1 Introduction

On behalf of the Revitalizing Auto Communities Environmental Response (RACER) Trust, Arcadis of Michigan, LLC (Arcadis) prepared this 2023 Annual Groundwater Monitoring Report (Annual Report) to support the Resource Conservation and Recovery Act (RCRA) Corrective Action process for RACER Trust Lansing Industrial Land, located in Lansing, Michigan (Site). The Site consists of former Plants 2, 3, and 6. This Annual Report summarizes groundwater monitoring completed between January and December 2023, consistent with the requirements of the Revised Interim Groundwater Monitoring Work Plan (IGMP; Arcadis 2019, as revised), which was approved by the Michigan Department of Environment, Great Lakes, and Energy (EGLE) on July 25, 2019. The IGMP was further revised in 2023 and revisions were approved by EGLE on April 20, 2023 (Arcadis 2023a). The 2023 Revised IGMP incorporated storm sewer monitoring; newly installed monitoring wells; and adjusted the number of wells, constituents, and frequency of sampling consistent with the evolving risk and regulatory requirements, as approved by EGLE.

The following sampling events were completed in accordance with the 2019 Revised IGMP:

- First quarter 2023 – A quarterly groundwater sampling and gauging event completed February 13 through February 17, 2023. Gauging was completed at 57 monitoring wells and groundwater samples were collected from a total of 53 monitoring wells.

The following sampling events were completed in accordance with the 2023 Revised IGMP:

- Second quarter 2023 – Gauging of light non-aqueous phase liquid (LNAPL) wells and quarterly and semi-annual groundwater sampling and gauging event completed May 15 through 25, 2023. Groundwater gauging was completed on a total of 233 monitoring wells (22 of which were LNAPL monitoring wells), and groundwater samples were collected from a total of 83 wells.
- Third quarter 2023 – A quarterly groundwater sampling and gauging event completed August 28 through August 30, 2023. Groundwater elevations were collected from a total of 39 monitoring wells and groundwater samples were collected from a total of 36 wells.
- Fourth quarter 2023 – Site-wide gauging, including LNAPL well gauging, were completed between October 23 through November 4, 2023, in addition to a quarterly, semi-annual, and annual groundwater sampling event. Annual sampling of Lansing Township municipal wells was also completed during the fourth quarter. Groundwater elevations were collected from a total of 234 monitoring wells (22 of which were LNAPL monitoring wells), and groundwater samples were collected from a total of 143 wells.
- Additionally, storm sewer sampling for PFAS was completed during each 2023 quarterly event on February 7, April 25, July 25, and October 24.

As outlined in the 2019 and 2023 Revised IGMP, this Annual Report includes quarterly data (e.g., tabulated data, figures, analytical narrative) and the following information:

- Objective and scope of the sampling events
- Summary of groundwater elevations and LNAPL gauging data, including contour maps and trend plots
- Figures, tables, and a brief narrative summarizing the groundwater sampling results
- Groundwater elevation contour maps for various water bearing zones
- Updated groundwater plume stability evaluation
- Summary of Lansing Township water supply well sampling
- Conclusions and recommendations for revisions to the IGMP as appropriate.

All groundwater monitoring activities were completed in accordance with the 2019 and 2023 Revised IGMP. The sampling frequencies and analytes for each well in the 2019 Revised IGMP are included in **Table 1A** and 2023 Revised IGMP are included in **Table 1B**. The locations of all Site monitoring wells are provided on **Figures 1A**, **1B**, and **1C**.

The following deviations from the 2019 and 2023 IGMP were observed during the 2023 monitoring activities:

- **MWBP-11-UST1-4** was unable to be located in fourth quarter but was gauged in second quarter 2023. Arcadis will attempt to locate again in 2024.
- **MW-03-02** and **MW-03-04** are flush-mounted wells located in low lying areas of Plant 6 and utilized for groundwater elevation monitoring. Both monitoring wells have been unable to be located since June 2020. In 2023 Arcadis was able to locate MW-03-02 and MW-03-04 during both second and fourth quarter gauging events.
- **MW-03-08** is a perched monitoring well with flush-mount construction and was unable to be accessed due to standing water in second and fourth quarter 2023. MW-03-08 is utilized for annual groundwater elevation monitoring and biennial VOC monitoring. Arcadis will evaluate converting this well to a stick-up casing in 2024, as well as address the grade near the well to prevent future submersion.
- **MW-13-51** was gauged during the second and fourth quarter events, but the digital gauging log from the fourth quarter was not able to be located. This well is only scheduled for semi-annual gauging and will be gauged again in second quarter 2024.
- **MW-14-69** was dry in second and fourth quarter 2023 and has been dry since installation in 2014. This monitoring well was installed in an area with limited perched groundwater with the intent of verifying whether saturated conditions existed and if the well would produce enough water for sampling and is checked semi-annually.
- **MW-18-96** was installed in shallow fill material at Plant 3 and contained water during development and initial sampling; however, the well has been dry since June 2020.
- **MW-19-110** was installed in August 2019 at the request of EGLE in an area of Plant 3 with limited perched groundwater with the intent of verifying whether saturated conditions existed and if the well would produce enough water for sampling. Since installation in 2019, the well has had either low water levels or been dry, resulting in no groundwater samples collected. No samples were collected at this location in 2023.
- **MW-19-113** was installed in a sand seam encountered from 16 to 23 feet below ground surface (ft bgs) on northern Plant 3 and had approximately 7 feet of water during development and initial sampling during 2019. The water level decreased dramatically during 2020 and continued to decrease until the well contained insufficient water to collect a sample beginning in fourth quarter 2020. The last groundwater sample collected from MW-19-113 was in June 2020. Low water levels were present during the second and fourth quarter 2023 gauging events (0.27 to 0.11 feet of water column, respectively). No samples were collected from this location in 2023.
- **MW-22-159** was installed from 26 to 31 ft bgs in a perched clay unit with a sand lens from 28.5 to 29 ft bgs. Since installation in September 2022, this location has been dry and has not been sampled.
- **TW-14-06** was observed to be damaged in first quarter 2023 and unable to be sampled. TW-15-11 was used as a replacement for first quarter and future sampling. Well TW-14-06 was part of the Biosparge system and had a damaged well seal that was affecting remedy performance. TW-14-06 was approved by EGLE for abandonment in early 2024 and was abandoned on February 2, 2024.

2 Sampling Methods

This section discusses the groundwater and storm sewer sampling methodology used at the Site.

2.1 Groundwater Sampling Methods

All groundwater samples were collected in a manner consistent with the low-flow sampling techniques in the Arcadis Standard Operating Procedure (SOP) for low-flow sample collection, and generally consistent with EGLE's Remediation and Redevelopment Division (RRD) Op Memo 2, Attachment 5 (EGLE 2004). Samples collected for 1,4-dioxane, VOCs, and general chemistry were submitted under chain of custody protocol to Merit Laboratories (Merit) located in East Lansing, Michigan. Samples collected for low-concentration 1,4-dioxane analysis were submitted under chain of custody protocol to Eurofins Laboratory in Barberton, Ohio. Samples collected for PFAS analyses were submitted under chain of custody protocol to Pace Analytical Laboratory located in West Columbia, South Carolina. Laboratory analytical reports and data validation reports for Lansing Township municipal wells and all other monitoring wells are included as **Appendix A** and **B-1**, respectively. Groundwater low-flow sampling logs are included as **Appendix C-1**.

During the second and fourth quarter 2023 semi-annual sampling events, and before sample collection, site-wide gauging was completed using electronic water level meters and LNAPL wells were gauged using an oil/water interface probe. During first and third quarter 2023 sampling events, gauging was limited to those wells selected for sampling. All gauging was completed within 24 hours with few exceptions due to access or other issues.

The most current sampling matrix provided as part of the 2023 Revised IGMP is included as **Table 1B**. In general, groundwater samples were submitted for analysis for one or more of the following parameters:

- Target compound list (TCL) VOCs using United States Environmental Protection Agency (USEPA) Method SW8260B, Revision 2 or SW8260C, Revision 3.
- Low-concentration 1,4-dioxane using USEPA Drinking Water Method 522, which provides a reporting limit (RL) of 0.20 microgram per liter (µg/L) – used for the Lansing Township municipal wells and select bedrock monitoring wells.
- 1,4-Dioxane using USEPA Method SW8260B-SIM – used for monitoring wells other than municipal and bedrock wells.
- PFAS using USEPA Method 537 modified with isotope dilution (DoD QSM 5.3).

2.1.1 Quality Control/Quality Assurance

Quality control (QC) samples were collected during the sampling event and included the following:

- One duplicate sample per every ten samples.
- One matrix spike and matrix spike duplicate (MS/MSD) sample per every 20 samples.
- One field blank sample per sampler per sampling event.
- One equipment blank sample per pump per sampling event, as well as additional equipment blank samples from the water level meters used for PFAS sampling.

Additionally, trip blanks were included with each cooler containing samples for VOC analysis. One sample delivery group per plant from each quarter underwent complete Tier I validation as defined in USEPA *Innovative Approaches to Data Validation*, USEPA Region III (USEPA 1995). Groundwater sample validation reports are included in **Appendix A** and **B-1** along with laboratory analytical reports.

2.1.2 Light Nonaqueous Phase Liquid Monitoring

LNAPL monitoring wells were gauged during the second and fourth quarter events with an oil/water interface probe. Gauging methods were consistent with the 2019 and 2023 revised IGMP (Arcadis 2019; 2023e).

2.2 Soil Vapor Monitoring

Soil vapor monitoring point SVMP-20-01 is located near the Plant 6 entrance for the purpose of monitoring VOCs in soil vapor potentially associated with the low concentration vinyl chloride plume located in this area. Details regarding the vapor intrusion assessment for this area were included in the Plant 6 Vapor Intrusion Investigation Summary report (Arcadis 2022c).

Soil vapor monitoring point SVMP-20-01 was sampled on February 14, May 1, August 29, and October 27, 2023, for USEPA Method TO-15 analysis. Soil gas laboratory analytical reports are provided in **Appendix B-2** and sampling logs are provided in **Appendix C-2**. The location of SVMP-20-01 is included on **Figure 1B**. A helium leak test was performed prior to each sampling event and the soil gas samples were collected in a laboratory-provided Bottle Vac and submitted to Fibertec Analytical Laboratory in Holt, Michigan for analysis.

2.3 Groundwater Elevation Monitoring

Monitoring wells were gauged during sampling using an electronic water level meter generally within a 24-hour period. To evaluate seasonality, site-wide gauging was previously rotated annually between the second quarter and fourth quarter events. However, in 2023 site-wide gauging was completed during second and fourth quarter semi-annual sampling events. During first and third quarter sampling events, gauging was limited to those wells selected for sampling. Gauging methods were consistent with the 2019 and 2023 revised IGMP (Arcadis 2019; 2023a).

2.4 Storm Sewer Sampling Methods

Storm sewer sampling was completed quarterly to confirm the effectiveness of storm sewer modifications and abandonments completed in Fall 2018, Winter 2019/2020, Fall 2020, Spring 2021, and Fall 2023 (Arcadis 2021c). Storm sewer sampling was completed prior to storm sewer modifications and abandonments in 2017 at Plant 2 and in 2019 on Plants 2 and 6. Storm sewer samples required for quarterly monitoring are collected from the sump of the structure. Past samples collected for investigation purposes were collected from sumps and individual inverts as needed. Samples are collected according to the Arcadis Technical Guidance Instruction (TGI) for PFAS sample collection and analyzed using USEPA Method 537 modified with isotope dilution (DoD QSM 5.3).

3 Results

This section summarizes results from sampling activities completed between January and December 2023. **Table 2** presents groundwater analytical data collected during the reporting period. As a frame of reference and not indicating the criteria are applicable or that additional response is necessary, figures showing exceedances of EGLE Part 201 residential drinking water criteria (DW criteria) and Part 201 groundwater surface water interface criteria (GSI criteria), are provided as **Figures 2** through **8**. Laboratory analytical reports and data validation reports for Lansing Township municipal wells and all other monitoring wells are included as **Appendix A** and **B-1**, respectively. Groundwater low-flow sampling logs are included as **Appendix C-1**.

3.1 Groundwater Monitoring Results

A summary table of the groundwater analytical data collected during 2023 is presented in **Table 2** with exceedances of DW criteria and GSI criteria, if applicable, highlighted in gray and summarized on **Figures 2** through **8**. Results of the 2023 groundwater monitoring events are summarized below.

3.1.1 Perched 1,4-Dioxane Results

In accordance with the approved 2023 IGMP Table (**Table 1B**), sampling of perched groundwater for 1,4-dioxane was completed as part of annual groundwater sampling event during fourth quarter 2023 and quarterly at the western property boundary of Plant 2 as part of investigations described below. Perched 1,4-dioxane results (**Figure 2**) are generally consistent with the results summarized in the 2022 Annual Groundwater Monitoring Report (Arcadis 2023b), except for MW-22-157, MW-14-59, and MW-14-58R.

Monitoring well MW-14-59 is a perched monitoring well located in central Plant 2. MW-14-59 exceeded 1,4-dioxane DW Criteria during the second quarter of 2022 but was below criteria in fourth quarter of 2023.

Monitoring well MW-22-157 is a perched monitoring well located off-site, west of MW-14-58R, in the west right-of-way of Rosemary Avenue. 1,4-Dioxane was below criteria at MW-22-157 in 2022, but concentrations increased to above DW Criteria in 2023.

Monitoring well MW-14-58R is a perched monitoring well located near the western property boundary of Plant 2 and was installed in October 2021 as a replacement for MW-14-58 which was damaged and subsequently abandoned. MW-14-58 was last sampled in June 2020 and had a 1,4-dioxane concentration of 38 µg/L. MW-14-58R was installed 5 to 6 feet north of MW-14-58 within similar geology and first sampled in December 2021 with a 1,4-dioxane concentration of 430 µg/L. Continued sampling of MW-14-58R has shown decreasing 1,4-dioxane concentrations in 2023 ranging between 173 and 250 µg/L.

Additional evaluation of 1,4-dioxane in the MW-14-58R area included three vertical aquifer profile (VAP) borings, and installation of three additional monitoring wells to the north of MW-14-58R (MW-23-161, MW-23-162, and MW-23-163). The new wells were first sampled in fourth quarter 2023 and showed decreasing concentrations north of MW-14-58R. A summary of the 2023 investigation results and proposed additional monitoring activities for 2024 were included in the *MW-14-58R Area September 2023 Investigation Summary* submittal on January 19, 2024 (Arcadis 2024). Groundwater sampling for 1,4-dioxane in this area be incorporated into the revised IGMP. Sampling at MW-22-153, MW-22-155, MW-22-156, MW-22-157, MW-23-161, MW-23-162, MW-23-163 and MW-14-58R will be proposed as semi-annual.

3.1.2 Lower 1,4-Dioxane Results

A biosparge remedy has been implemented per the *Interim Measures Work Plan: Lower 1,4-Dioxane Biosparge* work plan (Arcadis 2018). The lower 1,4-dioxane (i.e., weathered bedrock) biosparge system has been operating at Plant 3 since May 2019 and Plant 2 since August 2020. Performance monitoring of the biosparge system is summarized in the *Lower 1,4-Dioxane Biosparge Update Report* most recently submitted in April 2024, and in the *Lower 1,4-Dioxane Biosparge Progress Report and Shutdown Evaluation* (Arcadis 2023c), submitted to EGLE on March 27, 2023. Lower 1,4-dioxane concentrations (**Figure 3**) have been generally decreasing throughout the footprint of the plume in 2023.

Performance monitoring demonstrates treatment of the lower 1,4-dioxane plume within the radius of influence of the biosparge wells on Plants 2 and 3, as well as downgradient flushing. Performance reporting will continue on an annual basis under a separate cover. Lower 1,4-dioxane performance monitoring wells located within the area of influence of the biosparge system (e.g., MW-13-43, MW-19-121, MW-19-123, MW-20-128, and TW-14-06) have shown decreasing to stable trends since system startup. The results at the perimeter of the lower 1,4-dioxane plume were reviewed for potential changes:

- *Southern Extent (the toe)* – The lower 1,4-dioxane plume is defined to the south by MW-16-74, MW-16-75, MW-16-77, MW-16-78, MW-19-121, MW-21-140, and MW-21-141. These results suggest no significant expansion has occurred at the southern toe of the lower 1,4-dioxane plume since 2018. Future migration to the southeast is not expected due to the operation of the biosparge system and geologic conditions described as part of the *Lower 1,4-Dioxane Conceptual Site Model* (Arcadis 2021a).
- *Northeast Lobe (on Plant 2)* – Increasing and/or stable concentrations were observed within the northeast lobe of the lower 1,4-dioxane plume on Plant 2 during 2018-2021. Since then, stable to decreasing concentrations have been observed (e.g., at wells MW-16-84 and MW-17-86), likely attributable to the operation of the biosparge system (Arcadis 2021c, 2023b). Concentrations at MW-16-85 are increasing and will continue to be monitored on a semi-annual basis. See Section 4.2.1 for more information.
- *MW-20-130*: Monitoring well MW-20-130 is a weather bedrock monitoring well that was installed as a deep sentinel for PFAS at the Plant 2 PFAS source area. MW-20-130 has a 1,4-dioxane concentration of 75 µg/L (October 2023). Two weathered bedrock monitoring wells were installed downgradient of MW-20-130, one to the south (MW-21-140) and one to the east (MW-21-141), and 1,4-dioxane was not detected at either well in 2023.
- Monitoring well MW-16-80 located near the western Plant 2 property boundary in weathered bedrock, showed a 1,4-dioxane concentration exceeding the DW criterion of 7.2 µg/L in 2023. The detected concentration was generally consistent with previous results observed at this location. As previously reported, detections of 1,4-dioxane in the weathered bedrock at the western property boundary could be associated, wholly or in part, with the APC Site.

3.1.3 Municipal Well and Bedrock Monitoring Well Sampling Results

The results of the Lansing Township well sampling indicate 1,4-dioxane concentrations of <0.20 µg/L in Lansing Township well TWP-90-03, 0.24 µg/L in TWP-90-04 and 0.36 µg/L in TWP-90-05 (**Appendix A**). These concentrations are consistent with those detected in October 2022 (0.16 J in TWP-90-03, 0.31 ng/L in TWP-90-04, not sampled at TWP-90-05 due to maintenance). The locations of the municipal wells are shown and the bedrock 1,4-dioxane results are summarized on **Figure 4.**

Analytical results for the municipal wells are included in **Table 2**. Widespread 1,4-dioxane detections are potentially related to a 1,4-dioxane “background condition” in and around Lansing, as demonstrated by the low-

level 1,4-dioxane sampling completed at the Site in 2017. Sporadic detections of 1,4-dioxane in the bedrock monitoring wells installed along the core of the plume ranged from 0.12 µg/L to 5.7 µg/L and did not exceed DW Criteria in 2023. Annual sampling of Lansing Township wells will continue to monitor for 1,4-dioxane.

3.1.4 Other VOC Results

In accordance with the approved 2019 IGMP Table (**Table 1A**), and the 2023 IGMP Table (**Table 1B**), the annual analysis of VOCs was completed during the first and fourth quarters of 2023. Of the twenty-two (22) wells that were sampled for VOCs during 2023, three (3) wells had concentrations exceeding the DW and/or GSI criteria (**Figure 5**).

- *Plant 6 entrance at the intersection of Stanley and Osborn Streets* – A vapor intrusion investigation was completed in this area and details regarding the detection of vinyl chloride in shallow groundwater in this area was provided to EGLE in the *Plant 2, 3 and Plant 6 Vapor Intrusion Investigation Summary* (Arcadis 2021b). Vinyl chloride has been detected on-site at monitoring well MW-20-131 and off-site at MW-20-132 at concentrations above the Site-Specific Vapor Intrusion to Indoor Air Criteria (SSVIAC, 0.96 µg/L). A summary of the VI evaluation was provided to EGLE in June 2022 (Arcadis 2022c). An additional monitoring well was installed in September 2022 (MW-22-154) to the northeast of MW-20-132 to define the extent of SSVIAC exceedances in groundwater. Analytical results from MW-22-154 in 2023 showed vinyl chloride ranging from non-detect (<1 µg/L) during the first and second quarter, up to 2 µg/L in the fourth quarter. Soil vapor sampling at SVMP-20-01, located between the Plant 6 entrance and the residential properties located to the northeast, has not detected vinyl chloride. The soil vapor results are included as **Table 3** and the location of SVMP-20-01 is included on **Figure 1B**. Soil vapor results are discussed further in Section 3.3. Monitoring for VOCs at the Plant 6 entrance will continue in 2024.
- *Weathered bedrock wells MW-14-61, MW-17-86, and MW-19-120* – located in the northeast lobe of the lower 1,4-dioxane plume on Plant 2, these wells were previously monitored semi-annually for VOCs and are now monitored annually (MW-17-86 is now biennially) starting in 2023 due to IGMP revisions. Previously, low detections were observed of chlorinated VOCs (e.g., 1,2-DCE; chloroethane) related to leakage from the perched zone. VOCs were not detected in MW-14-61, MW-17-86, MW-19-120 in 2023. VOCs will continue to be monitored in the weathered bedrock zone.
- *Plant 2 western property boundary* – MW-22-156, located on the western property boundary of Plant 2, was sampled for VOCs on a quarterly basis in accordance with the 2023 IGMP as part of an ongoing investigation into the 1,4-dioxane source investigation at the property boundary discussed in the *MW-14-58R Area September 2023 Investigation Summary* (Arcadis 2024). The VOC results for MW-22-156 exceed DW criteria for 1,1-dichloroethene (1,1-DCE) and include detections of 1,1-dichloroethane. Monitoring well MW-22-157, located off-site and west of this area has not had any detections of VOCs, and both wells will continue to be monitored for VOCs in 2024.

3.1.5 PFAS Results

The following sections discuss the PFAS groundwater results at the Site.

3.1.5.1 PFOS Results

Perfluorooctane sulfonic acid (PFOS) concentrations exceeded the GSI criteria (12 nanograms per liter [ng/L]) and DW Criteria (16 ng/l) at 20 perched monitoring wells in 2023 (**Figure 6**).

- *MW-18-98*: Located on the northern portion of Plant 3, this perched well contained concentrations of PFOS between 140 ng/L to 250 ng/L in 2023, exceeding the DW and GSI criteria. Further north, the perched well MW-19-113 is screened in a similar depth interval and was dry in 2023 suggesting no further migration.
- *MW-18-88, MW-18-93, MW-18-95, and eastern Plant 3 off-site wells*: Perched monitoring wells located along the eastern boundary of Plant 3 contained PFOS concentrations of 150 to 320 ng/L at MW-18-88, 38 ng/L at MW-18-93, and 29 to 55 ng/L at MW-18-95. PFOS did not exceed the DW and GSI criteria in 2023 at any of the five perched monitoring wells installed in the City of Lansing's Dunnebacke and Westside Parks, located east of Plant 3.
- *MW-12-12 and MW-13-36R*: Located along the northern and eastern boundary of Plant 6, these wells contained concentrations of PFOS that exceed the DW and GSI criteria. However, PFOS detections did not exceed DW criterion at the vertical aquifer profiling (VAP) or off-site monitoring wells completed east of Plant 6 to delineate PFAS impacts.

3.1.5.2 PFOA Results

Perfluorooctanoic acid (PFOA) concentrations exceeded the DW Criterion of 8 ng/L at 31 perched monitoring wells in 2023 (**Figure 7**).

- *MW-18-88, MW-18-93, MW-18-95, and eastern Plant 3 off-site wells*: Perched monitoring wells located along the eastern boundary of Plant 3 contained PFOA concentrations of 6.1 to 9.7 ng/L at MW-18-88 and 29 ng/L at MW-18-93. MW-18-95 previously had exceeded DW criterion in 2022 but was non-detect in 2023. Additionally, PFOA has not exceeded the DW criterion at any of the five perched sentinel monitoring wells installed in the City of Lansing's Dunnebacke and Westside Parks.
- *MW-04-05(6), MW-12-10R, MW-12-12, MW-13-36R, MW-14-67, MW-14-70, MW-20-131, MW-20-132, and MW-22-151*: Perched monitoring wells located along the northeastern and eastern boundaries of Plant 6 and off-site, contained concentrations of PFOA that exceed the DW criterion. Additional investigation work was completed in September through December 2022 east of MW-22-145 including the installation of three additional wells (MW-22-158, MW-22-159 and MW-22-160) to complete delineation of PFOA (Arcadis 2023d). MW-22-158 and MW-22-160 were sampled quarterly in 2023 and did not exceed DW Criteria. MW-22-159 has been dry since installation in 2022. Off-site PFAS concentrations will continue to be monitored to evaluate concentration trends and stability.
- *MW-12-09 and MW-14-58R*: Perched monitoring wells located near the western boundary of Plant 2 both contained PFOA at 16 ng/L, exceeding the PFOA DW Criteria. This area is currently being investigated as part of the MW-14-58R evaluation (Arcadis 2024). There is the potential that PFAS concentrations near the Plant 2 boundary and within the Rosemary right-of-way could be combined with impacts associated with other potential off-site sources.

3.1.5.3 PFNA Results

Perfluorononanoic acid (PFNA) concentrations exceeded the DW criterion value of 6 ng/L at seven perched monitoring wells in 2023 (**Figure 8**). The highest concentration of PFNA was 220 ng/L observed in Plant 6 source area well P6-SB-07. Other exceedances ranged from 7.3 ng/L to 27 ng/L. Exceedances near the eastern property boundary of Plant 6 are delineated by downgradient wells.

3.1.5.4 Other PFAS Compounds

The only detections of perfluorohexanesulfonic acid (PFHxS) that exceed the DW criterion value (51 ng/L) in 2023 were concentrations of 250 to 300 ng/L in perched well MW-21-139 in the Plant 2 PFAS source area, 1,400 ng/L in Plant 3 source area monitoring well CH-14-RO, and 100 to 190 ng/L in perched well MW-18-103 located along the northern boundary of Dunneback Park east of Plant 3. The PFHxS detected at MW-18-103 appears to be isolated and may be related to an off-site source to the north where large quantities of roofing shingles are piled on the ground surface, processed, and recycled.

Sporadic low detections of perfluorobutanesulfonic acid (PFBS) and perfluorohexanoic acid (PFHxA) observed in monitoring wells during 2023 are below the DW criteria values of 420 ng/L and 400,000 ng/L, respectively.

In addition to PFOS, PFOA, PFNA, PFHxS, PFBS, and PFHxA, other PFAS compounds have been detected at the Site, however there are no established criteria for comparison. In general, these concentrations appear to correlate to PFOS and PFOA concentrations and decrease with distance from PFOS and PFOA source areas.

3.1.5.5 Storm Sewer Analytical Results

Storm sewer PFAS analytical results from 2023 are summarized on **Tables 8** through **10** with exceedances of Rule 57 criteria highlighted in gray. Third and fourth quarter data are also summarized on **Figures 9** through **11** Results of the third and fourth quarter 2023 sampling events are summarized below.

- Flow was not observed at outfall P3-MH-NE at the northeast corner of Plant 3.
- P2-MH-2 exceeded the Rule 57 criteria for PFOS of 12.0 ng/L during third quarter 2023 and fourth quarter 2023 with detections of 17 ng/L and 18 ng/L, respectively. No other outfall exceedances occurred on Plant 2 in third and fourth quarter 2023.
- P3-MH-284 did not exceed the Rule 57 criteria for PFOS during third quarter 2023 and fourth quarter 2023. No outfall exceedances occurred on Plant 3 in the third and fourth quarter 2023.
- Rule 57 criteria for PFOS was exceeded near Plant 6 as listed below. No other exceedances occurred on Plant 6 in third and fourth quarter 2023.
    - Osborn-MH-1 exceeded in the third quarter with a detection of 14 ng/L.
    - The northern invert of Osborn-MH-1, Osborn-MH-1_N, exceeded in the fourth quarter with a detection of 18 ng/L. The norther invert is the Osborn-MH-1 discharge and used as the fourth quarter Osborn-MH-1 sample.
    - Verlinden-MH-5 exceeded in the fourth quarter with a detection of 13 ng/L.

3.2 Light Nonaqueous Phase Liquid Monitoring

LNAPL is present in the central portion of Plant 2 and in the north-central portion of Plant 3 . LNAPL monitoring well locations and approximate extent of LNAPL are presented on **Figures 1A** and **1C**. LNAPL thicknesses were generally consistent with previous observations and are provided in **Table 4**. LNAPL trend graphs are included in **Appendix D**. The trend graphs indicate that, when present, LNAPL thickness generally gradually increases until it reaches equilibrium within the well and then stabilizes. For the deeper LNAPL, wells take longer to equilibrate with the confined LNAPL conditions relative to the static water level within the formation. The comprehensive *Plant 2 LNAPL Conceptual Site Model* was provided to EGLE for review on February 20, 2020 (Arcadis 2020). Based on the monitoring results, there is no indication of LNAPL migration. The LNAPL monitoring wells that have displayed consistent thicknesses of LNAPL were abandoned as part of 2023 well abandonment scope of work approved by EGLE.

3.3 Soil Vapor Monitoring

Soil vapor sampling at SVMP-20-01 near the Plant 6 entrance does not show soil vapor results in excess of the site-specific vapor intrusion criteria (SSVIAC). The results of the soil gas samples showed trichloroethene (TCE) at a concentration of 5.7 micrograms per cubic meter (µg/m^3) in August 2023, below the EGLE SSVIAC criterion of 67 µg/m^3. The remaining three samples from 2023 were non-detect for TCE (< 1.6 µg/m^3). Tetrahydrofuran was detected at 6.3 µg/m^3 in May but was non-detect in the remaining samples collected in 2023. Vinyl chloride has not been detected in any of the four soil vapor samples. SVMP analytical results are summarized on **Table 3** and compared to the EGLE Residential SSVIAC for a house with a basement.

3.4 Groundwater Elevation Monitoring

Site-wide groundwater elevation surveys were completed during both the semi-annual and annual 2023 events. Additional groundwater elevation measurements were collected at sampled wells during the quarterly events. **Table 5** summarizes groundwater elevation measurements collected at the Site. Groundwater elevation contour maps (**Figures 12** through **15**), LNAPL trend graphs (**Appendix D**), and groundwater elevation hydrographs (**Appendix E**) are provided for review. Trends within each water-bearing zone are discussed below.

3.4.1 Perched Zone

The groundwater elevation hydrographs included in **Appendix E** indicate that potentiometric surface elevations in the perched zone have been stable to increasing during the period of monitoring beginning in 2012. Storm sewer modifications were completed at Plant 3 during November 2018 and at Plant 2 in 2019 and 2020. Comparison of potentiometric surface elevations observed on Plant 3 prior to storm sewer modifications and post-modification potentiometric surface elevations generally show increased variability of water levels with fluctuations (both increasing and decreasing) that are within the range of seasonal variation. Perched potentiometric surface elevations on Plant 2 generally show a gradual increasing trend since 2012 and an increase in the slope of the trend following the 2019 storm sewer modifications. It is unclear whether the small changes in groundwater elevation on Plant 2 are influenced by storm sewer modifications, or part of longer-term trends related to decommissioning of the plants. Groundwater elevations at Plant 6 perched monitoring wells have been generally stable since 2012.

Due to the predominance of clay-rich sediment, the perched zone is interbedded and has an overall low permeability and is characterized by isolated sand zones within layers of silt and clay. The potentiometric surface measured within the perched zone is presented on **Figure 12** (Plants 2 and 6) and **Figure 13** (Plant 3). Both figures include potentiometric surface contours for all wells less than 25 feet deep. The lower conductivity clay and silt that dominate this zone result in high horizontal and vertical gradients. Sand zones are discontinuous and often do not correlate from well to well, and minor variations in well screen elevation have a significant impact on the potentiometric surface. Therefore, although the contour maps represent the overall shallow potentiometric surface, they are of limited use to determine groundwater flow direction.

3.4.2 Deep Overburden

Saturated deep overburden is present only at Plant 3 within a southwest-northeast trending bedrock valley. Groundwater present within the deep overburden is hydraulically connected to the weathered bedrock and bedrock zones. The groundwater elevation hydrographs included in **Appendix E** show that deep overburden water levels appear to be decreasing since 2020 following a period of steady increases 2016 to 2020. The variations observed in deep overburden water levels are likely the result of changes in precipitation, as well as long-term changes in municipal pumping.

Figure 14 presents potentiometric surface elevation contours for deep overburden wells located on Plant 3. In the northern portion of Plant 3, the apparent groundwater gradient is northwesterly. In the southwestern portion of Plant 3 there is a groundwater high below the former “coliseum” (former stamping area basement) source area with an apparent gradient to the southeast.

3.4.3 Weathered Bedrock and Bedrock

Potentiometric surface trend graphs for select bedrock and weathered bedrock wells are included in **Appendix E**. Following a period of increasing elevations from 2016 to 2020, the bedrock and weathered bedrock elevations have been decreasing since 2021 with an overall increase in vertical gradient (0.34 ft/ft downward) within the Saginaw Formation. The variable potentiometric surface is likely attributed to changes in municipal pumping patterns, both long-term and seasonally.

Similar to the perched zone, the depth of a monitoring well within the weathered bedrock or bedrock zones plays a large role in the potentiometric surface observed at that location. Large vertical gradients occur in formations with vertical anisotropy and indicate a lack of vertical groundwater communication. Traditional groundwater elevation contour maps were not prepared for the weathered bedrock wells because they would be of limited use for interpreting groundwater flow direction and transport.

For the bedrock (and by extension, the weathered bedrock), the effective head or “corrected” potentiometric surface elevation can be calculated based on the observed vertical gradients. As indicated in **Table 6**, the vertical gradient tends to be limited near the coliseum and increases to the south to 0.49 ft/ft downward at wells MW-15-72/MW-12-05R (located in central Plant 2) before stabilizing to 0.61 ft/ft downward at wells MW-13-52/MW-13-50 (located on western Plant 6). This variation in vertical gradient appears to coincide with the transition between bedrock formations. Near the former coliseum in the western portion of Plant 3, where the bedrock encountered consists of the more uniform and permeable Grand River Formation, the vertical gradient is negligible. To the south, within the interbedded sandstone and shale of the Saginaw Formation, there is a significant vertical gradient due to the vertical anisotropy created by the interbedded shale and sandstone of the Saginaw Formation. Review of the bedrock wells and other deep boring logs suggests an approximate geologic contact between the

Grand River and Saginaw Formations oriented roughly southwest to northeast. **Figure 15** includes the interpreted location of the geologic contact.

To calculate the effective head for the bedrock, an average downward gradient 0.34 ft/ft was applied to bedrock monitoring wells installed within the Saginaw Formation (**Table 6**) as follows:

$$GW_{eff} = GW – (dh/dl * \Delta Elev)$$

Where:

GW_{eff} = effective groundwater elevation

GW = measured groundwater elevation

dh/dl = vertical gradient

ΔElev = change in elevation between deepest well and measured well

As shown on **Figure 15**, the corrected bedrock groundwater elevation contours are a good match for the distribution of the lower 1,4-dioxane plume located within the weathered bedrock zone. Groundwater flow is generally to the southeast, but as documented in the December 5, 2019 *Update Meeting Presentation* provided to EGLE, the gradient in the central part of Plant 2 has become flatter and more variable in recent years with a west to east flow component beneath the Plant 2 LNAPL area.

4 Groundwater Plume Stability

A preliminary groundwater plume stability assessment was completed at the Site in April 2014 (Arcadis 2014a). The primary objective of that assessment was to provide an initial evaluation of plume stability and determine the suitability of monitored plume stability as a remedial alternative. The preliminary plume stability assessment used data collected between October 2011 and first quarter 2014 as well as geochemical data collected during the August and September 2013 events.

The plume stability assessment has been updated annually and incorporated into the annual reports. Stability assessments have been generally consistent and demonstrate that historical increasing trends are primarily limited to 1,4-dioxane in weathered bedrock wells, and PFOS and 1,4-dioxane in perched wells. Operation of the biosparge system in weathered bedrock has decreased concentrations in the lower 1,4-dioxane plume significantly since 2020. The plume stability assessment presented in this section represents an updated analysis of time-series concentration trends using data collected through fourth quarter 2023.

The updated statistical analysis of dissolved-phase constituent of concern (COC) concentrations with time was completed using the Mann-Kendall slope trend test. A revised list of wells and parameters were used for this report. The updated wells and parameters includes all wells that are part of the approved 2023 IGMP and meet the following criteria:

- At least seven sampling events have been completed.
- At least 50 percent of the sampling results were greater than detection limits.
- At least 25 percent of the sampling results exceeded the lowest relevant criteria in the last six sampling events.

Guidance for conducting the Mann-Kendall test have been provided in Section 17.3.2 of the US EPA guidance document (USEPA 2009). The Mann-Kendall trend test is a non-parametric test to evaluate if a statistically

significant unidirectional (consistently increasing or decreasing) trend was observed during the monitoring period. Correlations were accepted as significant for p-values less than or equal to the alpha value, 0.10 (with a confidence level of 90 percent). Additional information regarding the Mann-Kendall analysis and methods is provided in the 2014 *Preliminary Groundwater Geochemical and Plume Stability Assessment* (Arcadis 2014a) and in **Appendix F**. **Table 7** presents a comprehensive summary Mann-Kendall trend analysis results. The overall trend results are shown on **Figures 16** and **17** for perched and weathered bedrock zones, respectively. **Appendix F** presents plots of concentrations through time for all well/COC pairs that met criteria for statistical trend analysis.

4.1 Perched Zone

4.1.1 1,4-Dioxane

The 1,4-dioxane plume appears to be stable, decreasing, or show no significant trend within the perched zone.

4.1.2 Volatile Organic Compounds

Concentrations of VOCs in the perched zone are sporadic, and a large plume footprint has not been observed; rather, VOC concentrations in groundwater greater than DW criteria are limited to discrete source areas (e.g., central portion of Plant 2) and areas immediately surrounding observed LNAPL at Plants 2 and 3. VOC data showed decreasing or no significant trends across the Site with the exception of MW-14-60 in central Plant 2, which has an increasing trend of vinyl chloride. Vinyl chloride trend results for MW-14-60 are driven by increasing concentrations through 2019 (up to 12 µg/L). Since 2019, vinyl chloride concentrations have decreased at MW-14-60 (currently 4 µg/L).

4.1.3 PFOS, PFOA, PFNA, and PFHxS

Twenty-eight monitoring wells met the criteria for Mann-Kendall analysis for PFOA, PFOS, PFNA, and/or PFHxS during 2023. Statistical trend analysis indicates that six wells (MW-12-09, MW-14-60, MW-14-67, and MW-18-88, MW-18-98, and MW-18-103) have statistically increasing trends and all other wells with PFAS concentrations exceeding criteria demonstrate stable to decreasing trends. An increasing trend was observed at MW-14-67 for PFOA near the eastern boundary of Plant 6. This monitoring well was sampled semi-annually for PFAS, and concentrations remained stable during 2023 with PFOA concentrations of 19 ng/L in February, and 20 ng/L in October. PFOA is currently defined east of Plant 6 by results from monitoring wells.

Increasing trends are also observed for PFOS at Plant 3 at monitoring well MW-18-88. An increase in PFOS at well MW-18-88 was observed in first, second, and fourth quarters of 2023, ranging from 150 – 320 ng/L between February and November. Increasing trends of PFOS are not observed at the six perched sentinel monitoring wells installed further east within the City of Lansing's Dunnebacke and Westside Parks. PFHxS at MW-18-103 is an exception, which has concentrations up to 190 ng/L, compared to a range of < 0.51 to 1.4 J ng/L observed at the other five off-site perched sentinel wells. The presence of PFHxS at MW-18-103 appears to be isolated and may be related to an off-site source area.

Monitoring well MW-18-98 has shown an increasing trend for PFNA. The trend is related to a spike in concentration (up to 13 ng/L) in 2022 and has been decreasing since 2022 (currently 4 ng/L).

4.2 Deep Overburden and Weathered Bedrock

4.2.1 1,4-Dioxane

Prior to the operation of the biosparge system, concentrations within the lower 1,4-dioxane plume had decreasing to stable trends in the northern portion of the plume on Plant 3, and stable to increasing trends towards the toe of the plume and the Plant 2 LNAPL area. Since the biosparge startup, concentrations throughout the lower 1,4-dioxane plume are mostly stable to decreasing, with the exception of MW-20-127, MW-16-85, and MW-14-56, which show increasing trends.

Monitoring well MW-20-127 is a weathered bedrock well at Plant 2 located downgradient of biosparge Transect B. MW-20-127 has exhibited an overall increasing trend for 1,4-dioxane between 2020 and 2023, ranging from approximately 85 µg/L up to 180 µg/L. Monitoring wells surrounding MW-20-127 show stable to decreasing trends. Monitoring well MW-20-107 will continue to be sampled for 1,4-dioxane on a semi-annual basis in accordance with the 2023 IGMP.

Monitoring well MW-16-85 is a weathered bedrock well at the northeast lobe of the 1,4-dioxane plume on Plant 2, which initially indicated decreasing trends after the biosparge startup. In October of 2023 concentrations increased from near 7 µg/L to 28 µg/L. Monitoring well MW-16-85 will continue to be sampled for 1,4-dioxane on a semi-annual basis in accordance with the 2023 IGMP.

MW-14-56 is a weathered bedrock well on the western border of Plant 2 that has exhibited increasing trends for 1,4-dioxane since the installation of the well in 2014. Well MW-14-56 is located outside of the RACER lower 1,4-dioxane plume and downgradient of the APC facility. Rising concentration at this well may be attributed to the APC facility.

5 Conclusions

This Annual Report summarizes the groundwater monitoring activities completed between January and December 2023, consistent with the 2019 and 2023 Revised IGMP. Based on the results of the sampling and review of the plume stability evaluation, the following conclusions are offered:

- *Lower 1,4-Dioxane:* Installation of the biosparge system for the lower 1,4-dioxane plume has been completed per the *Interim Measures Work Plan: Lower 1,4-Dioxane Biosparge* work plan (Arcadis 2018). The Plant 3 biosparge system began operating in May of 2019, and the Plant 2 biosparge system began operating in August of 2020. Since the biosparge startup, concentrations across the lower 1,4-dioxane plume are mostly stable to decreasing. Three weathered bedrock wells exhibits increasing trends for 1,4-dioxane on Plant 2 (MW-20-127, MW-16-85, and MW-14-56). Deep impacts in these areas appear to be localized. These wells will continue to be monitored according to the 2023 IGMP.
- *Perched 1,4-Dioxane:* Elevated detections of 1,4-dioxane at MW-14-58R and associated wells on western Plant 2 will continue to be monitored semi-annually. Recommendations from the *MW-14-58R Area September 2023 Investigation Summary* (Arcadis, 2024) will also be carried out to determine next steps.

- *1,4-Dioxane in Bedrock:* Sporadic detections of 1,4-dioxane in deeper bedrock monitoring wells installed along the core of the plume ranged from 0.12 µg/L to 5.7 µg/L and did not exceed drinking water criteria in 2023.
  - Lansing Township wells TWP-90-03, TWP-90-04, and TWP-90-05 were sampled in October 2023 and analyzed for 1,4-dioxane using USEPA Method 522 for drinking water. Concentrations of <0.20 (TWP-90-03), 0.24 (TWP-90-04), and 0.36 µg/L (TWP-90-05), were reported and are consistent with previous sampling results. The low-level detections of 1,4-dioxane in the region may result from several regional and/or numerous nonpoint sources. Annual sampling of Lansing Township wells will continue in 2024.
- *VOCs:* Groundwater sample results indicate that concentrations of 1,1-dichloroethene and vinyl chloride exceed residential drinking water criteria during at least one sampling event at the Site. Elevated concentrations of 1,1-dichloroethene are observed in one perched zone monitoring well, MW-22-156, on the western property boundary of Plant 2. Concentrations of elevated 1,1-dichloroethene at MW-22-156 appears to be localized, as on-site and off-site wells in the vicinity remain below detection. Low concentrations of vinyl chloride at the northeast property boundary of Plant 6 at MW-22-154 increased from non-detect to 2 µg/L in October 2023, which exceeds the SSVIAC of 0.96 µg/L. Soil vapor sampling at SVMP-20-01, located between the Plant 6 entrance and the residential properties located to the northeast, has not detected vinyl chloride. Monitoring for VOCs at the Plant 6 entrance will continue in 2024.
- *PFAS Compounds:* PFOS, PFOA, PFNA, and PFHxS concentrations exceeded DW and GSI Criteria in perched monitoring wells during 2023 groundwater monitoring events. Concentrations of PFAS in perched groundwater at Plants 2, 3, and 6 property boundaries, show stable to decreasing trends, except for one well on Plant 2 western boundary, one well on the Plant 6 eastern boundary, and two wells on or near the Plant 3 eastern boundary (one on-site and one off-site). These locations appear to be localized or are delineated off-site. Additional sampling will continue in 2024 to monitor PFAS impacts.
- *Stormwater PFAS:* The quarterly storm sewer sampling indicates the storm sewer modifications at Plant 3 have successfully reduced PFAS discharge to concentrations at or below the Rule 57 criteria. Plant 2 and 6 modifications have reduced PFAS concentrations to near Rule 57 Criteria and will continue to be monitored for changes.
- *LNAPL:* LNAPL extent and thicknesses are consistent with previous annual reports, there is no indication of LNAPL migration. LNAPL thickness monitoring will be discontinued in 2024.

Based on these conclusions, no immediate action is recommended at this time. Results of the monitoring program do not suggest changes are required for the previously submitted *Plant 2 LNAPL Conceptual Site Model* (Arcadis 2020), or the *Lower 1,4-Dioxane Conceptual Site Model* (Arcadis 2021a). Further, there are no apparent risks of exposure noted for the surrounding residential neighborhoods. Groundwater and storm sewer PFAS monitoring will continue consistent with the 2023 revised IGMP.

6 Proposed IGMP Modifications

An update to the IGMP will be provided to EGLE under separate cover. At a minimum the revised IGMP will incorporate new monitoring wells, remove LNAPL gauging, and propose wells to be abandoned. The revised plan will be provided under separate cover to EGLE during the 3rd quarter 2024.

Data Flagging:

Bold font represents data where detections were noted above the laboratory method detection limit.

Gray shading represents result exceeding either or both the EGLE Part 201 Generic Cleanup Criteria and Screening Levels or the EGLE GSI Criteria (Updated December 21, 2020)

Notes:

1. EGLE Part 201 Residential Drinking Water Criteria and Groundwater Surface Water Interface Criteria from the Generic Cleanup Criteria and Screening Levels (dated January 10, 2018) are used for comparison with all VOC and Inorganic data and revised criteria values (dated October 12, 2023) are used for comparison with all PFAS data.
2. 1,4-Dioxane is compared to a drinking water criteria of 7.2 µg/L per the MDEQ Establishment of Cleanup Criteria for 1,4 -Dioxane: Emergency Rules dated October 27, 2016.
3. Duplicate analyses are presented in brackets
4. Samples were analyzed by EPA Method SM 4500PE, 4500-Norg/NH3, 522, 8260B, and Method 537 modified with isotope dilution per QSM 5.1, EGLE 28 compounds

Abbreviations:

- - = Not listed in the EGLE Criteria Tables.
* = Analyzed for low-level 1,4-Dioxane via EPA Method 522
Deg. C. = degrees Celsius
EGLE = Michigan Department of Environment, Great Lakes, and Energy
mg/L = milligrams per liter
NA = Not Analyzed
NR = Not Recorded
NTU = Nephelometric Turbidity Unit
s.u. = standard unit
µg/L = micrograms per liter
µS/cm = microSiemens per centimeter

Lab and Validation Data Qualifiers:

< = The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
B = Indicates an estimated value between the instrument detection limit and the Reporting Limit (RL).
E = Analyte exceeded calibration range. Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
F1 = Matrix spike and/or matrix spike duplicate recovery is outside acceptance limits.
J = The compound was positively identified, but the associated numerical value is an estimated concentration only.
O = Analysis performed by outside laboratory.
Q = Surrogate failure
S = Surrogate recovery outside of control limits
U = The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
X = Elevated reporting limit due to matrix interference.
Y = Elevated reporting limit due to high target concentration.

NOTES:
Note = Beginning August 14, 2023, Metiri (lab) will be removing 2-methylnaphthalene from the TO-15 analysis. This is due to a combination of increased challenges with retaining a suitable vendor for the laboratory standards and also recent changes in instrumentation.
All results compared to Michigan Department of Environment, Great Lakes and Energy (EGLE) site-specific volatilization to indoor air criteria (SSVIAC), August 15, 2018.
Residential SSVIAC - Applies to a residential house with a basement, the depth to groundwater of 10 feet at the Site and soil type of sand.
Bolded values were detected above laboratory detection limits
Dup - represents duplicate sample analytical results
NA - not analyzed for respective constituent
All analytical results are presented in micrograms per cubic meter (µg/m^3)
-- = No criteria requested for SSVIAC
< = Not Detected above laboratory detection limit
SVMP = Soil vapor monitoring point
SSVIAC = Site-specific volatilization to indoor air criteria (provided by EGLE)
U = The analyte was not detected at or above the reporting limit
V+ = Recovery in the associated continuing calibration verification sample (CCV) exceeds the upper control limit. Results may be biased high.

EGLE Footnotes:
(SE) = Site-specific criteria based on single event exposure; therefore, sampling methods should reflect shorter exposure scenarios.
ca = the criterion is based on carcinogenic health effects
dev = the criterion is based on developmental health effects
nc = the criterion is based on non-carcinogenic health effects
st = the criterion is based on short-term toxicity

Notes:
1. Where LNAPL was observed, groundwater elevations have been corrected using a measured LNAPL density of 0.8995 gram per milliliter.
2. PMW-01 and PMW-02 could not be gauged on 10/24/2023 as planned due to the flushmounts being under standing water.

Abbreviations:
LNAPL = light nonaqueous phase liquid
msl = mean sea level
NAPL = nonaqueous phase liquid
NM = not measured
NP = no product
TOC = top of casing
RACER = Revitalizing Auto Communities Environmental Response

Abbreviations:

-- insufficient data for calculating statistics (n < 4) or not available
FOD = frequency of detection (# detects / # samples)
mean = arithmetic mean
SD = standard deviation
NST = no significant trend
NT = no trend
DWN = downward trend
UP = upward trend

Notes:

1. All analytical results for PFAS are in ng/L and VOCs are in µg/L.
Result values less than 10 are reported to 2 significant figures; values greater than 10 are reported to 3 significant figures. P-values are reported to 3 decimal places.
2. Trend results are presented when at least seven samples, 50% detected values, and 25% exceedances in the last six samples are available. Significance of trends evaluated at 90% confidence (alpha = 0.1).
3. Non-detects were assigned a common value less than the minimum detected value, equal to half the minimum reporting limit (RL) in the dataset (USEPA, 2009).
If half the minimum RL was greater than the minimum detected value, then half the minimum detect was assigned.
4. Statistically significant trend defined as having p-value ≤ 0.1, or 90% confidence.
5a. MK and Sen's Trend results for datasets with fewer than 8 samples may not be reliable and should be treated with caution.
6. All well/analyte pairs were analyzed in 2023, except for 1,1-DCE at MW-14-59 and vinyl chloride at MW-03-06 and MW-14-60.
These datasets are still included in the MK results since the wells were sampled in 2023.

Narrative

Job Narrative
240-194285-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 10/26/2023 9:50 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.0°C

GC/MS Semi VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

Case Narrative
Arcadis U.S., Inc.
Lot Number: YB17038

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

PFAS
Samples YB17038-006, YB17038-008, YB17038-011, YB17038-014 required centrifugation prior to extraction, due to excessive solids present in the samples. Centrifugation was performed following the PFAS Aqueous Centrifuge Protocol; samples were spiked with Surrogate (SUR; Extracted Internal Standard/EIS) and shaken vigorously before being poured into a conical bottle and centrifuged. The centrifuged aqueous sample was decanted back into the original sample bottle, off of the condensed solids remaining in the centrifuge bottle. Original sample bottle was rinsed as normal and centrifuge bottle was rinsed with 4mL of MeOH. Centrifuge bottle rinsate was added to the elution. Samples concentrated to <5mL and reconstituted to 5mL using MeOH by transfer pipet.

Surrogate recovery for the following samples was outside the upper control limit: YB17038-001, YB17038-007, YB17038-008, YB17038-009, YB17038-013, YB17038-016, YB17038-017, YB17038-019. These samples did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Surrogate recovery for the following sample was outside control limits: YB17038-012. Re-extraction and/or re-analysis was performed with concurring results. The original analysis has been reported.

Case Narrative
Arcadis U.S., Inc.
Lot Number: YB20004

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: Drinking Water: VOC (excluding BTEX, MTBE, Naphthalene, & 1,2-dichloroethane) EPA 524.2, E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

Samples YB20004-001, YB20004-004, YB20004-005, YB20004-006, YB20004-007, YB20004-008 required centrifugation prior to extraction, due to excessive solids present in the samples. Centrifugation was performed following the PFAS Aqueous Centrifuge Protocol; samples were spiked with Surrogate (SUR; Extracted Internal Standard/EIS) and shaken vigorously before being poured into a conical bottle and centrifuged. The centrifuged aqueous sample was decanted back into the original sample bottle, off of the condensed solids remaining in the centrifuge bottle. Original sample bottle was rinsed as normal and centrifuge bottle was rinsed with 4mL of MeOH. Centrifuge bottle rinsate was added to the elution. Samples concentrated to <5mL and reconstituted to 5mL using MeOH by transfer pipet.

Surrogate recovery for the following samples was outside, the upper control limit: YB20004-002, YB20004-003, YB20004-004, YB20004-005, YB20004-006, YB20004-007, YB20004-008, YB20004-009. These samples did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Case Narrative
Arcadis U.S., Inc.
Lot Number: YB20006

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

The MS/MSD associated with sample YB20006-005 had compounds recovered outside of the acceptance limits. The LCS was recovered within the required acceptance limits; therefore, this demonstrates a matrix effect and data quality is not impacted.

Sample YB20006-005 had surrogates recovered outside of the acceptance limits due to confirmed matrix interference.

Case Narrative
Arcadis U.S., Inc.
Lot Number: YB08034

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

PFAS
Samples YB08034-001, YB08034-003, YB08034-004, YB08034-006 required centrifugation prior to extraction, due to excessive solids present in the samples. Centrifugation was performed following the PFAS Aqueous Centrifuge Protocol; samples were spiked with Surrogate (SUR; Extracted Internal Standard/EIS) and shaken vigorously before being poured into a conical bottle and centrifuged. The centrifuged aqueous sample was decanted back into the original sample bottle, off of the condensed solids remaining in the centrifuge bottle. Original sample bottle was rinsed as normal and centrifuge bottle was rinsed with 4mL of MeOH. Centrifuge bottle rinsate was added to the elution. Samples concentrated to <5mL and reconstituted to 5mL using MeOH by transfer pipet.

Surrogate recovery for the following samples was outside the upper control limit: YB08034-002, YB08034-004, YB08034-005, YB08034-007. This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Surrogate recovery for the following samples was outside control limits: YB08034-001 (MS/MSD), YB08034-003, YB08034-006. Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Organic Analysis Introduction

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Method 8260C and 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines NFG for Organic Superfund Methods Data Review, EPA-540-R-20-005 (November 2020), with reference to the historical (USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, OSWER 9240.1-05A-P, October 1999, as appropriate) and the Quality Assurance Project Plan, Revitalizing Auto Communities Environmental Response (RACER) Trust, August 2011.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - UB Compound is considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

The "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R"

values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Volatile Organic Compounds Analyses

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260C and 8260B by SIM	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2 with hydrochloric acid

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the reporting limit (RL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the RDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

For the SIM analysis, the samples were spiked with internal standards instead of surrogates. All internal standard recoveries were within the control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations

where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSDs exhibited recoveries and RPDs within the control limits.

5. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
MW-20-132 MW-20-131 DUP-06 Trip Blank	trans-1,4-Dichloro-2-butene	<LL but >10%	<LL but >10%
	Diethyl ether	AC	>UL

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6. Field Duplicate Analysis

The field duplicate sample analysis is used to assess the precision of the field sampling procedures and analytical method. A control limit of 30% is applied to the RPD between the parent sample and the field duplicate sample results for water matrices. For the case where the parent and/or duplicate sample concentrations are less than five times the reporting limit (RL), a control limit of two times the RL is applied to the difference between the results for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/ Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-20-131 / DUP-06	Vinyl Chloride	3	2	AC
	cis-1,2-Dichloroethene	2	2	AC
MW-13-34 / DUP-04	1,4-Dioxane	U	U	AC

Notes:
AC Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

Analytical Laboratory Report

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

Analytical Laboratory Report

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

Case Narrative
Arcadis U.S., Inc.
Lot Number: YE20007

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.4 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.4 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: Drinking Water: VOC (excluding BTEX, MTBE, Naphthalene, & 1,2-dichloroethane) EPA 524.2, E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

PFAS
Surrogate recovery for the following sample was outside the upper control limit: YE20007-003. This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Case Narrative
Arcadis U.S., Inc.
Lot Number: YE20009

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.4 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.4 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

PFAS
Sample YE20009-007 required centrifugation prior to extraction, due to excessive solids present in the samples. Centrifugation was performed following the PFAS Aqueous Centrifuge Protocol; samples were spiked with Surrogate (SUR; Extracted Internal Standard/EIS) and shaken vigorously before being poured into a conical bottle and centrifuged. The centrifuged aqueous sample was decanted back into the original sample bottle, off of the condensed solids remaining in the centrifuge bottle. Original sample bottle was rinsed as normal and centrifuge bottle was rinsed with 4mL of MeOH. Centrifuge bottle rinsate was added to the elution. Samples concentrated to <5mL and reconstituted to 5mL using MeOH by transfer pipet.

Surrogate recovery for the following samples was outside the upper control limit: YE20009-003, YE20009-007, YE20009-010. These samples did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Surrogate recovery for the following sample was outside of acceptance limits: YE20009-004. There was insufficient sample to perform a re-extraction; therefore, the data have been reported.

Case Narrative
Arcadis U.S., Inc.
Lot Number: YE26004

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.4 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.4 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

PFAS
Samples YE26004-004, YE26004-007, YE26004-011 required centrifugation prior to extraction, due to excessive solids present in the samples. Centrifugation was performed following the PFAS Aqueous Centrifuge Protocol; samples were spiked with Surrogate (SUR; Extracted Internal Standard/EIS) and shaken vigorously before being poured into a conical bottle and centrifuged. The centrifuged aqueous sample was decanted back into the original sample bottle, off of the condensed solids remaining in the centrifuge bottle. Original sample bottle was rinsed as normal and centrifuge bottle was rinsed with 4mL of MeOH. Centrifuge bottle rinsate was added to the elution. Samples concentrated to <5mL and reconstituted to 5mL using MeOH by transfer pipet.

Surrogate recovery for the following samples was outside the upper control limit: YE26004-002, YE26004-003, YE26004-005, YE26004-006, YE26004-007, YE26004-008, YE26004-009, YE26004-010, YE26004-011. This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Surrogate recovery for the following sample was outside control limits: YE26004-004. Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Case Narrative
Arcadis U.S., Inc.
Lot Number: YE30011

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.4 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.4 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a DoD/DoE and TNI accredited laboratory; however, Pace is not accredited for PFAS Direct Aqueous Injection or Method D8421.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

PFAS
Sample YE30011-004 required centrifugation prior to extraction, due to excessive solids present in the samples. Centrifugation was performed following the PFAS Aqueous Centrifuge Protocol; samples were spiked with Surrogate (SUR; Extracted Internal Standard/EIS) and shaken vigorously before being poured into a conical bottle and centrifuged. The centrifuged aqueous sample was decanted back into the original sample bottle, off of the condensed solids remaining in the centrifuge bottle. Original sample bottle was rinsed as normal and centrifuge bottle was rinsed with 4mL of MeOH. Centrifuge bottle rinsate was added to the elution. Samples concentrated to <5mL and reconstituted to 5mL using MeOH by transfer pipet.

Surrogate recovery for the following samples was outside the upper control limit: YE30011-001, YE30011-002, YE30011-004, YE30011-005, YE30011-006, YE30011-007, YE30011-009, YE30011-010, YE30011-011, YE30011-012, YE30011-013. These samples did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Surrogate recovery for the following sample was outside of acceptance limits: YE30011-014. There was insufficient sample to perform a re-extraction; therefore, the data have been reported.
