1.0 INTRODUCTION

Conestoga-Rovers & Associates, Inc. (CRA) was retained by Environmental Corporate Remediation (ENCORE), at the request of General Motors Corporation (GM) Legal Staff, to complete a Phase II Environmental Site Assessment (ESA), at the GM Pontiac Validation Center (PVC), located at 200 South Boulevard West in Pontiac, Michigan. This report summarizes the results of the Phase II ESA as they pertain to the South Parcel of the PVC (Site). The Site location is presented on Figure 1.1.

The Phase II ESA was performed to further investigate potential areas of concern (PAOCs) and potential areas of release (PAORs) identified during the Phase I ESA completed by CRA, the results of which are presented in a report dated October 2006 (CRA, 2006). CRA submitted the Phase II ESA Work Plan (WP) to ENCORE in October 2007 (CRA, 2007a). The Phase II ESA subsurface activities were performed between October 2007 and April 2008, in accordance with the WP.

A PAOC is an area with a documented release or likely presence of hazardous substances or petroleum products into the soils, groundwater, or surface water of the property that could pose an unacceptable risk to human health or the environment. The term PAOC is not intended to include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be subject to an enforcement action if brought to the attention of appropriate government agencies.

A PAOR is an area, piece of equipment, or structure that contains hazardous substances or petroleum products under conditions that, if not managed properly, represent a material threat of a release into the soils, groundwater, or surface water of the property. A PAOR is not a PAOC because there is no evidence of a release to the environment, while if there is evidence of a release then the PAOR would be classified as a PAOC that would require decommissioning.

1.1 SITE DESCRIPTION AND BACKGROUND

The Site is located at 200 South Boulevard West in Pontiac, Oakland County, Michigan. The Site is comprised of approximately 60 acres of land and consists primarily of vacant land that was occupied by three former manufacturing plants, Plants 3, 4, and 5. The Site is currently occupied by concrete slabs from former Plants 3, 4 and 5, an aboveground storage tank (AST) farm, paved parking areas, and landscaped areas. The

Site location is presented on Figure 1.1. A historical Site plan is presented on Figure 1.2. The current Site plan is presented on Figure 1.3.

GM acquired the former Plant 3 (formerly located in the southwest portion of the Site) from the Wilson Foundry Company (Wilson) in 1940. According to historical documentation, Plant 3 was used by Wilson to manufacture motors and castings. Historical GM operations have included paint mixing, paint booths/ovens, a phosphate line, and hazardous waste storage. More recently, Plant 3 was referred to as the "Paint Shop", serving the entire complex. Plant processes included color painting; an 8-stage phosphate process located in the northeast corner; an electrode position paint operations (ELPO) dip tank centrally located along the western portion of the building; and paint storage and mixing operations in the basement along the south wall. A former powerhouse (Building 13), and former buildings 12, 14, and 35 were located to the west of Plant 3.

The former Plant 4 (formerly located along the eastern Site boundary), reportedly acquired by GM from Wilson in 1937, consisted of Buildings 20, 25, 31, and 37. According to available information, Building 20 contained a spray booth and large in-ground conveyors. More recent operations have included a small test spray booth, plant maintenance, a lubricating oil fill station, an enclosed oil drum storage area, and small parts storage. Building 25 was used for material storage until the early 1970s, at which time it was converted to the G-Van body shop. More recently, Building 25 was utilized for welding operations. Historical operations at Building 31 have included a spray booth, material storage, and assembly for school buses. More recently, Building 31 was utilized for storage, shipping/receiving, quality assurance/quality control laboratories, and plant maintenance and miscellaneous repairs. Building 37 was previously used for assembly operations and as a body shop and, most recently, for equipment storage and maintenance activities.

GM reportedly acquired the former Plant 5 (formerly located in the central portion of the Site) from Wilson in 1965. According to documentation reviewed by CRA, historical operations have included the manufacture of motors and castings, and machining operations. Most recently, GM utilized Plant 5 for the final assembly of small and mid-sized trucks.

A switch yard and primary house belonging to Detroit Edison were previously located directly north of Plant 5, along with an industrial wastewater lift station. The industrial wastewater lift station included six large underground storage vaults. Wastewater was

periodically pumped via five underground sewers to a neighboring GM facility (Pontiac Assembly Center (PAC)) for treatment.

Four fuel ASTs are located in a tank farm north of the industrial wastewater lift station. According to Site personnel, the ASTs will be emptied for decommissioning in April 2009. The tanks store gasoline and diesel fuel used to supply the adjacent dispensing pump, which dispenses fuel to company vehicles.

A Waste Management Area (WMA) was historically located adjacent to the north of the tank farm. This structure was used to store hazardous waste (up to 90 days) and non-hazardous waste prior to removal from the Site for disposal and for cleaning of empty drums. The structure was constructed on a sealed concrete containment pad with a self-contained spill collection sump, and is enclosed by a concrete curb with an access ramp.

Based on the Phase I ESA (CRA, 2006), and discussions with individuals associated with the Site, additional uses of the Site consisted of: various commercial properties including a bank, a hospital, and industrial properties including Flander's Electrical Company Incorporated (manufacturers of electric automobiles), Pontiac Drop Forge Company, the Wilson Foundry and Machine Company, and Detroit Weather Proof Body Company.

1.2 PREVIOUS INVESTIGATIONS

A number of previous investigations have been completed at the Site. The locations of these areas are presented on Figure 1.4. Previous groundwater investigations at the Site were limited to Area C (gasoline underground storage tank (UST) south of former Plant 3). The previous investigation areas are broken down into the following:

- Area B (Waste Oil and Gasoline USTs, near Buildings 13 and 16, Plant 3);
- Area C (Gasoline UST south of Building 16, Plant 3);
- WMA south of Plant 3;
- Area D (Paint Trap USTs south of Building 17, Plant 3);
- 8-Stage Phosphate System in Plant 3;
- Building 5 (west of Plant 5); and
- Grand Trunk Railway (along wastewater lines to PAC Wastewater treatment plant (WWTP)).

These areas are further described in the Phase I ESA (CRA, 2006) and the Phase II ESA WP (CRA, 2007a).

1.3 SUMMARY OF THE CRA 2006 PHASE I ESA

Further information on each of these areas is presented in the Phase II ESA WP (CRA, 2007a).

The Phase I ESA completed by CRA in October 2006 (CRA, 2006) identified 18 PAOCs associated with the Site (4 other PAOCs were identified in the North Parcel of the PVC), which include the following:

- PAOC 2 – Historical Operations – Plants 3, 4, and 5;
- PAOC 3 – Historical Adjacent Properties;
- PAOC 5 – USTs – Plant 3;
- PAOC 6 – USTs – Plant 4;
- PAOC 7 – USTs – Plant 5;
- PAOC 8 – Former Incinerator;
- PAOC 9 – Tunnels;
- PAOC 10 – Former Powerhouse;
- PAOC 11 – Surficial Scarring;
- PAOC 13 – WMA south of Plant 3;
- PAOC 14 – AST Farm at Plant 1;
- PAOC 15 – Potential Fill Pipes;
- PAOC 16 – Bulk Loading/Unloading Areas;
- PAOC 17 – Former Foundry Sand;
- PAOC 19 – Former Wastewater Treatment;
- PAOC 20 – Former Transformers, Substations, and Large Capacitors;
- PAOC 21 – Wastewater Lift Station and Process Lines; and
- PAOC 22 – Former Paint Mix Rooms.

The Phase I ESA identified the following PAORs associated with the Site:

- PAOR 1 - Belowgrade Pits, Trenches, Conveyors, and Sumps;
- PAOR 2 - ASTs;
- PAOR 3 - WMAs;
- PAOR 4 - Releases to Sewers; and

It should be noted that at the time of the Phase I ESA completed by CRA, Plants 3, 4, and 5 (and their associated buildings and ancillary structures) were still present on the Site. During the time frame that CRA completed the Phase II ESA field activities, demolition of these on-Site structures occurred.

The locations of the PAOCs are presented on Figure 1.5. Based on the nature of the PAORs identified in the 2006 Phase I ESA, the PAORs were not investigated during this Phase II ESA.

1.4 REPORT ORGANIZATION

The remainder of this Phase II ESA Report is organized as follows:

Section 2.0 - Scope of Work (SOW);
Section 3.0 - Site Geology and Hydrogeology;
Section 4.0 - Phase II ESA Results;
Section 5.0 - Summary; and
Section 6.0 - References.

2.0 SCOPE OF WORK

The SOW for the Phase II ESA was to determine if there had been adverse impacts to the environment at each PAOC. PAORs were not investigated during this Phase II ESA due to the lack of evidence of a release and the ambiguity of locations that could be specifically targeted during field activities. The Phase II ESA was conducted in general accordance with ENCORE Field Method Guidelines and according to the SOW presented in the Phase II ESA WP (CRA, 2007a). CRA conducted Phase II ESA subsurface activities at the Site from October 2007 through April 2008. The Phase II ESA activities included the following tasks:

Task 1: Develop Health and Safety Plan (HASP);

Task 2: Perform utility clearance;

Task 3: Soil investigation;

Task 4: Groundwater investigation;

Task 5: Survey soil boring and monitoring well locations; and

Task 6: Conduct groundwater hydraulic monitoring events.

The investigative locations for the Site are presented on Figure 2.1. Additional details pertaining to the SOW are provided in the following sections (Sections 2.1 through 2.6).

It should be noted that due to concurrent demolition work during the Phase II ESA, or boring refusal, proposed soil borings BH31-07, BH45-07, BH66-08, and BH93-08 were not installed.

2.1 HEALTH AND SAFETY

A Site-specific HASP (CRA, 2007b) was developed for work conducted at the Site and included health and safety documentation relevant to the SOW associated with the Phase II ESA investigation. All personnel involved in the fieldwork reviewed the HASP prior to commencing field activities in order to minimize hazards and exposures. All field activities were performed utilizing appropriate Personal Protective Equipment (PPE) in accordance with the Site-specific HASP.

2.2 UTILITY CLEARANCE

As a part of the Phase II ESA, penetration of the ground surface was necessary to collect soil samples and install monitoring wells at predetermined locations. Prior to conducting subsurface work, underground hazards in the form of utility lines were identified and marked by private and public utility locators. CRA retained Power Plus Engineering Inc. to complete locates of underground utilities at the proposed drilling locations.

2.3 SOIL INVESTIGATION

The task of soil investigation included the advancement of soil borings, Shelby Tube sampling, and the collection of soil samples. Table 2.1 presents all soil borings and Shelby Tube sampling locations completed at the Site and their corresponding PAOC. Additionally, Table 2.1 presents all soil samples collected during the Phase II ESA and the parameters for which they were analyzed.

Drilling activities associated with the Phase II ESA investigation were conducted from October 9 to 17, 2007, December 3 to 7, 2007, and March 5 to 14, 2008. Sixty-four soil borings were advanced using a Geoprobe direct push technology with a MacroCore® sampler. Seventy-three soil samples were collected from the soil borings at various depths to investigate the PAOCs. The soil borings were advanced until a continuous clay layer/confining layer was reached (a depth of between 15 and 60 feet below ground surface (bgs)). After the continuous clay layer/confining layer was reached, each boring was advanced an additional 5 feet into the confining layer (to verify the lateral and vertical continuity of a confining layer).

Continuous soil samples were collected from each soil boring and examined by CRA field personnel for soil type, stratigraphy, banding, moisture, color, visual and olfactory evidence of impact, and screened for total volatile organic compounds (VOCs) with a photoionization detector (PID) with an 11.7 eV lamp in 2 to 2.5-foot intervals. In addition, Sudan IV jar tests were conducted in the field to identify the potential presence of NAPL in soil. All soil samples collected were described and classified according to the modified Unified Soil Classification System (USCS). Stratigraphic logs are presented in Appendix A.

Generally one to three soil samples were selected from a boring for chemical analysis. Depending on field conditions, soil samples were collected from the following unsaturated zone intervals for consideration:

- 0 to 2-foot interval below grade;
- 8 to 10-foot interval below grade;
- 2-foot interval above the water table;
- 2-foot interval above the confining layer if groundwater was not encountered; and
- 2-foot interval with the highest evidence of visual/olfactory impact and PID response.

Samples were submitted for laboratory analysis based on the following conditions:

1) **If evidence of impact was observed** (visual/olfactory or elevated PID response), the soil sample in the unsaturated zone with the highest evidence of visual/olfactory impact and PID response was selected for laboratory analysis of parameters as indicated in Table 2.1.

   Any sample collected for fractionated lead was placed on hold pending review of total lead analysis. If the total lead was greater than 75 milligrams per kilogram (mg/kg), the soil sample was also analyzed for fractionated lead.

2) **In the absence of evidence of impact** (visual/olfactory or elevated PID response), the 0 to 2-foot sample interval was selected for analysis unless there was information available specific to the PAOC to suggest the likely impacts would be deeper (e.g. former UST area). The remaining sample intervals were placed on hold (8 to 10 feet, 2 feet above water table, or 2 feet above confining layer if groundwater is not encountered).

Samples that were collected but not submitted were archived pending review of the results of the submitted samples. Archived samples were selected for analysis as required, based on analytical results of original samples (See Table 2.1). CRA ensured that holding times were not exceeded.

All soil samples were analyzed on a 5-day turnaround time (TAT), following the ENCORE Laboratory Program requirements, so as to not exceed recommended holding times for the additional archived samples. The field quality assurance/quality control (QA/QC) sampling strategy is outlined in the Phase II ESA WP (CRA, 2007a).

It should be noted that the soil sample collected from the 15 to 17 feet bgs interval at monitoring well MW32-07 was collected from below the water table (i.e., the sample was fully saturated). The sample collected from below the water table was submitted to identify potential contaminants, but was not considered for evaluation given that it consisted of more than one subsurface media.

In addition to the laboratory analysis, preliminary tests for the potential presence of non-aqueous phase liquid (NAPL) were completed at soil borings where field observations indicated evidence of potential impacts using Sudan IV jar tests. The results of Sudan IV jar testing are summarized in Section 4.1.1. Sudan IV jar test results are also presented in Table 2.1.

Soil samples were placed in coolers with ice to maintain a cooler temperature of approximately 4°C and were sent to Test America Laboratories, Inc. (Test America) under standard chain-of-custody (COC) procedures.

During drilling activities, refusal was encountered at various depths at some soil boring locations throughout the Site. In most instances (with the exception of soil boring BH66-08), offset soil borings were installed adjacent to the original refusal locations and samples were collected from the intended intervals. Refusal locations are indicated on the stratigraphic logs presented in Appendix A. At soil boring BH66-08, refusal was encountered at 3 feet bgs. Multiple off-set attempts were made; however, refusal was encountered at all off-set locations at 3 feet bgs. As such, no soil sample was collected from BH66-08 and the soil boring was not completed.

Undisturbed Shelby tube soil samples were collected from two locations (adjacent to soil borings BH23-07, and MW35-07) where a native continuous clay layer/confining layer was identified, and the samples were analyzed for moisture content, grain size distribution, and soil permeability (vertical hydraulic conductivity) to determine if the underlying native material is acting as an effective aquitard/aquiclude. These Shelby tube samples were collected as a part of a set of three samples being collected throughout the PVC.

All sampling equipment that contacted potentially impacted materials was decontaminated prior to field use and following collection of each sample. Decontamination of sampling equipment was performed as follows:

i) removing any debris or soil using a stiff brush, as necessary;

ii) cleaning thoroughly with water and a non-phosphate (Alconox) detergent; and

iii) rinsing with potable water and/or de-ionized water.

Soil cuttings and wash water were containerized in 55-gallon drums and taken for off-Site disposal on January 21, 2009.

2.4 GROUNDWATER INVESTIGATION

Monitoring wells were installed at locations where a porous saturated media greater than 1 foot was encountered. Where this condition was present at multiple locations in proximity to each other, one monitoring well was installed per three to four soil borings. The monitoring well was typically installed in the boring with the highest evidence of impact or the location closest to the property boundary to assess the likelihood of contaminants migrating off Site. Twenty-seven (including 5 temporary) monitoring wells were installed utilizing a Geoprobe® direct push method with a dual-tube rod system. Well screens were typically installed at each monitoring well location as presented in Table 2.2, such that the screen extended approximately 2 feet above the water table and 6 to 12 inches into the confining layer (when present). Well completion details are included on the stratigraphic logs presented in Appendix A.

Five temporary monitoring wells (TMW70-08, TMW71-08, TMW80-08, TMW81-08, and TMW87-08) were installed on March 5, 2008 in the basements of former Plants 3 and 4. The temporary monitoring wells were abandoned prior to backfilling activities completed by the demolition contractor on March 11, 2008. As a result, the temporary wells only received minimal recharge time, and thus, only temporary monitoring wells TMW71-08 and TMW81-08 generated enough groundwater for sample collection.

The monitoring wells were developed and groundwater samples were collected consistent with the Michigan Department of Environmental Quality (MDEQ) Remediation and Redevelopment Division (RRD) Operational Memorandum No. 2 – Attachment 5 (Collection of Samples for Comparison to Generic Criteria). All groundwater samples were collected using low-flow purging techniques. Some monitoring wells did not recharge, and as a result samples were only collected from 19 of the 27 monitoring wells. Monitoring well development and low-flow purging records are presented in Appendix B.

Table 2.3 presents all groundwater samples collected during the Phase II ESA and the analytical parameters for which they were tested. All groundwater samples were analyzed on a standard TAT. The field (QA/QC) sampling strategy is outlined in the Phase II ESA WP (CRA, 2007a).

All groundwater samples were packed in a cooler on ice to maintain a cooler temperature of approximately 4°C and were sent to Test America under standard COC procedures. A summary of all groundwater samples collected is presented in Table 2.3.

All sampling equipment that contacted potentially impacted materials was decontaminated prior to field use and following collection of each sample. Decontamination of sampling equipment was performed as follows:

i) removing any debris or soil using a stiff brush, as necessary;

ii) cleaning thoroughly with water and a non-phosphate (Alconox) detergent; and

iii) rinsing with potable water and/or de-ionized water.

Wash and purge waters were containerized in 55-gallon drums and removed for off-Site disposal on January 21, 2009.

2.5 SURVEYING

Investigation location surveys were conducted on December 20, 2007 and January 21, March 10, March 17, and May 8, 2008 to provide accurate locations of installed soil borings and monitoring wells. Surveying was completed in the Michigan State Planes, Southern Zone NAD 83 coordinate system. Multiple surveying events were required due to weather restrictions (e.g. ice and snow) and to accommodate concurrent demolition activities.

It should be noted that soil boring MW46-07 could not surveyed due to the demolition activities at the Site during the Phase II ESA. The location of this soil boring on Site figures is approximate.

2.6 GROUNDWATER ELEVATION MONITORING

Groundwater elevation monitoring events were conducted on December 20, 2007 and December 15, 2008 to provide a summary of groundwater elevations in each monitoring well located at the Site at that time. An oil-water interface probe was used to check for the presence and thickness of light NAPL (LNAPL). The water elevation measurements are presented in Table 2.4. The results of the monitoring event were used to evaluate Site hydrogeological conditions, as discussed in Section 3.2.2.

3.0 SITE GEOLOGY AND HYDROGEOLOGY

3.1 REGIONAL SETTING

This section provides a summary of the regional physiography, geology, and hydrogeology. The regional information for the City of Pontiac area was obtained from numerous published reports. The main sources are a report entitled, "Groundwater Resources of Southeastern Oakland County, Michigan", as prepared by Ferris, J.G., Burt, E.M., Stramel, G.J., and Crosthwaite, E.G., 2003; and "Hydrogeologic Framework of the Michigan Basin Regional Aquifer System", as prepared by Westjohn, D.B., and Weaver, T.L., 1998.

3.1.2 REGIONAL GEOLOGY

The Site is located in the City of Pontiac, Oakland County, in southeast Michigan. Oakland County is within the Central Lowlands portion of the Great Lakes Basin. Regional topography is variable, ranging from upland moraines to low-lying till plains and glacial outwash. The regional land surface slopes from the northwest to the southeast. Maximum topographic relief within Oakland County is approximately 360 feet.

The surficial geology of the Oakland County area consists of sediments deposited primarily during the Wisconsinan glacial stage by continental scale glaciers. At least four 'pulses' of ice advance and retreat have covered all or part of Michigan during the Late Wisconsin stage of the Pleistocene epoch (approximately 21,000 to 10,000 years before present). As a result, Oakland County has numerous heterogeneous moraines and till plains of glacial drift that were deposited directly by the meltwater of the glacier.

The overburden for the City of Pontiac is Quaternary aged glacial drift, glaciolacustrine deposits, and glacial outwash deposits of recent and Pleistocene age. Due to the deposits from retreating glaciers, there is a wide assortment of particle sizes in the glacial drift from a lack of sorting; it is common to find clay, silt, fine to coarse sand, gravel, and boulders intermixed. The glaciolacustrine sediments, commonly silts and clays, were suspended in the load of a stream and transported to glacial lakes for deposition. The glacial outwash contains rounded sand and gravel particles as well as some post-glacial alluvium. The glacial outwash is well sorted when compared to the glacial drift, due to transportation and stratification by flowing water. The glacial

deposits thickness for the City of Pontiac area is generally greater than 300 feet (Ferris, Burt, Stramel, and Crosthwaite, 2003).

The glacial drift, glaciolacustrine, and glacial outwash deposits for the City of Pontiac region are underlain by a thick section of clay, sandy clay, and gravelly clay that separates a layer of buried outwash. This clay sequence is less permeable than the surrounding glacial drift and, therefore, acts as a confining layer (Ferris, Burt, Stramel, and Crosthwaite, 2003). The buried outwash ranges from 20 feet to 150 feet thick and overlies the bedrock throughout the region. These Quarternary aged sediments overly the bedrock throughout Pontiac.

The bedrock beneath the City of Pontiac is Paleozoic in age and is found generally at an elevation of approximately 650 feet above mean sea level (AMSL). Most of the bedrock is from the early Mississippian system, and is from the Kinderhookian series. This formation is termed Coldwater Shale. The Coldwater Shale is of marine origin, evident by sporadic fossil assemblages contained throughout. The bedrock is composed of northwest-dipping strata and the direction of the Michigan Basin center. The Coldwater Shale ranges from 0 to 400 feet thick (Ferris, Burt, Stramel, and Crosthwaite, 2003). It contains shales, sandy shales, and shaly sandstones. It is predominantly gray, with some bluish-gray and blue shales. There tends to be a minor amount of dolomite, limestone, siltstone, and sandstone in this Formation. Most of the shales are thin-bedded, range from soft to hard, and are brittle and slate-like. The contacts with the Sunbury Shale below, and the Marshall Sandstone Formation above are conformable and can present difficulties in Formation identification.

In some regions of Pontiac, beneath the Coldwater Shale Formation exist other formations. One formation directly beneath the Coldwater Shale is the early Mississippian aged Sunbury Shale. The Sunbury Shale ranges from 0 to approximately 50 feet thick and is observed as a brown to black shale.

Beneath the Sunbury Shale Formation is the early Mississippian aged Berea Sandstone and Late Devonian aged Bedford Shale. The Berea Sandstone is from 0 to 100 feet thick and is observed to be a gray, massive, fine-grained sandstone with interbedded hard blue gray shale. The Bedford Shale unit ranges from 0 to 100 feet thick and is a soft gray and blue-gray shale.

Below the Berea Sandstone and Bedford Shale is the early Mississippian/late Devonian aged Antrim Shale. The Antrim Shale ranges from 70 to 170 feet thick and is black and brown carbonaceous shale.

3.1.3 REGIONAL HYDROGEOLOGY

The hydrogeologic features of Michigan are highly variable. Some areas have abundant supplies of groundwater and surface water of potable quality, while others have difficulty obtaining suitable water supplies. Oakland County has abundant groundwater supplies available (Huffman and Whited, 1993). Oakland County acquires most of its potable groundwater from the overburden glacial deposit aquifers; however, Michigan relies primarily on surface water from the Great Lakes for its water supply (Rheaume, 1991).

Although the Coldwater Shale Formation comprises the majority of the bedrock in the City of Pontiac, only some stray sandstones within the Formation yield potable water locally, which limits the use solely to domestic wells. In general, Coldwater Shale is extremely low yielding in terms of water content (Ferris, Burt, Stramel, and Crosthwaite, 2003).

Most of the groundwater is located in the surficial outwash and the buried outwash deposits within the upper 100 feet of the area. The groundwater in the buried outwash is under confined conditions due to the relatively thick layer of clay it underlies. This clay sequence is less permeable than the surrounding glacial drift and therefore acts as a confining layer. The outwash deposits tend to have a high permeability and are very transmissive (Ferris, Burt, Stramel, and Crosthwaite, 2003). The majority of the local recharge for these glacial deposit aquifers is limited to the gravelly outwash plains bordering rivers and streams.

3.2 SITE SETTING

This section provides a summary of the Site geology and hydrogeology. The information in this section was obtained from investigative activities completed historically and during this Phase II ESA at the Site.

3.2.1 SITE GEOLOGY

The geologic (stratigraphic) framework for the Site was defined from a review of stratigraphic and instrumentation logs from investigative activities. The stratigraphic logs from this Phase II ESA are provided in Appendix A.

Drilling activities associated with the Phase II ESA investigation were conducted from October 9 to 17, 2007, December 3 to 7, 2007, and March 5 to 14, 2008. During this Phase II ESA, approximately sixty-four soil borings were advanced at the Site. The deepest soil boring extends approximately 60 feet bgs (MW28-07).

Two geologic cross-sections were prepared utilizing the subsurface data obtained from Site investigations. The locations of the geologic cross-sections are shown on Figure 3.1. Geologic cross-sections A-A' (west-east bisecting the Site), and B-B' (north-south across entire Site) are presented on Figures 3.2, and 3.3 respectively. Based on the distribution of the stratigraphic data shown on the geologic cross-sections, the main layers that underlie the Site to the maximum depth of investigation of 60 feet bgs are: a thin and discontinuous surficial sand and gravel fill layer, an underlying regionally significant layer of clay/silt glacial deposits, and bedrock.

The sand and gravel fill layer is geologically insignificant and consists of fine- to medium-grained sand and medium- to coarse-grained sand and gravel deposits, with trace amounts of mixed clays, sandy clays, and silts. The fill layer tends to exist with varying amounts of concrete, asphalt, wood, and brick debris. The thickness of this fill layer varies, but is generally less than 0.5 feet in thickness. The fill material is poorly to moderately graded, quite loose in terms of compaction, and ranges in color from brown to black. This layer is dry to moist and is not water-bearing.

Glacial clay and silt deposits were encountered below the surficial fill horizon, extending to the depth of investigation (approximately 60 feet bgs). These deposits varied from clay, silty clay, sandy clay, or sand and clay. The clay/silt glacial deposits are stratigraphically equivalent to the glacial drift deposits discussed in Section 3.1.2. Stratigraphically isolated and discontinuous sand layers were encountered within this clay/silt glacial deposit.

The sand layers occur at various depths and range in thickness from 0.25 feet to a maximum thickness of 20 feet at BH49-07 (shown on the easternmost portion of geologic cross-section A-A'). The average thickness of the sand layer is less than 5 feet. The sand layers cannot be correlated laterally with a high degree of certainty on the geologic

cross-sections and, as discussed in Section 3.1.2, are likely the result of heterogeneous meltwater deposits of retreating glaciers.

The clay/silt glacial deposits contain, as described previously, primarily fine-grained material (clay and silt) with traces of fine sand and, locally, some gravel. A grain size analysis (see Section 4.2 and Appendix C) was conducted for the entire PVC property and confirmed the field descriptions and indicated that the combined clay and silt content of the clay/silt glacial deposits ranges from 55 to 100 percent. The fine sand content ranges from 0 to 42 percent and the gravel content ranges from 0 to 3 percent. This horizon exhibits a plasticity ranging from very low (in the case of the sandy clays) to very high (in the case of the fat clays). It shows a great variety from soft to very stiff, and can be found in an assortment of colors such as gray, brown, dark brown, dark gray, olive green, and brown/gray mottled. The clay layers tend to be moist to very moist in terms of water content.

The deep stratigraphy sequence at the Site was not investigated since the maximum depth of investigation was approximately 60 feet bgs. However, regional stratigraphic data indicated that the clay/silt glacial deposits and other fine-grained materials of glacial origin extend to the bedrock at depths of approximately 650 feet AMSL. According to regional information of Oakland County, a layer of buried outwash exists between the clay/silt glacial deposits and the bedrock (Ferris, Burt, Stramel, and Crosthwaite, 2003). Bedrock beneath the Site consists of Early Mississippian Coldwater Shale Formation, a gray to blue-gray shale.

3.2.2 SITE HYDROGEOLOGY

The majority of the overburden beneath the Site is underlain by fine-grained material of the clay/silt glacial deposits and subordinate layers of sand. The hydrogeologic behavior of the overburden would therefore be controlled by the hydraulic (i.e., permeability or hydraulic conductivity) properties of the clay and silt material.

Vertical hydraulic conductivity values of the fine-grained material for the entire PVC property were calculated by the Flexible Wall Permeameter (Constant Head Method ASTM D-5084) and range from 1.4×10^{-7} to 1.5×10^{-8} centimeters per second (cm/sec). Horizontal hydraulic conductivity values for the fine-grained material would be approximately one order of magnitude less (Freeze and Cherry, 1979) or on the order of 1×10^{-6} to 1×10^{-7} cm/sec. The clay materials provide a very good aquitard to the downward migration of groundwater. Although not measured, the hydraulic

conductivity of the sand layers would be 1 x 10^{-3} cm/sec based on the textural nature of these layers (Freeze and Cherry, 1979).

It should be noted that the majority of the groundwater monitoring wells are screened primarily in the coarser-grained (sand layers) deposits or straddling the interface between the fine-grained and coarse-grained deposits at shallow depths (less than 15 feet bgs), equivalent to an approximate elevation of 935 feet AMSL or higher. This represents the shallower groundwater environment or the depths where groundwater was first encountered during drilling.

Groundwater contours were generated using the groundwater elevations measured on December 15, 2008, in the shallow monitoring wells and are presented on Figure 3.4. The groundwater flow patterns shown on Figure 3.4 therefore represent the shallow groundwater flow environment for both the predominantly fine-grained material and sand layers within the clay/silt glacial deposits fine-grained matrix. Only the groundwater elevations representative of the monitoring wells with screens at elevations higher than 935 feet AMSL were used to generate the groundwater contours.

Groundwater elevations in the shallow clay/silt glacial deposits range from about 955 feet AMSL at the extreme southeast part of the Site to about 945 feet AMSL at the extreme northern portion of the Site. These elevations correspond to water table depths on the order of 2.5 to 17.5 feet bgs.

As shown on Figure 3.4, groundwater in the shallow portions of the clay/silt glacial deposits flows generally to the north-northwest and follows the ground surface topography. The average horizontal hydraulic gradient is between 0.01 and 0.02.

Assuming a conservative horizontal hydraulic gradient of 0.02, a conservative horizontal hydraulic conductivity of 1 x 10^{-6} cm/sec (0.0028 feet/day) for the fine-grained material, and a porosity of 30 percent (0.3), the resulting horizontal groundwater flow velocity would be 0.0002 feet/day or 0.07 feet/year within the clay and silt of the clay/silt glacial deposits. Assuming a hydraulic conductivity of 1 x 10^{-3} cm/sec (2.8 feet/day) and the same horizontal hydraulic gradient and porosity values as for the fine-grained material would result in a groundwater flow velocity of 0.2 feet/day or 73 feet/year.

The groundwater flux within the upper 15 feet of the clay/silt glacial deposits, based on the hydraulic properties of the fine-grained material and sand layers discussed above, would be about 0.000004 to 0.0004 gallons per minute (gpm), per linear foot perpendicular to groundwater flow for the fine-grained and sand layers, respectively.

3.3 GEOLOGIC AND HYDROGEOLOGIC SUMMARY

The regional and Site geologic and hydrogeologic framework is summarized as follows:

- the regional overburden is primarily dominated by Quaternary-aged glacial drift, glaciolacustrine deposits, and glacial outwash deposits of recent and Pleistocene age;
- the regional glacial deposits are underlain by a thick section of clay, sandy clay, and gravelly clay that separates a layer of buried outwash (e.g. sand);
- the regional bedrock is from the Coldwater Shale Formation which is up to 400 feet thick, contains shales, sandy shales, and shaly sandstones, and is predominantly gray with some bluish-gray and blue shales;
- bedrock is locally found at an elevation of approximately 650 feet AMSL, or about 310 feet bgs;
- the Site geologic setting is primarily dominated by a sand and gravel fill layer, underlain by native clay/silt glacial deposits, underlain by bedrock;
- the water table is found at depths from 2.5 to 17.5 feet bgs within the fine-grained material and the sand layers of the clay/silt glacial deposits;
- groundwater flow in the shallow system is mainly to the north-northwest at an average horizontal hydraulic gradient of 0.01 to 0.02;
- horizontal groundwater flow velocity would be 0.0002 feet/day or 0.07 feet/year within the clay and silt of the clay/silt glacial deposits. The horizontal groundwater flow velocity would be 0.2 feet/day or 73 feet/year in the fine-grained silty material;
- the clay till has a vertical hydraulic conductivity of approximately $1x10^{-7}$ cm/s prohibiting the downward migration of groundwater (e.g. aquitard); and
- groundwater flux within the upper 15 feet of the clay/silt glacial deposits would be about 0.0002 to 0.2 gpm, per linear foot perpendicular to groundwater flow for the fine-grained and sand layers, respectively.

4.0 PHASE II ESA RESULTS

Soil and groundwater samples were collected from the Site as discussed throughout Section 2.0. Investigative soil and groundwater samples were analyzed for constituents as indicated in Tables 2.1 and 2.3, respectively. The sampling locations for the Site are shown on Figure 2.1. Laboratory Analytical Data Reports are presented in Appendix C.

4.1 FIELD TESTS AND OBSERVATIONS

4.1.1 SUDAN IV JAR TESTS

Sudan IV jar tests were used to identify the potential presence of NAPL during field activities. The purpose of a Sudan IV jar test is to assess in the field which borings may be located in an area containing potential NAPL by identifying NAPL entrained in the soil pore space. Sudan IV jar tests were used on soil borings exhibiting the potential presence of NAPL. The potential presence of NAPL (i.e., a positive jar test result) was identified in soil borings MW32-07, MW33-07, MW69-07, BH72-08, and BH79-08. The results of the jar tests are indicated on Table 2.1.

4.1.2 FIELD OBSERVATIONS

Based on field observations, the following notes were made:

PAOC 2 – Historical Operations – Plants 3, 4, and 5

- A petroleum odor and black staining was encountered at soil boring MW32-07 at 15 feet bgs. The PID reading at 15 feet bgs was recorded as 39.3 ppm. Staining was no longer observed at 15.5 feet bgs. No odor was encountered at 19 feet bgs. There was a positive Sudan IV jar test result on the 15 to 17 feet bgs interval. A soil sample was collected from the 15 to 17 feet bgs interval and submitted for laboratory analysis based on the positive jar test result.
- Soil retrieved from soil boring BH48-07 was observed to be black throughout the 4.9 to 13.5 feet bgs interval. PID readings for the interval ranged from 0.2 to 0.8 ppm.
- A petroleum odor was encountered at soil boring MW69-08 at the 14 to 19 feet bgs interval and PID readings from 26 to 163 ppm were recorded. No odor was encountered at 21 feet bgs. There was a positive Sudan IV jar test result on the 18 to 20 feet bgs interval. A soil sample was collected from the 18 to 20 feet bgs interval and submitted for laboratory analysis based on the positive jar test result.

PAOC 3 – Historical Adjacent Properties

- A slight petroleum-like odor was encountered at soil boring MW17-07 at the 2.9 to 5.0 feet bgs interval. The PID reading for the interval was 0 ppm. There was a negative Sudan IV jar test result on the 3 to 5 feet bgs interval. No indication of contamination was encountered at depths greater than 5.0 feet bgs.

PAOC 5 – USTs – Plant 3

- A petroleum odor was encountered at soil boring MW33-07 at the 14.5 to 20.0 feet bgs interval. PID readings for the 15 to 20 feet bgs interval were recorded between 8.7 and 788 ppm. There was positive Sudan IV jar test result on the 16 to 18 feet bgs interval. A soil sample was collected from the 16 to 18 feet bgs interval and submitted for laboratory analysis based on the positive jar test result.
- Soil retrieved from soil boring BH89-08 was observed to be black throughout the 1.5 to 1.75 feet bgs interval. PID readings for the interval ranged from 3.2 to 3.4 ppm.

PAOC 6 – USTs – Plant 4

- Soil retrieved from temporary monitoring well TMW80-08 was observed to be black at a depth of 5.5 to 6.0 feet bgs. The PID reading for the 5.5 to 6.0 feet bgs interval was recorded at 0.6 ppm.

PAOC 10 – Former Powerhouse

- Black staining was observed in soil boring BH91-08 at the 3.5 to 8.0 feet bgs interval. A petroleum odor was encountered at 7 feet bgs. The PID reading at 7 feet bgs was recorded at 5.6 ppm. There was a negative Sudan IV jar test result on the 6 to 8 feet bgs interval.

PAOC 13/PAOC 19 - WMA south of Plant 3/Former Wastewater Treatment

- Black staining was observed in soil from temporary monitoring well TMW71-08 at the 4.6 to 6.0 feet bgs interval. A petroleum odor was encountered at 7 feet bgs. The PID reading for the 4.66 to 6.0 feet bgs interval was recorded at 0 ppm. No indication of contamination was encountered at depths greater than 7.0 feet bgs.

PAOC 21 – Wastewater Lift Station and Process Lines

- Soil retrieved from soil boring MW28-07 was observed to be black throughout the 0.5 to 12.0 feet bgs interval. PID readings for the interval ranged from 0 to 0.2 ppm.

PAOC 22 – Former Paint Mix Rooms

- A petroleum-like odor was encountered at soil boring BH72-08 at the 8.5 to 15.0 feet bgs interval. The maximum PID reading for the interval was 61.8 ppm at the 12.0 to 14.0 feet bgs interval. There was a positive jar test result on the 12 to 14 feet bgs interval. A soil sample was collected from the 12 to 14 feet bgs interval and submitted for laboratory analysis based on the positive jar test result. PID readings at depths greater than 14.0 feet bgs ranged from 4.2 ppm to 1.1 ppm.

4.2 SHELBY TUBE SAMPLE RESULTS

Three soil samples were collected from the PVC (two on-Site) for geotechnical analysis using a Shelby tube sampler on December 10, 2007. The on-Site samples were collected from the following locations: adjacent to BH23-07, 14 to 20 feet bgs (ST-2); and adjacent to MW35-07, 10.5 to 20 feet bgs (ST-3). The intervals were selected to provide representative samples of the overburden Site soils. The Shelby tube samples underwent hydraulic triaxial testing, to determine the hydraulic conductivity of the soils, and a grain size analysis.

According to the results of the hydraulic triaxial testing and grain size analyses, the soil samples were classified as follows:

Sample ID	***Location***	***Depth (feet bgs)***	***Soil Description***	***Hydraulic Conductivity (cm/sec)***
ST-2	Adjacent to BH23-07	14 to 20	Silt with clay	1.39×10^{-07}
ST-3	Adjacent to MW35-07	10.5 to 20	Clayey silt, with sand, trace gravel	1.49×10^{-08}

Grain size distribution charts and hydraulic conductivity calculations are presented in Appendix D.

4.3 PHASE II ESA ANALYTICAL DATA EVALUATION/CRITERIA

4.3.1 DATA VALIDATION AND EVALUATION

Qualifiers were applied to the data by the CRA project chemist in accordance with relevant criteria outlined in "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review", EPA 540/R-99/008, October 1999 and "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review", EPA 540/R-94/013, February 1994. Data validation was performed on 100 percent of the data. The Data Quality Assessment and Validation Memoranda for the soil and groundwater analyses are presented in Appendix E.

4.3.2 RELEVANT SCREENING CRITERIA

A data screening and risk evaluation was completed by ENVIRON for GM based on the existing subsurface data collected at the Site since 1989. The purpose of the data screening and risk evaluation was to identify potentially significant current and future exposures. A copy of the data evaluation report prepared by ENVIRON is presented in Appendix F.

Analytical results were screened against MDEQ Generic Screening Levels as defined in Part 201 of the "Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451" (MDEQ Part 201 Criteria). Soil screening criteria selected by ENVIRON included the Residential and Industrial scenarios of the following:

- Direct Contact Criteria (DCC);
- Soil Volatilization to Indoor Air Inhalation Criteria;
- Infinite Source Volatile Soil Inhalation Criteria (outdoor air) (VSIC); and
- Particulate Soil Inhalation Criteria (PSIC).

Groundwater screening criteria selected by ENVIRON included the following:

- Residential and Industrial Drinking Water Criteria (DWC);
- Residential and Industrial Groundwater Volatilization to Indoor Air Inhalation Criteria; and
- Groundwater Contact Criteria (GCC).

Screening criteria were selected by ENVIRON based on an anticipated deed restriction limiting the future property use to commercial/industrial purposes and based on the most representative future exposures given the implementation of the deed restriction. In addition, screening against limited residential criteria was completed to facilitate future development of a Due Care Plan for the Site.

It should be noted that, based on the above, the data screening completed by ENVIRON did not include screening against the following MDEQ Part 201 criteria/levels for soil and groundwater, as they were not considered to be representative for the Site:

- Drinking Water Protection Criteria;
- Groundwater Surface Water Interface Protection Criteria;
- Groundwater Contact Protection Criteria;
- Soil Saturation Concentration Screening Level;
- Groundwater Surface Water Interface Criteria;
- Water Solubility;
- Flammability and Explosivity Screening Level; and
- Acute Inhalation Screening Level.

The methodology and results of ENVIRON's data screening for all historical and current data collected from the Site are presented as part of a data evaluation report (see Appendix F).

4.4 PHASE II ESA ANALYTICAL RESULTS – PAOCS

As discussed in Section 4.3.2, ENVIRON completed a data screening of all available data for the Site. The results of the data screening specific to this Phase II ESA are presented in the following sections. A summary of parameters present at concentrations that exceeded the selected MDEQ Part 201 Criteria as identified by ENVIRON is presented is presented on Figure 4.1 for soil, and on Figure 4.2 for groundwater. Summary tables of exceedances pertaining to this Phase II ESA were generated by ENVIRON and are included in Appendix F. A Site-wide summary of detected parameters in soil is presented in Table 4.1, and a Site-wide summary of detected parameters in groundwater is presented in Table 4.2.

The results of the Phase II ESA are summarized in the following sections by PAOC. It should be noted that all soil borings advanced at the Site contributed to the investigation of historical Site operations (PAOC 2). Additionally, all soil borings advanced along the perimeter of the Site contributed to the investigation of historical adjacent properties (PAOC 3). The results of soil borings advanced solely to investigate PAOCs 2 and 3 are discussed in Section 4.4.1.

At soil boring BH66-08, refusal was encountered at 3 feet bgs. Multiple off-set attempts were made; however, refusal was encountered at all off-set locations at 3 feet bgs. As a result, no soil sample was collected from BH66-08.

4.4.1 PAOCS 2 AND 3 – HISTORICAL SITE OPERATIONS AND ADJACENT PROPERTIES

Based on the Phase I ESA (CRA, 2006), former Plants 3, 4, and 5 were developed as early as 1915 as Flander's Electrical Company Inc. (manufacturers of electric automobiles); Pontiac Drop Forge Company; the Wilson Foundry and Machine Company; and/or Detroit Weather Proof Body Company, with subsequent additions/changes to the facilities over the years. Primary operations conducted at former Plants 3, 4, and 5 included metal finishing operations (phosphating, pickling, plating, heat treating, and painting), degreasing, drop forging, casting, incinerating, stamping, grinding, machining, and polishing. Ancillary operations included hazardous and non-hazardous waste accumulation, handling, and storage, as well as the use and storage of raw petroleum products and solvents in both above and below-ground storage tanks and drums. No information regarding historical use of heating oil USTs or ASTs, septic systems, or property demolition procedures was available.

Adjacent properties to the Site were historically operated as petroleum filling stations, a plating company, an electric light plant/power plant, and various manufacturing facilities as early as 1909. These types of operations typically utilize petroleum products and solvents. Potential impacts to the Site from these operations could not be determined.

Soil Analytical Results

1,1-Dichloroethene (1,1-DCE) was detected at concentrations exceeding the Residential Soil Volatilization to Indoor Air Inhalation Criteria (SVIIC) at the 0 to 2.0 and 8.0 to 10.0 feet bgs intervals at MW74-08. Trichloroethene (TCE) was also detected at a

concentration exceeding the Residential SVIIC at the 8.0 to 10.0 feet bgs interval at MW74-08. No other constituents were detected at PAOC 2 and 3 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as evaluated by ENVIRON.

Groundwater Analytical Results

Aluminum was detected at concentrations exceeding the Residential DWC at monitoring wells MW19-07, MW32-07, MW68-08, and MW74-08. Iron was detected at a concentration exceeding the Residential and Industrial DWC at monitoring well MW48-07. Lead was detected at concentrations exceeding the Residential and Industrial DWC at monitoring well MW63-08.

TCE was detected at concentrations exceeding the Residential and Industrial DWC at monitoring well MW74-08.

1,1-DCE, cis-1,2-dichloroethene (cis-1,2-DCE), 1,1,1-trichloroethane (1,1,1-TCA), benzo(a)anthracene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, and chrysene were detected at concentrations exceeding the Residential DWC at monitoring well MW74-08. Additionally, 1,1-DCE, cis-1,2,DCE, 1,1,1-TCA, benzo(b)fluoranthene, benzo(g,h,I)perylene, benzo(k)fluoranthene, and chrysene exceeded the Industrial DWC at monitoring well MW74-08. Benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, and chrysene concentrations exceeded the GCC at monitoring well MW74-08.

No other constituents were detected at the PAOC 2 and 3 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as evaluated by ENVIRON.

4.4.2 PAOC 5: UNDERGROUND STORAGE TANKS – PLANT 3

Based on the Phase I ESA (CRA, 2006), at least 13 historic USTs were present in the vicinity of former Plant 3. No information regarding closure of three of the USTs at former Plant 3 (i.e., removed, abandoned-in-place, etc.) was available. The remaining 10 USTs were removed and at least 5 are listed as closed on the MDEQ database.

Soil borings MW33-07, MW34-07, BH36-07, MW37-07, MW40-07, MW43-07, BH89-08, BH90-08, and BH94-08 through BH96-08 were advanced throughout the former Plant 3

to investigate potential impacts associated with historic USTs. Soil samples were not collected from soil borings BH94-08 and BH95-08 based on negative jar test results and low PID readings, and given that additional subsurface data in the vicinity had already been collected (e.g., MW43-07). Monitoring wells were installed at MW33-07, MW34-07, MW37-07, MW40-07, and MW43-07 based on the presence of groundwater during soil boring advancement. Insufficient groundwater was present in monitoring well MW43-07 at the time of sampling.

Soil Analytical Results

Benzo(a)pyrene was detected at a concentration exceeding the Residential DCC criteria at BH36-07 at a depth of 0 to 2.0 feet bgs. No other constituents were detected at the PAOC 5 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as evaluated by ENVIRON.

Groundwater Analytical Results

Aluminum was detected at concentrations exceeding the Residential DWC criteria at MW33-07 and MW34-07. Vanadium was also detected at MW33-07 at a concentration exceeding the Residential DWC at MW33-07. No other constituents were detected at the PAOC 5 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as evaluated by ENVIRON.

4.4.3 PAOC 6: UNDERGROUND STORAGET TANKS – PLANT 4

Based on the Phase I ESA (CRA, 2006), at least 15 USTs were located in the vicinity of former Plant 4. No information regarding closure (i.e., removed, abandoned-in-place, etc.) of the USTs at former Plant 4 was available.

Soil borings MW46-07, BH47-07, BH75-08, TMW80-08, and BH84-08 through BH86-08 were advanced throughout the former Plant 4 to investigate potential impacts associated with historic USTs. A monitoring well was installed at MW46-07 and a temporary monitoring well was installed at TMW80-08 based on the presence of groundwater during soil boring advancement. Insufficient groundwater was present in temporary monitoring well TMW80-08, and MW46-07 was covered by demolition debris at the time of sampling.

Soil Analytical Results

Arsenic was detected at a concentration exceeding the Residential DCC criteria at soil boring BH47-07 at a depth of 17.5 to 20.0 feet bgs. No other constituents were detected at the PAOC 6 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as evaluated by ENVIRON.

4.4.4 PAOC 7: UNDERGROUND STORAGE TANKS – PLANT 5

Based on the Phase I ESA (CRA, 2006), at least one UST was located in the vicinity of former Plant 5. No information regarding closure (i.e., removed, abandoned-in-place, etc.) of the UST at former Plant 5 was available.

Soil boring BH22-07 was advanced to the north of the former Plant 5 to investigate potential impacts associated with historic USTs.

Soil Analytical Results

No constituents were detected at the PAOC 7 investigative location at concentrations exceeding the selected MDEQ Part 201 Criteria as identified by ENVIRON.

4.4.5 PAOC 8: FORMER INCINERATOR

Based on the Phase I ESA (CRA, 2006), a concrete refuse burner (i.e., incinerator) was present on the southwestern portion of the Site, to the west of the former Wilson Plant 4. No information was available regarding the types of materials incinerated or the historical disposal practices associated with the fly ash generated from incineration.

Soil boring BH88-08 was advanced to investigate potential impacts associated with the former incinerator.

Soil Analytical Results

No constituents were detected at the PAOC 8 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as identified by ENVIRON.

4.4.6 PAOC 9: TUNNELS

Based on Phase I ESA (CRA, 2006), a brick tunnel exists between former Plants 3 and 4, and former Plants 3 and 5. This tunnel was reportedly historically used for utility lines; however, at the time of the 2006 Phase I ESA it was abandoned and not available for inspection.

Soil borings BH76-08 and BH77-08 were advanced at the Site to investigate potential impacts associated with tunnels.

Soil Analytical Results

No constituents were detected at the PAOC 9 investigative location at concentrations exceeding the selected MDEQ Part 201 Criteria as identified by ENVIRON.

4.4.7 PAOC 10: FORMER POWERHOUSE

Based on the Phase I ESA (CRA, 2006), a powerhouse was located in former Building 13 (Plant 3). Coal was historically stored outside east of the Powerhouse. No information was available regarding if the coal was stored on bare ground or a paved surface.

Soil borings MW35-07 and BH91-08 were advanced at the Site to investigate potential impacts associated with the former powerhouse. A monitoring well was installed at MW35-07.

Soil Analytical Results

No constituents were detected at the PAOC 10 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as identified by ENVIRON.

Groundwater Analytical Results

Aluminum, arsenic, vanadium, and bis(2-Ethylhexyl-phthalate) were detected at concentrations that exceed the residential DWC at MW35-07. Arsenic and bis(2-ethylhexyl)phthalate also exceeded the industrial DWC. No other constituents were detected at the PAOC 10 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as evaluated by ENVIRON.

4.4.8 PAOC 11: SURFICIAL SCARRING

Based on the Phase I ESA (CRA, 2006), an area of surficial scarring is present on aerial photographs to the south of former Buildings 12 and 27 (Plant 1). These buildings historically conducted heat-treat and pickling operations. No further information regarding the surficial scarring was available.

Soil borings BH14-07 and MW15-07 were advanced at the Site to investigate potential impacts associated with the area of surficial scarring. A monitoring well was installed at MW15-07.

Soil Analytical Results

No constituents were detected at the PAOC 11 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as identified by ENVIRON.

Groundwater Analytical Results

No constituents were detected at the PAOC 11 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as identified by ENVIRON.

4.4.9 PAOC 13: WMA SOUTH OF PLANT 3/ PAOC 19: FORMER WASTEWATER TREATMENT

Based on the Phase I ESA (CRA, 2006), a Tank Waste Management Area (Solid Waste Management Unit (SWMU) No. 1) and Container Waste Management Area (SWMU No. 2) historically located south of Plant 3 were identified as areas of concern during the Preliminary Review/Visual Site Inspection (PR/VSI) and Preliminary Assessment (PA) performed for the United States Environmental Protection Agency (U.S. EPA). Supplemental investigation and closure of the area was completed. MDEQ released GM from further closure requirements, but not from future Resource Conservation and Recovery Act (RCRA) Corrective Action requirements.

Additionally, prior to 1978, wastewater was managed in a tank area south of Plant 3. This area was included in the RCRA Part A Waste Permit Application. It is unknown if this area was properly closed or if there were other areas used for wastewater treatment or disposal prior to 1978.

Soil borings BH39-07 and TMW71-08 were advanced to investigate potential impacts associated with the WMA and former wastewater treatment. A temporary monitoring well was installed at TMW71-08.

Soil Analytical Results

No constituents were detected at the PAOC 13 and PAOC 19 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as identified by ENVIRON.

Groundwater Analytical Results

No constituents were detected at the PAOC 13 and PAOC 19 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as identified by ENVIRON.

4.4.10 PAOC 14: AST FARM AT PLANT 1

Based on the Phase I ESA (CRA, 2006), an AST farm was historically present at Plant 1 (southeast – within the South Parcel boundary), and was removed in 1995. The eastern portion of the bermed area had a soil base. The tanks that were removed contained engine oil, glycol, steering fluid, waste oil, glycol, oil, and waste glycol. Confirmatory soil samples were collected and analyzed for benzene, toluene, ethylbenzene, and xylene (BTEX), polynuclear aromatic hydrocarbons (PNAs), PCBs, lead, cadmium, and arsenic. Based on the materials stored in the tanks, it is unknown if at the time of the 2006 Phase I ESA there were other VOCs remaining in the soil at concentrations of concern.

Soil boring MW15-07 was advanced to investigate potential impacts associated with historic AST farm at Plant 1. A monitoring well was installed at MW15-07.

Soil Analytical Results

No constituents were detected at the PAOC 14 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as identified by ENVIRON.

Groundwater Analytical Results

No constituents were detected at the PAOC 14 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as identified by ENVIRON.

4.4.11 PAOC 15: POTENTIAL FILL PIPES

Based on the Phase I ESA (CRA, 2006), potential fill pipes are located in Plant 5, near Column G8. No further information regarding these pipes was available.

Soil boring BH26-07 was advanced to investigate potential impacts associated with potential fill pipes.

Soil Analytical Results

No constituents were detected at the PAOC 15 investigative location at concentrations exceeding the selected MDEQ Part 201 Criteria as identified by ENVIRON.

4.4.12 PAOC 16: BULK LOADING/UNLOADING AREAS

Based on the Phase I ESA (CRA, 2006), the Site currently and formerly utilized several areas for bulk unloading and loading of petroleum, solvents, and acid products and waste. These areas include exterior load/unload fill ports and associated concrete pads, as well as former trainwells. Some of these areas have been replaced in the recent past; however, others have been in place since the facility was developed.

Bulk loading and unloading areas were not specifically investigated during this Phase II ESA as the exact location of all historical loading activities was unknown and could not be easily targeted. Similar to PAOCs 2 and 3, the results from the overall Phase II ESA investigation contribute to the evaluation of bulk loading and unloading areas.

4.4.13 PAOC 17: FORMER FOUNDRY SAND

Based on the Phase I ESA (CRA, 2006), outdoor storage of foundry sand was historically conducted to the east of the Plant 5. No information was available regarding if the foundry sand was stored on bare ground or a paved surface. No specific information

regarding historical dust control practices was available; and current Site personnel had no knowledge of dust control activities. No information was available regarding the historical use of these materials for fill at the Site and information regarding surface sampling underneath piles was unavailable for review.

Soil boring MW27-07 was advanced to investigate potential impacts associated with the former foundry sand. A monitoring well was installed at MW27-07 based on the presence of groundwater during soil boring advancement; however, insufficient groundwater was present in the well at the time of sampling.

Soil Analytical Results

No constituents were detected at the PAOC 17 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as identified by ENVIRON.

4.4.14 PAOC 20: FORMER TRANSFORMERS, SUBSTATIONS, AND LARGE CAPACITORS

Based on the Phase I ESA (CRA, 2006), numerous transformers and/or substations were historically located throughout the Site and were operated since at least 1909 in some instances. No information was available regarding the historical types of dielectric fluids utilized in the majority of the former transformers at the Site. Historical documentation for the Site indicates that transformers and large capacitors containing Askarel may have been present at the Site. There was evidence of PCBs present in a roof top transformer on Plant 4 in 1978

Former transformers, substations, and large capacitors were not specifically investigated during this Phase II ESA as the exact location of these items could not easily be targeted. Similar to PAOCs 2 and 3, the results from the overall Phase II ESA investigation contribute to the evaluation of historical transformers and/or substations. PCBs were analyzed in all soil samples collected from the Site as part of the investigation of PAOC 20. PCBs were detected in the soil sample collected from BH72-08 at a depth of 12.0 to 14.0 feet bgs (PAOC 22) at a concentration exceeding the Residential and Industrial DCC.

4.4.15 PAOC 21: WASTEWATER LIFT STATION AND PROCESS LINES

Based on the Phase I ESA (CRA, 2006), the process wastewater collection system at the Site consisted of a series of gravity and pressure sewers. Process wastewater was historically pumped from a series of collection sumps located in the production buildings, overhead to the main industrial wastewater lift station located north of Plant 5. At the main lift station, wastewater was stored in six large pits, which were most recently used to store general industrial wastewater and acid wastewater, but historically contained general wastewater, acid wastewater, cleaner wastewater, and ELPO wastewater. Based on the review of available documentation, numerous releases have occurred at the wastewater lift station. From the main lift station, process wastewater is conveyed underground to the off-Site PAC WWTP. The underground wastewater lines run approximately 2 to 3 miles along the Grand Trunk Railway.

Soil borings BH23-07 and MW28-07 were advanced to investigate potential impacts associated with the wastewater lift station and process line. A monitoring well was installed at MW28-07 based on the presence of groundwater during soil boring advancement; however, insufficient groundwater was present in the well at the time of sampling.

Soil Analytical Results

Manganese was detected at a concentration exceeding the Industrial PSIC at MW28-07 at a depth of 0 to 2.0 feet bgs. No other constituents were detected at the PAOC 21 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as evaluated by ENVIRON.

4.4.16 PAOC 22: PAINT MIX ROOMS

Based on Phase I ESA (CRA, 2006), a paint mix room is located in Plant 3. Historically, paint mixing was conducted in the basement of Plant 3. Additional information regarding historical paint mixing areas was not available.

Soil borings BH72-08, and BH73-08 were advanced to investigate potential impacts associated with the paint mix rooms.

Soil Analytical Results

Total PCBs were detected at a concentration exceeding the Residential DCC in soil boring BH72-08 on the 12.0 to 14.0 feet bgs interval. No other constituents were detected at the PAOC 22 investigative locations at concentrations exceeding the selected MDEQ Part 201 Criteria as evaluated by ENVIRON.

4.5 PHASE II ESA RESULTS – LNAPL AND LIF INVESTIGATION

LNAPL was observed (olive green to gray color) in monitoring well MW69-08 during its construction on March 13, 2008.

A sample of LNAPL was collected from MW69-08 and submitted for forensic analysis to determine its primary constituents and to assist in identifying a source area. The sample was submitted to Friedman & Bruya, Inc. for analysis.

According to the characterization results prepared by Friedman & Bruya, Inc. for the LNAPL sample collected from monitoring well MW69-08, the LNAPL is considered to be a middle distillate such as diesel fuel, kerosene, or similar material. Additionally, there is an abundance of isoprenoids and a lack of normal alkanes in the sample, indicating that the fuel has undergone substantial biological degradation over time. The results of the LNAPL characterization are presented in Appendix G. In addition, the viscosity and density of the LNAPL were analyzed. The results indicated that the dynamic viscosity was 0.001784 mpa/s at 49°C and the density was 0.81380 grams per milliliter.

CRA retained Fugro Consultants, Inc. (Fugro) to perform a Laser-Induced Fluorescence (LIF) investigation in the vicinity of monitoring well MW69-08. The LIF investigation was completed to aid in evaluating the extent and mobility/stability of the LNAPL plume.

Fugro utilized Cone Penetration Testing (CPT)/Rapid Optical Screening Tool (ROST™) testing to complete the LIF investigation. CPT was performed simultaneously with each ROST™ test. Soil classification was based on resistance and friction to the CPT probe during penetration through the ground. The CPT probe was advanced at a rate of 2 centimeters per second, per the ASTM Standard D5778-95. The CPT probe was equipped with a laser and a sapphire window, and during the ROST™ testing, laser light was directed through the window and into the subsurface. The laser light was

absorbed by hydrocarbon molecules, causing the molecules to fluoresce. A portion of the fluorescence intensity was reflected through the sapphire window and returned via fiber optic cable to a detection system. The emission data from the pulsed laser light was averaged into one reading per second intervals and was recorded continuously. Intensity of fluorescence was quantified via comparison against a standard hydrocarbon mixture used to calibrate the laser. The intensity of the fluorescence is proportional to the amount of hydrocarbon present (i.e. LNAPL saturation).

The LIF investigation was completed at the Site from April 28 through April 30, 2008. Thirty locations were investigated using the CPT/ROST™ tests. The locations of the LIF investigation are presented on Figure 4.3.

Based on the results of the LIF investigation, the LNAPL plume at the Site was delineated as presented on Figure 4.3. LNAPL was also suspected at monitoring well MW33-07. As such, 5 LIF investigation locations were advanced in the vicinity of monitoring well MW33-07. This smaller area is also presented on Figure 4.3.

Since the discovery of the LNAPL plume, CRA, on behalf of ENCORE, has completed a series of LNAPL recovery events. LNAPL is checked for thickness and any LNAPL present in a monitoring well is recovered using a disposable bailer. Given the nature of the LNAPL (biodegradable, etc.) and the extent shown on Figure 4.3, it is not anticipated that the LNAPL is highly mobile. Furthermore, the fine-grained overburden material at the Site assists in limiting significant migration of the LNAPL plume. The plume is located at the center of the Site at depths ranging from 10.0 to 14.0 feet bgs, and is located entirely beneath an existing concrete floor slab remaining from the demolition of Plant 3.

LNAPL thickness has been monitored at monitoring well MW69-08 since the discovery, as presented in Table 2.5. The average LNAPL thickness at monitoring well MW69-08 is approximately 3 feet and recovery of LNAPL is presently ongoing. LNAPL is removed from the monitoring well utilizing a disposable bailer. Approximately 7.75 gallons of LNAPL has been removed from monitoring well MW69-08 as of January 28, 2009. LNAPL removed from the monitoring well is stored in a grounded drum contained within an over-pack located in the central portion of the Site.

In order to determine any associated risk with the LNAPL, ENVIRON conducted a risk-based evaluation of the LNAPL sample results (see Section 4.7).

4.6 RISK EVALUATION RESULTS

ENVIRON performed a data screening and risk evaluation using the soil, groundwater and LNAPL data collected between 1989 and 2008 during various environmental assessments at the Site. While the data collected in 2007 and 2008 are believed to be the most representative of the current conditions at the Site, all data were used in screening and risk evaluation.

A risk evaluation of the constituents detected at concentrations exceeding the above-noted MDEQ Part 201 Criteria was completed. ENVIRON calculated cumulative cancer risk and non-cancer hazard index (HI) estimates for potential exposure to constituents in soil, groundwater, and LNAPL. The following exposure scenarios were considered for the risk evaluation:

- Routine worker ingestion, dermal contact, and inhalation of constituents in soil during typical activities that occur outdoors;
- Routine worker inhalation of constituents in soil, groundwater, or LNAPL that volatize and migrate into indoor air assuming a hypothetical commercial/industrial building that has the characteristics the MDEQ assumed in its derivation of the commercial/industrial soil and groundwater volatilization to indoor air criteria;
- Maintenance worker and construction worker ingestion, dermal contact, and inhalation of constituents in soil during excavations into the subsurface;
- Maintenance worker and construction worker ingestion, dermal contact, and inhalation of constituents in groundwater during excavations that extend into groundwater; and
- Maintenance worker and construction worker ingestion, dermal contact, and inhalation of constituents in LNAPL during excavations that extend into LNAPL.

Cumulative cancer risk and HI estimates for potential exposures to soil and groundwater were calculated using the highest concentration of each chemical, in its respective media, from all sample locations across the Site. Cumulative cancer risk and HI estimates for potential exposures to LNAPL were calculated using the highest concentration of each chemical in the LNAPL sample collected from MW69-08.

Based on the risk evaluation, ENVIRON concluded that the soil, groundwater, and LNAPL data used in the evaluation do not indicate a potential for significant worker exposures at the Site, with the exception of historical xylene concentrations in the soil south of former Building 17 and chloromethane concentrations in LNAPL north of

former Building 17. It is important to note that the xylene data used in the evaluation were collected in 1989 and 1995 and may not be representative of current conditions in this area. The details of the ENVIRON risk evaluation are presented in Appendix F.

5.0 SUMMARY

Based on the results of the Phase II ESA the following summary has been made:

- a total of 64 soil borings (excluding off-set refusal locations) were advanced at the Site. Of the 64 soil borings, 27 were converted into monitoring wells, 5 of which were temporary monitoring wells. Groundwater samples were only collected from 19 of the 27 installed monitoring wells due to demolition activities or inadequate groundwater recharge;
- the Site geologic setting is primarily dominated by a sand and gravel fill layer, underlain by native clay/silt glacial deposits (i.e. aquitard), underlain by bedrock;
- the water table is found at depths from approximately 2.5 to 17.5 feet bgs within the fine-grained material and the sand layers of the clay/silt glacial deposits;
- **PAOCs 2 and 3 – Historical Site Operations and Adjacent Properties:** Based on the ENVIRON screening, VOCs were detected in soil at soil boring MW74-08 at a concentration exceeding the selected MDEQ Part 201 criteria. Metals, VOCs, and SVOCs, were detected in groundwater at monitoring well MW74-08 at concentrations exceeding the selected MDEQ Part 201 criteria. Metals were detected in monitoring wells MW19-07, MW32-07, and MW68-08 at concentrations exceeding the selected MDEQ Part 201 criteria. LNAPL was detected in monitoring well MW69-08;
- **PAOC 5 – USTs – (Former) Plant 3:** Based on the ENVIRON screening, benzo(a)pyrene was detected in soil at soil boring BH36-07 at a concentration exceeding the selected MDEQ Part 201 criteria. Metals were detected in groundwater at monitoring wells MW33-07 and MW34-07 at concentrations exceeding the selected MDEQ Part 201 criteria;
- **PAOC 6 – USTs – (Former) Plant 4:** Based on the ENVIRON screening, arsenic was detected in soil at soil boring BH47-07 at a concentration exceeding the selected MDEQ Part 201 criteria;
- **PAOC 10 – Surficial Scarring:** Based on the ENVIRON screening, metals and SVOCs were detected in groundwater at monitoring well MW35-07 at concentrations exceeding the selected MDEQ Part 201 criteria;
- **PAOC 21 – Wastewater Lift Station and Process Lines:** Based on the ENVIRON screening, manganese was detected in soil at soil boring MW28-07 at a concentration exceeding the selected MDEQ Part 201 criteria;

- **PAOC 22 – Former Paint Mix Rooms:** Based on the ENVIRON screening, PCBs were detected in soil at soil boring BH72-08 at concentrations exceeding the selected MDEQ Part 201 criteria;
- LNAPL sampled from monitoring well MW69-08 was determined to be a biodegradable middle distillate such as diesel fuel or kerosene;
- The LNAPL has been horizontally and vertically delineated via a LIF survey and appears to be located in the central portion of the south area of the Site; and
- The ENVIRON risk evaluation concluded that the soil, groundwater, and LNAPL data used in the evaluation do not indicate a potential for significant worker exposures at the Site, with the exception of historical xylene concentrations in the soil south of former Building 17 (which may not be representative of current Site conditions) and chloromethane concentrations in LNAPL north of former Building 17.

NOTES:
1. SUMMARY OF EXCEEDANCES BASED ON ENVIRON'S DATA SCREENING.
2. TEMPORARY MONITORING WELLS TMW70-08, TMW80-08, AND TMW87-08 DID NOT RECHARGE SUFFICIENTLY TO COLLECT A GROUNDWATER SAMPLE PRIOR TO ABANDONMENT.
3. THE SAMPLE COLLECTED FROM MONITORING WELL MW69-08 WAS CLASSIFIED AS LNAPL AND IS THEREFORE NOT SHOWN ON THIS FIGURE.
4. MONITORING WELLS MW21-07, MW27-07, MW28-07, MW43-07, AND MW46-07 WERE DRY DURING GROUNDWATER SAMPLING ACTIVITIES.

T.G.	S.R.	APRIL 2009	
Scale: AS SHOWN	Project No.: 17322-06	Report No.: 009	Drawing No.: figure 4.2

17322-06(009)GN-WA012 JUN 12/2009

HISTORICAL SITE PLAN SOURCE: GENERAL MOTORS CORPORATION NORTH AMERICA TRUCK PLATFORM WEST FACILITY PONTIAC, MICHIGAN, THE TRAVERSE GROUP, DRAFT PHASE I ENVIRONMENTAL ASSESSMENT, DECEMBER 19, 1994.

AERIAL PHOTOGRAPH SOURCE: PONTIAC 2002 AERIAL SUPPLIED BY OAKLAND COUNTY MICHIGAN

NOTES:
- SITE PLAN IS HISTORICAL.
- LNAPL DELINEATED BY LIF.
- LNAPL SURROUNDING MW33-07 WAS DETECTED AT LOW LEVELS BY LIF. THE PRESENCE OF LNAPL WAS NOT CONFIRMED IN THE MONITORING WELL.

Notes:

[1]	Soil borings BH31-07, BH45-07, BH66-08, and BH93-08 were not completed due to refusal or demolition activities.
[2]	Sample was collected from under the water table and analyzed at the request of ENCORE.
[3]	Shelby tube sample collected adjacent to soil boring.
[4]	Samples not submitted for laboratory analysis due to negative jar test result.
-	No sample collected due to poor recovery, refusal, or investigation of fill.
BH	Soil boring.
MW	Monitoring well.
TMW	Temporary monitoring well.
dup	Field duplicate sample.
ft bgs	Feet below ground surface.
Metals	Target Analyte List Metals.
PAOC	Potential Area of Concern.
PCBs	Polychlorinated Biphenyls.
SVOCs	Target Compound List Semi-Volatile Organic Compounds.
VOCs	Target Compound List Volatile Organic Compounds.
Cr	Chromium.
pos.	Positive jar test result.
neg.	Negative jar test result.

Notes:

(1) Monitoring well MW15-07 was covered by a roll-off box during the December 15, 2008 event.
(2) Monitoring wells MW32-07, MW43-07, and MW64-08 not found during December 15, 2008 event due to snow and ice on-Site.
(3) Monitoring wells MW28-07and MW48-07 not found during December 20, 2007 event due to debris piles covering wells.
Monitoring well MW46-07 could not be located for surveying or monitoring.
ft AMSL: feet Above Mean Sea Level.
ft BTOC: feet Below Top Of Casing.
ft BGS: feet Below Ground Surface.

TABLE 2.5

SUMMARY OF LNAPL MONITORING AT MW69-08
PHASE II ESA
PVC (SOUTH PARCEL)
PONTIAC, MICHIGAN

Date of Monitoring [1]	*Initial Depth to LNAPL (ft BTOR)*	*Initial Depth to Water (ft BTOR)*	*Initial LNAPL Thickness (ft)*	*Volume LNAPL Removed* [2] *(gal)*	*Final Depth to LNAPL (ft BTOR)*	*Final Depth to Water (ft BTOR)*	*Final LNAPL Thickness (ft)*
January 28, 2009	11.04	11.94	0.90	0.50	11.86	11.96	0.10
December 15, 2008	11.21	12.46	1.25	0.50	12.30	12.55	0.25
December 12, 2008	10.92	13.58	2.66	1.50	12.81	13.02	0.21
July 3, 2008	9.43	16.39	6.96	2.75	12.73	12.98	0.25
April 3, 2008	12.10	16.44	4.34	2.50	14.50	14.80	0.30

Notes:
LNAPL: Light Non-Aqueous Phase Liquid.
ft: Feet.
BTOR: Below Top of Riser.
Gal: Gallons.
N/A: Not Available.
(1) : LNAPL was detected in monitoring well MW69-08 in March 2008.
(2) : Volume removed is approximate. LNAPL removed with a bailer and stored on-Site in a grounded drum with an overpack.

Notes:
(1) The pump intake will be placed at the well screen mid-point or at a minimum of 2 ft above any sediment accumulated at the well bottom.
(2) The drawdown from the initial water level should not exceed 0.3 ft.

MONITORING WELL RECORD FOR LOW-FLOW PURGING

Project Data:

Project Name: GM Validation
Ref. No.: 17322
Date: January 7, 2008
Personnel: C. Bondy

Monitoring Well Data:

Well No.: **MW33-07**
Measurement Point: TOR
Constructed Well Depth (ft): 20.50
Measured Well Depth (ft): 19.81
Depth of Sediment (ft):
Screen Length (ft): 10
Depth to Pump Intake (ft)[1]: 17.81
Well Diameter, D (in): 1"
Well Screen Volume, V_s (gal): ~ 0.4
Initial Depth to Water (ft): 17.17

Time	*Pumping Rate (mL/min)*	*Depth to Water (ft)*	*Drawdown from Initial Water Level[2] (ft)*	*pH*	*Temperature ^{o}C*	*Conductivity (mS/cm)*	*ORP (mV)*	*DO (mg/L)*	*Turbidity (NTU)*
14:50	250	17.51	0.34	10.99	13.81	2724	-147	0.02	33.9
14:52	well dry-lower tubing and purge completely								
1/8/08	sample ID: GW-17322-010808-CB-011 @ 1040 for TCL VOCs, TCL SVOCs, TCL PCBs, Site specific TAL metals,								
	amenable cyanide, hexavalent and trivalent chromium								
	Note: initial DTW: 16.15' and turbidity of 25.7								
	Note: collected 1L for SVOCs and 1L for PCBsas well as VOAs before well went dry. Had to come back on 1/9/08								
	to collect 1L for SVOCs, 1L for metals, cyanide and chromium.								
1/9/08	Initial DTW: 15.63' and turbidity of 13.0.								

Notes:
(1) The pump intake will be placed at the well screen mid-point or at a minimum of 2 ft above any sediment accumulated at the well bottom.
(2) The drawdown from the initial water level should not exceed 0.3 ft.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Results and reporting limits have been adjusted for dry weight.

NC The recovery and/or RPD were not calculated.

MSB The recovery and RPD were not calculated because the sample amount was greater than four times the spike amount.

N Spiked analyte recovery is outside stated control limits.

MATRIX SPIKE SAMPLE EVALUATION REPORT

TOTAL Metals

Client Lot #...: A7J170210 **Matrix.....:** SO
Date Sampled...: 10/16/07 08:20 **Date Received..:** 10/17/07

PARAMETER	PERCENT RECOVERY	RECOVERY LIMITS	RPD	RPD LIMITS	METHOD	PREPARATION-ANALYSIS DATE	WORK ORDER #
Vanadium	91	(75 - 125)			SW846 6010B	10/18/07	J85721DV
	95	(75 - 125)	2.9	(0-20)	SW846 6010B	10/18/07	J85721DW
		Dilution Factor: 1					
Zinc	362 N	(10 - 199)			SW846 6020	10/18-10/22/07	J85721AQ
	329 N	(10 - 199)	7.6	(0-20)	SW846 6020	10/18-10/22/07	J85721AR
		Dilution Factor: 1					

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Results and reporting limits have been adjusted for dry weight.

NC The recovery and/or RPD were not calculated.

MSB The recovery and RPD were not calculated because the sample amount was greater than four times the spike amount.

N Spiked analyte recovery is outside stated control limits.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

CASE NARRATIVE

CASE NARRATIVE

A7J290168

The following report contains the analytical results for two solid samples submitted to TestAmerica North Canton by Conestoga-Rovers & Associates, Inc. from the GM CBC SSOW# E111021 Site, project number 17322. The samples were originally received October 18, 2007, according to documented sample acceptance procedures. Further analysis was requested by the client on October 29, 2007. A revised chain of custody was received on October 29, 2007

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by a dry weight adjustment footnote at the bottom of the analytical report page. The list of parameters which are never reported on a dry weight basis is included on the Sample Summary.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise D. Heckler, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "J". Refer to the sample report pages for the affected analyte(s).

The matrix spike/matrix spike duplicate(s) for SO-17322-101707-CB-078 had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

No ICP Trace Form IX was provided for batch(es) 7303019. The serial dilution was performed on a different sample from the same QC batch(es).

GENERAL CHEMISTRY

The analytical results met the requirements of the laboratory's QA/QC program.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica North Canton (formerly STL North Canton) conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton (formerly STL North Canton) requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

EXECUTIVE SUMMARY

EXECUTIVE SUMMARY - Detection Highlights

SAMPLE SUMMARY

SAMPLE SUMMARY

A7J290168

WO #	SAMPLE#	CLIENT SAMPLE ID	SAMPLED DATE	SAMP TIME
J932V	001	SO-17322-101707-CB-078	10/17/07	13:40
J9320	002	SO-17322-101707-CB-077	10/17/07	14:00

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Results and reporting limits have been adjusted for dry weight.

NC The recovery and/or RPD were not calculated.

MSB The recovery and RPD were not calculated because the sample amount was greater than four times the spike amount.

N Spiked analyte recovery is outside stated control limits.

CASE NARRATIVE

CASE NARRATIVE

A7L040208

The following report contains the analytical results for four solid samples submitted to TestAmerica North Canton by Conestoga-Rovers & Associates, Inc. from the GM Validation SSOW# E111021 Site, project number 17322. The samples were received December 04, 2007, according to documented sample acceptance procedures. Select samples were taken off hold on December 18, 2007. All holding times were expired with the exception of metals when the samples were taken off hold.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

Any reference within this document to Severn Trent Laboratories, Inc. or STL, should be understood to refer to TestAmerica Laboratories, Inc. (formerly known as Severn Trent Laboratories, Inc.)

All solid sample results are reported on an "as received" basis unless otherwise indicated by a dry weight adjustment footnote at the bottom of the analytical report page. The list of parameters which are never reported on a dry weight basis is included on the Sample Summary.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise D. Heckler, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperatures of the coolers upon sample receipt were 0.7 and 1.3°C.

GC/MS VOLATILES

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

Sample(s) SO-17322-120307-CB-094, SO-17322-120307-CB-098, and SO-17322-120307-CB-099 were originally logged in as archived samples. These samples were taken out of archive and assigned for analysis. This was done after the samples were outside of the method's holding time. These samples were analyzed beyond the expiration date at the request of the client.

GC/MS SEMIVOLATILES

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

CASE NARRATIVE (continued)

GC/MS SEMIVOLATILES (continued)

The matrix spike/matrix spike duplicate(s) for SO-17322-120307-CB-095 and SO-17322-120307-CB-098 had RPD's outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

The matrix spike/matrix spike duplicate(s) for batch(es) 7351326 had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

Batch(es) 7362058 had recoveries and/or RPD's out high in the LCS. Since there were no hits detected in any of the associated samples for 1,4-Dichlorobenzene, no corrective action was necessary.

Three (3) surrogate recoveries were out in sample(s) SO-17322-120307-CB-095. Reextraction and/or reanalysis performed in accordance with exceeded criteria corrective action required by QAPjP. Reextraction and/or reanalysis resulted in all surrogate recoveries within QC limits, but the reextraction was performed outside of the recommended holding time. Both sets of data have been reported.

Sample(s) SO-17322-120307-CB-094, SO-17322-120307-CB-098, and SO-17322-120307-CB-099 were originally logged in as archived samples. These samples were taken out of archive and assigned for analysis. This was done after the samples were outside of the method's holding time. These samples were analyzed beyond the expiration date at the request of the client.

POLYCHLORINATED BIPHENYLS-8082

Sample(s) SO-17322-120307-CB-094, SO-17322-120307-CB-098, and SO-17322-120307-CB-099 were originally logged in as archived samples. These samples were taken out of archive and assigned for analysis. This was done after the samples were outside of the method's holding time. These samples were analyzed beyond the expiration date at the request of the client.

CASE NARRATIVE (continued)

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "J". Refer to the sample report pages for the affected analyte(s).

Matrix spike recovery and relative percent difference (RPD) data were not calculated for some analytes for SO-17322-120307-CB-094 and SO-17322-120307-CB-095 due to the sample concentration reading greater than four times the spike amount. See the Matrix Spike Report for the affected analytes which will be flagged with "NC, MSB".
The matrix spike/matrix spike duplicate(s) for SO-17322-120307-CB-094 and SO-17322-120307-CB-095 had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

No ICP Trace Form IX was provided for batch(es) 7351042. The serial dilution was performed on a different sample from the same QC batch(es).

Some reporting limits are lower than our standard reporting limit (SRL) but are supported by the laboratory's MDL and/or IDLs; however, there are no standards in the calibration curve low enough to support these value(s). The continuing calibration blanks and method blanks may not support the lower RL.

GENERAL CHEMISTRY

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

Sample(s) SO-17322-120307-CB-094, SO-17322-120307-CB-098, and SO-17322-120307-CB-099 were originally logged in as archived samples. These samples were taken out of archive and assigned for analysis. This was done after the samples were outside of the method’s holding time. These samples were analyzed beyond the expiration date at the request of the client.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica North Canton conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

SAMPLE SUMMARY

SAMPLE SUMMARY

A7L040208

WO #	SAMPLE#	CLIENT SAMPLE ID	SAMPLED DATE	SAMP TIME
KDD37	003	SO-17322-120307-CB-094	12/03/07	08:55
KDD38	004	SO-17322-120307-CB-095	12/03/07	09:05
KDD4A	005	SO-17322-120307-CB-098	12/03/07	10:40
KDD4C	006	SO-17322-120307-CB-099	12/03/07	10:45

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

TestAmerica Cooler Receipt Form/Narrative
North Canton Facility

Lot Number: A7040208

Client CRA Project _____ Quote # 77171

Cooler Received on 12-4-07 Opened on 12-4-07 By _____ (Signature)

FedEx ☑ Client Drop Off ☐ UPS ☐ DHL ☐ FAS ☐ TestAmerica Courier ☐

Stetson ☐ US Cargo ☐ Other _____

TestAmerica Cooler # _____ Foam Box ☐ Client Cooler ☐ Other _____

1. Were custody seals on the outside of the cooler? Yes ☑ ~~No ☑~~ NS 12-4 Intact? Yes ☑ No ☐ ~~NA ☑~~
   If YES, Quantity 1
   Were custody seals on the outside of cooler signed and dated? Yes ☑ No ☐ ~~NA ☑~~ NS 12-4
   Were custody seals on the bottles? Yes ☐ No ☑
   If YES, are there any exceptions _____
2. Shipper's packing slip attached to this form? Yes ☑ No ☐
3. Did custody papers accompany the sample(s)? Yes ☑ No ☐ Relinquished by client? Yes ☑ No ☐
4. Did you sign the custody papers in the appropriate place? Yes ☑ No ☐
5. Packing material used: Bubble Wrap ☑ ~~Foam ☐~~ None ☐ Other _____
6. Cooler temperature upon receipt _____ °C (see back of form for multiple coolers/temps)

METHOD: IR ☑ Other ☐ _____

COOLANT: Wet Ice ☑ Blue Ice ☐ Dry Ice ☐ Water ☐ None ☐

7. Did all bottles arrive in good condition (Unbroken)? Yes ☑ No ☐
8. Could all bottle labels and/or tags be reconciled with the COC? Yes ☑ No ☐
9. Were samples at the correct pH upon receipt? Yes ☐ No ☐ NA ☑
10. Were correct bottles used for the tests indicated? Yes ☑ No ☐
11. Were air bubbles >6 mm in any VOA vials? Yes ☐ No ☐ NA ☑
12. Sufficient quantity received to perform indicated analyses? NS 12-4 Yes ☑ No ☐
13. Was a Trip Blank present in the cooler? Yes ☑ ~~No ☑~~ Were VOAs on the COC? Yes ☐ No ☑

Contacted PM _____ Date _____ by _____ via Voice Mail ☐ Verbal ☐ Other ☐

Concerning _____

14. CHAIN OF CUSTODY

The following discrepancies occurred:

_____

15. SAMPLE CONDITION

Sample(s) _____ were received after the recommended holding time had expired.

Sample(s) _____ were received in a broken container.

16. SAMPLE PRESERVATION

Sample(s) _____ were further preserved in sample receiving to meet recommended pH level(s). *Nitric Acid Lot #071707-HNO3 - Sulfuric Acid Lot # 092006-H2SO4; Sodium Hydroxide Lot # 122805 -NaOH; Hydrochloric Acid Lot # 092006-HCl; Sodium Hydroxide and Zinc Acetate Lot # 050205-CH3COO2ZN/NaOH*

What time was preserved added to sample(s)? _____

Sample(s) _____ were received with bubble > 6 mm in diameter (Notify PM)

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Results and reporting limits have been adjusted for dry weight.

NC The recovery and/or RPD were not calculated.

MSB The recovery and RPD were not calculated because the sample amount was greater than four times the spike amount.

N Spiked analyte recovery is outside stated control limits.

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Results and reporting limits have been adjusted for dry weight.

NC The recovery and/or RPD were not calculated.

MSB The recovery and RPD were not calculated because the sample amount was greater than four times the spike amount.

N Spiked analyte recovery is outside stated control limits.

* Relative percent difference (RPD) is outside stated control limits.

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Results and reporting limits have been adjusted for dry weight.

NC The recovery and/or RPD were not calculated.

MSB The recovery and RPD were not calculated because the sample amount was greater than four times the spike amount.

N Spiked analyte recovery is outside stated control limits.

* Relative percent difference (RPD) is outside stated control limits.

ANALYTICAL METHODS SUMMARY

A7L050288

PARAMETER	ANALYTICAL METHOD
Cyanide, Total	SW846 9012A
Hexavalent Chromium	SW846 7196A
ICP-MS (6020)	SW846 6020
Mercury in Solid Waste (Manual Cold-Vapor)	SW846 7471A
PCBs by SW-846 8082	SW846 8082
Semivolatile Organic Compounds by GC/MS	SW846 8270C
Total Residue as Percent Solids	MCAWW 160.3 MOD
Trace Inductively Coupled Plasma (ICP) Metals	SW846 6010B
Trivalent Chromium	SW846 7196A
Volatile Organics by GC/MS	SW846 8260B

SAMPLE SUMMARY

A7L050288

WO #	SAMPLE#	CLIENT SAMPLE ID	SAMPLED DATE	SAMP TIME
KDHHA	001	SO-17322-120407-CB-108	12/04/07	10:15
KDHJN	002	SO-17322-120407-CB-111	12/04/07	12:00
KDHJ1	003	SO-17322-120407-CB-114	12/04/07	13:15
KDHJ8	004	TB-17322-120407-CB-001	12/04/07	

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Bold print denotes control parameters

a Spiked analyte recovery is outside stated control limits.

Results and reporting limits have been adjusted for dry weight.

p Relative percent difference (RPD) is outside stated control limits.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Results and reporting limits have been adjusted for dry weight.

NC The recovery and/or RPD were not calculated.

MSB The recovery and RPD were not calculated because the sample amount was greater than four times the spike amount.

N Spiked analyte recovery is outside stated control limits.

	67	(10 - 199)	1.7	(0-20)	SW846 6020	12/07-12/10/07	KDLGJ1DT
		Dilution Factor: 1					

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Results and reporting limits have been adjusted for dry weight.

NC The recovery and/or RPD were not calculated.

MSB The recovery and RPD were not calculated because the sample amount was greater than four times the spike amount.

N Spiked analyte recovery is outside stated control limits.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Bold print denotes control parameters

Results and reporting limits have been adjusted for dry weight.

p Relative percent difference (RPD) is outside stated control limits.

a Spiked analyte recovery is outside stated control limits.

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Results and reporting limits have been adjusted for dry weight.

NC The recovery and/or RPD were not calculated.

MSB The recovery and RPD were not calculated because the sample amount was greater than four times the spike amount.

* Relative percent difference (RPD) is outside stated control limits.

N Spiked analyte recovery is outside stated control limits.

Zinc	NC,MSB	(10 - 199)			SW846 6020	12/10/07	KDN3X1DU
	NC,MSB	(10 - 199)		(0-20)	SW846 6020	12/10/07	KDN3X1DV
		Dilution Factor: 1					

MS Lot-Sample #: A7L070218-001 **Prep Batch #...:** 7346197

Silver	79	(75 - 125)			SW846 6020	12/13/07	KDN3X1G7
	75	(75 - 125)	5.2	(0-20)	SW846 6020	12/13/07	KDN3X1G8
		Dilution Factor: 1					

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Results and reporting limits have been adjusted for dry weight.

NC The recovery and/or RPD were not calculated.

MSB The recovery and RPD were not calculated because the sample amount was greater than four times the spike amount.

* Relative percent difference (RPD) is outside stated control limits.

N Spiked analyte recovery is outside stated control limits.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.
