CASE NARRATIVE

A1D150470

The following report contains the analytical results for twenty-seven solid samples, four water samples and one quality control sample submitted to TestAmerica North Canton by Ohio Environmental Protection Agency from the MANSFIELD PH 2 Site, project number 103S17104. The samples were received April 15, 2011, according to documented sample acceptance procedures and were analyzed in accordance with Ohio Voluntary Action Program protocols, where applicable. The following requested analytes, parameter groups or methods analyzed and contained in this report are not certified by the laboratory: 1-Methylnapthalene by SW 8270C. This report may contain sample results between the MDL and RL. Results below the RL are not certified under the Oho Voluntary Action Program.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by a dry weight adjustment footnote at the bottom of the analytical report page. The list of parameters which are never reported on a dry weight basis is included on the Sample Summary.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the method detection limit and include qualified results where applicable.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

CASE NARRATIVE (continued)

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The coolers were received at temperatures ranging from 1.9 to 2.9° C.

GC/MS VOLATILES

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for SD06-LAN-0411 and SD12-LAN-0411 had RPD's outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

The matrix spike/matrix spike duplicate(s) for batch(es) 1116383 had RPD's outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample.

Sample(s) LANDFILL BORING 2, SB91-NEW-2527-0411, SB92-NEW-2530-0411, SB93-NEW-2730-0411, SD04-SSA-0411, SD05-SSA-0411, SD07-LAN-0411 and SD11-LAN-0411 were reanalyzed at a dilution due to internal standard recoveries outside of acceptance limits, per Ohio VAP requirements. Only compounds associated with internal standards that met criteria are reported from each analysis.

CASE NARRATIVE (continued)

GC/MS VOLATILES (cont)

Batch 1118255 had recoveries out high in the LCS. Since there were no reportable target analytes in any of the associated samples, no corrective action was necessary.

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch 1118255. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

An MS/MSD was analyzed in batch 1118325 but could not be reported because the associated sample was VAP with internal standard failures.

GC/MS SEMIVOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for SB66-CSA-04-0411 and SD08-LAN-0411 had RPD's outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

The matrix spike/matrix spike duplicate(s) for batch(es) 1105334 and 1108058 had RPD's outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

No corrective action was taken for the 4-Chlorophenyl phenyl ether failure for the LCS associated with batches1105331, 1105332, 1105334 and 1108046 due to questionable analyte concentration in calibration. If a hit for this analyte was detected, further corrective action would be required.

Samples SB67-CSA-04-0411, SB69-CSA-02-0411, SB93-NEW-2730-0411, SB63-CSA-02-0411, SB65-CSA-02-0411, SB63-CSA-04-0411, SB66-CSA-02-0411, SB62-CSA-04-0411, and SB62-CSA-04-0411 had elevated reporting limits due to matrix interferences.

There was no client requested matrix spike / matrix spike duplicate (MS/MSD) in batch 1108046.

CASE NARRATIVE (continued)

PURGEABLE PETROLEUM HYDROCARBONS-8015

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for SB63-CSA-04-0411 had RPD's outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

The MS for sample SB63-CSA-04-0411in batch 1119101 appears to have had a bad purge. Because it was not client specific, corrective action was not taken.

The opening CCV failed high for samples DUP0413, SB63-CSA-02-0411, SB65-CSA-02-0411 and B66-CSA-02-0411. Since the samples were non-detect, no corrective action is required.

EXTRACTABLE PETROLEUM HYDROCARBONS-8015

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The closing CCV failed high for samples SB64-CSA-04-0411 and DUP0413 for Diesel. Since the samples were non-detect (or J-flag values), no corrective action was needed.

There was no client requested matrix spike / matrix spike duplicate (MS/MSD) in batch 1108051.

POLYCHLORINATED BIPHENYLS-8082

The analytical results met the requirements of the laboratory's QA/QC program.

CASE NARRATIVE (continued)

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "J". Refer to the sample report pages for the affected analyte(s).

Matrix spike recovery and relative percent difference (RPD) data were not calculated for some analytes for batch(es) 1111027 due to the sample concentration reading greater than four times the spike amount. See the Matrix Spike Report for the affected analytes which will be flagged with "NC, MSB".

Solid samples with MS/MSD's utilize targeted weights due to LIM's calculation limitations. Weights are not targeted for all other solid metals samples.

GENERAL CHEMISTRY

The analytical results met the requirements of the laboratory's QA/QC program.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called Quality Control Batches (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a Method Blank (MB), a Laboratory Control Sample (LCS) and, a Matrix Spike/Matrix Spike Duplicate (MS/MSD) pair or a Matrix Spike/Sample Duplicate (MS/DU) pair.
For 600 series/CWA methods, QC samples include a Method Blank (MB), a Laboratory Control Sample (LCS) and, where appropriate, a Matrix Spike (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch, with the exception of poor performing analytes. A list of these analytes is listed below. No corrective action is taken if these analytes do not meet criteria.Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

Poor performers

Method 8270 Water and Solid:	
4-Nitrophenol	3,3' – Dichlorobenzidine
Benzoic Acid	2,4,6 - Tribromophenol
Phenol	2,4-Dinitrophenol
Phenol-d5	Pentachlorophenol
4,6-Dinitro-2-methylphenol	Hexachlorocyclopentadiene (LCG only)
Benzyl Alcohol	4-Chloroaniline
Method 8151 Solid	
Dinoseb	
Method 8260 Water and Solid	
Dichlorodifluoromethane	Hexachlorobutadiene
Trichlorofluoromethane	Naphthalene
Chloroethane	1,2,3-Trichlorobenzene
Acetone	1,2,4-Trichlorobenzene
Bromomethane	2,2-Dichloropropane
Bromoform	Chloromethane

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be ten fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results do not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate or Matrix Spike/Sample Duplicate.

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater. For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.
California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),

Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada (#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190), DoD ELAP (ADE-1437) USDA Soil Permit (P33-08-00123)

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

CASE NARRATIVE

A1D150489

The following report contains the analytical results for five solid samples submitted to TestAmerica North Canton by Ohio Environmental Protection Agency from the MANSFIELD PH 2 Site, project number 103S17104. The samples were received April 15, 2011, according to documented sample acceptance procedures and were analyzed in accordance with Ohio Voluntary Action Program protocols, where applicable. This report may contain sample results between the MDL and RL. Results below the RL are not certified under the Oho Voluntary Action Program.

The 8015 Ethylene Glycol analysis was performed at the TestAmerica Dayton Laboratory. A copy of their report has been included.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. Preliminary results were provided to Guy Montfort, Martin Smith, and Vicky Farmer on April 20, 2011. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by a dry weight adjustment footnote at the bottom of the analytical report page. The list of parameters which are never reported on a dry weight basis is included on the Sample Summary.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the method detection limit and include qualified results where applicable.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

CASE NARRATIVE (continued)

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The coolers were received at temperatures ranging from 1.9 to 2.9° C.

GENERAL CHEMISTRY

The sample duplicate data for batch(es) 110087 and 1110088 is not included in this report for Total Solids. The batch QC samples, which document the effect of a specific sample matrix on method performance, were not associated with a sample reported in this lot. The data, therefore, has no bearing on the samples reported herein. In order to document compliance with the QC requirement for a sample duplicate per 10 environmental samples, a summary of the sample/QC associations has been provided following this case narrative

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called Quality Control Batches (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a Method Blank (MB), a Laboratory Control Sample (LCS) and, a Matrix Spike/Matrix Spike Duplicate (MS/MSD) pair or a Matrix Spike/Sample Duplicate (MS/DU) pair.
For 600 series/CWA methods, QC samples include a Method Blank (MB), a Laboratory Control Sample (LCS) and, where appropriate, a Matrix Spike (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch, with the exception of poor performing analytes. A list of these analytes is listed below. No corrective action is taken if these analytes do not meet criteria.Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

Poor performers

Method 8270 Water and Solid:	
4-Nitrophenol	3,3' – Dichlorobenzidine
Benzoic Acid	2,4,6 - Tribromophenol
Phenol	2,4-Dinitrophenol
Phenol-d5	Pentachlorophenol
4,6-Dinitro-2-methylphenol	Hexachlorocyclopentadiene (LCG only)
Benzyl Alcohol	4-Chloroaniline
Method 8151 Solid	
Dinoseb	
Method 8260 Water and Solid	
Dichlorodifluoromethane	Hexachlorobutadiene
Trichlorofluoromethane	Naphthalene
Chloroethane	1,2,3-Trichlorobenzene
Acetone	1,2,4-Trichlorobenzene
Bromomethane	2,2-Dichloropropane
Bromoform	Chloromethane

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be ten fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results do not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate or Matrix Spike/Sample Duplicate.

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater. For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.
California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),

Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada (#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190), DoD ELAP (ADE-1437) USDA Soil Permit (P33-08-00123)

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Case Narrative: Results for ethylene glycol are Ohio VAP compliant at values at or above the laboratory reporting limit (RL). Values that are reported between the RL and laboratory method detection level are not compliant with the Ohio VAP program because they are estimated.

Ohio Certification Number: 4074, 857

Reproduction of this analytical report is permitted only in its entirety. This report shall not be reproduced except in full without the written approval of the laboratory.

CERTIFICATION SUMMARY

Any abnormalities or departures from sample acceptance policy shall be documented on the Chain of Custody and/or Case Narrative included with this report.

For information concerning certifications of this facility or another TestAmerica facility, please visit our website at www.TestAmericaInc.com

Samples collected by TestAmerica Field Services personnel are noted on the Chain of Custody (COC) .

DATA QUALIFIERS AND DEFINITIONS

J Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of unknown quality.

ADDITIONAL COMMENTS

Results are reported on a wet weight basis unless otherwise noted in the units.

Cooler/Sample Receipt

☐ MSDS or Known Hazard Information Supplied by Client
☐ Bottle stickers applied ☐ ELEMENT comment entered ☐ MSDS/COC scanned/emailed to EH&S
☐ Discrepancies Client ID W Creek
☐ Short Hold Work Order # DUD0796
☐ Rush ☐24hr ☐2day ☐3day ☐5day ☐other
Receipt evaluation performed by - Initials: JH Date: 4/16/11 Time: 1015

Method of Shipment:
☐ Walk-In Client ☐ TestAmerica Field/Courier
☐ Other Client/3rd Party Courier
☒ Fed Ex Tracking # 9784 9675 9370
☐ UPS Tracking #
☐ Other

Shipping Container Type:
☒ Cooler ☐ Box
☐ None ☐ Other
Packing Materials:
☒ Plastic Bags ☐ Foam
☒ Bubble Wrap ☐ Paper
☐ Packing Peanuts ☐ None
☐ Other

Custody Seals Intact:
☒ Yes ☐ No
☐ N/A (not used or required)
Cooling Materials:
☒ Ice *(solid)* ☐ Ice *(Melted)*
☐ Blue Ice ☐ None
☐ Other

Are there any soil samples from areas requiring USDA quarantine? *(AL, AR, AZ, CA, FL, GA, HI, ID, LA MS, NC, NM, NY, OK, SC, TN, TX, VA, Puerto Rico, Virgin Islands, any other Non-Domestic area)* ☒ **No** ☐ **Yes** (If Yes, *Project Manager must be notified).*

☐ **Check if Additional Sheets Required**

Receipt Temperatures

Thermometer ID	Observed (°C)	Corrected (°C)	Temp Blank	Sample Temp	Received on same day sampled?	Acceptable?*	Cooler ID	Note Affected Samples if temperature not acceptable
4	1.7	1.2	☒	☐	☐Yes ☐No	☐Yes ☐No		
			☐	☐	☐Yes ☐No	☐Yes ☐No		
			☐	☐	☐Yes ☐No	☐Yes ☐No		

* Receipt temperatures are considered acceptable if the samples are received on the same day they were collected & show signs that the cooling process has started. Temperature acceptance for most tests is ≤6.0°C, **but not frozen**. For additional information, please refer to SOP DT-SCA-004 ***Sample Receipt and Login, Attachment 2 – Holding Times, Preservation and Container Requirements.***

Receipt Questions**	Y	N	n/a	"No" answers require additional comment
COC present & TA receipt signature, date, & time properly documented?				
Containers & labels in good condition? *(unbroken, not leaking, appropriately filled, labels legible & attached)*				
Appropriate containers used & adequate volume provided?				
Number of sample containers match COC?				
Samples received within hold time?				
Samples submitted for GRO and Volatiles analyses (8260, 624, 524) received without headspace?				
Was a Trip Blank received with VOA samples?				
Were the samples free of any questionable physical conformities? For example, field duplicates or multiple bottles of the same sample do not significantly vary in appearance (color, proportion of solids, etc.)				
Were the COC, bottle labels, and all other items free of all other discrepancies or issues that would need to be addressed with the Project Manager and/or Client?				

** May not be applicable if samples are not for compliance testing

CASE NARRATIVE

A1E020418

The following report contains the analytical results for two solid samples, ten water samples and one quality control sample submitted to TestAmerica North Canton by Ohio Environmental Protection Agency from the MANSFIELD STAMPING PLANT Site, project number 1035171404.002. The samples were received April 30, 2011, according to documented sample acceptance procedures and were analyzed in accordance with Ohio Voluntary Action Program protocols, where applicable. The following requested analytes, parameter groups or methods analyzed and contained in this report are not certified by the laboratory: 1-Methylnapthalene by SW 8270C. This report may contain sample results between the MDL and RL. Results below the RL are not certified under the Ohio Voluntary Action Program.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. Preliminary results were provided to Guy Montfort and Martin Smith on May 10, 2011, and Guy Montfort, Martin Smith, and Vicky Farmer on May 22, 2011. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by a dry weight adjustment footnote at the bottom of the analytical report page. The list of parameters which are never reported on a dry weight basis is included on the Sample Summary.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the method detection limit and include qualified results where applicable.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

CASE NARRATIVE (continued)

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The coolers were received at temperatures ranging from 1.2 to 4.6° C.

GC/MS VOLATILES

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for batch(es) 1132384 and 1132282 had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample.

GC/MS SEMIVOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for MW 4-7 had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

CASE NARRATIVE (continued)

GC/MS SEMIVOLATILES (cont)

The matrix spike/matrix spike duplicate(s) for batch(es) 1123029 and 1123031 had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

The client specific or regulatory program requirements stated that corrective action must be performed for surrogate recoveries outside criteria. The re-preparation and reanalysis also had surrogate recoveries outside criteria confirming probable matrix interference; therefore, the original data are contained in the report for sample(s) MW 9-1.

PURGEABLE PETROLEUM HYDROCARBONS-8015

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

EXTRACTABLE PETROLEUM HYDROCARBONS-8015

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "J". Refer to the sample report pages for the affected analyte(s).

Solid samples with MS/MSD's utilize targeted weights due to LIM's calculation limitations. Weights are not targeted for all other solid metals samples.

CASE NARRATIVE (continued)

GENERAL CHEMISTRY

The analytical results met the requirements of the laboratory's QA/QC program.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called Quality Control Batches (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a Method Blank (MB), a Laboratory Control Sample (LCS) and, a Matrix Spike/Matrix Spike Duplicate (MS/MSD) pair or a Matrix Spike/Sample Duplicate (MS/DU) pair.
For 600 series/CWA methods, QC samples include a Method Blank (MB), a Laboratory Control Sample (LCS) and, where appropriate, a Matrix Spike (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch, with the exception of poor performing analytes. A list of these analytes is listed below. No corrective action is taken if these analytes do not meet criteria.Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

Poor performers

Method 8270 Water and Solid:	
4-Nitrophenol	3,3' – Dichlorobenzidine
Benzoic Acid	2,4,6 - Tribromophenol
Phenol	2,4-Dinitrophenol
Phenol-d5	Pentachlorophenol
4,6-Dinitro-2-methylphenol	Hexachlorocyclopentadiene (LCG only)
Benzyl Alcohol	4-Chloroaniline
Method 8151 Solid	
Dinoseb	
Method 8260 Water and Solid	
Dichlorodifluoromethane	Hexachlorobutadiene
Trichlorofluoromethane	Naphthalene
Chloroethane	1,2,3-Trichlorobenzene
Acetone	1,2,4-Trichlorobenzene
Bromomethane	2,2-Dichloropropane
Bromoform	Chloromethane

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be ten fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results do not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate or Matrix Spike/Sample Duplicate.

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater. For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.
California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),

Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada (#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190), DoD ELAP (ADE-1437) USDA Soil Permit (P33-08-00123)

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

TestAmerica Cooler Receipt Form/Narrative **Lot Number:** 410020418
North Canton Facility

Client Tetra Tech Project Mansfield Plant By: _____ (Signature)
Cooler Received on 4/30/11 Opened on _____
FedEx ☑ UPS ☐ DHL ☐ FAS ☐ Stetson ☐ Client Drop Off ☐ TestAmerica Courier ☐ Other _____
TestAmerica Cooler # _____ Multiple Coolers ☑ Foam Box ☐ Client Cooler ☐ Other _____

1. Were custody seals on the outside of the cooler(s)? Yes ☐ No ☑ Intact? Yes ☐ No ☐ NA ☑
   If YES, Quantity _____ Quantity Unsalvageable _____
   Were custody seals on the outside of cooler(s) signed and dated? Yes ☐ No ☐ NA ☑
   Were custody seals on the bottle(s)? Yes ☐ No ☑
   If YES, are there any exceptions? _____
2. Shippers' packing slip attached to the cooler(s)? Yes ☑ No ☐
3. Did custody papers accompany the sample(s)? Yes ☑ No ☐ Relinquished by client? Yes ☑ No ☐
4. Were the custody papers signed in the appropriate place? Yes ☑ No ☐
5. Packing material used: Bubble Wrap ☑ Foam ☐ None ☐ Other _____
6. Cooler temperature upon receipt _____ °C See back of form for multiple coolers/temps ☑
   METHOD: IR ☑ Other ☐ _____
   COOLANT: Wet Ice ☑ Blue Ice ☐ Dry Ice ☐ Water ☐ None ☐
7. Did all bottles arrive in good condition (Unbroken)? Yes ☑ No ☐
8. Could all bottle labels be reconciled with the COC? Yes ☑ No ☐
9. Were sample(s) at the correct pH upon receipt? Yes ☑ No ☐ NA ☐
10. Were correct bottle(s) used for the test(s) indicated? Yes ☑ No ☐
11. Were air bubbles >6 mm in any VOA vials? Yes ☑ No ☑ NA ☐
12. Sufficient quantity received to perform indicated analyses? Yes ☑ No ☐
13. Was a trip blank present in the cooler(s)? Yes ☑ No ☐ Were VOAs on the COC? Yes ☑ No ☐

Contacted PM DSP/KSK Date 5/2/11 by DM via Verbal ☐ Voice Mail ☐ Other ☑
Concerning #14

14. CHAIN OF CUSTODY

The following discrepancies occurred:

- Rec'd 4 x 40 TB not on COC will log
- Rec'd 1 x 500 (diss metals) for ID DUPLICATE 4/28 not on COC
  - bottle = 5-2D on lid, already rec'd volume for MW5-2D.
  Rec'd 5 x 40 (3 x 40 VOC + 2 x 40 GRO) also not on COC. for Duplicate
- MS/MSD not marked on COC for MW-47 will log MS/MSD

15. SAMPLE CONDITION

Sample(s) _____ were received after the recommended holding time had expired.
Sample(s) _____ were received in a broken container.
Sample(s) _____ were received with bubble >6 mm in diameter. (Notify PM)

16. SAMPLE PRESERVATION

Sample(s) _____ were further preserved in Sample Receiving to meet recommended pH level(s). *Nitric Acid Lot#* 100110-HNO_3; *Sulfuric Acid Lot#* 110410-H_2SO_4; *Sodium Hydroxide Lot#* 100108 -*NaOH; Hydrochloric Acid Lot#* 092006-*HCl; Sodium Hydroxide and Zinc Acetate Lot#* 100108-($CH_3COO)_2ZN$/*NaOH*. What time was preservative added to sample(s)? _____

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

GC/MS Semi VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.
X	Surrogate is outside control limits

GC Semi VOA

Qualifier	Qualifier Description
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
U	Indicates the analyte was analyzed for but not detected.
X	Surrogate is outside control limits

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis.
EPA	United States Environmental Protection Agency
ND	Not Detected above the reporting level.
MDL	Method Detection Limit
RL	Reporting Limit
RE, RE1 (etc.)	Indicates a Re-extraction or Reanalysis of the sample.
%R	Percent Recovery
RPD	Relative Percent Difference, a measure of the relative difference between two points.

Laboratory: TestAmerica North Canton

Narrative

CASE NARRATIVE

Client: Ohio Environmental Protection Agency

Project: MANSFIELD

Report Number: 240-258-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 05/17/2011; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 16.7 C.

The following sample(s) was received at the laboratory outside the required temperature criteria: . The client was contacted regarding this issue, and the laboratory was instructed to <<CHOOSE ONE>> proceed with/analysis.

All other samples were received in good condition within temperature requirements.

TCLP VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples PRESS ROOM PINE FLOOR (240-258-1), SHIPPING PINE FLOOR (240-258-2), WEST SHIPPING COMPOSITE (240-258-3), TOOL ROOM PINE FLOOR (240-258-4), WEST SHIPPING PINE (240-258-5), SHIPPING COMPOSITE FLOOR (240-258-6) and PRESS ROOM PECAN FLOOR (240-258-7) were analyzed for TCLP volatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 1311/8260B. The samples were leached on 05/23/2011 and analyzed on 05/26/2011 and 05/27/2011.

No difficulties were encountered during the volatiles analyses.

All quality control parameters were within the acceptance limits.

Method(s) 8260B: The following volatiles sample(s) was diluted due to foaming at the time of purging during the original sample analysis: PRESS ROOM PECAN FLOOR, PRESS ROOM PINE FLOOR, SHIPPING PINE FLOOR, TOOL ROOM PINE FLOOR, WEST SHIPPING COMPOSITE, WEST SHIPPING PINE. Elevated reporting limits (RLs) are provided.

No other analytical or quality issues were noted.

TCLP SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples PRESS ROOM PINE FLOOR (240-258-1), SHIPPING PINE FLOOR (240-258-2), WEST SHIPPING COMPOSITE (240-258-3), TOOL ROOM PINE FLOOR (240-258-4), WEST SHIPPING PINE (240-258-5), SHIPPING COMPOSITE FLOOR (240-258-6) and PRESS ROOM PECAN FLOOR (240-258-7) were analyzed for TCLP semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 1311/8270C. The samples were leached on 05/23/2011, prepared on 05/24/2011 and 06/06/2011 and analyzed on 06/01/2011 and 06/09/2011.

Job ID: 240-258-1 (Continued)

Laboratory: TestAmerica North Canton (Continued)

Nitrobenzene-d5 (Surr) and Terphenyl-d14 (Surr) failed the surrogate recovery criteria low for TOOL ROOM PINE FLOOR (240-258-4). Terphenyl-d14 (Surr) failed the surrogate recovery criteria low for SHIPPING COMPOSITE FLOOR (240-258-6). Refer to the QC report for details.

No other difficulties were encountered during the semivolatiles analyses.

All other quality control parameters were within the acceptance limits.

Method(s) 8270C: Internal standard responses were outside of acceptance limits for the following sample: TOOL ROOM PINE FLOOR. The sample shows evidence of matrix interference.

Method(s) 8270C: Elevated reporting limits due to sample matrix.

Method(s) 8270C: The following sample(s) was diluted due to the nature of the sample matrix: PRESS ROOM PINE FLOOR. Elevated reporting limits (RLs) are provided.

Method(s) 8270C: Sample 240-258-B-3-H had acid surrogates recovered below acceptance criteria. Upon reextraction and reanalysis all QC met criteria, however, sample holding times had been exceeded. Both sets of data have been reported. <<EXPLANATION REQUIRED>>

No other analytical or quality issues were noted.

Method(s) 8082: Due to the level of dilution required for the following sample(s), surrogate recoveries are not reported: WEST SHIPPING PINE.

Method(s) 8082: Surrogate recovery for the following sample(s) was outside the upper control limit: SHIPPING PINE FLOOR. This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Method(s) 8082: The following sample(s) was diluted due to the nature of the sample matrix analytes. As such, surrogate recoveries are not reported, and elevated reporting limits (RLs) are provided.

Method(s) 8082: Due to the level of dilution required for the following sample(s), surrogate recoveries are diluted: PRESS ROOM PINE FLOOR, SHIPPING COMPOSITE FLOOR, TOOL ROOM PINE FLOOR.

No other analytical or quality issues were noted.

TCLP METALS (ICP)

Samples PRESS ROOM PINE FLOOR (240-258-1), SHIPPING PINE FLOOR (240-258-2), WEST SHIPPING COMPOSITE (240-258-3), TOOL ROOM PINE FLOOR (240-258-4), WEST SHIPPING PINE (240-258-5), SHIPPING COMPOSITE FLOOR (240-258-6) and PRESS ROOM PECAN FLOOR (240-258-7) were analyzed for TCLP metals (ICP) in accordance with EPA SW-846 Methods 1311/ 6010B. The samples were leached on 05/23/2011, prepared on 05/25/2011 and analyzed on 05/26/2011.

No difficulties were encountered during the metals analyses.

All quality control parameters were within the acceptance limits.

Barium and Selenium were detected in method blank LB 240-2532/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged. Barium was detected in method blank MB 240-2532/2-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged. Refer to the QC report for details.

TCLP MERCURY

Samples PRESS ROOM PINE FLOOR (240-258-1), SHIPPING PINE FLOOR (240-258-2), WEST SHIPPING COMPOSITE (240-258-3), TOOL ROOM PINE FLOOR (240-258-4), WEST SHIPPING PINE (240-258-5), SHIPPING COMPOSITE FLOOR (240-258-6) and PRESS

Job ID: 240-258-1 (Continued)

Laboratory: TestAmerica North Canton (Continued)

ROOM PECAN FLOOR (240-258-7) were analyzed for TCLP mercury in accordance with EPA SW-846 Methods 1311/7470A. The samples were leached on 05/23/2011, prepared on 05/25/2011 and analyzed on 05/26/2011.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

IGNITABILITY

Samples PRESS ROOM PINE FLOOR (240-258-1), SHIPPING PINE FLOOR (240-258-2), WEST SHIPPING COMPOSITE (240-258-3), TOOL ROOM PINE FLOOR (240-258-4), WEST SHIPPING PINE (240-258-5), SHIPPING COMPOSITE FLOOR (240-258-6) and PRESS ROOM PECAN FLOOR (240-258-7) were analyzed for ignitability in accordance with EPA SW-846 Method 1010. The samples were analyzed on 05/24/2011.

No difficulties were encountered during the ignitability analyses.

All quality control parameters were within the acceptance limits.

General Chemistry

Method(s) Moisture: The following samples were received with greater than 50% of holding time expired: PRESS ROOM PECAN FLOOR, PRESS ROOM PINE FLOOR, SHIPPING COMPOSITE FLOOR, SHIPPING PINE FLOOR, TOOL ROOM PINE FLOOR, WEST SHIPPING COMPOSITE, WEST SHIPPING PINE. As such, the laboratory had insufficient time remaining to perform the analysis within holding time.

No other analytical or quality issues were noted.

VOA Prep

No analytical or quality issues were noted.

TestAmerica Cooler Receipt Form/Narrative **Lot Number:** 258
North Canton Facility

Client Tetra Tech Project Mansfield By: (Signature)
Cooler Received on 5/12/11 Opened on 5/12/11
FedEx ☒ UPS ☐ DHL ☐ FAS ☐ Stetson ☐ Client Drop Off ☐ TestAmerica Courier ☐ Other
TestAmerica Cooler # CJ382 Multiple Coolers ☐ Foam Box ☐ Client Cooler ☐ Other

1. Were custody seals on the outside of the cooler(s)? Yes ☐ No ☒ Intact? Yes ☐ No ☐ NA ☒
   If YES, Quantity Quantity Unsalvageable
   Were custody seals on the outside of cooler(s) signed and dated? Yes ☐ No ☐ NA ☒
   Were custody seals on the bottle(s)? Yes ☐ No ☒
   If YES, are there any exceptions?
2. Shippers' packing slip attached to the cooler(s)? Yes ☒ No ☐
3. Did custody papers accompany the sample(s)? Yes ☒ No ☐ Relinquished by client? Yes ☒ No ☐
4. Were the custody papers signed in the appropriate place? Yes ☒ No ☐
5. Packing material used: Bubble Wrap ☒ Foam ☐ None ☐ Other
6. Cooler temperature upon receipt 16.7 °C See back of form for multiple coolers/temps ☐
   METHOD: IR ☒ Other ☐
   COOLANT: Wet Ice ☐ Blue Ice ☐ Dry Ice ☐ Water ☐ None ☒
7. Did all bottles arrive in good condition (Unbroken)? Yes ☒ No ☐
8. Could all bottle labels be reconciled with the COC? Yes ☒ No ☐
9. Were sample(s) at the correct pH upon receipt? Yes ☐ No ☐ NA ☒
10. Were correct bottle(s) used for the test(s) indicated? Yes ☒ No ☐
11. Were air bubbles >6 mm in any VOA vials? Yes ☐ No ☐ NA ☒
12. Sufficient quantity received to perform indicated analyses? Yes ☒ No ☐
13. Was a trip blank present in the cooler(s)? Yes ☐ No ☒ Were VOAs on the COC? Yes ☐ No ☒

Contacted PM DJP Date 5/12/11 by JL via Verbal ☒ Voice Mail ☐ Other ☐
Concerning High Temp

14. CHAIN OF CUSTODY

The following discrepancies occurred:

15. SAMPLE CONDITION

Sample(s) were received after the recommended holding time had expired.
Sample(s) were received in a broken container.
Sample(s) were received with bubble >6 mm in diameter. (Notify PM)

16. SAMPLE PRESERVATION

Sample(s) were further preserved in Sample Receiving to meet recommended pH level(s). *Nitric Acid Lot#* 100110-HNO_3; *Sulfuric Acid Lot#* 110410-H_2SO_4; *Sodium Hydroxide Lot#* 100108 -*NaOH; Hydrochloric Acid Lot#* 092006-*HCl; Sodium Hydroxide and Zinc Acetate Lot#* 100108-$(CH_3COO)_2ZN/NaOH$. What time was preservative added to sample(s)?

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	False	SAMPLES WERE RECEIVED WITHOUT ANY ICE
Cooler Temperature is recorded.	True	16.7
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD exceeds the control limits
B	Compound was found in the blank and sample.
F	MS or MSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

GC/MS Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
F	MS or MSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis.
EPA	United States Environmental Protection Agency
ND	Not Detected above the reporting level.
MDL	Method Detection Limit
RL	Reporting Limit
RE, RE1 (etc.)	Indicates a Re-extraction or Reanalysis of the sample.
%R	Percent Recovery
RPD	Relative Percent Difference, a measure of the relative difference between two points.

Narrative

CASE NARRATIVE

Client: Ohio Environmental Protection Agency

Project: Mansfield Stamping Plant

Report Number: 240-259-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The samples were analyzed in accordance with Ohio Voluntary Action Program protocols, where applicable. The following requested analytes, parameter groups or methods analyzed and contained in this report are not certified by the laboratory: 1-Methylnapthalene by SW 8270C. This report may contain sample results between the MDL and RL. Results below the RL are not certified under the Oho Voluntary Action Program.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 05/17/2011; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 1.6 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples LANDFILL-1 (240-259-1), LANDFILL-2 (240-259-2), LANDFILL-3 (240-259-3) and LANDFILL-4 (240-259-4) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW 8260A. The samples were analyzed on 05/25/2011.

1,2,4-Trichlorobenzene and Methylene Chloride were detected in method blank MB 240-2567/6 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged. Refer to the QC report for details.

Chloroethane failed the recovery criteria high for LCS 240-2567/5. Refer to the QC report for details.

Chloroethane failed the recovery criteria high for the MS of sample LANDFILL-4MS (240-259-4) in batch 240-2567.

Chloroethane failed the recovery criteria high for the MSD of sample LANDFILL-4MSD (240-259-4) in batch 240-2567.

Refer to the QC report for details.

No other difficulties were encountered during the volatile organic compounds (GC-MS) analyses.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples LANDFILL-1 (240-259-1), LANDFILL-2 (240-259-2), LANDFILL-3 (240-259-3) and LANDFILL-4 (240-259-4) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW 8270C. The samples were prepared on 05/21/2011 and analyzed on 05/27/2011.

Job ID: 240-259-1 (Continued)

Laboratory: TestAmerica North Canton (Continued)

No difficulties were encountered during the semivolatile organic compounds (GC-MS) analyses.

All quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDSC (GC 8082)

No analytical or quality issues were noted

TOTAL METALS (ICP)

Samples LANDFILL-1 (240-259-1), LANDFILL-2 (240-259-2), LANDFILL-3 (240-259-3) and LANDFILL-4 (240-259-4) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 05/23/2011 and analyzed on 05/24/2011.

Barium was detected in method blank MB 240-2355/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged. Refer to the QC report for details.

Cadmium failed the recovery criteria low for the MS of sample LANDFILL-1MS (240-259-1) in batch 240-2517.

Refer to the QC report for details.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples LANDFILL-1 (240-259-1), LANDFILL-2 (240-259-2), LANDFILL-3 (240-259-3) and LANDFILL-4 (240-259-4) were analyzed for total mercury in accordance with EPA SW-846 Method 7471A. The samples were prepared on 05/23/2011 and analyzed on 05/24/2011.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

14. CHAIN OF CUSTODY

The following discrepancies occurred:

15. SAMPLE CONDITION

Sample(s) were received after the recommended holding time had expired.
Sample(s) were received in a broken container.
Sample(s) were received with bubble >6 mm in diameter. (Notify PM)

16. SAMPLE PRESERVATION

Sample(s) were further preserved in Sample Receiving to meet recommended pH level(s). *Nitric Acid Lot#* 100110-HNO_3; *Sulfuric Acid Lot#* 110410-H_2SO_4; *Sodium Hydroxide Lot#* 100108 -*NaOH; Hydrochloric Acid Lot#* 092006-*HCl; Sodium Hydroxide and Zinc Acetate Lot#* 100108-$(CH_3COO)_2ZN/NaOH$. What time was preservative added to sample(s)?

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	1.6
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Laboratory Report Number: L11060205

Jackie Barr
Ohio Environmental Protection Agency
50 W. Town Street
Columbus, OH 43215

Please find enclosed the analytical results for the samples you submitted to Microbac Laboratories. Review and compilation of your report was completed by Microbac's Ohio Valley Division (OVD). If you have any questions, comments, or require further assistance regarding this report, please contact your service representative listed below.

This report was reviewed on 06/10/2011 16:35

Amanda Fickiesen

Amanda Fickiesen – Client Services Specialist
(740) 373-4071
Amanda.Fickiesen@microbac.com

I certify that all test results meet all of the requirements of the accrediting authority listed blow. All results for soil samples are reported on a 'dry-weight' basis unless specified otherwise. Analytical results for water and wastes are reported on a 'as received' basis unless speciified otherwise. A statement of uncertainty for each analysis is available upon request. This laboratory report shall not be repordcuced, except in full, without the written approval of Microbac Laboratories. The reported results are related only to the samples analyzed as received.

This report was certified on 06/10/2011 16:35

Record of Sample Receipt and Inspection

Comments/Discrepancies

This is record of the shipment conditions and the inspection records for the samples received and reported as a sample delivery group (SDG). All of the samples were inspected and observed to conform to our receipt policies, except as noted below.

The following discrepancies were noted:

Discrepancy	Resolution
Received set of Trip Blank not on Chain of Custody. 6/2/11 @1720	Please add the Trip Blank (826-SPE)

Coolers

Cooler #	Temperature Gun	Temperature	COC #	Airbill #
0016039	H	3		345750551100000187565399572620 05

Inspection Checklist

#	Question	Result
1	Were shipping coolers sealed?	Yes
2	Were custody seals intact?	Yes
3	Were cooler temperatures in range of 0-6?	Yes
4	Was ice present?	Yes
5	Were COC's received/information complete/signed and dated?	Yes
6	Were sample containers and labels intact and match COC?	No
7	Were the correct containers and volumes received?	Yes
8	Were samples received within EPA hold times?	Yes
9	Were correct perservatives used? (water only)	Yes
10	Were pH ranges acceptable? (voa's excluded)	Yes
11	Were VOA samples free of headspace (less than 6mm)?	Yes

METHOD

Preparation SW-846 5030C/5035A

Analysis SW-846 8260B

HOLDING TIMES

Sample Preparation: All holding times were met.

Sample Analysis: All holding times were met.

PREPARATION

Sample preparation proceeded normally.

CALIBRATION

Initial Calibration: For all compounds that yielded a %RSD greater than 15%, linear or higher order equations were applied. All acceptance criteria were met.

Alternate Source Standards: The percent difference was out of range for the following analytes: Dichlorodifluoromethane, Vinyl Acetate. Please see the applicable QC report for a detailed presentation of the failures.

Continuing Calibration and Tune: All acceptance criteria were met.

BATCH QA/QC

Method Blank: All acceptance criteria were met.

Laboratory Control Sample: All acceptance criteria were met.

Matrix Spikes: Recoveries out of range were observed for the following analytes: 2-Chloroethyl vinyl ether. Please see the applicable QC report for a detailed presentation of the failures.

SAMPLES

Internal Standards: All acceptance criteria were met.

Surrogates: All acceptance criteria were met.

Other: None.

Manual Integration Reason Codes

Reason #1: Data System Fails to Select Correct Peak. In some cases the chromatography system selects and integrates the 'wrong peak'. In this case the analyst must correct the selection and force the system to integrate the proper peak. Other times the system may miss the peak completely.

Reason #2: Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak. This phenomena is common at low concentrations where the signal:noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low area counts for the target compound.

Reason #3: Improperly Integrated Isomers and/or coeluting compounds. This system often fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations are wrong, and they must be corrected by manual integration. Prime examples are benzo(k)fluoranthene and benzo(b)fluoranthene which are often unresolved and integrated improperly when both are present at low concentrations in standards or samples.

Reason #4: System Establishes Incorrect Baseline. There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and should be corrected via manual procedures.

Reason #5: Miscellaneous. Other situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the laboratory management. If the form of manual integration is not clearly covered by these four cases, then review and approval by the Managing Director or the QAO will be required.

I certify that this data package is in compliance with the terms and conditions agreed to by the client and Microbac Laboratories Inc., both technically and for completeness, except for the conditions noted above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or designated person, as verified by the following signature.

Surrogate	% Recovery	Lower	Upper	Qual
Dibromofluoromethane	96.6	86	118	
1,2-Dichloroethane-d4	95.5	80	120	
Toluene-d8	94.5	88	110	
4-Bromofluorobenzene	96.2	86	115	

J The analyte was positively identified, but the quantitation was below the RL
U Not detected at or above the reporting limit (RL).

Microbac Laboratories Inc.
List of Valid Qualifiers
June 10, 2011

Qualkey: ND_TO_U

Qualifier	Description
*	Surrogate or spike compound out of range
+	Correlation coefficient for the MSA is less than 0.995
<	Result is less than the associated numerical value.
>	Result is greater than the associated numerical value.
A	See the report narrative
B	Analyte present in method blank
B1	Target analyte detected in method blank at or above the method reporting limit
B3	Target analyte detected in calibration blank at or above the method reporting limit
B4	The BOD unseeded dilution water blank exceeded 0.2 mg/L
BB	Analyte present in the method blank.
C	Confirmed by GC/MS
CG	Confluent growth
D	The analyte was quantified at a secondary dilution factor
DL	Surrogate or spike compound was diluted out
E	Estimated concentration due to sample matrix interference
EDL	Elevated sample reporting limits, presence of non-target analytes
EMPC	Estimated Maximum Possible Concentration
F, S	Estimated result below quantitation limit; method of standard additions(MSA)
FF	The analyte was positively identified, but the quantitation was below the RL
FL	Free Liquid
H1	Sample analysis performed past holding time.
I	Semiquantitative result (out of instrument calibration range)
J	Estimated concentration.
J	The analyte was positively identified, but the quantitation was below the RL
J,B	Analyte detected in both the method blank and sample above the MDL.
J,P	ESTIMATE & COLUMNS DON'T AGREE TO WITHIN 40%
J,S	Estimated concentration; analyzed by method of standard addition (MSA)
JJ	Estimated concentration due to interference
L	Sample reporting limits elevated due to matrix interference
L1	The associated blank spike (LCS) recovery was above the laboratory acceptance limits.
L2	The associated blank spike (LCS) recovery was below the laboratory acceptance limits.
M	Spike (MS/MSD) results suggest matrix effects
N	Tentatively identified compound(TIC)
NA	Not applicable
ND	Not detected at or above the reporting limit (RL).
ND, L	Not detected; sample reporting limit (RL) elevated due to interference
ND, S	Not detected; analyzed by method of standard addition (MSA)
NF	Not found by library search
NFL	No free liquid
NI	Non-ignitable
NR	Analyte is not required to be analyzed
NS	Not spiked
P	Concentrations >40% difference between the two GC columns
PP	Duplicate precision not met
Q	One or more quality control criteria failed. See narrative.
QNS	Quantity of sample not sufficient to perform analysis
RA	Reanalysis confirms reported results
RE	Reanalysis confirms sample matrix interference
S	Analyzed by method of standard addition (MSA)
SMI	Sample matrix interference on surrogate
SP	Reported results are for spike compounds only
TIC	Library Search Compound
TNTC	Too numerous to count
U	Analyte was not detected. The concentration is below the reported MDL.
U	Not detected at or above the reporting limit (RL).
UJ	Undetected; the MDL and RL are estimated due to quality control discrepancies.
UJ	Undetected; the analyte was analyzed for, but not detected.
UQ	Undetected; the analyte was analyzed for, but not detected.
W	Post-digestion spike for furnace AA out of control limits
X	Exceeds regulatory limit
X, S	Exceeds regulatory limit; method of standard additions (MSA)
Z	Cannot be resolved from isomer - see below

*****Special Notes for Organic Analytes**

Qualkey: ND_TO_U

1. Acrolein and acrylonitrile by method 624 are semi-quantitative screens only.
2. 1,2-Diphenylhydrazine is unstable and is reported as azobenzene.
3. N-nitrosodiphenylamine cannot be separated from diphenylamine.
4. 3-Methylphenol and 4-Methylphenol are unresolvable compounds.
5. m-Xylene and p-Xylene are unresolvable compounds.
6. The reporting limits for Appendix II/IX compounds by method 8270 are based on EPA estimated PQLs referenced in 40 CFR Part 264, Appendix IX. They are not always achievable for every compound an are matrix dependent.

Organic QA/QC

Microbac

Laboratory Report Number: L11120224 *(Revised)*

Brandon Helm
Tetra Tech
250 W. Court St.
Cincinnati, OH 45202

Please find enclosed the analytical results for the samples you submitted to Microbac Laboratories. Review and compilation of your report was completed by Microbac's Ohio Valley Division (OVD). If you have any questions, comments, or require further assistance regarding this report, please contact your service representative listed below.

This report was reviewed on January 05 2012

Tony Long – Team Chemist/Data Specialist
(740) 373-4071
Tony.Long@microbac.com

I certify that all test results meet all of the requirements of the accrediting authority listed below. All results for soil samples are reported on a 'dry-weight' basis unless specified otherwise. Analytical results for water and wastes are reported on a 'as received' basis unless specified otherwise. A statement of uncertainty for each analysis is available upon request. This laboratory report shall not be reproduced, except in full, without the written approval of Microbac Laboratories. The reported results are related only to the samples analyzed as received.

This report was certified on January 05 2012

Record of Sample Receipt and Inspection

Comments/Discrepancies

This is the record of the shipment conditions and the inspection records for the samples received and reported as a sample delivery group (SDG). All of the samples were inspected and observed to conform to our receipt policies, except as noted below.

There were no discrepancies.

Discrepancy	Resolution

Coolers

Cooler #	Temperature Gun	Temperature	COC #	Airbill #
0016344	G	5.0		1015923830760004575000795760436532
0015673	G	4.0		1001845330910004575000898709115390
0016437	G	5.0		1001845331040004575000898709115389

Inspection Checklist

#	Question	Result
1	Were shipping coolers sealed?	Yes
2	Were custody seals intact?	Yes
3	Were cooler temperatures in range of 0-6?	Yes
4	Was ice present?	Yes
5	Were COC's received/information complete/signed and dated?	Yes
6	Were sample containers intact and match COC?	Yes
7	Were sample labels intact and match COC?	Yes
8	Were the correct containers and volumes received?	Yes
9	Were samples received within EPA hold times?	Yes
10	Were correct perservatives used? (water only)	NA
11	Were pH ranges acceptable? (voa's excluded)	NA
12	Were VOA samples free of headspace (less than 6mm)?	NA

METHOD

Preparation SW-846 5030C/5035A

Analysis SW-846 8260B

HOLDING TIMES

Sample Preparation: All holding times were met.

Sample Analysis: All holding times were met.

PREPARATION

Sample preparation proceeded normally.

CALIBRATION

Initial Calibration: For all compounds that yielded a %RSD greater than 15%, linear or higher order equations were applied. All acceptance criteria were met.

Alternate Source Standards: The percent difference was out of range for the following analytes: Dichlorodifluoromethane. Please see the applicable QC report for a detailed presentation of the failures.

Continuing Calibration and Tune: All acceptance criteria were met.

BATCH QA/QC

Method Blank: All acceptance criteria were met.

Laboratory Control Sample: Recoveries out of range were observed for the following analytes: Dichlorodifluoromethane. Please see the applicable QC report for a detailed presentation of the failures.

Matrix Spikes: The MS/MSD results were not associated with this sample delivery group (SDG), due to insufficient volume of sample. The laboratory included an LCS and LCS duplicate in the preparation batch in lieu of the NELAC prescribed MS/MSD. Microbac Laboratories recommends site specific MS/MSD samples to avoid possible data qualifications.

SAMPLES

Internal Standards: Recoveries out of range were observed for the following analytes:1,4-Dichlorobenzene-d4. Please see the applicable QC report for a detailed presentation of the failures. Reanalysis confirmed the outlier.

Surrogates: All acceptance criteria were met.

Other: None.

Manual Integration Reason Codes

Reason #1: Data System Fails to Select Correct Peak. In some cases the chromatography system selects and integrates the 'wrong peak'. In this case the analyst must correct the selection and force the system to integrate the proper peak. Other times the system may miss the peak completely.

Reason #2: Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak. This phenomena is common at low concentrations where the signal:noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low area counts for the target compound.

Reason #3: Improperly Integrated Isomers and/or coeluting compounds. This system often fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations are wrong, and they must be corrected by manual integration. Prime examples are benzo(k)fluoranthene and benzo(b)fluoranthene which are often unresolved and integrated improperly when both are present at low concentrations in standards or samples.

Reason #4: System Establishes Incorrect Baseline. There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and should be corrected via manual procedures.

Reason #5: Miscellaneous. Other situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the laboratory management. If the form of manual integration is not clearly covered by these four cases, then review and approval by the Managing Director or the QAO will be required.

I certify that this data package is in compliance with the terms and conditions agreed to by the client and Microbac Laboratories Inc., both technically and for completeness, except for the conditions noted above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or designated person, as verified by the following signature.

Microbac Laboratories Inc.
List of Valid Qualifiers
January 05, 2012

Qualkey: STD

Qualifier	Description
*	Surrogate or spike compound out of range
+	Correlation coefficient for the MSA is less than 0.995
<	Result is less than the associated numerical value.
>	Result is greater than the associated numerical value.
A	See the report narrative
B	Analyte present in method blank
B1	Target analyte detected in method blank at or above the method reporting limit
B3	Target analyte detected in calibration blank at or above the method reporting limit
B4	The BOD unseeded dilution water blank exceeded 0.2 mg/L
C	Confirmed by GC/MS
CG	Confluent growth
DL	Surrogate or spike compound was diluted out
E	Estimated concentration due to sample matrix interference
EDL	Elevated sample reporting limits, presence of non-target analytes
EMPC	Estimated Maximum Possible Concentration
F, S	Estimated result below quantitation limit; method of standard additions(MSA)
FL	Free Liquid
H1	Sample analysis performed past holding time.
I	Semiquantitative result (out of instrument calibration range)
J	Estimated value; the analyte concentration was less than the RL/LOQ.
J,B	Analyte detected in both the method blank and sample above the MDL.
J,P	Estimate; columns don't agree to within 40%
J,S	Estimated concentration; analyzed by method of standard addition (MSA)
L	Sample reporting limits elevated due to matrix interference
L1	The associated blank spike (LCS) recovery was above the laboratory acceptance limits.
L2	The associated blank spike (LCS) recovery was below the laboratory acceptance limits.
M	Matrix effect; the concentration is an estimate due to matrix effect.
N	Tentatively identified compound(TIC)
NA	Not applicable
ND	Not detected at or above the reporting limit (RL).
ND, L	Not detected; sample reporting limit (RL) elevated due to interference
ND, S	Not detected; analyzed by method of standard addition (MSA)
NF	Not found by library search
NFL	No free liquid
NI	Non-ignitable
NR	Analyte is not required to be analyzed
NS	Not spiked
P	Concentrations >40% difference between the two GC columns
Q	One or more quality control criteria failed. See narrative.
QNS	Quantity of sample not sufficient to perform analysis
RA	Reanalysis confirms reported results
RE	Reanalysis confirms sample matrix interference
S	Analyzed by method of standard addition (MSA)
SMI	Sample matrix interference on surrogate
SP	Reported results are for spike compounds only
TIC	Library Search Compound
TNTC	Too numerous to count
U	Analyte was not detected. The concentration is below the reported MDL.
UJ	Undetected; the MDL and RL are estimated due to quality control discrepancies.
UJ	Undetected; the analyte was analyzed for, but not detected.
UQ	Undetected; the analyte was analyzed for, but not detected.
W	Post-digestion spike for furnace AA out of control limits
X	Exceeds regulatory limit
X, S	Exceeds regulatory limit; method of standard additions (MSA)
Z	Cannot be resolved from isomer - see below

*****Special Notes for Organic Analytes**

1. Acrolein and acrylonitrile by method 624 are semi-quantitative screens only.
2. 1,2-Diphenylhydrazine is unstable and is reported as azobenzene.
3. N-nitrosodiphenylamine cannot be separated from diphenylamine.
4. 3-Methylphenol and 4-Methylphenol are unresolvable compounds.
5. m-Xylene and p-Xylene are unresolvable compounds.
6. The reporting limits for Appendix II/IX compounds by method 8270 are based on EPA estimated PQLs referenced in 40 CFR Part 264, Appendix IX. They are not always achievable for every compound and are matrix dependent.

Organic QA/QC

Comments: Samples L11120197 (01,02,04,05), L11120198 (16,18,19), L11120224 (01,04,05,08,12,13) were re-ran due to check std. failure against OVAP limits.
Due to the random baseline signal spikes, maintenence on GC systems were performed and a new ICAL was run.

Microbac

Laboratory Report Number: L11120198

Brandon Helm
Tetra Tech
250 W. Court St.
Cincinnati, OH 45202

Please find enclosed the analytical results for the samples you submitted to Microbac Laboratories. Review and compilation of your report was completed by Microbac's Ohio Valley Division (OVD). If you have any questions, comments, or require further assistance regarding this report, please contact your service representative listed below.

This report was reviewed on December 20 2011

Tony Long – Team Chemist/Data Specialist
(740) 373-4071
Tony.Long@microbac.com

I certify that all test results meet all of the requirements of the accrediting authority listed below. All results for soil samples are reported on a 'dry-weight' basis unless specified otherwise. Analytical results for water and wastes are reported on a 'as received' basis unless specified otherwise. A statement of uncertainty for each analysis is available upon request. This laboratory report shall not be reproduced, except in full, without the written approval of Microbac Laboratories. The reported results are related only to the samples analyzed as received.

This report was certified on December 20 2011

David Vandenberg – Managing Director

Record of Sample Receipt and Inspection

Comments/Discrepancies

This is the record of the shipment conditions and the inspection records for the samples received and reported as a sample delivery group (SDG). All of the samples were inspected and observed to conform to our receipt policies, except as noted below.

There were no discrepancies.

Discrepancy	Resolution

Coolers

Cooler #	Temperature Gun	Temperature	COC #	Airbill #
0016344	G	5.0		1015923830760004575000795760436532
0015673	G	4.0		1001845330910004575000898709115390
0016437	G	5.0		1001845331040004575000898709115389

Inspection Checklist

#	Question	Result
1	Were shipping coolers sealed?	Yes
2	Were custody seals intact?	Yes
3	Were cooler temperatures in range of 0-6?	Yes
4	Was ice present?	Yes
5	Were COC's received/information complete/signed and dated?	Yes
6	Were sample containers intact and match COC?	Yes
7	Were sample labels intact and match COC?	Yes
8	Were the correct containers and volumes received?	Yes
9	Were samples received within EPA hold times?	Yes
10	Were correct perservatives used? (water only)	NA
11	Were pH ranges acceptable? (voa's excluded)	NA
12	Were VOA samples free of headspace (less than 6mm)?	NA

METHOD

Preparation 3545

Analysis SW-846 8270C

HOLDING TIMES

Sample Preparation: All holding times were met.

Sample Analysis: All holding times were met.

PREPARATION

Sample preparation proceeded normally.

CALIBRATION

Initial Calibration: For all compounds that yielded a %RSD greater than 15%, linear or higher order equations were applied. All acceptance criteria were met.

Alternate Source Standards: All acceptance criteria were met.

Continuing Calibration and Tune: All acceptance criteria were met.

BATCH QA/QC

Method Blank: All acceptance criteria were met.

Laboratory Control Sample: All acceptance criteria were met.

Matrix Spikes: There were no MS/MSD results associated with this sample delivery group, due to insufficient volume of sample. The laboratory included an LCS and LCS duplicate in the preparation batch in lieu of the NELAC prescribed MS/MSD. Microbac recommends site specific MS/MSD samples to avoid possible data qualification.

SAMPLES

Samples: Samples 03-05, 07, 11 and 15 were analyzed at a dilution due to the appearance and viscosity of the extracts. Samples 03-05, 07 and 11 required additional dilutions to be within calibration range. Samples 06, 13, 17 and 19 were analyzed a dilution to be within calibration range.

Internal Standards: All acceptance criteria were met.

Surrogates: All acceptance criteria were met.

Manual Integration Reason Codes

Reason #1: Data System Fails to Select Correct Peak In some cases the chromatography system selects and integrates the 'wrong peak'. In this case the analyst must correct the selection and force the system to integrate the proper peak. Other times the system may miss the peak completely.

Reason #2: Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak This phenomena is common at low concentrations where the signal:noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low area counts for the target compound.

Reason #3: Improperly Integrated Isomers and/or coeluting compounds. This system often fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations are wrong, and they must be corrected by manual integration. Prime examples are benzo(k)fluoranthene and

benzo(b)fluoranthene which are often unresolved and integrated improperly when both are present at low concentrations in standards or samples.

Reason #4: System Establishes Incorrect Baseline There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and should be corrected via manual procedures.

Reason #5: Miscellaneous Other situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the laboratory management. If the form of manual integration is not clearly covered by these four cases, then review and approval by the Managing Director or the QAO will be required.

I certify that this data package is in compliance with the terms and conditions agreed to by the client and Microbac Laboratories Inc., both technically and for completeness, except for the conditions noted above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or designated person, as verified by the following signature.

List of Valid Qualifiers
December 20, 2011

Qualkey: STD

Qualifier	Description
*	Surrogate or spike compound out of range
+	Correlation coefficient for the MSA is less than 0.995
<	Result is less than the associated numerical value.
>	Result is greater than the associated numerical value.
A	See the report narrative
B	Analyte present in method blank
B1	Target analyte detected in method blank at or above the method reporting limit
B3	Target analyte detected in calibration blank at or above the method reporting limit
B4	The BOD unseeded dilution water blank exceeded 0.2 mg/L
C	Confirmed by GC/MS
CG	Confluent growth
DL	Surrogate or spike compound was diluted out
E	Estimated concentration due to sample matrix interference
EDL	Elevated sample reporting limits, presence of non-target analytes
EMPC	Estimated Maximum Possible Concentration
F, S	Estimated result below quantitation limit; method of standard additions(MSA)
FL	Free Liquid
H1	Sample analysis performed past holding time.
I	Semiquantitative result (out of instrument calibration range)
J	Estimated value; the analyte concentration was less than the RL/LOQ.
J,B	Analyte detected in both the method blank and sample above the MDL.
J,P	Estimate; columns don't agree to within 40%
J,S	Estimated concentration; analyzed by method of standard addition (MSA)
L	Sample reporting limits elevated due to matrix interference
L1	The associated blank spike (LCS) recovery was above the laboratory acceptance limits.
L2	The associated blank spike (LCS) recovery was below the laboratory acceptance limits.
M	Matrix effect; the concentration is an estimate due to matrix effect.
N	Tentatively identified compound(TIC)
NA	Not applicable
ND	Not detected at or above the reporting limit (RL).
ND, L	Not detected; sample reporting limit (RL) elevated due to interference
ND, S	Not detected; analyzed by method of standard addition (MSA)
NF	Not found by library search
NFL	No free liquid
NI	Non-ignitable
NR	Analyte is not required to be analyzed
NS	Not spiked
P	Concentrations >40% difference between the two GC columns
Q	One or more quality control criteria failed. See narrative.
QNS	Quantity of sample not sufficient to perform analysis
RA	Reanalysis confirms reported results
RE	Reanalysis confirms sample matrix interference
S	Analyzed by method of standard addition (MSA)
SMI	Sample matrix interference on surrogate
SP	Reported results are for spike compounds only
TIC	Library Search Compound
TNTC	Too numerous to count
U	Analyte was not detected. The concentration is below the reported MDL.
UJ	Undetected; the MDL and RL are estimated due to quality control discrepancies.
UJ	Undetected; the analyte was analyzed for, but not detected.
UQ	Undetected; the analyte was analyzed for, but not detected.
W	Post-digestion spike for furnace AA out of control limits
X	Exceeds regulatory limit
X, S	Exceeds regulatory limit; method of standard additions (MSA)
Z	Cannot be resolved from isomer - see below

*****Special Notes for Organic Analytes**

1. Acrolein and acrylonitrile by method 624 are semi-quantitative screens only.
2. 1,2-Diphenylhydrazine is unstable and is reported as azobenzene.
3. N-nitrosodiphenylamine cannot be separated from diphenylamine.
4. 3-Methylphenol and 4-Methylphenol are unresolvable compounds.
5. m-Xylene and p-Xylene are unresolvable compounds.
6. The reporting limits for Appendix II/IX compounds by method 8270 are based on EPA estimated PQLs referenced in 40 CFR Part 264, Appendix IX. They are not always achievable for every compound and are matrix dependent.

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits
U	Indicates the analyte was analyzed for but not detected.
E	Result exceeded calibration range.
F	MS or MSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDA	Minimum detectable activity
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 240-17414-1

Laboratory: TestAmerica Canton

Narrative

CASE NARRATIVE

Client: Tetra Tech EM Inc.

Project: Mansfield Stamping Plant / Racer

Report Number: 240-17414-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

TestAmerica utilizes USEPA approved methods, where applicable, in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated and were analyzed in accordance with Ohio Voluntary Action Program protocols, where applicable.

A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 11/09/2012; the samples arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 2.4 C.

The following sample was submitted for analysis; however, it was not listed on the Chain-of-Custody (COC): DUPLICATE (240-17414-17).

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples SB2102 (240-17414-1), SB2124 (240-17414-2), SB2202 (240-17414-3), SB2224 (240-17414-4), SB2302 (240-17414-5), SB2324 (240-17414-6), SB2402 (240-17414-7), SB2424 (240-17414-8), SB2702 (240-17414-9), SB2724 (240-17414-10), SB2602 (240-17414-11), SB2624 (240-17414-12), SB2502 (240-17414-13), SB2524 (240-17414-14), SB2802 (240-17414-15), SB2824 (240-17414-16) and DUPLICATE (240-17414-17) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 11/20/2012 and analyzed on 11/23/2012 and 11/26/2012.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Several analytes failed the surrogate recovery criteria low for SB2102 (240-17414-1).

Job ID: 240-17414-1 (Continued)

Laboratory: TestAmerica Canton (Continued)

Benzo[b]fluoranthene and Fluoranthene failed the recovery criteria high for the MS/MSD of sample DUPLICATEMS (240-17414-17) in batch 240-66058.

Samples SB2102 (240-17414-1)[250X], SB2102 (240-17414-1)[625X], SB2202 (240-17414-3)[6.67X], SB2224 (240-17414-4)[10X], SB2302 (240-17414-5)[10X], SB2324 (240-17414-6)[4X], SB2402 (240-17414-7)[4X], SB2702 (240-17414-9)[12.5X], SB2724 (240-17414-10)[4X], SB2602 (240-17414-11)[4X], SB2624 (240-17414-12)[10X], SB2502 (240-17414-13)[4X], SB2802 (240-17414-15)[2X] and SB2824 (240-17414-16)[2.5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the SVOCs analyses. All other quality control parameters were within the acceptance limits.

PERCENT SOLIDS

Samples SB2102 (240-17414-1), SB2124 (240-17414-2), SB2202 (240-17414-3), SB2224 (240-17414-4), SB2302 (240-17414-5), SB2324 (240-17414-6), SB2402 (240-17414-7), SB2424 (240-17414-8), SB2702 (240-17414-9), SB2724 (240-17414-10), SB2602 (240-17414-11), SB2624 (240-17414-12), SB2502 (240-17414-13), SB2524 (240-17414-14), SB2802 (240-17414-15), SB2824 (240-17414-16) and DUPLICATE (240-17414-17) were analyzed for percent solids in accordance with EPA Method 160.3 MOD. The samples were analyzed on 11/14/2012.

Percent Moisture exceeded the rpd limit for the duplicate of sample SB2302DU (240-17414-5). Refer to the QC report for details.

No other difficulties were encountered during the % solids analyses. All other quality control parameters were within the acceptance limits.

Detection Summary

Client: Tetra Tech EM Inc.
Project/Site: Mansfield Stamping Plant / Racer

TestAmerica Job ID: 240-17414-1

Client Sample ID: SB2102 — Lab Sample ID: 240-17414-1

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Benzo[a]anthracene	200000		1800		ug/Kg	250	☼	8270C	Total/NA
Benzo[a]pyrene	160000		1800		ug/Kg	250	☼	8270C	Total/NA
Benzo[g,h,i]perylene	78000		1800		ug/Kg	250	☼	8270C	Total/NA
Benzo[k]fluoranthene	74000		1800		ug/Kg	250	☼	8270C	Total/NA
Anthracene	62000		1800		ug/Kg	250	☼	8270C	Total/NA
Chrysene	230000		1800		ug/Kg	250	☼	8270C	Total/NA
Dibenz(a,h)anthracene	15000		1800		ug/Kg	250	☼	8270C	Total/NA
Fluoranthene	530000	E	1800		ug/Kg	250	☼	8270C	Total/NA
Fluorene	30000		1800		ug/Kg	250	☼	8270C	Total/NA
Indeno[1,2,3-cd]pyrene	72000		1800		ug/Kg	250	☼	8270C	Total/NA
Phenanthrene	360000		1800		ug/Kg	250	☼	8270C	Total/NA

1.0 INTRODUCTION

This report presents the groundwater modeling evaluation to support closure of a former automotive stamping plant in Mansfield, Ohio. The site is being closed under the Ohio EPA Voluntary Action Program (VAP). Several chemicals of concern (COC) were detected in groundwater onsite above the Ohio VAP generic unrestricted potable use standards (UPUS). Ohio EPA has requested a demonstration that groundwater COCs will not impact off-site receptors at concentrations exceeding the UPUS.

Section 1.0 of this report discusses the objectives of modeling and rationale for selecting model codes. Sections 2.0 and 3.0 discuss the approach to modeling and model runs. Section 4.0 presents the modeling results. Section 5.0 summarizes the model limitations. Section 6.0 provides the conclusions, and Section 7.0 lists the documents used to prepare this report. All Tables follow Section 7.0. Attachment 1 provides model input and output screens.

1.1 OBJECTIVES OF MODELING

The COCs for this modeling evaluation were arsenic, barium, and tetrachloroethene (TCE). Table 1 lists monitoring wells and maximum detected concentrations of the COCs.

The objectives of modeling were to (1) simulate the migration of COCs from the hypothetical source area to the downgradient off-site receptors; (2) estimate the reasonable worst-case concentration of COCs in groundwater that might be expected at the off-site receptor locations; and (3) compare simulated maximum concentrations of COCs at the off-site receptor locations to the UPUS. Model input parameters were selected that would result in the conservative model predictions (reasonable worst-case COC concentrations at receptor locations).

The model code BIOSCREEN Version 1.4 was used to simulate migration of arsenic and barium in groundwater. The model code BIOCHLOR Version 2.2 was used to simulate the migration of TCE in groundwater. Section 1.2 further discusses the rationale for selecting these model codes.

1.2 RATIONALE FOR SELECTION OF MODEL CODES

The model code BIOSCREEN Version 1.4 (EPA 1996) is based on the Domenico analytical solution for the advective-dispersive solute transport equation (Domenico 1987), and it has the ability to simulate advection, dispersion, and retardation due to sorption or degradation (decay). BIOSCREEN includes different model types, including solute transport without decay. Therefore, the application of this model code to simulate the migration of arsenic and barium in groundwater is appropriate.

The BIOCHLOR model code (Aziz and others 2002) uses an analytical advective-dispersive transport module with sequential first-order decay to simulate the in situ biotransformation of chlorinated ethenes in a single zone or multiple reaction zones. Both BIOSCREEN and

BIOCHLOR are EPA-approved screening level models that are routinely used by various regulatory agencies and are in the public domain.

2.0 MODELING APPROACH

The overall modeling approach used to simulate migration and estimate concentrations of COCs in groundwater at the off-site receptor locations consisted of the following steps:

- Establish a set of conservative parameter values for use in modeling;
- Using selected parameter combinations perform model runs to estimate peak concentrations of COCs in groundwater at the off-site receptor locations.

Groundwater modeling used a conservative assumption of steady-state continuing source of COCs in groundwater. For simplicity, it was assumed that the specific monitoring well was the source area for the COC. Both the BIOSCREEN and BIOCHLOR models simulate source as a vertical plane perpendicular to groundwater flow direction. The source width can be represented as the maximum horizontal extent of area with the elevated COC concentrations. The source thickness represents the contaminated portion of the water-bearing zone where chemicals are slowly dissolving into groundwater. Both the source width and thickness are not exactly known but were assumed to be relatively large (conservative case). To maximize the simulated source strength the maximum COC concentration observed in a monitoring well was assigned in the model.

In addition, the model was conservative in that it did not account for changes in geochemical conditions in groundwater down gradient from the site that may trigger precipitation of COCs such as arsenic out of solution. It also did not account for biodegradation, the process that over time would reduce concentration of TCE in groundwater.

The process by which dissolved substances are transported by the bulk motion of flowing groundwater is known as advection. Owing to advection, nonreactive solutes are carried at an average rate equal to the average linear velocity of the water (Freeze and Cherry 1979). However, the solutes are subjected to hydrodynamic dispersion, which is the process of irregular spreading of solutes longitudinally (along the direction of groundwater flow), transversely (perpendicular to groundwater flow), and vertically (downward) because of mechanical mixing and chemical diffusion in the aquifer. Mechanical mixing is the primary mechanism for hydrodynamic dispersion in zones of active groundwater flow, and it occurs as a result of macroscopic and microscopic variations in the aquifer materials. As a result of hydrodynamic dispersion, contaminant mass becomes distributed over a greater volume of the aquifer at lower concentration than it would under the influence of advection alone. Under the assumptions used for this modeling of no chemical transformation of arsenic, barium, and TCE hydrodynamic dispersion is the only process that reduces their concentrations during groundwater transport.

An empirical aquifer property controlling the magnitude of dispersion is called dispersivity (Spitz and Moreno 1996). Both the BIOSCREEN and BIOCHLOR models require the input of

longitudinal, transverse and vertical dispersivity values. Selection of dispersivity values for modeling applications is a difficult process, given the impracticability of measuring dispersion in the field (EPA 1996a). In modeling applications the longitudinal (α_x), transverse (α_y), and vertical (α_z) dispersivities are estimated based on some commonly used relationships that have been determined by several researchers over time. The α_x is typically defined based on distance from the source, while α_y and α_z are usually derived as some ratios of α_x.

One commonly used approach to estimate longitudinal dispersivity is to assume that α_x is 10 percent of the estimated plume length or distance from the source to the receptor location (Pickens and Grisak 1981). A commonly used ratio to estimate transverse dispersivity is $\alpha_y = 0.1\alpha_x$ (ASTM 1995). A commonly used ratio for vertical dispersivity is $\alpha_z = 0.05\alpha_x$ or less (ASTM 1995; Gelhar et al. 1992). For this modeling evaluation, longitudinal dispersivity was estimated as 10 percent of the shortest distance from the monitoring well to the receptor location (that is based on the minimum value from the range of distances). Transverse dispersivity was set at 10 percent of longitudinal. Vertical dispersivity was set to be negligibly small.

The modeling approach described above resulted in model simulations that likely overestimate concentrations of COCs at receptor locations. The limitations of using a simplified analytical modeling approach are more fully discussed in Section 5.0.

2.1 SITE CONCEPTUAL MODEL

The conceptual model for the site was formulated to organize existing field data and literature-derived parameter values so the groundwater flow system could be analyzed more readily. As presented in Phase II Environmental Site Assessment Report (Tetra Tech 2014), the site is underlain by low permeability silty clay with sporadic, laterally and vertically discontinuous interbedded saturated sandy and gravelly lenses.

Monitoring wells in which COCs were detected above UPUS are located in the vicinity of former landfill and are screened in both shallow (MW5-2S, MW10-2) and deep (MW2-1, MW2-2, MW5-1, MW5-2D, and MW5-4) groundwater zones. Groundwater elevations measured in shallow wells are 10-30 feet higher than those in the deep wells (Tetra Tech 2014).

Groundwater flow direction in the shallow groundwater zone appears to be southeasterly at a hydraulic gradient of approximately 0.0299 feet by feet (ft/ft). Based on groundwater elevations measured in the deep wells, a mound appears to be present near the southeast corner of the former landfill. Because of this mound groundwater flow direction in the deep groundwater zone can be southeasterly and northeasterly (at a gradient of 0.0281 ft/ft), as well as southwesterly (at a gradient of 0.0111 ft/ft).

Pumping tests conducted in two shallow and one deep well indicated low well yields (Tetra Tech 2014). Interpretation of the water level recovery data at the conclusion of the pumping test in the deep well MW5-2D resulted in the estimated hydraulic conductivity (K) of 0.02 feet per day [ft/d] (7.06×10^{-6} centimeters per second). Per the boring log for this well, both silty sandy clay

and sand and gravel are present in the screen interval (Tetra Tech 2013). Considering that all other wells listed in Table 1 are screened almost entirely in silty or sandy clay, the K value derived for well MW5-2D conservatively represents permeability of the formation at the site and was used in the modeling.

Of the COCs detected in seven monitoring wells above the UPUS, only arsenic appears to be detected consistently (Table 1). Its occurrence in groundwater may be related to the former landfill which likely generated reducing conditions favorable for mobilization of naturally occurring arsenic from soils to groundwater. However, further away from the landfill the conditions in groundwater may become more oxidizing, which would likely cause arsenic to precipitate out of solution and limit its migration to off-site receptors.

2.2 Groundwater Model Assumptions

The conceptual model described above formed the basis for selecting model input parameters and constructing the model. To the extent practical, the model incorporated all field data collected at the site. Table 1 summarizes the model parameters for source releases and Table 2 summarizes various transport parameter values. Modeling assumptions are listed below.

Assumptions Required for Use in Analytical Models

- The water-bearing zone is homogeneous, isotropic, and infinite in areal extent.
- Groundwater flow is horizontal, unidirectional, and at steady state.

Physical Assumptions

- The area of concern is the well with the highest COC concentration above the respective water quality standard.
- Groundwater flow is in the direction of shortest travel from the assumed location of the source area to the receptor.
- The saturated thickness is set equal to the well screened interval of 5 or 10 feet (Table 1) to represent conservative case of the contaminated portion of the water-bearing zone (which is laterally discontinuous; the actual affected thickness of the water-bearing zone is likely less).
- The hydraulic conductivity is set equal to 0.02 ft/d to represent predominant permeability of the formation.
- The hydraulic gradient is equal to 0.0111 and 0.0299 ft/ft to simulate respectively faster and slower groundwater seepage velocity.

- The effective porosity for the water-bearing zone is set equal to 0.2 (unitless), which is an upper-bound effective porosity value for silty sandy clay (Domenico and Schwartz 1990).

- The groundwater seepage velocity ranges from 0.4 to 1.1 feet per year (ft/yr) (Table 2). The following calculation was used to determine seepage velocity (Fetter 1980):

  $v = (k \times i) / n_e$

  where:

v	=	seepage velocity, or pore water velocity (ft/d)
k	=	hydraulic conductivity (ft/d)
i	=	hydraulic gradient (ft/ft)
n_e	=	effective porosity (unitless)

- Following common approaches to estimate contaminant dispersion (Pickens and Grisak 1981; ASTM 1995), the longitudinal dispersivity was estimated as 10 percent of the shortest distance from the monitoring well to the receptor location (based on the distance from well MW5-4 of 595 feet, while the distances to receptors range up to 2,056 feet, see Table 2). Transverse dispersivity was set at 10 percent of the longitudinal. Vertical dispersivity was set to 0.0001 feet to indicate that dispersion in a vertical plane is negligibly small.

Chemical-Specific Assumptions

- The source of contamination and source release is continuous and at a constant concentration (based on the maximum concentrations of COCs detected in 2011 sampling events [Tetra Tech 2014]).

- The simulated source release is through a vertical plane which is perpendicular to the groundwater flow direction (Aziz and others 2002). The width of the source area is conservatively assumed to be 30 feet and its thickness is set equal to well screen length.

- Even though metals (including arsenic and barium) are known to adsorb or precipitate under many common geochemical conditions, including the conditions present within the site and down gradient from it, a conservative modeling considered a case of metals migration with the same velocity as groundwater (the retardation factor was set 1.0).

- Based on the organic carbon partition coefficient (K_{oc}) for TCE of 126 liters per kilogram (L/kg) (Aziz and others 2002), BIOCHLOR model calculated a retardation factor for TCE of 13.6. Therefore, because of sorption TCE is expected to migrate nearly 14 times slower than the average seepage velocity of groundwater. The calculation used the bulk density of 1.7 kilograms per liter (kg/L) and fraction of organic carbon of 0.0118 using average values from three borings (Tetra Tech 2014).

- Chlorinated ethenes biodegrade by a sequential first-order decay process (Wiedemeier et al. 1999). The biodegradation would reduce TCE concentrations in groundwater. However, this conservative modeling

BIOSCREEN and BIOCHLOR models were constructed to meet the objectives outlined in Section 1.2 and relied on the site conceptual model and assumptions described above. Model runs and sensitivity analyses are further discussed in Section 3.0.

3.0 MODEL RUNS AND SENSITIVITY ANALYSIS

The available data did not allow a detailed calibration of the model (Anderson and Woessner 1992). However, the uncalibrated model results are acceptable to meet the objectives of the modeling states in Section 1.2.

The model runs were conducted for individual wells and COCs listed in Table 1. BIOSCREEN model was run to simulate migration of arsenic and barium in shallow groundwater zone (wells MW5-2S and MW10-2) and migration of arsenic in deep groundwater zone (wells MW2-1, MW2-2, MW5-1, MW5-2D, and MW5-4). BIOCHLOR model was run to simulate the migration of TCE in shallow groundwater zone (well MW5-2S). Both models were run to estimate the reasonable worst-case concentration of COCs in groundwater that might be expected at the off-site receptor locations.

For the continuous constant source used in all modeling runs, retardation of COCs due to sorption would only increase the arrival time of the peak concentration but will not reduce the concentration. As discussed in Section 2.0, dispersion is the only mechanism causing a reduction in COC concentrations in groundwater as it migrates from the source area towards the receptor.

Limited model sensitivity analysis conducted during this modeling effort indicated that model outcomes are strongly influenced by the source size (width and saturated zone thickness) and dispersivity. However, given the uncertainties associated with the determination of these parameters, the selection of overly conservative continuous source assumption would outweigh the errors associated with the estimates used for these parameters. In addition, model sensitivity analysis indicated that incorporating retardation into the model would result in COCs arriving to receptor locations after a period of thousands of years. For this reason, model simulations were set to unrealistically long times (10,000 years).

4.0 MODEL RESULTS

Table 3 summarizes simulated concentrations of COCs for individual wells. Attachment 1 contains model input and output screens for model runs.

The modeling results presented in Table 3 indicate that simulated COC concentrations in groundwater at receptor locations would not exceed UPUS.

5.0 MODEL LIMITATIONS

For this investigation, model parameters were selected based on field data, where possible. The hydraulic conductivity estimate was based on the interpretation of recovery data from the pumping test. The hydraulic gradient was estimated based on the observed range of groundwater elevations at the site. The porosity of soil was established from an upper-end literature-based value for silty sandy clay (Domenico and Schwartz 1990). The type of modeling used for this evaluation is consistent with the characteristics of a "generic model" (Anderson and Woessner 1992). Generic models are used to analyze flow in simplified hydrogeological systems and do not necessarily require formal calibration (Anderson and Woessner 1992).

Numerous assumptions and simplifications were incorporated to develop the analytical transport model for the site, which are likely to result in overestimated concentrations of COCs at the receptor locations. Uncalibrated model results provide a reasonable worst-case analysis and are considered to be conservative for protecting potential off-site receptors. Section 2.2 of this report summarizes the important assumptions and simplifications of this evaluation.

6.0 CONCLUSIONS

The BIOCHLOR and BIOSCREEN analytical models were used to simulate the fate and transport of arsenic, barium, and TCE detected above the UPUS in groundwater at the site. The objectives of modeling were to:

(1) simulate the migration of COCs from the hypothetical source area to the downgradient off-site receptors;

(2) estimate the reasonable worst-case concentration of COCs in groundwater that might be expected at the off-site receptor locations; and

(3) compare simulated maximum concentrations of COCs at the off-site receptor locations to the UPUS.

The approach to modeling included selecting input parameters that would result in conservative model results, because detailed model calibration was not possible due to lack of downgradient groundwater data.

Modeling results indicate that under present site conditions the COCs would take hundreds to thousands of years to arrive at the receptor locations. The concentrations of arsenic, barium, and TCE are not predicted to exceed UPUS at the off-site receptor locations.

The predicted concentrations of COCs are likely overestimated. The modeling did not account for geochemical effects on arsenic and barium fate and transport, which would likely reduce their concentrations in groundwater and limit their migration towards receptors. Similarly, the modeling disregarded biodegradation that would likely reduce concentration of TCE over time.

EMERGENCY RESPONSE

RECEIVED
90 NOV 19 AM 11
OHIO EPA EMERGENCY RESPONSE

Dear Sir:

The intent of this letter is to provide written confirmation of the telephone notification No. 11-70-5308 made to the office of Ohio Environmental Protection Agency Emergency Response on November 12, 1990 at 3:43 p.m. concerning an excursion of oil and grease in our storm water effluent.

Listed below is pertinent information:

Callers Name:	Edward Fish
Position:	Chief Power House Engineer
Company:	C-P-C Group of General Motors Corp. Mansfield Fabricating Plant 2525 W. Fourth Street Richland County Mansfield, Ohio 44906
Telephone:	(419) 755-5351
NPDES Permit #:	2IS00045*CD
Application #:	OH0006050
Level of Excursion:	14 mg/l on 10-30-90
Permit Limitation:	10 mg/l
Streams Affected:	Unnamed tributary to Clearfork Reservoir

A follow up call made to Mr. Rich Carter, Duty Officer, Ohio EPA Emergency Response, on November 14, 1990 and logged as Notification No. 11-70-5339. The purpose of the phone call was to report results of the investigation as to the source of the oil and grease detected in the storm water discharge samples taken on October 8 and October 30, 1990.

There were no spills reported on the plant property to cause a release. Visual monitoring of the lagoon noted normal conditions. The floating baffle, brill skimmer and underflow weir were all in place and operating properly in the storm water pond during this period.

Two ditches (hereafter referred to as "Beer Road" and "State Route 309" ditches) which flow onto C-P-C property were inspected the morning of 11-13-90 to determine if surface water runoff from the adjacent commercial and industrial properties may have caused contamination. A visible sheen was observed on the surface of the water in the ditch along Beer Road. Visual trail of the sheen led the observer upstream to the former Bender & Louden Trucking Terminal, where the contamination apparently originated. This terminal, located at 815 N. Beer Road, was once the site of underground diesel fuel tanks.

Absorbent socks are in place where the Beer Road and State Route 309 ditches flow on to C-P-C property. The sock along Beer Road had become tangled in the fence, allowing contaminants (observed as visible oil sheen) to enter our property. Absorbent pads were used to blot up the contaminantson November 11, 1990.

The C-P-C Mansfield storm water pond discharge was sampled again on November 12, 1990. The oil & grease level was found to be within the permit limitation. The results were as follows:

C-P-C Storm Water Pond	2 mg/l	11-12-90

C-P-C Mansfield has increased inspection frequency of the Beer Road ditch to ensure that the absorbent sock is in place and to note visual appearance of the ditch.

Contamination flowing onto the C-P-C property from the ditch along Beer Road appears to have caused the oil & grease level in the C-P-C Mansfield storm water pond discharge to exceed the NPDES permit limit during the month of October 1990.

Please contact Edward Fish at (419) 755-5351 if there are any questions regarding this matter.

Sincerely,

for Jorge Broggio
Plant Manager

Box 124 Bellville 886-4416

[3] CONDITIONS LEADING TO REPORT OF SUSPECTED RELEASE (*Check all that apply*)

___ Inventory control results indicate a release may have occurred.

___ Testing, monitoring or sampling results indicate a release may have occurred.

___ Unusual operating conditions observed (e.g., sudden drop in tank volume).

__✓ Impacts noticed in area surrounding tank (e.g., vapors, well contaminated, run-off).

__✓ Soil contaminated, or soil exceeds 100 ppm total hydrocarbons using G.C. or O.V.A.

___ Spill or overfill of petroleum in excess of 25 gallons.

___ Spill or overfill of petroleum less than 25 gallons when containment is not possible.

___ Spill or overfill of petroleum below ground, or soaking into ground after spill.

___ Spill or overfill of petroleum to surface water when petroleum created sheen on water.

OTHER CONDITIONS: Drain from vault pit flows into a ditch which flows to a ditch on G.M.'s property. Ditch eventually

FIELD ACTIVITY REPORT

Site No. 709417

Date: 6/8/89 Time: 10 :00 (AM) PM Weather: rain (clear) cloudy snow

County: Richland Temperature: 80 °F

Site Name: Bowsher/London Motor Freight

Location: 815 N. Bowsher Ave.
Ontario, Ohio 44906

Personnel:

BUSTR : Kelly Gill

Other: (see attached list)

Purpose of Visit: Check for soil and surface water contamination around 2-diesel U.S.T.'s.

Findings/ Actions: Soil high contaminated around top of tanks. Vent pipes not in compliance. Weigh Scale leaving for trucks filled w. water w/product on water. Slight sheen on water running from drainage tile running along east side of property. Two Recovery Not Kept very well. Bridge/London hired contractor (Plemick) to pull tanks. Were pulling tanks when I left at 2:00 p.m.

Recommendations: Site investigation with possible site assessment after receipt report and review of water sample data which will be sent to us from two (2) water wells by Health Dept.

RE: Bender & Loudon Motor Freight Terminal
815 North Beer Road
Ontario, Ohio
Richland County
Incident #709417-00

Dear Mr. Housley:

The Ohio Revised Code, Section 3737.88, gives the State Fire Marshal the responsibility for implementation of the underground storage tank program and corrective action for releases from underground tank systems. This office has been notified of a confirmed release from an underground storage tank system at the aforementioned facility.

As the underground storage tank owner/operator, you are subject to state and federal regulations governing the investigation and clean-up of releases from underground storage tank (UST) systems. The Initial Corrective Actions, as listed in the Ohio Administrative Code(OAC) 1301:7-7-36 (C)(2), include: stopping any further release from the UST system; mitigating all fire, explosion, and safety hazards; and the removal of all visibly contaminated soil and any associated groundwater from the excavation zone. In addition, you must conduct an investigation to determine the possible presence of free product and initiate removal of any free product as soon as practicable. Once these activities have been conducted, a report shall be submitted to the State Fire Marshal within twenty (20) days of the discovery or confirmation of the release. In addition to the aforementioned activities, a site investigation shall be performed which includes all of the elements as listed in OAC 1301:7-7-36 (C)(3) and (4).

If residual contamination remains following Initial Corrective Actions and the Site Investigation the owner/operator will be required to perform a Site Assessment in accordance with OAC 1301:7-7-36 (E). The Site Assessment will define the vertical and horizontal extent of soil and groundwater contamination on site and off site. In addition, a Corrective Action Plan would then be required to be prepared by the owner/operator which describes in detail how the soil and groundwater will be cleaned up. Other activities not specifically described herein may be required by the State Fire Marshal.

Enclosed is a copy of the "Corrective Action Guidance for Petroleum Releases" along with OAC 1301:7-7-36 and portions of 1301:7-7-28. These have been provided to assist underground storage tank owners/operators in conducting the corrective action activities required by the State Fire Marshal. Please take special note

of the deadline requirements for compliance with your responsibilities as specified in OAC 1301:7-7-36. The Initial Corrective Action and Site Investigation reports are required to be submitted to the State Fire Marshal within twenty (20) days of the discovery of the release. A Free Product Removal report (see OAC 1301:7-7-36 (D)) must be submitted within thirty (30) days of the discovery of the release The deadline for the Site Assessment and Corrective Action Plan will be determined by the State Fire Marshal.

When soil and groundwater samples are to be collected and analyzed pursuant to OAC 1301:7-7-36 certain protocols are to be followed. These protocols include those described in the enclosed "State Fire Marshal Corrective Action Sampling Guidelines". At a minimum these guidelines must be followed in order for sample results to be considered valid.

To assist our office in expediting a review of your correspondence please reference the incident number (709417-00) and place it in the upper right hand corner of your correspondence. Thank you for your cooperation and, if you have any questions regarding this matter, please call us at (614) 752-8200.

Sincerely,

Kelly Gill

Incident # 709417-00

Mr. Gill:

Please be advised per our phone conversation of this morning. We are making every effort to have a completed report to you A.S.A.P.

In order to file a completed report to you with a ground water sample we are requesting a fourteen day extension.

Steps taken towards correcting the problem to date are:

A. Removial of tanks
B. Fuel Lines
C. Fuel island concret
D. Diging out contaminated soil and stock piling on visqueen and covered by same.
E. Sending samples out for testing.

I have not received a copy today. But I believe Musick's Service have some.

Sincerely,

Rich Housley
Director of Maintance.

RE: Bender and Louden Motor Freight Terminal
815 North Bear Road
Ontario, Ohio
Richland County
Incident #709417-00

Dear Mr. Bender:

On June 7, 1989, a confirmed release from the underground storage tank system located at the aforementioned facility was reported to the State Fire Marshal.

On June 13, 1989, you were sent a letter and attachments which described your responsibilities for complying with the Ohio Administrative Code (OAC) §1301:7-7-36. As the underground storage tank owner/operator or a legal representative thereof, you are responsible for the investigation and clean-up of releases from underground petroleum storage tank (UST) systems. To date, no response has been received by the State Fire Marshal. You must prepare and submit to the Bureau of Underground Storage Tank Regulations a report which meets the requirements of OAC §1301:7-7-36(C) detailing initial corrective actions and site investigation activities.

To assist you in understanding your responsibilities under the OAC, I have enclosed appropriate statutes and rules related to petroleum UST suspected release investigations and corrective actions. Please take special note of the deadline requirements. The Initial Corrective Action and Site Investigation reports are required to be submitted to the State Fire Marshal within twen y (20) days of the discovery of the release. A Free Product Removal report [see OAC §1301:7-7-36(D)] must be submitted within thirty (30) days of the discovery of the release.

When soil and groundwater samples are to be collected and analyzed pursuant to OAC §1301:7-7-36 certain protocols are to be followed. These protocols include those described in the enclosed "State Fire Marshal Corrective Action Sampling Guidelines". At a minimum, these guidelines must be followed in order for sample results to be considered valid.

To assist our office in expediting a review of your correspondence please reference the incident number (709417-00) and place it in the right hand corner of all your correspondence. Thank you for your cooperation, and if you have any questions regarding this matter, please call us at (614) 752-7938.

Sincerely,

Charles E. Zepp
Site Coordinator
Bureau of Underground
Storage Tank Regulations

pump. Mr. Musick inspected site. Spoke with Rich & Mr. West about reporting if they thought they spilled more than 25 gallons, they should report it. Dispatched a crew to site to cut a trench between tanks and pump off product. Pumped out water and skimmed fuel. Brought back total of 275 gallons for disposal at shop. Dug hole & recovery hole right between tanks, 3' deep.

5-27-89: Crew returned to site and skimmed off fuel and water from tank hole. Brought back 198 gallons for disposal.

5-30-89 Mr. Musick went to location to check. Spoke to manager and he said they will pump the tanks down and wants us to give them a bid for removal. Sent a crew over to skim off the fuel from the tank hole. While there, they also replaced the check valve under the west pump (had to remove the pump off the island to change the valve). Brought back 15 gallons contaminated water for disposal.

6-02-89: Mr. Musick went to site and checked. Hole needs pumped again.

6-03-89: (Saturday) Technician went to site and skimmed top of tank hole off. Left (1) 55 gallon full drum at site.

6-05-89: Technician went to site and changed the pump hoses from one pump that was no longer in use to the other pump currently in use. Transfered balance of product from one tank (no longer in use) to the other tank currently in use. Skimmed fuel off of water in the tank hole. Placed contaminated water into four (4) drums; brought back to shop (Total 220 gallons).

6-8-89 Evacuated all associated groundwater and fuel from the two recovery holes that were put in on 5-26-89. Then we removed the tanks. See removal for details. More water was removed from the tank excavation. Tank #1, was not leaking. This tank had previously been armourcoated. I have no details regarding this. Tank was plugged near the bottom approximately 7 feet from the north end of the tank. Then armour coated. Tanks were installed approximately 1965 and were made of steel construction. Kelly Gill, State Fire Official, suggested installed an adsorbant boom at the creek to adsorb any fuel that may be traveling in that direction. Went to K & D and picked up the booms. Delivered drums to the site. 6-9-89 Evacuated more water from the excavation. Checked soils, cleaned out bottom of the hole clear down to the concrete pad and exposed. Piled dirt on and covered with visqueen. No visual contamination at this point. Per request of Kelly Gill, State Fire Marshal dug a hole 15' deep, approximately 25' east of the excavation to check for water table. Did not hit water at 15'. Checked creek at boom's, found nothing on the water. Dug area at edge of the tank hole over to the concrete drive area. Fuel oil was coming out from under the concrete. Removed concrete island, excavated and removed product lines. Took samples from under product lines. Delivered samples to the laboratory for analysis. (Time under removal.) Made arrangements with Fishburn Services to pick up fuel and water that was evacuated from the tank hole excavation. Made sure he was approved by State and EPA. Hauled tank away for disposal. (Time under contract.) 6-10-89 Hauled second tank away for disposal. (Time under removal.) 6-12-89 Met with Fishburn Services, pumped off drums on site and what was brought into our facility and pumped fuel and water from scale pit. A total of 2500 gallons was removed. 50 gallons was product that was hand pumped from the bottom of the tanks. Approximately 15 gallons was fuel. 6-13-89 Picked up two tanks and drums. Checked for water sample at east end of tank hole, could not get one. Water table is too low. Set barricades. Skimmed product from tank hole. Recovered 100 gallons of water, 20 gallons of fuel. Disposed of at Musick's Service STation Maintenance. Then was picked up by Fishburn services. 6-16-89 Bill West called, said Fire Dept was on site. Wind has blown covering from the soil pile. Rain washing it away. Needs contained. Dispatched someone immediately. Skimmed 10 gallons of product and 90 gallons of water. Covered dirt again. Left drums on site. 6-20-89 Discuss soil removal with Bill West, explained proper procedure. Asked for an incident number. 6-17-89 Filled out paperwork. Called Bill West, Bender and Loudon, he said to send removal bill directly to Richard Housley, Main Office, Akron. I asked Bill if he received an offical notification yet from the state with an incident number and he said no. He will call me just as soon as he received it so we can get started on the report. Told him to be sure to put all notes in writing. 6-27-89 Called and requested an incident number again. Richard Housley did have on file. Will send me copies ASAP. #709417-00, with 20 and 30 day notifications.

JAN-30-91 WED 12:56 MUSICK'S

6-8-89 OBTAINED PERMIT FROM THE SPRINGFIELD TWONSHIP FIRE DEPARTMENT. PERMIT # 89-27 ISSUED BY RON HENRY. RON HENRY, SPRINGFIELD TOWNSHIP FIRE DEPARTMENT, JEFFREY WANDER, OHIO EPA, AND KELLY GILL, STATE FIRE MARSHAL'S OFFICE, REPRESENTATIVES OF BENDER/LOUDON RICHARD HOUSLEY, DIRECTOR OF MAINTENANCE, AND BILL WEST, MANAGER. ALL WERE ON SITE. EXCAVATED IN DIRT AREA TO TOP OF TANKS. DRAINED AND FLUSHED PIPING INTO TANKS. OWNER HAD THEIR TRANSPORT TRUCK TO COME IN AND REMOVE THE PRODUCT FROM THE TANKS. A TOTAL OF 25 GALLONS WAS LEFT IN EACH TANK. REMOVED WITH A HAND PUMP AND DRUMMED. 6-9-89 OBTAINED SOIL SAMPLES. TANK EXCAVATION #1. SAMPLE WAS TAKEN FROM EACH END OF THE TANK. CONCRETE SLAB WAS IN BOTTOM OF TANK HOLE. SO SAMPLES WERE TAKEN JUST OUTSIDE SLAB AREA, AT THE BOTTOM OF THE EXCAVATION, APPROXIMATELY 12' DEEP. TANK EXCAVATION #2. SAME CONDITIONS APPLY AS TANK #1. PRODUCT LINE: ONE SOIL SAMPLE WAS OBTAINED FROM THE PRODUCT LINE TRENCH APPROXIMATELY 4' NORTH OF THE ISLAND AND ONE SAMPLE WAS TAKEN FROM DIRECTLY UNDERNEATH THE SUCTION PUMPS. SOIL SAMPLES WERE TAKEN USING A TRIER SAMPLER AND PLACED IN APPROVED CONTAINERS SUPPLIED BY KELLY GILL, STATE FIRE MARSHAL'S OFFICE.

CONDITION OF TANKS

booms. 6-30-89 Took down barricades and put up fencing because of safety factor. The tank hole is quite full of water. 7-6-89 Dug test hole for groundwater sample per instruction of Kelly Gill, State Fire Marshal. Dug down 18' waited for groundwater to come in overnight. None found. 7-7-89 Went back to the site, dug test hole deeper. Finally got a groundwater sample at 23' deep. 7-8-89 Prepare paperwork and deliver sample to laboratory. 7-22-89 Work on report. Job is still incomplete.

Taber

7-17-89 (This time was not picked up on invoice 89-1239). Re-secured fencing around open hole. Filled in test holes. 8-14-89 Stirred soil piles. Covered again. 8-15-89 Met with Richard Housley on site. Obtain site map necessary for reporting. Water was full of water. Obtained sample for analysis. Discuss getting background samples and went over what we feel is the next step regarding cleaning up the contamination. At this time we feel it is necessary to take out an additional 2' of soil off all sides of the tank hole and digging along side of the concrete pad in the bottom of the tank hole to obtain another soil sample. Hopefully we will not have to remove [illegible] concrete pad in the botton of the hole. Removing the concrete slab on top of the [illegible] the south side of the excavation, it appears that product is trapped under [illegible] and seeping through the side walls of the tank excavation. 8-14-89 Spoke to Craig Postel with Chem Tech consultants regarding land farming verses soil disposal. Took him to the site for inspection. 8-15-89 Made up exhibits of soil analysis and cover sheet for reporting. Tried to get in contact with Kelly Gill, State Fire Marshal's office, but he was not in and is to get in touch with me. 8-18-89 Prepare estimates, ballpark figures only, regarding land farming and soil disposal. Called in to Richard Housley.

Taber

8-22-89 Cultivate dirt to aerate. Discuss job with consultant.

Report on Sample of Soil Pile

Report No. 89-31129

Date: October 6, 1989

Client: Chem-Tech Consultants
559 State Route 97 East
Bellville, Ohio 44813 - Attn: Craig Postel

P.O.No. CCT-387

Identification: Soil sample from Bendee submitted on 9-30-89

Top foot of trench OK excavation.

Test methods from USEPA document SW-846

	Exc. West	Detection Limit
Benzene (ug/kg)	< 10	10
Toluene (ug/kg)	< 10	10
Ethylbenzene (ug/kg)	< 10	10
Xylene (ug/kg)	< 10	10
Total Petroleum Hydrocarbons (mg/kg)	<0.5	0.5

Respectfully submitted,

Terry Harbaugh

Attn: Charlie Zepp

RE: Bender & Loudon

Dear Charlie;

For our many conversations, please review the attached report and get back to me as soon as possible.

We are very confident that this site is cleaned up as much as possible, even beyond the background sample that was taken from the lot.

Should you agree that no additional work is needed please send us a no further action letter, as this property is in the process of being sold however has been held up due to the contamination.

Sincerely,

Julie Kabbes

Executive Summary

Bill West called Musick's on May 26, 1989 stating that he suspected a leak under the pump. Musick's advised him to report the spill to the State Fire Marshal's office.

Two 8,000 gallon diesel fuel underground storage tanks were removed on June 8, 1989 from the property of Bender and Loudon. The removal was performed by Musick's Service Station Maintenance.

Excavation of soil was performed in three stages. After the first stage, the tanks and surrounding soil were removed. The second stage involved removal of additional soil to the south and east. The scale, soil around it, and soil around the drain line from the scale were removed during the third stage. Samples were taken after the third stage.

Notification

Notification was made to the State Fire Marshal's office by Bill West of Bender and Loudon.

A. Initial Corrective Actions (1301-7-7-36)

1. Report

This report is intended to comply with OAC 1301-7-7-36.

2. Stop Any Further Release

A check valve was replaced on the west pump on May 30, 1989. The tanks were pumped of remaining product and then removed on June 8, 1989.

3. Mitigate Fire, Explosion & Safety Hazards

Any potential fire or explosion hazards were removed from the site. Explosion proof pumps were used to remove free product and groundwater.

Barricades were placed in order to prevent inadvertent public access into the excavation area.

4. Removal and Disposal of Contaminated Soil or H_2O

Contaminated soil was placed on and covered with visqueen.

Contaminated water was removed from the site and disposed of at the Mansfield Wastewater Treatment Plant by Brownie Sewer & Septic Tank Service.

The tanks were purged with dry ice, etched, and disposed of by Kittle Truck & Equipment Company of Crestline.

5. Free Product Investigation

A trench was dug between the tanks on May 26, 1989. Water and fuel were skimmed from the hole.

Booms were placed on a nearby creek and checked occasionally for free product but none was found.

Area from the edge of the tank hole was dug to the concrete drive area. Diesel fuel came out from under the concrete. The concrete was then removed.

B. Site Investigation

1. Data on the Nature of the Release and Estimated Quantity

The release of diesel fuel was estimated to be greater than reportable quantity.

2. Data from Surface and Subsurface Soil Sampling

Sample#	BTEX (mg/kg)	TPH (mg/kg)
23701	<0.005	42.2
23702	<0.005	32.4
23703	<0.005	65.6
23704	<0.005	66.8
23705	<0.005	59.1
23706*	<0.005	125

23707	<0.005	46.8
23708*	<0.005	42.5

*Background Samples

3. Data from Groundwater and/or Surface Water Sampling and Analyses

Final Ground Water Sample From Excavation

Sample #	BTEX (mg/l)	TPH (mg/l)
23918	<2.0	1.02

4. Data from Available Sources - Soil Survey Map, ODNR Groundwater Maps, Background Site Levels Prior to the Release, Land Use, Climatological Conditions

The soil survey map of Richland County (see Appendix) indicates the site is in an area of cut and fill land. The material is variable because the natural soil has been altered by cutting and filling.

The ODNR Groundwater Resources Map indicates that the site is in an area in which yields of as much as 25 gallons or more per minute may be developed. Groundwater supplies for domestic use may be developed in the sandstone-shale bedrock at depths of 50 to 275 feet.

Background site levels were not established before the release. However, a background sample was taken 100 feet south of the excavation in the slag drive at a depth of 1-3 feet. The drive had been coated with oil. Oil was present

visually to a depth of six inches. This is sample #23706 with a TPH of 125 mg/kg.

The other background sample, #23708, was taken 300 feet north and upgradient of the tanks. It is consistent with the samples taken from the excavation.

Land use is commercial, industrial and agricultural. Trac-Line Equipment and Quality Farm and Fleet are to the north and northwest. There is a farm approximately 1/4 mile to the south. CPC Division of General Motors is to the east.

The climate of Richland County is marked by a wide range in annual, daily, and day-to-day temperature. Winter is reasonably cold and cloudy. Summer is reasonably warm and humid.

C. Free Product Removal 1301-7-7-36 (C2)

1. Implementation

Free product and contaminated groundwater was collected by Musick's on a regular basis. Free product and water was skimmed from the excavation and taken to Musick's or drummed on-site until disposal.

2. Estimated Quantity and Product Type

Brownie Sewer & Septic Tank Service evacuated 52,500 gallons of water from the excavation.

On June 12, 1989, Fishburn Services hauled away 2,500 gallons of contaminated water for disposal. Included in the 2,500 gallons was 50 gallons of product that was hand pumped from the bottom of the tanks and an additional 15 gallons of fuel. On June 13, 1989, 100 gallons of water and 20 gallons of fuel were collected, stored at Musick's and then picked-up by Fishburn Services. On June 16, 10 gallons of free product and 90 gallons of water were collected.

3. Product Recovery System Details

Product recovery was skimming by Musick's. Currently, there is no recovery system in place.

4. On/Off-Site Discharge

No on/off-site discharge.

5. Disposition of the Recovered Product

Product and contaminated water were collected and then stored on-site or at Musick's. It was then hauled off for disposal.

Much of the contaminated water was disposed of at the Mansfield Wastewater Treatment Plant.

RE: Bender & Loudon, Mansfield, Ohio, Richland County (BL\TM\LTR)

Dear Charlie:

Per your request, Chem-Tech Consultants, Inc. is providing the information requested for Bender & Loudon in Mansfield, Ohio.

Attached are the lab procedures, field techniques, and PID calibrations that were utilized for Bender & Loudon. The disposition of the soil is a non-hazardous determination and still remains on-site pending disposal or on-site treatment. Upon removal the soil was placed on Visqueen and covered.

I hope this will satisfy the remaining information needed to generate a no further action letter.

Sincerely,

CHEM-TECH CONSULTANTS, INC.

Report on Methodology of Analysis

October 17, 1991

Project No.: 89-31128

Client: Chem Tech Consultants
559 St. Rt. 97 East
Bellville, Ohio 44813 - Attn: Craig Postel

P. O. No.:

Identification: Project report submitted October 6, 1989.

Test Method for BTEX - Method 8020 from US EPA Document SW 846.

Test Methods for TPH - Methods 9071 and 418.1 from US EPA Document SW 846 and US EPA Document 600/4-78-020.

Respectfully Submitted,

Stephen Rhodes, Chemist

Field Instrument Calibration BENDER / LOUDON PROTOCOL

HNU MOD HW-101

The unit is calibrated twice daily:

1. Prior to job use
2. Post-job use

The analyzer is calibrated by use of a cylinder and a regulator. The cylinder contains a calibration gas consisting of a mixture of isobutylene in zero air.

The regulator sets and controls the flow rate of gas to the analyzer at a value preset at the factory. The output of the regulator is connected to the analyzer by a short, clean section of flexible tubing.

The meter is then checked for battery strength, re-zero, adjustment to span of calibration media.

The analyzer is completely torn down and maintained periodically as a deviation from the calibration span indicates the necessity.

Typical gases that will be ionized by the analyzer:

Gas	Ionization Potential (eV)
Xylene	8.56
Toluene	8.82
Cyclohexanone	9.14
Benzene	9.25
Isobutylene	9.44
Trichloroethylene	9.45
Methyl ethyl ketone	9.53
Tetrahydrofuran	9.54
Acetone	9.69
Vinyl chloride	10.00
Ammonia	10.15
Isopropanol	10.17
Hexane	10.18
Ethanol	10.48

Calibration: 40 ppm at 9.8 Span Setting
Media: Isobutylene
Lamp: 10.2 eV

Field Screening Procedures

Two scans are generally noted. The first is an inexcavation screening which involves exposing fresh soil screening. These readings are logged or tabulated as required. The second screening involves actual sample head space. In extreme cold temperatures, the sample may have to be warmed in order to receive valid readings. Then a duplicate sample is then taken into appropriate containers and delivered for the lab analysis.

Sample Collection Procedures

BENDER / LOUDON PROTOCOL

Excavation sampling was performed utilizing a stainless steel core sampling tool (thin-walled tube sampler). Four to six inches of earth was removed prior to the sampling event. The collected sample was placed into glass jars with Teflon lids and refrigerated prior to delivery to the laboratory.

Core samples were collected into a stainless shelby tube sampler, extracted into glass jars with Teflon lids and refrigerated.

All sampling equipment was decontaminated between use, applying a three-rinse technique. Proper chain-of-custody procedures were followed in the transfer of the samples.

Groundwater Collection Procedure

Groundwater samples were obtained through a 4" PVC environmental well screen within an excavated area around the tank cavity. A clean glass jar was used to collect the water and transfered to 40 ml septum sealed vials and one quart glass jars with Teflon lids. Samples were refrigerated following the collection. Proper chain-of-custody procedures were followed in the transference of the sample. Groundwater samples were under the direction of Kelly Gill of the State Fire Marshal's office.

Incident #709417-00

Dear Mr. Bender:

The State Fire Marshal, Bureau of Underground Storage Tank Regulations, (SFM, BUSTR) has received all required information regarding the site investigation at the aforementioned location. Our review of the analytical results and associated information indicates that you have met the current site investigation requirements. Regarding corrective action activities at this site, BUSTR is not requiring any further action at this time. However, information provided to BUSTR indicates that the contaminated soil excavated during the UST closure, which is not regulated by SFM, BUSTR, has not been disposed of in accordance with the Ohio Environmental Protection Agency (OEPA) requirements. We have notified OEPA, Northwest District Office, Division of Solid and Infectious Waste of this matter by sending them a copy of this letter.

Due to information potentially not discovered or revealed, nothing in this letter should be interpreted as a guarantee or warrantee that no problems exist at the aforementioned location. In addition, this letter does not release the responsible party from future responsibility and liability under sections 3737.88 through 3737.89 of the Ohio Revised Code and other state laws and regulations or under the Federal Clean Water Act, Resource Conservation and Recovery Act, or Comprehensive Environmental Response, Compensation, and Liability Act for remedying conditions resulting from any release of contaminants to the environment.

If you have any questions about this determination, you can telephone me at (614) 752-7938.

Sincerely,

Charles E. Zepp

May 4, 2011

Mr. Guy Montfort
Ms. Vicky Farmer
Tetra Tech EM Inc.

SUBJECT:
Ground Penetrating Radar survey:-Former GM Stamping Plant, Mansfield Ohio.

Dear Mr. Montfort:

GeoSearches, Inc has completed the Ground Penetrating Radar Imaging survey, April 5 2011 at the Mansfield Stamping Plant. The object of this survey was to clear drill locations and also look at an area south of the facility that was possibly an historical landfill.

The subsurface conditions on the day of the survey were wet. Data lines executed in a North/ South and East /West direction which covered the area to accumulate enough data to draw a conclusion on this area.

The data did show consistency down to the collected depth of 10 feet and did not show any irregularities consistent with landfill conditions.

Best regard's,

Terence M. Hamill
President / Principal Geophysicist

SUBJECT: Mansfield Stamping Plant

Concrete Radar investigation – Marriage Pit

Dear Mr. Montfort:

GeoSearches, Inc has completed the two part Geophysical survey, April 19, 2011 at the Mansfield Stamping Plant in Mansfield, Ohio.
This Full Report presents the results regarding the targeted concrete radar survey.
If you have further questions please contact GeoSearches, Inc it has been a pleasure working with you on this project.

Best regard's,

Terence M. Hamill
President / Principal Geophysicist
GeoSearches, Inc.

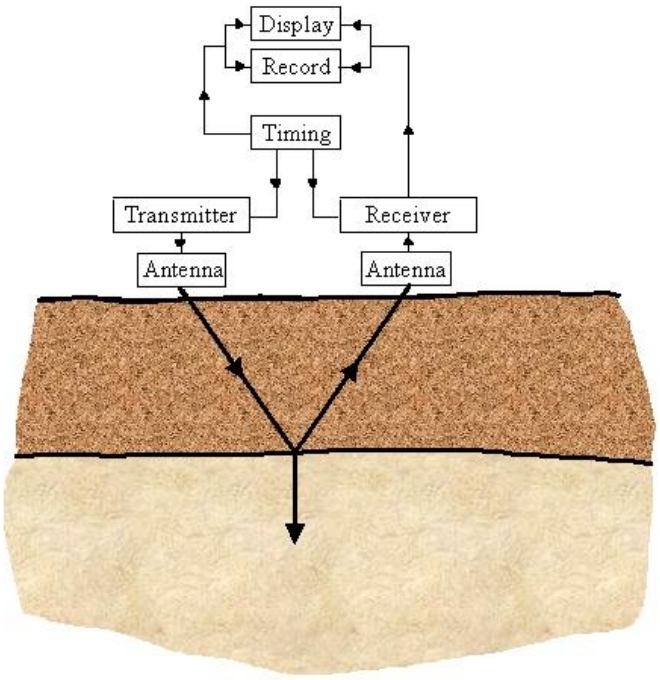
SITE PROJECT AND DESCRIPTION

Introduction:

GeoSearches, Inc. was retained by Tetra Tech EM to conduct a Concrete Penetrating Radar survey. The object of the survey was to detect if a concrete floor within the "Marriage Pit" area at the Mansfield Stamping Plant had been compromised over the years.

The non-intrusive, subsurface investigation was conducted using Ground Penetrating Radar (GPR). GPR detects subsurface structures by transmitting radio frequency waves into the ground and monitoring the strength and time delay of the reflection. The returning signal can then be evaluated to locate subsurface anomalies. Anomalies can be caused by void spaces, differences in soil/bedrock texture, differences in soil/bedrock moisture content, differences in the sediment compaction, and the presence of subsurface structures such as pipelines.



Part One: Method

The survey was conducted using a Noggin GPR from Sensors and Software, Inc., with a 500MHz antenna. The data were acquired using the common-offset reflection profiling method. The depth of penetration ranged from 0 to 10 feet below the surface

Before fieldwork was started, historical data and detailed diagrams were reviewed to provide background information on the site. A preliminary, straight-line GPR survey was conducted at the beginning of the investigation, establishing the typical response based on the site geology and subsurface structures. The survey was conducted by moving the GPR equipment along the grid lines in two, perpendicular directions. The GPR data were reviewed in the field before processing.

Part Two: Processing

Following the field investigation, the data was processed by applying filters and gains to better define the anomalies of interest. Tools used to process the data and improve image quality included SPIVIEW TOOLS and WIN EKKO software from Sensors and Software, Inc.

Once each data survey is loaded and the grid properly oriented spatially, a short (3-sample) temporal median trim filter is applied to each GPR trace (one gridline) to attenuate noise spikes that degrades the data quality. A residual median filter is then applied to attenuate the wow (Short range GPR signals often possess a low-frequency component, commonly referred to as a "wow" that causes amplitude distortion along an individual trace), this filtering attenuates both the low and high frequency components of the wow, without adding precursors or other artifacts to the wavelet. Time zero determination and datuming is also performed.
The data is then processed by applying amplitude compensation. For each GPR survey line, the rectified-amplitude versus time fall-off is determined. The inverse of this curve is scaled by a multiplier (0.3) to form the gain function. The multiplier is used to slightly reduce the gain function so that anomalously high amplitude values are not clipped after amplitude compensation.

Part Three: Interpretation and data quality

After completion of the data processing, each GPR reflection image was evaluated to:

(1) evaluate the GPR penetration depth and resolution of the data collected at 500MHz and compare reflection character of the two, perpendicular line orientations; and

(2) Interpret GPR reflections and image patterns as bounding surfaces and architectural elements in profile.

AN INLINE REFLECTION PROFILE WAS USED IN THIS SURVEY TO SHOW A PICTURE OF WHAT ANOMALIES, IF ANY, EXISTS WITH DATA COLLECTED USING 500 MHZ ANTENNAE.

GROUND PENETRATING RADAR EQUIPMENT ON SITE

Section Two

DISCUSSION and INTERPRETATION

Part One: Discussion

The GPR survey included:

- The project area was 70% accessible. The area consisted of concrete and metal mats on the ramp area.
- The concrete surface was covered with water, oil and grease on the concrete surface in the pit. Above the pit and along the corridor water was lying on the concrete surface also.

Part Two: Interpretation

The primary objectives of the GPR survey were to determine the location and depth of the historical culvert and the internal reinforcement locate.

Results

The object of the Geophysical survey and the use of Concrete Penetrating Radar to achieve the project goals were to find and delineate the location of any concrete issues in the "Marriage Pit" area.

1. **Sump Area** -100'x20'
   The concrete thickness in this area is approximately 2 feet.
   In Fig 1 we can see from the data crossection that the concrete floor has not created voids, cracks or leakage within the concrete floor and all looks consistent.

2. **Corridor Area** -422'x10'
   Ramp -46'x7'

   The concrete thickness in this area was approximately 2 feet also.
   In Fig 2 we can see from the data crossection that the concrete floor between 140'-200' has been subjected to water damage. The water leakage overtime has infiltrated the concrete and has created voids and warped the reinforcement.

The ramp area did not show any deterioration within the concrete structure.

Conclusion

The Geophysical survey produced good quality data and the results established the condition of the concrete flooring in and around the Marriage Pit area AT THE Stamping Plant facility.

General Qualifications

The GPR data presented herein are interpreted. No warranty, certification, or statement of fact, either expressed or implied, regarding actual subsurface conditions within the surveyed area is contained herein. No interpretation of subsurface conditions can be made for areas not surveyed.

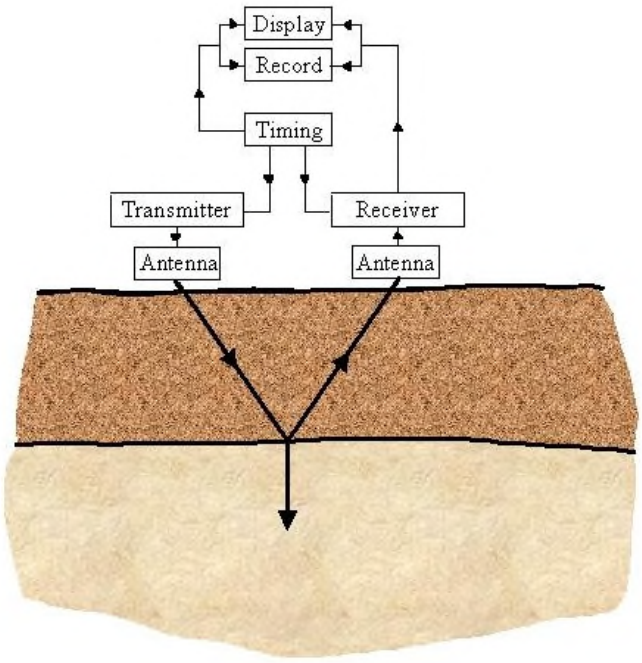
SITE PROJECT AND DESCRIPTION

Introduction:

GeoSearches, Inc. has been retained by Tetra Tech to conduct a Geophysical survey at the former GM facility in Mansfield Ohio. The object of the survey is to detect if the designated survey area was utilized as an historical dump for drums.

The non-intrusive, subsurface investigation was conducted using Ground Penetrating Radar (GPR). GPR detects subsurface structures by transmitting radio frequency waves into the ground and monitoring the strength and time delay of the reflection. The returning signal can then be evaluated to locate subsurface anomalies. Anomalies can be caused by void spaces, differences in soil/bedrock texture, differences in soil/bedrock moisture content, differences in the sediment compaction, and the presence of subsurface structures such as pipelines.



Part One: Method

A series of Ground Penetrating Radar and Electromagnetic (GPR) data lines were acquired at the site. The survey coverage region totaled approximately 132000 sq ft which included all areas of interest. The goal of the survey is to determine the location of underground storage tanks or other anomalies that could be present. These images will be used to construct a 2-D/ 3-D model of the area surveyed at the site. Depth of penetration ranges from 0-ft to 13-ft.

Before fieldwork historical data and detailed diagrams were reviewed to provide background information on the site.

A grid survey of 68 data lines was laid out at the site at intervals of 5 feet.
Observation points were established along each line. Moving the GPR equipment along the grid lines completed the survey. The records are quality controlled and reviewed in the field before processing.

The equipment used was a Noggin 250 GPR system from Sensors and Software, Inc. The antennae had center frequency of 250 MHz
All of the data were acquired using the common-offset reflection profiling method. We completed a series of single line tests using the antennae to optimize acquisition parameters, and used these results to design the survey.

Part Two: Processing

GPR data: apply filters and gains to make anomalies of interest more visible; plot data with uniform scales; compare model curves with data plots; time slice data.

We processed the data to improve image quality using SPIVIEW TOOLS, and WIN EKKO software from Sensors and Software, Inc.

The first step in processing is to input geometry information and edit headers. Next, a short (3-sample) temporal median trim filter is applied to each trace to attenuate noise spikes that contaminated some of the data... A residual median filter is then applied to attenuate the wow. Tests show that this filter successfully attenuates both the low and high frequency components of the wow, without adding precursors or other artifacts to the wavelet. Time zero determination and datuming is also performed.

The next step in the processing sequence is amplitude compensation. For each line, we determine the rectified-amplitude versus time fall-off of the data. The inverse of this curve is scaled by a multiplier (0.3) to form the gain function. The multiplier is used to reduce the gain function somewhat so that anomalously high amplitude values are not clipped after amplitude compensation.

Part Three: Interpretation and data quality

After completion of the data processing, each GPR reflection image was evaluated to:

(1) evaluate the GPR and EM penetration depth and resolution of the data collected to compare reflection character of the two, perpendicular line orientations; and

(2) Interpret GPR and EM reflections and image patterns as bounding surfaces and architectural elements in profile.

AN INLINE REFLECTION PROFILE WAS USED IN THIS SURVEY TO SHOW A PICTURE OF WHAT ANOMALIES, IF ANY, EXISTS WITH DATA COLLECTED USING GPR.

Geophysical equipment on site

Section Two

DISCUSSION and INTERPRETATION

Part One: Discussion

The GPR survey included:

- The survey area consisted of vegetation cover.
- The weather conditions were overcast and mild.

Part Two: Interpretation

With the collected data and final processing the goal is to establish were inconsistencies exist within the data coverage to establish the areas of concern.

Results

The object of the Geophysical survey and the use of Ground Penetrating Radar was to detect if drums had been buried beneath the surface at the designated site.

The survey was conducted with 100% coverage of the property area.
Straight data lines transected all areas and when a subsurface anomaly was identified small data lines would transect the area of possible anomalies.

In **Figure 2** the processed data imaging includes a plan view section of the complete project area with a data cross section sample in **Figure 3**

The depth of data acquisition was 13 feet. The area consisted of sandy clays and areas of subsurface disturbance could be seen close to the surface near the area of the sample auger.
After processing the data and final interpretation there was no evidence to suggest that subsurface orphaned drums exist below the designated areas.

Conclusion

The Geophysical survey produced good quality data and the data did not indicate the existence of buried drums.

General Qualifications

The GPR data presented herein are interpreted. No warranty, certification, or statement of fact, either expressed or implied, regarding actual subsurface conditions within the surveyed area is contained herein. No interpretation of subsurface conditions can be made for areas not surveyed.

TABLE OF CONTENTS

1.0	EXECUTIVE SUMMARY	1
2.0	INTRODUCTION	2
2.1	Background	2
2.2	Scope	2
3.0	INSPECTION PROCEDURES	3
3.1	Visual Inspection	3
3.2	Bulk Sample Collection	3
3.3	Sample Analysis	3
4.0	ASBESTOS EXPOSURE ASSESSMENT	4
4.1	Condition of Material	4
4.2	Water Damage	4
4.3	Exposed Surface Area	4
4.4	Accessibility	4
4.5	Activity and Movement	5
4.6	Air Plenum or Direct Air Stream	5
4.7	Friability	5
4.8	Asbestos Content	5
5.0	RESULTS OF VISUAL INSPECTION	6
5.1	Press Room and Metal Assembly	6
5.2	Administration Offices and Mezzanine Level	6
5.3	Plant Security	6
5.4	Roof Substations and Roof Mechanical Rooms	6
5.5	Roof Cooling Tower	7
5.6	Waste Treatment Complex	7
5.7	Baler House Building and Scrap Conveyor	7
5.8	Powerhouse Building	7
5.9	Original Switch House	7
5.10	Guard House No. 3	7
6.0	ANALYTICAL RESULTS	8
6.1	Airborne Analysis	8
6.2	Bulk Sample Analysis	10
7.0	REMEDIAL ACTION ALTERNATIVES	25
7.1	Removal	25
7.2	Enclosure	25
7.3	Encapsulation/Repair	26
8.0	OPERATION AND MAINTENANCE PROGRAMS	27

9.0 RECOMMENDATIONS 28

9.1 General Recommendations 28
9.2 Specific Recommendations 29

9.2.1 Press Room and Metal Assembly 29
9.2.2 Administration Offices and 29
9.2.3 Roof Substations and Roof Mechanical Rooms 29
9.2.4 Waste Treatment Complex 30
9.2.5 Boiler House Building and Scrape Coveyor 30
9.2.6 Powerhouse Building and Cooling Tower (including Ash Silo and Trestle) 30

1.0 EXECUTIVE SUMMARY

In an effort to identify potential liabilities with respect to the presence of asbestos containing materials (ACM), General Motors (GM) has initiated an Asbestos Management Program (AMP) and an Operations and Maintenance Program (O & M). The initial phase of an AMP is an asbestos materials survey. BCM Engineers Inc. (BCM) was retained to conduct this survey. The Manufacturing Building press room (Col. A1-32 & OA1-32), metal assembly area (Col. OA1-32 & C'1-32), administration offices, mezzanine level, plant security, roof substations (E-H, J-N, & P), roof mechanical rooms (E-G & K), roof cooling equipment, original switch house, Guard House No. 3, powerhouse building and cooling tower, baler house building, and waste treatment complex at the Mansfield facility were visually inspected for the presence of ACM in various forms including pipe insulation, fitting and elbow insulation, tank and boiler cover, transite wallboard, and miscellaneous building materials. All suspect materials were sampled, where possible, and analyzed by polarized light microscopy (PLM) at BCM's NVLAP-accredited laboratory to determine asbestos content. The locations of all bulk samples and identified ACM were noted on the floor plans.

BCM

2.0 INTRODUCTION

2.1 BACKGROUND

The U.S. Environmental Protection Agency (EPA) has been concerned about the health hazard potential of exposure to airborne asbestos since the early 1970s. Most of the EPA's efforts to date have been in the identification and control of friable asbestos materials in school buildings. The EPA's National Emissions Standards for Hazardous Air Pollutants (NESHAP) regulations require that buildings scheduled for demolition have any asbestos materials removed before they are razed.

The Occupational Safety and Health Administration (OSHA) regulates the exposure of workers to airborne asbestos fibers. In the time period of 1970 through 1976, the maximum allowable exposure to airborne asbestos fibers was 5.0 fibers per cubic centimeter of air (f/cc). In 1976, OSHA lowered this standard to 2.0 f/cc, and on June 20, 1986, again lowered the standard to 0.2 f/cc with an action level of 0.1 f/cc. It should be emphasized here that these figures were designed to protect workers in an industrial environment over an 8-hour work shift. In 1988, OSHA established a short-term (30-minute) exposure limit of 0.1 f/cc.

2.2 SCOPE

BCM was retained by GM to perform an asbestos materials inspection, testing, and assessment survey at its Mansfield, Ohio, facility. The scope of the project was three-fold as follows:

1. To identify the location and type of friable and non-friable asbestos present in construction materials used in the facilities

2. To quantify the amount of ACM present and its condition

3. To list feasible response actions when corrective action is recommended

BCM

3.0 INSPECTION PROCEDURES

3.1 VISUAL INSPECTION

The insulated pipes and friable and nonfriable materials within the Manufacturing Building press room, metal assembly area, administration offices, mezzanine level, plant security, roof substations (E-H, J-N & P), roof mechanical rooms (E, F, G & K), powerhouse building and cooling tower, baler house building, original switch house, and waste treatment complex were visually inspected for suspect ACM. Samples were taken in accordance with GM Project No. MAN89-018, Proposal No. AMS89-001, Item No. 1.1, paragraph 4. Areas that contain no ACM are as follows: Guard House No. 3, electrical roof substations (F & G, J-N & P).

3.2 BULK SAMPLE COLLECTION

Sample collection was performed in conjunction with the visual inspection. Samples were taken of material that could not be visually identified as ACM. The suspect material was given an identifying number that corresponded to the area from which it was taken. Discretionary core samples of the suspect material were collected by penetrating the material to the substrate to ensure a valid sample. The field survey was conducted to pinpoint and identify ACM locations. Insulation that was in good condition was normally not sampled since sampling requires the breaking of the protective jacket that covers the material, thus potentially exposing friable ACM.

3.3 SAMPLE ANALYSIS

The material samples were returned to BCM's NVLAP-accredited, EPA-certified laboratory for analysis by PLM. This method utilizes an optical microscope equipped with a polarizing lens through which a trained microscopist can identify asbestos fibers according to their crystalline structure. Fibers are first isolated within the microscope field; the analyst then aligns the polarizing filter first parallel, and then perpendicular to the fiber. This polarizing effect causes a color change in the fiber which is specific for the mineral contained in the sample.

BCM

4.0 ASBESTOS EXPOSURE ASSESSMENT

Several factors, acting singularly or in combination, can cause potential environmental contamination and exposure of building occupants. Experience has shown that eight factors generally influence exposure potential.

4.1 CONDITION OF MATERIAL

Material condition indicates the extent of contamination and the likelihood of future contamination. This factor is a combination of quality of installation, adhesion of the friable material to the underlying surface, material deterioration, and damage. Delamination or deterioration of the material depends on the individual characteristics of each material.

4.2 WATER DAMAGE

Water can dislodge, delaminate, and disturb ACM materials that are otherwise in excellent condition. Water can carry fibers in a slurry to other areas in the building where evaporation will leave a collection of fibers that can become suspended in the air. Water damage will have a significant effect on selection of a corrective method, essentially eliminating certain types of sealants (encapsulation).

4.3 EXPOSED SURFACE AREA

The exposed surface area of friable ACM has an effect on potential fiber fallout levels and increases the possibility for contact and damage. A useful criterion to apply for this factor is whether the friable ACM is visible. ACM above suspended ceilings, for instance, is not considered to be exposed. However, if the ceiling panels are removed for routine maintenance activities above the suspended ceiling or are damaged, the ACM should be considered as exposed in that area. Areas with louvers, grids, or other open ceiling systems should also be considered as exposed.

4.4 ACCESSIBILITY

If the material can be reached in the work space, it is accessible and subject to accidental or intentional contact and damage. This factor should also include some consideration of the proximity of friable ACM to heating, ventilation, lighting, and plumbing systems requiring maintenance or repair. Material that is accessible is considered a greater risk because vandalism is possible.

BCM

4.5 ACTIVITY AND MOVEMENT

Air movement, vibration from machinery or other sources, and occupant activity levels have the potential of resulting in the release of fibers to the air. This factor is also an indicator of future exposure potential.

4.6 AIR PLENUM OR DIRECT AIR STREAM

Friable ACM contained within an air plenum or in an air stream environment, if undisturbed, has very low potential for contaminating the building environment. However, contact and damages that occur during maintenance, repairs, and renovation will cause fibers to be dispersed throughout the ventilation system.

4.7 FRIABILITY

The ACM can vary in degree of friability. The more friable the material, the greater the potential for asbestos fiber release and contamination. Sprayed ACM is generally more friable than most troweled material.

4.8 ASBESTOS CONTENT

Materials with a high percentage of asbestos have the potential to release more asbestos fibers than those with smaller percentages.

BCM

5.0 RESULTS OF VISUAL INSPECTION

5.1 PRESS ROOM (COL. A1-32 - OA1-32) & METAL ASSEMBLY (COL. OA1-32 - C'1-32)

These areas contain approximately 26,000 linear feet of asbestos-containing pipe insulation (ACPI) on the high and low pressure steam lines. There are an additional 41,000 linear feet of nonasbestos pipe insulation on which the elbows and fittings contain asbestos. Hot and cold waterlines and welder waterlines are insulated in this manner. There are also areas of HVAC system insulation (approximately a 2-inch wide coating around the edges of the air handling units) which contain asbestos. All insulation is generally in very good condition with areas of localized damage, ranging from minor to severe. For recommendations pertaining to the damaged areas, refer to Section 9.2.1.

5.2 ADMINISTRATION OFFICES & MEZZANINE LEVEL (INCLUDING PASSAGEWAY)

These areas contain several types of ACM. There are approximately 2,000 linear feet of ACPI on the high and low pressure steam lines. An additional 12,000 linear feet of pipe insulation are asbestos-free with asbestos-containing elbows and fittings. Hot and cold waterlines are insulated in this manner. There are also areas of HVAC system insulation as described above (approximately a 2" wide coating around the edges) which contain asbestos. All insulation is generally in very good condition with localized areas of minor damage. There is approximately 61,500 square feet of vinyl asbestos floor tile (VAT) in these areas. This VAT is generally in very good to excellent condition. Approximately 26,000 square feet of dust sheeting are located above the metal pan ceiling in various areas. This material is generally in poor condition and is highly friable. There are also approximately 22,000 square feet of transite board in these areas. This material is generally in good condition with some areas of minor damage. For recommendations pertaining to the damaged areas, refer to Section 9.2.2.

5.3 PLANT SECURITY (INCLUDING HOURLY EMPLOYEE ENTRANCE & GARAGE)

This area contains approximately 300 linear feet of ACPI. There are an additional 450 linear feet of nonasbestos pipe insulation on which the elbows and fittings contain asbestos. This area also contains approximately 3,000 square feet of VAT. These materials are generally undamaged.

5.4 ROOF SUBSTATIONS (E-H, J-N & P) & ROOF MECHANICAL ROOMS (E-G & K)

These areas contain approximately 200 linear feet of ACPI. There are an additional 700 linear feet of nonasbestos pipe insulation on which the elbows and fittings contain asbestos. There are also areas of HVAC system insulation as previously described (approximately a 2" wide coating around the edges) which are asbestos- containing. These materials can be found in various degrees of physical condition, ranging from extremely damaged to excellent. For recommendations pertaining to the damaged areas, refer to Section 9.2.3.

7.0 REMEDIAL ACTION ALTERNATIVES

There are several options available to remediate damaged ACM. The principal options available are removal, enclosure, encapsulation/repair. Each of these alternatives is discussed briefly below.

7.1 REMOVAL

Most asbestos abatement managers believe removal of ACM is the only final and satisfactory solution to the problem of potential asbestos exposure. If properly performed with adequate protection for the workers and building occupants, removal will virtually eliminate all potential for exposure. On the other hand, removal may be a complicated task and cost substantially more than other abatement alternatives.

The first step in any removal operation involves the erection of containment barriers around the work area. These containment barriers, although temporary, are designed to prevent the release of airborne asbestos fibers during the removal activities. The work area also contains HEPA air filtration systems, which remove any generated airborne asbestos fibers and maintain the work area under differential air pressure. Removal of all types of asbestos must be initiated only after the material is wetted with amended water (a solution of water and a wetting agent) to reduce fiber release. Once the ACM is removed, it must be disposed of in leak-tight containers, typically 6-mil thick polyethylene bags, and taken to a landfill with state approval for asbestos disposal.

7.2 ENCLOSURE

Enclosure involves construction of airtight barriers ceilings around surfaces coated with ACM. Enclosures should be constructed with impact-resistant materials. Since the ACM will have to be removed when the building is remodeled or demolished, enclosure is only a temporary solution. On the other hand, carefully constructed, airtight enclosures may reduce, if not eliminate, the release of fibers within the building for its remaining life.

The initial cost of constructing enclosures is close to that of asbestos removal and disposal. Since sealing the substrate and replacing the ACM are not required, total project cost for enclosure initially may be somewhat lower, but the cost of periodic inspections and repair of enclosures for the life of the building and of asbestos removal before demolition may negate this initial cost savings.

BCM

7.3 ENCAPSULATION/REPAIR

Encapsulation/repair involves spraying the ACM with a sealant. This activity helps bind together the asbestos fibers and other material components and offers some resistance to impact damage. As with enclosures, encapsulants are, at best, a temporary control measure, and the ACM will still have to be removed before building demolition. In addition, the presence of encapsulants can make wetting and thus removing the material more difficult.

Encapsulation/repair may be as costly as removal and disposal. This is largely due to the need for work area containment and worker protection measures during sealant application. As with enclosure, no additional cost to replace the ACM is necessary. However, long-term costs are likely to be more than for removal due to continuing inspection, periodic application of the sealant, and removal of ACM before building demolition.

BCM

8.0 OPERATION AND MAINTENANCE PROGRAMS

BCM recommends that as long as asbestos is present in a building, an O & M Program should be implemented. This program, which will assure compliance with EPA and OSHA regulations, requires periodic visual inspection and documentation to assure that the ACM remains in good condition, and that any damages are repaired promptly. A separate strategy should be developed for each type of ACM (i.e., surfacing materials, pipe lagging, boiler cover, and other miscellaneous materials). A system for immediate notification and the proper documentation during emergency situations is an integral part of an O & M Program. All repair work should be conducted by maintenance or custodial personnel who have been properly trained in asbestos abatement procedures. Air monitoring, conducted by an accredited testing laboratory, should follow any incident of major damage and accompany minor removal projects. Records of all actions (inspections, repairs, removal, air testing, etc.) should be kept for both in-house reference and protection against future liabilities.

Maintenance and custodial worker training is the key to a successful O & M Program. An approved training agency should be hired to educate workers on the history and principles of asbestos use, health effects, regulations, personal and area protection principles, and practical abatement and control methods. BCM also strongly recommends that anyone involved in an O & M Program read and understand EPA 560/5-85-024, Guidance for Controlling Asbestos-Containing Materials in Building (particularly Chapter 3, "Establishing a Special Operations and Maintenance O & M Program"), and 29 CFR Parts 1920 and 1926, OSHA Asbestos Standard for General Industry and OSHA Asbestos Standard for Construction Industry, respectively.

BCM

9.0 RECOMMENDATIONS

9.1 GENERAL RECOMMENDATIONS

It is usually recommended that ACM be removed by a competent asbestos removal contractor in order to minimize liabilities with respect to exposure; but because of high costs and relocation problems associated with this activity, this solution is rarely feasible to do a full scale operation. Therefore, an asbestos abatement program should be initiated to phase the removal of damaged asbestos as funds become available. Until the time that the damaged asbestos can be removed, there are several steps that GM can undertake to prevent unnecessary fiber release.

- Have people on staff trained in proper small-scale, short duration removal techniques in cases of emergency repair (i.e., broken pipes, changing valves, etc.);
- Train all maintenance personnel in the proper handling and maintenance of ACM;
- Encapsulate all exposed ends and tears in insulation covering;
- Purchase a vacuum with a High Efficiency Particulate Absolute (HEPA) filter to clean up any asbestos debris or dust;
- Purchase of 6-mil thick labelled asbestos disposal bags to contain and store any asbestos removed in-house until a load is taken to an approved landfill (note DOT requirements under NESHAPS);
- Do not use power tools when working with transite board or any ACM. Use a vacuum with a HEPA filter to clean all dust produced;
- Code any new reinsulation (other than fiberglass) by tagging or painting so that it will not be confused with ACM; and
- Inform all employees of the location of ACM in order to limit any future liabilities or damage.

9.2 SPECIFIC RECOMMENDATIONS

9.2.1 Press Room and Metal Assembly

At a minimum, BCM recommends the removal of approximately 300 linear feet of ACPI and the encapsulation/repair of an additional 100 linear feet of ACPI in these areas. Specific locations and quantities of ACPI requiring remedial action are summarized in Table 2.

It is recommended that any exposed ends or tears on ACPI be repaired/ encapsulated.

9.2.2 Administration Offices & Mezzanine Level

At a minimum, BCM recommends the removal of approximately 10 linear feet of ACPI and the encapsulation/repair of an additional 10 linear feet of ACPI in these areas. Specific locations and quantities of ACPI requiring remedial action are summarized in Table 2.

It is recommended that any exposed ends or tears on ACPI be repaired/ encapsulated.

BCM recommends the removal of all asbestos-containing dust sheeting which is located above the suspended ceiling in these areas. BCM also recommends the removal or decontamination of asbestos-contaminated ceiling tile in these areas. It is recommended that the transite board be encapsulated in areas where it has been cut or damaged.

9.2.3 Roof Substations and Roof Mechanical Rooms

At a minimum, BCM recommends the removal of approximately 30 linear feet of ACPI and the encapsulation/repair of an additional 20 linear feet of ACPI in these areas. Specific locations and quantities of ACPI requiring remedial action are summarized in Table 2.

It is recommended that any exposed ends or tears on ACPI be repaired/ encapsulated.

9.2.4 Waste Treatment Complex

At a minimum, BCM recommends the removal of approximately 15 linear feet of ACPI and the encapsulation/repair of an additional 10 linear feet of ACPI in this area. Specific locations and quantities of ACPI requiring remedial action are summarized in Table 2.

It is recommended that any exposed ends or tears on ACPI be repaired/ encapsulated.

9.2.5 Baler House Building and Scrap Conveyor

At a minimum, BCM recommends the removal of approximately 300 linear feet of ACPI and the encapsulation/repair of an additional 50 linear feet of ACPI in these areas. Specific locations and quantities of ACPI requiring remedial action are summarized in Table 2.

It is recommended that any exposed ends or tears on ACPI be repaired/ encapsulated.

9.2.6 Powerhouse Building (Including Ash Silo & Trestle) & Cooling Tower

At a minimum, BCM recommends the removal of approximately 200 linear feet of ACPI and the encapsulation/repair of an additional 600 linear feet of ACPI in these areas. BCM also recommends the encapsulation/repair of approximately 400 square feet of boiler and tank insulation in these areas. Specific locations and quantities of ACPI and boiler/tank insulation requiring remedial action are summarized in Table 2.

It is recommended that any exposed ends or tears on ACPI be repaired/ encapsulated.
