Section 1.0 Introduction 1

Section 2.0 Background 1

2.1 Historical Ownership and Operations 1
2.2 Current Ownership and Operations 3
2.3 RCRA Regulatory History and Corrective Action Status 4

Section 3.0 Environmental Setting 5

3.1 Physiography and Topography 5
3.2 Land Use 5
3.2.1 Regional Land Use 5
3.2.2 Site-Specific Land Use 6
3.2.3 Adjacent Land Use 6
3.3 Geology 7
3.3.1 Regional Geology 7
3.3.2 Site-Specific Geology 7
3.4 Hydrogeology 8
3.4.1 Regional Hydrogeology 8
3.4.2 Site-Specific Hydrogeology 9
3.5 Surface Water Hydrology 10
3.5.1 Regional Surface Water Hydrology 10
3.5.2 Site-Specific Surface Water Hydrology 11
3.6 Ecological Setting 11
3.6.1 Regional Ecology 11
3.6.2 Site-Specific Ecology 12
3.7 Regional Water Supply and Groundwater Use 12
3.8 Regional Demographics 15
3.9 Regional Climate 15
3.10 Regional Plant Life 16
3.11 Regional Animal Life 17

Section 4.0 Source Characterization 17

4.1 AOI 1: SWMU 1 – Oily Aluminum Scrap Holding Area 18
4.1.1 Previous Investigations 19
4.2 AOI 2: SWMU 2 – WWTP 19
4.2.1 Previous Investigations 20
4.3 AOI 3: SWMU 3 – Hazardous Waste Storage Building (Former Delco Remy Warehouse) 21

Section 1.0 Introduction

Review of the United States Environmental Protection Agency (U.S. EPA) Resource Conservation and Recovery Act (RCRA) Corrective Action Site Progress Profile[1] for 1200 West 8th Street in Muncie, Indiana (Property or Site), indicates that the Property was assessed on January 19, 1990. The 1990 RCRA Facility Assessment (RFA) concluded that a RCRA Facility Investigation (RFI) of the Site was required. Conestoga-Rovers & Associates (CRA) has prepared this RFI Report, on behalf of the Revitalizing Auto Communities Environmental Response (RACER) Trust, to summarize the RFI in accordance with the conclusions of the 1990 RFA.

The information presented in this RFI Report describes the areas of known or potential environmental impairment, referred to as Areas of Interest (AOIs), the historical investigations conducted at each AOI (if any), and the procedures, methods, and results of the field investigations conducted during the RFI. The information includes a comparison of both historical and RFI data with Indiana Department of Environmental Management (IDEM) generic Screening Levels[2] to identify whether there has been a significant release of hazardous waste or hazardous constituents from each AOI. Where a potentially significant release was identified, the nature and extent of hazardous constituents in the environmental media are discussed. A Refined Human Health Risk Assessment (RHHRA) is included in this RFI Report to provide a basis for determining whether the presence of hazardous constituents pose a current unacceptable risk to human health that would warrant corrective measures.

Section 2.0 Background

The Site consists of the property with a municipal address of 1200 West 8th Street, Muncie, Delaware County, Indiana, as well as surrounding properties east of Elliot Street and south of 8th Street as defined on Figure 1 (Site Location Map). The historical operational areas of the Site consist of approximately 62 acres of land, including an approximately 1.2 million square foot manufacturing building and several outlying buildings and structures as presented on Figure 2 (Historical Site Layout). At present, no above grade structures remain at the Site. A land title survey, including a legal property description of the Site, is included in Appendix A.1.

2.1 Historical Ownership and Operations

With the exception of the Carpenter Shop constructed in 1899, the Site was reportedly either utilized for agricultural purposes for various types of crops or consisted of vacant undeveloped land prior to industrial development in 1904 (northern portion) and 1920 (southern portion).

[1] www.epa.gov/enviro/facts/rcrainfo, accessed March 25, 2014
[2] IDEM's Remediation Closure Guide, dated March 22, 2012 and related amendments through March 5, 2014

Prior to use as a woodworking shop, the Carpenter Shop was utilized by Warner Lamp Company and by an underwear company.

The Site operated under various divisions of General Motors Corporation (GMC) beginning in 1904. Manufacturing operations began at the Site in 1904 when the northern 18 acres of the Site were developed with the construction of the former Delco Remy Battery Plant (former Battery Plant). Operations conducted at the former Battery Plant included the manufacture of lead acid batteries. Based on the review of available information, the primary operations conducted at the former Battery Plant included grid and parts molding, plate curing, oxide manufacturing and grinding, battery case cleaning, battery assembly, battery charging, and lead reclamation. Ancillary operations included receipt and storage of raw materials, maintenance activities, shipment of finished products, and administrative activities. Based on the review of previous environmental documentation, slag residue containing lead was historically stored outside of the former Battery Plant on bare ground. Historical drawings showing the former Battery Plant layout, including some subsurface structures, in 1949, 1956, and 1972 are provided in Appendix A.2.

The southern 44 acres of the Site were purchased by GMC in 1919 and the Muncie Products Division (MPD) of GMC was constructed in 1920. After several plant expansions and updates, the Property was developed to include a manufacturing building (approximately 1.2 million square feet in size) and several outlying buildings and structures [i.e., Wastewater Treatment Plant (WWTP), former Delco Remy Warehouse, Carpenter Shop, Powerhouse, and Metallurgical Building]. The chronology of Site construction and building expansions/updates is presented on Figure 3.

Operations conducted at MPD consisted of the manufacture of transmissions, steering gears, and valves. Primary MPD operations at the Site included heat treating, grinding and machining, electroless plating, and assembly. Ancillary operations included receipt and storage of raw materials, product and materials testing, wastewater treatment, equipment maintenance activities, hazardous and non-hazardous waste management, shipment of finished goods, and administrative activities. Forging operations were also conducted at the MPD plant from 1929 until 1981. Various types of bar stock were received by rail and stored outside the forge plant (more recently, the transfer line area). The bar stock was cut with a shear, dropped to forge the part, heated in a rotary furnace to trim edges, and moved to a draw furnace.

MPD closed in 1932 and remained closed until 1935. In 1935, the MPD portion of the Site was reopened by the Chevrolet Motor Division of GMC. The Site continued to manufacture passenger and commercial vehicle transmissions until 1941, when production shifted to the manufacture of aircraft parts. In 1945, production returned to the manufacture of vehicle transmissions by the Chevrolet Motor Division of GMC.

The former Battery Plant on the northern portion of the Site was decommissioned and demolished between 1978 and 1979. Following decommissioning and demolition of the former Battery Plant, the area of the former Battery Plant was capped with asphalt. The former Hazardous Waste Storage Building (i.e., former Delco Remy Warehouse) was not demolished at the time of the Battery Plant demolition activities. The former Delco Remy Warehouse remained to support operations at the transmission manufacturing facility.

In 1980, the operation and maintenance of the northern 18 acres of the Site reverted to the Chevrolet Motor Division of GMC. In November 1984, the Site was transferred to Detroit Diesel Allison Division of GMC and in 1986, the Site was transferred to the Hydra-Matic Division of GMC. The Hydra-Matic Muncie Plant department layout is presented on Figure 4.

In April 1990, the Site was operated as New Venture Gear, Inc. (NVG) through a joint venture between GMC and Acustar New Process Gear, Inc. (Acustar). Under the joint venture, Acustar had primary responsibility for operating the Site. Ownership and operational responsibility of the Site reverted to GMC in 2003 and operations began as Manual Transmissions of Muncie (MTM) in January 2004. According to Site personnel, NVG and MTM made relatively few changes in the types of operations performed at the Site between 1990 and 2006, when manufacturing operations at the plant ceased and significant amounts of equipment were sold and removed from the Site. The NVG department layout is presented on Figure 5. A 2005 aerial image of the former operational areas of the Site is presented on Figure 6. Oblique historical photographs of the Site are presented in Appendix A.3.

2.2 Current Ownership and Operations

Manufacturing operations at the Site ceased on March 29, 2006. Natural gas utilities servicing the plant were terminated on July 3, 2006 and water and sanitary wastewater services were terminated on October 1, 2006. Decommissioning and demolition activities were completed in February 2009. At the time this RFI Report was prepared, only portions of floor slabs, below grade structures, and asphalt parking areas/driveways remained at the Site.

As a result of GMC's 2009 bankruptcy, certain operating assets of GMC were sold on July 10, 2009 to a newly formed company, now known as General Motors LLC (GM). Existing non-continuing assets, including the Site, remained the property of "old" GMC, now referred to as Motors Liquidation Company (MLC) in its capacity as debtor-in-possession in the bankruptcy case. In October 2010, the United States Government announced that MLC had agreed to resolve its liabilities at 89 sites relating to liabilities under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), RCRA, and the Clean Air Act through an environmental response trust. On March 31, 2011, all of the properties and cleanup funds

were transferred from MLC to RACER Trust. RACER Trust is currently conducting, managing, and funding cleanup at 89 sites formerly owned by MLC, including the Site.

A summary of the historical operational entities is provided in Table 1.

2.3 RCRA Regulatory History and Corrective Action Status

On November 18, 1980, GMC submitted a RCRA Part A permit application to the U.S. EPA for interim status container storage at the former Delco Remy Warehouse. A Revised Part A permit application was submitted on August 21, 1987, based on the generation of a new waste stream due to alterations in the Powerhouse operations. A letter from IDEM to Hydra-Matic Division of GMC dated March 7, 1988 indicated that the Site either had to file for a Part B permit, or submit a closure plan in lieu of a Part B permit application. A Closure Plan was submitted to IDEM by Hydra-Matic Division of GMC on May 2, 1988 and amended May 20, 1988 and June 2, 1988. The Closure Plan was approved, with one modification, by IDEM in a letter dated August 1, 1988. Closure of the hazardous waste storage area (i.e., former Delco Remy Warehouse) was obtained from IDEM in a letter dated January 17, 1991.

IDEM was requested by the U.S. EPA to conduct a RFA of the Muncie Hydra-Matic Division of GMC, which was presented in the document titled "RCRA Facility Assessment PR/VSI Report and CERCLA Preliminary Assessment Report for Hydra-Matic Division of General Motors, Muncie, Indiana dated August 16, 1989 (see Appendix B) (IDEM, 1989). The RFA consisted of a Preliminary Review (PR), a Visual Site Inspection (VSI), and a CERCLA Preliminary Assessment (PA). According to the RFA, the CERCLA PA and VSI provided no evidence of a current (at that time) release of hazardous materials to the environment from the Site. In the CERCLA PA, IDEM recommended the Site receive a priority assessment status of No Further Remedial Action Planned (NFRAP). At the time of the RFA, GMC had recently conducted an investigation at the former Battery Plant. The CERCLA PA noted that only preliminary reports of the GMC investigation were available and therefore, the NFRAP status of the Site was conditional on the final report by GMC not identifying any areas of concern at the former Battery Plant.

Review of the U.S. EPA RCRA Corrective Action Site Progress Profile[3] indicates that the Property was assessed on January 19, 1990. The 1990 RFA concluded that a RFI of the Site was required. This RFI Report has been prepared to summarize the RFI in accordance with the conclusions of the 1990 RFA.

The RCRA Facility Investigation Work Plan (CRA, 2011b) was submitted to IDEM by RACER Trust in May 2011, approved by IDEM on August 3, 2011, and implemented by CRA between November and December 2011. Following receipt and review of analytical data generated

[3] www.epa.gov/enviro/facts/rcrainfo, accessed March 25, 2014

through implementation of the RFI Work Plan, the RFI Stage II Work Plan (CRA, 2012) was submitted to IDEM on December 11, 2012. The RFI Stage II Work Plan was approved by IDEM on December 12, 2012 and implemented by CRA between February and March 2013.

In April and May 2014, CRA conducted groundwater monitoring activities across the Site. Groundwater monitoring activities included hydraulic monitoring with an oil/water interface probe and low flow sampling for volatile organic compounds (VOCs) and polychlorinated biphenyls (PCBs).

This RFI Report has been prepared to summarize previous remedial actions and investigations, describe the procedures and methods of the field investigations conducted during the RFI, and provide a comparison of relevant analytical data to generic and Site-specific screening levels to determine if corrective measures are necessary.

Section 3.0 Environmental Setting

3.1 Physiography and Topography

The State of Indiana covers an area of approximately 36,300-square miles. Indiana's topography ranges from 324 to 1,257 feet above mean sea level (amsl). The lowest point of elevation is in the southwest corner of Indiana, where the Wabash River flows into the Ohio River. The highest point is in Wayne County in east central Indiana. The topography of Delaware County is characterized as flat to gently rolling.

The Site is located at an elevation of approximately 950 feet amsl. The Site is relatively flat with little topographic relief.

3.2 Land Use

3.2.1 Regional Land Use

Land use in Indiana primarily consists of farming with the primary crops being corn, soybeans, feed grains, and hay. Industry and dairy farming are important to nearby urban areas. Farming is central to the economy of Indiana and its counties. Oil and gas (in the east central section) were discovered in 1889, however, this resource was depleted by 1912. There are several oil fields located in the southwestern portion of Indiana.

3.2.2 Site-Specific Land Use

The former operational areas of the Site are bounded to the north by Penn Central Railway, to the east by Elliot Street, to the south by 8th Street, and to the west by Perkins Avenue. Properties included in the Site boundary east and south of the former operational areas were used for employee parking. The former operational areas of the Site are zoned as Intense Industrial (II). The former employee parking areas are zoned as Resident Zones 4 and 5. A portion of the zoning map for the City of Muncie in the vicinity of the Site is presented on Figure 7.

3.2.3 Adjacent Land Use

Review of Figure 7 indicates mixed land use surrounding the Site. The following buildings or features are located on the properties adjacent to the Site:

- a railway to the north of the Site, north of which is an auto salvage yard
- industrial properties, including warehouses, northeast and northwest of the Site
- a dry cleaning operation, located south of the Site
- residential properties located west, south, and east of the Site

PSP Realty Incorporated (PSP Realty) located at 1011 South Perkins Avenue, northwest of the Site, is undergoing RCRA corrective action due to waste materials left at the property by a former tenant, resulting in an Agreed Order (AO) with IDEM. Two groundwater grab samples were collected from the PSP Realty property on January 13, 2010, the results of which indicate trichloroethene (TCE) is present in groundwater grab samples above the Risk Integrated System of Closure (RISC) Residential Default Closure Level (RDCL), but below the RISC Industrial Default Closure Level (IDCL)[4]. The source of the TCE detected on PSP Realty's property is currently unknown.

Dry cleaning operations are conducted upgradient of the Site, at the southwest corner of South Sampson Street and West Eighth Street. As discussed in Section 4.36, an investigation of the upgradient dry cleaning facility was conducted by Harding ESE, Inc. (Harding), including a file review and site visit, monitoring well installations and groundwater sampling, an evaluation of migration pathways, and analytical modeling, beginning in 1998 and continuing until 2001. Harding's investigation determined that tetrachloroethene (PCE) in Site groundwater is most likely attributable to operations at a dry cleaning facility upgradient of the Site. Further, it was determined by Harding that the dry cleaner was likely disposing of PCE in the sanitary sewer and the PCE was leaking out of the sewer and migrating to the upper sand and gravel aquifer

[4] The RISC RDCLs and IDCLs were the applicable IDEM generic criteria at the time of the 2010 investigation.

through a permeable window that may have been created near the intersection of Eight Street and Sampson Street during sewer construction (Harding, 2001a/b).

3.3 Geology

3.3.1 Regional Geology

Delaware County is characterized by the glaciofluvial loamy till (unsorted mixture of sand, silt, clay, and boulders) of the Huron-Erie Lobe, which are Wisconsin deposits common to central Indiana. Based on a review of the United States Department of Agriculture (USDA) Soil Survey of Delaware County, Indiana, the soils that formed in glacial till in Delaware County are divided into two groups. The southern third of the county is formed in till that has a dominant texture of loam. The major soils in the southern third of the county are Crosby, Miami, Miamian, Treaty, and Williamstown soils. The soils in the northern two-thirds of the county formed in till that has a dominant texture of clay. The major soils in this part of the county are Blount, Morley, and Pewamo soils.

The configuration of the land surface in Delaware County, or physiography, is made up of two distinct landforms (i.e., ground moraines and recessional moraines). The ground moraines are broad flat surfaces with swell and swale topography and scattered closed depressions. The recessional moraines are a series of rolling, mostly convex ridges that are narrower and more sloping than the ground moraines (USDA, 2004). The physiographic divisions of the State of Indiana are presented on Figure 8.

Bedrock in the vicinity of the Site consists of lower and middle age Sulurian limestone and dolomite and is expected to be encountered between 25 and 200 feet below ground surface (bgs). Figure 9 presents the bedrock geology of Indiana. Sulurian limestone is part of the Bainbridge Group which has a vaguely defined vertical cutoff boundary in southwestern Indiana against rocks ranging upward from the Salomonie Dolomite through the Wabash Formation. Three distinct lithologies characterize the Bainbridge Group. Bailey limestone is white, gray, and brown, very fine grained, cherry, and partly argillaceous limestone and some dolomitic limestone. Moccasin Springs Formations are multihued, dense, argillaceous to shaly, silty limestone and some shale. Finally, St. Clair limestone is relatively pure white to pink, red, gray, and brown granular echinoderm-rich limestone. Figure 10 presents a generalized stratigraphic column for Paleozoic formations in Indiana.

3.3.2 Site-Specific Geology

The locations of four geologic cross sections prepared for this Report are presented on Figure 11. The locations of the cross sections were selected to be parallel and perpendicular to

the primary (northwest) and secondary (north) groundwater flow directions across the Site. The cross sections are presented on Figures 12 through 15.

As presented on the geologic cross sections, a shallow clay and silt layer between 10 and 35 feet thick is present across much of the Site. The clay and silt layer is underlain by sand and gravel that contains discontinuous lenses of clay and silt of varying size and thickness.

An intermediate clay layer between 5 and 25 feet thick is encountered across most of the Site at depths ranging from 40 to 60 feet bgs and appears to be continuous. The intermediate clay layer separates the higher permeability units into two layers, the upper continuous sand and gravel layer overlaying the intermediate clay and a lower unit of sand or limestone with discontinuous silt/clay lenses beneath the intermediate clay. Bedrock is most shallow in the south and west of the site, deepening towards the east.

3.4 Hydrogeology

3.4.1 Regional Hydrogeology

Pre-Wisconsin and Wisconsin glacial sediments completely cover Delaware County. However, the thickness of unconsolidated sediments is quite variable. Depth to the bedrock surface of central Delaware County is shallow and, in general, deepens to the north and south. Thickness of sediments that overlie bedrock range from no sediments where bedrock is exposed near the White River in east-central Delaware County, to as much as 330 feet where glacial sediments have filled pre-glacial valleys. Regional estimates of aquifer susceptibility to contamination from the surface can differ considerably. Variations within geologic environments can cause variation in susceptibility to surface contamination.

There are several aquifers in Delaware County. The Site is primarily located within the White River and Tributaries Outwash aquifer subsystem where sand and gravel aquifer deposits generally range from 10 to 30 feet thick. In some areas the deposits are separated by intermittent clay or sandy clay materials, and are commonly capped by silt, sandy clay, or clay ranging from 5 to 40 feet thick. Domestic well yield in the Tributaries and Outwash subsystem are typically from 5 to 25 gallons per minute (gpm) and static water levels are 10 to 20 feet bgs. Areas within this aquifer system that have overlying clay or silt deposits are moderately susceptible to surface contamination; whereas, areas that lack overlying clay or silt deposits are highly susceptible to contamination. The Site is bound to the south by the Till Veneer Aquifer System in which the unconsolidated sediments are dominated by clay materials with some thin, fine grained sand and gravel units present. Due to the generally low permeability of the near-surface materials, this system is less susceptible to contamination from surface sources. The Site is bound to the far east and west by the New Castle Bluffton Till aquifer system which

typically consists of thick clay with intermittent sands and gravels that are up to 250 feet in total thickness in places (IDNR, 2006).

The Silurian and Devonian Carbonates aquifer system is extensive throughout nearly all of Delaware County. The system includes Silurian age carbonate rock units (limestone and dolomite) with some interbedded shale units. Total thickness of the Silurian bedrock deposits ranges from 200 to 400 feet. Depth to the bedrock surface ranges from about 0 to 300 feet but is commonly 35 to 110 feet. Groundwater flow within the aquifer takes place along the joints, fractures, and openings in the bedrock formation. The permeability of the bedrock decreases rapidly with depth. Most of the water produced from the dolomite is obtained from the upper 50 feet, however, some water bearing zones have been found as deep as 100 feet. Recharge to the dolomite is predominantly precipitation percolating through the glacial deposits. Discharge is typically seepage to the overlying glacial drift in the valleys of the larger streams (IDNR, 2006).

3.4.2 Site-Specific Hydrogeology

Based on a review of previously conducted subsurface investigations, groundwater is present at the Site at a depth of approximately 10 to 20 feet bgs. Historical groundwater elevation data are summarized in Table 2.

Groundwater elevation contours based on December 2011 measurements are plotted on Figure 16 and indicate that groundwater flows north and northwest across the Site towards the west fork of the White River.

The December 2011 groundwater elevation data were used to calculate the average vertical and horizontal gradients. The average hydraulic gradient across the Site was calculated as 0.0075 however, it is noted that horizontal gradients ranged from 0.0035 at the northern portion of the Site to 0.0098 at the southern portion of the Site. The downward vertical gradient at the northern boundary of the Site is 0.027. A study conducted in 1990 concluded that the variability in the horizontal and vertical gradients across the Site may be attributed to the variable thickness of the silt aquitard that overlies bedrock and the degree of hydraulic connection between the drift aquifer and the bedrock aquifer at these locations.

In-situ hydraulic conductivity tests (slug tests) conducted in 1989 indicated that the average hydraulic conductivity of the upper sand and gravel is approximately 65 feet/day. Aquifer pumping tests conducted in 1994 indicate an average hydraulic conductivity of 450 feet/day in the area of pumping well PW-02. A review of boring logs reveals that a discontinuous zone of higher hydraulic conductivity (i.e., soils with more gravel and less silt) is present in the area of the pumping well.

The groundwater flow velocity through the Site was calculated using a modified form of Darcy's law: V (the average linear velocity of groundwater flow in feet/day) is equal to K (the hydraulic conductivity in feet/day) multiplied by i (the horizontal hydraulic gradient in feet/feet) divided by n (estimated effective porosity in percent).

Using an average hydraulic conductivity of 450 feet/day as determined by the 1994 pumping test, the average horizontal hydraulic gradient of 0.0075 feet/feet, and an estimated effective porosity of 30 percent, the average groundwater velocity was estimated to be 11.25 feet/day. Using an average hydraulic conductivity of 65 feet/day as determined by the 1989 slug test, the average groundwater velocity was estimated to be 1.625 feet/day.

3.5 Surface Water Hydrology

3.5.1 Regional Surface Water Hydrology

Indiana is located on the eastern edge of the North American Great Interior Plains. The north-south continental divide traverses through northern Indiana draining watersheds into the Great Lakes basin and the Mississippi River and Ohio River systems. Surface water in the northern one-quarter of the State flows north into the Great Lakes and then through the St. Lawrence River to the Atlantic Ocean. The southern three-quarters of the State drain into the Ohio River or Illinois River and flows into the Mississippi River then south to the Gulf of Mexico (IDNR, 2006).

The nearest surface water body to the Site is the west fork of the White River, which is located approximately one half mile north of the Site. The White River is a two-forked river that flows through central and southern Indiana and is the main tributary to the Wabash River. The west fork is approximately 273 miles long and is the longest fork of the River beginning in Randolf County, winding through the Cities of Muncie, Anderson, and Indianapolis, Indiana (USGS, 1981). The principal streams of the White River drainage basin are presented on Figure 17.

The United States Geological Survey (USGS) maintains a stream gauging station along the west fork of the White River in Muncie (USGS 03347000). Data recorded at the gauging station indicate that for the available period (October 1, 1931 to September 30, 2012), the average daily stream flow was 232 cubic feet per second (cfs). The minimum and maximum average daily flows were 34 and 636 cfs, respectively. The minimum and maximum single day flow rates recorded between October 1, 1931 and March 9, 2014 were 1.1 and 11,600 cfs, respectively.

3.5.2 Site-Specific Surface Water Hydrology

No surface water bodies exist on the Site. The closest body of water is the west fork of the White River located approximately one half mile north of the Site. Although the White River is the nearest surface water body to the Site, surface water flows south from the Site and discharges to Buck Creek. Buck Creek is located approximately three-quarters of a mile south of the Site and flows to the west. Buck Creek discharges to the White River at a location approximately 5.5 miles west of the Site.

3.6 Ecological Setting

3.6.1 Regional Ecology

The City of Muncie lies within the White River Basin, approximately one-half mile southeast of the west fork of the White River. The White River Basin spans three ecoregions. The northern and southeastern parts of the basin are in the Eastern Corn Belt Plain ecoregion, characterized by low relief. Land use is mostly row-crop agriculture. Drainage density is about one-half mile per square mile. The south central part of the basin is in the Interior Plateau ecoregion, characterized by moderate relief and a hill and valley landscape. Land use is mixed with forest, pasture, and some row-crop agriculture, confined mainly to valley floors. Drainage density is about two miles per square mile. The southwestern part of the basin is in the Interior River Lowland ecoregion, characterized by rolling hills. Land use is mixed with row-crop agriculture, pasture, forest, and oil and gas production. Drainage density is about two miles per square mile[5].

There is a limited fish consumption advisory (FCA) in effect for the west fork of the White River for PCBs and mercury in most species of fish. The extent and level of FCA issued for a given stream is based on levels of PCBs and mercury found in fish tissue. Samples were taken of bottom feeding fish, top feeding fish, and fish feeding in the water column in streams across the State. The statewide database includes over 1,600 fish tissue samples, which were analyzed for PCBs, pesticides, and heavy metals. Numerical sample results of the FCA are not published.

As of March 2014, fish species covered by FCA in Delaware County streams near Muncie include[6]:

Buck Creek – longear sunfish, smallmouth bass, and white sucker bass
Prairie Creek Reservoir – bluegill, common carp, largemouth bass, smallmouth bass, walleye, white crappie, and yellow perch

[5] http://in.water.usgs.gov/nawqa/fishes.pdf, accessed 2006

[6] http://fn.cfs.purdue.edu/prodAAI/published/general/en/Delaware.pdf, accessed March 2014

Mississinewa River – common carp, channel catfish, flathead catfish, quillback, white crappie, and white sucker
West Fork of White River – redhorse, bluegill sunfish, green sunfish, black bullhead, channel catfish, largemouth bass, quillback, spotted sucker, and white sucker

Fish species, size classes, and level of advisory in Indiana streams are shown in the attached table from the Purdue University Angling Indiana website (see Appendix C).

There were originally more than 20 million acres of hardwood forest covering Indiana, however, a "prairie peninsula" projected well into the northwestern part of the State characterized by a dense mixture of tall grasses and other herbaceous plants. Most of the original prairie in the State has been lost to drainage, urbanization, and agriculture. Today, only 20 percent of the forests and less than 13 percent of the wetlands remain. Principal wetland cover types are primarily palustrine, unconsolidated bottom, intermittently exposed, and diked and impounded artificial wetlands, based on a 1990 Natural Wetlands Inventory Map.

According to the 1987 Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map for Muncie, the Site does not lie within the 100-year or 500-year floodplain[7]. The FEMA Flood Insurance Rate map for Muncie, Indiana is provided in Appendix D.

3.6.2 Site-Specific Ecology

Review of the wetlands inventory map (Figure 18) identified a riverine wetland in the area corresponding to the former cooling pond. A riverine wetland typically occurs along streams, rivers, and irrigation canals, forming ribbons of trees and shrubs. The former cooling pond was a man made, concrete lined, 685,000-gallon water retention basin, clearly not meeting the three requirements of a wetland (i.e., containing hydrology, hydrophytic vegetation, and hydric soils). The former cooling pond was reportedly filled with demolition debris (i.e., concrete) during Site decommissioning activities.

An ecological evaluation of the Site has been conducted by CRA. Table 3 presents the ecological habitat matrix for the Site.

3.7 Regional Water Supply and Groundwater Use

According to Site personnel, potable water was supplied to the Site by the Indiana American Water Company (IAWC). According to Site personnel and based on observations made during CRA's Site inspections, no water supply wells are currently utilized on Site. Based on a review of available documentation, one water supply well (production well) was historically present at

[7] http://www.fema.gov,accessed March 2014

the Site. This well was utilized for boiler make-up prior to 1967 and for the production of make-up water for the former cooling pond after 1967 during forging operations. Based on review of available documentation, the well was a six-inch diameter well that was 206 feet deep that was installed in approximately 1920. The well screen was set in limestone at approximately 70 feet bgs. A well log was not available in the Site files for this production well. The production well was located in a pit outside the southeast corner of the former Powerhouse.

Based on available documentation, the well was last used as a production well on June 1, 1976; however, the well was used in the late 1980s and early 1990s as a monitoring well to collect groundwater samples during investigations conducted at the Site. The well was referenced as MW-7 for the purposes of groundwater sampling. The production well was abandoned in June 2005 when the well piping was removed and the hole was filled with bentonite. Closure of the well was documented by CRA in July 2005.

The IDEM Office of Water Management, Drinking Water Branch (DWB) is the primary administrator of the Indiana Public Water Supply Supervision Program. The IDEM-DWB maintains an inventory of all public water supplies (PWS). Each PWS is required to collect and analyze drinking water samples for various contaminants (IDEM DWB[8]). The water sample analysis data are compiled to ensure that public water systems do not exceed the maximum contaminant levels (MCLs) established by the State of Indiana and the Federal government.

There are approximately 4,200 active PWS in Indiana. Drinking water in Indiana comes from groundwater sources via wells or surface water sources such as lakes or rivers. Some public water systems purchase water from other PWS and distribute the water to their customers. Ninety-seven percent of all public water systems are classified as groundwater systems (IDEM DWB, 2012).

Fifty-six percent of Indiana's population relies on groundwater for drinking and household use. In 1995, it was estimated that 1.52 million people were supplied water from private domestic wells and PWS supplied 2.1 million people from a groundwater source. Approximately 303 million gallons per day (gpd) of groundwater was pumped by PWS registered as significant water withdrawal facilities (100,000 gpd capacity) in 1992. Approximately 4,200 PWS and countless industries use groundwater as their source of water (IDEM-DWB, 2001).

In 1996, ABB Environmental Services, Inc. (ABB-ES) performed a preliminary water well reconnaissance of areas surrounding the Site to evaluate well locations. The field check involved correlating the names, addresses, and/or distance and direction information on well

[8] https://myweb.in.gov/IDEM/DWW/, accessed 2013

logs to names and addresses on buildings. A total of nine water wells were identified, eight of which were identified by well logs. Six of the nine wells were identified as having residential use. The six residential wells are located more than 4,000 feet south and southwest of the Site. These wells are upgradient of the Site. One industrial well was identified approximately 3,500 feet north of the Site. This industrial well is located north of the west fork of the White River which is likely the discharge point for Site groundwater. One public well was identified approximately 600 feet north of the Site and the owner of the property was contacted as part of the 1994 activities. At that time, the owner stated that the property was serviced by municipal water and suspected that the public well in question had been abandoned. During previous investigations, the possibility of a well existing at the Beech Grove Cemetery was discussed. ABB-ES contacted the groundskeeper at the Beech Grove Cemetery who stated that the cemetery has a shallow well that it uses for irrigation. According to the groundskeeper, drinking water at the cemetery is obtained from the municipal water supply.

In 1996 ABB-ES discovered that there are no restrictions on the installation of a private well in the City of Muncie even though municipal water supplies are available. Therefore, it is possible that a private water well was installed without a record being submitted to Indiana Department of Natural Resources (IDNR). As a result, additional actions were taken to confirm that private water wells did not exist. ABB-ES requested IAWC review a list of 279 addresses within a 13 block area downgradient of the Site (north to the west fork of the White River) to determine if the addresses were connected to the public water supply. After reviewing the information provided by IAWC and conducting a door to door survey of the addresses in question (i.e., downgradient of the Site), ABB-ES did not identify additional private water wells between the Site and the west fork of the White River.

In an effort to update the 1996 survey and develop a better understanding of the potential risks due to Site groundwater, CRA conducted a water well survey in 2008. The water well survey involved a review of available public records relating to the City of Muncie water supply and water well logs but did not include a door-to-door survey. The results of the water well survey indicated that 41 properties down-gradient of the Site may use groundwater for potable or non-potable purposes, the closest of which are approximately 400 feet down-gradient of the Site.

A door-to-door survey of the properties of interest (i.e., those properties down-gradient of the Site, south of West Kilgore Avenue, and/or with frontage on West 2nd Street) down-gradient of the Site was conducted in 2010 to inquire about the presence or absence of groundwater wells on the property and, if present, the construction details of the well. CRA did not identify the presence of water wells visually or through interviews with persons knowledgeable about the properties of interest.

In preparing this RFI Report, CRA conducted a database search of IDNR record of water wells for water wells within a one-mile radius of the Site. Recorded wells within a one-mile radius of the Site identified during CRA's water well search are presented on Figure 19. Review of Figure 19 indicates that two water wells have been installed between the Site and White River (well logs 1454 and 1455). A copy of the water well records for water wells within a one-mile radius of the Site are provided in Appendix E. Review of well log 1454 indicates a water well, owned by Holister Whitney Electric Company with a well depth of 49 feet, was installed in 1959. Review of well log 1455 indicates a water well, owned by Floyd & Sons Machine Shop with a well depth of 61 feet, was installed in 1959. The current status of the wells is unknown. Recent groundwater sampling in the vicinity of wells 1454 and 1455 (i.e., MW41-11, MW42-11, and MW43-11) found groundwater was free of VOCs. Other wells near the Site (well logs 1459, 1460, 1464, and 1465) were installed by Site operators and are believed to be investigative in nature.

3.8 Regional Demographics

According to the 2012 U.S. Bureau of Census, Delaware County had a population of approximately 117,364. The population racial mix in Delaware County is approximately 89.4 percent Caucasian; 7.1 percent African American; 0.3 percent American Indian and Alaska Native; 1.1 percent Asian; 0.1 percent Native Hawaiian or other pacific islander; and 2.0 percent persons reporting two or more races. The male population in Delaware County is approximately 56,335 and the female population is approximately 61,029 (U.S. Bureau of Census, 2012).

Delaware County's top five major employers are Ball State University, Indiana University Health, Muncie Community Schools, IBM Call Center, and Sallie Mae (Muncie-Delaware County, Indiana, 2013).

3.9 Regional Climate

The climate in Delaware County is temperate with warm summers, cold winters, and no distinguishable wet or dry seasons. Precipitation is generally evenly distributed throughout the year, although, precipitation is somewhat greater from March through July.

According to the National Oceanic and Atmospheric Administration (NOAA), the average length of the growing season, or freeze-free period, ranges from 148 days in northeastern Indiana to 194 days in southwestern Indiana. According to meteorological data from the National Climatic Data Center (NCDC), the average annual precipitation in Indiana ranges from 37 inches in the north to 47 inches in the south; average annual snowfall ranges from 14 inches in the southwest to 76 inches in north-central Indiana, near Lake Michigan.

January is typically the coldest month of the year with normal daily average temperatures ranging from 19.9 to 34.3 degrees Fahrenheit (°F) over the last 10 years. July is the warmest month with daily average temperatures ranging from 64.3 to 84.2 °F over the last 10 years (NOAA, 2014).

Prevailing winds in the vicinity of the Site are from the west/southwest based on the information obtained for Muncie, Indiana from the NCDC. The NCDC wind rose for Muncie, Indiana is presented on Figure 20.

3.10 Regional Plant Life

Common plant communities in the region range from obligate wetland to upland forest. Low areas with saturated soils support wetland species such as buttonbush (Cephalanthus occidentalis) and several sedge species. The highest and driest sites have a thicker shrub layer full of poison ivy (Toxicodendron radicans), spicebush (Lindera benzoin), paw paw (Asimina triloba), elderberry (Sambucus Canadensis), and an occasional possumhaw (Ilex deciduas). Some other common herbaceous species include jewelweed (Impatiens capensis), bedstraw (Galium triflorum), wild rye (Elymus virginicus), avens (Geum canadense), grape (Vitis spp.) and a characteristic plant of the bottomland forest, the woolly pipe vine (Isotrema tomentosa). Common woody bushes and trees include azalea (Rhododendron sp.), rhododendron (Rhododendron canadense), buckeye (Aesculus californica), hickory (Carya spp.), serviceberry (Amelanchier spp.), American sycamore (Platanus occidentalis), American chestnut (Castanea dentata), dogwood (Cornus spp.), hawthorn (Crataegus spp.), ash (Fraxinus spp.), hackberry (Caltis occidentalis), buttonbush, box-elder (Acer negundo), black walnut (Juglans nigra), black cherry (Prunus serotina), red oak (Quercus rubra), black locust (Robinia pseudoacacia), yew (Taxus spp.), and red and black maple (Acer rubrum and A. nigrum). Non-woody plants include larkspur (Delphinium spp.), stinging nettle (Laportea canadensis), sweetclover (Melilotus officinalis), lupine (Lupinus spp.), mustard (Brassica spp.), milkweed (Asclepias syriaca), and horsetails (Equisetum spp.). Common plants that are invasive to Indiana include purple loosestrife (Lythrum salicaria), bush honeysuckle-amur (Lonicera maackii), tartarian (Lonicera tatarica L.), morrow (Lonicera mortowii), Japanese honeysuckle (Lonicera japonica Thunb.), garlic mustard (Alliaria petiolata), buckthorns (Rhamnus sp.), autumn olive (Eleaganus umbellate Thunb.), crown vetch (Coronilla varia), reed canary grass (Phalaris arundinaceae), common reed, (Phragmites australis), and Oriental bittersweet (Celastrus orbiculatus) (USDA, 2001).

A list of endangered, threatened, rare, and extirpated plants of Indiana is presented in Appendix F.

3.11 Regional Animal Life

There are a number of species known to inhabit in Indiana which are listed by the Federal or State government as endangered or threatened. Species of threatened or endangered birds in Delaware County include the American Bittern (Botaurus lentiginosus), the Loggerhead Shrike (Lanius ludovicianus), the Yellow-crowned Night-heron (Nyctanassa violacea), the Black-crowned Night-heron (Nycticorax nycticorax), and the King Rail (Rallus elegans). Species of threatened or endangered mammals in Delaware County include the Indiana bat (Myotis sodalis). Species of threatened and endangered fish known to occur in Delaware County include lake sturgeon (Acipenser fulvescens), northern cavefish (Amblyopsis spelaea), redside dace (clinostoma histrio), spotted darter (Etheostoma maculatum), tippecanoe darter (Etheostoma tippecanoe), variegate darter (Etheostoma variatum), greater redhorse (Moxostoma valenciennesi) gilt darter (Percina evides), and southern cavefish (Typhlichthys subterraneus) (U.S. Fish and Wildlife, 2006).

A list of Delaware County's endangered, threatened, and rare species and a list of Indiana's endangered, threatened, rare, and extirpated vertebrates and invertebrates are presented in Appendix F.

Section 4.0 Source Characterization

IDEM conducted a RFA for the Site in 1989, consisting of a PR and a VSI conducted on August 16, 1989, and a CERCLA PA. These activities resulted in the identification of ten solid waste management units (SWMUs) that are identified as AOIs 1 through 10. Additional AOIs were identified at the Site based on a review of available files, interviews with Site personnel, historical investigations and environmental activities, and Site inspections. In total, 36 AOIs have been identified at the Site as summarized in Table 4. The approximate locations of the AOIs are shown on Figure 21.

Several documented environmental investigations were conducted at the Site prior to initiating the RFI, beginning as early as the late 1970s. Throughout Section 4.0, the details of each AOI, including historical operations and the results of previous environmental investigations will be presented along with a conclusion as to whether additional investigation was warranted under the RFI.

Historical soil, borehole water, and groundwater quality data have been compared to the IDEM Remediation Closure Guide (RCG) Screening Levels (March 5, 2014), herein referred to as the Screening Levels.

Soil quality data were compared to the following Screening Levels, as summarized in Appendix G.1:

- Commercial/Industrial Direct Contact
- Excavation Direct Contact
- Residential Migration to Groundwater (MTG)

Borehole water and groundwater quality data were compared to the following Screening Levels, as summarized in Appendix G.2 and G.3, respectively:

- Residential Drinking Water (Tap)
- Residential Vapor Exposure
- Commercial/Industrial Vapor Exposure

A list of presentation parameters was developed that represents the constituents that were detected above one or more of the Screening Levels in one or multiple samples. As such, the results of only the presentation parameters are presented on figures throughout this Report.

In general, the results of historical environmental investigations have been associated with one or more AOI and are therefore discussed in the following corresponding subsections. However, a small number of soil samples, as shown on Figure 22, were collected for general soil quality screening.

4.1 AOI 1: SWMU 1 – Oily Aluminum Scrap Holding Area

The oily aluminum scrap holding area consisted of a semi-trailer and was located east of Oil House adjacent to Elliot Street (Figure 21). At the time of the 1989 RFA, this area was paved with asphalt, diked, and sloped to a drain northeast of the area that reportedly discharged to the on-Site WWTP.

The 1989 VSI conducted by IDEM identified this area as SWMU 1 and it was therefore identified as an AOI (AOI 1). During the VSI, it was noted that oil released from the trailer was confined to the diked area and was flowing into the drain.

On December 18, 1987, reclaimed oil was released in the vicinity of AOI 1 from an AST located north of the WWTP (i.e., AST No. 28). Approximately 1,400 gallons of reclaimed oil was released when the tank level gauge failed and the tank overfilled. Due to the grade of the area, the reclaimed oil flowed along the fence alignment north of the WWTP, and ultimately to Elliot

Street. The release and cleanup activities are discussed further in relation to the WWTP ASTs (i.e., AOI 12.5).

The semi-trailer used for the staging of aluminum scrap prior to sale was not present at the Site from at least 2005 when an above grade facility assessment was conducted. Based on observations made during a May 2006 Site inspection, the asphalt/concrete in the area of the former aluminum scrap staging area was in fair condition with some cracks present and expansion joints. Black and oily staining was observed in the immediate vicinity of the drain.

4.1.1 Previous Investigations

No subsurface investigations were completed in this area of the Site with respect to AOI 1 prior to implementation of the RFI Work Plan.

Due to the presence of staining around the drain observed in 2006 and potential impacts to this area of the Site resulting from the 1987 reclaimed oil release, this area was identified as an AOI requiring further investigation in the RFI Work Plan. Details of the RFI activities are provided in Section 6.0.

4.2 AOI 2: SWMU 2 – WWTP

The Site operated a WWTP to treat industrial wastewater generated at the Site prior to discharge to the Publicly Owned Treatment Works (POTW). The WWTP was constructed in 1968 by GMC. The 1989 VSI conducted by IDEM identified this area as SWMU 2 and it was therefore identified as an AOI (AOI 2). No observed releases in this area were noted during the 1989 VSI. The location of AOI 2 is presented on Figure 21.

Industrial wastewater from the plant was collected in holding tanks at the WWTP. Oil collected would float to the top of the tanks and was treated with polymers and alum to break up and coagulate the oil. The oily wastewater was then pumped to two parallel dissolved air flotation (DAF) units. The float was collected and heated to separate the oil from the water for reclamation. The reclaimed oil was treated with sulfuric acid, as necessary, and was either sent off Site for recycling or was utilized as on Site boiler fuel. The remaining water was pumped to another treatment tank, where caustic solution was added to adjust the pH to the permit discharge limitation. Following pH adjustment, the water was discharged to the POTW.

The WWTP consisted of the following:

- Two 176,000 gallon batch waste tanks
- One 360,000 gallon process waste tank

- One 20,000 gallon sludge tank
- Two 15,000 gallon reclaimed oil ASTs
- One 8,000 gallon sulfuric acid AST
- One 10,000 gallon caustic soda storage AST
- Two 1,500 gallon polymer storage ASTs
- One 10,000 gallon alum storage AST
- One 10,000-gallon reclaimed alum storage AST
- One 3,000 gallon cutting additive AST
- Two 7,000-gallon float storage ASTs
- One 10,000-gallon free oil storage AST
- One 5,000-gallon cool tank
- One approximately 200-gallon flash tank
- Eight 2,500-gallon cooker ASTs
- Three 3,000-gallon mix ASTs
- One 500-gallon caustic feed AST
- One 500-gallon reclaimed alum feed AST
- One 500-gallon alum feed AST
- One 300-gallon sulfuric acid feed AST
- One 550-gallon polymer feed AST

With the exception of the batch tanks, process waste tank, sludge tank, reclaimed oil tank, and sulfuric acid tanks, the WWTP tanks were located inside a building that would act as secondary containment for the tanks. Based on available documentation and observations made during Site inspections, secondary containment for the batch tanks, the process waste tank, and the sludge tank consisted of four inch curbing and a concrete base. This containment system included a waste drain that discharged to the tanks. The reclaimed oil and sulfuric acid ASTs were equipped with secondary containment consisting of concrete walls and a gravel base. The locations of ASTs are shown on Figure 23. WWTP ASTs were assessed as part of AOI 12.

Final cleaning and decommissioning of the WWTP was completed in 2007.

4.2.1 Previous Investigations

Below grade infrastructure (i.e., pits, sumps, and trenches) was assessed for integrity following cleaning activities conducted prior to building demolition. A pit within the former WWTP building (i.e., PIT 28825) was found to be in poor condition at the time it was assessed. Given

the poor pit integrity, this area was identified as an AOI requiring further investigation in the RFI Work Plan. Details of the RFI activities are provided in Section 6.0.

4.3 AOI 3: SWMU 3 – Hazardous Waste Storage Building (Former Delco Remy Warehouse)

The former Delco Remy hazardous waste storage building, referred herein as the former Delco Remy Warehouse, was constructed in 1954 and was located in the northeast corner of the former Delco Remy property. The former Battery Plant was decommissioned and demolished between 1978 and 1979, however, the former Delco Remy Warehouse remained to support operations at the transmissions manufacturing facility until decommissioning and demolition activities were completed in 2009 (see Section 1.2 for a detailed description of the former Battery Plant operations). The floor of the former Delco Remy Warehouse was concrete, at least six inches thick, diked and encircled by a trench drain. The 1989 VSI conducted by IDEM identified this area as SWMU 3 and it was therefore identified as an AOI (AOI 3). No observed releases in this area were noted during the 1989 VSI. The location of AOI 3 is presented on Figure 21.

Hazardous waste was temporarily stored in a locked and labeled fenced area in the former Delco Remy Warehouse prior to appropriate transportation and off-Site disposal. Historically, hazardous wastes temporarily stored in this area included PCB oil from old transformers, shot peening dust, and solvents [e.g., 1,1,1-trichloroethane (1,1,1-TCA)]. It is noted that degreasing operations utilizing 1,1,1-TCA ceased in 1997. More recently, hazardous wastes generated at the Site included light bulbs, lead acid batteries, dry cell batteries, paint thinners, and paint debris.

Closure of the hazardous waste storage building was obtained from IDEM in a letter dated January 17, 1991. The Site building was used to store miscellaneous equipment and hazardous waste for less than 180 days prior to October 2008, when demolition activities began.

4.3.1 Previous Investigations

In 2002, an investigation of the subsurface below the former Delco Remy Warehouse was conducted. The investigation was to include the advancement of two boreholes upgradient of the secondary containment area located in the southwest corner of the former Delco Remy Warehouse. During these activities, drilling equipment made contact with what appeared to be a metal obstruction at boring SB-04. A steel tape was advanced into the borehole annulus at SB-04 to gauge the depth of the object. When the tape was removed, it was covered in an oily substance. A wipe sample of the oily tape was collected and analyzed for PCBs. The laboratory results indicated the presence of PCBs [i.e., 130 micrograms (µg) of Aroclor 1248] on the wipe. Given that the wipe sample was from a steel tape, it was not possible to confirm that the area

of the sample covered 100 square centimeters (cm^2). Based on discussions with facility personnel and review of historical facility drawings, the exact nature of the subsurface obstruction is not known. Based on discussions with Site personnel and review of Site drawings at the time of the investigation, it is thought that the metal object may be part of a bank of three electrical generators and their associated trenches. Given that the exact nature of the subsurface structure could not be determined, installation of a proposed second borehole location (i.e., SB-05) was not completed. Historical drilling locations at AOI 3 are shown on Figure 24.

The former Delco Remy Warehouse was inspected in 2002 as part of the above grade review process. During the review process, several floor samples were collected for laboratory analysis of PCBs and RCRA metals. Analytical results indicated that the concrete floor slab was impacted with PCBs at concentrations up to 1,222 milligrams per kilogram (mg/kg) which exceed both unrestricted and restricted criteria for porous surfaces under the Toxic Substances Control Act (TSCA).

Due to the presence of PCBs, additional delineation sampling of the floor slab was completed to evaluate the extent of PCB impact. Delineation activities concluded that the first floor concrete and trenches, first floor mezzanine concrete, and concrete pad to the west of the former Delco Remy Warehouse were impacted with PCBs. The extent of PCB concrete impacted concrete at AOI 3 is presented on Figure 24.

PCB impacted concrete floor slab was generally addressed as detailed in the "Notification of Self Implementing PCB Cleanup and Disposal Approval" report (O'Brien & Gere, 2006) during decommissioning and demolition activities. However, the concrete was capped with asphalt instead of epoxy and, based on CRA's observations, does not extend to the limits of PCB impacts above 1 mg/kg in all areas. No notes related to inspection of the integrity of the PCB impacted concrete floor and trenches were reviewed by CRA. Therefore, further investigation of underlying soil quality was proposed in the RFI Work Plan.

4.4 AOI 4: SWMU 4 – Shot Peener

One of two shot peeners used during manufacturing operations was located in Department 16 in the northwest corner of the manufacturing building (Figure 21). Shot peening was utilized to enhance the performance of steel used to make transmission parts. Shot peening is a process whereby a large number of hardened particles (shot) are accelerated against the steel surface of a part. Each impingement of a shot makes a small indentation in the surface of the part, thereby inducing compressive residual stresses, which are usually intended to resist fatigue fracture or stress-corrosion cracking. Dust from the process was collected by a bag house and held in a drum (IDEM, 1989). It is noted that according to Site personnel, shot peening

operations conducted at the Site used steel shot. It is estimated that operation of the shot peener commenced in 1976.

The 1989 VSI conducted by IDEM identified this area as SWMU 4 and it was therefore identified as an AOI (AOI 4). At the time of the 1989 VSI, dust was noted on the floor at the base of the unit.

Operation of the shot peener stopped with cessation of manufacturing operations in March 2006. CRA conducted a visual inspection of this AOI on September 12, 2006. No evidence of a release to the environment was identified during the September 2006 inspection. The potential for a release to the environment was considered to be low based on the nature of the activities and location of the SWMU (i.e., inside the building with a concrete floor). Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.5 AOI 5: SWMU 5 – Shot Peener

The second of two shot peeners used during manufacturing operations was located in Department 15 in the southwest corner of the Heat Treat Building (Figure 21). It is estimated that operation of the shot peener commenced in 1969.

The 1989 VSI conducted by IDEM identified this area as SWMU 5 and it was therefore identified as an AOI (AOI 5). At the time of the 1989 VSI, dust was noted on the floor at the base of the unit.

Operation of the shot peener stopped with cessation of manufacturing operations in March 2006. CRA conducted a visual inspection of this AOI on September 12, 2006. No evidence of a release to the environment was identified during the September 2006 inspection. The potential for a release to the environment was considered to be low based on the nature of the activities and location of the SWMU (i.e., inside the building with a concrete floor). Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.6 AOI 6: SWMU 6 – Steel Scrap Crusher and Holding Area

The steel scrap crusher and holding area was located near the center of the manufacturing building near column I15 (Figure 21). It is estimated that the operation of the steel scrap crusher began in 1964. The steel scrap crusher and holding area was utilized for the storage of steel scrap that had been cut away from steel stock by a lathe. The metal scrap was stored in bins, crushed, and sold (IDEM, 1989). The steel scrap crusher and holding area was not present at the Site from at least 2006.

The 1989 VSI conducted by IDEM identified this area as SWMU 6 and it was therefore identified as an AOI (AOI 6). No releases were observed at this area at the time of the VSI. CRA conducted a visual inspection of this AOI on September 12, 2006. The concrete flooring was found in good repair and no evidence of a release to the environment was identified. The potential for a release to the environment was considered to be low based on the nature of the activities and location of the SWMU (i.e., inside the building with a concrete floor). Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.7 AOI 7: SWMU 7 – Paint Room

The paint room was located near the center of the manufacturing building, west of Department 65 and immediately south of the Training Center (Figure 21). The paint room was used for maintenance painting (using oil and latex paints); storage of related paints, solvents, and waste paint solvents (IDEM, 1989); and included a paint spraying area with exhaust vents and filters. It is estimated that the operation of the paint room began in 1964. Painting operations stopped with cessation of manufacturing operations in March 2006.

The 1989 VSI conducted by IDEM identified this area as SWMU 7 and it was therefore identified as an AOI (AOI 7). At the time of the VSI, paint overspray was observed on the floor of the spray paint area however, no releases of solvents were observed. CRA conducted a visual inspection of this AOI on September 12, 2006. The concrete flooring was found in good repair and no evidence of a release to the environment was identified. The potential for a release to the environment was considered to be low based on the nature of the activities and location of the SWMU (i.e., inside the building with a concrete floor). Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.8 AOI 8: SWMU 8 – Nylon Coating Machine

The nylon coating machine was located in Department 44 in the central portion of the manufacturing building (Figure 21). Operation of the nylon coating machine commenced in 1969. The nylon coating machine was used to coat transmission parts with nylon through a baking process. Waste nylon primer, containing methyl ethyl ketone (MEK), was historically collected at the machine (IDEM, 1989). According to plant personnel, operation of the nylon coating machine stopped in the early 1990's.

The 1989 VSI conducted by IDEM identified this area as SWMU 8 and it was therefore identified as an AOI (AOI 8). At the time of the VSI, no releases were observed. CRA conducted a visual inspection of this AOI on September 12, 2006. The concrete flooring was found in good repair and no evidence of a release to the environment was identified. The potential for a release to the environment was considered to be low based on the nature of the activities and location of

the SWMU (i.e., inside the building with a concrete floor). Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.9 AOI 9: SWMU 9 – Degreasing Station

One of two degreasing stations used during manufacturing operations was located along the east side of the manufacturing building near column H27 and H28 (Figure 21). The degreasing station consisted of a tank within a well marked, diked, and drained area. The floor drain reportedly discharged to the on-Site WWTP. It is estimated that operation of the degreasing station commenced in 1969. Metal parts and tools were degreased by being submerged in a solvent contained in the degreasing tank. According to Site personnel, 1,1,1-TCA was the only solvent used for degreasing between 1985 and 1992 (GMC, 2006). The type of degreasing solvent used at this AOI prior to 1985 and following 1992 is unknown. According to plant personnel, operations at the degreasing stations ceased in 1996.

The 1989 VSI conducted by IDEM identified this area as SWMU 9 and it was therefore identified as an AOI (AOI 9). At the time of the VSI, no releases from the unit were observed.

4.9.1 Previous Investigations

Chlorinated solvents, including low levels of 1,1,1-TCA, are present in Site groundwater. Although no specific evidence of a release of hazardous constituents to the environment has been identified, the potential for a release to soil/groundwater from the historical operations at this AOI was determined to be moderate to high. Therefore, further investigation was proposed for this AOI in the RFI Work Plan.

4.10 AOI 10: SWMU 10 – Degreasing Station

The second of two degreasing stations used during manufacturing operations was located in Department 97 along the west side of the manufacturing building near columns D106/D107 and E106/E107 (Figure 21). The degreasing station consisted of a tank within a well marked, diked, and drained area. The floor drain reportedly discharged to the on Site WWTP. It is estimated that operation of the degreasing station commenced in 1979. Metal parts and tools were degreased by being submerged in a solvent contained in the degreasing tank. According to Site personnel, 1,1,1-TCA was the only solvent used for degreasing between 1985 and 1992 (GMC, 2006). The type of degreasing solvent used at this AOI prior to 1985 and following 1992 is unknown. According to plant personnel, operations at the degreasing stations ceased in 1996.

The 1989 VSI conducted by U.S. EPA identified this area as SWMU 10 and it was therefore identified as an AOI (AOI 10). At the time of the VSI, no releases from the unit were observed.

4.10.1 Previous Investigations

Chlorinated solvents, including low levels of 1,1,1-TCA, are present in Site groundwater. Although no specific evidence of a release of hazardous constituents to the environment have been identified, the potential for a release to soil/groundwater from the historical operations at this AOI was determined to be moderate to high.

CRA conducted a subsurface investigation in the vicinity of AOI 10 on September 21, 2007 that included the advancement of one borehole (i.e., BH-21) to 25 feet bgs. No visual and/or olfactory evidence of impact was observed during drilling and/or field screening of the soils collected. Three soil samples were collected for laboratory analysis of VOCs and the borehole was instrumented with a temporary monitoring well to facilitate the collection of one borehole water sample for VOC analysis. Soil VOC results from all sampled depths (i.e., 0-2 feet bgs, 4-6 feet bgs, and 8-10 feet bgs) were non-detect.

Concentrations of PCE and TCE were detected in duplicate borehole water samples above the IDEM RCG residential drinking water and residential vapor exposure Screening Levels, but below the commercial/industrial vapor exposure Screening Levels. No other parameters, including 1,1,1-TCA, were detected in the borehole water samples above the Screening Levels.

As there were no soil VOC detections, it is unlikely that the PCE and TCE concentrations in the borehole water sample are attributable to historical operations at this AOI. As such, no further investigation of this AOI was proposed in the RFI Work Plan.

Soil analytical results are summarized in Appendix G.1 with select parameters shown on Figure 25. Borehole water analytical results are summarized in Appendix G.2. Groundwater quality is further assessed as part of AOI 35 (Site-Wide Groundwater).

4.11 AOI 11: Underground Storage Tanks

Twenty underground storage tanks (USTs) were identified at the Site, and have collectively been identified as AOI 11. The locations of former USTs are shown on Figure 26. The following subsections describe the historical operations and current status of each UST.

4.11.1 AOI 11.1: Powerhouse USTs (T-1 through T-8)

The Powerhouse USTs were 50,000 gallons in size, installed between 1968 and 1976, and contained various grades of fuel oil for boilers. USTs T-1 through T-5 contained Fuel Oil No. 6, USTs T-6 and T-7 contained Fuel Oil No. 4, and UST T-8 contained Fuel Oil No. 2. Based on the contents and use of the contents, the USTs were not regulated by IDEM. The Powerhouse USTs were identified as AOI 11.1, and are shown on Figure 21. The Powerhouse USTs were removed

under the direction of O'Brien & Gere in 1990. Details of the UST removal activities and soil verification sample results were presented in "Summary Report, Underground Storage Tank Removal Project, General Motors Corporation, Powertrain Division, New Venture Gear Transmission Facility, Muncie, Indiana" (O'Brien & Gere, 1992).

4.11.1.1 Previous Investigations

Prior to excavation activities, all tanks were emptied of product, cleaned, and purged of vapors. During excavation activities, excavated soil was assumed to be impacted and was therefore stockpiled on polyethylene sheeting and sampled for waste characterization purposes. Throughout the excavation activities, O'Brien & Gere monitored the excavation and excavated soils for visual and/or olfactory evidence of impact. Approximately 2,100 cubic yards of soil were removed from the excavation to a depth of 18 feet bgs. Once the USTs were exposed, the USTs and associated piping were removed from the excavation, measured, photographed, and inspected for signs of leakage. The inspection of T-1 revealed a one inch crease near the lower east end of T-1. USTs T-2 through T-8 showed no evidence of damage (i.e., no apparent holes or perforations). Following inspection, each UST was cut into several pieces to render the tanks unusable. Before the excavation was backfilled, several floor and piping run soil samples (i.e., G-1 through G-8, G-10, G-12 through G-18, and G-20 through G-40) were collected for laboratory analysis of benzene, toluene, ethylbenzene, and xylene (BTEX) and total petroleum hydrocarbons (TPH). The excavation was then backfilled with sand fill material and the surface restored with crushed limestone. BTEX parameters were not identified in any of the soil samples above laboratory method detection limits, however, TPH was identified in 19 of the soil sample locations at concentrations exceeding the Underground Storage Tank Branch Guidance Manual (USTBGM) October 1994 leaking UST (LUST) Site Cleanup Objective of 100 mg/kg (herein referred to as the LUST Site Cleanup Objective). The concentrations of TPH detected ranged from non-detect above 10 mg/kg to 25,714 mg/kg (at sample location G-16).

A soil and groundwater investigation was conducted by ABB-ES between April 1995 and May 1995 to evaluate the condition of the subsurface adjacent to the Powerhouse excavation area (ABB-ES, 1995a). The investigation included borehole advancement at five locations (P-1 to P-5) adjacent to areas where previous soil sample results exceeded the LUST Site Cleanup Objective for TPH. Soil samples were collected for TPH analysis, the results of which indicated that TPHs were detected at 93 mg/kg between 18 and 20 feet bgs at P-1 and non-detect at P-2 through P-5. A temporary well (TW-1) was installed at the northwest corner of the Powerhouse UST area (i.e., at P-5). Groundwater samples were collected downgradient of the former Powerhouse UST area (i.e., TW-1 and MW-22) for laboratory analysis of VOCs and semi volatile organic compounds (SVOCs). No VOCs or SVOCs were detected at MW-22. Chlorinated hydrocarbons were detected in the temporary well (TW-1) above IDEM's Screening Levels. As the chlorinated hydrocarbons detected in the temporary well are not constituents in fuel oil,

these groundwater impacts are not considered attributable to the historical operations at this AOI.

Soil and groundwater analytical results are summarized in Appendix G.1 and G.3, respectively. Select soil parameters are shown on Figure 27. Groundwater quality is further assessed as part of AOI 35 (Site-Wide Groundwater).

Due to the presence of elevated concentrations of TPH in soil, this area was identified as an AOI requiring further investigation in the RFI Work Plan to characterize the SVOC constituents contributing to the elevated TPH concentrations.

4.11.2 AOI 11.2: Gasoline UST (T-9)

UST T-9 was historically located to the east of the administration portion of the manufacturing building, and was identified as AOI 11.2 (Figure 21). UST T-9 was a 5,000 gallon gasoline UST that was installed in 1968. Site files indicate that towards the end of the UST's service it contained unleaded gasoline, however, Site personnel indicated that leaded gasoline was historically used at the Site. UST T-9 was removed under the direction of O'Brien & Gere in 1989.

4.11.2.1 Previous Investigations

Inspection of UST T-9 found the UST in good condition. Following inspection, UST T-9 was purged of vapors, cleaned, and cut into several pieces to render the tank unusable. Before the excavation was backfilled, two soil samples were collected of the native soil beneath the ends of the former UST (T-9 West and T-9 East) location for laboratory analysis of BTEX and TPH. The excavation was then backfilled with excavated soils that did not exhibit field evidence of impact. No BTEX parameters were detected above laboratory method detection limits. TPH was detected at a concentration of 51 mg/kg at sample location T-9 East that is below the LUST Site Cleanup Objective for TPH of 100 mg/kg. TPH was not detected at sample location T-9 West. The approximate locations of the soil verification samples are shown on Figure 28. Soil sample analytical results are presented in Appendix G.1.

The IDEM UST database search results indicate that the status of UST T-9 is "permanently out of service" with a closure date of December 9, 1989. As BTEX constituents are not present in soil at this AOI, no further action was proposed for this AOI in the RFI Work Plan.

4.11.3 AOI 11.3: Gasoline UST (T-10) and Diesel UST (T-11)

USTs T-10 and T-11 were historically located to the east of the administration portion of the manufacturing plant, and were identified as AOI 11.3 (Figure 21). USTs T-10 and T-11 were

1,000 gallon USTs containing gasoline and diesel, respectively, and were installed in 1961. Site files indicate that towards the end of the USTs' service, UST T-10 contained unleaded gasoline, however, Site personnel indicated that leaded gasoline was historically used at the Site. USTs T-10 and T-11 were removed under the direction of O'Brien & Gere in 1989.

4.11.3.1 Previous Investigations

Removal and inspection of UST T-10 found several holes approximately 1/16 inch in diameter in the ends of the tank and field evidence of impacted soils (i.e., diesel fuel odor). Impacted soils surrounding the UST were stockpiled on polyethylene sheeting and sampled for waste characterization purposes. Once the UST was exposed, the UST, dispenser, dispenser island, and associated piping were removed from the excavation, measured, photographed, and inspected for signs of leakage. Following inspection, UST T-10 was purged of vapors, cleaned, and cut into several pieces to render the tank unusable.

Removal and inspection of UST T-11 found several holes approximately 1/16 inch in diameter in the ends of the tank and field evidence of impacted soils (i.e., gasoline odor). Impacted soils surrounding the UST were stockpiled on polyethylene sheeting and sampled for waste characterization purposes. Once the UST was exposed, the UST, dispenser, dispenser island, and associated piping were removed from the excavation, measured, photographed, and inspected for signs of leakage. Following inspection, UST T-11 was purged of vapors, cleaned, and cut into several pieces to render the tank unusable.

Before the excavation from the tank removals was backfilled, two composite soil samples were collected of the native soil beneath the ends of the former UST locations for laboratory analysis of BTEX and TPH, the results of which were non-detect. The excavation was then backfilled with excavated soils that did not exhibit field evidence of impact. Soil analytical results are summarized in Appendix G.1. Select parameters are shown on Figure 29.

The Hydra-Matic Muncie Plant reported a release from T-10 and T-11 to IDEM on December 9, 1989 (Incident No. 198912046). It is noted that Incident No. 198912046 is also associated with a release from USTs T-14 and T-19. As required by 40 Code of Federal Regulations (CFR) Part 280.63, the Hydra-Matic Muncie Plant submitted the "Initial Site Characterization Report" (Hydra-Matic, 1990) for Incident No. 198912046 to IDEM UST Program, Office of Environmental Response (OER) on February 1, 1990 (GMC, 2004) (CRA, 2005).

The IDEM UST database search results indicate the status of UST T-10 and UST T-11 are "permanently out of service" with a closure date of December 9, 1989. However, due to IDEM's request for further information associated with USTs T-14 and T-19, the status of Incident No. 198912046 remained active.

GMC submitted correspondence to IDEM's Office of Land Quality LUST Section on October 30, 2006 requesting a No Further Action (NFA) determination for USTs T-10 and T-11. On April 2, 2009, IDEM granted an NFA determination associated with Incident No. 198912046 related to USTs T-10 and T-11. Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.11.4 AOI 11.4: Gasoline UST (T-12)

UST T-12 was formerly located south of the guard shack to the west of the Carpenter Shop, and was identified as AOI 11.4 (Figure 21). Site files indicate that towards the end of the UST's service it contained unleaded gasoline, however, Site personnel indicated that leaded gasoline was historically used at the Site. UST T-12 was a 2,000 gallon gasoline UST installed in 1983 and removed in 1990.

4.11.4.1 Previous Investigations

Removal and inspection of UST T-12 found minor pitting around the base of the tank and impacted soils alongside and beneath the UST. Impacted soils surrounding the UST were stockpiled on polyethylene sheeting and sampled for waste characterization purposes. Prior to excavation activities, T-12 was emptied of product, cleaned, and purged of vapors. Once the UST was exposed, the UST and associated piping were removed from the excavation, measured, photographed, and inspected for signs of leakage. Following inspection, T-12 was cut into several pieces to render the tank unusable. Excavation extended vertically to the concrete anchor pad that was removed with the excavation and laterally until visual and olfactory monitoring showed no evidence of impact. Before the excavation was backfilled, three soil samples were collected for laboratory analysis of BTEX and TPH, the results of which were non-detect. The excavation was then backfilled with sand fill material to grade. Soil analytical results are summarized in Appendix G.1 and select parameters are shown on Figure 30.

NVG reported a release to IDEM on December 17, 1990. Incident No. 199012568 was assigned to the release of gasoline from T-12 and quench oil from T-13. In accordance with 40 CFR 280.62, NVG submitted the "20 Day Initial Abatement Report" (NVG, 1990a) to IDEM's UST Program, OER on December 31, 1990. The "45 Day Report, Site Characterization and Free Product Removal Reports, New Venture Gear, Inc., Muncie Transmission Division, 1200 West 8th Street, Muncie, Indiana 47307" (O'Brien & Gere, 1991) was submitted to IDEM to comply with federal regulations 40 CFR 280.63 and 40 CFR 280.64 as adopted by IDEM.

The IDEM UST database search results indicate the status of UST T-12 is "permanently out of service" with a closure date of December 18, 1990. Incident No. 199012568 has received NFA status. Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.11.5 AOI 11.5: Quench Oil UST (T-13)

UST T-13 was historically located near the northwest corner of the manufacturing building, and was identified as AOI 11.5 (Figure 21). UST T-13 was a 5,000-gallon quench oil UST installed in 1976 and removed in 1990. Based on a review of available data and discussions with Site personnel, four types of quench oil have been used at the Site, namely: Fenso 71 and Fenso 161 manufactured by Exxon, Houghto Quench G manufactured by Houghton, and Marr Quench. The Material Safety Data Sheets (MSDSs) for the various quench products have been appended to this report (Appendix A.4). It is not clear from the Site files which quench oils were stored in which USTs.

4.11.5.1 Previous Investigations

UST T-13 was removed under the direction of O'Brien & Gere in December 1990. Removal and inspection of UST T-13 found the tank in good condition with no signs of corrosion, however, impacted soils were observed alongside and beneath the UST. Impacted soils surrounding the UST were stockpiled on polyethylene sheeting and sampled for waste characterization purposes. Prior to excavation activities, UST T-13 was emptied of product, cleaned, and purged of vapors. Once the UST was exposed, the UST and associated piping were removed from the excavation, measured, photographed, and inspected for signs of leakage. Following inspection, UST T-13 was cut into several pieces to render the tank unusable. Excavation activities extended vertically to the concrete anchor pad that remained in place, and laterally until visual and olfactory monitoring showed no evidence of impact. Before the excavation was backfilled, three soil samples were collected for laboratory analysis of TPH at the locations shown on Figure 31. The sampling results indicated low levels (i.e., 18 to 21 mg/kg) of TPH in in-situ soils. The excavation was then backfilled with sand fill material and the surface subsequently paved. Soil analytical results are summarized in Appendix G.1.

NVG reported a release to IDEM on December 17, 1990. Incident No. 199012568 was assigned to the release of gasoline from UST T-12 and quench oil from UST T-13. In accordance with 40 CFR 280.62, NVG submitted the "20-Day Initial Abatement Report" (NVG, 1990a) to IDEM's UST Program, OER on December 31, 1990. The "45-Day Report, Site Characterization and Free Product Removal Reports, New Venture Gear, Inc., Muncie Transmission Division, 1200 West 8th Street, Muncie, Indiana 47307" (O'Brien & Gere, 1991) was submitted to IDEM under federal regulations 40 CFR 280.63 and 40 CFR 280.64 as adopted by IDEM.

The database search results indicate that the status of UST T-13 is "permanently out of service" with a closure date of December 18, 1990. Incident No. 199012568 has received NFA status. Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.11.6 AOI 11.6: Quench Oil UST (T-14)

UST T-14 was formerly located in the truck well in the central portion of the manufacturing building adjacent to the Heat Treat Building (AOI 28) beneath a rail line that serviced the plant (AOI 14.2). UST T-14 was identified as AOI 11.6, and is presented on Figure 21. UST T-14 was a 4,000-gallon quench oil UST installed in 1953 and removed in 1989.

4.11.6.1 Previous Investigations

UST T-14 was removed under the direction of O'Brien & Gere in December 1989. Following removal of the quench oil UST and excavation of the quench oil impacted soil surrounding the UST, two soil verification samples (i.e., T-14 North and T-14 South) were collected from the floor of the excavation for laboratory analysis of BTEX and TPH. No BTEX parameters were detected above laboratory detection limits. TPH was detected at a concentration of 3,900 mg/kg and 20,000 mg/kg at sample location T-14 North and T-14 South, respectively that exceed the LUST Site Cleanup Objective of 100 mg/kg.

Subsurface investigation activities were conducted at AOI 11.6 between April 1990 and May 1990, between April 1995 and June 1995, and between November 2004 and July 2005. In April 1990, one soil sample was collected for VOCs, SVOCs, and saturated aliphatic hydrocarbon analyses. With the exception of methylene chloride (a possible laboratory contaminant), no parameters were detected above the IDEM Screening Levels.

The investigations conducted between April 1995 and June 1995 included the installation of five boreholes in the vicinity of UST T-14 and the collection of ten soil samples for laboratory analysis of TPH. TPH concentrations were detected above the LUST Site Cleanup Objective at each location. One borehole water sample was also collected and analyzed for VOCs and SVOCs in May 1995. With the exception of TCE, no parameters were detected above the IDEM Screening Levels in the borehole water sample. The presence of TCE in the borehole water sample may not be directly related to activities conducted at this AOI, as chlorinated compounds such as TCE are present across the Site.

The investigations conducted between November 2004 and July 2005 included the installation of 9 boreholes in the vicinity of UST T-14 and the collection of 17 soil samples for laboratory analysis of BTEX, methyl tert-butyl ether (MTBE), and hexane extractable material (HEM) at the request of IDEM. No parameters were detected above the Screening Levels during the 2004/2005 investigations. Borehole water samples were collected from four locations and

analyzed for BTEX, MTBE, and HEM between November 2004 and July 2005. With the exception of a benzene concentration detected above the residential drinking water Screening Level at BH-2, located east of the approximate excavation limit, detectable concentrations were below the Screening Levels.

Soil analytical results are summarized in Appendix G.1 and select parameters are shown on Figure 32. Borehole water analytical results are summarized in Appendix G.2. Groundwater quality is further assessed as part of AOI 35 (Site-Wide Groundwater).

The Hydra-Matic Muncie Plant reported a release from T-10 and T-14 to IDEM on December 9, 1989 (Incident No. 198912046). It is noted that Incident No. 198912046 is also associated with a release from USTs T-10, T-11, and T-19. The IDEM UST database search results indicate that the status of UST T-14 is "permanently out of service" with a closure date of December 9, 1989. However, the status of Incident No. 198912046 remained active until institutional controls were implemented to limit groundwater and land use through an Environmental Restrictive Covenant (ERC), entered into by GMC on June 17, 2008.

On August 29, 2008, IDEM granted an NFA determination associated with Incident No. 198912046 related to USTs T-14 and T-19. Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.11.7 AOI 11.7: Hydraulic Oil USTs (T-15 and T-16)

USTs T-15 and T-16 represent three 40-gallon hydraulic oil reservoirs used during operation of the vehicle lifts in the garage that were identified as AOI 11.7 (Figure 21). Based on the size and contents of the USTs, they were not regulated. Two of the three hydraulic oil reservoirs associated with vehicle lifts in the garage were closed in place with grout and one was removed between June and July 1996. No investigations have been completed in this area.

The database search results indicate that the status of USTs No. T-15 and T-16 are "unregulated" with no closure date(s) provided. No evidence of a release of hazardous constituents to the environment exists, therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.11.8 AOI 11.8: Oil USTs (T-17 and T-18)

The tanks identified as USTs T-17 and T-18 on the Site's UST notification form were identified as AOI 11.8 and were reportedly located on the northern portion of the former Delco Remy property at the approximate location presented on Figure 21. USTs T-17 and T-18 were identified as 10,000-gallon oil USTs, however; it is unclear whether or not the tanks were

installed as USTs. The tanks were said to have been located inside a building that was razed in 1978.

4.11.8.1 Previous Investigations

Magnetometer surveys were conducted by O'Brien & Gere in 1990 in an attempt to locate the tanks. Based on the results of the magnetometer survey, six areas were excavated in an attempt to locate the tanks. Four excavation areas were located in the transaxle parking lot and two areas were excavated north of the transaxle parking lot, however, no evidence of USTs was observed. NVG reported to IDEM, in a letter dated June 20, 1990, that the tanks were either removed from the ground in 1978 when the building was razed or they never existed underground (NVG 1990b).

CRA reviewed relevant Sanborn Fire Insurance Maps to assist in the identification of historical land use. The Sanborn Maps commonly indicate the existence and location of aboveground and underground storage tanks, structures, improvements, and facility operations. The location where T-17 and T-18 were reportedly located roughly corresponds to the location of several tanks labeled on the 1950, 1954, and 1972 Sanborn maps as "never used". The tanks on the Sanborn Maps appear to be southwest of the potential location of the USTs investigated by O'Brien & Gere; however, a map illustrating the six areas investigated by O'Brien & Gere was not available for review by CRA. The Sanborn Maps do not identify whether these tanks are USTs or ASTs. Sanborn Maps are provided in Appendix H.

The database search results indicate that the status of USTs T-17 and T-18 are "permanently out of service" with a closure date of December 9, 1989. It is reasonable to conclude, based on available information, that the tanks were either removed when the building was razed or that the tanks never existed as USTs. No evidence of a release to the environment associated with these tanks was documented in the Site files. Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.11.9 AOI 11.9: Fuel Oil UST (T-19)

UST T-19 represents two fuel USTs with a capacity of 500-gallons each that were reportedly located northeast of the Carpenter Shop. The location of UST T-19, which was identified as AOI 11.9, is presented on Figure 21.

4.11.9.1 Previous Investigations

The USTs associated with T-19 were removed in 1989. Following removal of the fuel oil USTs and associated piping, and excavation of fuel oil impacted soil surrounding the USTs, two soil verification samples (i.e., T-19 North and T-19 South) were collected for laboratory analysis of

BTEX and TPH. No parameters were detected above the IDEM Screening Levels however, the concentration of TPH at sample location T-19 North exceeded the LUST Site Cleanup Objective.

Subsurface investigation activities were conducted at AOI 11.9 in September 1995, November 2004, and July 2005. In September 1995, ten soil samples were collected for BTEX and TPH from five borehole locations. No parameters were detected above the IDEM Screening Levels or the LUST Site Cleanup Objective for TPH.

The investigations conducted between November 2004 and July 2005 included the installation of 11 boreholes in the AOI 11.9 area and the collection of 23 soil samples for laboratory analysis of BTEX, MTBE, and gasoline range organic (GRO) TPH. TPH concentrations were detected above the LUST Site Cleanup Objective for TPH at three locations, and benzene was detected above the residential MTG Screening Level in ten samples. Seven borehole water samples were also collected and analyzed for BTEX, MTBE, and GRO TPH from six locations. Benzene and/or ethylbenzene were detected above the IDEM Screening Levels at three locations. No other parameters were detected above the Screening Levels in the borehole water samples collected between November 2004 and July 2005.

Groundwater samples have been collected from monitoring well MW-21A, located inside AOI 11.9, since 1991. The most recent groundwater quality data from MW-21A for SVOCs and metals (May 2006) indicates that naphthalene and arsenic remain above the residential drinking water Screening Level, but below the residential and commercial/industrial vapor exposure Screening Levels.

Soil analytical results are summarized in Appendix G.1 and select parameters are shown on Figure 33. Borehole water and groundwater analytical results are summarized in Appendix G.2 and Appendix G.3, respectively. Groundwater quality is further assessed as part of AOI 35 (Site-Wide Groundwater).

The Hydra-Matic Muncie Plant reported a release from T-19 to IDEM on December 9, 1989 (Incident No. 198912046). It is noted that Incident No. 198912046 is also associated with a release from USTs T-10, T-11, and T-14. The IDEM UST database search results indicate that the status of UST T-19 is "permanently out of service" with a closure date of December 9, 1989, however, the status Incident No. 198912046 remained active until institutional controls were implemented to limit groundwater and land use through an ERC, entered into by GMC on June 17, 2008. On August 29, 2008, IDEM granted an NFA determination associated with Incident No. 198912046 related to USTs T-14 and T-19. Therefore, no further action was proposed for the AOI in the RFI Work Plan.

4.11.10 AOI 11.10: Quench Oil UST (T-20)

UST T-20 was historically located under a loading dock in the NVG Department 65. UST T-20 was an 8,000-gallon quench oil UST that was installed in 1954 and closed in place in 1996 with inert flowable slurry, with concurrence from IDEM. The location of UST T-20, which was identified as AOI 11.10, is presented on Figure 21.

4.11.10.1 Previous Investigations

A pre-closure Site assessment was conducted by ABB-ES in September 1995 and presented in "Pre-Closure Site Assessment, Quench Oil Underground Storage Tank, New Venture Gear, Muncie, Indiana (ABB-ES, 1995). Four boreholes (i.e., P-7, P-8A, P-9, and HA-16) were advanced to depths ranging from 10.5 feet bgs at HA-16 to 20 feet bgs at the locations of P-7 through P-9. Soil sample intervals were selected for laboratory analyses based on the vertical position of the tank. At locations P-7 through P-9, soil samples were collected from 1 foot bgs (near surface), 8 to 12 feet bgs (estimated midpoint of the tank), and 16 to 20 feet bgs (near the bottom of the tank) were selected for laboratory analysis. At HA-16, soil samples collected from a depth of 2 to 3 feet (near surface) and 8 to 10 feet (estimated midpoint of the tank) were selected for laboratory analysis. A total of 14 soil samples were collected for analysis of TPH to evaluate the condition of the subsurface soil adjacent to T-20. TPH was detected in two soil samples (i.e., P-8A and P-9) at concentrations of 346 mg/kg and 170 mg/kg that exceed the LUST Site Cleanup Objective. Soil analytical results are summarized in Appendix G.1 and select parameters are shown on Figure 34.

The Pre-Closure Site Assessment Report was submitted to IDEM and the State Fire Marshal in October 1995. As a result of the concentration of TPH above IDEM UST guidance, IDEM assigned Incident No. 199512501, with a low priority, to the release of an undetermined amount of quench oil from UST T-20. GMC received concurrence from IDEM to close the UST in place in a letter dated January 5, 1996.

Closure activities were conducted between June 29, 1996 and July 24, 1996. Oil and sludge were removed from piping and contained in 55-gallon drums for waste characterization and appropriate disposal. The tank was wiped with absorbent material until no visual signs of oil remained. The tank was then filled with inert, flowable slurry. Details of the in-place closure of UST T-20 were presented in "Quench Oil Underground Storage Tank Closure, New Venture Gear, Muncie, Indiana" (ABB-ES, 1996) that included a Site-specific risk assessment and Site-specific human-health based criterion calculation for TPH in soils associated with UST T-20.

The database search results indicate that the status of UST T-20 is "permanently out of service" with no closure date provided. Incident No. 199512501 has NFA status dated June 11, 2004. Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.12 AOI 12: Above Ground Storage Tanks

Fifty-six ASTs were identified at the Site, and have collectively been identified as AOI 12. The locations of former ASTs at the Site are shown on Figure 23. The following subsections describe the historical operations and current status of each AST.

4.12.1 AOI 12.1: Oil House ASTs (T-1 through T-12)

The Oil House ASTs (T-1 through T-12) were single wall steel ASTs and were installed in 1974. The Oil House ASTs, identified as AOI 12.1, were located inside the Oil House building. The location of AOI 12.1 is presented on Figure 21.

The characteristics of the Oil House ASTs are summarized below.

AST No.	***Size***	***Contents***	***Containment***
T-1	10,000 gal	Soluble Oil	Yes
T-2	10,000 gal	Soluble Oil	Yes
T-3	10,000 gal	Soluble Oil	Yes
T-4	10,000 gal	Cold Quench Oil	Yes
T-5	10,000 gal	Reclaimed Cutting Oil	Yes
T-6	10,000 gal	Floor Soap	Yes
T-7	7,500 gal	Hot Quench Oil	Yes
T-8	7,500 gal	Soluble Oil	Yes
T-9	7,500 gal	Transmission Oil	Yes
T-10	7,500 gal	Mineral Seal	Yes
T-11	15,000 gal	Hydraulic Oil	Yes
T-12	15,000 gal	Transmission Oil	Yes

An inspection of the Oil House ASTs was conducted in 2002. At that time, all ASTs identified above were labeled and no significant signs of staining, leakage, or spills were observed. The Oil House ASTs were observed to have secondary containment (CRA, 2002a/b/c).

Prior to cessation of manufacturing operations in March 2006, the Oil House ASTs were in use at the Site. The Oil House AST containment areas were inspected as part of the 2005/2006 review process and found to be free of significant staining. No further action was proposed for this AOI in the RFI Work Plan.

4.12.2 AOI 12.2: Powerhouse ASTs (T-13 through T-17)

ASTs T-13 through No. T-16 were single wall steel ASTs installed in 1990. AST T-17 was a single wall steel AST installed prior to 1960. The Powerhouse ASTs were identified as AOI 12.2, and were located northeast of the Powerhouse. The location of AOI 12.2 is presented on Figure 21.

The characteristics of the Powerhouse ASTs are summarized below.

AST No.	***Size***	***Contents***	***Containment***
T-13	25,000 gal	Fuel Oil	Yes
T-14	25,000 gal	Fuel Oil	Yes
T-15	25,000 gal	Fuel Oil	Yes
T-16	25,000 gal	Fuel Oil	Yes
T-17	300 gal	Diesel	Yes

An inspection of the Powerhouse ASTs was conducted in 2002. At that time, all ASTs identified above were labeled and no significant signs of staining, leakage, or spills were observed.

Prior to cessation of manufacturing operations in March 2006, all Powerhouse ASTs were in use at the Site. The Powerhouse AST containment areas were inspected as part of the 2005/2006 review process and found to be free of significant staining.

An inspection of the Powerhouse ASTs was conducted as part of CRA's September 12, 2006 Site inspection. At that time, the ASTs had not been removed from the Site and no significant signs of staining, leakage, or spills were observed. No further action was proposed for this AOI in the RFI Work Plan.

4.12.3 AOI 12.3: Heat Treat ASTs (T-18 and T-19)

AST No. T-18 was a single wall steel AST installed in 1960. AST No. T-19 was a single wall steel AST installed in 1988. ASTs T-18 and T-19 were located north of the Heat Treat Building, and were identified as AOI 12.3. The location of AOI 12.3 is presented on Figure 21.

The characteristics of the heat treat ASTs are summarized below.

AST No.	Size	Contents	Containment
T-18	11,000 gal	Liquid Nitrogen	No
T-19	1,000 gal	Ammonia	No

An inspection of the heat treat ASTs was conducted in 2002. At that time, the ASTs identified above were labeled and no significant signs of staining, leakage, or spills were observed. The heat treat ASTs were observed to be without secondary containment.

Prior to cessation of manufacturing operations in March 2006, both heat treat ASTs were in use at the Site. The heat treat AST staging area was inspected as part of the 2005/2006 review process and found to be free of significant staining.

An inspection of the heat treat AST staging area was conducted in September 2006. At that time AST T-18 had been removed from the Site as part of the decommissioning activities. CRA visually inspected AST T-19 and no significant signs of staining, leakage, or spills were observed. No further action was proposed for this AOI in the RFI Work Plan.

4.12.4 AOI 12.4: Northwest Corner of Plant ASTs (T-20 through T 22)

ASTs T-20 through T-22 were single wall steel ASTs installed in 1990. ASTs T-20 and T-21 were moved from the northwest corner of the plant to the southeast corner of the Oil House containment pad in 2003 or 2004. When ASTs T-20 and T-21 were relocated, they were each stored inside a 630-gallon secondary containment structure equipped with a roof. The location of these ASTs (AOI 12.4) is presented on Figure 21.

The characteristics of the ASTs in the northwest corner of the plant are summarized below.

AST No.	Size	Contents	Containment
T-20	500 gal	Gasoline	Yes
T-21	500 gal	Diesel	Yes
T-22	10,000 gal	Quench Oil	Yes

An inspection of the ASTs in the northwest corner of the plant was conducted in 2002. At that time, the ASTs identified above were labeled and no staining or signs of leakage or spills were observed. The ASTs in the northwest corner of the plant were observed to have secondary containment.

Prior to cessation of manufacturing operations in March 2006, the ASTs in the northwest corner of the plant were in use at the Site. The AST containment areas in the northwest corner of the

plant were inspected as part of the review process and found to be free of significant staining. No further action was proposed for this AOI in the RFI Work Plan.

4.12.5 AOI 12.5: WWTP ASTs (T-23 through T-29)

AST Nos. T-23 through T-29 were single wall steel ASTs installed in 1968. ASTs T-23 through T-25 and T-29 were located west of the WWTP and ASTs T-26 through T-28 were located north of the WWTP. These ASTs are collectively known as the WWTP ASTs, and were identified as AOI 12.5. The location of AOI 12.5 is presented on Figure 21.

The characteristics of the WWTP ASTs are summarized below.

AST No.	***Size***	***Contents***	***Containment***
T-23	176,000 gal	Holding Tank	Yes[(1)]
T-24	176, 000 gal	Holding Tank	Yes[(1)]
T-25	360,000 gal	Holding Tank	Yes[(1)]
T-26	8,000 gal	Sulfuric Acid	Yes
T-27	15,000 gal	Reclaimed Oil	Yes
T-28	15,000 gal	Reclaimed Oil	Yes
T-29	20,000 gal	Sludge	Yes[(1)]

[(1)] – containment consists of 4-inch curbing

Prior to cessation of manufacturing activities, industrial wastewater from plant operations was sent to the on-Site WWTP. There, the oil was separated from the wastewater and transferred to two 15,000-gallon reclaimed oil ASTs north of the WWTP (i.e., ASTs T-27 and T-28) presented on Figure 23. From the reclaimed oil ASTs, oil was sent to the Powerhouse for burning, the Oil House for use as cutting oil, or transported off-Site for appropriate recycling/disposal. The two reclaimed oil ASTs (i.e., T-27 and T-28) and one 8,000-gallon sulfuric acid AST (i.e., T-26) were located north of the WWTP within a five to six foot high concrete containment wall.

The following describes releases from WWTP ASTs.

Release from Holding Tank AST

According to Site files, a release from one of the holding tanks occurred on December 28, 1989. It is unclear from the Site files from which tank the release occurred. The release of oily wastewater was a result of a broken pipe on the base of one of the holding tanks. The release was contained in the area of the holding tank and the pipe was repaired. There was no evidence to suggest an investigation or remedial action was conducted as a result of the release from the holding tank.

Releases from Holding Tank No. 1 AST (T- 23)

According to Site files, a release from holding tank No. 1 (i.e., AST T-23) occurred on July 27, 1987. Site personnel observed a release of approximately 2 to 3 gallons per minute of wastewater from the area between the seal and the concrete base of the tank. The release was contained and it was therefore determined that no reportable spill had occurred to the waterways or to the ground.

On May 17, 1995, a release from holding tank No. 1 (i.e., AST T-23) occurred. Approximately 100 gallons of oily wastewater was discharged to the area surrounding the WWTP tanks and an earthen berm was constructed to prevent further migration. The WWTP sump reached an overflow status and the oily wastewater flowed east towards the Oil House containment pad where it entered the Oil House sump and was pumped back to the WWTP. The Muncie Sanitary District, Bureau of Water Quality, and IDEM were notified of the release.

There was no evidence to suggest an investigation or remedial action was conducted as a result of the releases from AST T-23.

Release from Holding Tank No. 3 AST (T-25)

On May 5, 2003, less than 100 gallons of oily wastewater originating from holding tank No. 3 (i.e., AST T-25) was released to the combination storm/sanitary sewer. The release was due to overflow of the tank during heavy rains. The release of oily wastewater was reported to IDEM and assigned Indiana Spills No. S105862069). There was no evidence to suggest an investigation or remedial action was conducted as a result of the release from AST T-25.

Release from Sulfuric Acid AST (T-26)

On May 10, 1999, a release from the sulfuric acid AST (i.e., AST T-26) occurred. Approximately 2,000 gallons of sulfuric acid was discharged to the WWTP ASTs containment area. According to Site personnel, approximately 1,000 gallons of sulfuric acid was believed to be routed to the WWTP via a drain in the vicinity of the release and approximately 1,000 gallons were lost to the underlying soils in the containment area. The spill was a result of the failure of a mechanical joint in the piping that leads from the AST to the manufacturing building. On May 11, 1999, Heritage Environmental Services LLC (Heritage) mobilized equipment to the Site to remove impacted soils as a result of the sulfuric acid release. Soils were placed in a transfer box, stabilized using agricultural lime, and appropriately disposed by The Environmental Quality Company in Belleville, Michigan (MID 000 724 831). The release of sulfuric acid was reported to IDEM and assigned Indiana Spills No. S105104772.

An investigation of the area related to the sulfuric acid release from AST T-26 was conducted in 2002 and included advancement of one borehole (i.e., SB-06) in the southwest corner of the secondary containment structure for the WWTP ASTs. A soil sample was collected for laboratory analysis of pH. The pH was measured at 9.1. The location of SB-06 is shown on Figure 22.

Release from Reclaimed Oil AST (T-28)

On December 18, 1987, a release from a reclaimed oil AST (i.e., AST T-28) occurred. Approximately 1,400 gallons of reclaimed oil was released to the gravel beneath the AST when the tank level gauge failed and the tank overfilled. The reclaimed oil flowed around the outside of the Oil House containment wall and along the fence alignment north of the WWTP until it reached Elliot Street. It is estimated that approximately 20 gallons of reclaimed oil were lost to the sanitary sewer manhole approximately 7 feet east of the WWTP AST containment area. In total, the reclaimed oil covered approximately 2,500 square feet between the WWTP containment area and Elliot Street. Hydra-Matic Division of GMC removed all oil stained gravel and dirt from the area of the spill (MTP, 1987).

An inspection of the WWTP ASTs was conducted in 2002. At that time, all ASTs identified above were labeled and were observed to have secondary containment. The inspection of the WWTP ASTs in 2002 identified the following:

- several repair patches were observed on the north side of AST T-23
- sludge dripping from the top of AST T-23 along the north side
- signs of spillage on the southwest side of AST T-23, along the base of the tank
- a broken pipe was hanging down from AST T-25
- signs of minor corrosion on the valves and flanges of AST T-26
- orange and black staining on the concrete at the base of AST T-29
- worn insulation on the valves and flanges

With the exception of the sulfuric acid AST (i.e., AST T-26) and prior to cessation of manufacturing operations in March 2006, the WWTP ASTs were in use at the Site. The WWTP AST containment areas were inspected as part of the 2005/2006 review process and, with the exception of the WWTP AST containment area north of the WWTP (i.e., ASTs T-26 throughT-28), were found to be free of significant staining. At the time of CRA's September 12, 2006 Site inspection, the sulfuric acid AST had been removed as part of the ongoing decommissioning activities, and the holding tanks had been cleaned and large holes had been

cut in the sides of each of the tanks. The holding tanks and remaining WWTP ASTs were later removed as a part of the decommissioning activities at the Site.

4.12.5.1 Previous Investigations

Subsurface investigations in the vicinity of the reclaimed oil ASTs were conducted by others in 1988, in 1989, and in 1995. Soil sampling conducted in 1988 and 1989 in the containment area near the ASTs indicated that soils were visibly stained to a depth of approximately 6 feet bgs, concentrations of TPH were as high as 100,000 mg/kg, and toluene and xylenes were detected in soil samples. The majority of the samples collected outside of the containment area were below the detection limits; however, TPH and toluene were detected in some areas beyond the contamination area.

Based on the investigation results, the upper two feet of soil were removed from the containment area and transported off-Site for disposal. The underlying impacted soils were left in place and were treated utilizing in-situ bioremediation. The bioremediation system was installed in August 1993 and consisted of product removal and dewatering using a combination fluid recovery well system and soil vapor extraction system. Soil samples collected in 1994, after one year of bioremediation, indicated a decrease in TPH concentrations.

In June 1995, ABB-ES conducted soil sampling to evaluate the post-treatment conditions in this area. Soil samples were analyzed for TPH, BTEX, and polycyclic aromatic hydrocarbons (PAHs). No BTEX or PAH parameters were detected during the June 1995 activities at concentrations exceeding the Screening Levels. TPH was detected at various concentrations, as high as 47,100 mg/kg at monitoring location HA-12.

A human health risk-based soil cleanup concentration based on exposure to the surface soils for a Site worker was calculated. The concentration of TPH detected in some soils during the June 1995 investigation exceeded the human health risk based soil cleanup criteria for the AST containment area. As such, and based on the estimated time to remediate the soils through operation of the in-situ bioremediation system, ABB-ES recommended additional removal of impacted soils followed by capping.

In June 1996, additional excavation of impacted soils was conducted, the bioremediation system was decommissioned, and the containment area was capped. Capping included the installation of a nylon-reinforced liner, backfilling, the placement of concrete, and the installation of a bentonite perimeter seal. Light non-aqueous phase liquid (LNAPL) was found at two monitoring locations during groundwater monitoring activities in 1997.

In November 2008, the horizontal and vertical extent of remaining petroleum impact to soils in the vicinity of the WWTP AST area were delineated by the advancement of 18 boreholes. Boreholes were first advanced within the containment area of former Reclaimed Oil Tank No. 1, and then advanced in all directions until no visual or olfactory evidence of impact was noted. The analytical results from soil sampling activities were evaluated and, with the exception of arsenic and iron, as well as PCE at one location, analyzed parameters were either not detected above the laboratory method detection limit or, if detected, were detected at concentrations below the Screening Levels. Arsenic and iron were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels at AOI 12.5, with the exception of SB-63, where arsenic was detected above the commercial/industrial Screening Level and below the excavation soil direct contact Screening Level. PCE was found at a concentration above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels at SB-58. Soil analytical results are summarized in Appendix G.1 and select parameters are shown on Figure 35.

LNAPL known to accumulate in stand pipes located within the containment area is believed to be residual and highly localized. Further, the presence of residual petroleum impacts has not impacted soil above acceptable levels for current and/or reasonably expected future land use. The soil data presented above is sufficient to document the subsurface conditions at this AOI. As such, no further action was proposed for this AOI in the RFI Work Plan.

4.12.6 AOI 12.6: WWTP Building ASTs (T-30 through T-56)

AST T-30 through T-56 were single wall steel ASTs installed in 1968. The WWTP building ASTs were located inside the WWTP structure, and were identified as AOI 12.6. The location of AOI 12.6 is presented on Figure 21.

The characteristics of the WWTP building ASTs are summarized below:

AST No.	***Size***	***Contents***	***Containment***
T-30	10,000 gal	Caustic Soda	Yes
T-31	1,500 gal	Polymer	Yes
T-32	1,500 gal	Polymer	Yes
T-33	10,000 gal	Alum	Yes
T-34	10,000 gal	Reclaimed Alum	Yes
T-35	3,000 gal	Cutting Additive	Yes
T-36	7,000 gal	Float Storage	Yes
T-37	7,000 gal	Float Storage	Yes
T-38	10,000 gal	Free Oil	Yes

AST No.	Size	Contents	Containment
T-39	5,000 gal	Cool Tank	Yes
T-40	200 gal	Flash Tank	Yes
T-41	2,500 gal	Cooker Tank	Yes
T-42	2,500 gal	Cooker Tank	Yes
T-43	2,500 gal	Cooker Tank	Yes
T-44	2,500 gal	Cooker Tank	Yes
T-45	2,500 gal	Cooker Tank	Yes
T-46	2,500 gal	Cooker Tank	Yes
T-47	2,500 gal	Cooker Tank	Yes
T-48	2,500 gal	Cooker Tank	Yes
T-49	3,000 gal	Mix Tank	Yes
T-50	3,000 gal	Mix Tank	Yes
T-51	3,000 gal	Mix Tank	Yes
T-52	500 gal	Caustic	Yes
T-53	500 gal	Reclaimed Alum	Yes
T-54	500 gal	Alum	Yes
T-55	300 gal	Sulfuric Acid	Yes
T-56	550 gal	Polymer	Yes

Operations at the WWTP were idled in July 2006 and the WWTP Building ASTs were removed as part of the decommissioning activities. An inspection of the WWTP building ASTs was conducted as part of CRA's September 12, 2006 Site inspection. At that time, all ASTs identified above were labeled and no significant signs of staining, leakage, or spills were observed. All WWTP building ASTs were observed to have secondary containment, as they were located inside a building. No further action was proposed for this AOI in the RFI Work Plan.

4.13 AOI 13: Former Chicago Pump House

The former Chicago Pump House (AOI 13) was an underground structure located along the northern wall of the manufacturing building that previously received non-contact cooling water from the former forge plant. The structure historically consisted of an equipment room and a blind sump. The sump was historically observed to be filled with water, oil, and sludge. The location of AOI 13 is presented on Figure 21.

The Chicago Pump House underwent closure in 1994 under the direction of ABB-ES. ABB-ES presented the details of the closure activities in an August 1994 letter report (ABB-ES, 1994).

4.13.1 Previous Investigations

Closure activities involved steam cleaning and removal of pumps, piping, and walls of the equipment room. Pipe inlets/outlets remaining along the walls of the structure were sealed using metal blockers with gaskets or concrete. The oily water within the sump was pumped to an oil/water separator where the oil and water phases were segregated. Recovered oils were placed in steel drums and the water phase was filtered and processed through an absorbent polymer/activated carbon column and placed in a storage tank. Analytical results for a water sample collected from the storage tank indicated that the treatment process reduced chemical concentrations in the water to concentrations below the City of Muncie POTW discharge limits. Upon receipt of a discharge authorization from the City of Muncie, the water was transported to the POTW for disposal.

Upon removal of the water, a black, heavy, oily sludge was discovered in the northern half of the sump. The heavy sludge was removed by hand using steel buckets and was placed into a sealed roll-off container for appropriate off-Site disposal. The concrete walls, ceiling, and floor of the sump were then decontaminated by scraping and steam cleaning. Five wipe samples were collected: one from each wall and one from the floor of the sump for laboratory analysis of PCBs. All results were less than 10 µg/100 cm^2. The sump was then backfilled with pea gravel. A slurry was used to backfill the portions of the sump which could not be filled with pea gravel. Openings in the floor of the equipment room were filled with concrete (ABB-ES, 1994).

The closure activities did not include an assessment of the integrity of the sump following decontamination and subsequent backfilling operations. Therefore, further investigation was proposed for this AOI in the RFI Work Plan. A discussion of the RFI activities is provided in Section 6.0.

4.14 AOI 14: Former Rail Lines

Evidence of several former railroad lines was identified during various investigations at the Site. Approximately 2,900 feet of rail line previously serviced the manufacturing building. A separate line serviced the former Delco Remy property. Approximately 400 feet of rail was buried inside the plant between column lines 11 and 12.

Of the approximately 2,900 feet of rail line which serviced the Site, four specific areas of the rail lines were identified as AOIs, as shown on Figure 21 and presented below:

AOI 14.1: Former Rail Line West of Heat Treat Building
AOI 14.2: Former Rail Line East of Heat Treat Building
AOI 14.3: Former Rail Line North of Power House
AOI 14.4: Former Rail Line North of Lamb Operations

4.14.1 AOI 14.1: Former Rail Line West of Heat Treat Building

This AOI represents approximately 40 feet of rail line located north of the manufacturing building to the west of the Heat Treat Building. According to Site personnel, the 40 feet of rail line located outside of the main manufacturing building was used to store rail cars loaded with oily chips and scrap metal for off-Site management until the early 1990s. Site personnel identified that oily leaks from the rail cars were periodically observed. The AOI also includes approximately 400 feet of rail line which extended into the building between column lines 11 and 12. This portion of the rail was reportedly filled and a concrete floor placed over the filled area in 1993.

Information found in the Site files indicates that concrete flooring and soil underlying wood floor block was utilized as fill material to raise the grade at the abandoned rail spurs prior to placing the concrete floor.

4.14.1.1 Previous Investigations

An investigation was conducted in 2002 to evaluate the subsurface in the areas of former rail lines. The 2002 investigation included the advancement of a borehole (i.e., SB-14) at the former rail spur located inside the building between column lines 11 and 12. The borehole had to be abandoned due to subsurface obstructions (i.e., railroad tracks and concrete) in this area. The location of SB-14 is presented on Figure 36. No soil sample was obtained from this borehole.

As part of the post plant closure cleaning activities, the approximately 40 feet of rail line outside, west of the Heat Treat Building, were cleaned and covered with asphalt. During CRA's May 2006 Site inspection, CRA observed the cleaning operations and noted that significant oil staining was present in the rail car loading area and an oil seep along the retaining wall which forms the west side of the loading area. Further, no information on the composition or quality of the materials which may have been used as backfill around the now-buried rail is available. The types of material used have a potential to contain hazardous constituents such as PCBs. Therefore, further investigation was proposed for this AOI in the RFI Work Plan.

4.14.2 AOI 14.2: Former Rail Line East of Heat Treat Building

This AOI represents the approximately 40 feet of former rail line located north of the main manufacturing building to the east of the Heat Treat Building and UST T-14. The AOI also includes the approximately 400 feet of rail line which extended into the building between column lines 17 and 18. This portion was reportedly filled in and a concrete floor placed over the fill area in 1994.

Information found in the Site files indicates that the concrete flooring and soil underlying wood floor block was utilized as fill material to raise the grade at the abandoned railroad tracks prior to placing the concrete floor.

According to Site personnel the 40 feet of rail line outside was used to store rail cars loaded with oily chips and scrap metal for off-Site management. Site personnel identified that oily leaks from the rail cars were periodically observed.

During CRA's May 2006 Site inspection, CRA noted that his area was covered with asphalt. It is not known whether the former rail lines have been removed or if they are buried beneath the current asphalt.

The release potential of hazardous constituents to soil/groundwater as a result of the operations conducted at this area was determined to be moderate to high. In addition, no information on the composition or quality of the materials which may have been used as backfill around the now-buried rail is available. The types of materials used have the potential to contain hazardous constituents (e.g. PCBs). Therefore, further investigation was proposed for this AOI in the RFI Work Plan.

4.14.3 AOI 14.3: Former Rail Line North of Power House

This AOI represents the approximately 100 feet of former rail line located north of the Power House terminating at the western end of the Power House fuel oil AST area.

According to Site personnel, the approximately 100 feet of former rail line located north of the Power House was used for the delivery of bulk fuel oil to the Power House fuel oil ASTs. In addition, according to Site personnel, the Site historically stored coal in the area north of the former cooling pond and this rail spur may have been used for the delivery of coal to the Site.

During CRA's May 2006 Site inspection, CRA noted that his area was covered with asphalt. It is not known whether the former rail lines have been removed or if they are buried beneath the current asphalt.

The release potential of hazardous constituents to soil/groundwater as a result of the operations conducted in this area was determined to be moderate to high. Therefore, further investigation was proposed for this AOI in the RFI Work Plan.

4.14.4 AOI 14.4: Former Rail Line North of Lamb Operation

This AOI represents the approximately 500 feet of former rail line located north of the lamb area that was used for the delivery of raw materials to the Site, such as steel when this area of the Site was used as the forge plant. The rail line ran north of the manufacturing building.

4.14.4.1 Previous Investigations

An investigation was conducted in 2002 to evaluate the subsurface in the areas of former rail lines. The 2002 investigation included the advancement of a borehole (i.e., SB-15) at the former rail line located north of the manufacturing building near column N14. A soil sample was collected between 4.5 feet and 6 feet bgs for laboratory analysis of VOCs, polynuclear aromatic hydrocarbons (PNAs), PCBs, and metals. No parameters were detected above the IDEM Screening Levels. Soil analytical results are summarized in Appendix G.1 and select parameters are shown on Figure 37.

During CRA's May 2006 Site inspection, CRA noted that this area was covered with concrete. It is not known whether the former rail lines have been removed or if they are buried beneath the current concrete.

No evidence of a release of hazardous constituents to the environment from this area exists and the release potential to soil/groundwater as a result of the operations conducted in this area was determined to be low. Therefore, no further investigation is proposed for this area.

4.15 AOI 15: Former Cooling Pond and Adjacent Former Coal Storage

The former cooling pond (AOI 15) was located north of the manufacturing building, between the WWTP and the Powerhouse. Although commonly referred to as the cooling pond, this structure consisted of a 685,000 gallon rectangular concrete retention basin approximately 10 feet deep. The former cooling pond was historically used for providing cooling water for forging operations, however, the pond was also used for providing water for the facility's fire suppression system. Coal was historically stored along the northern berm of the former cooling pond. The location of AOI 15 is presented on Figure 21.

4.15.1 Previous Investigations

Inspection of this area found remnants of coal along the north berm of the former cooling pond. Four boreholes (i.e., SB-7 through SB-10) were advanced at the locations presented on Figure 38. Stratigraphic borehole logs (Appendix I) indicate that coal is at surface grade.

Following closure of the facility, the cooling pond was drained, sediment material in the former cooling pond was removed and disposed of off-Site, and the walls and floor of the pond were cleaned by scraping and power washing. The water from the pond was discharged to the Site WWTP.

No evidence of a release of hazardous constituents to the environment from this area exists and the release potential to soil/groundwater as a result of the operations conducted at this area was determined to be low. Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.16 AOI 16: Former Delco Remy Property

The former Delco Remy property (AOI 16) represents the northern 18 acres of the Site. Delco Remy constructed the former Battery Plant in 1904. Numerous additions were constructed on the former Battery Plant between 1920 and 1973. The chronology of Site construction and expansion/updates is presented on Figure 3. The location of AOI 16 is presented on Figure 21.

Operations conducted at the former Battery Plant consisted of the manufacture of lead acid batteries including: grinding, plate curing, lead reclamation and oxide manufacturing, grid and parts molding, battery assembly, battery charging with sulfuric acid, and battery case cleaning. Further, based on the review of previous environmental documentation, slag residue containing lead was historically stored outside of the former Battery Plant on bare ground. The former Battery Plant was decommissioned and demolished between 1978 and 1979. Based on the review of available information, numerous pits, sumps, ventilation tunnels, and trenches were utilized at locations throughout the Former Battery Plant. In addition, a utility tunnel was historically present. During decommissioning and demolition activities, these areas were observed to be deteriorated and corroded. These structures were reportedly filled with clean demolition debris or concrete and were capped with concrete. The approximate location of the utility tunnel is shown on Figure 2. Information identifying the locations of the pits, sumps, and trenches was not available in the Site file.

A final inspection was conducted at the former Battery Plant on October 24, 1979 following demolition. The following observations were made:

- With the exception of the Shipping Warehouse (former Delco Remy Warehouse) and main entrance gate house (Guard Shack), all structures and stored materials had been removed.
- Pits and channels had been filled with on-Site, uncontaminated rubble and sealed with concrete.
- The railroad spur connecting the Chevrolet Plant to the Penn Central Railroad had been upgraded and no solids buildup along the spur was observed.

- With the exception of the grassy area east of the former Battery Plant building, the former Delco Remy property was paved.
- The grassy area east of the former Battery Plant building was not paved due to its distance from the former manufacturing areas.
- Remaining concrete surfaces within the production areas were cleaned using a rotary power broom and loose materials had been removed.
- The former Delco Remy property had been enclosed by an 8-foot high chain link security fence with barbed wire.

Details of the former Battery Plant demolition and waste management activities were presented in "Report to Delco Remy Division, General Motors Corporation, Muncie, Indiana on Facility Demolition and Site Cleanup at Battery Plant No. 9, Muncie, Indiana" (Metcalf & Eddy, 1980).

4.16.1 Previous Investigations

Documented environmental investigative activities commenced in May 1976 when GMC Plant Engineering and Construction Management staff conducted an investigation of the former Battery Plant to assess potential areas of concern resulting from the manufacturing operations. The investigation was conducted between May 1976 and June 1976 and included sampling and analysis of various building surfaces and materials (i.e., sewer sediment, interior and/or exterior wall, floor and roof sampling, soil, groundwater, etc.). Following the investigation conducted by GMC Plant Engineering and Construction Management Staff, Metcalf & Eddy, Inc. (Metcalf & Eddy) further investigated the structural and environmental conditions at the former Battery Plant. The investigation was conducted between November 1977 and June 1978 and included sampling and analysis of structural surfaces (i.e., floors, walls, and roof), sediment and water contained in manholes, tunnels and catch basins, surface and subsurface soils, and groundwater. The results of the investigation indicate various structural elements (i.e., walls, roof, utilities, etc.), surface soils, and groundwater exhibited elevated concentrations of metals and/or PCBs.

Following decommissioning/demolition of the Delco Remy infrastructure, several soil quality investigations were conducted at this AOI between 1988 and 2008. Soil analytical results are summarized in Appendix G.1 and select parameters are shown on Figures 39a (VOCs), 39b (SVOCs), and 39c (PCBs and metals). Soil sample analytical results indicate the presence of constituents of concern above the Screening Levels, primarily metals, across much of the AOI. As some areas of soil impairment were not historically delineated, additional investigation was proposed for this AOI in the RFI Work Plan.

Groundwater analytical results are summarized in Appendix G.3. Groundwater quality is further discussed as part of AOI 35 (Site-Wide Groundwater).

4.17 AOI 17: Former Bone Yard

The former Bone Yard (AOI 17) is a paved area located on the former Delco Remy property, adjacent to the former Delco Remy Warehouse. Obsolete machinery and equipment was formerly stored outside in a paved area referred to as the Bone Yard. Prior to storage in the Bone Yard, machinery and equipment was reportedly drained of all fluids. The location of AOI 17 is presented on Figure 21.

4.17.1 Previous Investigations

An inspection of the former Bone Yard was conducted in 2002. At that time, staining was observed near some of the equipment in this area. As such, three boreholes (i.e., SB-01 through SB-03) were advanced at the locations presented on Figure 40. Soil samples were collected at each of the boreholes for laboratory analysis of VOCs, PNAs, PCBs, and metals. Soil analytical results are summarized in Appendix G.1 and select parameters are shown on Figure 40. With the exception of arsenic in the soil sample collected at monitoring location SB-1 (2 to 4 feet bgs), no parameters were detected above the IDEM Screening Levels. Arsenic was found at a concentration above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels at AOI 17, and may be attributable to background concentrations. Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.18 AOI 18: Main Fork Truck Battery Charging Area

The main fork truck battery charging area (AOI 18) was located in the central portion of the manufacturing building at column F22 to F23, and was used to charge batteries for mobile plant equipment. The location of AOI 18 is presented on Figure 21.

Operation of the main fork truck battery charging area stopped with cessation of the manufacturing operations in March 2006. Final cleaning and decommissioning of the main fork truck battery recharging area occurred in July 2007.

4.18.1 Previous Investigations

The main fork truck recharging area was investigated during the 2005/2006 review process. At the time of the review process, staining and corrosion was observed on the floor in this area. A floor sample was collected in the fork truck battery charging area for laboratory analysis of pH and metals. The analytical results indicated a pH of 11.6 but did not indicate the presence of

elevated metals. Given the poor condition of the floor at this AOI, additional investigation of this AOI was proposed in the RFI Work Plan.

4.19 AOI 19: Gleason Machines

Gleason machines are cutting tools used to cut gear teeth in blanks. These machines were located in the western part of the manufacturing building in the NVG Department 97, between columns E and M, 106 to 107, and were identified as AOI 19. The location of AOI 19 is presented on Figure 21.

While the Gleason machines were operational (i.e., 2001 to 2006), oil reportedly leaked from the machines into floor sumps that were cored in the concrete floor beneath each machine. Each floor sump was approximately eight inches in diameter and between 3 inches to 6 inches deep. The level of oil that collected in the floor sumps was periodically inspected by plant personnel and removed, when needed. The concrete floor in this portion of the manufacturing building is approximately 7 inches in thickness.

4.19.1 Previous Investigations

The sumps below the Gleason machines were inspected as part of the 2005/2006 review process. A sample of the oily sludge was collected from two of the floor sumps for laboratory analysis of PCBs and RCRA metals. The results from one of the two samples indicated an elevated concentration of chromium (1,530 µg/g), however PCBs were not detected.

CRA conducted a subsurface investigation at AOI 19 in September 2007 that included the advancement of four boreholes (i.e., BH-22, BH-23, BH-24, and BH-25) to 4-feet bgs, at the approximate locations shown on Figure 41. Soil samples were collected at 0 to 2 feet bgs at each borehole location for laboratory analysis of metals and hexavalent chromium. No visual and/or olfactory evidence of impacts was observed at the borehole locations. Analyzed parameters were non-detect or where detected, were found at concentrations below the Screening Levels with the exception of arsenic, hexavalent chromium, and iron, which were detected above the residential soil MTG Screening Levels. Soil analytical results are summarized in Appendix G.1 and select parameters are shown on Figure 41.

Groundwater quality downgradient of this AOI (MW-16 and MW-18) meets the residential Screening Levels (AOI 35) for metals. This demonstrates that the soil concentrations exceeding the residential soil MTG Screening Levels have not resulted in significant groundwater metals impairment, if any. As such, no further investigation of this AOI was proposed in the RFI Work Plan.

4.20 AOI 20: Oil Houses

4.20.1 AOI 20.1: Oil House Inside Main Manufacturing Building

The Oil House located within the manufacturing building (AOI 20.1) was located in the vicinity of columns B29 and B31 to C29 and C31. The Oil House was used for dispensing of bulk liquids. Bulk liquids were transferred from various ASTs located outside of the manufacturing building via overhead piping where it was dispensed from the Oil House. The location of the AOI 20.1 is presented on Figure 21.

Pump filling operations stopped with cessation of manufacturing operations in March 2006. Final cleaning and decommissioning of the Oil House occurred in October 2007. Documentation of the integrity of the integrity of the floor following cleaning and decommissioning of the Oil House was not reviewed by CRA. As such, investigation of this AOI was included in the RFI Work Plan.

4.20.2 AOI 20.2: Oil House Outside Main Manufacturing Building

The Oil House located outside of the manufacturing building (AOI 20.2) was located east of the WWTP adjacent to Elliot Street. The Oil House was constructed in 1974. The northern two thirds of the oil house were used as a tank room and contained a sump in the southeast corner of the room. The southern one third of the Oil House was used as a barrel room. The location of the AOI 20.2 is presented on Figure 21.

On May 10, 1999, an unknown amount of oil was released when a tank at the Oil House was over filled and oil was discharged via roof conductors to the combined storm/sanitary sewer. The release to the sewer is assessed as a part of AOI 34 (Storm Sewers).

The Oil House and the associated ASTs were cleaned and decommissioned in April 2007. Documentation of the integrity of the floor or sump following cleaning and decommissioning of the Oil House was not reviewed by CRA. As such, investigation of this AOI was proposed in the RFI Work Plan.

4.21 AOI 21: Outdoor Chemical Storage Area

The outdoor chemical storage area, identified as AOI 21, was an area adjacent to the east side of the Oil House (AOI 20.2) and south of the former aluminum scrap holding area (AOI 1). The surface of this area was concrete; the area was diked and sloped to a drain northeast of the area at AOI 1. Plastic totes and metal and plastic drums containing various chemicals were, at times, stored in this area. The location of AOI 21 is presented on Figure 21.

CRA conducted a visual inspection of the outdoor chemical storage area in May 2006. At the time of the May 2006 Site inspection, several totes and drums were present at AOI 21 and a leak, onto the concrete and within the diked area, was identified in a plastic tote partially full of liquid. At the time of the September 2006 Site inspection, all of the chemicals had been removed from the area. The concrete in the area of the outdoor chemical storage was in fair condition with some cracks present and some staining observed.

Due to the presence of a leaking tote identified during the May 2006 Site inspection and the presence of staining and some cracks on the concrete at this AOI, further investigation was proposed for this AOI in the RFI Work Plan.

4.22 AOI 22: Substation 6

Substation 6 (AOI 22) was located on the roof of the manufacturing building and contained three transformers (i.e., Transformer No. 3, Transformer No. 5, and Transformer No. 6). Since Substation 6 is located on the roof of the manufacturing building, AOI 22 is listed (but not shown) on Figure 21.

According to the review process, three transformers at Substation 6 formerly contained PCBs but were retrofitted in 1989 to non-PCB dielectric fluid. The transformers at Substation 6 were removed and disposed off-Site in June 2002.

4.22.1 Previous Investigations

An investigation of this area was conducted in 2002 and included the collection of wipe samples from concrete pads of the transformers for laboratory analysis of PCBs for waste characterization purposes and found concrete pads exhibited PCB concentrations from 7.3 micrograms per 100 square centimeters (µg/100 cm^2) to 210,000 µg/100 cm^2.

The PCB impacted concrete pads were removed as part of the decommissioning activities. Potential impact to storm water runoff from PCB impacted concrete pads was assessed as part of AOI 34 (Storm Sewers). No further action was proposed for this AOI in the RFI Work Plan.

4.23 AOI 23: Substation 3

Substation 3 was located in the manufacturing building on the first floor mezzanine between columns J23 and K23 and contained two transformers, and was identified as AOI 23. The location of AOI 23 is presented on Figure 21.

Transformers in Substation 3 historically contained PCBs. However, according to the review process, the former PCB containing transformers were retrofitted in 1989 to a non-PCB

dielectric fluid. The transformers at Substation No. 3 were removed in September 2000 and disposed in October 2000 as part of the building decommissioning activities.

4.23.1 Previous Investigations

During the review process, two samples of the concrete pads at Substation 3 were collected for laboratory analysis of PCBs. The analytical results indicated a concentration of Aroclor 1248 of 17.7 mg/kg and a concentration of Aroclor 1254 of 3.93 mg/kg. Due to the presence of PCBs in concentrations greater than 1 mg/kg, additional delineation sampling of this area was considered. However, due to the small quantity of concrete (i.e., approximately 200-square feet) no additional sampling was conducted. The PCB impacted concrete was then removed as detailed in the "Notification of Self Implementing PCB Cleanup and Disposal Approval" report (O'Brien & Gere, 2006b). Due to the location of this AOI (i.e., first floor mezzanine), the potential for a release to the environment from the operation of Substation 3 is unlikely. Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.24 AOI 24: Primary Substation

The primary substation (AOI 24) was located to the southeast of the Carpenter Shop. Electricity was provided to the Site by American Electric Power (AEP) through the on-Site primary transformer substation and switch house. The electrical power was distributed to smaller substations located on the manufacturing building roof and to transformers located across the Site for further distribution. The location of AOI 24 is presented on Figure 21.

Two transformers [i.e., No. 32755 and No. 32758 (also identified as transformer No. 1 and No. 4, respectively)] located in the primary substation historically contained PCBs. However, according to the review process, the former PCB containing transformers were retrofitted in 1989 to a non-PCB dielectric fluid. Decommissioning/removal of the primary substation was conducted as part of Site decommissioning activities.

4.24.1 Previous Investigations

The primary substation was inspected as part of the review process activities. At the time of the review process, oil staining was observed along the sides of the concrete pads. A sample was collected from the concrete pad of each of the transformers formerly containing PCBs for laboratory analysis of PCBs. The analytical results indicate a concentration of Aroclor 1248 of 1.54 mg/kg. Due to the presence of PCBs in concentrations great than 1 mg/kg, additional delineation sampling of this area was completed to evaluate the extent of PCBs on the concrete surfaces of the primary substation. PCB delineation activities were conducted between May 2, 2006 and July 5, 2006. Soil samples were collected at a depth of up to 2-inches adjacent to the pads to evaluate the potential for PCBs in surface soils. The soil sample collected south of the

east pad contained PCBs at a concentration of 0.184 mg/kg, which is below the industrial/commercial and excavation direct contact Screening Levels (there is no total PCB Screening Level for the residential soil MTG pathway). The soil sample collected south of the west pad contained PCBs at a concentration of 5.14 mg/kg, which is also below the industrial/commercial and excavation direct contact Screening Levels.

Decommissioning/removal of the transformers in the primary substation were coordinated with AEP during Site decommissioning activities. PCB impacted concrete was addressed as detailed in the "Notification of Self Implementing PCB Cleanup and Disposal Approval" report (O'Brien & Gere, 2006b). The operation of the primary substation did not result in concentrations of PCBs in soil above industrial/commercial and excavation direct contact Screening Levels. Therefore, no further action was proposed for this AOI in the RFI Work Plan.

4.25 AOI 25: East Shipping and Receiving Dock

The east shipping and receiving dock (AOI 25) was located between column H29 and H30 to the south and between column K29 and K30 to the north, and was used for the unloading and loading of trucks with raw materials/parts and finished product. The location of AOI 25 is presented on Figure 21.

4.25.1 Previous Investigations

The east shipping and receiving dock was inspected as part of the review process activities. During the review process, stained concrete was observed. As such, one sample of the concrete was collected for laboratory analysis of PCBs. The analytical results indicated an Aroclor 1248 concentration of 66.3 mg/kg. Due to the presence of PCBs in concentrations greater than 1 mg/kg, additional delineation sampling of this area was completed to evaluate the extent of PCBs on the concrete surface of the east shipping and receiving dock. PCB delineation activities were conducted between May 2, 2006 and July 5, 2006. PCB delineation sampling activities delineated the PCB impact of the concrete floor to the south and east. Facility walls formed a physical barrier to delineate the extent of PCB floor impact to the north and west. Detected concentrations of PCBs in the concrete floor and walls of this area ranged from 0.1 mg/kg to 218 mg/kg. PCB impacted concrete was generally addressed as detailed in the "Notification of Self Implementing PCB Cleanup and Disposal Approval" report (O'Brien & Gere, 2006b), however, PCB impacted concrete was capped with asphalt instead of epoxy as indicated in the Self Implementing Plan.

According to Site personnel, oil was observed beneath the concrete floor during the installation of concrete protection bollards. Holes in the concrete floor were drilled to install the bollards at which point the oil was reportedly observed. The bollards were located in the southeast corner of the east shipping and receiving deck.

Documentation of the integrity of the concrete floor following cleaning was not reviewed by CRA. Given the visual evidence of oil observed beneath the area and the unknown integrity of the floor slab, additional investigation of this AOI was proposed in the RFI Work Plan.

4.26 AOI 26: Locker Room Entrance/Cell 62

The locker room entrance (AOI 26) was located in the manufacturing building north of column C21. The location of AOI 26 is presented on Figure 21. The structure of the floor at the locker room entrance and to the north and east of the locker room entrance (i.e., Cell 62) was comprised of wood block. Wood block flooring was used in a number of locations throughout the manufacturing building. The majority of the wood block flooring was replaced with epoxy coated block over time, however, some wood block flooring remained. Due to the nature of the operations at the Site, the wood block flooring at the entrance of the locker room became oil stained, likely due to the tracking of oil on employee's shoes from operational areas of the Site.

4.26.1 Previous Investigations

The wood floor block at the locker room entrance/Cell 62 was inspected as part of the 2005/2006 review process activities. During the review process, stained wood block was observed. As such, one sample of the floor block was collected for laboratory analysis of PCBs. The analytical results indicate a concentration of Aroclor 1248 of 1.38 mg/kg. Due to the presence of PCBs in concentrations great than 1 mg/kg, additional delineation sampling of this area was completed to evaluate the extent of PCBs on the wood block surface of the locker room entrance/Cell 62 area. PCB delineation activities were conducted between May 2, 2006 and July 5, 2006.

PCB impacted wood floor block was addressed as detailed in the "Notification of Self Implementing PCB Cleanup and Disposal Approval" report (O'Brien & Gere, 2006b). Documentation of the integrity of the concrete beneath the wood block floor was not reviewed by CRA. As such, additional investigation of the soil quality beneath this AOI was proposed in the RFI Work Plan.

4.27 AOI 27: Tool Hardening

The tool hardening area (AOI 27) was located along the north wall of the manufacturing building to the east of the Heat Treat Building. The tool hardening area contained various pieces of machinery, including a lead pot and a pit approximately 4 feet by 6 feet by 5 feet deep. The tool hardening area was historically used to ensure tools used in the various manufacturing process were of a consistent/required hardness. According to plant personnel,

tool steel was heated to its critical temperature in a small furnace and quenched in oil. It is noted that these operations were kept to one to two pieces each day and that the quench oil used was typically the same as the quench oil used at the main heat treat operations. The location of AOI 27 is presented on Figure 21.

4.27.1 Previous Investigations

The tool hardening area was inspected as part of the 2005/2006 review process activities. During the review process, staining was observed on the concrete floor. As such, a sample of the concrete was collected for laboratory analysis of PCBs and metals. The analytical results indicate a concentration of Aroclor 1248 of 1.55 mg/kg and a concentration of Aroclor 1254 of 1.58 mg/kg. Due to the presence of PCBs in concentrations greater than 1 mg/kg, additional delineation sampling of this area was completed to evaluate the extent of PCBs on the concrete surface of the tool hardening area. PCB delineation activities were conducted between May 2, 2006 and July 5, 2006. The extent of the PCB impacted concrete is shown on Figure 42.

A sample of the water/sludge contained in the pit located within the tool hardening area was also sampled as part of the review process. The sample collected was analyzed for PCBs and RCRA metals. The analytical results indicate detectable concentrations of Aroclor 1242 (0.554 mg/kg).

Below grade structures (i.e., sumps and trenches) were inspected for evidence of a release to the environment to determine if further investigation is necessary. The evaluation of below grade structures is discussed as a part of AOI 32. PCB impacted concrete was addressed as detailed in the "Notification of Self Implementing PCB Cleanup and Disposal Approval" report (O'Brien & Gere, 2006b). Documentation of the integrity of the concrete floor was not reviewed by CRA. As such, additional investigation of the soil quality beneath this AOI was proposed in the RFI Work Plan.

4.28 AOI 28: Heat Treat Building

The Heat Treat Building (AOI 28) was located at the north central portion of the manufacturing building. The Heat Treat Building contained various pieces of equipment to support the heat treat process. The location of AOI 28 is presented on Figure 21. It should be noted that AOI 28 is located immediately east of UST T-14 (i.e., AOI 11.6).

The Heat Treat Building was constructed in 1962 and operated until manufacturing operations ceased in 2006. Heat treat operations were conducted to alter the hardness and toughness of steel used in manufacturing operations. Several furnace pits of varying dimensions collected oily sludge below the furnaces in the Heat Treat Building. Two quench tanks are located below

ground at the north end of the Heat Treat Building within a containment vault. The capacity of the quench tanks was approximately 15,000 gallons each.

4.28.1 Previous Investigations

On August 12, 1992, a release of 200 gallons of quench oil from the heat treat furnace occurred (IN Spills No. S103011601). Approximately 200 gallons of oil was lost to the ground under the main manufacturing plant in the vicinity of the heat treat furnace that was down for repair. The release was discovered coming up through a floor joint in the area. NVG plant personnel recovered approximately 125 gallons of free product. The incident was reported to IDEM Emergency Response Branch. An investigation in the area of the historical spill was conducted in 2002 and included advancement of one borehole (SB-13) at the location presented on Figure 43.

Significant staining on the concrete in the vicinity of a trench drain near the north end of the Heat Treat Building was observed during the 2002 investigation in the area of the historical spill. The trench drain reportedly discharged to the on-Site WWTP. One borehole (SB-11) was advanced northeast of the Heat Treat Building at the location presented on Figure 43.

The Heat Treat Building was inspected as part of the 2005/2006 review process activities. During the review process, the sludge collected within the pits located below the furnaces was sampled for laboratory analysis of PCBs. Analytical results indicated a concentration of Aroclor 1242 of 217 mg/kg. In addition, an oily concrete pad along the east side of the Heat Treat Building and stained concrete flooring along the inside of the east wall of the Heat Treat Building were sampled for PCBs and RCRA metals during the review process. The analytical results from the oily pad indicated a concentration of lead (i.e., 1,150 mg/kg) and chromium (i.e., 340 mg/kg). The analytical results from the stained concrete inside the Heat Treat Building indicate a concentration of Aroclor 1260 of 1.07 mg/kg. Due to the presence of PCBs in concentrations greater than 1 mg/kg, additional delineation sampling of this area was completed to evaluate the extent of PCBs on the concrete surface between May 2, 2006 and July 5, 2006.

Soil analytical results are summarized in Appendix G.1 and select parameters are shown on Figure 43.

PCB impacted concrete was generally addressed as detailed in the "Notification of Self Implementing PCB Cleanup and Disposal Approval" report (O'Brien & Gere, 2006b). However, the concrete was capped with asphalt, not epoxy, and based on CRA's observations, does not extend to the limits of PCB impacts above 1 mg/kg. No documentation related to inspection of

the integrity of the PCB impacted concrete floor were reviewed by CRA. Therefore, further investigation of underlying soil quality was proposed in the RFI Work Plan.

Several pits were located within the Heat Treat Building as shown on Figures 43 and 44. These pits were assessed as part of AOI 32 (Below Grade Infrastructure).

4.29 AOI 29: Powerhouse

The Powerhouse (AOI 29) was constructed in 1920 north of the central portion of the manufacturing building to house large boilers used to create steam heat for the Site buildings. Four fuel oil ASTs were located to the east of the Powerhouse and one diesel AST was located adjacent to the southwest corner of the Powerhouse. The location of AOI 29 is presented on Figure 21.

Used oil recovered from the WWTP operations was stored in two ASTs north of the WWTP. The used oil from those ASTs was then pumped to four ASTs located to the east of the Powerhouse via underground piping. Natural gas and reclaimed oil from the WWTP was utilized as fuel for the boilers in the Powerhouse to generate steam heat for the buildings.

The Powerhouse was inspected as part of the 2005/2006 review process activities. As part of the Powerhouse inspection, a sample of oil from a compressor pit (approximately 12-feet by 9-feet by 6-feet) was collected for laboratory analysis of PCBs. The analytical results indicate a concentration of Aroclor 1248 (i.e., 7.53 mg/kg) and a concentration of Aroclor 1260 (5.63 mg/kg). In addition, a sample of oily sludge from a sump (approximately 2-feet by 3-feet by 3-feet) was collected for laboratory analysis of PCBs and RCRA metals. The analytical results indicate a concentration of Aroclor 1248 (i.e., 9.01 mg/kg), Aroclor 1254 (i.e., 4.88 mg/kg), and lead (i.e., 1,750 µg/g). Stained concrete flooring was observed on the northwest side if the Powerhouse basement. A sample of the stained concrete was collected for laboratory analysis of PCBs and RCRA metals. The analytical results indicate a concentration of Aroclor 1248 of 0.919 mg/kg.

Additional delineation sampling of this area was completed to evaluate the extent of PCB impacts throughout the Powerhouse building between May 2, 2006 and July 5, 2006. Results from the PCB delineation activities indicated that the basement of the Powerhouse, concrete flooring, painted surfaces, and sludge within pits and trenches were impacted with PCBs. The extent of PCB impacted flooring is shown on Figure 45.

Operations at the Powerhouse building stopped with cessation of the manufacturing operations in March 2006. Final cleaning and decommissioning of the Powerhouse building occurred during decommissioning and demolition activities. Following building demolition activities, PCB

impacted concrete was removed from the Site. Documented evidence that confirmation soil sampling was conducted was not reviewed by CRA. As a result, soil sampling was proposed at this AOI in the RFI Work Plan.

Several pits were located within the Powerhouse as shown on Figure 44. These pits were assessed as part of AOI 32 (Below Grade Infrastructure).

4.30 AOI 30: Carpenter Shop Concrete Pad

The Carpenter Shop (AOI 30) was constructed in 1899. A scrap steel chip concrete containment pad was located northeast of the Carpenter Shop. There is no evidence to suggest that operations at the Carpenter Shop (used by an underwear company and as a woodworking shop by Warner Lamp Company) were associated with the concrete pad, however, due to the physical location of the concrete pad relative to the Carpenter Shop the areas have been grouped for ease of identification. The location of AOI 30 is presented on Figure 21.

A soluble oil release occurred near the Carpenter Shop from the scrap steel chip containment pad on October 5, 1995 (Indiana Spills No. S105102433). Approximately 200 gallons of white water, equivalent to approximately 10 gallons of soluble oil, was released to the storm sewer. The release was caused when the sump pump at the chip containment pad stopped operating and the containment area was flooded. NVG personnel began pumping the white water from the containment pad and blocked two nearby catch basins using plastic and sand. The storm sewer outfall to Buck Creek and two other downstream locations were checked for signs of the release. No evidence of oil was detected at the Buck Creek outfall or the downstream locations. The release was reported to the National Response Center (Report No. 297671) and IDEM Emergency Response Branch (Incident No. 199506296).

The scrap steel chip containment pad was inspected as part of the review process activities. One sample of stained concrete was collected for laboratory analysis of PCBs. The analytical results indicate a concentration of Aroclor 1248 of 3.36 mg/kg. In addition, one floor sample was collected of the stained concrete floor within the Carpenter Shop for laboratory analysis of PCBs and RCRA metals. Analytical results were below laboratory method detection limits. Further PCB delineation sampling was conducted of the stained concrete floor inside the Carpenter Shop between May 2, 2006 and July 5, 2006. The four additional floor samples were also non-detect for PCBs.

4.30.1 Previous Investigations

An investigation was conducted at AOI 30 in 2002 due to significant oil staining observed in the vicinity of the scrap metal grinding and turnings dumpsters in the chip handling area. The investigation included advancement of one borehole (SB-12) in the vicinity of the historical spill

and noted staining and the collection of one soil sample at 13 feet bgs for VOCs, PNAs, PCBs, and metals analysis, the results of which meet the IDEM Screening Levels. Soil analytical results are summarized in Appendix G.1 and select parameters are shown on Figure 46.

The extent of PCB impacted concrete at AOI 30 is shown on Figure 46. The PCB impacted concrete from the chip containment pad was removed and disposed of off-Site during decommissioning activities in July 2008. Due to the presence of oil staining and PCB impacted concrete, additional investigation of the soil quality beneath the former concrete chip containment pad was proposed in the RFI Work Plan.

4.31 AOI 31: Parking Lots East and South of Plant

AOI 31 represents the properties east of Elliot Street and south of West 8th Street. The location of AOI 31 is presented on Figure 21. AOI 31 is composed of the following parking lots:

- Parking lot No. 1 is an approximately 0.34 acre parcel of land and is located northeast of the former Plant, near the intersection of West Willard Street and South Elliot Street. The lot is bounded to the north by West Willard Street, to the west by South Elliot Street, to the south by a walkway, and to the east by residential property. This area was used as a parking lot for GMC employees' vehicles when the former Plant was in operation. At the time of the investigation, it was observed that the residents in the dwelling along the east portion of parking lot No. 1 had occupied the eastern portion of the lot for vehicle parking and storage. The remaining portion of the parking lot was vacant at the time of the investigation.
- Parking lot No. 2 is an approximately 0.34 acre parcel of land and is located northeast of the former Plant, south of parking lot No. 1, at the intersection of West 5th Street and South Elliot Street. The lot is bounded to the north by a walkway, to the west by South Elliot Street, to the south by West 5th Street, and to the east by residential property. This area was also formerly used as a parking lot for GMC employees' vehicles. Parking lot No. 2 was vacant at the time of the investigation.
- Parking lot No. 3 is an approximately 0.38 acre parcel of land and is located east of the former Plant. The lot is bounded to the north by West 5th Street, to the west by South Elliot Street, to the south by a walkway, and to the east by residential property. This area was formerly used as a parking lot for GMC employees' vehicles and was vacant at the time of the investigation.
- Parking lot No. 4 is an approximately 1.16 acre parcel of land and is located east of the former Plant between the intersection of West 7th Street and South Elliot Street. The lot is bounded to the north by a walkway, to the west by South Elliot Street, to the south by West 7th Street, and to the east by residential property. Approximately two-thirds of parking lot No. 4 is currently used by M&M Bus Company employees to park vehicles. However, prior

to use by M&M's employees, the lot was used as a parking lot for GMC employees' vehicles. Prior to GMC's purchase of the property, a junk yard was reportedly operated in the area by a previous owner. It was reported that approximately 6-inches of highly viscous material was removed from the surface of this area when GMC took ownership.

- Parking lot No. 5 is an approximately 0.95 acre parcel of land and is located south of the former Plant, near the intersection of South Elliot Street and West 8th Street. The lot is bounded to the north by West 8th Street, to the west by residential property, to the south by West 9th Street, and to the east by South Elliot Street. This area was used as a parking lot for GMC employees' vehicles and was vacant at the time of the investigation.
- Parking lot No. 6 is an approximately 4.35 acre parcel of land and is located south of the former Plant, near the intersection of West 8th Street and South Sampson Street. This parking lot is bounded to the north by West 8th Street, to the west by South Sampson Street, to the south by West 9th Street, and to the east by South Birch Street. This area was used as a parking lot for GMC employees' vehicles and was vacant at the time of the investigation.

Boreholes were advanced at the six adjacent parking lots to depths of approximately 5 feet bgs, utilizing direct push technologies in November 2008. Borehole locations were placed based on a grid sampling approach. A grid spacing of approximately 50 feet by 50 feet was imposed at each parking lot to ensure that soils in all areas within the parking lots were represented in the soil samples and to provide confidence that the soils in each parking lot have been fully characterized. In general, with the exception of minor iron staining of some soils, no visual, olfactory, or photoionization detector (PID) evidence of impact were noted during the November 2008 investigation.

4.31.1 Previous Investigations

Two types of soil samples were collected. Discrete soil samples were collected to investigate the potential presence of VOCs in soils. Composite samples (3-point and 4-point at small and large areas, respectively) were collected from 0 to 2 feet bgs and submitted for laboratory analysis of SVOCs, PCBs, and metals (excluding earth metals). Soil samples were collected from 25-percent of the grid locations using random sampling methods. Analytical results for discrete and composite samples are presented in Appendix G.1. Select parameters at AOI 31 are shown on Figure 47a (discrete samples) and Figure 47b (composite samples). With the exception of the following, no exceedances of the Screening Levels were detected:

- Benzo(a)pyrene was detected at the commercial/industrial soil direct contact Screening Level but below the residential soil MTG and excavation soil direct contact Screening Levels in one composite soil sample collected at parking lot No. 4. At the same location,

benzo(a)anthracene was detected above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels.

- Arsenic, cobalt, iron, and manganese were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels.
- Lead was detected above the Screening Levels at parking lot Nos. 3 and 4.

As some areas of soil impairment were not fully delineated in 2008, additional investigation was proposed for this AOI in the RFI Work Plan.

4.32 AOI 32: Below Grade Infrastructure

Process infrastructure includes various pits, sumps, and trenches located throughout the manufacturing building, including the pits below the four Henry™ filters, Harpoon™ chip conveyors, and quench oil tanks located in the Heat Treat Building. This infrastructure was located throughout the manufacturing building and is therefore only listed (and not shown) on Figure 21.

A variety of pits, sumps, and trenches were located throughout the manufacturing building and were utilized to capture oil and/or coolant utilized during the machining processes or as containment areas for equipment. Specific areas that were identified during the Site inspections are discussed below.

Henry™ Filter Pits

Four Henry™ filters were located within the main manufacturing building to clean and recycle fluids used in machining equipment. Liquid coolant, contaminated with metal and debris from machining operations, enters the filter tank inlet duct. The heaviest particles fall to a drag conveyor, while lighter particles travel to filter belt/media. The filter belt cycles provide a continuous loop of filtration and rinse operation (http://news.thomasnet.com/fullstory/14217, 2006).

Harpoon™ Chip Conveyors

Various Harpoon™ chip conveyors were located throughout the main manufacturing building. These conveyors are designed for in floor applications and were used at the Site to collect and convey scrap metal and fines (http://www.prab.com/chip%20processing%20harpoon.html, 2006).

Heat Treat Quench Tanks

Two quench tanks were located below the ground at the north end of the Heat Treat Building in a containment vault. The capacities of the quench tanks are reportedly 15,000 gallons each. The quench tanks were used to support heat treat operations.

4.33.1 Previous Investigations

CRA advanced two boreholes in 2002 (i.e., SB-16 and SB-17) at the locations presented on Figure 48 to assess potential below grade impacts in the vicinity of select trenches. Soil samples were collected from SB-16 at 9 feet bgs and SB-17 at 6 feet bgs, and were analyzed for TCL VOCs, PNAs, PCBs, and RCRA metals. Analytical results for the soil samples indicate that no parameters were detected above the Screening Levels. Soil analytical results are presented in Appendix G.1 and select parameters are shown on Figure 48.

The 2005/2006 review process conducted by O'Brien & Gere identified and inspected a total of 24 sumps, 38 pits, and 48 trenches. Residual materials remaining in 14 sumps, 20 pits, and 17 trenches were sampled and analyzed for PCBs and total metals. Results indicated that PCBs were present within residual materials at a maximum concentration of 217 mg/kg. Total chromium and total lead were also present within residual material at maximum concentrations of 1,530 mg/kg and 3,180 mg/kg, respectively, within sumps, pits, and trenches. Residual material in plant pits, sumps, and trenches were addressed as part of the decommissioning activities. Following cleaning and decommissioning activities associated with plant pits, sumps, and trenches, an inspection program was implemented to identify evidence of potential releases to the environment. The locations and conditions of pits, sumps, and trenches are shown on Figure 44. Process infrastructure (i.e., pits, sumps, and trenches) with poor or undocumented integrity has the potential to result in a release to the environment. As such, additional investigation of this AOI was proposed in the RFI Work Plan.

4.33 AOI 33: Documented Releases from Industrial and Sanitary Sewers

Industrial wastewater generated at the Site consisted of five wastewater streams, including: spray and dip washers; central systems maintenance (cutting coolants); rinse water from the phosphate coating; spent machine fluids; and floor and general maintenance cleaning. Prior to 1968 when the on-Site WWTP was constructed, industrial wastewater was discharged directly to the sanitary sewer system. After construction of the WWTP, industrial wastewater generated during production operations was treated on-Site prior to discharge to the sanitary sewer system under the facility's industrial wastewater discharge permit (Permit No. 008-004) with the Bureau of Water Quality of the Muncie Sanitary District. Sanitary wastewater generated at the Site consisted of wastewater from sinks and toilets which were discharged directly to the sanitary sewer until operations at the plant ceased. Sanitary wastewater

generated at the Site discharged directly to the sanitary sewer system prior to October 1, 2006 when water and sanitary services were discontinued at the Site. The Site sanitary sewers discharge directly to the local POTW.

The general locations of the pipelines and catch basins are presented on the Site Sewer Plan (Figure 49). The location of the WWTP is provided on Figure 2. The sanitary and industrial sewers are located throughout the Site and are therefore only listed (and not shown) on Figure 21 as AOI 33.

During an extremely heavy rainfall on June 18, 1992, the lift station located on the south end of the Track 6 (AOI 14.2) railroad trackwell overflowed into the railroad trackwell. The sump in the trackwell could not accommodate the flow and the oily water overflowed from the lift station. As a result, a release of approximately 2,000 gallons of oily water was discharged to the combined sewer.

On August 26, 1999 oil from an oil chiller was observed on the roof over Number 10 Furnace. The oil was found to be entering the Muncie Sanitary District combined sewer through the rainwater roof leaders. The rate of the oil entering the roof leader was estimated at approximately one gallon per hour, but the volume of oil was not quantified because the duration of the leak was not determined (i.e., between several hours and one day in duration). The roof leaders and entrance into the sewers were blocked upon identification of the leak. Absorbent pillows were placed into the sewers and guttering holes were plugged and runoff of rainwater and oil residue was redirected to a contained area and pumped to the WWTP. The Bureau of Water Quality was notified and a waste disposal vendor recovered water from the interceptor in the Beech Grove Cemetery and the receiving tank at the POTW. The oil chiller leak was fixed and the roof was cleaned to prevent additional oil residue from entering the gutters.

According to Site personnel, all sanitary sewers were plugged and abandoned in place prior to or during decommissioning and demolition activities. Any potential impacts will be assessed as part of AOI 35 (Site-Wide Groundwater).

4.34 AOI 34: Storm Sewers – MH#1 through MH#5

Storm water generated at the Site consists of run-off from the building roofs and impermeable surface covers. The majority of the storm water generated at the Site flowed into on-Site catch basins and discharged to the Muncie Sanitary District combined sewer system or infiltrated undeveloped Site surfaces. The City of Muncie's combined sewer system discharges to the local POTW during periods of dry weather. However, during heavy rainfall or snow melt, there is the

potential for combined sewer overflow structures to overflow into Buck Creek and ultimately White River.

Storm water from roof drains and certain outdoor locations discharged/exited the Site at two separate permitted outfall locations (i.e., outfall 001 and 002). Outfall 001 handled primarily roof drainage from the west side of the Site, as well as surface drainage from an area north of the main manufacturing building near the Carpenter Shop. Outfall 001 discharged into a storm sewer located in Sampson Street, which discharged into Buck Creek. Outfall 002 handled primarily roof drainage from the East Side of the Site and surface drainage from an area east of the main manufacturing building near the shipping and receiving dock. Outfall 002 discharged into a storm sewer located in Elliot Street that flows into Outfall 001 at Sampson Street and eventually to Buck Creek which discharged to the west fork of the White River.

The Site filed an individual National Pollutant Discharge Elimination System (NPDES) permit application with IDEM for storm water discharge at the Site on July 13, 1992. In July 1995, IDEM notified the Site that their discharges fell under the general NPDES industrial permit regulations. The Site requested that the individual storm water discharge permit be converted to the General NPDES Industrial Permit and completed a Notice of Intent (NOI) under the general industrial storm water rules. Authorization for the NOI from IDEM was received on December 27, 1995. On November 3, 1995, IDEM issued a general storm water permit, Permit No. INR00N061, for the Site. The Site filed a Rule 6 Renewal NOI on June 26, 2004 and received a new permit number, Permit No. INR110097, on August 27, 2004.

Documented non-permitted releases to the Site storm or Muncie Sanitary District combined sewer systems include:

- Approximately 2,000 gallons of oily water released from a track well on June 18, 1992
- Approximately 200 gallons of soluble oil released from the chip containment pad on October 5, 1995
- Unknown quantity of oil released from the Oil House on May 10, 1999
- Unknown quantity of oil released from an rooftop oil chiller on August 26, 1999
- Less than 100 gallons of oily wastewater released from holding tank No. 3 on May 5, 2003

An AO and Enforcement Compliance Schedule (ECS) were issued by the Bureau of Water Quality Muncie Sanitary District on August 31, 1999. Based on discussions with Site personnel, the AO was issued in response to two of the releases to the combined sewer system from the Site, including the May 10, 1999 oil release from the Oil House and the August 26, 1999 oily storm water discharge from the rooftop oil chiller. The AO required that the facility identify and correct any potential areas of release to storm water at the Site. It is noted in the AO that

only four of 669 tests of the discharge to the POTW exceeded the Site permit discharge limits in the five years preceding the AO. The AO also stated that "no environmental damage was done" and "the discharge to White River was not affected".

During a 2002 Site inspection, oil was noted near some of the roof air handling equipment (oil mist units) adjacent to storm water roof leaders. According to facility personnel, previous releases to the combined sewer system had occurred from the coolant oil on the roof. PCB wipe samples were collected from an oil mist handler unit and the roof area below the unit. Analytical results for the wipe samples were non-detect for PCBs.

As shown on Figure 49, information about the storm sewer system on the former Delco Remy property is not available. The furthest north storm sewer manhole identified on Site drawings is located to the northeast of the guard shack at the western entrance to the Site. Site drawings identify an 8 inch diameter vitrified clay pipe (VCP) storm sewer line heading to the north of this manhole (identified as MH#1 for the purposes of this report). In addition, a 15-inch diameter concrete overflow connection to the combined sewer system exists at the east side of MH#1.

To better understand the storm sewer system at the former Delco Remy property, MTM environmental personnel initiated a manhole labeling/identification project in 2004 beginning at MH#1. On July 25, 2004, Site personnel observed a layer of oil on the water and noted a petroleum odor in manhole MH#1. An oil/water sample was collected from MH#1 and submitted for laboratory analysis for PCBs and waste characterization parameters. Analytical results of the oil phase of the sample indicated the presence of PCB Aroclors 1248 and 1254 at concentrations of 58 mg/kg and 11 mg/kg, respectively. PCB Aroclor 1248 was also detected in the water phase of the sample at a concentration of 260 µg/L.

On August 13, 2004, CRA re-sampled the water, oil, and sludge from MH #1 for laboratory analysis of PCBs and waste characterization parameters. PCBs were detected in the oil at a concentration of 2.8 mg/kg, in the sludge at a concentration of 2.8 mg/kg, and in the water at a concentration of 0.07 mg/L.

To address the presence of PCB containing materials in MH#1, a waste disposal vendor was retained to conduct a manhole investigation beginning on November 3, 2004. The manhole investigation, which included sewer cleaning and video inspection activities, identified the following:

- The storm sewer line which enters MH#1 from the north is connected to MH#2 located approximately 50-feet north of MH#1.

- One storm sewer line enters MH#2 from the northeast. The storm sewer line entering MH#2 is connected to MH#3, which does not have any storm sewer lines entering the manhole, and MH#4, which is located on the former Delco Remy property and has two lines entering; one form the north and one from the east.
- Obstructions were observed in the two lines entering manhole MH#4 and video inspection could not be continued in these directions.
- The storm line on the south side of MH#1 flows out of MH#1 to catch basin CB#1 located approximately 50-feet south of MH#1.
- The storm lines entering MH#1 from the north and the storm line leaving to the south are the only two lines in MH#1. There are no storm lines to the east and west as noted on the Site drawings (the manhole in question on the Site drawings appears to be the manhole designated on Figure 50 as MH#5, see discussion below). MH#1 does not appear to have an overflow connection to the combined sewer system.
- Catch basin CB#1, south of MH#1 has a line exiting to the south which discharges to MH#5.
- MH#5, located south of CB#1, has five storm lines entering or exiting the manhole as follows:
  - The storm line entering at the north from CB#1, as discussed above
  - A storm line entering from the northwest which is connected to catch basin CB#2 located north of the security gate #3 guard house
  - A storm line to the west (direction of flow not known) which has a bulkhead. The purpose of the bulkhead is not known but it may be to act as an overflow to the Perkins Street combination sewer system
  - A storm line exiting to the south which is connected to storm Outfall 001 at Buck Creek
  - A storm line entering from the east which is connected to catch basin CB#3. CB#3 appears to be connected to an overflow to the combined sewer system to the north.

According to Site personnel, storm sewers were plugged and abandoned in place during facility decommissioning and demolition. Currently, no evidence of a release to Site soil/groundwater from the Site storm sewer system exists. No evidence of a release to the environment was recorded in daily environmental reports prepared during decommissioning and demolition. As such, no further action was proposed for this AOI in the RFI Work Plan.

4.35 AOI 35: Site-Wide Groundwater

Documented releases to the environment resulting from manufacturing operations at the Site have occurred over time. It is believed that some of these have impacted groundwater at the Site. Since groundwater is being evaluated on a Site-wide basis, on-Site groundwater is only listed (and not shown) on Figure 21 as an AOI.

Various investigations were conducted to evaluate the potential contaminants in groundwater at the Site. The earliest documented investigation was conducted at the former Delco Remy property in 1976. Additional area specific and Site-wide investigations were conducted from 1976 through 2010. Further groundwater characterization was proposed in the RFI Work Plan. The historical and RFI-related analytical results are discussed in Section 6.0.

4.36 AOI 36: Adjacent (Upgradient) Dry Cleaning Operations

Dry cleaning operations are conducted upgradient of the Site, at the southwest corner of South Sampson Street and West Eighth Street. An investigation of the upgradient dry cleaning facility was conducted by Harding, including a file review and site visit, monitoring well installations and groundwater sampling, an evaluation of migration pathways, and analytical modeling, beginning in 1998 and continuing until 2001. Harding's investigation determined that PCE in Site groundwater is most likely attributable to operations at a dry cleaning facility upgradient of the Site. Further, it was determined by Harding that the dry cleaner was likely disposing of PCE in the sanitary sewer and the PCE was leaking out of the sewer and migrating to the upper sand and gravel aquifer through a permeable window that may have been created near the intersection of Eight Street and Sampson Street during sewer construction (Harding, 2001a/b). Soil analytical results associated with the investigation of the dry cleaning operations are summarized in Appendix G.1 and select parameters are shown on Figure 51.

Following the dry cleaner investigation, CRA conducted sanitary sewer inspection along West Eighth Street, between Sampson Street and Perkins Street (i.e., upgradient of the dry cleaner). CRA televised the sewer in May 2005 and July 2005 and found that the concrete tiles that make up the utility corridor were fractured and discontinuous in some places. The deterioration of the utility corridor is likely due to age and possibly vibrations due to traffic along West Eighth Street. The deterioration of the utility corridor provides a pathway of contaminant migration due to the off-Site operations at the dry cleaning facility onto the former GMC property.

As the downgradient extent of PCE impacted groundwater was not well defined beneath the former manufacturing building, additional investigation of this AOI was proposed in the RFI Work Plan as part of AOI 35 (Site-Wide Groundwater).

Section 5.0 RCRA Facility Investigation

In May 2011, CRA submitted the RFI Work Plan (CRA, May 2011) to IDEM for approval. The objective of the RFI Work Plan was to detail the investigations necessary to document the nature and extent of releases of hazardous waste and/or hazardous constituents at or from the

Site's AOIs where the potential for a release was moderate to high and/or a documented historical release had occurred but had not been fully characterized. Following IDEM's approval of the RFI Work Plan, CRA implemented Work Plan in November and December 2011. The results of the RFI Work Plan indicated that additional soil and groundwater sampling was required to delineate the extent of observed impacts and to collect Site-specific background data to support the preparation of a Site-specific RHHRA (Section 7.0). In December 2012, CRA submitted the Stage II RFI Work Plan (CRA, December 2012) to IDEM for approval, which detailed the investigations necessary to delineate the extent of observed impacts. Following IDEM's approval of the Stage II RFI Work Plan, CRA implemented the Work Plan in February and March 2013.

CRA Services, a licensed driller in the State of Indiana, was retained by CRA to provide drilling services for the advancement of boreholes and instrumentation of temporary and permanent monitoring wells. Direct push technologies were used to complete the scope of work which included advancement of 157 boreholes and installation of three temporary monitoring wells and ten permanent monitoring wells.

In April and May 2014, CRA conducted groundwater monitoring activities across the Site. Groundwater monitoring activities included hydraulic monitoring with an oil/water interface probe and low flow sampling for volatile organic compounds (VOCs) and polychlorinated biphenyls (PCBs).

5.1 Soil Sampling

Boreholes were advanced to targeted depths using direct push drilling (Geoprobe®) technology. Soil samples were collected using a 2-inch outside diameter by 4-foot long Geoprobe® stainless steel sampler (macro core) lined with a disposable acetate liner. A new liner was used for each 4-foot sample interval and the macro core was decontaminated between each borehole location using Alconox and water. Soil samples were collected continuously as borings were advanced and were screened in the field for evidence of staining, odor, and/or VOC impacts using a PID. The lithology of the soil encountered during drilling operations was logged in accordance with the Unified Soil Classification System (USCS) along with any visual, olfactory, or PID evidence of impacts. Stratigraphic and instrumentation logs are provided in Appendix J. Samples were selected for analysis to meet the objectives of the investigation at each AOI and based on field evidence of impact, if any.

Soil samples were collected in general accordance with the RFI and Stage II Work Plans and the Quality Assurance Project Plan (QAPP) (CRA, 2011a). Soil samples were placed directly into pre-cleaned sample containers with required preservative, where appropriate, and submitted to TestAmerica Laboratories in North Canton, Ohio (TestAmerica) under chain of custody (COC)

protocol for analysis. Field duplicate and matrix spike/matrix spike duplicate (MS/MSD) samples were collected for quality assurance/quality control (QA/QC) purposes.

A Sample Key is presented in Table 5. RFI soil sample locations are shown on Figure 52.

5.2 Monitoring Well Installation

Borehole installation and soil sampling was completed prior to monitoring well installations. Monitoring well locations and depths were based on the field observations and field screening results.

CRA Services, a licensed driller in the State of Indiana, was retained by CRA to install monitoring wells at the Site. In general, well installation was conducted as follows:

- Advance well boring using approximately 4-inch inside diameter hollow stem augers from ground surface to the targeted depth
- Install a 2-inch diameter well consisting of a 10 foot long polyvinyl chloride (PVC) well screen (No. 10 slot) and a 2-inch diameter PVC threaded riser pipe with lockable cap and lock
- Backfill each well installation with a measured sand pack around the well screen (No. 20 sand) placed to a minimum of 2-feet above top of screen and a bentonite seal over the sand pack
- Grout an approved protective casing in place around the well for protection
- Survey well for vertical control

5.3 Monitoring Well Development

New monitoring wells were developed no sooner than 48 hours following installation. Well development was accomplished by pumping in accordance with CRA's Standard Operating Procedures (SOPs). Monitoring well development details are included in Table 6. Groundwater removed from the wells was collected for disposal.

5.4 Groundwater Elevation Measurement

Each well was given a permanent, easily identified reference point marked on the well casing from which its water level elevation is measured. An electric tape water level measuring device sufficiently sensitive to reliably provide a measurement accurate to 0.01 foot was used to determine the depth to groundwater. Shallow groundwater contours from groundwater elevations measured in December 2011 are shown on Figure 16. Historical groundwater elevation data is included in Table 2.

On April 29, 2014, hydraulic monitoring was conducted at the Site using a calibrated oil/water interface probe. Given the absence of an oil sheen or measureable thickness of free product, no LNAPL is present beneath the Site.

5.5 Groundwater Sampling

Wells were purged and sampled no sooner than 48 hours following development using low flow techniques in accordance with CRA's SOPs. Monitoring well purging details are included in Table 6. Purged groundwater was collected in 55 gallon containers for appropriate off-Site disposal.

Groundwater samples were collected in general accordance with the RFI and Stage II Work Plans and the QAPP. The groundwater samples were placed directly into pre-cleaned sample containers with required preservative, where appropriate, and submitted to TestAmerica under COC protocol for analysis. Field duplicate and MS/MSD samples were collected for QA/QC purposes.

A Sample Key is presented in Table 5. Site-wide groundwater sample locations are shown on Figure 53.

5.6 Sample Tracking and Data Management

Sample tracking and data management was performed as discussed in the QAPP to ensure that the sampling program was completed properly and that the sample turnaround times and requested analyses were met.

The sample tracking and management activities included:

- Delivery coordination of sample containers, shipping coolers, and sampling supplies from the laboratory to the Site
- Making certain that sample shipments from the field arrived at the laboratory properly preserved
- Resolution of sample documentation issues, if any
- Identification of samples with unique turnaround time requirements or non-routine analyses
- Maintenance of the integrity of field data (e.g., water levels, pH, conductivity) and sample identification information (e.g., field duplicates, MS/MSD samples) through the use of standardized spreadsheet templates that are completed by field sampling crews and electronically transferred to the database management team

- Distribution of preliminary and final data packages to the data users in a timely manner

The EQuIS database format was used for storing and managing monitoring data. EQuIS is designed to include all tabular data including sampling and chemistry information for various media, groundwater elevations, well completion and lithology, and other information.

5.7 Laboratory Data and Data Validation

A standardized electronic data deliverable (EDD) was provided by the laboratory to ensure that laboratory analytical results were received in a format most efficient for import into the EQuIS database. The laboratory analytical data was validated as discussed in the QAPP. The output from the data validation process has been provided in a memorandum format (Appendix K). In general, data were found to be of sufficient quality for their intended use. Data qualifiers assigned by the laboratory or at the time of CRA's data validation are included in the summaries of soil, groundwater grab, and groundwater analytical results in Appendix G. The following outlines the results of data validation conducted for 360 soil samples, groundwater grab samples, and groundwater samples collected during the RFI:

- All samples were prepared and analyzed within the required holding times, and all samples were properly delivered on ice, and stored by the laboratory at the required temperature (0-6°C). 16 samples were qualified due to violation of sample holding time periods (i.e., samples did not arrive at the laboratory in the required amount of time from sampling).
- Select analyzed parameters in 85 samples were qualified or rejected due to laboratory contamination observed in method blank samples. Method blank samples are prepared from a purified sample matrix and are processed concurrently with investigative samples to assess the presence and the magnitude of sample contamination introduced during sample analysis.
- Individual sample performance for organic analyses was monitored by assessing the results of surrogate compound percent recoveries. Select analyzed parameters in four samples were qualified because the surrogate recovery acceptance criteria were not met.
- Select analyzed parameters in 28 samples were qualified because laboratory control sample (LCS) percent recoveries were not within the laboratory control limits. The LCS analyses serve as a monitor of the overall performance in all steps of the sample analysis and are analyzed with each sample batch.
- To assess the long term accuracy and precision of the analytical methods on various matrices, MS/MSD percent recoveries and the relative percent difference (RPD) control limits of the concentrations were determined. Select analyzed parameters in 33 samples were qualified due to violation of MS/MSD percent recovery criteria.

- Overall precision for the sampling events and laboratory procedures were monitored using the results of field duplicate sample sets. Select analyzed parameters in eight samples were qualified because duplicate sample result RPDs associated with these duplicate samples were greater than 50 for soil samples or 100 percent for water samples.
- To monitor potential cross-contamination of VOCs during aqueous sample transportation and storage, trip blank samples were submitted to the laboratory for VOC analysis with each shipping cooler containing multiple samples. Select analyzed parameters in three samples were qualified due to trip blank contamination.

Section 6.0 Discussion of Results

The following subsections discuss the RFI soil and groundwater sampling activities and the analytical results generated therefrom to characterize the nature and extent of any releases of hazardous waste and/or hazardous constituents in environmental media at select AOIs. A sample key is provided in Table 5. Laboratory analytical results and data validation memoranda for RFI soil, groundwater grab samples, and groundwater samples are included in Appendix K.

Soil and groundwater data generated during the RFI have been compared to the Screening Levels as summarized in Appendix G.

6.1 Background Soil Quality Sampling

An investigation of background soil quality was conducted to identify constituents in soil that are naturally occurring or may be elevated due to anthropogenic inputs. The background soil sampling area selected is approximately 1,600 feet (0.3 miles) upwind (southwest) of the Site as shown on Figure 54. Ten boreholes were advanced in the background soil sampling area to facilitate the collection of soil samples for laboratory analysis of metals, the results of which are summarized in Table 7. Review of Table 7 indicates that elevated levels of arsenic, cobalt, iron, lead, and manganese are characteristic of background soil quality upwind of the Site.

6.2 AOI 1: SWMU 1 – Oily Aluminum Scrap Holding Area

Prior to the RFI, no subsurface investigations had been conducted at AOI 1. One borehole (BH1-11) was advanced to facilitate the collection of soil samples due to observed staining around a drain and potential impacts resulting from a reclaimed oil release. Samples were submitted to the laboratory for analysis of VOCs, SVOCs, PCBs, and inorganics, as presented in Appendix G.1. With the exception of arsenic, cobalt, and iron, analyzed parameters were non-detect or where detected, were detected at concentrations below the Screening Levels. Arsenic, cobalt, and iron were found at concentrations above the residential soil MTG Screening Level, but below

the commercial/ industrial and excavation soil direct contact Screening Levels at AOI 1, as shown on Figure 55.

BH1-11 was instrumented as a temporary monitoring well to facilitate the collection of a representative groundwater grab sample. One groundwater grab sample was collected and submitted to the laboratory for analysis of VOCs, SVOCs, PCBs, and inorganics, as presented in Appendix G.2. With the exception of 1,1-dichloroethane (1,1-DCA), cobalt, and manganese, analyzed parameters were non-detect or where detected, were detected at concentrations below the Screening Levels. 1,1-DCA, cobalt, and manganese were found at concentrations above the residential groundwater Screening Level at AOI 1 but below the commercial/industrial Screening Levels.

Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.3 AOI 2: SWMU 2 – WWTP

One borehole (BH2-11) was advanced in the vicinity of a pit found to be in poor condition to facilitate the collection of two soil samples. Soil samples were submitted to the laboratory for analysis of VOCs, SVOCs, PCBs, and inorganics, as presented in Appendix G.1. With the exception of cobalt and iron, analyzed parameters were non-detect or where detected, were detected at concentrations below the Screening Levels. Cobalt and iron were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels, as shown on Figure 56.

BH2-11 was instrumented as a temporary monitoring well to facilitate the collection of a representative groundwater grab sample. One groundwater grab sample was collected and submitted to the laboratory for analysis of VOCs, SVOCs, PCBs, and inorganics, as presented in Appendix G.2. Analyzed parameters were either non-detect or where detected, were detected at concentrations below the Screening Levels.

6.4 AOI 3: SWMU 3 – Hazardous Waste Storage Building (Former Delco Remy Warehouse)

The RFI proposed additional subsurface investigations at AOI 3 due to the presence of below grade structures and to evaluate soil quality beneath PCB impacted flooring. Two boreholes were advanced in the southwest corner of the former building where previous investigations were halted due to an unidentified obstruction, one borehole was advanced in the vicinity of a former pit that was found in poor condition, and three boreholes were advanced at various locations to provide a general screening of the soil quality beneath the building.

Soil samples were submitted to the laboratory for analysis of VOCs, SVOCs, PCBs, and inorganics, as presented in Appendix G.1. With the exception of Aroclor 1248, arsenic, cobalt, and iron, analyzed parameters were non-detect or where detected, were detected at concentrations below the Screening Levels. PCBs (Aroclor 1248), arsenic, cobalt, and iron were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels, as shown on Figure 24.

One borehole was instrumented as a monitoring well to facilitate the collection of representative groundwater samples. One groundwater sample was collected from MW45-11 using low flow purge and sampling techniques and submitted to the laboratory for analysis of VOCs, SVOCs, PCBs, and inorganics, as presented in Appendix G.3. With the exception of antimony, analyzed parameters were either non-detect or where detected, were detected at concentrations below the Screening Levels. Antimony was detected at an estimated concentration marginally above the residential drinking water Screening Level, but below the commercial/industrial Screening Levels. PCBs were non-detect.

Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.5 AOI 9: SWMU 9 – Degreasing Station

One borehole (MW46-11) was advanced in the vicinity of the former degreasing station to investigate the potential for a release to soil/groundwater from the historical operations at this AOI. Soil samples were submitted to the laboratory for analysis of VOCs, as presented in Appendix G.1. Analyzed parameters were non-detect or where detected, were detected at estimated concentrations below the Screening Levels, as shown on Figure 57.

One groundwater sample was collected and submitted to the laboratory for analysis of VOCs, as presented in Appendix G.3. Analyzed parameters are either non-detect or where detected, are detected at estimated concentrations below the Screening Levels.

Based on the results of the RFI, there is no evidence to suggest that operations at the former degreaser resulted in a release to the environment.

6.6 AOI 11: USTs

6.6.1 AOI 11.1: Powerhouse USTs (T-1 through T-8)

Several historical investigations were conducted in the vicinity of AOI 11.1 prior to the RFI, which identified elevated concentrations of TPH in soil. As such, additional investigation of this AOI was proposed to assess the constituents in the detected hydrocarbons to determine if the elevated TPH represents a potential risk to human health. A total of 18 boreholes were advanced to facilitate the collection of soil samples. In general, three soil samples were collected at each borehole. Samples were collected of the soil interval with the greatest field evidence of impact; at the soil interval immediately below the interval of greatest impact; and immediately above the water table. Samples were submitted to the laboratory for analysis of SVOCs and TPH, as presented in Appendix G.1. Based on the results of the investigation, remaining TPH impacts to soil, if any, are limited to soils immediately below the former USTs. The results of the SVOC analysis indicated that 1,1-biphenyl, naphthalene, and pentachlorophenol were detected above the residential MTG Screening Level but below the commercial/industrial Screening Levels. Further, the exceedances of the residential MTG Screening Levels were limited to two locations. Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.7 AOI 13: Former Chicago Pump House

The sump integrity in the former Chicago Pump House was not assessed at the time of closure. As such, one borehole (BH20-11) was advanced in the vicinity of AOI 13 to facilitate the collection of three soil samples. Samples were submitted to the laboratory for analysis of VOCs, SVOCs, PCBs, and inorganics as presented in Appendix G.1. With the exception of arsenic, cobalt, iron, and manganese, analyzed parameters were non-detect or where detected, were detected at concentrations below the Screening Levels. Arsenic, cobalt, iron, and manganese were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels, as shown on Figure 58. Based on the results of the RFI, there is no evidence to suggest that historical operations at this AOI resulted in a release to the environment.

6.8 AOI 14: Former Rail Lines

6.8.1 AOI 14.1: Former Rail Line West of Heat Treat Building

Oil staining and an oil seep were observed in the vicinity of the former rail line west of the Heat Treat Building. In addition, no information on the composition or quality of backfill materials used at AOI 14.1 was available. As such, six boreholes were advanced through the fill until native soil was observed to facilitate the collection of soil samples. In general, one soil sample was collected of the fill material, where fill was present and at the interval with greatest field

evidence of impact and one soil sample was collected from the native silty clay beneath the fill. Samples were submitted to the laboratory for analysis of VOCs, SVOCs, PCBs, and inorganics as presented in Appendix G.1 and on Figure 36.
Arsenic, cobalt, iron, and manganese were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels across AOI 14.1. Lead was detected at one location (MW54-13) above the residential soil MTG and commercial/industrial direct contact Screening Levels, but below the excavation soil direct contact Screening Level.

Methylene chloride (a common laboratory contaminant) was detected at four locations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels. As shown on Figure 36, cis-1,2-dichloroethene (cis-1,2-DCE), PCE, and vinyl chloride are present in the native material above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels at one location (BH24-11). TCE was also detected in soil at BH24-11 above all three Screening Levels.

Benzo(a)anthracene and naphthalene were detected at one location (MW54-13) above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels. Benzo(a)pyrene was detected at MW54-13 above the commercial/industrial direct contact Screening Level, but below the residential soil MTG and excavation soil direct contact Screening Levels.

Exceedances of relevant soil Screening Levels have been delineated and are further assessed through the RHHRA provided in Section 7.0.

A groundwater sample was collected from MW53-13 to monitor for the presence of VOCs and metals due to the observed soil impacts at BH24-11 and MW53-13. TCE and vinyl chloride were detected above the Screening Levels at MW53-13. Monitoring well MW54-13 was installed to investigate possible groundwater impacts due to the former oil seep. No oil or oily sheen was observed during groundwater sampling at MW54-13. VOCs and metals were not detected above the Screening Levels in groundwater at MW54-13, with the exception of antimony which was detected at a concentration exceeding the Screening Levels in a parent sample but was not detected the associated field duplicate sample at MW54-13. Groundwater analytical results are summarized in Appendix G.3. Groundwater quality is further assessed as part of AOI 35 (Site-Wide Groundwater).

6.8.2 AOI 14.2: Former Rail Line East of Heat Treat Building

Prior to the RFI, no subsurface investigations had been conducted at AOI 14.2. As such, eight boreholes were advanced to facilitate the collection of soil samples along the former rail line. Boreholes were advance through the fill until native soil was observed. Samples were submitted to the laboratory for analysis of VOCs, SVOCs, PCBs, and inorganics, as presented in Appendix G.1 and on Figure 59.
Sampling results indicate that cis-1,2-DCE was detected above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels at one location (BH29-11).

Benzo(a)anthracene, 1,1-biphenyl, dibenzofuran, and naphthalene were found at concentrations above the residential soil MTG Screening Levels, but below the commercial/industrial and excavation soil direct contact Screening Levels at one location (BH28-11). Benzo(a)pyrene was detected at BH28-11 above the commercial/industrial direct contact Screening Level, but below the residential soil MTG and excavation soil direct contact Screening Levels.

Arsenic, cobalt, iron, and manganese were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels across AOI 14.1. Lead also detected above the residential soil MTG and commercial/industrial direct contact Screening Levels, but below the excavation soil direct contact Screening Level at one location (BH39-13).

Exceedances of relevant soil Screening Levels have been delineated and are further assessed through the RHHRA provided in Section 7.0.

6.8.3 AOI 14.3: Former Rail Line North of Power House

Prior to the RFI, no subsurface investigations had been conducted at AOI 14.3. Two boreholes (BH31-11 and BH32-11) were advanced to facilitate the collection of soil samples at the locations shown on Figure 60. Boreholes were advance through the fill until native soil was observed. One soil sample was collected of the fill material, where fill was present and at the interval with greatest field evidence of impact and one soil sample was collected from the native silty clay below the fill.

Samples were submitted to the laboratory for analysis of VOCs, SVOCs, PCBs, and inorganics, as presented in Appendix G.1. With the exception of cobalt, iron, and manganese, analyzed parameters were non-detect or where detected, were detected at concentrations below the Screening Levels. Cobalt, iron, and manganese were found at concentrations above the

residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels.

Exceedances of relevant soil Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.9 AOI 16: Former Delco Remy Property

Several historical investigations were conducted at this AOI which identified elevated concentrations of some constituents, primarily lead. As such, 39 boreholes were advanced across AOI 16 to varying depths to delineate historically identified lead impacts. In general, three soil samples were collected from each borehole at varying depths to achieve vertical delineation of the anticipated impacts. Samples were submitted to the laboratory for analysis of total lead, as presented in Appendix G.1 and on Figure 39c. Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.10 AOI 18: Main Fork Truck Battery Charging Area

One borehole (BH58-11) was advanced in the vicinity of AOI 18 due to observed staining and deterioration of the floor at this AOI. One soil sample was collected from the native silty clay found immediately below the concrete and a second sample was collected at 6 to 8 feet bgs for vertical delineation of impacts, if any. Samples were submitted to the laboratory for analysis of PCBs and inorganics, as presented in Appendix G.1 and on Figure 61. With the exception of arsenic, cobalt, iron, and manganese, analyzed parameters were non-detect or where detected, were found at concentrations below the Screening Levels. Arsenic, cobalt, iron, and manganese were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels.

Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.11 AOI 20: Oil Houses

6.11.1 AOI 20.1: Oil House Inside Main Manufacturing Building

Due to the undocumented integrity of the Oil House floor, one borehole was advanced to facilitate the collection of soil samples beneath the floor. One soil sample was collected from the native silty clay found immediately below the concrete and a second sample was collected at 12 to 14 feet bgs for vertical delineation of impacts, if any. Samples were submitted to the laboratory for analysis of VOCs, SVOCs, PCBs and inorganics, as presented in Appendix G.1 and on Figure 62. With the exception of arsenic, cobalt, and iron, analyzed parameters were non-

detect or where detected, were found at concentrations below the Screening Levels. Arsenic, cobalt, and iron were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels. Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.11.2 AOI 20.2: Oil House Outside Main Manufacturing Building

Three boreholes were advanced to facilitate the collection of soil samples in proximity to below grade structures of unknown integrity. Due to refusal at two locations, soil samples were collected from one borehole (BH62-11), located in the southwest corner of the former oil house. Samples were collected from the native silty clay immediately below the concrete and a second sample was collected for vertical delineation of impacts, if any. Subsequently, an additional borehole (BH15-13) was advanced in the vicinity of the drilling refusal. Three samples were collected from BH15-13: one sample immediately below the slab; one from 8 to 10.5 feet bgs; and one from the interval immediately above the water table. Soil results are summarized in Appendix G.1 and select parameters are presented on Figure 63. With the exception of arsenic, cobalt, iron, and manganese, analyzed parameters were non-detect or where detected, were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels.

BH62-11 was instrumented as a temporary monitoring well to facilitate the collection of a representative groundwater grab sample. One groundwater grab sample was collected and submitted to the laboratory for analysis of VOCs, SVOCs, PCBs, and inorganics, as presented in Appendix G.2. With the exception of PCBs, aluminum, arsenic, cobalt, iron, lead, and manganese, analyzed parameters were non-detect or where detected, were detected at concentrations below the residential drinking water Screening Level.

BH62-11 was converted into a permanent monitoring well (MW52-13) for the purpose of collecting groundwater samples using standard low-flow purge and sample techniques. MW52-13 was developed and sampled for laboratory for analysis of PCBs and inorganics, as presented in Appendix G.3. With the exception of cobalt and iron, analyzed parameters were non-detect or where detected, were detected at concentrations below the residential drinking water Screening Level. PCBs were non-detect.

Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.12 AOI 21: Outdoor Chemical Storage Area

Four boreholes were advanced to facilitate the collection of soil samples in proximity to areas of poorest concrete integrity and/or areas of greatest staining at AOI 21. Samples were collected from the soil interval immediately below the concrete and a second sample was collected at a greater depth for vertical delineation of impacts, if any. Samples were submitted to the laboratory for analysis of VOCs, SVOCs, PCBs and inorganics, as presented in Appendix G.1 and on Figure 64.

1,1-DCA, 1,1-dichloroethene (1,1-DCE), PCE, 1,1,1-TCA, and TCE were detected at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels in surface and sub-surface soils. Arsenic, cobalt, iron, and manganese were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels.

Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.13 AOI 25: East Shipping and Receiving Dock

Two boreholes were advanced to facilitate the collection of soil samples immediately below the PCB impacted concrete slab and the collection of deeper samples in the area where oil was previously observed. Samples were submitted to the laboratory for analysis of VOCs, SVOCs, PCBs and inorganics, as presented in Appendix G.1 and on Figure 65. Benzo(a)anthracene and naphthalene were detected at one location (BH67-11) above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels. Benzo(a)pyrene was detected at BH67-11 above the commercial/industrial direct contact Screening Level, but below the residential soil MTG and excavation soil direct contact Screening Levels. Arsenic, cobalt, iron, and manganese were detected across AOI 25 above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels.

Lead was detected marginally above the residential MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels at one additional sampling location (BH17-13), as shown on Figure 65.

Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.14 AOI 26: Locker Room Entrance/Cell 62

Two boreholes were advanced to facilitate the collection of soil samples immediately below the PCB impacted concrete slab and the collection of deeper samples for vertical delineation of impacts, if any. Samples were submitted to the laboratory for analysis of PCBs and inorganics, as presented in Appendix G.1 and on Figure 66. With the exception of arsenic, cobalt, iron, and manganese, metals were detected below the Screening Levels. Arsenic, cobalt, iron, and manganese were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels. PCBs were non-detect.

Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.15 AOI 27: Tool Hardening

Two boreholes were advanced to facilitate the collection of soil samples immediately below the PCB impacted concrete slab and the collection of deeper samples for vertical delineation of impacts, if any. Samples were submitted to the laboratory for analysis of TCL PCBs and TAL inorganics, as presented in Appendix G.1 and on Figure 42. With the exception of arsenic and iron, metals were non-detect or where detected, were detected below the Screening Levels. Arsenic and iron were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels at. PCB Aroclor 1248 was detected below the Screening Levels at both borehole locations.

Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.16 AOI 28: Heat Treat Building

Five boreholes were advanced to facilitate the collection of soil samples. Three boreholes were in proximity to below grade structures found in poor condition. Soil samples were collected at the depth of the below grade structures and deeper samples were collected for vertical delineation of impacts, if any. Two boreholes were advanced in the vicinity of the PCB impacted concrete pad. Soil samples were collected immediately below the concrete slab and deeper samples were collected for vertical delineation of impacts, if any. Samples were submitted to the laboratory for analysis of VOCs, SVOCs, PCBs and inorganics, as presented in Appendix G.1 and on Figure 43. With the exception of the following, analyzed parameters were non-detect or where detected, were detected below the Screening Levels.

Naphthalene was detected (at an estimated concentration) above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels between 1 and 3 feet bgs at BH74-11. The deeper sample at this location was non-detect for naphthalene.

Arsenic, cobalt, iron, and manganese were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels.

Lead was detected above the residential soil MTG and commercial/industrial soil direct contact Screening Levels, but below the excavation soil direct contact Screening Level between 1 and 3 feet bgs at BH74-11. Two additional boreholes (BH42-13 and BH43-13) were advanced to delineate the observed lead exceedance. No exceedances of Screening Levels for lead were detected in the delineation samples.

Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.17 AOI 29: Powerhouse

Four boreholes were advanced to facilitate the collection of soil samples to document soil quality in the vicinity of the former Powerhouse following decommissioning of the building and removal of PCB impacted concrete. Soil samples were collected at the depths of the below grade structures and a deeper sample was collected at each borehole for vertical delineation of impacts, if any. Samples were submitted to the laboratory for analysis of TCL PCBs and TAL inorganics, as presented in Appendix G.1 and on Figure 45. With the exception of arsenic, cobalt, iron, and manganese, all parameters were non-detect or where detected, were detected below the Screening Levels. Arsenic, cobalt, iron, and manganese were found at concentrations above the residential soil MTG Screening Level, but below the commercial/ industrial and excavation soil direct contact Screening Levels at AOI 29.

Based on the results of the RFI, there is no evidence to suggest that historical operations at this AOI resulted in a release to the environment.

6.18 AOI 30: Carpenter Shop Concrete Pad

One borehole was advanced to facilitate the collection of soil samples beneath the former PCB impacted concrete. A soil sample was collected immediately below the concrete and a deeper sample was collected for vertical delineation of impacts, if any. Samples were submitted to the laboratory for analysis of PCBs and inorganics, as presented in Appendix G.1 and on Figure 46. With the exception of arsenic, cobalt, and iron, all parameters were non-detect or where

detected, were detected below the Screening Levels. Arsenic, cobalt, and iron were found at concentrations above the residential soil MTG Screening Level, but below the commercial/ industrial and excavation soil direct contact Screening Levels at AOI 30.

Based on the result of the RFI, there is no evidence to suggest that historical operations at this AOI resulted in a release to the environment.

6.19 AOI 31: Parking Lots East and South of Plant

Historical investigations conducted at this AOI prior to the RFI indicated localized benzo(a)pyrene and lead impacts, the extents of which had not been defined. Four boreholes were advanced to a maximum depth of 5 feet bgs to facilitate the collection of soil samples for delineation of the observed benzo(a)pyrene and lead impacts at parking lot Nos. 3 and 4. Samples from Lot 3 were submitted to the laboratory for analysis of total lead and samples from Lot 4 were submitted to the laboratory for total lead and benzo(a)pyrene analysis, as presented in Appendix G.1 and on Figure 47b. Review of Figure 47b indicates that lead and benzo(a)pyrene impacts have been delineated. Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.20 AOI 32: Below Grade Infrastructure

In accordance with the RFI Work Plan, eleven boreholes were advanced in close proximity to previously identified below grade process infrastructure with poor or unknown integrity to facilitate the collection of soil samples, as presented in Appendix G.1 and shown on Figure 48.

Chlorinated VOCs (cis-1,2-DCE, TCE, and vinyl chloride) were detected at one location (BH89-11) above the residential MTG Screening Level but below the commercial/industrial and excavation direct contact Screening Levels. A deeper sample at this location did not contain these parameters above the Screening Levels. Four additional boreholes were advanced in the vicinity of BH89-11 to delineate the extent of chlorinated VOCs. Results of the sampling, as shown on Figure 48, indicated that VOCs were not detected above the Screening Levels at these locations. TCE was also detected at one additional location (BH96-11) at an estimated concentration that was marginally above the residential MTG Screening Level but below the commercial/industrial and excavation direct contact Screening Levels. A deeper sample was not collected at this location.

Benzo(a)anthracene and naphthalene were detected above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels. Benzo(a)pyrene was detected above the commercial/industrial direct contact Screening Level, but below the residential soil MTG and excavation soil direct contact Screening Levels.

Arsenic, cobalt, iron, and manganese were found at concentrations above the residential soil MTG Screening Level, but below the commercial/industrial and excavation soil direct contact Screening Levels.

Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

6.21 AOI 35: Site-Wide Groundwater

With the exception of groundwater quality beneath the former main manufacturing building, groundwater quality at and near the Site was well documented prior to the RFI. Additional groundwater quality assessments were conducted during the RFI to fill this data gap and to collect some AOI-specific groundwater quality data as discussed previously in Section 6.0. Historical and RFI borehole water/groundwater grab sample results are summarized in Appendix G.2. Groundwater sample results, are summarized in Appendix G.3. Select parameters are presented on the following figures:

Figure 67	Site-Wide Borehole Water/Groundwater Grab Analytical Results
Figure 68a	Groundwater Analytical Results – VOCs (1988 to 1996)
Figure 68b	Groundwater Analytical Results – VOCs (1997 to 2000)
Figure 68c	Groundwater Analytical Results – VOCs (2001 to 2005)
Figure 68d	Groundwater Analytical Results – VOCs (2006 to 2010)
Figure 68e	Groundwater Analytical Results – VOCs (2001 to 2013)
Figure 68f	Groundwater Analytical Results – VOCs (2014)
Figure 69	Groundwater Analytical Results – SVOCs
Figure 70	Groundwater Analytical Results – PCBs
Figure 71	Groundwater Analytical Results – Metals

In general and based on the most recent groundwater sampling results (i.e., 2014), Site groundwater is impacted with chlorinated VOCs. PCE, a common dry cleaning agent, was detected at a maximum concentration of 2,000 µg/L at MW-15, immediately downgradient of the off-Site dry cleaning operations. PCE extends north beneath the former main manufacturing building but is not detected above the Screening Levels north of the former building or east beyond the immediate vicinity of the dry cleaners. TCE and 1,1,1-TCA, common degreasing agents, are detected at their highest concentrations immediately downgradient of the former heat treat building. TCE and its degradation products (primarily cis-1,2-DCE, trans-1,2-DCE and vinyl chloride) are also detected at elevated concentrations upgradient of the former heat treat building and at the downgradient (northwest) Property boundary. Groundwater quality approximately 200 feet downgradient of the Site (MW40-11) exceeds the residential tap water and vapor exposure Screening Levels but is below the

commercial/industrial vapor exposure Screening Level. There are no residences in the vicinity of MW40-11. Groundwater approximately 400 feet downgradient of the Site meets IDEM's VOC Screening Levels.

A small number SVOCs have been detected above the residential tap water Screening Level, primarily in the vicinity of the former Powerhouse and associated USTs and ASTs. In general, groundwater quality at the downgradient Property boundary meets the SVOC residential tap water Screening Levels however, indeno(1,2,3-cd)pyrene was detected above the Screening Level at MW-27 in 2008.

PCBs were historically detected in groundwater beneath the northern portion of the Site however, due to the age of the data and lack of information regarding sampling techniques, the presence of PCBs was assessed in 2010 and again during the RFI. With the exception of a borehole water sample collected at BH62-11, PCBs have not been detected in Site groundwater above the Screening Levels since at least 2010. As PCBs adhere to soil particles which may have been present in the borehole water sample, PCB borehole water results may be biased high. As such, a permanent monitoring well (MW52-13) was installed at the location of BH62-11 to facilitate the collection of a groundwater sample using standard low flow purge and sampling techniques to reduce the amount of sediment introduced into the sample. The groundwater sample collected from MW52-13 did not contain PCBs above the laboratory reporting limit. In 2014, groundwater sampling for PCBs was conducted at select monitoring wells across the Site, including locations where PCBs had historically been detected. PCBs were not detected above the laboratory reporting limit during the 2014 sampling event. In summary, with the exception of a borehole water sample collected in 2011, PCBs have not been detected in Site groundwater above laboratory reporting limits since at least 2010.

A small number of metals, primarily lead and arsenic, have been detected at concentrations above the residential tap water Screening Levels, as shown on Figure 71. With the exception of MW-3 where arsenic is present in the dissolved sample above the Screening Level, recent dissolved metals results are below the Screening Level at the downgradient Property boundary.

Exceedances of relevant Screening Levels are further assessed through the RHHRA provided in Section 7.0.

Section 7.0 Baseline Human Health Risk Assessment

The following RHHRA uses available soil and groundwater data to determine the current risk conditions at the Site and the surrounding area by comparing exposure estimates to Site-specific, risk-based screening levels (SSSLs). The RHHRA is primarily based on the guidance

specified in the 2012 RCG, as amended through March 5, 2014. Items not explicitly defined in the RCG are based on the information contained in various documents published by the U.S. EPA on Risk Assessment Guidance for Superfund (RAGS) (U.S. EPA 1989, 1991c, 1991d, 1991e, 1991f, 2004b, and 2009). Either RCG or RAGS sources are cited for each screening decision, input, calculation, or remediation objective.

7.1 Purpose and Objectives

The purpose of the RHHRA is to integrate the results of historical investigations to determine whether realistic exposure levels of Site constituents have the potential to adversely affect human health on- and off-Site.

One of the main objectives of the RHHRA is the derivation of SSSLs for remaining risk drivers. The SSSLs are directly supportive of ensuing risk assessment, risk management, and data gap decisions and represent one of the remediation objectives specified in the RCG.

7.2 Data Screening

Section 4.0 discusses the results of historical soil and groundwater sampling activities. Section 6.0 discusses the results of RFI soil and groundwater sampling. Together, Section 4.0 and Section 6.0 characterize the nature and extent of any releases of hazardous waste and/or hazardous constituents in environmental media at the Site's AOIs where known or potential historical sources exist. Given industrial operations at the Site ceased in 2006 and related infrastructure was demolished to grade between 2007 and 2009, no operational sources to soil or groundwater impairment exist. Recent advancements in risk assessment, risk management, regulatory guidance, and applied toxicology were incorporated into the RHHRA to ensure that the potential remedial actions, if any, are not only contemporary but also protective of human health. The RHHRA process begins with exposure characterization, as described below.

The exposure characterization step (per the RCG), where the nature and extent of potential impacts to exposure media are assessed via comprehensive sampling, yields all-inclusive analytical results that must be screened for constituents that may be associated with adverse health effects on receptors (i.e., potential risk drivers). The data screening step directly utilizes the Screening Levels discussed and identified in the RCG and subsequent Screening Level updates through March 5, 2014.

The key parameters used in the screening step of the Site data are:

- Background levels: the highest Site background results in surface soil were used to interpret the collected soil data, as specified in the RCG

- Detection Frequency (DF): a cutoff of 10-percent detection frequency was used to screen out uncommon constituents, as specified in the RAGS
- Detection Limit (DL): one-half of the detection limit for results below the quantification limits was adopted for non-detected constituents, as specified in the RAGS
- Essential elements without IDEM Screening Levels: calcium, magnesium, potassium, and sodium were excluded from the assessment based on their "generally regarded as safe" (GRAS) nature, as specified in the RAGS
- IDEM's 2014 Screening Levels
- Appropriate and applicable screening levels from other jurisdictions or equivalent chemical surrogates (adjusted to 10^{-5} for carcinogens per the RCG) to fill Screening Level data gaps

The Screening Levels were used to identify the Constituents of Potential Concern (COPCs; referred to as the Potential Contaminants [PCs] in the RCG) subject to further assessment in the current RHHRA.

7.2.1 Background Soil Concentrations

IDEM's guidance recommends screening inorganic constituents (i.e., metals) of potential concern against background concentrations. This is one of RCG's fundamental remediation objectives (ROs).

Soil background sampling was conducted in 2012 as discussed in Section 6.1. Ten boreholes were advanced to facilitate the collection of background soil samples for laboratory analysis of metals, the results of which are summarized in Table 7. Review of Table 7 indicates that elevated levels of arsenic, cobalt, iron, lead, and manganese are characteristic of background soil quality upwind of the Site. The maximum detected relevant inorganic concentrations in background surface soil samples are provided below:

Parameter	***Concentration (mg/kg)***
Aluminum	13,000
Antimony	0.46 J
Arsenic	11
Barium	150
Beryllium	0.89
Cadmium	1.2
Chromium	24
Cobalt	14
Copper	48
Iron	20,000

Parameter	***Concentration (mg/kg)***
Lead	440 J
Manganese	1,200
Mercury	0.14 J
Nickel	25
Selenium	0.7
Silver	0.18 J
Thallium	1.3 J
Vanadium	35
Zinc	200

Note: Concentrations denoted with "J" are estimated.

The highest concentration of total lead in the background samples from the top soil layer (i.e., 0 to 6 in bgs; the depth horizon most likely contacted by Site receptors) was reported at 440 mg/kg. This layer reflects the combined geogenic and anthropogenic inputs, with the latter likely contributing the most of total mass of air-deposited lead in an urban environment such as that found at the Site. Accordingly, local receptors may be exposed to background lead, and other metals, even without any contributions from the Site. Based on the results from background sampling, the exposure concentration associated with local soil can reach 440 mg/kg. This background exposure is taken into consideration in the RHHRA.

7.2.2 Soil COPCs

Exceedances of the soil Screening Levels are identified in Table 8. Screening levels from other jurisdictions or equivalent chemical surrogates used to fill Screening Level data gaps are noted in Table 8. The screening results for each chemical class are discussed below. Please refer to Table 8 for receptor and exposure scenario details regarding exceedances of the IDEM Screening Levels for soil. The identified soil COPCs are forwarded to the RHHRA step discussed in Section 7.3.

An off-Site exposure assessment is ongoing, the results of which will be provided under separate cover.

7.2.2.1 Volatile Organic Compounds (VOCs)

Chlorinated VOCs were detected in on-Site soil samples at frequencies above 10-percent and at concentrations exceeding at least one of the IDEM Screening Levels. The exceedances were associated with dichloroethane, 1,1-DCA, methylene chloride (a common laboratory contaminant), trichloroethane (TCA), PCE, and TCE.

7.2.2.2 Semi-Volatile Organic Compounds (SVOCs)

Multiple SVOCs were detected in on-Site soil above the threshold DF and at concentrations exceeding the IDEM Screening Levels. The exceedances were associated with benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenzofuran, indeno(1,2,3-cd)pyrene, naphthalene, and TPH. It should be noted that benzo(k)fluoranthene and indeno(1,2,3-cd)pyrene exceedances of the IDEM Screening Levels were limited to the residential direct contact exposure pathway. On-Site soil was evaluated with respect to this exposure pathway for the purpose of determining the parameters for which Tresspasser SSSLs are required. The residential direct contact Screening Level is not applicable to on-Site Soil.

7.2.2.3 Polychlorinated Biphenyls (PCBs)

Total PCBs were detected in on-Site soil above the threshold DF and at concentrations exceeding the IDEM Residential MTG Screening Levels. However, as noted in Section 6.21, PCBs are non-detect in Site groundwater.

7.2.2.4 Metals

Detections of metals in on-Site soil at concentrations exceeding the threshold DF and applicable IDEM Screening Levels were those for arsenic, cadmium, hexavalent chromium, cobalt, iron, lead, manganese, and thallium. It should be noted that thallium exceedances of the IDEM Screening Levels were limited to the residential direct contact exposure pathway. On-Site soil was evaluated with respect to this exposure pathway for the purpose of determining the parameters for which Tresspasser SSSLs are required. The residential direct contact Screening Level is not applicable to on-Site Soil.

7.2.3 Groundwater COPCs

Exceedances of the groundwater Screening Levels are identified in Table 9 for on-Site data and Table 10 for off-Site data. Screening levels from other jurisdictions or equivalent chemical surrogates used to fill Screening Level data gaps are noted in Tables 9 and 10. The results for each chemical class are discussed below. Please refer to Tables 9 and 10 for receptor and exposure scenario details regarding exceedances of the IDEM Screening Levels for groundwater. The identified groundwater COPCs are forwarded to the refined risk assessment step discussed in Section 7.3.

7.2.3.1 Volatile Organic Compounds

The VOCs detected in on-Site groundwater above the threshold DF and the applicable IDEM Screening Levels are 1,1-DCA, 1,2-DCE (cis- and trans-), methylene chloride (a possible

laboratory contaminant), PCE, TCE, and vinyl chloride. The VOCs detected in off-Site groundwater above the threshold DF and applicable IDEM Screening Levels are PCE, TCE, and vinyl chloride.

7.2.3.2 Semi-Volatile Organic Compounds

Benzo(b)fluoranthene was detected in on-Site groundwater at a concentration exceeding the threshold DF and the applicable IDEM Screening Level. There were no SVOCs identified in off-Site groundwater above the IDEM Screening Levels.

7.2.3.3 Metals

The metals detected in on-Site groundwater above the threshold DF and IDEM Screening Levels included antimony, arsenic (total and dissolved), cadmium (total), cobalt (total), iron (total), lead (total), and manganese (dissolved). The metals found in off-Site groundwater above the threshold DF and the applicable IDEM Screening Levels are arsenic (total) and manganese (dissolved).

7.3 Reverse Risk Assessment

The significance of the analytical results, data screening, and the completed interim remedial measures is assessed in the RHHRA, where realistic exposure parameters are used to estimate the potential for adverse impacts on human health. In accordance with the RCG and RAGS, the main steps in a risk assessment are hazard identification, exposure assessment, toxicity assessment, and risk characterization. Traditionally, these steps are executed in sequence and yield a "forward" risk assessment to determine whether current or future exposures may or may not be associated with potentially unacceptable health risks/hazards. The "reverse" risk assessment (RRA) approach performed here, where the SSSLs are compared to the exposure media results, is also recognized by the RCG (and equations for the calculation of SSSLs are included in Appendix A of the RCG). Based on the RCG, the RRA approach, along with the SSSL development methodology, is applied to assess exposure and risk both on-Site (soil and groundwater) and off-Site (groundwater only).

The risk characterization step, consisting of comparing the SSSLs to the current COPC concentrations in exposure media, identifies not only the potential risks on a sample-by-sample basis, but also delineates areas on- and off- Site where further remediation and/or management decisions may be needed. This is the end product of a RRA approach, details of which are presented below.

7.3.1 Hazard Identification

The hazard identification step involves the development of a Conceptual Site Model (CSM) of potential human exposure pathways/routes as well as the identification of COPCs via screening of exposure media data against conservative screening benchmarks. The screening step was completed in Section 7.1. The CSM, as it relates to human receptors, is presented in Section 7.3.2 and the list of COPCs forwarded to the RHHRA is presented in Section 7.2.3.

7.3.2 Conceptual Site Model (CSM)

A CSM is a simplified representation of the relationship between chemical sources, fate/transport processes, exposure pathways, and exposure routes to receptors at a given location. Its purpose is the identification of complete exposure pathways, which should be addressed in a risk assessment. As per the U.S. EPA (1989), a complete exposure pathway must have the following components:

- source of a chemical constituent
- transport mechanism from source to receptor
- exposure point
- route to the receptor

A pathway is incomplete if any of these four components is missing; incomplete pathways do not require further risk assessment. Otherwise, the pathway is considered complete and needs to be evaluated further. The complete/incomplete exposure pathway analysis is indicated in the RCG.

The Site has an industrial origin and is projected to remain so in the foreseeable future (RACER's goal is to obtain a No Further Action designation based on a non-residential land use). Accordingly, commercial/industrial workers (CIWs) would be the primary receptors at the Site and non-residential land use the primary exposure setting. Soil is the main exposure medium since large surface water bodies are not present, the use of on-Site groundwater will be prohibited via an ERC (i.e., implementation of an institutional control of this potential exposure pathway per RCG). CIWs are assessed for on-Site soil dermal contact, inhalation of dusts and vapors, and incidental ingestion of soil. There is also a potential for inhalation of outdoor and indoor vapors. Other on-Site receptors may also include construction (excavation) workers (Es) and trespassers (Ts). Those receptors are assessed in the RHHRA as well.

The source media associated with the potential for adverse impacts off-Site is groundwater. Accordingly, the receptors that may come into contact with off-Site groundwater are residents (Rs) via inhalation of indoor vapors, recreators (RECs) via direct contact , CIWs via inhalation of

indoor vapors, and Es while groundwater is exposed during utility, construction, and maintenance work. Please keep in mind that on- and off-Site groundwater use is very unlikely (i.e., municipal water is provided at and near the Site) and future use of on-Site groundwater will be restricted (via restrictive covenants).

Based on the characterization of the Site and its current/future use, the exposure pathways for each receptor group are:

- Current/Future Commercial/Industrial Worker (adult)
  - Dermal contact with soil
  - Incidental ingestion of soil
  - Inhalation of soil particulate matter (or dust) and vapors entrained in ambient or indoor air
- Current/Future Construction (Excavation) Worker (adult)
  - Dermal contact with soil and groundwater
  - Incidental ingestion of soil and groundwater
  - Inhalation of soil particulate matter (or dust) and vapors in ambient air
- Current/Future Trespasser (young adult)
  - Dermal contact with soil and groundwater
  - Incidental ingestion of soil and groundwater
  - Inhalation of vapors in ambient air
- Current/Future Residents/Recreators (adult and child)
  - Dermal contact with groundwater
  - Incidental ingestion of groundwater
  - Inhalation of vapors in ambient air

For the purpose of the RHHRA, a worker is an adult with exposure parameters based on age ranging from 16 to 30 years (U.S. EPA, 2004), averaging time of 25 years (RCG), exposure frequency of 250 days/year (RCG), and exposure duration of 25 years (RCG). A commercial/industrial worker (also known as the indoor worker) is typically an occupant of a commercial building who infrequently ventures beyond the work space other than a parking lot and works scheduled hours each day. This type of a receptor has limited potential for direct exposure to soil and groundwater. Affected dust originating from surface soil as well as vapors emanating from subsurface media may enter the building and lead to exposure. Exposure via potable water uses is not possible because the Site groundwater is not currently used, and the future use of Site groundwater will be prohibited under an ERC.

A construction (excavation) worker is typically present on a short-term basis and is limited by the duration of construction, maintenance, and subsurface activities. Per the RCG, averaging time is 1 year, exposure frequency is 45 days per year (RCG), and exposure duration is 1 year. Due to the invasive nature of construction (and remediation) activities, the worker may be exposed to all potentially-affected media through dermal contact, ingestion, and inhalation. However, the implementation of personal protective equipment and safety procedures at the Site will limit or eliminate such exposure.

An off-Site resident/recreator (there are no on-Site residential receptors) is a child or an adult occupying a particular domicile for as long as a lifetime (exposure duration is set to 30 years per the RCG).

A trespasser is a youth that occasionally enters a controlled Site over a ten year period (ages 6-16) and is potentially exposed to soil, groundwater (if excavations remain open), and any ambient dusts/vapors.

7.3.3 Summary of Exposure Media Data and RHHRA COPCs

COPCs are chemicals related to a site that have the potential to pose unacceptable risk to public health. In general, chemicals are identified as COPCs based on their elevated concentrations relative to the conservative screening benchmarks, frequency of occurrence, and history of use. The screening benchmarks are not specific to a site (i.e., apply to all sites) and, therefore, are necessarily conservative. The latter is a feature that is useful in the initial data screening, but not necessarily to directly support remediation efforts. The initial screening step using the screening benchmarks helps to ensure that all potential risks due to specific constituents, however minimal, are identified early on. Screening benchmark (i.e., IDEM's Screening Levels in the current RHHRA) exceedances do not imply that remediation and/or risk management are required. Rather, this indicates that additional assessment is needed. To this end, SSSLs for each of the COPCs identified in the screening step are developed and applied in the refinement step to identify any significant risks (i.e., these are the risk drivers) that may need to be addressed via remediation and/or institutional controls. The Site data set applied in the groundwater COPC screening includes all results gathered up to March 2013. Data screening summaries for soil and groundwater are presented in Appendix L.

Constituents determined to be present in each source medium (i.e., soil and groundwater) at concentrations above the Screening Levels (and that had a level of detection frequency equal to or greater than 10-percent; after U.S. EPA, 1989) were identified as COPCs for further analysis (see Section 7.1). The resulting list of constituents is assessed further in the RHHRA

(Section 7.2). All other detected constituents were eliminated from further consideration in the RHHRA.

For soil, the identified COPCs exceeding one or more of the conservative Screening Levels and forwarded to the RHHRA include:

- 1,1-DCA
- methylene chloride
- PCE
- TCA
- TCE
- TPH
- PCBs
- benzo(a)anthracene
- benzo(a)pyrene
- benzo(b)fluoranthene
- benzo(k)fluoranthene
- dibenzofuran
- indeno(1,2,3-cd)pyrene
- naphthalene
- arsenic
- cadmium
- chromium VI
- cobalt
- iron
- lead
- manganese
- thallium

It should be noted that benzo(k)fluoranthene, indeno(1,2,3-cd)pyrene, and thallium exceedances of the IDEM Screening Levels were limited to the residential direct contact exposure pathway. On-Site soil was evaluated with respect to this exposure pathway for the purpose of determining the parameters for which Trespasser SSSLs are required. Residential direct contact with on-Site soils is not a complete exposure pathway for the Site.

For groundwater, the identified COPCs exceeding one or more of the conservative Screening Levels and forwarded to the RHHRA include:

- 1,1-DCA
- cis/trans-1,2-DCE
- methylene chloride
- PCE
- TCE
- vinyl chloride
- benzo(b)fluoranthene
- antimony
- arsenic
- cadmium
- cobalt
- iron
- lead
- manganese

7.3.4 Site-Specific Risk Characterization

In this step, the detected concentrations of COPCs were compared to the corresponding SSSLs, which were specifically derived for the identified exposure scenarios. This process is undertaken to determine if potential exposures may be above the target risk/hazard thresholds and, perhaps, require additional assessment, remediation, and/or risk management measures. The second stage data screening (i.e., comparison to SSSLs) helps to reduce the list of the identified COPCs to those that are the potential risk drivers for the affected receptors identified in the CSM. The SSSL derivation and their implementation are described below.

7.3.4.1 Derivation of Site-Specific Screening Levels (SSSLs)

For each constituent that exceeds any of the Screening Levels, a SSSL is derived according to the RCG. The calculated SSSLs capture not only the practical and realistic intent of Site-specific remedial design, but also the latest developments in applied toxicology and risk assessment, while ensuring the protection of human health. In essence, SSSLs strike the necessary balance between remediation and protection recognized by many agencies, including IDEM. The SSSL derivation approach is presented below, with additional details presented in Appendix L.

For maximum transparency, expedited regulatory acceptance, and the SSSL value optimization, a systematic procedure specified in the RCG was adopted for the Site. The steps taken in the CIWs SSSL derivation were as follows (they were replicated from the RCG, including the use of the same language):

1. Multiply the value (if any) appearing in the carcinogenic screening level column of the U.S. EPA Regional Screening Level (RSL) Industrial Soil Table by ten to produce a carcinogenic screening level at a target cancer risk of 10^{-5}
2. Select the lower of the following as the IDEM commercial/industrial soil direct contact screening level:
    a. 10^{-5} carcinogenic screening level (if any)
    b. Non-carcinogenic screening level (if any) from the RSL Industrial Soil Table
    c. Saturation Concentration (Csat) (estimated saturation limit for a given constituent and medium)
    d. 100,000 mg/kg
3. Calculate lead screening levels for the commercial/industrial scenario using U.S. EPA's Adult Lead Model.

This procedure was enhanced by adding certain steps to account for the intended SSSL use (i.e., industrial land cleanup), provide the most current inputs, adjust for risk-based endpoints (to support risk-based decision-making), and to account for bioavailability in soil. These enhancements provide for the most up-to-date, applicable, and scientifically-defensible SSSLs for use in risk-based Site cleanup decisions.

The specific enhancements/adjustments contained in the SSSLs for soil and direct contact exposure (this derivation does not apply to the leaching potential SSSL, which is addressed separately) are listed below:

Potential Risk Driver	*SSSL Adjustment*	*Rationale*
Chromium VI[C]	Applied 50% soil bioavailability factor	Per ATSDR (2012) chromium VI in soil has limited bioavailability Witmer et al. (1991) rat study indicates 50% uptake at most
Lead[NC]	Applied the ALM using IDEM input and reported soil bioavailability of 11%	Uses most current information from Batelle (2000) on the bioavailability of lead in soil
Benzo(a)anthracene[C]	Applied 70% soil bioavailability factor	Uses most current information from Lu et al. (2010) on the bioavailability of Polycyclic Aromatic Hydrocarbons PAHs in soil
Benzo(a)pyrene[C]	Applied 70% soil bioavailability factor	Uses most current information from Lu et al. (2010) on the bioavailability of PAHs in soil
Benzo(b)fluoranthene[C]	Applied 70% soil bioavailability factor	Uses most current information from Lu et al. (2010) on the bioavailability of PAHs in soil
Indeno(1,2,3-cd)pyrene[C]	Applied 70% soil bioavailability factor	Uses most current information from Lu et al. (2010) on the bioavailability of PAHs in soil
TCE[C]	Updated to the November 2013 RSL	Uses November 2013 RSL

C-carcinogen
NC-noncarcinogen

Pre- and post-adjustment SSSL values for CIWs and soil are indicated below:

Potential Risk Driver	*IDEM SL Direct Contact CIW (mg/kg)*	*SSSL Direct Contact CIW (mg/kg)*
Chromium VI	56	112
Lead	800	1,660
Benzo(a)anthracene	21	30
Benzo(a)pyrene	2.1	3
Benzo(b)fluoranthene	21	30
Indeno(1,2,3-cd)pyrene	21	30
TCE	20	64

The construction (excavation) worker exposure pathway SSSLs were based on the CIW SSSLs and exposure duration/frequency factors specified in the RCG for converting CIW to E SSSLs. The resulting SSSLs are presented in Table 8. Refer to Appendix L for additional calculation details.

The migration to groundwater exposure pathway SSSLs were calculated using IDEM's non-default closure tool. The tool was also used to calculate industrial groundwater SSSLs

(commercial/industrial tap water use [CITW]). The resulting SSSLs are presented in Table 8. Calculation details are presented in Appendix L.

The trespasser and recreator exposure pathway SSSLs were derived using the U.S. EPA's Regional Screening Level (RSL) calculator[9]. The COPCs were selected from the available chemical list and the risk level was adjusted to 10^{-5} for carcinogens per IDEM guidance. Trespassers were evaluated for exposure to Site soil and groundwater and recreators were evaluated for off-Site groundwater exposure. The most conservative calculated screening value was selected for use as the SSSL for these two receptors. It should be noted that dermal contact with groundwater and incidental ingestion of groundwater are not considered applicable off-Site exposure pathways at this time.

To account for the vapor intrusion pathway due to affected groundwater (on- and off-Site), the methodology outlined in the IDEM RCG was utilized for calculation of SSSLs for volatile constituents. An adjustment was made to Equation A-10 of the RCG to account for the IDEM suggested soil temperature of 12.5˚C and the suggested groundwater-to-indoor air attenuation factor of 0.001. Vapor intrusion SSSLs are presented in Tables 9 and 10. The vapor intrusion SSSL derivation details for groundwater protective of this pathway are included in Appendix L.

7.3.4.2 Risk/Hazard Assessment

For the purpose of the risk/hazard assessment, the concentrations of COPCs in the affected media, which may be contacted by the Site receptors, were approximated using Exposure Point Concentrations (EPCs). EPCs are statistical estimators that are part of the RAGS to represent realistic exposures, which capture the risk assessment concept of exposure averaging. The latter states that an actual receptor is exposed to a range of concentrations, low and high, rather than just high, as is the principal postulation in the conservative data screening step performed in Section 7.1.

EPCs in RAGS, and the current RHHRA, are represented by the 95% upper confidence limit on the mean (UCL) and the geometric mean. The UCL quantifies the Reasonable Maximum Exposure (RME), the geometric mean, and, the Central Tendency Exposure (CTE) per RAGS. Upper confidence limits were calculated using ProUCL (version 4.1.01), a computer application that is commonly accepted and used by multiple agencies, including IDEM, as indicted in the RCG.

The 95% UCLs for Site COPCs were calculated according to specific statistical distributions fitted to exposure media data. UCLs were selected based on the program recommendation. If no recommendation was made by ProUCL, the Chebyshev 95% UCL was manually selected for

[9] http://epa-prgs.ornl.gov/cgi-bin/chemicals/csl_search

consistency with other UCLs and conservatism (i.e., it was the highest result). Similarly, geometric means were calculated using the ProUCL software. Geometric, rather than arithmetic means, were used in CTE estimates to better represent the central tendency of log-normally distributed data. CTEs afford more realistic exposure estimates than those provided by the RMEs. As such, CTE-based risk conclusions are generally better-suited to support remediation decisions as they more likely reflect actual, rather than hypothetical impacts. Therefore, the current RHHRA provides recommendations based on the CTE scenario (while RME also displaying results for the RME scenario).

The calculated EPCs are presented in Tables 8 through 10. Calculation details are contained in Appendix L.

7.3.5 Comparison of SSSLs to Exposure Media Concentrations

Comparisons of on-Site concentrations of COPCs in soil and groundwater to corresponding SSSLs lead to the following observations.

7.3.5.1 On-Site Risk Characterization

Soil Hot Spot Analysis

For on-Site soil, the potential hot-spot risk drivers (i.e., those associated with sufficiently frequent, detected [i.e., cannot be a non-detected constituent], and elevated concentrations above SSSLs at individual sampling locations) are limited to two VOCs (i.e., TCE and PCE), one SVOC (i.e., benzo[a]pyrene), and two metals (i.e., arsenic and lead,) (i.e., Det.>SSSLs; Table 8). This determination is inclusive of the Commercial/Industrial Worker, Construction (Excavation) Worker, Trespasser, and MTG scenarios. Please refer to Table 8 for the basis for each SSSL exceedance.

The named constituents are identified as potential hot-spot (i.e., limited to the vicinity of the sampling point rather than impacting wider exposure areas) risk drivers and are subjected to further analysis to evaluate their impact on a Site-wide basis (as quantified by EPCs) and to account for receptor exposure averaging per RAGS (see below). As is demonstrated in Section 7.3.5.3 and Table 8, none of the listed constituents are associated with unacceptable risks on average- and Site-wide bases.

Figure 72 illustrates the soil sample locations with SSSL exceedances at one or more sample depths.

Groundwater Hot Spot Analysis

For on-Site groundwater, the potential hot-spot risk drivers are seven VOCs (i.e.,1,1-DCA, cis- and trans-1,2-DCE, methylene chloride, PCE, TCE, and vinyl chloride) and one metal (i.e., arsenic) (i.e., Det.>SSSLs; Table 9). This determination is inclusive of the Trespasser and Commercial/Industrial Worker (direct contact and vapor inhalation) scenarios based on groundwater data through 2013. The listed constituents are identified as potential hot-spot risk drivers and are subject to further analysis to evaluate their impact on Site-wide basis (see below). As is demonstrated in Section 7.3.5.3 and Table 9, none of listed constituents are associated with unacceptable risks on average- and Site-wide bases.

Figure 73 illustrates on-Site groundwater sample locations with SSSL exceedances detected during the most recent sampling event at that location. It should be noted that there are no recent exceedances of the Trespasser SSSLs for VOCs, including locations where higher concentrations have historically been detected.

Average Exposure Analysis

While the identification of hot-spot risk drivers is important for any focused affected media removal where exposure averaging neither applies nor is warranted, it is also vital that a Site-wide risk level be understood.

Based on pooled concentration estimates for soil, no Site-wide risk drivers in on-Site soil were identified for receptors and exposure scenarios associated with average exposures (i.e., CTE>SSSL). Only under highly hypothetical exposures (i.e., RME>SSSL), TCE (MTG and E scenarios), benzo(a)pyrene (CIW scenario), arsenic (MTG scenario), and lead (T scenario) in on-Site soil may be associated with elevated risk for adverse effects on human health.

For on-Site groundwater, TCE (commercial/industrial vapor [CIV]) was associated with CTE (average exposures) exceedances of the applicable SSSLs (i.e., CTE>SSSL) (Table 9). In contrast, high-end (RME) CIV and commercial/industrial direct contact (CITW) exposures to PCE, TCE, vinyl chloride and arsenic (CITW scenario) in on-Site groundwater may be associated with elevated risk for adverse effects on human health (i.e., RME>SSSL) (Table 9).

7.3.5.2 Off-Site Groundwater Risk Characterization

The same comparative analysis conducted in the preceding section for on-Site potential risk drivers was performed for off-Site groundwater receptors.

Groundwater Hot Spot Analysis

For off-Site groundwater, the potential hot-spot risk drivers include three VOCs (i.e., PCE, TCE, and vinyl chloride) and two metals (i.e., arsenic and manganese) (i.e., Det.>SSSLs; Table 10). This determination is inclusive of the residential/recreator (REC), residential vapor inhalation (RVI), and CIV scenarios. The listed constituents are identified as potential hot-spot risk drivers and are subject to further analysis to evaluate their impact on Site-wide basis (see below).

Figure 74 illustrates off-Site groundwater sample locations with SSSL exceedances detected during the most recent sampling event at that location. It should be noted that there are no recent exceedances of the CIV SSSLs for VOCs, including locations where higher concentrations have historically been detected.

Review of Figure 74 indicates that off-Site exceedances of SSSLs include monitoring wells MW-34 and MW-35 in the vicinity of dry cleaning operations south of the Site, and monitoring wells north (MW40-11) and east (MW-9) of the former manufacturing operations. It should be noted that the PSP Realty property (i.e., 1011 South Perkins Avenue), where TCE has historically been detected in groundwater, is located in the vicinity of monitoring well MW40-11. The source of the TCE detected on PSP Realty's property is currently unknown.

Average Exposure Analysis

Manganese (REC scenario) in off-Site groundwater may be associated with elevated risk for adverse effects on human health under exposure averaging and high-end exposures (i.e., RME and CTE>SSSL). In contrast, high-end (RME) exposures to PCE (REC scenario), TCE (REC scenario), vinyl chloride (REC and RVI scenarios), and arsenic (REC scenario) in off-Site groundwater may be associated with elevated risk for adverse effects on human health (i.e., RME>SSSL) (Table 10).

7.3.5.3 Risk Characterization Summary

On-Site

Based on the SSSL comparisons to the on-Site soil data, PCE (MTG scenario), TCE (CIW, E, and MTG scenarios), benzo(a)pyrene (T, CIW, and MTG scenarios), arsenic (CIW and MTG scenario), and lead (T, CIW, and E scenarios) at some locations may be associated with elevated risks. However, under realistic averaged receptor exposures (i.e., CTE scenario), none of the listed constituents would be associated with unacceptable risks.

Figure 72 illustrates the soil sample locations with SSSL exceedances at one or more sample depths. Soil samples with detected exceedances of the MTG pathway were further evaluated for their potential to act as a source of groundwater impairment. Arsenic exceedances of the

MTG pathway were detected across the Site. Though arsenic is identified in Site groundwater, it is not a risk driver for the Site given groundwater is not currently used and future use will be prohibited through deed restrictions. Benzo(a)pyrene was detected above the MTG SSSL at two locations (MW-12 and BH84-11), however, groundwater samples collected at MW-12 did not contain detectable concentrations of benzo(a)pyrene. Monitoring wells in proximity to and downgradient from BH84-11 (i.e., MW-23 and MW-24) also do not contain detectable concentrations of benzo(a)pyrene. The absence of benzo(a)pyrene in groundwater at MW-12 and downgradient to BH84-11 indicates that the soil exceedances of the MTG SSSLs have not resulted in arsenic or benzo(a)pyrene groundwater impairment.

Soil samples collected at or near the water table for PCE were found to have exceedances of the MTG pathway at PB-04, PB-05, and PB-06. These locations are downgradient of the off-Site dry cleaning operations. In all cases, soil PCE concentrations were not detected in samples closest to the ground surface or, where detected, soil PCE concentrations were marginal near ground surface and increased with depth. As such, the observed PCE exceedances of the MTG SSSL are not likely the result of a surface release. Rather, they are likely the result of groundwater impairment.

Soil samples collected at or near the water table for TCE were found to have exceedances of the MTG pathway at SB-125 and BH24-11. The exceeding concentration at BH24-11 corresponds to soil collected at a depth of 12-14 feet bgs which corresponds to the approximate surface of the water table. However, a shallower sample at this location has only a marginal TCE concentration, ruling out the potential for a surface release to soil at this location. The exceeding concentration at SB-125 corresponds to soil collected at a depth of 60 feet bgs. As such, it is possible that the impacts are related to impacted groundwater in the soil matrix.

In on-Site groundwater, 1,1-DCA (CIV scenario), cis-1,2-dichloroethene (CIV and CITW scenarios), trans-1,2-DCE (CIV scenario), methylene chloride (CITW scenario), PCE (T, CITW, and CIV scenarios), TCE (T, CITW, and CIV scenarios), vinyl chloride (CITW and CIV scenarios), and arsenic (CITW scenario) at some monitoring wells may be associated with elevated risks. However, under realistic receptor exposures (i.e., CTE scenario), only TCE (CIV scenario) would be associated with unacceptable risks. In 2014, TCE was detected above the CIV SSSL at 17 locations across the Site. Figure 73 illustrates on-Site groundwater sample locations with SSSL exceedances detected during the most recent sampling event at that location.

Off-Site

In off-Site groundwater, PCE (REC, RVI, and CIV scenarios), TCE (REC and RVI scenarios), vinyl chloride (RCR and RVI scenarios), arsenic (REC scenario), and manganese (REC scenario) at some monitoring wells may be associated with elevated risks. Under realistic receptor exposures (i.e., CTE scenario), only manganese (REC scenario) may impose an unacceptable risk in off-Site

groundwater. As discussed in Sections 3.7 and 7.3.2, CRA conducted a water well survey in 2008 and 2010. CRA identified 41 properties of interest down-gradient of the Site that may use groundwater for potable or non-potable purposes. However, CRA did not identify the presence of water wells visually or through interviews with persons knowledgeable about the properties of interest. As such, dermal contact with groundwater and incidental ingestion of groundwater are not considered applicable off-Site exposure pathways at this time. Further, exceedances of the VOC SSSLs were not detected in monitoring wells MW41-11, MW42-11, or MW43-11, located downgradient of the Site and upgradient of the 41 properties of interest.

Figure 74 illustrates off-Site groundwater sample locations with SSSL exceedances detected during the most recent sampling event at that location. Review of Figure 74 indicates that off-Site exceedances of vapor intrusion SSSLs include upgradient monitoring wells in the vicinity of dry cleaning operations and a monitoring well downgradient of the former manufacturing operations. The upgradient exceedances are related to PCE and TCE and may be associated with historical releases from the dry cleaning operations.

Monitoring well MW40-11 is the only off-Site downgradient monitoring well with exceedances of the SSSLs. Based on the most recent (i.e., 2011) groundwater results for TCE, groundwater at MW40-11 exceeds the residential SSSLs (REC and RVI scenarios) but meets the more applicable commercial SSSL (CIV scenario) based on nearby land use.

Based on the most recent (i.e., 2014) groundwater results for vinyl chloride, groundwater at monitoring well MW-9, located cross-gradient to the operational area of the Site, also exceeds the residential SSSLs (REC and RVI scenarios) but meets the more applicable commercial SSSL (CIV scenario) based on nearby land use. It should be noted that vinyl chloride was not detected at MW44-11 (located downgradient of MW-9) in 2014.

Based on the most recent (i.e., 2005 and 2008) groundwater results for arsenic and manganese, groundwater at monitoring well MW-8, located cross-gradient to the operational area of the Site, exceeds the REC SSSLs. It should be noted that arsenic and manganese were not detected at MW52-13 (located downgradient of MW-8) in 2013 above the applicable IDEM Screening Level. Further, dermal contact with groundwater and incidental ingestion of groundwater are not considered applicable off-Site exposure pathways at this time.

In summary, groundwater outside od the former operational areas of the Site does not pose a current unacceptable risk.

7.4 Risk Assessment Summary

A RHHRA for the Site using RRA methodology and IDEM guidance (RCG) reveals a subset of constituents found in concentrations above the IDEM Screening Levels. These constituents, in each main source media, are:

Soil

- 1,1-DCA
- methylene chloride
- TCA
- PCE
- TCE
- benzo(a)anthracene
- benzo(a)pyrene
- benzo(b)fluoranthene
- benzo(k)fluoranthene
- dibenzofuran
- indeno(1,2,3-cd)pyrene
- naphthalene
- PCBs
- TPH
- arsenic
- cadmium
- chromium VI
- cobalt
- iron
- lead
- manganese
- thallium

It should be noted that benzo(k)fluoranthene, indeno(1,2,3-cd)pyrene, and thallium exceedances of the IDEM Screening Levels were limited to the residential direct contact exposure pathway. On-Site soil was evaluated with respect to this exposure pathway for the purpose of determining the parameters for which Trespasser SSSLs are required.

Groundwater

- methylene chloride
- 1,1-DCA
- cis- and trans-1,2-DCE
- vinyl chloride (also off-Site COPC)
- TCE (also off-Site COPC)
- PCE (also off-Site COPC)
- benzo(b)fluoranthene
- antimony
- arsenic (also off-Site COPC)
- cobalt
- cadmium
- iron
- lead
- manganese (also off-Site COPC)

The identified COPCs were forwarded to further assessment in the RHHRA section of this document to identify any candidate risk drivers that may warrant potential remedial and/or risk management actions. The risk driver discussion is presented below.

7.4.1 Summary of Risk Drivers in Soil

After an evaluation of the potential risk drivers in excess of the SSSLs on-Site, and taking exposure averaging into consideration under the pragmatic CTE scenario, none of the soil COPCs are likely associated with unacceptable risks to human receptors. Therefore, on-Site soil is not considered as an exposure medium containing significant risk drivers when considering

area-wide exposure. Note that hot-spot exceedances on a smaller exposure scale may necessitate further risk management study despite the preceding conclusion.

7.4.2 Summary of Risk Drivers in Groundwater

After an evaluation of potential risk drivers in excess of the SSSLs on- and off-Site, and taking exposure averaging into consideration under the CTE scenario, TCE (on-Site vapor intrusion scenario) and manganese (off-Site potable water use scenario) were identified as requiring further consideration Since off-Site groundwater use is very unlikely (i.e., municipal water is provided), direct tap water use risks are not expected. Off-Site monitoring wells downgradient to the Site have been assessed for the presence of volatile constituents in groundwater. Based on the 2011 results, groundwater downgradient of the Site does not pose an unacceptable vapor intrusion risk.

7.5 Risk Assessment Conclusions

While localized concentrations of select VOC, SVOC, and metals may be in excess of the SSSL, perhaps necessitating additional risk management study, on average, the only potential risk driver is the potential for TCE in groundwater to pose an unacceptable on-Site vapor inhalation risk. Given that there are no current Site structures, on-Site vapor inhalation is considered an incomplete exposure pathway and therefore, no current risk due to on-Site groundwater TCE concentrations exists. Mitigation of this pathway will consist of prohibiting future development without further vapor intrusion assessment and/or construction of appropriate vapor barriers, if warranted. Further, data suggest that a surgical assessment of hot spots with significantly elevated levels of COPCs may be appropriate.

TABLE 1

HISTORY OF OPERATIONAL ENTITIES
RFI REPORT
FORMER MANUAL TRANSMISSIONS OF MUNCIE FACILITY
MUNCIE, INDIANA

Date	*Operational Entity*	*Comments*
1904	Delco-Remy	Operated the former Battery Plant on the northern 18 acres of the Site
1920	Muncie Products Division	Operated the main manufacturing building on the southern 44 acres of the Site
1929	Muncie Products Division	Forge Plant added to MPD
1932-1935	Muncie Products Division	MPD Closed
1935	Chevrolet Motor Division	Operated the main manufacturing building on the southern 44 acres of the Site
1941-1945	Unknown	Plant expanded and operations changed to the manufacturing of aircraft parts
1945	Chevrolet Motor Division	Operations returned to the manufacture of automotive parts
1977-1978	Delco-Remy	Former Battery Plant demolition activities
1980	Chevrolet Motor Division	northern 18 acres of the Site transferred to Chevrolet Motor Division
1984	Detroit Diesel Allison Division	Property transferred from Chevrolet Motor Division
1986	Hydra-Matic Division	Property transferred from Detroit Diesel Allison Division
1990	New Venture Gear	Joint venture between GM and Chrysler
2003	Manual Transmissions of Muncie	Joint venture dissolved, property transferred to GM
2006	Manual Transmissions of Muncie	Plant ceased operations

Notes:

AOI - Area of Interest
ft bgs - feet below ground surface
TCL - Total Compound List
TAL - Total Analyte List
VOC - Volatile Organic Compound
SVOC - Semi-Volatile Organic Compound
PCB - Polychlorinated Biphenyls
TPH - Total Petroleum Hydrocarbon
N - Normal
FD - Field Duplicate
MS/MSD - Matrix Spike/Matrix Spike Duplicate
TAL Inorganics - Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Chromium VI (hexavalent), Cobalt, Copper, Iron, L
Magnesium, Manganese, Mercury, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc
MNA Parameters - Total Organic Carbon, Dissolved Organic Carbon, Chloride, Nitrate, Nitrite, Dissolved Manganese, Sulphate, Sulphide, Methane, I
Ethene, Hardness, and Alkalinity (Carbonate and Bicarbonate)

Notes

mg/kg - Milligrams per kilogram

"-" - No value

U - Not detected at the associated reporting limit.

J - Estimated concentration.

UJ - Not detected; associated reporting limit is estimated.

R - Rejected.

BOLD[abc] - Concentration exceeds associated screening level

IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014

a - Exceeds IDEM residential migration to ground water screening levels

b - Exceeds IDEM commercial/industrial direct contact screening levels

c - Exceeds IDEM excavation direct contact screening levels

Notes:

CIW - Commercial/Industrial Worker
CTE - Central Tendency Exposure
DF-Detection Frequency
E - Construction (Excavation) Worker
IDEM - Indiana Department of Environmental Management
MTG - Migration to Groundwater
NA - Not Available or Applicable
PCB- Polychlorinated Biphenyl
R - Resident
RME - Reasonable Maximum Exposure
SL - Screening Level
SSSL - Site Specific Screening Level
SVOCs- Semi-Volatile Organic Compounds
T - Trespasser
TPH-Total Petroleum Hydrocarbon
VOCs- Volatile Organic Compounds
UCL - Upper Confidence Limit
(1) Table A-6: Screening Levels Summary Table - March 2014 Screening Levels - Final - IDEM RCG, unless otherwise specified.
(2) Constituent exceeding accable risk/hazard threshold at individual sample locations.
(3) Constituent exceeding accable risk/hazard threshold Site-wide.
(4) Screening level (SL) value not available from IDEM, SL for 1,1-dichloroethane used as a surrogate.
(5) Screening level (SL) value not available from IDEM. SL for 1,2-dichloroethane used as a surrogate.
(6) Screening level (SL) value not available from IDEM. SL for acenaphthene used as a surrogate.
(7) TPH Screening Values from IDEM TPH Fracnation Tool. IDEM June 2010

Notes:

CITW- Commercial/Industrial Tap Water Use (and Direct Contact)
CIV- Commercial/Industrial Vapor
CTE - Central Tendency Exposure
DF-Detection Frequency
GW- Groundwater
IDEM - Indiana Department of Environmental Management
NA - Not Available or Applicable
PCB- Polychlorinated Biphenyl
RME - Reasonable Maximum Exposure
RTW - Residential Ingestion
SL - Screening Level
SSSL - Site Specific Screening Level
SVOCs- Semi-Volatile Organic Compounds
T - Trespasser
UCL - Upper Confidence Limit
VOCs- Volatile Organic Compounds

(1) Table A-6: Screening Levels Summary Table - March 2014 Screening Levels - Final - IDEM RCG.
(2) Constituent exceeding accable risk/hazard threshold at individual sample locations.
(3) Constituent exceeding accable risk/hazard threshold Site-wide.
(4) Vapor intrusion (VI) value not available from IDEM, VI value for 1,1-dichloroethylene used as a surrogate.
(5) Vapor intrusion (VI) value not available from IDEM, VI value for 1,2-dichloroethane used as a surrogate.
(6) Vapor intrusion (VI) value not available from IDEM, VI value for naphthalene used as a surrogate.

ALTA / ACSM Land Title Survey

ALTA/ACSM LAND TITLE SURVEY

LEGAL

A part of the Northwest Quarter and a part of the Southwest Quarter of Section 16, Township 20 North, Range 10 East, more particularly described as follows, to-wit:

Beginning at a point in the West line of Elliott Street, as said Elliott Street is laid out and platted in the T. F. Rose First Addition to the City of Muncie, Indiana at the point of intersection of the West line of said Elliott Street with the North line of the Southwest Quarter of Section 16, Township 20 North, Range 10 East; thence South 00°-06'-45" West and on and along the West line of said Elliott Street 1,299.74 feet to its intersection with the North line of 8th Street, as said 8th Street is laid out and platted in the T. F. Rose First Addition to the City of Muncie, Indiana; thence North 90°-00'-00" West and on and along the North line of said 8th Street and said line extended West 1,847.15 feet to a point 30.0 feet East of the East line of Perkins Avenue, as said Perkins Avenue is laid out and platted in J. J. Perkins Addition to the City of Munice, Indiana; thence in a Northwesterly direction on a curve to the right, said curve having a radius of 30.0 feet and a long chord distance of 42.43 feet to its intersection with the East line of said Perkins Avenue at a point 40.0 feet North of the Southwest Corner of Lot 206 in said J. J. Perkins Addition; thence North 00°-00'-00" East and on and along the East line of said Perkins Avenue 1,102.80 feet to its intersection with the South Right-of-Way line of the Conrail Railroad (formerly the C.C.C. & St. Louis Railroad); thence North 76°-50'-45" East and on and along the said South Right-of-Way Line of said Conrail Railroad 1,930.93 feet to its intersection with the West line of Elliott Street in the T. F. Rose First Addition to the City of Muncie, Indiana; thence South 00°-06'-45" West and on and along the West line of said Elliott Street 271.34 feet to the point of beginning.

EXCEPTING THEREFROM Lots 292, 291 and the West (four) 4.0 feet of Lot 290 and the South Half of the vacated alley lying adjacent and North of the above described lots, all in J. J. Perkins Addition to the City of Muncie, Indiana. Containing after said Exception 58.012 acres, more or less.

(The above description is intended to include all of T. F. Rose First Addittion East of Elliott Street heretofore vacated and the following lots in J. J. Perkins Addition to the City of Muncie, Indiana; Lots 193 thru 206, except South ten (10.0) feet, Lots 217 thru 230, Lots 241 thru 254, Lots 265 thru 278, Lot 289, the East 46' of Lot 290, Lots 293 thru 302, Lots 317 thru 326; ALSO including vacated 5th Street from the East line of Perkins Avenue to the West line of Sampson Avenue, vacated 6th Street, from the East line of Perkins Avenue to the East line of the J. J. Perkins Addition, vacated 7th Street from the East line of Perkins Avenue to the East line of the J. J. Perkins Addition, and vacated Sampson Avenue from the South line of 5th Street to a point 10.0 feet North of the North line of 8th Street. ALSO, all of the vacated alley between Lots 317 thru 326 and Lots 293 thru 302, all of the vacated alley between Lots 265 thru 268 and Lots 241 thru 244, all of the evacated alley between Lots 269 thru 278 and Lots 245 thru 254, all of the vacated alley between Lots 217 thru 220 and Lots 193 thru 196, all ov the vacated alley between Lots 221 thru 230 and Lots 197 thru 206 and the South Half of the vacated alley adjacent to Lots 289 and the East 46' of Lot 290).

ALSO the following described parcel of land, more particularly described as follows, to-wit:

Beginning at the Southwest corner of Lot 148 in J. J. Perkins First Addition to the City of Muncie, Indiana (being the intersection of the East line of Sampson Avenue and the North line of 9th Street); thence North on the East line of said Sampson Avenue 301.7 feet to the South line of 8th Street; thence East on the South line of said 8th Street and said South line extended East 858.8 feet to the West line of Birch Street, as said street is laid out and platted in Winton Place, an Addition to the City of Muncie, Indiana; thence South on the West line of said Birch Street and said West line extended South 182.5 feet to a point 17.5 feet South of the North line of said 9th Street in said Winton Place; thence West and parallel with the North line of said 9th Street 350.0 feet; thence South 3.82 feet; thence in a Southerly and Westerly direction on a curve to the left, said curve having a radius of 137.5 feet and an arc distance of 153.74 feet to its intersection with the North line of 9th Street extended; thence West on the North line of said 9th Street and said line extended 210.0 feet to the East line of Lot 145 in J. J. Perkins First Addition; thence South on the said East line 10.0 feet to the Southeast corner of said Lot 145; thence West on the North line of said 9th Street 200.0 feet to the point of beginning. Estimated to contain 4.907 Acres, more or less.

(The above description is intended to include all of the following, Lots 70 thru 75 except North 10.0 feet, Lots 219 and 223 except North 10 feet; Lots 220, 221, 222, 224, 225, 226, 227 and 228, the vacated North 17.5 feet of 9th Street, vacated Pierce Street, the vacated alley lying adjacent to and West of Lots 223 thru 228, all in Winton Place, an addition to the City of Muncie, Indiana; also intended to include Lots 169 thru 172, and Lots 145 thru 148 and a vacated alley lying between Lots 169 thru 172 and Lots 145 thru 148 all in J. J. Perkins First Addition.)

ALSO, the following described parcel of land, more particularly described as follows, to-wit:

All of Lots 7, 8, 14, 15, 16, 23, 24, 25, 46, 47, 48, 69, 70, 71, 92, 93, 94 in T. F. Rose First Addition to the City of Muncie, Indiana and the following vacated alley and street; vacated 6th Street between Lots 46 thru 48 and Lots 69 thru 71, and vacated alley between Lots 69 thru 71 and Lots 92 thru 94 all in T. F. Rose First Addition to the City of Muncie, Indiana.

ALSO, the following described parcel of land, more particularly described as follows, to-wit:

Lots 63, 64, 65, 66 and 67, except the North ten (10.0) feet and also the vacated North 17.5 feet of 9th Street lying adjacent to Lots 63 thru 67 all in Winton Place, an Addition to the City of Muncie, Indiana.

Subject to all easements of record for utilities.

SURVEYOR'S REPORT

Survey ordered by: Fred Zehnder
General Motors Corporation Worldwide Real Estate
Renaissance Center - 38th Floor
Detroit, Michigan 48265

Owner of Record: General Motors
Type of Survey: Retracement
Purpose for Survey: ALTA/ACSM Land Title survey for possible disposal of property.

THEORY OF LOCATION:

The following referenced plats were used, The plat of T. F. Rose First Addition as recorded in Plat Book 4, Page 19, the pl;at of J. J. Perkins First Addition as recorded in Plat Book 2, Page 73 and Winton Place Addition as recorded in Plat Book 2, Page 23 all in the City of Muncie, Indiana, and recorded in the Office of the Recorder of Delaware County, Indiana. We were also given documents from personel of New Venture Gear from within the engineering department that included a ground and aerial survey dated August of 1965 by Abrams Aerial Survey Corporation of Lansing, Michigan in conjunction with William & Works, civil engineers and surveyors of Grand Rapids, Michigan. Also, surveys that were done by Harold K. Morrison in the mid 1960's, in which I participated on a field crew in surveying properties in Winton Place Addition for at that time a future parking lot.
The basis of bearing for this survey is the deed bearing of North 76 degrees 50 minutes 45 seconds East on and along the South right-of-way line of the Norfolk & Southern Railroad (formerly the C.C.C. & St. Louis Railroad) as definded by the current location of the two sets of railroad rails. The actual bearing between the two brass disk monuments on the South right-of-way line of said Railroad which is the North line of the property in question is North 76 degrees 50 minutes 55 seconds East. The baseline used for this survey with regards to the subsequent calls is the East line of Sampson Avenue as platted in J. J. Perkins First Addition between Fifth Street and Eighth Street, and as noted by found moaments as follows: A brass disc in concrete held at the point of intersection of the East line of Sampson Avenue and the North line of Fifth Street. A #4 existing iron rod with a missing and assumed brass disc was found and held at the point of intersection of the East line of Sampson Avenue and the South line of Eighth Street. The distance between said Brass disc and the existing iron rod per Abrams survey is 980.96 feet. The distance as measured on this survey was found to be 980.98 feet. Using the baseline in conjuction with said Abrams survey, the Southwest corner of the 10 feet off of the South side of Lot 196 in said Perkin's Addition, and the Southeast corner of Lot 159 in T. F. Rose First Additon were then calculated to establish the North line of Eighth Street. A brass disc in concrete was held at the point of intersection with the East line of Perkins Avenue with said South right-of-way thereby establishing said South right-of-way line. A point 10 feet North of the Southwest corner of Lot 206 in said Perkins Addition was then calculated by the bearing-bearing method: The said North line of Eighth Street as established by intersecting the East line of Perkins Avenue (said East line of Perkins Avenue by establishing the centerline of said Avenue by curb splits) and the East line established by the point 10 feet North of the Southwest corner of Lot 206 to the exsiting brass disc at the intersection of the East line of Perkins Avenue and the Southerly right-of-way line of said Railroad. Two points of tangency were then established by stricking an arc from the point established 10 feet North of the Southwest corner of Lot 206 in said Perkins Addition at a radius of 30 feet. One tangent point being on the East line of Perkins Avenue and the other being on the North line of Eighth Street as now located, In the summation of this part of the 58.29 Acre (deed) tract being bounded on the North by the Southerly right-of-way line of the Norfolk & Southern Railroad, the East line being the West line of Elliott Street, the South being the North right-of-way line of Eighth Street and the West being the East line of Perkins Avenue. Contained within said 58.29 Acre tract is believed to be owned by Indiana & Michigan Electric Company which I have no deed for, just as an exception in the General Motors legal description. The exception is Lots 292, 291 and the West 4 feet of Lot 290 and the South Half of a 10 foot vacated Alley lying adjacent to and North of said Lots all in J. J. Perkins First Addition. The boundary of this parcel was established from the aforesaid Abram's survey and after said exception this parcel became 57.98 Acres (deed).
Considering that part of this survey which is along and East of Elliott Street, the East line of said T. F. Rose First Addition was established by calculating the Southeast corner of Lot 162 regular from the Southeast corner of Lot 159 and holding (for line only) a one inch brass pin on and along said East line between Lot 9 and Lot 16. Said East line as now established was then extended Northwardly to intersect the centerline of Willard Street as established by curb splits. The resulting point of intersection was then mathematically adjusted 0.9 of a foot Northwardly to better fit with other control found. The resulting distance between the Southeast corner of Lot 162 and the centerline of Willard Street is 1297.61 feet (measured) compared to 1298.24 feet (platted). The distance between the centerline of Elliott Street and said point of intersection on the centerline of Willard Street measured East along the centerline of Willard Street to the East line of said Addition a distance of 150.46 feet (measured) compared to 150.65 feet (platted). The West line of the Northwest Quarter of the Southeast Quarter of Section 16, Township 20 North, Range 10 East was established by holding an existing railroad spike in Eighth Street at or near the Southwest corner of the said Quarter-Quarter Section and the said point of intersection in the centerline of Willard Street the property corners were then calculated and monuments found were held if possible.
Considering that part of this survey which ia along and South of Eighth Street, the South line of Eighth Street was called parallel with the North line of Eighth Street and at 60 feet distance. Monuments were found and held at the Southeast corner of Lot 148, Northwest corner of Lot 172 and the Northeast corner of Lot 219, all in Winston Place, an Addition to the City of Muncie, Indiana (recorded in Plat Book 2, Page 23). Monuments found on and along the East line of Lot 63 and Lot 70 in said Winston Place were held for line only. Property corners were then calculated with the North line of Ninth Street making them parallel with the North line of Eighth Street, as now established.

OBSERVATIONS

The point of beginning of the legal description of the 59+ Acre tract was not a found monumented on this survey, but was calculated from the best available evidence. The resulting distance to the South right-of-way line of the Norfolk & Southern Railroad is 273.48 feet measured compared to 271.34 feet, deed distance.
The Southwest corner of the Northwest Quarter of the Southeast Quarter of Section 16, Township 20 North, Range 10 East is shown on the recorded plat of T. F. Rose First Addtion, as a stone being 28.2 feet South of the North line of Eighth Street
The existing railroad spike at or near the said Southwest corner of the said Quarter Section is 30.26 feet South of the said North line of Eighth Street. The distance from the existing railroad spike Northward to the centerline of Willard Street as established on this survey is 1328.85 feet (measured) compared to 1326.5 feet (platted).
The curbs on Perkins Avenue and Elliott Street, respectively, were older (50+ years) and said curbs on either side of both Streets were relatively parallel. The curbs on either side of Eighth Street varied from parallel by 2 feet, more or less. from Perkins Avenue to Elliott Street and therefore, a curb split was not used.
A report by Abrams Aerial Survey Corporation in conjunction with their ground and aerial survey dated August 1965 states that, "the property lines were determined by actual field survey and follow the lines of former surveys mentioned previously, City of Muncie street line control data and by their stakes and / or monuments found." The former surveys mentioned include, but are not limited to, "Maps or former property line surveys prepared by others on portions of the plant property." Because, in the course of this survey, several existing monuments were not used, a serch for prior field notes was conducted including contacting Abrams and Williams & Works in Grand Rapids, Michigan, and on site engineering files. No field notes were found and it appears that from this survey it can be concluded that at least some of the control referred to by Abrams, has been destroyed by building expansion, street reconstruction, sidewalk and curb improvements, fence line construction and removal and utility improvments and repairs. Also, due to a fence line encroachment on the Eighth Street parking lot, Morrison & Associates, a surveying firm in Muncie, Indiana, was contracted to do a boundary survey of a portion of said property in 1973. Drawings found in the on site files clearly show that said firm did not hold some of the monuments found during their survey, but instead, they set their own monuments (P.K. Nails) for more accurate relocation of existing fence lines.
During the course of this survey, over 50 P.K. Nails were found that had been set by others. Some of those nails appeared to be at or near property corners while others appeared to be points on line. It has been concluded as a result of this survey that said nails were set in a systematic way for the purpose of defining the location of parking spaces and lines. Said nails were not considered in the calculations of property corners.
There is an area between the East line of T. F. Rose First Addition and the West line of the Northwest Quarter of the Southeast Quarter of Section 16, Township 20 North, Range 10 East, of varying width, between Fifth Street and Seventh Street which we occupy based on asphalt parking lot improvement up to the existing chain link fence.
Conversations with on site personnel indicated that the parking lot between Fifth Street and Seventh Street on the East side of Elliott Street may be sold to the East adjoiner. It was uncertain weather or not the Southern portion would be included so the boundary of Lots 92, 93, 94 and half of a vacated Alley adjacent to the North was calculated. There is an existing chain link fence along the centerline of said vacated Alley.

SCHEDULE B – EXCEPTIONS

75 Reservation of easement of Central Indiana Gas Company over that part of 5th Street from the east property line of Sampson Avenue to the east curb line of Perkins Avenue, a distance of approximately 560 feet; also, all that part of Sampson Avenue from the south property line of 5th Street extending south 105 feet, and reservation of easement to Indiana & Michigan Electric Company over the 50 foot right-of-way of West 5th Street as it was platted prior to its vacation by this Decree, commencing at the east line of Perkins Avenue and extending to the east line of Sampson Avenue as it was platted prior to the vacation of this Decree. Also the east 39 feet of the right-of-way of Sampson Avenue as it existed prior to its vacation by this Decree, commencing at the north line of said West 5th Street and running south to the center line of West 6th Street as it existed prior to its vacation by this Decree. Together with the right of ingress and egress to, from and over said right-of-way, as granted by the Delaware Circuit Court in the order vacating said streets, Cause No. 76/454 dated October 29, 1976. (Affects property, plotted)

76 Reservation of easement contained in a deed from Indiana & Michigan Electric Company to General Motors Corporation, dated Oct. 22, 1969 and recorded Jan. 20, 1970 in Deed Record 1970 page 327, over the North 13 feet of the following described tract: A part of vacated Sixth Street in the J. J. Perkins First Addition to the City of Muncie, Indiana, more particularly described as follows, to wit: Beginning at the Southwest corner of Lot 292, Block 19, in the J. J. Perkins First Addition to the City of Muncie, Indiana, said plat being shown in Plat Book 2, page 73 in the Recorder's Office of Delaware County, Indiana; thence East on the South line of Lots 292, 291 and 290, Block 19, in the said J. J. Perkins First Addition to the City of Muncie, Indiana, one hundred four (104) feet; thence South parallel with the East right-of-way line of Sampson Avenue, as the said Sampson Avenue is shown in the said J. J. Perkins First Addition to the City of Muncie, Indiana, twenty-five (25) feet to the center line of the now vacated Sixth Street; thence West on the center line of the said now vacated Sixth Street, one hundred four (104) feet to the East right-of-way line of the said Sampson Avenue; thence North on the East right-of-way line of said Sampson Avenue, twenty-five (25) feet to point of beginning. (Affects property, plotted)

Being and intended to be the North Half of vacated Sixth Street contiguous with Lots 292, 291 and 290, Block 19 in the said J. J. Perkins First Addition to the City of Muncie, Indiana; said Sixth Street being vacated under Circuit Court Cause 66/266, August 26, 1966.

77 Easement from General Motors Corporation to Indiana & Michigan Electric Company, dated Oct. 22, 1969 and recorded Jan. 20, 1970 in Deed Record 1970 page 330, over the following described tracts: A strip of land Sixteen (16) feet of equal width on either side of a center line which begins at a point on the North line of the vacated alley between Lots Twenty Six (26) and Forty Nine (49) of Rose 1st Addition Two hundred and eighteen and two tenths (218.2) feet East of the center line of Sampson Avenue and extends in a Northeasterly direction a distance of Two Hundred and twenty-three and fifteen one hundredths (223.15) feet to a point Two hundred and forty and seven tenths (240.7) feet East of the center line of Sampson Avenue and seventy-two (72) North of the center line of vacated Fifth (5th) Street.

Also a strip of land Twenty (20) feet of equal width on each side of a center line beginning at a point on the East side of Elliott Street which is Three hundred and eighty-eight and twenty-four hundredths (388.24) feet South of the center line of Willard Street, thence East parallel with the center line of Willard Street a distance of Eighty (80) feet.

Also the North 13 feet of vacated Sixth Street, contiguous with Lots 289, 290, Block 19 in the J. J. Perkins First Addition to the City of Muncie, and Lot 49 of T. F. Rose 1st Addition to the City of Muncie, said Sixth (6th) Street, having been vacated under Circuit Court Cause 66/266 August 26, 1966. (Affects property, plotted)

78 License from General Motors Corporation to Indiana & Michigan Electric Company to revise and relocate facilities, dated Nov. 18, 1976 and recorded Feb. 9, 1977 in Deed Record 1977 page 489, located as shown on the plat at page 495, copy attached. (Affects property, plotted)

79 Easements, if any, for public utilities or facilities installed in any portions of the vacated streets and alleys hereinabove described, together with rights of ingress and egress to maintain, replace or remove the same. (Affects property, not plotable)

80 Easement from H. F. Howard et ux to Indiana & Michigan Electric Company, dated March 20, 1947 and recorded August 29, 1947 in Deed Record 96 page 386, size and location of easement not specified, covering Lot 64 in Winton Place. (Affects property, not plotted, no defined location)

81 Easement from Edith E. Osbun et al to Indiana & Michigan Electric Company, dated April 5, 1947 and recorded August 29, 1947 in Deed Record 296 page 387, limited to overhang of wires only, covering Lot 63 in Winton Place. (Affects property, plotted)

82 Easement from Atha McMichael to Indiana & Michigan Electric Company dated October 20, 1965 and recorded February 8, 1966 in Deed Record 460 page 534, described as follows: Beginning at a point on the south line 11 feet east of the southwest corner of Lot 75, Winton Place, running thence north 50 feet; thence east 8 feet; thence south 50 feet; thence west 8 feet to the place of beginning. (Affects property, plotted)

PLATS, NOTES AND WITNESSES:

The following previous surveys and plats were referenced.
-The plat of Winton Place, an Addition recorded in Plat Book 2, Page 23.
-The plat of J. J. Perkins First Addition as recorded in Plat Book 2, Page 73.
-The plat of Muncie Land Company Subdivision of W. S. Hall Addition as recorded in Plat Book 2, Page 28.
-Notes from files of the Manual Transmission of Muncie, LLC a division of General Motors.
-Valuation Map V-40 over 16 dated June 30, 1915, of the C.C.C. & St. Louis Railroad Right-of-Way Map
-The plat of T. F. Rose First Addition as recorded in Plat Book 4, page 19.
-Also other notes and witnesses on file in the offices of Richard E. Ward & Associates, and in other Delaware County Offices.

UNCERTAINTY IN LOCATION OF LINES AND CORNERS:

1) Availability and condition of reference monuments:
-Monuments were found and held as shown on the plat above. Monuments found are presumed to be those set from previous surveys as identified above.
-Unless otherwise noted on the plat, found monuments were undisturbed, in good condition, and at or near grade.

2) Occupation or possession lines:
-There was no observable evidence of occupation or possession defining the lines surveyed, except as noted on the plat above.

3) Clarity or ambiguity of record descriptions used:
-There does not appear to be any ambiguity in the recorded description.

4) Classification of survey:
-This is an "Urban" Survey according to Title 865, Article 1, Rule 12 of the Indiana Administrative Code and is within the relative positional accuracy as allowed in this type of survey.

NOTES:

1) Dimensions on this plat are expressed in feet and decimal parts thereof, and are the measured values.

2) The basis of bearings for this survey was the South right-of-way line of the C.C.C. & St. L. Railroad (now the Norfolk & Southern Railroad), as evidence by found monuments. Bearings are based on said monuments and are used to denote angles only.

3) Survey monuments set for the survey are 5/8 inch diameter 30 inch long rebar set at grade with "REW FIRM 0076" identification caps, unless otherwise noted on plat.

4) A commitment for title insurance, Lawyers Title Insurance Corporation Commitment No. 262742, was provided for use on this survey. Surveyor has made no investigation or independent search for easements of record, encumbrances, restrictive covenants, ownership title evidence, or any other facts that an accurate and current title search may disclose.

5) Fence lines, as shown, are for informational purposes only. This survey does not warrant the right of possession or ownership of that part of the within described real estate lying between said fence lines and deed lines.

6) Unless specifically shown hereon, this survey does not purport to indicate the presence or absence of storage tanks, asbestos, contaminants, or other hazardous or environmentally injurious materials; and the surveyor expressly disclaims any responsibility or liability for the same.

7) A search for easements of record is not to be implied by this survey. Matters of zoning compliances is not expressed or guaranteed by this survey.

LAND SURVEYOR CERTIFICATE

To General Motors Corporation Worldwide Real Estate, Lawyers Title Insurance Corporation:

This is to certify that this map or plat and the survey on which it is based were made in accordance with the "Minimum Standard Detail Requirements for ALTA/ACSM Land Title Surveys," jointly established and adopted by ALTA and NSPS in 2005, and includes Items 1, 2, 3, 4, 7(a), 7(b)(1), 7(c), 8, 9, 10, 11(a), and 13 of Table A thereof. Pursuant to the Accuracy Standards as adopted by ALTA and NSPS and in effect on the date of this certification, undersigned further certifies that in my professional opinion, as a land surveyor registered in the State of Indiana, the Relative Positional Accuracy of this survey does not exceed that which is specified therein.

Quench Oil Material Safety Data Sheets

Revision Date: May 5, 2006

Material Safety Data Sheet

Houghto Quench G

Section I- Product Identification

Product Name: **Houghto Quench G**
Product Code: 34100719
Product Use: Metal Annealing or Tempering

Supplier: **Houghton Canada Inc.**
Site: 100 Symes Road
Toronto, Ontario, M6N 3T1
Mail: P.O. Box 113 Station D
Toronto, Ontario, M6P 3J5
Phone number: 416-763-4691
DUNS number: 20-167-2573

Manufacturer: Same as supplier

For spill or medical emergencies,
Monday to Friday, 8:30 am to 4:30 pm, (office hours), call Houghton Canada Inc at 416-763-4691.
All other times, call Canutec at 613-996-6666.

Proper Shipping Name:	Petroleum Oil or Grease – N.O.S.
TDG Classification:	Non Hazardous
WHMIS Hazard:	D2B

Section II- Hazardous Components

Material Description	CAS No.	Percent	Hazard
Mineral Oil	64742-65-0	60 – 100	LD50 (oral, rat): Not available LD (oral, rat): > 5 g/kg LD50 (dermal, rabbit): Not available LD (dermal, rabbit:): >5 g/kg LC50 (inhalation, rat): Not available

Section III-Physical Data

Physical State	Liquid	Vapor Pressure (mm Hg)	<1
Appearance and Odour	Dark clear liquid, mineral oil odour	Evaporation Rate (BuAc = 1)	<0.01
Odour Threshold (ppm or mg/m^3)	Not available	Vapor Density (Air=1)	>11
Boiling Point (°F)	>500	Coefficient of water/oil distribution	Not available
Freezing Point (°F)	Not available	Soluble in water	Insoluble
Specific Gravity (Water = 1)	0.867	pH Neat	Not applicable

Section IV-Fire and Explosion Hazard Data

Flash Point (°F): >340 Method Used: C.O.C.

Auto-ignition temperature: Not determined

LEL: Not determined

UEL: Not determined

Flammability: Product is a combustible liquid at elevated temperatures. Product will burn above its flashpoint.

NFPA Classifications: Health: 1
Fire: 1
Reactivity: 0

Extinguishing Methods: Use carbon dioxide, foam or dry chemical.

Special Fire Fighting Instructions: Firefighters should wear a full set of protective clothing and self-contained breathing apparatus when fighting fires involving product. Fires involving product should be fought upwind from the maximum distance possible. Cool containing vessels with water spray in order to prevent possible pressure build-up, autoignition or explosion.

Unusual Fire and Explosion Hazards: None known.

Sensitivity to mechanical impact: None known.

Sensitivity to static discharge: None known.

Hazardous products of combustion: May produce toxic or suffocating gases, smoke and irritating vapours as products of incomplete combustion. Oxides of carbon may be formed if involved in a fire or subjected to intense heat.

Section V- Toxicological Properties

Threshold Limit Value (TLV) and Permissible Exposure Limit (PEL):

Material Description	CAS No.	Exposure Limits		
		ACGIH TLV		OSHA PEL
		TWA	STEL	TWA
Mineral Oil	64742-65-0	5 mg/m^3 *	10 mg/m^3 *	5 mg/m^3 *
Intermediate Resin	8052-42-4	0.5 mg/m^3	Not available	Not available

*Exposure limit values are measured as oil mist.

Primary Routes of Exposure – Eyes, skin, inhalation

Chronic or Recurrent Effects: None known

Reproductive Effects: None known
Teratogenicity: None known
Embryotoxicity: None known
Mutagenicity: None known

Carcinogens as defined by:

NTP: Based on current information, none of the components of this product that are known to be present in a quantity greater than 0.1% are listed by NTP as carcinogenic.

IARC: Based on current information, none of the components of this product that are known to be present in a quantity greater than 0.1% are listed by IARC as a group 1 or 2 carcinogen.

ACGIH: Based on current information, none of the components of this product that are known to be present in a quantity greater than 0.1% are listed by ACGIH as a group A1 or A2 carcinogen.

OSHA: Based on current information, none of the components of this product that are known to be present in a quantity greater than 0.1% are listed as a carcinogen by OSHA.

Synergistic products: None known.
Sensitization to product: None known.

Acute Effects:

Inhalation: Avoid breathing product mists. Breathing product mists in excess of the TLV may cause irritation of the upper respiratory tract. Persons with chronic respiratory disease may show increased symptoms due to irritation.

Skin: Short term exposure is not expected to cause skin irritation. Prolonged or repeated contact may cause skin irritation.

Eyes: May be a mild irritant.

Ingestion: Ingestion of small quantities is not likely to cause any significant effects. This product is expected to have a low oral toxicity. Ingestion of mineral oils may lead to aspiration of the liquid. This may result in irritation of the upper respiratory tract.

Section VI – First Aid Measures

Inhalation: Remove person to source of fresh air. If breathing has stopped, apply artificial respiration and administer oxygen if necessary. Oxygen should only be administered by qualified personnel. Seek medical attention.

Skin: Wash skin with water and soap. Remove contaminated clothing and launder before reusing. Seek medical attention if irritation occurs or persists.

Eye: Flush eye with large amount of water for 15 minutes while holding eyelids open. Seek medical attention.

Ingestion: Do not induce vomiting. Seek medical attention. If vomiting occurs spontaneously, keep head below hips to prevent aspiration of liquid into the lungs.

Note to Physicians: No specific antidote known. Based on individual reactions of the patient, the physician's judgment should be used to control symptoms and clinical conditions.

Section VII - Reactivity Data

Stability: Stable [X] Unstable [ ]

Incompatibility (Materials to Avoid): Strong Oxidizers

Hazardous Decomposition Products: Thermal: Oxides of carbon

Hazardous polymerization: May occur: [ ] Will Not Occur [X]

Section VIII – Preventative Measures

Personal Protective Equipment:

Engineering Controls: Local exhaust ventilation is required in misting conditions to ensure applicable exposure limits are not exceeded.

Ventilation: If a mist or a vapour is generated and engineering controls are not feasible, use a NIOSH-certified air-purifying respirator. If oil particles or mists are present, exceeding exposure limits documented in section V, use a NIOSH type R or P filter. For instances where the exposure levels are not known, use a full-face positive pressure, air-supplied respirator. Selection and use of respiratory protective equipment should be in accordance with CSA Standard Z94.4.

Protective Gloves:	Rubber, neoprene, nitrile or equivalent gloves are recommended depending on the duration of exposure and the type of work related to prevent skin exposure.
Eye Protection:	Safety goggles or safety glasses with side shields are recommended.
Protective Clothing:	General type is satisfactory.
Other protective equipment	Eye wash station and safety shower recommended.

Storage and Handling:	Avoid contact with strong oxidizers. Keep containers closed when not in use. Store in tightly closed containers in cool, dry, isolated area and away from all sources of ignition. Wear eye protection and gloves when handling neat product. Wash hands thoroughly after handling product. Use with adequate ventilation. All precautions apply to "empty" containers.
Spill, Leak or Release:	For small spills apply dry absorbent material, such as dry earth, sand or other non-combustible material and transfer to containers for disposal. For large spills stop spill at source and contain. Ventilate area and eliminate all ignition sources. Pump or vacuum transfer spilled product to clean containers for recovery. Absorb unrecoverable product. Wear appropriate personal protective equipment.
Waste disposal:	Follow pertinent regulations for disposal. It is the responsibility of the product user to determine, at the time of disposal, whether a material containing the product or derived from the product is classified as a hazardous waste.

Section IX – Preparation Data

MSDS prepared by: Houghton Canada Inc.
Phone Number: 416-763-4691
Revision Date: May 5, 2006

Additional Product Information

RCRA Hazardous Waste Number:	Not Applicable
CERCLA RQ:	Not applicable
SARA Title III section 313:	This product contains no toxic chemicals subject to the reporting requirements of Section 313 of Title III of the Superfund Amendments and Reauthorization act of 1986 and 40 CFR part 372.
DSL Canada:	All materials are listed.

Esso Imperial Oil

MATERIAL SAFETY DATA SHEET

Date Prepared: April 25, 2002
Supersedes: October 14, 1998
MSDS Number: 15213

1. PRODUCT INFORMATION

Product Identifier: EXXON FENSO 161

Application and Use:
Quench oil

Product Description:

A lubricating oil consisting of a mixture of saturated and unsaturated hydrocarbons derived from paraffinic distillate, and additives.

REGULATORY CLASSIFICATION

WHMIS:
Not a controlled product

CEPA: CANADIAN ENVIRONMENTAL PROTECTION ACT
All components of this product are either on the Domestic Substances List (DSL) or are exempt.

TDG INFORMATION (RAIL/ROAD):
Not Regulated in Canada.

Please be aware that other regulations may apply.

TELEPHONE NUMBERS		MANUFACTURER/SUPPLIER:
Emergency 24 hr.	(519) 339-2145	IMPERIAL OIL
Technical Info.	(800) 268-3183	Products Division
		240 4th Avenue S.W.
		Calgary, Alberta
		T2P 3M9

2. REGULATED COMPONENTS

The following components are defined in accordance with sub-paragraph 13(a) (i) to (iv) or paragraph 14(a) of the Hazardous Products Act:

NAME	%	CAS #
Not applicable		

3. TYPICAL PHYSICAL & CHEMICAL PROPERTIES

Physical State: Liquid
Specific gravity: 0.900 at 15.5 deg C
Viscosity: 31.00 cSt at 100 deg C
Vapour Density: not available
Boiling Point: 260 to 600 deg C
Evaporation rate: <0.1 (1= n-butylacetate)
Solubility in water: negligible
Freezing/Pour Point: not available
Odour Threshold: not available
Vapour Pressure: <1 kPa at 38 deg C
Appearance/odour: Clear amber liquid, mild petroleum odour.

4. HEALTH HAZARD INFORMATION

NATURE OF HAZARD

INHALATION:

Negligible hazard at normal temperatures (up to 38 deg C).
Elevated temperatures or mechanical action may form vapours, mists or fumes which may be irritating to the eyes, nose, throat and lungs.
Avoid breathing vapours or mists.

EYE CONTACT:

Slightly irritating, but will not injure eye tissue.

SKIN CONTACT:

Low toxicity.
Frequent or prolonged contact may irritate the skin.

INGESTION:

Low toxicity.

ACUTE TOXICITY DATA:

Based on animal testing data from similar materials and products, the acute toxicity of this product is expected to be:

Oral	:	LD50 > 5000 mg/kg (Rat)
Dermal	:	LD50 > 3160 mg/kg (Rabbit)
Inhalation	:	LC50 > 5000 mg/m3 (Rat)

OCCUPATIONAL EXPOSURE LIMIT:

ACGIH recommends:
For oil mists, 5 mg/m3.

Local regulated limits may vary.

---

5. FIRST AID MEASURES

INHALATION:

Vapour pressure of this material is low and as such inhalation under normal conditions is usually not a problem. If overexposed to oil mist, remove from further exposure. Administer artificial respiration if breathing has stopped. Keep at rest. Call for prompt medical attention.

EYE CONTACT:

Flush eyes with large amounts of water until irritation subsides. If irritation persists, get medical attention.

SKIN CONTACT:

Flush with large amounts of water. Use soap if available.
Remove severely contaminated clothing (including shoes) and launder before reuse.
If irritation persists, seek medical attention.

INGESTION:

If swallowed, DO NOT induce vomiting. Keep at rest. Get prompt medical attention.

---

6. PREVENTIVE AND CORRECTIVE MEASURES

PERSONAL PROTECTION:

The selection of personal protective equipment varies, depending upon conditions of use.
In open systems where contact is likely, wear safety goggles, chemical-resistant overalls, and chemically impervious gloves.
Where only incidental contact is likely, wear safety glasses with side shields. No other special precautions are necessary provided skin/eye contact is avoided.
Where concentrations in air may exceed the occupational exposure limits given in Section 4 and where engineering, work practices or other means

of exposure reduction are not adequate, approved respirators may be necessary to prevent overexposure by inhalation.

ENGINEERING CONTROLS:

The use of local exhaust ventilation is recommended to control emissions near the source. Laboratory samples should be handled in a fumehood. Provide mechanical ventilation of confined spaces.

HANDLING, STORAGE AND SHIPPING:

Keep containers closed. Handle and open containers with care.
Store in a cool, well ventilated place away from incompatible materials.
In keeping with good personal hygiene practices, wash hands thoroughly after handling the material.
Empty containers may contain product residue. Do not pressurize cut, heat, or weld empty containers. Do not reuse empty containers without commercial cleaning or reconditioning.

LAND SPILL:

Eliminate source of ignition. Keep public away. Prevent additional discharge of material, if possible to do so without hazard.
Prevent spills from entering sewers, watercourses or low areas. Contain spilled liquid with sand or earth.
Recover by pumping or by using a suitable absorbant.
Consult an expert on disposal of recovered material. Ensure disposal in compliance with government requirements and ensure conformity to local disposal regulations. Notify the appropriate authorities immediately.
Take all additional action necessary to prevent and remedy the adverse effects of the spill.

WATER SPILL:

Remove from surface by skimming or with suitable absorbents. If allowed by local authorities and environmental agencies, sinking and/or suitable dispersants may be used in unconfined waters.
Consult an expert on disposal of recovered material. Ensure disposal in compliance with government requirements and ensure conformity to local disposal regulations. Notify the appropriate authorities immediately.
Take all additional action necessary to prevent and remedy the adverse effects of the spill.

7. FIRE AND EXPLOSION HAZARD

Flashpoint and method: 280 deg C COC ASTM D92

Autoignition: NA Flammable Limits: LEL: NA UEL: NA

GENERAL HAZARDS:

Low Hazard; liquids may burn upon heating to temperatures at or above the flash point.

Toxic gases will form upon combustion.

FIRE FIGHTING:

Use water spray to cool fire exposed surfaces and to protect personnel.
Shut off fuel to fire.
Use foam, dry chemical or water spray to extinguish fire.
Respiratory and eye protection required for fire fighting personnel.
Avoid spraying water directly into storage containers due to danger of boilover.

A self-contained breathing apparatus (SCBA) should be used for all indoor fires and any significant outdoor fires. For small outdoor fires, which may easily be extinguished with a portable fire extinguisher, use of an SCBA may not be required.

HAZARDOUS COMBUSTION PRODUCTS:

Smoke, carbon monoxide, carbon dioxide and traces of oxides of sulphur

---

8. REACTIVITY DATA

STABILITY:

This product is stable. Hazardous polymerization will not occur.

INCOMPATIBLE MATERIALS AND CONDITIONS TO AVOID:

Strong oxidizing agents

HAZARDOUS DECOMPOSITION:

none

---

9. NOTES

All components of this product are listed on the U.S. TSCA inventory.

THREE YEAR WHMIS REVIEW.

REVISION SUMMARY:
Since 14 October 1998, this MSDS has been revised in Section(s):

10. PREPARATION

Date Prepared: April 25, 2002
Prepared by: Lubricants & Specialties
IMPERIAL OIL
Products Division
240 4th Avenue S.W.

Calgary, Alberta
T2P 3M9
(800) 268-3183

CAUTION: " The information contained herein relates only to this product or material and may not be valid when used in combination with any other product or material or in any process. If the product is not to be used for a purpose or under conditions which are normal or reasonably foreseeable, this information cannot be relied upon as complete or applicable. For greater certainty, uses other than those described in Section 1 must be reviewed with the supplier. The information contained herein is based on the information available at the indicated date of preparation. This MSDS is for the use of Imperial Oil customers and their employees and agents only. Any further distribution of this MSDS by Imperial Oil customers is prohibited without the written consent of Imperial Oil."

Imperial Oil

MATERIAL SAFETY DATA SHEET

Date Prepared: October 22, 2003
Supersedes: September 14, 1999
MSDS Number: 15214

1. PRODUCT INFORMATION

Product Identifier: EXXON FENSO 71

Application and Use:
Quench oil

Product Description:

A lubricating oil consisting of a mixture of saturated and unsaturated hydrocarbons derived from paraffinic distillate, and additives.

REGULATORY CLASSIFICATION

WHMIS:
Not a controlled product

CEPA: CANADIAN ENVIRONMENTAL PROTECTION ACT
All components of this product are either on the Domestic Substances List (DSL) or are exempt.

TDG INFORMATION (RAIL/ROAD):
Not Regulated in Canada.

Please be aware that other regulations may apply.

TELEPHONE NUMBERS		MANUFACTURER/SUPPLIER:
Emergency 24 hr.	(519) 339-2145	IMPERIAL OIL
Technical Info.	(800) 268-3183	Products Division
		240 4th Avenue S.W.
		Calgary, Alberta
		T2P 3M9

2. REGULATED COMPONENTS

The following components are defined in accordance with sub-paragraph 13(a)(i) to (iv) or paragraph 14(a) of the Hazardous Products Act:

NAME	%	CAS #
Not applicable		

3. TYPICAL PHYSICAL & CHEMICAL PROPERTIES

Physical State: Liquid
Specific gravity: 0.880 at 15.5 deg C
Viscosity: 12.50 cSt at 100 deg C
Vapour Density: not available
Boiling Point: not available
Evaporation rate: <0.1 (1= n-butylacetate)
Solubility in water: negligible
Freezing/Pour Point: not available
Odour Threshold: not available
Vapour Pressure: <1 kPa at 38 deg C
Appearance/odour: Yellow oil, petroleum odour

4. HEALTH HAZARD INFORMATION

NATURE OF HAZARD

INHALATION:

Negligible hazard at normal temperatures (up to 38 deg C).
Elevated temperatures or mechanical action may form vapours, mists or fumes which may be irritating to the eyes, nose, throat and lungs.
Avoid breathing vapours or mists.

EYE CONTACT:

Slightly irritating, but will not injure eye tissue.

SKIN CONTACT:

Low toxicity.
Frequent or prolonged contact may irritate the skin.

INGESTION:

Low toxicity.

ACUTE TOXICITY DATA:

Based on animal testing data from similar materials and products, the acute toxicity of this product is expected to be:

Oral	:	LD50 > 5000 mg/kg	(Rat)
Dermal	:	LD50 > 3160 mg/kg	(Rabbit)
Inhalation	:	LC50 > 5000 mg/m3	(Rat)

OCCUPATIONAL EXPOSURE LIMIT:

ACGIH recommends:
For oil mists, 5 mg/m3.

Local regulated limits may vary.

5. FIRST AID MEASURES

INHALATION:

Vapour pressure of this material is low and as such inhalation under normal conditions is usually not a problem. If overexposed to oil mist, remove from further exposure. Administer artificial respiration if breathing has stopped. Keep at rest. Call for prompt medical attention.

EYE CONTACT:

Flush eyes with large amounts of water until irritation subsides. If irritation persists, get medical attention.

SKIN CONTACT:

Flush with large amounts of water. Use soap if available.
Remove severely contaminated clothing (including shoes) and launder before reuse.
If irritation persists, seek medical attention.

INGESTION:

If swallowed, DO NOT induce vomiting. Keep at rest. Get prompt medical attention.

6. PREVENTIVE AND CORRECTIVE MEASURES

PERSONAL PROTECTION:

The selection of personal protective equipment varies, depending upon conditions of use.
In open systems where contact is likely, wear safety goggles, chemical-resistant overalls, and chemically impervious gloves.
Where only incidental contact is likely, wear safety glasses with side shields. No other special precautions are necessary provided skin/eye contact is avoided.
Where concentrations in air may exceed the occupational exposure limits given in Section 4 and where engineering, work practices or other means

of exposure reduction are not adequate, approved respirators may be necessary to prevent overexposure by inhalation.

ENGINEERING CONTROLS:

The use of local exhaust ventilation is recommended to control emissions near the source. Laboratory samples should be handled in a fumehood. Provide mechanical ventilation of confined spaces.

HANDLING, STORAGE AND SHIPPING:

Keep containers closed. Handle and open containers with care.
Store in a cool, well ventilated place away from incompatible materials.
In keeping with good personal hygiene practices, wash hands thoroughly after handling the material.
Empty containers may contain product residue. Do not pressurize cut, heat, or weld empty containers. Do not reuse empty containers without commercial cleaning or reconditioning.

LAND SPILL:

Eliminate source of ignition. Keep public away. Prevent additional discharge of material, if possible to do so without hazard.
Prevent spills from entering sewers, watercourses or low areas. Contain spilled liquid with sand or earth.
Recover by pumping or by using a suitable absorbant.
Consult an expert on disposal of recovered material. Ensure disposal in compliance with government requirements and ensure conformity to local disposal regulations. Notify the appropriate authorities immediately.
Take all additional action necessary to prevent and remedy the adverse effects of the spill.

WATER SPILL:

Remove from surface by skimming or with suitable absorbents. If allowed by local authorities and environmental agencies, sinking and/or suitable dispersants may be used in unconfined waters.
Consult an expert on disposal of recovered material. Ensure disposal in compliance with government requirements and ensure conformity to local disposal regulations. Notify the appropriate authorities immediately.
Take all additional action necessary to prevent and remedy the adverse effects of the spill.

7. FIRE AND EXPLOSION HAZARD

Flashpoint and method: 238 deg C COC ASTM D92

Autoignition: NA Flammable Limits: LEL: NA UEL: NA

GENERAL HAZARDS:

Low Hazard; liquids may burn upon heating to temperatures at or above the flash point.

Toxic gases will form upon combustion.

FIRE FIGHTING:

Use water spray to cool fire exposed surfaces and to protect personnel.
Shut off fuel to fire.
Use foam, dry chemical or water spray to extinguish fire.
Respiratory and eye protection required for fire fighting personnel.
A self-contained breathing apparatus (SCBA) should be used for all indoor fires and any significant outdoor fires. For small outdoor fires, which may easily be extinguished with a portable fire extinguisher, use of an SCBA may not be required.

HAZARDOUS COMBUSTION PRODUCTS:

Smoke, carbon monoxide, carbon dioxide and traces of oxides of sulphur

MATERIAL SAFETY DATA SHEET 1 of 8

1. IDENTIFICATION AND EMERGENCY INFORMATION

Product Name: MARQUENCH OIL 600

Emergency Telephone No.
(317)634-7300
After Hrs: (800)553-8191
HMIS Rating: Health: 1
Fire: 1 , Reactivity: 0
HMIS Rating System:
Least-0, Slight-1,
Moderate-2, High-3,
Extreme-4

Manufacturer:
Miller Oil of Indiana Inc .
1751 W. Raymond St.
Indianapolis, IN 46221

Preparer: W. J. Majeske
DATE REVISED: 03/16/01

2. INGREDIENTS AND HAZARD INFORMATION

CAS No.	%/Vol.	Chemical Name
64742-54-7	>90	HEAVY PARAFFINIC BASE OIL
656608-26-4	<10	PETROLEUM SULFONATE
MIXTURE	<1	ALKYARYLAMINE

All ingredients in this product are listed in the U.S. TSCA inventory. None of the ingredients are listed as carcinogenic in NTP, IARC or OSHA 1910.

EXPOSURE LIMIT FOR TOTAL PRODUCT: 5 mg/M3 for oil mist (aerosol) for an 8 hour day.

3. PHYSICAL DATA

Boiling Point: 635 OF
Vapor Pressure 20 OC, mmHg: <0.01
Vapor Density (Air=1): >5
Solubility in Water: NIL
Specific Gravity: 0.90
Melting Point: N/A
Evaporation Rate: Nil
pH: Essentially Neutral
Appearance and Odor: BROWN LIQUID. PETROLEUM ODOR
NA = NOT Applicable
ND = NOT Determined

4. FIRE AND EXPLOSION DATA

Flash Point, COC 0F: 475
Auto-ignition Temperature, 0F: >500
Flammable and Explosive Limits
(Approximate percent by volume in air)
Estimated Values: Lower Flammable Limit 0.9%
Upper Flammable Limit 7.0%

HANDLING PRECAUTIONS: Use product with caution around heat, sparks, pilot lights, static electricity and open flame.

EXTINGUISHING MEDIA AND FIRE FIGHTING PROCEDURES:
Foam, water spray (fog), dry chemical, carbon dioxide and vaporizing liquid type extinguishing agents may all be suitable for extinguishing fires involving this type of product. Plan fire protection and response strategy through consultation with local fire protection authorities or appropriate specialists.

The following procedures for this type of product are based on the National Fire Protection Association's 'Fire Protection Protection Guide on Hazardous Materials', Tenth Edition (1991):

Use water spray, dry chemical, foam or carbon dioxide to extinguish the fire. Water or foam may cause frothing. Use water to keep fire-exposed containers cool. Water spray may be used to flush spills away from exposures. Mimimize breathing of gases, vapor, fumes or decomposition products. Use supplied-air breathing equipment for enclosed or confined spaces or as otherwise needed.

DECOMPOSITION PRODUCTS UNDER FIRE CONDITIONS:
Fumes, smoke, carbon monoxide, sulfur oxides, phosphorous oxides, nitrogen oxides, metal oxides, aldehydes and other decomposition products in the case of incomplete combustion.

UNUSUAL FIRE AND EXPLOSION HAZARDS: None

EMPTY CONTAINER WARNINGS:
Empty containers retain residue (liquid and/or vapor) and can be dangerous. DO NOT PRESSURIZE, CUT, WELD, BRAZE, SOLDER, DRILL GRIND OR EXPOSE SUCH CONTAINERS TO HEAT, FLAMES, SPARKS, STATIC ELECTRICITY OR OTHER SOURCES OF IGNITION; THEY MAY EXPLODE OR CAUSE INJURY OR DEATH. Do not attempt to clean since residue is difficult to remove. Empty drums should be completely drained, properly bunged and promptly returned to a drum reconditioner. All other containers should be disposed of in an environmentally safe manner and in accordance with governmental regulations. For work on tanks refer to Occupational Safety and Health Administration Regulations, ANSI Z49.1, and other governmental and industrial references pertaining to cleaning, repairing, welding or other contemplated operations.

5. REACTIVITY

STABILITY: Stable

CONDITIONS TO AVOID: High Heat, Sparks and Flame.
Hazardous polymerization will not occur.

MATERIALS TO AVOID: Strong oxidants present a serious explosion hazard.

HAZARDOUS COMPOSITION PRODUCTS:
Oxides of carbon.

6. TOXICOLOGICAL INFORMATION

OSHA PEL: 5mg/M3 ACGIH TLV: 5mg/M3 STEL: 10mg/M3

ROUTES OF EXPOSURE AND AFFECTS OF OVEREXPOSURE

EYES: May cause eye irritation.

SKIN ABSORPTION: No acute affects expected.

SKIN CONTACT: May cause skin irritation.

INHALATION: Vapors or mist in excess of permissible concentrations or in unusually high concentrations generated from spraying, heating the material or as from exposure in poorly ventilated areas or confined spaces, may cause irritation of the nose and throat, headache, nausea and drowsiness.

INGESTION: Abdominal discomfort, nausea and diarrhea may occur.

MEDICAL CONDITIONS GENERALLY AGGRAVATED BY OVEREXPOSURE:
None Known

FIRST AID MEASURES:

EYES: Flush eyes with plenty of water for several minutes. Seek medical attention if irritation persists.

SKIN: Wash skin with plenty of soap and water for several minutes. Seek medical attention if skin irritation develops or persists. Material has a low order of dermal toxicity.

INGESTION: Give 2 glasses of water (16 oz.). Do not induce vomiting. Seek medical attention. Material has a low order of oral toxicity.

INHALATION: If irritation, headache, nausea or drowsiness occurs, remove to fresh air. Seek medical attention if breathing becomes difficult or respiratory irritation persists.

OTHER INSTRUCTIONS: High pressure injection of this material into the skin can cause severe injury. Failure to debride the wound of all residue material can result in disfigurement, loss of function or may require amputation of the affected area.

Remove and launder or dry clean clothing soaked or soiled with this material before reuse.

7. SAFE HANDLING SPILL AND LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE OF SPILL: Keep product out of streams and waterways by diking or impounding the spill. Soak up the spill on inert absorbent material and dispose of in accordance with all applicable government regulations. Advise authorities if spill has entered or may enter sewers, watercourses or extensive land areas.

WASTE CLASSIFICATION: This material does not meet RCRA criteria of hazardous waste in its purchased form. Refer to federal, state and local regulations for proper handling of disposal or recycling of used material.

CERCLA REPORTABLE QUANTITY: This product does not contain any CERCLA regulated materials

STORAGE AND HANDLING PROCEDURES: Store containers closed and away from extreme temperatures. Avoid breathing mists. Avoid contact with eyes. Wash skin thoroughly after handling. Do not ingest.

8. CONTROL MEASURES

RESPIRATORY PROTECTION: Good industrial hygiene practices recommend that engineering controls be used to reduce environmental concentrations to the threshold limit value (TLV) or permissible exposure limit (PEL). If any TLV or PEL is exceeded, provide NIOSH approved respiratory protection.

PROTECTIVE GLOVES: Oil impervious gloves.

EYE PROTECTION: Safety glasses with side shields or chemical goggles.

OTHER PROTECTIVE CLOTHING: Oil impermeable apron recommended.

OTHER MEASURES: Eye wash station, launder soiled clothing before reuse, discard oil soaked shoes.

9. REGULATORY INFORMATION

SUPERFUND AMENDMENT AND REAUTHORIZATION ACT OF 1986 (SARA)

SARA TITLE III STATUS:
SECTION 311 AND 312 HAZARDOUS CHEMICALS

This product contains the following ingredient(s) defined as hazardous by OSHA Hazard Communication Standard CFR 1910.1200 (d).

CAS#	CHEMICAL NAME	% BY WEIGHT
NONE		

SECTION 313 SUPPLIER NOTIFICATION

This product contains the following toxic chemicals subject to the reporting requirements of section 313 of the Emergency Planning and Community Right to Know Act of 1986 and of CFR 372.

CAS#	CHEMICAL NAME	% BY WEIGHT
NONE		

10. TRANSPORTATION

DOT:
PROPER SHIPPING NAME: Not regulated

OSHA REQUIRED LABEL INFORMATION: In compliance with hazard and right-to-know requirements, where applicable OSHA Hazard Warnings may be found on the label, bill of lading or invoice accompanying this shipment. Label may contain non-OSHA related information also.

DISCLAIMER

The information and recommendations contained herein have been compiled from information supplied to Miller Oil of Indiana, Inc. by our suppliers and other sources considered to be dependable and is accurate and reliable to the best of Miller Oil's knowledge and belief as of date issued but is not guaranteed to be so. Nothing herein is to be construed as recommending any practice or the use of any product in violation of any patent or in violation of any law or regulation. It is the user's responsibility to determine the suitability of any material for a specific purpose and to adopt such safety precautions as may be necessary. Miller Oil makes no warranty as to the results to be obtained in using any material and since conditions of use are not under our control, we must necessarily disclaim all liability with respect to the use of any material supplied by Miller Oil of Indiana, Inc.

EXECUTIVE SUMMARY

EXECUTIVE SUMMARY

INTRODUCTION

The Indiana Department of Environmental Management (IDEM) was requested by the United States Environmental Protection Agency (U.S. EPA) to conduct a Resource Conservation Recovery Act (RCRA) Facility Assessment (RFA) of the Hydra-matic Division of General Motors of Muncie, Indiana. The RFA consists of a Preliminary Review (PR), a Visual Site Inspection (VSI), and a Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Preliminary Assessment (PA).

Preliminary Review

A search of the IDEM files provided information about the past and current operation at the Hydra-matic Division of General Motors plant in Muncie, Indiana. The PR was used to define the scope of the VSI in addition to providing pertinent information concerning the PA. The Hydra-matic Division of GM produces manual transmissions for automobiles. A closure plan for its RCRA interim TSD facility was received by the IDEM on May 6, 1988. It was also discovered a portion of the present Hydra-matic property was formerly used by Delco Remy as a battery plant.

Hazardous and special waste are created in various parts of the manufacturing process. All hazardous waste are stored on a concrete pad, which is diked and drained to a confined sump. Industrial wastewater produced by the plant is treated on the site before it is released into the Muncie Sanitation System.

A site investigation of the former Delco Remy battery plant has been conducted by GM and its contractor. The report is not yet available to the State. Preliminary verbal reports indicate the total metal levels are above background in the soil but normal in the groundwater. GM has sealed the site with asphalt.

VISUAL SITE INSPECTION

On August 16, 1989, Ms. Michele Anderson and Mr. Kurt Gilliam, of IDEM, conducted a VSI of the Hydra-matic Division of GM, located at 1200 West 8th Street, Muncie, Indiana. Hydra-matic was represented by Mr. Jerry Berghoff, Environmental Engineer.

Based on the VSI and discussion with Mr. Berghoff, ten (10) solid waste management units (SWMUs) were identified and evaluated. No migration of uncontrolled hazardous waste from any SWMU was observed. There is no sampling data from the closure of the plant's RCRA interim TSD facility available at this time.

PRELIMINARY ASSESSMENT

A CERCLA Preliminary Assessment (PA) was completed by Mr. Kurt Gilliam, IDEM, in conjunction with the Hydra-matic Division of GM's RFA. A CERCLA PA is designed to assess the potential of a site to release hazardous material into the environment. The Hydra-matic Division's PA addresses potential releases to groundwater, surface water, soil and air.

The population potentially affected by releases to any of the routes was assessed. The facility received a No Further Remedial Action Planned (NFRAP) priority assessment, provided a site investigation conducted by GM does not

reveal areas of concern at the former battery plant property, which is part of this site. No other evidence of a release to the environment of hazardous materials was discovered.

PRELIMINARY REVIEW REPORT

PRELIMINARY REVIEW REPORT (PR)
RCRA FACILITY ASSESSMENT (RFA)

1. Facility Name Hydra-matic Division of General Motors
EPA ID # IND 006076296
Preparer Kurt Gilliam
Date August 11, 1989

2. General Description of Facility and Processes:

A. Description: The Hydra-matic Division of General Motors manufactures manual transmissions for automobiles in Muncie, Indiana. Manufacturing related to the automotive industry has taken place at this site since 1935. A section of the property was formerly used by Delco Remy to produce batteries for automobiles. This facility was demolished in 1979 and the site was annexed by Hydra-matic.

The primary processes at the plant is machining steel stock. The metal is turned on a lathe and certain parts a peened with steel shot to harden them. Nylon coating of some transmission parts is also performed. There is a spray painting room in the facility. All wastewater produced by the manufacturing process is pre-treated before it is released to the city's sewage system.

The plant's hazardous waste stream includes 1,1,1-trichloroethane from degreasing, waste paint and thinner, waste primer from nylon coating (methyl ethyl ketone) and sludge from the wastewater treatment plant. Special waste generated include shot peening dust, grinding sump and sludge from waste oil. There are PCB transformers on the site. All hazardous waste except the treatment sludge, is held in a hazardous waste storage area.

B. Information on Solid Waste Management Units (attach additional sheets as needed):

	Unit	Release (yes/no/unknown/suspected)
i.	Hazardous Waste Storage	UNKNOWN
ii.	Paint Room	UNKNOWN
iii.	Nylon Primer	UNKNOWN
iv.	Wastewater Pre-Treatment	NO
v.	Shot Peener	UNKNOWN
vi.	Metal Lathe	UNKNOWN
vii.	Former Delco Remy Battery Plant	UNKNOWN
viii.		
ix.		
x.		

3. Specific Unit Information (prepare one for each unit):

A. Unit Type: Hazardous Waste Storage
Age: UNKNOWN
Capacity: UNKNOWN
Period of Operation: UNKNOWN
Waste Type: Solvents, waste oil,
Volume: UNKNOWN
Regulatory Status: RCRA
Hazardous Constituents (attach separate sheet): 111 TrichloroEthane, PCB, Paint Shop

B. Unit Description: The storage area is in a building separate from the main plant. The unit is a former TSD facility which has gone through RCRA closure. The area has a drainage trench around its perimeter which flows to a isolated sump.

Additional Information Needed: Determine age and size of the unit

3. Specific Unit Information (prepare one for each unit):

A. Unit Type: Paint Room
Age: unknown
Capacity: unknown
Period of Operation: unknown
Waste Type: Paint waste + solvents
Volume:
Regulatory Status: RCRA
Hazardous Constituents (attach separate sheet): Lead, Tolene, Benzene

B. Unit Description: Paint room with spray booth, supplies and paint thinners

Additional Information Needed: age, capacity + volume

3. Specific Unit Information (prepare one for each unit):

A. Unit Type: Nylon primer waste
Age: UNKNOWN
Capacity: UNKNOWN
Period of Operation: UNKNOWN
Waste Type: Nylon primer
Volume: one drum
Hazardous Constituents (attach separate sheet): Methyl Ethyle Ketone

Regulatory Status: RCRA

B. Unit Description: machine which a nylon coating is placed on various parts of the transmission

Additional Information Needed: age and capacity of the unit.

3. Specific Unit Information (prepare one for each unit):

A. Unit Type: Wastewater Treatment Plant
Age: 21 years (built 1969)
Capacity: UNKNOWN
Period of Operation: 1969 - present
Waste Type: sludge
Volume: Unknown
Regulatory Status:
Hazardous Constituents (attach separate sheet): Cutting oils, metals, solvents

B. Unit Description: A wastewater pretreatment plant with several holding tanks

Additional Information Needed: Capacity and volume of the unit

3. Specific Unit Information (prepare one for each unit):

A. Unit Type: Shot Peener
Age: UNKNOWN
Capacity: UNKNOWN
Period of Operation: UNKNOWN
Waste Type: Steel shot dust
Volume: UNKNOWN
Regulatory Status: RCRA
Hazardous Constituents (attach separate sheet): steel shot dust

B. Unit Description: The unit is a machine used to harden metal by blasting it with steel shot. Dust from the process is collected by a baghouse

Additional Information Needed: Age, capacity and volume of the unit

3. Specific Unit Information (prepare one for each unit):

A. Unit Type: Metal Lathe
Age: UNKNOWN
Capacity: UNKNOWN
Period of Operation: UNKNOWN
Waste Type: Cutting oil + Scrap Iron
Volume: UNKNOWN
Regulatory Status: RCRA
Hazardous Constituents (attach separate sheet): Heavy metals

B. Unit Description: Metal Lathes used to machine metal stock. Each machine uses cutting oil and creates steel shavings.

Additional Information Needed: Age, capacity and volume

3. Specific Unit Information (prepare one for each unit):

A. Unit Type: former Delco Battery Plant
Age: Razed 1979
Capacity: N/A
Period of Operation: unknown
Waste Type: Heavy metals
Volume: UNKNOWN
Hazardous Constituents (attach separate sheet): lead, cadmium, heavy metals

Regulatory Status: CERCLA

B. Unit Description: The unit is a former Delco Remy Battery plant which was razed in 1979. Lead levels above background were detected in the soil. The area has been sealed with an asphalt cap. The site is being monitored by GM.

Additional Information Needed: Lead concentrations in the soil.

C. Monitoring Description (groundwater, surface water, etc.): Groundwater monitoring is performed around the site of the former Delco Remy Battery Plant. All wastewater generated by the plant is pretreated before it is released to the city's sewage system.

Additional Information Needed: Examine site for migration of contaminated surface water (ie ~~to ditch~~). Also investigate air pollution control and look for possible migration into groundwater.

D. Environmental Setting: The site is in an industrial area. There are railroad tracks on the north side of the plant. The topography in the area is regular, with gentle sloping toward White River about one-half (½) mile to the northwest. The soil between the surface and the main aquifer is primarily silty clays. The aquifer is about 35 feet below the surface

Additional Information Needed: Determine what percent of the neighborhood is residential.

E. Evidence of Suspected Past or Current Releases: On December 12, 1987 waste cutting oil was inadvertently dumped outside the containment dike into a parking lot. A portion of the oil then flowed into the street where it was then contained.

A Delco Remy Battery Plant was formerly located on the northeast corner of the site. Lead levels in the soil are reported to be above background. Some effort has been made to stabilize the lead contaminated soil.

Additional Information Needed: Determine if the oil spill had any permanent impact. Find more information about the former battery plant and possible soil contamination. Determine if any additional, unreported spills have taken place.

4. Visual Site Inspection (VSI)

A. Specific Objectives:

1) Identify all solid waste management units present at the facility.

2) Identify closed SWMU's at the facility.

3) Obtain evidence of past or current releases, should such evidence exist.

4) Note age and condition of SWMU's

5) Evaluate the potential for releases from regulated and unregulated units

VISUAL SITE INSPECTION REPORT

FACILITY VISUAL SITE INSPECTION FORM

Facility Name: Hydra-matic Div. of GM EPA I.D Number: IND000606286

Location Address: 1200 W. 8th St. Muncie, IN 47303

Facility Contact/Title: Jerry Berghoff / Environmental Engineer

Phone Number: (317) 747-2073

Date of Inspection: 8-16-89 Time of Inspection: 9:00 AM

Weather: Clear, Sunny + Warm 82° F

Person(s) Interviewed	Organization	Title
Jerry Berghoff	Hydra-matic Div. of GM	Env. Engineer

Inspector(s)	Organization	Title
Michele Anderson	IDEM	Environmental Scientist
Steve Pauly	IDEM	Environmental Scientist
Kurt Gilliam	IDEM	Environmental Scientist

Facility Description: The Hydra-matic Division of GM produces manual transmissions for automobiles. The plant's hazardous waste stream includes 1,1,1-Trichloroethane from degreasing, waste paint and thinner, waste primer from nylon coating (methyl ethyl ketone) and sludge from its waste water pretreatment plant. Special waste generated at the site include shot peening dust, grinding swarf and sludge from waste oil. Several transformers containing PCB oil are being phased out and the oil is being sent off site for disposal.

Visual Site Inspection
Solid Waste Management Unit
Description Form

UNIT CHARACTERISTICS:

Type of Unit- Oily Aluminium Scrap Holding Area

Age of Unit- 1 year

Location of Unit- East side of the site, adjacent to Elliot Street; see site map, unit #1

General Physical Condition of Unit-

The area is paved with asphalt, diked and slopes to a drain in the northeast corner of the lot. All liquids entering the drain flow to the pre-treatment plant on the site. The aluminium scrap is held in a semi-trailer and oil drains out of the trailer. The scrap is sold.

Type of Wastes Placed In Unit-

Oily Aluminium scrap

Possible Migaration Pathways from this Unit-

Into drain and to the wastewater pre-treatment plant

Observed Releases from Unit (describe)-

Oil was draining from the aluminium in the holding trailer. All oil was confined to the diked area and was flowing into the drain

Proximity to Nearest Residence, Waterway, or other Exposure Potential-

White River is about 1/2 to the northeast, the nearest resident was about 1/10 mile to the east

Comments-

All oil was contained by the diking and being sent to the pre-treatment plant.

Visual Site Inspection
Solid Waste Management Unit
Description Form

UNIT CHARACTERISTICS:

Type of Unit- Waste Water Pre-Treatment Plant

Age of Unit- Built 1968, 21 years

Location of Unit- East side of the site, west of Oily Aluminium Scrap Holding Area; See site map, unit #2

General Physical Condition of Unit-

Large, two story building with several holding tanks for wastewater treatment

Type of Wastes Placed In Unit-

All wastewater from plant, except sewage from restrooms. The sludge from this unit is considered a hazardous waste.

Possible Migaration Pathways from this Unit-

Muncie's Sanitary Sewer and treatment plant

Observed Releases from Unit (describe)-

None

Proximity to Nearest Residence, Waterway, or other Exposure Potential-

The unit is connected to the city's sewage system; White River is 1/2 mile to the northwest; the nearest resident is about 1/4 mile

Comments-

John Craddock, Director of Water Quality, Muncie Sanitation Distric, stated this facility has an excellent record for removing hazardous wastes from the plants effluent.

Visual Site Inspection
Solid Waste Management Unit
Description Form

UNIT CHARACTERISTICS:

Type of Unit- Hazardous Waste Storage Area

Age of Unit- 10 years

Location of Unit- Northeast corner of a building in the northeast section of the site; see facility map, unit #3

General Physical Condition of Unit-

The floor of the unit is concrete at least 6 inches thick. All cracks are sealed. The area is diked and encircled by a trench drain. All substances entering the drain are held in a sump which is not connected to any other drain. A fence with a locked gate secures the area.

Type of Wastes Placed In Unit-

PCB oil from old transformers, shot peening dust, solvents

Possible Migaration Pathways from this Unit-

none, area completely contained

Observed Releases from Unit (describe)-

None

Proximity to Nearest Residence, Waterway, or other Exposure Potential-

1/2 mile to White River, approximately 1/4 mile to nearest residant

Comments-

The unit has gone through closure as a TSD under RCRA.

Visual Site Inspection
Solid Waste Management Unit
Description Form

UNIT CHARACTERISTICS:

Type of Unit- Shot Peener

Age of Unit- 12 years

Location of Unit- Department 16, northwest corner of the building; see site map, unit #4

General Physical Condition of Unit-
The unit is a machine which hardens metal by blasting it with steel shot. Dust from the process is collected by a bag house and held in a drum.

Type of Wastes Placed In Unit-
Steel shot dust

Possible Migaration Pathways from this Unit-
air, although the unit is inside the building

Observed Releases from Unit (describe)-
Some dust was on the floor at the base of the unit

Proximity to Nearest Residence, Waterway, or other Exposure Potential-
White River is about 1/2 mile to the northwest, the nearest resident is about 1/4 mile

Comments-
Shot dust is considered a special waste.

Visual Site Inspection
Solid Waste Management Unit
Description Form

UNIT CHARACTERISTICS:

Type of Unit- Shot Peener

Age of Unit- 20 years

Location of Unit- Department 15; see Site Map, unit #5

General Physical Condition of Unit-
The unit is a machine which hardens metal by blasting it with steel shot. Dust from the process is collected by a baghouse and held in a drum.

Type of Wastes Placed In Unit-
Steel shot dust

Possible Migaration Pathways from this Unit-
air, although the unit is inside the building

Observed Releases from Unit (describe)-
some dust was on the floor at the base of the unit.

Proximity to Nearest Residence, Waterway, or other Exposure Potential-
White River is about 1/2 mile to the northwest, the nearest resident is about 1/4 mile

Comments-
Shot dust is considered a special waste.

Visual Site Inspection
Solid Waste Management Unit
Description Form

UNIT CHARACTERISTICS:

Type of Unit- Steel Scrap Crusher and Holding Area

Age of Unit- 25 years

Location of Unit- Near the center of the building; see site map, unit #6

General Physical Condition of Unit-
The unit is a holding area for steel scrap cut away from steel stock by a lathe. The metal is stored in binds until it is crushed into cubes and sold.

Type of Wastes Placed In Unit-
steel scrap

Possible Migaration Pathways from this Unit-
Floor

Observed Releases from Unit (describe)-
None

Proximity to Nearest Residence, Waterway, or other Exposure Potential-
White River is about 1/2 mile to the Northwest, the nearest resident is about 1/4 mile.

Comments-
Only steel is held at this SWMU.

Visual Site Inspection
Solid Waste Management Unit
Description Form

UNIT CHARACTERISTICS:

Type of Unit- Paint Room

Age of Unit- 25 years

Location of Unit- near the center of the building; see site map, unit #7

General Physical Condition of Unit-
The unite is a room housing a paint spraying area with exhaust vents and filters, containers of paint, solvents and waste paint solvents.

Type of Wastes Placed In Unit-
Paint, solvents

Possible Migaration Pathways from this Unit-
Floor, air

Observed Releases from Unit (describe)-
Paint overspray was on the floor

Proximity to Nearest Residence, Waterway, or other Exposure Potential-
White River is about 1/2 mile to the northwest, the nearest resident is about 1/4 mile.

Comments-
No visible spill of solvents.

Visual Site Inspection
Solid Waste Management Unit
Description Form

UNIT CHARACTERISTICS:

Type of Unit- Nylon Coating Machine

Age of Unit- 20 years

Location of Unit- Department 44; see Site Map, unit #8

General Physical Condition of Unit-
The unit is a machine which coats specific parts of transmissions with nylon and bakes it on. Waste nylon primer is collected at the unit.

Type of Wastes Placed In Unit-
Waste nylon primer (Methyl Ethyl ketone)

Possible Migaration Pathways from this Unit-
Floor

Observed Releases from Unit (describe)-
None

Proximity to Nearest Residence, Waterway, or other Exposure Potential-
White River is about 1/2 mile to the northwest, the nearest resident is about 1/4 mile

Comments-

Visual Site Inspection
Solid Waste Management Unit
Description Form

UNIT CHARACTERISTICS:

Type of Unit- Degreasing Station

Age of Unit- 20 years

Location of Unit- Department 78, See site map, #9 unit

General Physical Condition of Unit-

Unit is a tank used for degreasing metal parts and tools. The area is well marked, diked and drained.

Type of Wastes Placed In Unit-

1,1,1 Trichloroethane

Possible Migaration Pathways from this Unit-

Floor, drain to waste water pre-treatment plant

Observed Releases from Unit (describe)-

none

Proximity to Nearest Residence, Waterway, or other Exposure Potential-

1/2 mile to White River, about 1/4 mile to the nearest resident.

Comments-

Visual Site Inspection
Solid Waste Management Unit
Description Form

UNIT CHARACTERISTICS:

Type of Unit- Degreasing Station

Age of Unit- 10 years

Location of Unit- Department 97; See site map, unit #10

General Physical Condition of Unit-

Unit is a tank used for degreasing metal parts and tools. The area is well marked, diked and drained

Type of Wastes Placed In Unit-

1,1,1 - Trichloroethane

Possible Migaration Pathways from this Unit-

Floor and drains to wastewater pre-treatment plant

Observed Releases from Unit (describe)-

None

Proximity to Nearest Residence, Waterway, or other Exposure Potential-

½ mile to White River, about ¼ mile to the nearest resident

Comments-

==========

State Comments:

The Hydra-matic Division of GM produces manual transmissions for automobiles. The hazardous wastes produced at the site are stored in drums on a concrete floor, which is diked and drained to a confined sump. Other waste storage areas are located on concrete and contained by diking and drains. The industrial wastewater produced by the plant is treated on site before it is released to the Muncie sanitation system. No violations of the plants NPDES permits were discovered.

The northeast section of the property was formerly used by Delco Remy for battery manufacturing. All buildings associated with this plant were razed, except one warehouse. The area was sealed with asphalt. Soil testing of the area, both adjacent to and beneath the asphalt, was conducted by GM. Preliminary reports indicate total metal level of 330 ppm and EP Toxicity

HAZARDOUS WASTE MANAGEMENT PROGRAM

HYDRA-MATIC MUNCIE

HAZARDOUS WASTE STORAGE AREA

CLOSURE PLAN

MAY 6 10 49 AM '88

I. INTRODUCTION

Under the U. S. EPA Regulations, 40 CFR Part 265, Subpart G, Sections 265.110 through 265.120, each facility which stores, treats, or disposes of hazardous wastes must have a Closure Plan on file. This Closure Plan has been prepared to cover the following facility:

1) EPA IDENTIFICATION NUMBER: IND006066286

2) OWNER'S NAME:

General Motors
Hydra-matic Division
1200 West Eighth Street
Muncie, Indiana 47307

3) THIS PLAN HAS BEEN UPDATED BY:

Gerard J. Berghoff
Environmental Engineer
May 2, 1988

4) THE ATTACHED CHART SHOWS THE FACILITIES FOR STORAGE OF HAZARDOUS WASTES.

II. DESCRIPTION OF THE FACILITY

The Hazardous Waste Storage Area at the Hydra-matic Muncie Plant is located within a warehouse on the Northeast corner of the property. The hazardous wastes generated in the plant are stored in 55-gallon drums within the hazardous waste storage area before shipping to a waste solvent reclaimer.

The Hazardous Waste Storage Area is 52' x 50', and is currently permitted under interim status for 20,000 gallons of container storage. In order to properly contain any accidental releases of hazardous wastes, the area is surrounded by a trench and pit with a blind sump. The flooring inside of the trenched area is made of an impervious material. The area is posted "Danger - Unauthorized Personnel Keep Out Hazardous Waste Storage Area Container Storage Only" and "No Smoking". The wastes that may possibly be in storage at the facility consists of the following:

Waste Description

Waste 1,1,1 Trichloroethane (F001)
Waste Paint Related Material (Xylene - F003)
Waste Primer P (Methyl Ethyl Ketone - F005)
Waste Boiler Residue (D002)

III. CLOSURE SCHEDULE (continued)

hazardous if it contains any of the F00_ wastes or if it exhibits the characteristic of ignitability. If tests results show the drummed rinsate is not hazardous, it will be disposed of at Hydra-matic Muncie's Wastewater Treatment Plant.
Contaminated soil. If a spill occurs in the storage building at any time during this procedure, the steps beginning at Day 2 will be repeated. If a spill occurs which reaches the ground or if contamination is found in the soil samples, the affected soil will be removed for proper disposal until dry, uncontaminated soil is reached. Soil below the removed soil will be sampled, sent to the contract laboratory and tested for the material spilled or the parameters as listed in "Day 25-29, Sample collection and testing". If contamination is found to the groundwater level, a remedial action plan will be submitted to the IDEM within 30 days. All contaminated soil shall be placed into a drum and the above procedure repeated until no hazardous waste is found. From this point, the steps from Day 60 will be followed and between 30 and 60 days would be added to the steps below, depending on the severity of the contamination.

Once proper disposal procedures have been established for all drummed wastes, preparation for shipment of the applicable drums includes proper labeling and marking of the containers, and preparation of the shipping papers and manifest(s).

DAY 65-79

Contact disposal contractor. Copies of the manifests and any new waste stream descriptions along with the applicable F00_ pretreatment certifications will be sent, as necessary (hazardous rinsate or contaminated soil), to the current, licensed disposal contractor. An appointment will be set up for waste pickup.

DAY 80

Waste is picked up by the licensed hazardous waste hauler for transport to the contracted licensed disposal site(s) for reclamation/ recycle.

DAY 81

Certification of closure by an independent registered professional engineer.

DAY 90-150

(up to 60 days after closure) Certification sent to IDEM.

APPENDIX II

LETTER FROM GENERAL MOTORS CORPORATION
TO U. S. EPA, REGION V
RE: FORMER DELCO REMY BATTERY PLANT PROPERTY

HYDRA-MATIC

Division of General Motors Corporation Ypsilanti, Michigan 48197

June 23, 1988

Mr. Bill Messenger
United States Environmental Protection
Agency, Region V
230 South Dearborn Street
Mail Code 5HR11
Chicago, Illinois 60604

Subject: General Motors Corporation,
Hydra-matic Division,
Muncie, Indiana;
Former Delco Remy Battery Plant Property

Dear Mr. Messenger:

The Hydra-matic Division of General Motors Corporation ("Hydra-matic") occupies property in Muncie, IN at 1200 W. Eighth Street (EPA ID# IND006066286). The subject property, which is adjacent to the Hydra-matic transmission manufacturing plant site, was formerly the site of the GM Delco Remy Division Battery Plant No. 9. The old battery plant facility was demolished in 1979 with the exception of a warehouse and an entrance gatehouse. The property was then transferred successively from the Delco Remy Division to the Chevrolet Motor Division, the Chevrolet-Pontiac-GM of Canada Group, the Detroit Diesel Allison Division, and ultimately to the Hydra-matic Division.

Hydra-matic is considering selling all or a portion of the subject property. However, a study conducted in 1978, prior to demolition of the former battery plant, indicates that there were lead levels in the soil above background, presumably from battery manufacturing processes. No groundwater contamination was detected. The 1978 study also indicated that the existing lead was unlikely to migrate due to the fact that lead forms highly insoluble compounds in the slightly basic high carbonate soil which existed at the site. Nonetheless, an asphalt cap was placed over the contaminated soil at the time of demolition to minimize the potential for migration of any contaminants.

At the time of the 1978 study and subsequent plant demolition, there were no regulatory notification requirements that would have been applicable to the reported soil contamination. Furthermore, based upon current knowledge, the 1978 study would not appear to require that Hydra-matic notify EPA of a "current release" pursuant to Section 103(a) of the Comprehensive Environmental Response, Compensation and Liability Act ("CERCLA"). However, as a precautionary measure, Hydra-matic is providing this notification pursuant to Section 103(c) of CERCLA.

Hydra-matic intends to conduct an environmental assessment of the site to determine the current condition of the soil and groundwater. Any subsequent action will depend on the findings of the assessment.

Should you have any questions regarding these matters, please contact Gretchen Ferrari at (313) 481-5884.

Very truly yours,

Robert J. Haglund
Hydra-matic Division

NOTIFICATION OF HAZARDOUS WASTE ACTIVITY

INSTRUCTIONS: If you received a preprinted label, affix it in the space at left. If any of the information on the label is incorrect, draw a line through it and supply the correct information in the appropriate section below. If the label is complete and correct, leave Items I, II, and III below blank. If you did not receive a preprinted label, complete all items. "Installation" means a single site where hazardous waste is generated, treated, stored and/or disposed of, or a transporter's principal place of business. Please refer to the INSTRUCTIONS FOR FILING NOTIFICATION before completing this form. The information requested herein is required by law *(Section 3010 of the Resource Conservation and Recovery Act)*.

CONTINUE ON REVERSE

RECOMMENDATIONS

RECOMMENDATIONS

The Preliminary Review and Visual Site Inspection provided no evidence of current release of hazardous materials to the environment by the Hydra-matic Division of General Motors. Monitoring the asphalt cap for cracks and the groundwater in the area of the former Delco Remy Plant should be continued. The State Recommends no Sampling Visit be performed at this facility, pending review of sampling conducted by GM's contractor at the former battery plant.

INSPECTION REQUEST FORM

TO: Jim Hunt, Chief, Compliance Monitoring Section

FROM: Floyd R. Hertweck, Jr, Plan Review and Permit Section

THRU: Terry Gray, Chief, Plan Review and Permit Section

Facility: GMC - Hydra-Matic

EPA ID #: IND 006066286

Location: Muncie

Permit Writer's Initials: FRH

Key Date, CMEL: 03 / 07 / 88 (Date Plan Initially Received)

Date of This Request: 03 / 23 / 88

The following type of inspection is requested:

X Part B Call-In (RCRA) Compliance Evaluation (PBE)

____ Pre-Closure Inspection (PCI)

____ Closure Inspection (Final Certification Received ____ / ____ / ____) (CLI)

____ Other Inspection (Comment: _____) (CSI - if closure status inspection)

Priority:

X Part B Closure or Part B Call-In

____ Interim Status Closure

~~It~~ IT is requested that this inspection be conducted before 06 / 07 / 88. If this is not possible, please contact the Plan Review and Permit Section. A typewritten memorandum summarizing the inspection should be sent to the Plan Review and Permit Section within fifteen (15) days of your visit.

Re: Part B Permit Application
GMC Hydra-Matic Muncie
Muncie, Indiana
IND 006066286

Dear Mr. Berghoff:

Under the authorities of Indiana Rule 320 IAC 4.1-34-1 and 40 CFR 270.10, this is a formal request for submittal of the Part B portion of the Resource Conservation and Recovery Act (RCRA) Hazardous Waste Permit Application for GMC Hydra-Matic Muncie, 1200 West 8th Street, Muncie, Indiana, IND 006066286.

There are two parts to a RCRA Permit Application--Part A and Part B. The Part A consists of the form your company submitted on November 18, 1980, to the United States Environmental Protection Agency (U.S. EPA). This allowed your company to obtain "interim status," and to continue to operate the following hazardous waste management activities: container storage (S01), 20,000 gallons. On January 31, 1986, the Indiana Department of Environmental Management (IDEM) was authorized to implement the RCRA Program in lieu of the U.S. EPA. The next step in the hazardous waste permitting process would be for your company to submit the Part B Permit Application to the IDEM and the U.S. EPA.

If your company has acted as a treatment, storage or disposal facility (TSD) of hazardous waste at any time after November 19, 1980, and does not wish to continue to do so, then a closure plan must be submitted in lieu of the Part B Permit Application. If you have not treated, stored, or disposed of hazardous waste at any time on or after November 19, 1980, you are not subject to permit requirements. Therefore, you may request in writing an Administrative Change of Status to remove your company from the TSD list.

On November 8, 1984, the Hazardous and Solid Waste Amendments of 1984 (HSWA) were signed into law. This new law amends RCRA, and contains many provisions which affect your company. The final permit will contain a State portion prepared by the IDEM and a Federal portion prepared by the U.S. EPA. One important HSWA provision mandates that interim status shall terminate unless the Part B Permit Application is submitted for a determination regarding issuance of a final permit. Another provision requires corrective action for all releases of hazardous wastes or constituents from any solid waste management unit at a TSD facility seeking a permit under HSWA, regardless of the time at which waste was placed in the unit. The U.S. EPA will address these and other applicable provisions of HSWA during the permit review process.

We have also enclosed a copy of 320 IAC 4.1-41-49, 55 and 56 (rules promulgated prior to the enactment of HSWA) and 40 CFR 264.73(b)(3),(9),(11),(12); 90(a)(1); 101; 190-199 and 40 CFR 270.14(d)(3) and 16 which includes technical standards for the operation of treatment, storage, and disposal facilities. These standards, plus appropriate HSWA standards, will become applicable to your facility upon issuance of a final permit by the IDEM and the U.S. EPA. A copy of our "Part B Completeness Checklist" is also enclosed; it will help you to prepare a comprehensive and complete permit application.

The IDEM and the U.S. EPA are committed to jointly conducting the permitting process as efficiently as possible, and will strive for the simultaneous issuance of the Federal and State portions of the final RCRA permit. I suggest you contact Mr. Floyd R. Hertweck, Jr., of this office at AC 317/232-3264 as you begin preparing your application.

Sincerely,

Jane Magee

General Population

*Sensitive populations include: pregnant or nursing women, women that will become pregnant, and children under 6 years of age. These consumers should use caution when eating some types of sportfish.

**The maximum amount for adults to eat is determined by fishing location, species and fish length. For instance, if you eat the maximum amount of one species during a week, you should not eat any other fish which has a consumption limitation until the following week. Example - if you eat the limit (4 ounces) of a 20 inch long Carp from the Easy Catch River, then you should not eat any other sportfish from the list until the following week.

Howard County	Common Carp	up to 23	PCB	1 meal / week (8 ounces / week)
		23+	PCB	1 meal / month (8 ounces / month)
Eel River (Upper Wabash River Basin)				
Consumption of fish from the Eel River should be limited to no more than one meal per month (Group 3) by the general population and NO CONSUMPTION by the sensitive population. Exceptions are listed below.				
Cass/Miami/Wabash/Whitley County	Bluegill	6+	PCB	1 meal / 2months (8 ounces / 2 months)
	Common Carp	up to 24	PCB	1 meal / month (8 ounces / month)
		24+	PCB	1 meal / 2months (8 ounces / 2 months)
Eel River (West Fork White River Basin)				
Clay/Greene County	Channel Catfish	23+	PCB	1 meal / month (8 ounces / month)
	Sauger	18+	PCB	1 meal / month (8 ounces / month)
Elkhart River				
Elkhart County	Rock Bass	up to 7		unrestricted
	Smallmouth Bass	up to 12		unrestricted
Elkhorn Creek				

General Population

*Sensitive populations include: pregnant or nursing women, women that will become pregnant, and children under 6 years of age. These consumers should use caution when eating some types of sportfish.

**The maximum amount for adults to eat is determined by fishing location, species and fish length. For instance, if you eat the maximum amount of one species during a week, you should not eat any other fish which has a consumption limitation until the following week. Example - if you eat the limit (4 ounces) of a 20 inch long Carp from the Easy Catch River, then you should not eat any other sportfish from the list until the following week.

Mud Creek				
Fulton County	Creek Chub	up to 7		unrestricted
	White Sucker	up to 11		unrestricted
Muddy Fork of Sand Creek				
Decatur County	Black Redhorse	15+	Hg	1 meal / month (8 ounces / month)
	Bluegill	up to 6	Hg	unrestricted
	Northern Hogsucker	6-10	PCB	1 meal / month (8 ounces / month)
		10+	PCB	1 meal / 2months (8 ounces / 2 months)
	Rock Bass	up to 6		unrestricted
	White Sucker	12+		unrestricted

General Population

*Sensitive populations include: pregnant or nursing women, women that will become pregnant, and children under 6 years of age. These consumers should use caution when eating some types of sportfish.

**The maximum amount for adults to eat is determined by fishing location, species and fish length. For instance, if you eat the maximum amount of one species during a week, you should not eat any other fish which has a consumption limitation until the following week. Example - if you eat the limit (4 ounces) of a 20 inch long Carp from the Easy Catch River, then you should not eat any other sportfish from the list until the following week.

Sugar Creek (Walnut Fork) Consumption of all fish from the Walnut Fork of Sugar Creek above Little Sugar Creek should be limited to no more than one meal per week (Group 2) by the general population and one meal per month by the sensitive population. Exceptions for the general population are listed below.				
Montgomery County upstream of the confluence with Little Sugar Creek.	Black Redhorse	up to 14	PCB	1 meal / month (8 ounces / month)
		14+	PCB	1 meal / 2months (8 ounces / 2 months)
	Longear Sunfish	up to 4		unrestricted
	Rock Bass	up to 6		unrestricted
Summit Lake Henry County	Channel Catfish	up to 21		unrestricted
	Common Carp	up to 24		unrestricted
		24+	PCB	1 meal / week (8 ounces / week)
Sylvan Lake Noble County	Black Bullhead	up to 13		unrestricted
	Black Crappie	up to 10		unrestricted
	Bluegill	up to 8		unrestricted
	Common Carp	up to 28	PCB	1 meal / month (8 ounces / month)
		28+	PCB	1 meal / 2months (8 ounces / 2 months)
	Largemouth Bass	up to 12		unrestricted
	Northern Pike	up to 28		unrestricted
	Walleye	up to 18		unrestricted
	White Sucker	up to 15		unrestricted
Tanners Creek Dearborn County	Bluegill	up to 6		unrestricted
	Largemouth Bass	up to 13		unrestricted
		17+	Hg, PCB	1 meal / month (8 ounces / month)
Tippecanoe Lake Kosciusko County	Largemouth Bass	12+	Hg	1 meal / month (8 ounces / month)
Carroll County From Lake Freeman Dam to the confluence with the Wabash River	Black Redhorse	up to 17		unrestricted

General Population

*Sensitive populations include: pregnant or nursing women, women that will become pregnant, and children under 6 years of age. These consumers should use caution when eating some types of sportfish.

**The maximum amount for adults to eat is determined by fishing location, species and fish length. For instance, if you eat the maximum amount of one species during a week, you should not eat any other fish which has a consumption limitation until the following week. Example - if you eat the limit (4 ounces) of a 20 inch long Carp from the Easy Catch River, then you should not eat any other sportfish from the list until the following week.

*EXPLANATION OF ZONE DESIGNATIONS

ZONE	EXPLANATION
A	Areas of 100-year flood; base flood elevations and flood hazard factors not determined.
AO	Areas of 100-year shallow flooding where depths are between one (1) and three (3) feet; average depths of inundation are shown, but no flood hazard factors are determined.
AH	Areas of 100-year shallow flooding where depths are between one (1) and three (3) feet; base flood elevations are shown, but no flood hazard factors are determined.
A1-A30	Areas of 100-year flood; base flood elevations and flood hazard factors determined.
A99	Areas of 100-year flood to be protected by flood protection system under construction; base flood elevations and flood hazard factors not determined.
B	Areas between limits of the 100-year flood and 500-year flood; or certain areas subject to 100-year flooding with average depths less than one (1) foot or where the contributing drainage area is less than one square mile; or areas protected by levees from the base flood. (Medium shading)
C	Areas of minimal flooding. (No shading)
D	Areas of undetermined, but possible, flood hazards.
V	Areas of 100-year coastal flood with velocity (wave action); base flood elevations and flood hazard factors not determined.
V1-V30	Areas of 100-year coastal flood with velocity (wave action); base flood elevations and flood hazard factors determined.

NOTES TO USER

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size, or all plan-metric features outside Special Flood Hazard Areas.

Certain areas not in the Special Flood Hazard Areas may be protected by flood control structures.

Corporate limits shown are current as of the date of this map. Users should contact appropriate community officials to determine if any changes have occurred subsequent to the issuance of this map.

For adjoining panels, see separately printed Map Index.

Endangered Species List

Indiana's State Endangered Species

Also available online at www.endangeredwildlife.in.gov

STATE

STATE ENDANGERED: Any animal species whose prospects for survival or recruitment within the state are in immediate jeopardy and are in danger of disappearing from the state. This includes all species classified as endangered by the federal government that occur in Indiana.

SPECIAL CONCERN: Any animal species requiring monitoring because of known/suspected limited abundance or distribution or because of a recent change in legal status or required habitat.

FEDERAL

FEDERALLY ENDANGERED: Any species that is in danger of extinction throughout all or a significant portion of its range. Designated with (FE).

FEDERALLY THREATENED: Any species that is likely to become endangered within the foreseeable future throughout all or a significant portion of its range. Designated with (FT).

FEDERAL CANDIDATE: These species have been submitted for review for protection under the Federal Endangered Species Act. If added to the federal list, they will automatically be considered a state endangered species. Designated with (FC).

M A M M A L S

State Endangered

Gray Myotis (FE)	*Myotis grisescens*
Indiana Myotis (FE)	*Myotis sodalis*
Evening Bat	*Nycticeius humeralis*
Swamp Rabbit	*Sylvilagus aquaticus*
Franklin's Ground Squirrel	*Spermophilus franklinii*
Allegheny Woodrat	*Neotoma magister*

Special Concern

Smoky Shrew	*Sorex fumeus*
Pygmy Shrew	*Sorex hoyi*
Star-nosed Mole	*Condylura cristata*
Southeastern Myotis	*Myotis austroriparius*
Eastern small-footed Myotis	*Myotis leibii*
Little Brown Myotis	*Myotis lucifugus*
Northern long-eared Myotis	*Myotis septentrionalis*
Silver-haired Bat	*Lasionycteris noctivagans*
Eastern Pipistrelle	*Perimyotis subflavus*
Red Bat	*Lasiurus borealis*
Hoary Bat	*Lasiurus cinereus*
Rafinesque's Big-eared Bat	*Corynorhinus rafinesquii*
Plains Pocket Gopher	*Geomys bursarius*
Least Weasel	*Mustela nivalis*
Badger	*Taxidea taxus*

B I R D S

State Endangered

Trumpeter Swan	*Cygnus buccinator*
American Bittern	*Botaurus lentiginosus*
Least Bittern	*Ixobrychus exilis*
Black-crowned Night-Heron	*Nycticorax nycticorax*
Yellow-crowned Night-Heron	*Nyctanassa violacea*
Osprey	*Pandion haliaetus*
Northern Harrier	*Circus cyaneus*
Peregrine Falcon	*Falco peregrinus*
Black Rail	*Laterallus jamaicensis*
King Rail	*Rallus elegans*
Virginia Rail	*Rallus limicola*
Common Moorhen	*Gallinula chloropus*
Whooping Crane (FE)	*Grus americana*
Piping Plover (FE)	*Charadrius melodus*
Upland Sandpiper	*Bartramia longicauda*
Least Tern (FE)	*Sternula antillarum*
Black Tern	*Chlidonias niger*
Barn Owl	*Tyto alba*
Short-eared Owl	*Asio flammeus*
Loggerhead Shrike	*Lanius ludovicianus*
Sedge Wren	*Cistothorus platensis*
Marsh Wren	*Cistothorus palustris*
Golden-winged Warbler	*Vermivora chrysoptera*
Kirtland's Warbler (FE)	*Dendroica kirtlandii*
Cerulean Warbler	*Dendroica cerulea*
Henslow's Sparrow	*Ammodramus henslowii*
Yellow-headed Blackbird	*Xanthocephalus xanthocephalus*

Special Concern

Great Egret	*Ardea alba*
Mississippi Kite	*Ictinia mississippiensis*
Bald Eagle	*Haliaeetus leucocephalus*
Sharp-shinned Hawk	*Accipiter striatus*
Red-shouldered Hawk	*Buteo lineatus*
Broad-winged Hawk	*Buteo platypterus*
Sandhill Crane	*Grus canadensis*
American Golden-Plover	*Pluvialis dominica*
Solitary Sandpiper	*Tringa solitaria*
Greater Yellowlegs	*Tringa melanoleuca*
Ruddy Turnstone	*Arenaria interpres*
Buff-breasted Sandpiper	*Tryngites subruficollis*
Short-billed Dowitcher	*Limnodromus griseus*
Wilson's Phalarope	*Phalaropus tricolor*
Common Nighthawk	*Chordeiles minor*
Whip-poor-will	*Caprimulgus vociferus*
Black-and-white Warbler	*Mniotilta varia*
Worm-eating Warbler	*Helmitheros vermivorum*
Hooded Warbler	*Wilsonia citrina*
Western Meadowlark	*Sturnella neglecta*

Revised 4/2013

FISH

State Endangered

Northern Brook Lamprey	*Ichthyomyzon fossor*
Lake Sturgeon	*Acipenser fulvescens*
Redside Dace	*Clinostomus elongatus*
Pallid Shiner	*Hybopsis amnis*
Greater Redhorse	*Moxostoma valenciennesi*
Northern Cavefish	*Amblyopsis spelaea*
Bantam Sunfish	*Lepomis symmetricus*
Variegate Darter	*Etheostoma variatum*
Channel Darter	*Percina copelandi*
Gilt Darter	*Percina evides*

Special Concern

Pugnose Shiner	*Notropis anogenus*
Bigmouth Shiner	*Notropis dorsalis*
Longnose Dace	*Rhinichthys cataractae*
Longnose Sucker	*Catostomus catostomus*
Northern Madtom	*Noturus stigmosus*
Ohio River Muskellunge	*Esox masquinongy ohioensis*
Cisco	*Coregonus artedi*
Lake Whitefish	*Coregonus clupeaformis*
Trout-perch	*Percopsis omiscomaycus*
Slimy Sculpin	*Cottus cognatus*
Western Sand Darter	*Ammocrypta clara*
Spotted Darter	*Etheostoma maculatum*
Cypress Darter	*Etheostoma proeliare*
Tippecanoe Darter	*Etheostoma tippecanoe*
Banded Pygmy Sunfish	*Elassoma zonatum*

MOLLUSKS*

State Endangered

Fanshell (FE)	*Cyprogenia stegaria*
White Catspaw (FE)	*Epioblasma obliquata perobliqua*
Northern Riffleshell (FE)	*Epioblasma torulosa rangiana*
Tubercled Blossom (FE)	*Epioblasma torulosa torulosa*
Snuffbox (FE)	*Epioblasma triquetra*
Longsolid	*Fusconaia subrotunda*
Pink Mucket (FE)	*Lampsilis abrupta*
Round Hickorynut	*Obovaria subrotunda*
White Wartyback (FE)	*Plethobasus cicatricosus*
Orangefoot Pimpleback (FE)	*Plethobasus cooperianus*
Sheepnose (FE)	*Plethobasus cyphyus*
Clubshell (FE)	*Pleurobema clava*
Rough Pigtoe (FE)	*Pleurobema plenum*
Pyramid Pigtoe	*Pleurobema rubrum*
Fat Pocketbook (FE)	*Potamilus capax*
Rabbitsfoot (FC)	*Quadrula cylindrica cylindrica*
Rayed Bean (FE)	*Villosa fabalis*

Special Concern

Wavyrayed Lampmussel	*Lampsilis fasciola*
Ohio Pigtoe	*Pleurobema cordatum*
Kidneyshell	*Ptychobranchus fasciolaris*
Salamander Mussel	*Simpsonaias ambigua*
Purple Lilliput	*Toxolasma lividus*
Ellipse	*Venustaconcha ellipsiformis*
Little Spectaclecase	*Villosa lienosa*
Pointed Campeloma	*Campeloma decisum*
Swamp Lymnaea	*Lymnaea stagnalis*

* It is illegal to take or possess live mussels and mussel shells of any species of native mussel from the waters of Indiana.

AMPHIBIANS

State Endangered

Hellbender	*Cryptobranchus alleganiensis*
Mole Salamander	*Ambystoma talpoideum*
Green Salamander	*Aneides aeneus*
Red Salamander	*Pseudotriton ruber*
Crawfish Frog	*Lithobates areolatus*
Plains Leopard Frog	*Lithobates blairi*

Special Concern

Common Mudpuppy	*Necturus maculosus*
Streamside Salamander	*Ambystoma barbouri*
Blue-spotted Salamander	*Ambystoma laterale*
Four-toed Salamander	*Hemidactylium scutatum*
Northern Cricket Frog	*Acris crepitans*
Northern Leopard Frog	*Lithobates pipiens*

REPTILES

State Endangered

Alligator Snapping Turtle	*Macrochelys temminckii*
Eastern Mud Turtle	*Kinosternon subrubrum*
Spotted Turtle	*Clemmys guttata*
Blanding's Turtle	*Emydoidea blandingii*
River Cooter	*Pseudemys concinna*
Ornate Box Turtle	*Terrapene ornata*
Scarletsnake	*Cemophora coccinea*
Kirtland's Snake	*Clonophis kirtlandii*
Copper-bellied Watersnake (FT†)	*Nerodia erythrogaster*
Smooth Greensnake	*Opheodrys vernalis*
Southeastern Crowned Snake	*Tantilla coronata*
Butler's Gartersnake	*Thamnophis butleri*
Cottonmouth	*Agkistrodon piscivorus*
Timber Rattlesnake	*Crotalus horridus*
Massasauga (FC)	*Sistrurus catenatus*

Special Concern

Eastern Box Turtle	*Terrapene carolina*
Red-bellied Mudsnake	*Farancia abacura*
Rough Greensnake	*Opheodrys aestivus*
Western Ribbonsnake	*Thamnophis proximus*

† Only the northern population of copperbelly water snake is federally threatened.

Support the conservation of Indiana's nongame and endangered species by donating to the Nongame Fund. The money you donate goes directly to the protection and management of more than 750 wildlife species in Indiana. Look for the eagle logo on your Indiana state tax form to donate all or part of your refund. Or to donate directly write to:
Nongame Fund, 402 W. Washington St. Rm W273, Indianapolis, IN 46204.

Endangered, Threatened, Rare and Extirpated Plants of Indiana

Species Name	Common Name	GRANK	SRANK	FEDERAL	STATE
Acalypha deamii	Mercury	G4?	S2		SR
Aconitum uncinatum	Blue Monkshood	G4	S1		SE
Actaea rubra	Red Baneberry	G5	S2		SR
Adlumia fungosa	Climbing Fumatory	G4	SX		SX
Aesculus octandra	Yellow Buckeye	G5	S3		WL
Agalinis auriculata	Earleaf Foxglove	G3	S1		ST
Agalinis fasciculata	Clustered Foxglove	G5	S3		WL
Agalinis gattingeri	Roundstem Foxglove	G4	S3		WL
Agalinis skinneriana	Pale False Foxglove	G3G4	S1		ST
Agave virginica	Virginia Tube-rose	G5	S3		WL
Alnus rugosa	Speckled Alder	G5T5	S3		WL
Amelanchier humilis	Running Serviceberry	G5	S1		SE
Ammophila breviligulata	Marram Grass	G5	S3		WL
Andromeda glaucophylla	Bog Rosemary	G5	S2		SR
Andropogon ternarius	Silver Bluestem	G5	S3		WL
Androsace occidentalis	Western Rockjasmine	G5	S2		ST
Anemone caroliniana	Carolina Anemone	G5	SX		SX
Antennaria solitaria	Single-head Pussytoes	G5	S3		WL
Arabis drummondii	Drummond Rockcress	G5	S1		SE
Arabis glabra	Tower-mustard	G5	S2		WL
Arabis missouriensis var. deamii	Missouri Rockcress	G5T3?Q	S1		SE
Arabis patens	Spreading Rockcress	G3	S1		SE
Aralia hispida	Bristly Sarsaparilla	G5	S1		SE
Arctostaphylos uva-ursi	Bearberry	G5	S2		SR
Arenaria patula	Pitcher's Stitchwort	G4	S1		SE
Arenaria stricta	Michaux's Stitchwort	G5	S2		SR
Arethusa bulbosa	Swamp-pink	G4	SX		SX
Aristida intermedia	Slim-spike Three-awn Grass	GNR	S2		SR
Aristida tuberculosa	Seabeach Needlegrass	G5	S2		SR
Aristolochia tomentosa	Woolly Dutchman's-pipe	G5	S3		WL
Armoracia aquatica	Lake Cress	G4?	S1		SE
Asclepias meadii	Mead's Milkweed	G2	SX	LT	SRE
Asclepias variegata	White Milkweed	G5	S3		WL
Asclepias viridis	Green Milkweed	G4G5	S1		SE
Asplenium bradleyi	Bradley's Spleenwort	G4	S1		SE

GRANK G1=critically imperiled globally, G2=imperiled globally,G3=rare or uncommon,G4= widespread but with long term concerns, G5=widespread and secure, T ranks indicate taxonomic subunit rank, ? or Q=questionable rank, NR=not ranked or uncertain rank

Endangered, Threatened, Rare and Extirpated Plants of Indiana

Species Name	Common Name	GRANK	SRANK	FEDERAL	STATE
Asplenium montanum	Mountain Spleenwort	G5	S1		SE
Asplenium resiliens	Black-stem Spleenwort	G5	S1		SE
Asplenium ruta-muraria	Wallrue Spleenwort	G5	S2		SR
Aster borealis	Rushlike Aster	G5	S2		SR
Aster furcatus	Forked Aster	G3	S2		SR
Aster oblongifolius	Aromatic Aster	G5	S2		SR
Aster schreberi	Schreber Aster	G4	S1		SE
Aster sericeus	Western Silvery Aster	G5	S2		SR
Aster solidagineus	Narrowleaf Aster	G5	S3		WL
Aster undulatus	Waxy-leaved Aster	G5	S3		WL
Astragalus tennesseensis	Tennessee Milk-vetch	G3	SX		SRE
Aureolaria grandiflora var. pulchra	Large-flower False-foxglove	G4G5T4T5	SX		SX
Azolla caroliniana	Carolina Mosquito-fern	G5	S2		ST
Bacopa rotundifolia	Roundleaf Water-hyssop	G5	S1		ST
Baptisia australis	Wild False Indigo	G5	S2		SR
Baptisia leucophaea	Cream Wild-indigo	G4G5	S3		WL
Baptisia tinctoria	Yellow Wild-indigo	G5	S3		WL
Bartonia paniculata	Twining Bartonia	G5	S3		WL
Berberis canadensis	American Barberry	G3	S1		SE
Besseya bullii	Kitten Tails	G3	S1		SE
Betula papyrifera	Paper Birch	G5	S3		WL
Betula populifolia	Gray Birch	G5	S1		SE
Bidens beckii	Beck Water-marigold	G4G5	S1		ST
Botrychium biternatum	Sparse-lobe Grape-fern	G5	S3		WL
Botrychium matricariifolium	Chamomile Grape-fern	G5	S2		SR
Botrychium multifidum var. intermedium	Leathery Grape-fern	G5T4?	SX		SX
Botrychium oneidense	Blunt-lobe Grape-fern	G4	S3		WL
Botrychium simplex	Least Grape-fern	G5	S1		SE
Brachyelytrum aristosum	Northern shorthusk	G4G5	S1		SE
Buchnera americana	Bluehearts	G5?	S1		SE
Bumelia lycioides	Buckthorn	G5	S1		SE
Cabomba caroliniana	Carolina Fanwort	G3G5	SX		SX
Cakile edentula var. lacustris	American Sea-rocket	G5T3T5	S3		WL
Calamagrostis porteri ssp. insperata	Reed Bent Grass	G4T3	S1		ST
Calamagrostis porteri ssp. porteri	Porter's reedgrass	G4T4	S1		SE

Endangered, Threatened, Rare and Extirpated Plants of Indiana

Species Name	Common Name	GRANK	SRANK	FEDERAL	STATE
Cyperus pseudovegetus	Green Flatsedge	G5	S2		SR
Cypripedium acaule	Pink Lady's-slipper	G5	S3		WL
Cypripedium calceolus var. parviflorum	Small Yellow Lady's-slipper	G5	S2		SR
Cypripedium calceolus var. pubescens	Large Yellow Lady's-slipper	G5T5	S3		WL
Cypripedium candidum	Small White Lady's-slipper	G4	S2		WL
Cypripedium reginae	Showy Lady's-slipper	G4	S3		WL
Dennstaedtia punctilobula	Eastern Hay-scented Fern	G5	S3		WL
Dentaria diphylla	Two-leaf Toothwort	G5	S3		WL
Dentaria multifida	Divided Toothwort	G4?	S1		SE
Deschampsia cespitosa	Tufted Hairgrass	G5	S2		SR
Desmodium laevigatum	Smooth Tick-trefoil	G5	S3		WL
Desmodium viridiflorum	Velvety Tick-trefoil	G5?	S3		WL
Dichanthelium sabulorum var. thinium	Hemlock Panic-grass	G5T5	S2		SR
Dicliptera brachiata	Wild Mudwort	G5	S1		SE
Didiplis diandra	Water-purslane	G5	S2		SE
Diervilla lonicera	Northern Bush-honeysuckle	G5	S2		SR
Diodia virginiana	Buttonweed	G5	S2		WL
Dodecatheon frenchii	French's Shootingstar	G3	S2		SR
Drosera intermedia	Spoon-leaved Sundew	G5	S2		SR
Drosera rotundifolia	Roundleaf Sundew	G5	S3		WL
Dryopteris celsa	Log Fern	G4	S1		SE
Dryopteris clintoniana	Clinton Woodfern	G5	SX		SX
Echinodorus berteroi	Burhead	G5	SX		SX
Echinodorus cordifolius	Creeping Bur-head	G5	S1		SE
Echinodorus parvulus	Little Bur-head	G3Q	S1		SE
Eleocharis bifida	Glades spikerush	G3G4	S1		SE
Eleocharis equisetoides	Horse-tail Spikerush	G4	S1		SE
Eleocharis geniculata	Capitate Spike-rush	G5	S2		ST
Eleocharis melanocarpa	Black-fruited Spike-rush	G4	S2		ST
Eleocharis microcarpa	Small-fruited Spike-rush	G5	S1		SE
Eleocharis pauciflora	Fewflower Spikerush	G5	S3		WL
Eleocharis robbinsii	Robbins Spikerush	G4G5	S2		SR
Eleocharis wolfii	Wolf Spikerush	G3G4	S2		SR
Epigaea repens	Trailing Arbutus	G5	S3		WL
Epilobium angustifolium	Fireweed	G5	S1		SE

Species Name	Common Name	GRANK	SRANK	FEDERAL	STATE
Epilobium ciliatum	Hairy Willow-herb	G5	SX		SX
Equisetum sylvaticum	Woodland Horsetail	G5	S1		SE
Equisetum variegatum	Variegated Horsetail	G5	S1		SE
Erianthus alopecuroides	Woolly Beardgrass	G5	S3		WL
Eriocaulon aquaticum	Pipewort	G5	S1		SE
Eriophorum angustifolium	Narrow-leaved Cotton-grass	G5	S2		SR
Eriophorum gracile	Slender Cotton-grass	G5	S2		ST
Eriophorum spissum	Dense Cotton-grass	G5T5	SX		SX
Eriophorum viridicarinatum	Green-keeled Cotton-grass	G5	S2		SR
Erysimum capitatum	Prairie-rocket Wallflower	G5	S2		ST
Eupatorium album	White Thoroughwort	G5	S1		ST
Eupatorium incarnatum	Pink Thoroughwort	G5	S2		ST
Eupatorium rotundifolium	Round-leaved Boneset	G5	S3		WL
Euphorbia obtusata	Bluntleaf Spurge	G5	S1		SE
Euphorbia polygonifolia	Seaside Spurge	G5?	S3		SR
Euphorbia serpens	Matted Broomspurge	G5	S1		SE
Festuca paradoxa	Cluster Fescue	G5	S1		ST
Filipendula rubra	Queen-of-the-prairie	G4G5	S3		WL
Fimbristylis annua	Annual Fimbry	G5	S1		SE
Fimbristylis puberula	Carolina Fimbry	G5	S1		SE
Fragaria vesca var. americana	Woodland Strawberry	G5T5	S1		SE
Fuirena pumila	Dwarf Umbrella-sedge	G4	S2		ST
Galactia volubilis var. mississippiensis	Eastern Milk-pea	G5	S3		WL
Gaura filipes	Slender-stalked Gaura	G5	S2		ST
Gentiana alba	Yellow Gentian	G4	S2		SR
Gentiana puberulenta	Downy Gentian	G4G5	S2		ST
Gentiana villosa	Striped Gentian	G4	S1		SE
Geranium bicknellii	Bicknell Northern Crane's-bill	G5	S1		SE
Geranium robertianum	Herb-robert	G5	S2		ST
Geum rivale	Purple Avens	G5	S1		SE
Gleditsia aquatica	Water-locust	G5	S1		SE
Glyceria acutiflora	Sharp-scaled Manna-grass	G5	S1		SE
Glyceria borealis	Small Floating Manna-grass	G5	S1		SE
Glyceria grandis	American Manna-grass	G5	S1		SE
Gnaphalium macounii	Winged Cudweed	G5	SX		SX

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Total solids	%	-	-	-	-	-	-	-	-	-	-	-	-

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

pH	s.u.	-	-	-	-	-	-	-	-	-	-	-
Saturated aliphatic hydrocarbons	mg/kg	-	-	-	-	-	-	-	-	-	-	-
Sulfate	mg/kg	-	-	-	-	-	-	-	-	-	-	-
Total solids	%	-	-	-	-	-	-	-	-	-	-	-

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Total solids	%	-	-	-	-	-	-	-	-	-	-	-

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

General Chemistry							
Carbonate (as CaCO3)	mg/kg	-	-	-	-	-	-
Chloride	mg/kg	-	-	-	-	-	-
Chloride	s.u.	-	-	-	-	-	-
Cyanide (total)	mg/kg	-	-	-	-	-	-
N-Hexane extractable material	mg/kg	-	-	-	-	-	-
Percent moisture	%	-	-	-	-	-	-
pH	s.u.	-	-	-	-	-	-
Saturated aliphatic hydrocarbons	mg/kg	-	-	-	-	-	-
Sulfate	mg/kg	-	-	-	-	-	-
Total solids	%	-	-	-	-	-	-

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Sulfate	mg/kg	-	-	-	-	-	-
Total solids	%	-	-	-	-	-	-

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Total solids	%	86	85	90	90	-	-	-	-	-	81.8

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Sulfate	mg/kg	-	-	-	-	-	-
Total solids	%	88.6	81.5	87.5	79.5	89.7	89.6

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Total solids	%	-	-	-	-	-	-	-	-	83.6	81.9

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

pH	s.u.	-	-	-	-	-	-	-	-	-
Saturated aliphatic hydrocarbons	mg/kg	-	-	-	-	-	-	-	-	-
Sulfate	mg/kg	-	-	-	-	-	-	-	-	-
Total solids	%	93.9	89.2	89.9	91	95	95	88	86	96

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Sulfate	mg/kg	-	-	-	-	-	-	-	-	-	-	-
Total solids	%	-	-	-	-	-	-	-	-	-	-	-

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Sulfate	mg/kg	-	-	-	-	-	-
Total solids	%	-	-	-	-	-	-

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Sulfate	mg/kg	-	-	-	-	-	-	-	-	-	-	-	-
Total solids	%	-	-	-	-	-	-	-	-	-	-	-	-

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

General Chemistry											
Carbonate (as CaCO3)	mg/kg	nc	nc	nc	-	-	-	-	-	-	-
Chloride	mg/kg	nc	nc	nc	-	-	-	-	-	-	-
Chloride	s.u.	nc	nc	nc	-	-	-	-	-	-	-
Cyanide (total)	mg/kg	40	140	230	-	-	-	-	-	-	-
N-Hexane extractable material	mg/kg	nc	nc	nc	-	-	-	-	-	-	-
Percent moisture	%	nc	nc	nc	-	-	-	-	-	-	-
pH	s.u.	nc	nc	nc	-	-	-	-	-	-	-
Saturated aliphatic hydrocarbons	mg/kg	nc	nc	nc	-	-	-	-	-	-	-
Sulfate	mg/kg	nc	nc	nc	-	-	-	-	-	-	-
Total solids	%	nc	nc	nc	-	-	-	-	-	-	-

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

Notes

mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

N-Hexane extractable material	mg/kg	-	-	-	-	-	-	-	-	-	-
Percent moisture	%	-	-	-	-	-	-	-	-	-	-
pH	s.u.	-	-	-	-	-	-	-	-	-	-
Saturated aliphatic hydrocarbons	mg/kg	-	-	-	-	-	-	-	-	-	-
Sulfate	mg/kg	-	-	-	-	-	-	-	-	-	-
Total solids	%	-	-	-	-	-	-	-	-	-	-

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
a - Exceeds IDEM residential migration to ground water screening levels
b - Exceeds IDEM commercial/industrial direct contact screening levels
c - Exceeds IDEM excavation direct contact screening levels

General Chemistry							
Carbonate (as CaCO3)	mg/kg	-	-	-	-	-	-
Chloride	mg/kg	-	-	-	-	-	-
Chloride	s.u.	-	-	-	-	-	-
Cyanide (total)	mg/kg	-	-	-	-	-	-
N-Hexane extractable material	mg/kg	-	-	-	-	-	-
Percent moisture	%	-	-	-	-	-	-
pH	s.u.	-	-	-	-	-	-
Saturated aliphatic hydrocarbons	mg/kg	-	-	-	-	-	-
Sulfate	mg/kg	-	-	-	-	-	-
Total solids	%	-	-	-	-	-	-

Notes
mg/kg - Milligrams per kilogram
"-" - No value
U - Not detected at the associated reporting limit
J - Estimated concentration
UJ - Not detected; associated reporting limit is estimated
R - Rejected
s.u. - Standard units
nc - No criteria
ND - Non Detect (calculation)
BOLD[abc] Concentration exceeds associated screening level
IDEM Appendix A: Screening Levels Remedation Closure Guide - March 25, 2014
