (ng/L)
    - Perfluorooctanesulfonic acid (PFOS) – 13 ng/L
    - Perfluorooctanoic acid (PFOA) – 14 ng/L
  - Interim Specific Groundwater Quality Standards (Effective 5 June 2023)
    - Perfluoro-2-propoxypropanoic acid (PFPrOPrA)(GenX)(HFPO-DA)

1.2 REPORT ORGANIZATION

The following describes the investigation and sampling activities completed in October 2023, along with an additional explanation of data screening methodology and key findings. Tables, figures, and appendices summarize the investigation results. Supporting information to the document includes:

- **Appendix A** presents field documentation for sampling activities;
- **Appendix B** presents laboratory analytical results;
- **Appendix C** presents the data quality assessment and validation reports for the laboratory analytical data;
- The tables present a summary of analytical data collected for surface water and groundwater; and
- The figures present a comparison of detected groundwater concentrations against the screening values, as well as upgradient PFAS results from the Naval Air Warfare Center (NAWC) data collected during the period of 2017 to 2018.

2. Sampling Activities

As identified in the PFAS SAP, the sampling included the collection of groundwater, surface water, and french drain manhole samples as illustrated on **Figure 2** and listed in **Table 1**. Field investigation activities were completed from 12 through 17 October 2023 and included the following:

- Collection of:
  - 33 groundwater samples;
  - two surface water samples; and
  - three French drain manhole samples
- Collection of additional analytes from French drain manhole samples including volatile organic compounds (VOCs), nickel, chromium, and 1,4-dioxane.

These select sampling points represent upgradient locations, locations in the vicinity of former plating production areas or waste management areas, and downgradient locations at the Site.

2.1 SAMPLING PROCEDURES

As specified in the SAP, samples were collected in accordance with Haley & Aldrich, Inc. (Haley & Aldrich) Standard Operating Procedure 3032 for the Collection of Environmental Samples for the Analysis of PFAS which is based on methods recommended by the United States Environmental Protection Agency (USEPA) and Interstate Technology and Regulatory Council, and in compliance with the project's Quality Assurance Project Plan (QAPP). Groundwater sample collection was conducted utilizing low-flow groundwater sampling procedures with a peristaltic pump to minimize the amount of equipment in contact with the sampled groundwater. Storm sewer water and surface water were collected via grab sampling techniques utilizing a dip cup from the air to water interface. Copies of the field documentation and sampling forms are provided in **Appendix A.**

Due to the presence of PFAS compounds generally available in consumer products, low analytical detection limits (i.e., parts per trillion range), and thus the potential for false positive detections in the project samples, the sampling program included the collection and analysis of Quality Assurance/Quality Control (QA/QC) samples. These QA/QC samples will include the following:

- one field blanks;
- five equipment decontamination blanks; one per day; and
- two field duplicate samples.

2.2 LABORATORY ANALYSIS

The water samples were submitted for analysis of PFAS compounds via USEPA Draft Method 537.1M (Method 537.1M) modified with isotope dilution to Eurofins Environment Burlington, Vermont (New Jersey laboratory certification # VT972). **Table 2** provides the list of the PFAS compounds analyzed, and the associated laboratory reporting limits for Method 537.1M. Method 537.1M provides analysis for all of the key constituents potentially associated with plating operations prior to the cessation of operations in 1998. For the purposes of this investigation, the three parameters (PFNA, PFOS, and PFOA) with New Jersey GWQS as well as the one parameter with an interim GWQS (perfluoro-2-

propoxypropanoic acid) are listed in **Table 3** were used for decision making for the Site. Data associated with the remaining parameters are intended for informational purposes regarding potential off-Site sources. The laboratory analytical results are presented in **Appendix B**.

2.3 DATA USABILITY ASSESSMENT

Groundwater, storm sewer water and surface water samples were collected and evaluated in accordance with NJDEP regulation and guidance documents. The data usability review is summarized below for data collected for this scope of work.

2.3.1 Quality Assurance Project Plan

In accordance with New Jersey Administrative Code (N.J.A.C.) 7:26E-1.6 (the Technical Requirements for Site Remediation) a QAPP that complies with N.J.A.C. 7:26E-2.2 and with the Quality Assurance Project Plan Technical Guidance (version 1.0, 2014) has been prepared and previously submitted as part of the PFAS SAP.

2.3.2 Data Quality Assessment

The Data Usability Review, conducted per NJDEP's Data Quality Assessment/Data Usability Evaluation Technical Guidance dated April 2014, has determined the data to be usable for its intended purposes. A usability review was completed for the data, as described in the procedures and guidelines presented in the Quality Assurance Project Plan Technical Guidance (version 1.0, 2014). The laboratory reports are provided as **Appendix B**.

2.3.3 Data Usability Evaluation

A usability review as described in the procedures and guidelines presented in the Quality Assurance Project Plan Technical Guidance (version 1.0, 2014) was performed on data generated for this sampling event, as required by the NJDEP. The review has determined the data to be usable for its intended purposes. A summary of the review is presented in **Appendix C**. The summary includes an examination of issues identified during the review. No data use limitations have been identified in the data usability review (**Appendix C**).

2.4 NOTABLE ISSUES

A few issues were encountered during field activities that precluded completion of the planned scope of work as follows:

- French drain manhole FDMH-3 was dry, preventing the collection of water or sediment samples.
- French drain manhole FDMH-5 was paved over with asphalt. To prevent damage to the roadway surface of Parkway Avenue, FDMH-5 was not opened or sampled.

3. Site Setting

3.1 HYDROGEOLOGIC SETTING

The hydrogeologic model in the area of the Site is extraordinarily complex, with a series of regional and local high-angle faulting and fracturing of varying strike angles, along with weathering overlain onto sedimentary bedrock with bedding plane joints dipping (north/northeast) in the opposite direction from regional groundwater flow (south/southeast). This creates a complex and irregular groundwater transport pathways through the area. Groundwater transport is typically in the overburden/weathered bedrock and bedrock in the secondary fracture and bedding plane porosity, rather than the bedrock matrix. The overburden/weathered bedrock is in direct communication with the bedrock through secondary pathways such as these fractures, faults and weathering. Groundwater recharges northwest of the Site, migrates downward and to the southeast, where it ultimately discharges to Gold Run. Gold Run is considered a hydraulic boundary for the area.

The general geology of the Site has been characterized as follows:

- Overburden - The overburden soils range in thickness from 0 to 20 feet, overlying weathered bedrock. The soils are generally: fill, 0 to 10 feet thick, and residual bedrock, clays, silts, sands and rock fragments, 0 to 10 feet thick. The soils are thinnest at the northwest corner of the Site, and thicken in the center of the Site, where extensive fill has been placed, then thinning as the topography drops towards Gold Run. The overburden soils typically are dry, with groundwater present in the underlying weathered bedrock.
- Weathered Bedrock - The weathered bedrock is highly fractured saprolite and regolith zones of bedrock, defined up to a depth of 30 feet below ground surface, where it transitions to competent bedrock. Groundwater is typically first encountered in the weathered bedrock zone in many areas of the Site and is in communication with groundwater in the bedrock.
- Bedrock - The underlying bedrock unit consists of alternating bands of light gray to reddish-brown, medium- to coarse-grained arkosic sandstone and reddish to purplish-brown siltstone and shale, with several thicker, more massive sandstone beds of the Raven Rock Member of Stockton Formation. The bedrock was formed during the late Triassic period. Bedding planes typically strike N70˚E to N85˚E, with a dip to the north/northwest ranging from 9 to 14 degrees, contrary to regional groundwater flow patterns. Numerous episodes of faulting and fracturing, with varying orientations, have been documented at the Site, the bedrock is highly fractured with high secondary porosity, creating numerous hydraulically interconnected vertical and horizontal fractures, along with bedding plane joints.

The hydrogeology of the Site is as follows:

- Overburden/Weathered Bedrock - The overburden/weathered bedrock unit is considered to constitute a single hydrogeologic unit and has an average hydraulic conductivity of $3x10^{-2}$ centimeters per second. Groundwater within the overburden/weathered bedrock aquifer generally flows from the west to east/southeast across the Site and discharges into Gold Run, as evidenced by the comparison of water levels to Gold Run surface water levels. Accordingly, Gold Run is considered a hydrogeologic boundary along the eastern portion of the Site for groundwater flowing through the overburdened/weathered bedrock.

- Bedrock - As noted above, the bedrock is highly fractured on varying orientations with high secondary porosity, creating numerous hydraulically interconnected vertical and horizontal fractures. In some areas of the Site, where multiple fractures intersect such as the area near MW-87 and MW-84AR, the intersecting fractures creates a groundwater setting similar to a macroscale porous media. Groundwater flow in the bedrock units is primarily through secondary porosity, such as bedding plane joints, fractures, and faults, rather than the primary porosity of the bedrock itself. Bedding plane joints, typical in New Jersey geology for conducting groundwater flow, are present, however due to their dip contrary to groundwater flow, their significance in relation to overall bedrock groundwater flow is overshadowed by significant structural geologic deformation, fracturing, and faulting.

Regionally the groundwater flow direction is typically from the northwest to the southeast across the area. However, at the Site scale, as mentioned above, there are innumerous interconnected fractures, bedding planes, and faults that create a complex flow pattern as groundwater follows the regional pattern. Along the western property boundary, roughly parallel to the railroad tracks, a high angle fault has been identified that creates a low flow boundary evident by hydraulic heads stacking (a large change in head [greater than 5 feet] when comparing the western elevations to those east of the fault area). Groundwater in this area, flows over the top of this western fault, due to the higher permeability in the overburden/weathered bedrock.

Additionally intersecting fractures cause bends in the groundwater contours deflecting flow toward the center of the Site and allowing for transport of off-Site groundwater and contamination from north of Parkway Avenue onto the Site. Within the vicinity of the former building slab area, the various fracture regimes intersect into a highly fractured, well connected, and transmissive area that allows groundwater to migrate deeper into the bedrock on its path to the southeast. Within the vicinity of Gold Run, the stream has been interpreted as gaining from bedrock flow, based on groundwater elevations compared to the stream levels and upward gradients in the area.

Vertical gradients across the Site vary spatially both in direction and magnitude. In areas proximal to groundwater flow boundaries, such as Gold Run and the western side of the fault along the western border of the Site, vertical groundwater gradients are upward. In the areas located some distance from the boundaries, vertical gradients are downward indicative of groundwater recharge.

As reported in the Groundwater Investigation Summary Report (Haley & Aldrich, May 2009), during the August 2008 groundwater sampling event, depths to groundwater were measured concurrently in NAWC monitoring wells and former Roller Bearing Company facility monitoring wells. An area-wide groundwater elevation contour plan was created to estimate the overall flow direction in the overburden/weathered bedrock for the area surrounding the Site, as shown on **Figure 3**. The area-wide groundwater elevation contours for overburden indicate groundwater flow is from the northwest to southeast, influenced by Gold Run and the Delaware River further to the south.

3.2 NEARBY SITES

The Site is bordered to the east and west by mixed commercial properties, former industrial sites, and residential neighborhoods, to the north by a shopping plaza and the former NAWC, and to the south by a residential development constructed on property formerly owned by RBC Bearings, Inc. (RBC facility) which operated as an industrial manufacturing facility. The Site is located approximately 1.5 miles north of the Delaware River. Gold Run, which roughly bisects the Site property and has its headwaters at the

NAWC, is a tributary to the Delaware River. The Site is situated between two known groundwater contamination sites: the former NAWC and the RBC facility. These are briefly described herein to provide a context to the groundwater investigation at the Site, along with information on area-wide groundwater conditions.

3.2.1 NAWC

The former NAWC (a former United States Department of Defense testing facility) is located less than 0.1-mile northwest of the Site with Parcels A, B and D. A former NAWC testing laboratory and administration facility (Parcel C) was located directly north of the former General Motors manufacturing building, immediately across Parkway Avenue on the east side of the railroad tracks. The eastern portion of the former NAWC (Parcel C) has been redeveloped into a multi-story apartment complex. **Figure 5** depicts these locations.

Portions of the western portion of the NAWC (Parcels A, B and D) are currently undergoing active remediation, including migration control of contaminated groundwater. In addition, the NAWC is a United States Geological Survey (USGS) research site for investigation, evaluation, and clean-up of chemical releases to fractured rock aquifers. According to the USGS website:

> *"The former Naval Air Warfare Center (NAWC) was a U.S. Navy jet engine testing facility for military aircraft from the mid-1950's until the late 1990's. As a result of the activities at the facility, trichloroethylene (TCE), jet fuel, and other chemicals have leaked into the subsurface. The NAWC covers 67 acres and has large jet-engine test buildings, associated service buildings, hangers, and scores of smaller support structures all interconnected with a vast network of aboveground and underground service lines…*
>
> *The NAWC Research Site, West Trenton, New Jersey, is located 4 miles north of Trenton, NJ. The fractured bedrock at the site has been contaminated with TCE a chlorinated solvent. The plume of TCE was caused by leakage of TCE from aboveground service lines and storage tanks. The TCE was used as a heat transfer agent during jet engine tests.* ***An estimated 100,000 gallons*** *[equivalent to 1.2 million pounds]* ***of TCE was lost through leakage and spills at the site. Dense non-aqueous phase liquids (DNAPL) have been identified at the site, and have flowed vertically downward and in the down-dip direction of the fractured sedimentary rocks.*** *[emphasis added] The aqueous phase plume of dissolved TCE has flowed along the strike and the up-dip directions of the sedimentary rocks. There is evidence of natural attenuation of TCE, probably and at least in part due to the presence of a jet-fuel oil spill that overlaps part of the plume."*

In 2000, the NAWC established a groundwater Classification Exception Area (CEA) along with the length of the north and south storm sewers that lie beneath Parkway Avenue up to the discharge point to Gold Run. The CEA identifies the areas where groundwater was identified to be impacted above GWQS for various VOCs and metals. The storm sewers identified in the CEA include culvert portions of the former Gold Run, where it originates as springs on and near the NAWC. The CEA has not been revised to include PFAS compounds above GWQS at the NAWC.

In 2018, the NAWC issued a report detailing their PFAS sampling efforts entitled "Draft Per- and Polyfluoroalkyl Substances Site Inspection for Multiple Sites Former Naval Air Warfare Center Trenton, Trenton, New Jersey" dated March 2022, which indicted:

> *"A Site Inspection (SI) for per- and polyfluoroalkyl substances (PFAS) was conducted in 2017 and 2018 at the former Naval Air Warfare Center (NAWC) Trenton…*

The PFAS SI was conducted to gather representative groundwater, surface water, and storm water PFAS data to aid in determining the path forward for four of eight potential PFAS source areas that were identified during an installation-specific Preliminary Assessment (PA) at the former NAWC Trenton. Potential PFAS source areas were selected based on known or suspected PFAS-related historical operations; and included areas used for storage of AFFF, fire-fighting training, facility wastewater treatment, and waste disposal. The four potential PFAS source areas investigated are:

- *Site 2, Fire-Fighting Training Area.*
- *Site 3, Former Sludge Disposal Area.*
- *Building 49, Former Fire Station.*
- *Area along Railroad Tracks East of Fire Station."*

And

"Perfluorooctanoic acid (PFOA), perfluorooctanesulfonic acid (PFOS), and perfluorononanoic acid (PFNA) were detected in surface water samples collected upgradient and downstream in Gold Run…

Groundwater results in the eastern portion of the site, particularly in shallow overburden monitoring wells, suggest that potential former NAWC Trenton PFAS sources are located near the aboveground fuel tanks, former fire-fighting training area (Site 2), and sludge disposal beds (Site 3). PFAS detections along Jack Stephan Way suggest that a source contributor might exist upgradient of the sampling locations. However, the upgradient on-site spring at the headwaters of the OF-1 (West Ditch) system also has similar PFAS concentrations, suggesting that these locations may potentially share a common, upgradient on-site or off-site source(s)."

4. Sampling Results and Interpretation

Surface and groundwater samples were collected from 33 existing groundwater monitoring wells, two surface water locations, and three storm sewer/French drain manholes during the period of 12 to 17 October 2023. Groundwater samples were collected utilizing low-flow sampling techniques; surface water and storm sewer samples were collected utilizing grab sampling techniques from the air-water interface. The sampling results are summarized in **Tables 4**, **5**, and **6**, and presented on **Figure 6**.

4.1 ON-SITE GROUNDWATER RESULTS

As shown on **Table 4**, the results indicated that PFAS constituents were detected in all on-Site groundwater sampling locations, with the majority locations having one or more PFAS above GWQS. The only exception was MW-89, where PFAS constituents were detected, but below criteria. Some of the highest PFAS concentrations in groundwater, notably PFOS over 100 times the GWQS, were detected on the northern, upgradient side of the Site at the MW-92 cluster (**Table 4** and **Figure 6**):

- MW-92 overburden/weathered bedrock: 1420 ng/L,
- MW-92A intermediate bedrock: 1610 ng/L, and
- MW-92B bedrock: 1470 ng/L

Of the top 25 PFOS detections in groundwater, over half were on the upgradient northern or western upgradient sides of the Site. These locations exhibited elevated PFOS concentrations over 10 times the GWQS, including:

- MW-16C bedrock: 1,010 ng/L,
- MW-91A bedrock: 631 ng/L,
- MW-16A overburden/weathered bedrock: 400 ng/L
- MW-39A bedrock: 395 ng/L,
- MW-93A bedrock: 377 ng/L,
- MW-91 overburden/weathered bedrock: 325 ng/L,
- MW-17B bedrock on the western side of the Site: 174 ng/L,
- MW-90AR bedrock: 154 ng/L,
- MW-90R overburden/weathered bedrock: 150 ng/L,
- MW-17 A overburden/weathered bedrock: 116 ng/L,
- MW-93 overburden/weathered bedrock: 95.6/89.8 ng/L,

The MW-92 monitoring cluster was installed on the northern end of the former manufacturing building, away from the potential PFAS source areas such as the former plating pits and sludge drying beds. The highest PFOS concentrations detected in this cluster were in the upper bedrock. Furthermore, the other high detections of PFOS were similarly found in bedrock groundwater on the upgradient, northern side of the Site, with lower concentrations in overburden/weathered bedrock wells. This indicates that the PFOS-dominated detections on the upgradient sides of the Site in bedrock are not originating from an unknown source the Site, but rather demonstrate on-Site groundwater contamination from an off-Site

source. The highest PFOS concentrations, centered on the MW-92 cluster, are also coincident with the highest trichloroethene concentrations in the area.

There does not appear to be a concentrated high or increasing pattern PFAS associated with potential source areas, such as the plater pits, sludge drying beds or other waste management areas. Rather, the distribution pattern starting around MW-92A, appears to migrate into and across the Site in the overburden/weathered bedrock and bedrock as shown on **Figure 6**. This PFOS-dominated pattern follows Site groundwater flow patterns, consistent with the Site conceptual model discussed in Section 3.1, decreasing as it migrates into the Site.

The immediate downgradient locations from MW-92 cluster, such as MW-82, MW-83R, MW-84AR, and MW-84R show a clear pattern decreasing PFOS concentration away from the upgradient property boundaries. The highest PFOS concentrations in the former plating area were detected in the bedrock well, MW-84AR, beneath lower PFOS concentration overburden/weathered bedrock monitoring wells in the area, such as MW-84R and MW-83R, which further indicates that PFAS is not originating in this suspected source area. The decreasing PFOS concentration pattern continues towards the wells along Gold Run, such as MW-2, MW-3, MW-4, MW-6, and MW-7, where vertical groundwater heads transition to upward and discharge to Gold Run.

Some notable differences in the PFAS constituent mix are only observed in overburden/weathered bedrock monitoring wells on the perimeter of the Site, in monitoring wells such as MW-17A, MW-90R, MW-93, MW-39, MW-15, MW-34R, and MW-77. These wells have higher concentrations of PFAS constituents other than PFOS, and more closely match the patterns observed in the french drain and upgradient Gold Run locations, discussed below. This is likely the result of these surface water features in close communication with the shallow groundwater in the overburden/weathered bedrock.

PFAS constituents were also detected in MW-15 and MW-34R, on the east side of Gold Run. The Site conceptual model indicates that Gold Run is a discharge feature that would serve as a hydraulic boundary. As such, these wells would be hydraulically disconnected from the western portion of the Site. The MW-15 and MW-34R results indicates a general PFAS constituent mix, with PFOS and PFOA above GWQS. The remediated buried drum area was located adjacent to MW-34R; however, MW-15 is located away from and upgradient of this former waste management area. The PFAS concentrations are similar in both wells, with MW-15 exhibiting higher PFOS concentrations. This indicates that an off-Site source is likely impacting the groundwater across this area.

4.2 PARKWAY AVENUE FRENCH DRAIN AND GOLD RUN STREAM RESULTS

The Park Avenue french drain, influent and effluent Gold Run stream samples are summarized in **Table 5** and 6 and shown on **Figure 6**. As identified above, two of the french drain samples could not be collected due to either low water levels or blocked manholes. In general, the french drain locations had very little water to sample, likely related to the dry weather period prior and during the sampling event.

The french drain manholes that were sampled, are located in the railroad underpass of Parkway Avenue and exhibited lower PFOS concentrations than typically detected in groundwater, as summarized on **Table 5** and shown on **Figure 6**. Only PFOS was detected above GWQS, however PFHpA, PFHxS and PFHxA at similar concentrations. Similar to the french drain manholes, the upstream and downstream surface water samples from Gold Run indicated PFOS above GWQS, with a more general distribution of PFAS constituents, and elevated PFHpA, PFHxS and PFHxA concentrations. PFOA was also detected

above GWQS in the downstream sample, SW-4. The downstream concentrations of PFOS and PFOA in SW-4 were higher than the upstream sample, SW-1. This concentration rise is consistent with the overburden/weathered bedrock and bedrock groundwater discharges to Gold Run, as identified above.

In addition to PFAS compounds, samples collected from storm sewer manholes were analyzed for metals (chromium and nickel), semi-volatiles organic compounds (1,4-dioxane), and VOCs. The results of these analyses are presented in **Table 6**. Exceedances of GWQS for 1,4-dioxane and trichloroethene (TCE) were reported in samples analyzed from location FDMH-4. With detections of nickel (FDMH-1), cis-1,2-dichloroethene (FDMH-2 and FDMH-4), and TCE (FDMH-2) below GWQS.

4.3 COMPARISON TO NAWC RESULTS

The on-Site PFAS results have the highest PFOS detections on the upgradient property boundary, notably at the MW-92 cluster, away from the manufacturing areas. Furthermore, PFAS constituents are observed in the upgradient french drains and influent sample to Gold Run. These results clearly indicate a significant potential for on-Site groundwater contamination from an off-Site source. Consequently, the results were evaluated in relationship to the historical PFAS sampling results from the NAWC documented in the *Draft Per- and Polyfluoroalkyl Substances Site Inspection for Multiple Sites* dated March 2022. The evaluation of the historical NAWC data indicates that the NAWC has multiple areas with PFAS releases. Two dominant PFAS concentration patterns are observed in the PFAS constituent; these areas are on the western and eastern sides of the NAWC.

The western portion of the NAWC, which had the testing and operational areas, exhibits very low PFOS concentrations, as shown on **Figure 7**. In this area, a more general PFAS constituent mix pattern is observed, with lower PFOS concentrations with higher PFOA, PFHpA, PFHxA and PFHxS, as summarized in **Table 7** for the storm sewers manholes, MW-118.5N, MH-117N (noting that the T locations were coming from the eastern part of NAWC) and GR-OF, along Parkway Avenue. The constituent patterns for samples historically collected by NAWC correlate well with the samples recently collected from the french drain manhole and influent Gold Run surface water samples. As noted above, this also closely correlates to many of the shallow wells along Parkway Avenue and wells along the western portion of the RACER Ewing Site. This would suggest that the source of the PFAS in water in the french drain manholes and upstream sample of Gold Run is originating from the Parkway Avenue storm sewers immediately south of the NAWC.

The eastern portion of the NAWC, along the railroad, had PFAS source areas including the former fire training area, sludge disposal, and aqueous film forming foam (AFFF) sprayed gravel areas. The historical PFOS concentrations in the eastern portion of the NAWC are over an order of magnitude higher than detect on the upgradient side of the RACER Ewing Site at the MW-92 cluster, specifically at MW-11S (25,800 ng/L) and MW-27S (26,500 ng/L). The PFOS concentrations present at the NAWC are found in both shallow and bedrock groundwater, and even extend onto the neighboring Gardens at Birmingham apartments immediately east of the railroad, as demonstrated by bedrock monitoring well, MW-37BR (570 ng/L). The PFOS concentration map, **Figure 7**, clearly shows extremely high PFOS concentrations originating near the former tank farm on the east side of the NAWC, propagating south and southeast with regional and local groundwater flow patterns, and migrating onto the RACER Ewing Site.

5. Conclusions and Recommendations

Based on the evaluation presented herein, the PFAS concentrations identified at the Ewing Township Industrial Land Site demonstrate an upgradient, off-Site source. The following key observations are made:

- PFAS constituents were all on-Site groundwater, surface water and stormwater sampling locations.
- The majority of the detections were above GWQS in nearly, with the only exception MW-89, where PFAS constituents were detected, but below criteria.
- The highest concentrations of PFAS detected at the Site are along the upgradient boundaries of the Site.
- The PFOS-dominated concentrations in the upgradient monitoring well cluster, MW-92, on-Site are similar to those identified on the eastern side of NAWC.
- Concentrations on-Site are lower than those observed within the NAWC source areas by more than an order of magnitude.
- PFOS dominated detections in the upgradient center portion of the Site, centered around MW-92A in bedrock, appears to migrate into and across the Site in the bedrock.
- No distinct pattern is apparent in the plating areas or sludge drying beds, with PFOS concentrations in all process related areas lower than upgradient locations. Rather, consistent with the Site Conceptual Model (CSM), off-Site PFOS in bedrock groundwater migrates through the Site and ultimately appears to contribute to shallow overburden/weathered bedrock zones along Gold Run as bedrock groundwater discharges to this surface water feature.
- A general PFAS constituent mix, with less PFOS, is present in upgradient stormwater. A similar pattern is also present in upgradient shallow overburden/weathered bedrock zones on the north, western, and eastern sides of the Site and surface water from Gold Run. This indicates a connection between stormwater and the shallow overburden/weathered bedrock zones and Gold Run.
- This general PFAS pattern matches closely to what is observed in the NAWC data for storm sewer immediately south of the NAWC.
- PFAS constituents were even detected in MW-15 and MW-34R on the east side of Gold Run, which is considered a hydraulic boundary. The PFAS detections exhibit a mix of PFAS constituents, with concentrations in the upgradient well, MW-15, slightly higher than in MW-34R, adjacent to the remediated drum burial area.

The pathway presented by PFAS indicates a potential source on the NAWC, migrating down-gradient towards, onto, and throughout the RACER Ewing Site, ultimately discharging to Gold Run. Consequently, no further investigation is warranted for PFAS on the RACER Ewing Site.

Notes:
1. ND: Result is not detected above the indicated reporting limit
   J: Estimated value
   D: Sample was diluted
2. Results in red exceed the following criteria:
   - Post June 1, 2020 Groundwater Quality Standards (GWQS)
3. Results in **bold** are detected.
4. Sample Types: N - Normal Sample
   FD - Field Duplicate
5. * Is an Interim Specific Ground Water Quality Criteria (Effective 6/5/23)

LEGEND

- PROPERTY LINE
- WATER BODY
- EWING MONITORING WELL LOCATION ASSOCIATED WITH OVERBURDEN (LOCATIONS NOT SAMPLED FOR PFAS GRAYED OUT)
- EWING MONITORING WELL LOCATION ASSOCIATED WITH BEDROCK (LOCATIONS NOT SAMPLED FOR PFAS GRAYED OUT)
- NAVAL AIR WARFARE CENTER (NAWC) MONITORING WELL
- STORMWATER LOCATION ASSOCIATED WITH BEDROCK (LOCATIONS NOT SAMPLED FOR PFAS GRAYED OUT)
- MANHOLE LOCATION ASSOCIATED WITH BEDROCK (LOCATIONS NOT SAMPLED FOR PFAS GRAYED OUT)

GW PFOS CONCENTRATION LEGEND

- ND - 10 ng/L
- 10 ng/L - 100 ng/L
- 100 ng/L - 1000 ng/L
- 1000 ng/L - 10000 ng/L
- > 10000 ng/L

NOTES

1. MONITORING WELL LOCATIONS BASED ON A SURVEY PERFORMED BY GERALD G. DEGROAT, LS, DATED NOVEMBER 20, 2002, REVISED TO APRIL 15, 2013. BOUNDARY INFORMATION SHOWN IS BASED ON A SURVEY PERFORMED BY GERALD G. DEGROAT, LS, DATED JUNE 21, 2005. BEARINGS SHOWN ARE BASED ON DEED BOOK 4512, PAGE 252.
2. AERIAL IMAGERY SOURCE: NEARMAP, 27 FEBRUARY 2023.
3. VERTICAL DATUM : NAVD 1988; HORIZONTAL DATUM - N.J.S.P.C.S. NAD 1983.
4. PFAS DATA COMES FROM MOST RECENT SAMPLING EVENT AT EACH LOCATION.
5. NAWC PFAS DATA FROM DRAFT PER- AND POLYFLUOROALKYL SUBSTANCES SITE INSPECTION FOR MULTIPLE SITES FORMER NAVAL AIR WARFARE CENTER TRENTON, NEW JERSEY DATED MARCH 2022.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northeast, LLC Project Manager.

CASE NARRATIVE

Client: Haley & Aldrich, Inc.

Project: Racer, Ewing/Trenton

Report Number: 460-290219-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 10/12/2023; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 5.5 C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

PER- AND POLYFLUOROALKYL SUBSTANCES (PFAS)

Samples MW90AR-101223-0927-95 (460-290219-1), MW90R-101223-1030-26 (460-290219-2), MW41R-101223-1137-29.5 (460-290219-3), MW14A-101223-1231-40 (460-290219-4), MW83R-101223-1346-29 (460-290219-5), 1000-101223-0003 (460-290219-6), MW89A-101223-0946-96 (460-290219-7), MW89-101223-1056-25 (460-290219-8), MW17A-101223-1206-29 (460-290219-9), MW17B-101223-1306-96 (460-290219-10), MW82-101223-1411-30 (460-290219-11) and 1000-101223-0002 (460-290219-12) were analyzed for Per- and Polyfluoroalkyl Substances (PFAS) in accordance with PFC-IDA - 537 (modified). The samples were prepared on 10/19/2023 and analyzed on 10/21/2023.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 200-196590.

The “I” qualifier associated with sample MW83R-101223-1346-29 (460-290219-5) is applied because the transition mass ratio for the indicated analyte(s) was outside of the established ratio limits. The qualitative identification has some degree of uncertainty, however analyst judgment was used to positively identify the analyte(s).

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the PFAS analysis.

All other quality control parameters were within the acceptance limits.

Sample Summary

Client: Haley & Aldrich, Inc.
Project/Site: Racer, Ewing/Trenton

Job ID: 460-290219-1

Lab Sample ID	Client Sample ID	Matrix	Collected	Received

Qualifiers

LCMS

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count
