Section 1.0 Introduction 1

1.1 Purpose 1

1.2 Report Organization 1

Section 2.0 Overview of RFI 2

2.1 Site Description 2

2.1.1 Historical Operations 3

2.1.2 Current Operations 4

2.2 Summary of Previous Investigations 4

2.3 Summary of Investigated Areas 5

2.3.1 Open Burn Area 5

2.3.2 Northern Sludge Area 6

2.3.3 Southern Sludge Area 6

2.3.4 Southern Trenches Area 7

2.3.5 Northern Trenches Area 7

2.3.6 Northern and Southern Former Die Storage Pad Area 8

2.3.7 Former Fuel Oil Tank Area 8

2.3.8 Groundwater 8

Section 3.0 Environmental Setting 9

3.1 Adjacent Land Use 9

3.2 Water Supply and Groundwater Use 9

3.3 Topography 9

3.4 Climate 9

3.5 Regional Geology and Site Geology 10

3.6 Regional and Site Hydrogeology 10

3.7 Regional and Site Hydrology 11

Section 4.0 Investigation Results and Discussion 11

4.1 AOI 1 – Open Burn Area 12

4.1.1 Scope and Results 12

4.1.2 Discussion of Results 13

4.1.3 Conclusions 13

4.2 AOI 2 – Northern Sludge Area 14

4.2.1 Scope and Results 14

4.2.2 Discussion of Results 14

4.2.3 Conclusions 15

4.3 AOI 3 – Southern Sludge Area 15

4.3.1 Scope and Results....15
4.3.2 Discussion of Results....16
4.3.3 Conclusions....17
4.4 AOI 4 – Northern Trenches Area....17
4.4.1 Scope and Results....17
4.4.2 Discussion of Results....17
4.4.3 Conclusions....18
4.5 AOI 5 – Southern Trenches Area....18
4.5.1 Scope and Results....18
4.5.2 Discussion of Results....19
4.5.3 Conclusions....19
4.6 AOI 6 – Northern Die Storage Pad Area....20
4.6.1 Scope and Results....20
4.6.2 Discussion of Results....20
4.6.3 Conclusions....21
4.7 AOI 7 – Southern Die Storage Pad Area....21
4.7.1 Scope and Results....21
4.7.2 Discussion of Results....22
4.7.3 Conclusions....23
4.8 AOI 8 – Former Fuel Oil Tank Area....23
4.8.1 Scope and Results....23
4.8.2 Discussion of Results....24
4.8.3 Conclusions....24
4.9 AOI 9 – Sitewide Groundwater....24
4.9.1 Scope and Results....25
4.9.2 Discussion of Results....26
4.9.3 Conclusions....26

Section 5.0 Human Health Risk Assessment (HHRA)....26

5.1 Objectives of the HHRA....26
5.2 Site Characterization....27
5.2.1 Conceptual Site Model....27
5.2.2 Selection of Chemicals of Potential Concern (COPCs)....28
5.2.3 Summary of Selected COPCs....28
5.3 Exposure Assessment....30
5.3.1 Characterization of Exposure Setting....31
5.3.2 Identification of Potential Exposure Pathways....31
5.3.2.1 Potential Migration Routes....32
5.3.2.2 Potential Exposure Points....33
5.3.2.3 Potential Exposure Routes....33
5.3.2.4 Exposure Scenarios and Completed Exposure Pathways....33
5.3.3 Quantification of Exposure....34
5.3.3.1 Specific Intake Equations....36

5.3.3.2 Exposure Scenario Assumptions 37
5.4 Toxicity Assessment 40
5.4.1 Non-carcinogenic Hazards....40
5.4.2 Carcinogenic Risks 41
5.4.3 Potential Risk from Carcinogens 42
5.5 Risk Characterization 43
5.5.1 Hazard Estimates....43
5.5.2 Cancer Risk Estimates....44
5.5.3 Risk Quantification Summary....45
5.5.3.1 Open Burn Area....45
5.5.3.2 Northern Sludge Area....46
5.5.3.3 Southern Sludge Area....47
5.5.3.4 Southern Trench Area 48
5.5.3.5 Southern Die Storage Area....48
5.5.3.6 Northern Die Storage Area....49
5.5.3.7 Former Fuel Oil Tank Area....50
5.5.4 Summation of Risks 51
5.5.4.1 Open Burn Area....52
5.5.4.2 Northern Sludge Area....52
5.5.4.3 Southern Sludge Area....53
5.5.4.4 Southern Trench Area 53
5.5.4.5 Southern Die Storage Area....54
5.5.4.6 Northern Die Storage Area....54
5.5.4.7 Former Fuel Oil Tank Area....55
5.5.5 Summary of Exceedances....55
5.5.5.1 Open Burn Area....55
5.5.5.2 Northern Sludge Area....56
5.5.5.3 Southern Sludge Area....56
5.5.5.4 Southern Trench Area 56
5.5.5.5 Southern Die Storage Area....57
5.5.5.6 Northern Die Storage Area....57
5.5.5.7 Former Fuel Oil Tank Area....57
5.5.6 Risk and Hazard COPC Contributions 57
5.5.6.1 Northern Sludge Area....58
5.5.6.2 Southern Sludge Area....59
5.5.6.3 Southern Trench Area 60
5.5.6.4 Southern Die Storage Area....61
5.5.6.5 Northern Die Storage Area....62
5.5.6.6 Former Fuel Oil Tank Area....62
5.5.7 Uncertainty Analysis....63
5.5.7.1 Sampling Procedure Bias....63
5.5.7.2 Exposure Point Concentration Estimates....63
5.5.7.3 Exposure Scenario Assumptions 64
5.5.7.4 Dose Response 64
5.5.7.5 Theoretical Nature of Risk Estimates 65
5.5.7.6 Synergistic, Additive, and Antagonistic Effects 65

5.6 Conclusions....66

Section 6.0 Level 1 Scoping Risk Assessment....67

6.1. The Relevance of the Level 1 Scoping ERA to the ERA Process.... 67

6.2 Existing Data Summary 68
6.2.1 Site Location and Physical Setting....68
6.2.2 Current and Future Site Land Use....69

6.3 Known or Suspected Hazardous Substance Releases.... 69
6.3.1 Soil....70
6.3.2 Surface Water and Sediments....70
6.3.3 Groundwater....70
6.3.4 Contaminants of Interest....71
6.3.5 Rare/Threatened/Endangered Species....71

6.4 Site Visit and Onsite Habitat Characterization 72
6.4.1 Onsite Habitat Cover Types....72
6.4.1.1 Mature Deciduous Woods....72
6.4.1.2 Forested Wetlands/Vernal Pools....72
6.4.1.3 Upland Meadow and Thicket....73
6.4.1.4 Mowed Lawn....73
6.4.1.5 Wooded Hedgerow/Open Drainage Ditches....73
6.4.1.6 Areas of Ponded Water....74
6.4.1.7 Emergent and Scrub-Shrub Wetlands....74
6.4.1.8 Sparsely Vegetated Areas....74
6.4.1.9 Wildlife Observed on the Site....74

6.5 Site Visit Summary 75

6.6 Identification of Complete Exposure Pathways between Site-Related Chemicals and Ecologically Important Resources.... 76

6.7 Conclusions of the ERA 77

Section 7.0 Summary and Conclusions....78

7.1 Summary of AOI Results 79

7.2 Recommendations 83

Section 8.0 References....84

LIST OF APPENDICES

Appendix A	Soil Boring Logs and Monitoring Well Construction Logs
Appendix B	Analytical Data
Appendix C	Data Validation Memos
Appendix D	Human Health Risk Assessment: Supporting Calculations and Related Information
Appendix E	Level 1 Scoping Ecological Risk Assessment: Supporting Photographs and Agency Correspondence
Appendix F	Site Groundwater Evaluation

List of Acronyms

ADD	average daily dose
AMSL	above mean sea level
AOI	area of interest
ASAP	Additional Sampling and Analysis Plan
AST	above-ground storage tank
B_{ca}	bias-corrected and accelerated
bgs	below ground surface
C_{air}	chemical concentration in air
cf/s	cubic feet per second
CFR	Code of Federal Regulations
COPC	chemical of potential concern
cm/s	centimeters per second
CRA	Conestoga-Rovers & Associates
CSM	conceptual Site model
DCC	Direct Contact Criteria
DWC	Drinking Water Criteria
EI	Environmental Indicator
GCC	Groundwater Contact Criteria
GM	General Motors Corporation
gpm	gallons per minute
GVIIC	Groundwater Volatilization to Indoor Air Inhalation Criteria
HEAST	Health Effects Assessment Summary Tables
HI	hazard index
HQ	hazard quotient
IRIS	Integrated Risk Information System
K_p	permeability coefficient for dermal absorption
LADD	lifetime average daily dose
NCEA	National Center for Environmental Assessment
OEPA	Ohio Environmental Protection Agency

PCB	polychlorinated biphenyl
PID	photoionization detector
ppm	part per million
PRG	preliminary remediation goal
PSIC	Particulate Soil Inhalation Criteria
RACER	Revitalizing Auto Communities Environmental Response
RCRA	Resource Conservation and Recovery Act
Report	RFI Report
RfCs	chronic inhalation reference concentrations
RfDs	chronic reference doses
RFI	RCRA Facility Investigation
RME	reasonable maximum exposures
SFs	cancer slope factors
Site	1400 Lowell Street, City of Elyria, Lorain County, Ohio
SSR	Site Summary Report
STL	Severn Trent Laboratories
SVIIC	Soil Volatilization to Indoor Air Inhalation Criteria
SVOC	semi-volatile organic compound
TAL	Target Analyte List
TCL	Target Compound List
TSCA	Toxic Substances Control Act
UCLs	upper confidence limits
URFs	inhalation unit risk factors
VOC	volatile organic compound
VSIC	Infinite Source Volatile Soil Inhalation Criteria
WWTP	wastewater treatment plant

Section 1.0 Introduction

1.1 Purpose

Conestoga-Rovers & Associates (CRA) has prepared this Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) Report (Report) on behalf of Revitalizing Auto Communities Environmental Response (RACER) Trust, for the property located at 1400 Lowell Street, in the City of Elyria, Lorain County, Ohio (Site). The Site's United States Environmental Protection Agency (U.S. EPA) Identification Number is OHD004201091.

RACER conducted the RFI to investigate the areas of interest (AOIs) identified in the Site's Site Summary Report (SSR) (CRA, June 2007) for the presence of releases of hazardous waste or hazardous constituents that could pose an unacceptable risk to human health or the environment. The RFI was conducted in accordance with a RFI Work Plan (CRA, June 2011) and supplemental data submittals and correspondence that were submitted to the Ohio Environmental Protection Agency (OEPA).

This document describes the technical approach, procedures, and results of the field activities conducted during the RFI. The information includes a comparison of the RFI data with appropriate risk-based screening criteria to identify whether there is a potentially significant release of hazardous waste or hazardous constituents from each AOI. Where a potentially significant release has been identified, the nature and extent of hazardous constituents in the environmental media characterized during the RFI are discussed. In addition, a human health risk assessment and ecological risk assessment are included in this Report to provide a basis for determining whether the presence of these hazardous constituents poses an unacceptable risk to human health and the environment that would warrant corrective measures.

1.2 Report Organization

This Report is organized as follows:

- Section 2.0 provides an overview of the RFI, including a summary of the AOIs.
- Section 3.0 discusses the environmental setting regionally and in the vicinity of the Site, including information on surface water hydrology, geology, hydrogeology, background soil characteristics, land use, and groundwater use.
- Section 4.0 presents a summary and discussion of the RFI results for each of the AOIs. The discussion for each area investigated includes a summary of the scope of the field investigations, a summary and evaluation of the RFI data, and a discussion of whether a potentially significant release of hazardous constituents has been identified.

- Section 5.0 presents a human health risk assessment that evaluates the potential significance of reasonable maximum exposures to affected environmental media under current and reasonably expected future land use at and around the Site to determine whether corrective measures are warranted.
- Section 6.0 presents a Level I Scoping ecological risk assessment.
- Section 7.0 summarizes the conclusions of the RFI.
- Section 8.0 lists the references cited in the Report.
- Tables and figures cited in the text of the Report are found at the end of the text.
- Appendix A contains the soil boring logs and monitoring well construction logs for all of the soil borings and monitoring wells installed during the RFI.
- Appendix B contains all soil and groundwater analytical laboratory reports.
- Appendix C summaries of the results of the data review and data validation.
- Appendix D contains the human health risk assessment calculations and related supporting information.
- Appendix E contains the Level 1 scoping ecological risk assessment photos and agency correspondence.
- Appendix F contains an evaluation of the extent of groundwater contamination, potential for off-site migration of contaminants in groundwater and screening evaluation of potential risk associated with site groundwater.

Section 2.0 Overview of RFI

2.1 Site Description

The Site is located at 1400 Lowell Street in City of Elyria, Lorain County, Ohio. The Site location is presented on Figure 2.1.1. The Site's facility identification is OHD 004201091. The Site is approximately 25 miles southwest of Cleveland, Ohio. Lorain County is located on the eastern fringe of the till plain of the Great Central Lowlands. The topography in the vicinity of the Site is relatively flat to gently rolling. The northward-flowing Black River is located less than 1 mile to the east of the Site, and Lake Erie is located approximately 8 miles to the north of the Site.

The Site property is owned by RACER. There is a notice in the deed to the facility that indicates that a portion of the Site has been used to manage hazardous wastes, and use of this portion of the property is restricted. The perimeter of the site is also fenced. The Site layout is presented on Figure 2.1.2.

Adjacent properties are used for industrial, commercial, and agricultural purposes. The Site is bounded to the west by the former General Motors Inland Fisher Guide Division Plant, which is currently used for commercial/industrial purposes by Northern Ohio Associates Limited Partnership. The Site was part of the General Motors Inland Fisher Guide Division Plant (former GM facility) until 1988. The former GM manufacturing building (former plant) and surrounding property were sold to Northern Ohio Associates Limited. The remaining portion of the former GM facility became the RACER property and is the subject facility of this RFI. Vacant industrial and agricultural properties bound the Site to the southwest, south, and east. A 193-foot wide railway right-of-way separates the Site from additional commercial and industrial properties further north of the Site.

2.1.1 Historical Operations

During the initial operating stages of the former GM facility, manufactured products included wheel covers, bumper guards, auto grills, hood hinges, die cast parts, foam instrument panels and jet engine turbine blades. Beginning in 1984, products included seat cushions, metal seat frames and hinges, sunroof assemblies and automotive trim. Electroplating was a process used in the manufacture of many of the former GM facility products (Ecology, 1991).

While in operation, four basic types of wastewater were generated at the former facility (acid/alkali or metal bearing wastewater, chromic acid bearing wastewater, cyanide-based wastes and rinses, and cleaner pre-soaked based wastes). The wastewater generated from the facility's electroplating lines was neutralized at the facility's former wastewater treatment plant (WWTP) and the treatment sludges were placed into three former surface impoundments located at the Site. The majority of the electroplating operations at the facility were discontinued by July 31, 1984. Subsequently, Fisher Guide Division (FGD) of GM incorporated a plate filter press into the WWTP process to dewater the sludge and to eliminate any further need for the surface impoundments (Ecology, 1991). No facility process sludges were placed into the surface impoundments at the Site after August 1986 (Fisher Guide, 1987). All production at the former facility ceased in July 1988 (Fisher Guide, 1988).

Prior to selling the former plant parcel to Northern Ohio Limited Partnership, facility closure activities were conducted from July 1987 through July 1988. During the closure activities, sludges dewatered at the facility's WWTP's plate filter press were disposed of off Site at an appropriately licensed disposal facility (WSI, 1988). The facility's WWTP was subsequently decontaminated (Ecology, 1991). The facility closure activities ensured that all of the facility's Resource Conservation and Recovery Act (RCRA) treatment, storage, and disposal (TSD) units were closed in accordance with plans and specifications approved by Ohio EPA and/or United

States Environmental Protection Agency (USEPA) (Fisher Guide, 1988). A RCRA closure plan was conditionally approved by Ohio EPA in August 1987. The Site's surface impoundments were closed and the sludges were solidified with cement kiln dust. The solidified sludges were placed into a landfill (Closed Landfill Area) that was constructed over the Site's former surface impoundments. The Closure Certification Report (WSI, 1988) for the surface impoundments, landfill, and RCRA units was submitted to Ohio EPA on September 16, 1988.

2.1.2 Current Operations

No daily activities are currently conducted at the Site. The only periodic activity that takes place is landfill leachate removal.

2.2 Summary of Previous Investigations

Between 1987 and 1988, a series of tasks were performed at the former facility to identify contaminated materials, waste, and waste residues for assuring the environmentally safe closure of the former facility. General housekeeping at the facility was good due to efforts to clean areas prior to facility expansions, during process decommissioning, or during process change-overs. Minor contaminated materials plus hazardous and nonhazardous wastes or potential wastes were identified. Further investigation was warranted in some areas and recommendations were made regarding facility closure.

Eleven investigative test trenches were excavated on the Site, east of the former facility's north-south access road. Fourteen soil borings were completed parallel to the former facility's north-south access road. Both the investigative test trench samples and the soil borings were analyzed for total chromium, copper, nickel, and volatile organic compounds (VOCs), with the exception of four soil borings west of the road along the southern end of the road which were not analyzed for VOCs. An examination of the results of the soil samples concluded that inorganic contamination was found on the Site, east of the access road. The inorganic contamination did not extend off the Site, west of the road (i.e. onto the parcel which included the facility building).

U.S. EPA tasked Ecology and Environment, Inc. (Ecology) to conduct a Screening Site Inspection (SSI) of the Site in 1990. The SSI report was prepared in 1991 and the report consisted of a historical uses summary, interviews with Site representatives, a reconnaissance inspection, collection of seven soil samples from three former waste placement areas and a discussion of migration pathways. The purpose of the reconnaissance inspection was to refine a preliminary hazard ranking system score for the Site; establish potential priority for the NPL (National Priorities List), and to identify if the Site was a candidate for further investigation (Ecology, 1991).

In June 2000, CRA conducted further investigation of the three former placement areas (Open Burn Area, Northern Sludge Area and the Southern Sludge Area). Nine monitoring wells ("FD" Wells) were installed at the perimeter of the Site and groundwater samples were collected for analysis (CRA, 2004). All wells were analyzed for dissolved metals, general chemistry and VOCs, with the exception of FD-09 which was only analyzed for VOCs due to insufficient well recovery volume.

Between 2000 and 2014, CRA conducted further investigations of Site groundwater which included the installation of 60 groundwater wells and piezometers for the purpose of collecting groundwater samples.

2.3 Summary of Investigated Areas

Figure 2.3.1 presents the Site layout with the Areas of Interest (AOIs) and include:

AOI 1 – Open Burn Area
AOI 2 – Northern Sludge Area
AOI 3 – Southern Sludge Area
AOI 4 – Northern Trenches Area
AOI 5 – Southern Trenches Area
AOI 6 – Northern Die Storage Pad Area
AOI 7 – Southern Die Storage Pad Area
AOI 8 – Former Fuel Oil Tank Area
AOI-9 – Site Groundwater

Each AOI is described below.

2.3.1 Open Burn Area

The Open Burn Area is located in the north central portion of the Site. This area is approximately 4.8 acres in size.

This area was used for open burning and placement of general facility trash from 1947 to 1974 (Ecology, 1991). Materials were burned and/or placed in this area. This area is now covered with soil and is overgrown.

In 1990, the USEPA conducted a screening site inspection (SSI) and collected two soil samples from each of three areas (Open Burn Area, Northern Sludge Area, and Southern Sludge Area).

The USEPA soil samples contained a number of Target Analyte List (TAL) and Target Compound List (TCL) compounds with concentrations above Site background levels (Ecology, 1991).

2.3.2 Northern Sludge Area

The Northern Sludge Area is located in the northeastern portion of the Site. This area is approximately 6.8 acres in size.

This area was used for placement of WWTP sludges from 1956 to 1967 (Ecology, 1991). Approximately 25,000 cubic yards of material were placed within this area. Currently this area is overgrown.

In 1990, the USEPA conducted a SSI and collected two soil samples from each of three areas (Open Burn Area, Northern Sludge Area, and Southern Sludge Area). The USEPA soil samples contained a number of TAL and TCL compounds with concentrations above Site background levels (Ecology, 1991).

2.3.3 Southern Sludge Area

The Southern Sludge Area is located in the east central portion of the Site. This area is approximately 6.5 acres in size.

This area was used for placement of WWTP sludges from 1972 to 1977 (Ecology, 1991). Approximately 40,000 cubic yards of material were placed within this area. Currently this area is overgrown.

In 1990, the USEPA conducted a SSI and collected two soil samples from each of three areas (Open Burn Area, Northern Sludge Area, and Southern Sludge Area). The USEPA soil samples contained a number of TAL and TCL compounds with concentrations above Site background levels (Ecology, 1991).

Ohio EPA was consulted in the 1970s by the former facility personnel regarding the use of this area for the placement of excavated sludge from the former surface impoundments. Ohio EPA indicated, in a letter dated March 21, 1974, that they have no objection to the use of this area for the placement of sludge materials from the former surface impoundments (Ohio EPA, 1974).

2.3.4 Southern Trenches Area

The Southern Trenches Area is located in the west central portion of the Site. This area is approximately 0.7 acre in size.

Four investigative test trenches were excavated in 1988 south of the former fuel oil tank. The four investigative trenches contained waste fill material including rags, paper, wood, roofing material, wiring, transite board, metal scrap, rubber gloves, and concrete rubble. Soil samples were collected from three of the investigative trenches, and analysis indicated that the most frequently reported parameters were chromium, copper and nickel.

A former monitoring well, MW-16, was installed in 1988. Visual observations indicated this location was potentially impacted. Soil and groundwater samples were collected. Soil analytical results indicated elevated concentrations of inorganics (e.g., chromium, nickel, zinc and copper) and organics [e.g., 1,2-dichloroethene (1,2-DCE), toluene, trichloroethene (TCE), and xylenes]. Groundwater analytical results also indicated elevated concentrations of inorganics (e.g., nickel and zinc) and organics (e.g., TCE, 1,2-DCE, vinyl chloride, xylenes, and ethyl benzene). The contamination at this location could be due to direct waste placement in the vicinity, metal bearing sludge or paint sludge in the vicinity, or equipment/die cleaning activities on the nearby die storage pads.

2.3.5 Northern Trenches Area

The Northern Trenches Area is located in the northwestern portion of the Site. This area is approximately 0.8 acre in size.

Four investigative test trenches were excavated in 1988 northeast of the open burn area and north of the former fuel oil tank. Two investigative trenches contained waste fill material. A soil sample was collected from each of the investigative trenches and analysis indicated that the most frequently reported parameters were chromium, copper, and nickel.

A former monitoring well, MW-15, was installed in 1988. Soil and groundwater samples were collected. Soil analytical results indicated no metal contamination at this location, detectable concentrations of TCE and low concentrations of other VOCs. The groundwater analytical results indicated no VOCs were detected. This location is vertically isolated by low permeability soils.

2.3.6 Northern and Southern Former Die Storage Pad Area

The former Die Storage Pad Areas are located in the west central portion of the Site. This area is approximately 1.6 acres in size.

This area consists of two concrete pads (located on the north side and the south side of the railway spur) formerly used to store dies. Equipment and die cleaning activities occurred on these pads. The cleaning activities reportedly included the use of various solvents.

Waste fill materials were found in trenches excavated in 1988 east of the former facility and just north of the pads (see Section 4.6). It is unknown whether there is any relationship between the Southern Trenches Area (discussed in Section 4.6) and the Former Die Storage Pad Area.

2.3.7 Former Fuel Oil Tank Area

The former Fuel Oil Tank Area is located in the northwestern portion of the Site. This area covers approximately 1.5 acres.

This area included the former 2,310,000-gallon fuel oil tank and the earth dyke that surrounded the tank (Fisher Guide, November 1985).

One investigative test trench was excavated north of the former fuel oil tank in 1988. A soil sample was collected from the investigative trench and analysis of the sample indicated that chromium (total), copper and nickel were present.

There is no record of a release of hazardous materials from this area, and there is no physical evidence such as surface staining or stressed vegetation to indicate that a release had ever occurred at this location.

2.3.8 Groundwater

Groundwater beneath each AOI, across the site and from off-site was holistically evaluated for the site. An evaluation of site groundwater is included in Appendix F.

Section 3.0 Environmental Setting

3.1 Adjacent Land Use

Adjacent properties have been used for industrial, commercial, and agricultural purposes. The Site is bounded to the west by the former facility, which is currently used for

commercial/industrial purposes. Vacant industrial and agricultural properties bound the landfill parcel to the southwest, south, and east. A 193-foot wide railway right-of-way separates the Site from additional commercial and industrial properties further north of the Site (CRA, 2004).

3.2 Water Supply and Groundwater Use

Based on a file search of Ohio Department of Natural Resources (ODNR) logs for off-Site wells, the closest well is approximately 0.6 mile to the northwest of the Site. This well is not downgradient of the Site. In general, wells in the Berea Sandstone aquifer in the vicinity of the Site are capable of producing a maximum of 5 to 25 gallons per minute (gpm) of water; however, typically 3 to 10 gpm of water are produced under long-term withdrawal. Areas within the City of Elyria have access to the public water supply including the area in the vicinity of the Site. The City of Elyria obtains it water from Lake Erie. Installation of private potable water supply wells is discouraged by the permitting and approvals process, and by the associated costs of installing, operating, and maintaining a private water supply well. Some locations within Lorain County may also experience issues regarding groundwater taste and odor, which also discourages private water well installation (CRA, 2004).

3.3 Topography

Lorain County is located on the eastern fringe of the till plain of the Great Central Lowlands. The topography in the vicinity of the Site is relatively flat to gently rolling (CRA, 2006). The Site property is wooded, but includes a maintained clearing around the Closed Landfill Area.

3.4 Climate

Elyria experiences a continental climate with strong modifying influences due to the presence of Lake Erie. Summers are moderately warm and humid. Winters are cold and cloudy with the average temperatures in December, January, and February below freezing. Consistent with a continental climate, precipitation can vary widely; however, it is normally abundant and well distributed over the year. The most frequent precipitation is in May through September, and winter is the driest season (CRA, 2006).

3.5 Regional Geology and Site Geology

The general area was subject to Wisconsinan glaciation, leaving a thin layer of drift material known as the Hiram Till over the southern two-thirds of Lorain County and lacustrine silty clay across the northern one-third of the county. The drift material consists of clay-rich soil up to 25 feet in thickness. Elyria lies on glaciated, lake plain deposits and beach ridges of Old Lake Whittlesey, Lake Maumee, and Lake Warren (Stout et al., 1943). The area is located near the

eastern boundary of the till plain area of the Central Lowland physiographic province (CRA, 2001).

The bedrock underlying Lorain County consists of relatively flat-lying sedimentary strata and includes the upper Devonian and lower Mississippian Cleveland Shale, Bedford Shale, Berea Sandstone, and Cuyahoga Shale. Bedrock dips slightly to the south or southeast. The most important bedrock aquifer in Lorain County is the Berea Sandstone which typically yields 3 to 10 gpm under long-term withdrawal (Barber, 1988).

There are three main stratigraphic units at the Site. The stratigraphic units proceeding from the surface downwards are drift (clay till), Berea Sandstone, and Bedford Shale. All three stratigraphic units are described in the Post-Closure Plan, Section E-2b dated September 2, 1993 (WSI, 1993). The two water bearing horizons for post-closure monitoring of the landfill are:

1. The Till unit and the contact with the Berea Sandstone (referred to as Till Contact unit)
2. The upper portion of the Berea Sandstone aquifer (referred to as the Bedrock unit)

For the purpose of evaluating groundwater flow across the entire Site, groundwater is assumed to travel in one stratigraphic horizon which straddles both the Till Contract unit and the Bedrock unit. Because groundwater flow in the Till Contact unit and the Bedrock unit is observed as having similar elevations and groundwater flow patterns when evaluated on a Site-wide basis, and because these two units are in contact with each other, one groundwater flow horizon is representative of Site conditions for the purposes of the risk screening and evaluation in this report.

3.6 Regional and Site Hydrogeology

The regional hydrogeologic influences in the vicinity of the Site are the northward-flowing Black River which is located less than 1 mile to the east of the Site, and Lake Erie which is located approximately 8 miles to the north of the Site.

Groundwater elevations and contours for the groundwater flow zone are presented in Appendix F. Groundwater flows generally to the northeast beneath the landfill and southern portion of the site. As described in Appendix F, the groundwater flow in the northern portion of the site is influenced by existing storm sewers. In the northern area, groundwater flow is inward toward the storm sewers (Appendix F). The storm sewers appear to prevent off-site migration of groundwater and acts similar to a gaining stream.

3.7 Regional and Site Hydrology

There is no known groundwater discharge to surface water in the immediate vicinity of the Site. In general, precipitation that falls on the Site is diverted from the capped landfill via riprap swales to adjacent drainage ditches. Intermittent flow has been observed in the Site drainage ditches after precipitation events. The surface water flows off of the Site via sewers and drainage ditches.

There are low lying areas to the east and west of the landfill that have been observed to be inundated with surface water at times. A Wetland Delineation Report was completed in June 2014 which identified 13 wetland areas at the Site. Of the 13 wetland areas identified, 10 were described as jurisdictional wetlands (41.09 acres) and 3 were described as isolated wetlands (2.32 acres).

The closest major water body is the West Branch of the Black Creek which is more than 0.8 mile to the east of the Site.

Section 4.0 Investigation Results and Discussion

This section presents the results of the field investigations conducted during the RFI and is divided into subsections corresponding to the AOIs. Each subsection includes a description of the area(s) investigated; the scope of the field investigations; a summary of the results; and a discussion of the results with respect to whether a potentially significant release of hazardous constituents has been identified and, if so, the nature and extent of the release.

The identification of a potentially significant release at an AOI based on comparison of the maximum concentrations detected in the applicable characterization data collected during the RFI for the given area with appropriate risk-based screening criteria.

The approach for evaluating the soil and groundwater data is discussed below.

Soil

The soil characterization data were compared to the screening criteria contained in the Regional Screening Level (RSL) Table, Industrial Soil, June 2011.

Groundwater

Groundwater samples were collected from on and off-Site monitoring wells either set at the till-bedrock interface (shallow) or into the bedrock (deep). The groundwater characterization data

were compared to screening criteria derived from U.S. EPA Maximum Contaminant Levels (MCLs).

Each of the following subsections includes a sample summary, a figure identifying the sample locations, and a table comparing the AOI/Area analytical characterization data for each matrix with the screening criteria. Each subsection also includes databox plans that illustrate the spatial distribution of the RFI data for constituents which were detected, at least one at a concentration higher than the industrial screening criteria in any media at any AOI.

4.1 AOI 1 – Open Burn Area

AOI 1 is located in the north central portion of the Site. This area is approximately 4.8 acres in size. This area was used for open burning and placement of general facility trash from 1947 to 1974 (Ecology, 1991). Materials were burned and/or placed in this area. This area is now covered with soil and is overgrown.

4.1.1 Scope and Results

The scope of the RFI field investigations at AOI 1 consisted of the collection of soil samples to define the nature and extent of hazardous constituents released into soil as a result of the former operations at AOI 1. The RFI sampling locations for soil are indicated on Figures 4.1.1 and 4.1.2.

The following paragraphs summarize the sampling activities conducted for soil at AOI 1:

Soil

During the initial RFI soil investigation, 4 soil samples were collected during the installation of two soil borings. Three of the four soil samples were analyzed for VOCs, SVOCs, metals, and hexavalent chromium. The fourth sample was analyzed for Dioxins only. A sample summary is presented in Table 4.1.1.

A second round of soil sampling was completed in order to more fully delineate metals within AOI 1. This work was covered under the Additional Sampling and Analysis Plan (ASAP) (CRA, June 2013). An additional 14 soil borings were installed within AOI 1 and 12 soil samples were submitted for laboratory analysis. All samples were analyzed for cobalt, copper, manganese, nickel, and zinc. Sample locations are presented on Figure 4.1.2 and a sample summary is presented in Table 4.1.2.

The field activities were conducted in accordance with methods described in the RFI Work Plan and ASAP. The stratigraphic logs for the borings are provided in Appendix A.

The analytical data generated from the laboratory analyses of these RFI samples are suitable for use as documented in the data review and validation memoranda provided in Appendix E.

4.1.2 Discussion of Results

Soil sample results from the initial RFI sampling activities exceeded the soil screening criteria within AOI 1 for one compound; arsenic. The following provides more detailed information regarding the soil RFI results:

- Arsenic was reported at two locations above screening criteria ranging from 5.5 to 17 mg/kg. These results are above the RSL for Industrial soil (1.6 mg/kg).
- All other compounds analyzed were reported below the screening criteria.

During the second round of RFI soil sampling activities all compounds analyzed were reported below the screening criteria.

The RFI soil screening results within AOI 1 are summarized in Appendix D and on Figures 4.1.1 and 4.1.2. The data validation memoranda and analytical data summary tables are presented in Appendix C.

4.1.3 Conclusions

The results of the soil RFI within AOI 1 indicate that all compounds exceeding screening criteria have been delineated to screening criteria or adequate data have been collected for the HHRA and ERA. The soil sampling conducted during all RFI phases has adequately characterized the constituents within AOI 1. The potential significance of all detected concentrations from the soil RFI is evaluated in the HHRA and ERA provided in Sections 6 and 7, respectively, in this Report.

4.2 AOI 2 – Northern Sludge Area

AOI 2 is located in the northeastern portion of the Site. This area is approximately 6.8 acres in size. This area was used for placement of WWTP sludges from 1956 to 1967 (Ecology, 1991). Approximately 25,000 cubic yards of material were placed within this area. Currently this area is overgrown.

4.2.1 Scope and Results

The scope of the RFI field investigations at AOI 2 consisted of the collection of soil samples to define the nature and extent of hazardous constituents released into soil as a result of the former operations at AOI 2. The RFI sampling locations for soil are indicated on Figures 4.2.1 and 4.2.2.

The following paragraphs summarize the sampling activities conducted for soil at AOI 2:

Soil

During the initial RFI soil investigation five soil samples, including one duplicate, were collected during the installation of two soil borings. All five soil samples were analyzed for VOCs, SVOCs, metals, and hexavalent chromium. A sample summary is presented in Table 4.2.1.

A second round of soil sampling was completed in order to more fully delineate metals within AOI 2. This work was covered under the ASAP. An additional 15 soil borings were installed within AOI 2 and 14 soil samples were submitted for laboratory analysis. All samples were analyzed for cobalt, copper, manganese, nickel, and zinc. Sample locations are presented on Figure 4.2.2 and a sample summary is presented in Table 4.2.2.

The field activities were conducted in accordance with methods described in the RFI Work Plan and ASAP. The stratigraphic logs for the borings are provided in Appendix A.

The analytical data generated from the laboratory analyses of these RFI samples are suitable for use as documented in the data review and validation memoranda provided in Appendix E.

4.2.2 Discussion of Results

Soil sample results from the initial RFI sampling activities exceeded the soil screening criteria within AOI 2 for two compounds; arsenic and hexavalent chromium. The following provides more detailed information regarding the soil RFI results:

- Arsenic was reported at two locations above screening criteria ranging from 3.4 to 8.6 mg/kg. These results are above the RSL for Industrial soil (1.6 mg/kg).
- Hexavalent chromium was reported at two locations above screening criteria ranging from 6.3 to 10 mg/kg. This result is above the RSL for Industrial soil (5.6 mg/kg).
- All other compounds analyzed were reported below the screening criteria.

During the second round of RFI soil sampling activities all compounds analyzed were reported below the screening criteria except for Nickel at BH100-13. Nickel was reported at 28,000 mg/kg which is above the screening criteria of 14,000 mg/kg.

The RFI soil screening results within AOI 2 are summarized in Appendix D and on Figures 4.1.1 and 4.1.2. The data validation memoranda and analytical data summary tables are presented in Appendix C.

4.2.3 Conclusions

The results of the soil RFI within AOI 2 indicate that all compounds exceeding screening criteria have been delineated to screening criteria or adequate data have been collected for the HHRA and ERA. The soil sampling conducted during all RFI phases has adequately characterized the constituents within AOI 2. The potential significance of all detected concentrations from the soil RFI is evaluated in the HHRA and ERA provided in Sections 6 and 7, respectively, in this Report.

4.3 AOI 3 – Southern Sludge Area

AOI 3 is located in the east central portion of the Site. This area is approximately 6.5 acres in size. This area was used for placement of WWTP sludges from 1972 to 1977 (Ecology, 1991). Approximately 40,000 cubic yards of material were placed within this area. Currently this area is overgrown.

4.3.1 Scope and Results

The scope of the RFI field investigations at AOI 3 consisted of the collection of soil samples to define the nature and extent of hazardous constituents released into soil as a result of the former operations at AOI 3. The RFI sampling locations for soil are indicated on Figures 4.3.1 and 4.3.2.

The following paragraphs summarize the sampling activities conducted for soil at AOI 3:

Soil

During the initial RFI soil investigation four soil samples were collected during the installation of two soil borings. All four soil samples were analyzed for VOCs, SVOCs, metals, and hexavalent chromium. A sample summary is presented in Table 4.3.1.

A second round of soil sampling was completed in order to more fully delineate metals within AOI 3. This work was covered under the ASAP. An additional 21 soil borings were installed

within AOI 3 and 13 soil samples were submitted for laboratory analysis. All samples were analyzed for cobalt, copper, manganese, nickel, and zinc. Sample locations are presented on Figure 4.3.2 and a sample summary is presented in Table 4.3.2.

The field activities were conducted in accordance with methods described in the RFI Work Plan and ASAP. The stratigraphic logs for the borings are provided in Appendix A.

The analytical data generated from the laboratory analyses of these RFI samples are suitable for use as documented in the data review and validation memoranda provided in Appendix E.

4.3.2 Discussion of Results

Soil sample results from the initial RFI sampling activities exceeded the soil screening criteria within AOI 3 for two compounds; arsenic and hexavalent chromium. The following provides more detailed information regarding the soil RFI results:

- Arsenic was reported at four locations above screening criteria ranging from 9.6 to 15 mg/kg. These results are above the RSL for Industrial soil (1.6 mg/kg)
- Hexavalent chromium was reported at two locations above screening criteria ranging from 8 to 9.3 mg/kg. This result is above the RSL for Industrial soil (5.6 mg/kg)
- All other compounds analyzed were reported below the screening criteria

During the second round of RFI soil sampling activities all compounds analyzed were reported below the screening criteria except for nickel. Nickel was reported at four locations above the screening criteria ranging from 23,000 to 34,000 mg/kg which is above the screening criteria of 14,000 mg/kg.

The RFI soil screening results within AOI 3 are summarized in Appendix D and on Figures 4.3.1 and 4.3.2. The data validation memoranda and analytical data summary tables are presented in Appendix C.

4.3.3 Conclusions

The results of the soil RFI within AOI 3 indicate that all compounds exceeding screening criteria have been delineated to screening criteria or adequate data have been collected for the HHRA and ERA. The soil sampling conducted during all RFI phases has adequately characterized the constituents within AOI 3. The potential significance of all detected concentrations from the soil RFI is evaluated in the HHRA and ERA provided in Sections 6 and 7, respectively, in this Report.

4.4 AOI 4 – Northern Trenches Area

AOI 4 is located in the northwestern portion of the Site. This area is approximately 0.8 acre in size.

4.4.1 Scope and Results

The scope of the RFI field investigations at AOI 4 consisted of the collection of soil samples to define the nature and extent of hazardous constituents released into soil as a result of the former operations at AOI 4. The RFI sampling locations for soil are indicated on Figures 4.4.1 and 4.4.2.

The following paragraphs summarize the sampling activities conducted for soil at AOI 4:

Soil

During the initial RFI soil investigation four soil samples were collected during the installation of two soil borings. All four soil samples were analyzed for VOCs, SVOCs, metals, and hexavalent chromium. A sample summary is presented in Table 4.4.1.

The field activities were conducted in accordance with methods described in the RFI Work Plan. The stratigraphic logs for the borings are provided in Appendix A.

The analytical data generated from the laboratory analyses of these RFI samples are suitable for use as documented in the data review and validation memoranda provided in Appendix E.

4.4.2 Discussion of Results

Soil sample results from the initial RFI sampling activities exceeded the soil screening criteria within AOI 4 for two compounds; arsenic and benzo(a)pyrene. The following provides more detailed information regarding the soil RFI results:

- Arsenic was reported at four locations above screening criteria ranging from 7.7 to 26 mg/kg. These results are above the RSL for Industrial soil (1.6 mg/kg).
- Benzo(a)pyrene was reported at one location above screening criteria at 0.6 mg/kg. This result is above the RSL for Industrial soil (0.21 mg/kg).
- All other compounds analyzed were reported below the screening criteria.

The RFI soil screening results within AOI 4 are summarized in Appendix D and on Figures 4.4.1 and 4.4.2. The data validation memoranda and analytical data summary tables are presented in Appendix C.

4.4.3 Conclusions

The results of the soil RFI within AOI 4 indicate that all compounds exceeding screening criteria have been delineated to screening criteria or adequate data have been collected for the HHRA and ERA. The soil sampling conducted during the initial RFI phase adequately characterized the constituents within AOI 4. The potential significance of all detected concentrations from the soil RFI is evaluated in the HHRA and ERA provided in Sections 6 and 7, respectively, in this Report.

4.5 AOI 5 – Southern Trenches Area

AOI 5 is located in the west central portion of the Site. This area is approximately 0.7 acre in size.

4.5.1 Scope and Results

The scope of the RFI field investigations at AOI 5 consisted of the collection of soil samples to define the nature and extent of hazardous constituents released into soil as a result of the former operations at AOI 5. The RFI sampling locations for soil are indicated on Figures 4.5.1 and 4.5.2.

The following paragraphs summarize the sampling activities conducted for soil at AOI 5:

Soil

During the initial RFI soil investigation five soil samples, including one duplicate, were collected during the installation of two soil borings. All five soil samples were analyzed for VOCs, SVOCs, metals, and hexavalent chromium. A sample summary is presented in Table 4.5.1.

A second round of soil sampling was completed in order to more fully delineate metals within AOI 5. This work was covered under the ASAP. An additional 9 soil borings were installed within AOI 5 and 12 soil samples were submitted for laboratory analysis. All samples were analyzed for cobalt, copper, manganese, nickel, and zinc. Sample locations are presented on Figure 4.5.2 and a sample summary is presented in Table 4.5.2.

The field activities were conducted in accordance with methods described in the RFI Work Plan and ASAP. The stratigraphic logs for the borings are provided in Appendix A.

The analytical data generated from the laboratory analyses of these RFI samples are suitable for use as documented in the data review and validation memoranda provided in Appendix E.

4.5.2 Discussion of Results

Soil sample results from the initial RFI sampling activities exceeded the soil screening criteria within AOI 5 for one compound; arsenic. The following provides more detailed information regarding the soil RFI results:

- Arsenic was reported at four locations above screening criteria ranging from 4.9 to 15 mg/kg. These results are above the RSL for Industrial soil (1.6 mg/kg).
- All other compounds analyzed were reported below the screening criteria.

During the second round of RFI soil sampling activities all compounds analyzed were reported below the screening criteria.

The RFI soil screening results within AOI 5 are summarized in Appendix D and on Figures 4.5.1 and 4.5.2. The data validation memoranda and analytical data summary tables are presented in Appendix C.

4.5.3 Conclusions

The results of the soil RFI within AOI 5 indicate that all compounds exceeding screening criteria have been delineated to screening criteria or adequate data have been collected for the HHRA and ERA. The soil sampling conducted during the initial RFI phase adequately characterized the constituents within AOI 4. The potential significance of all detected concentrations from the soil RFI is evaluated in the HHRA and ERA provided in Sections 6 and 7, respectively, in this Report.

4.6 AOI 6 – Northern Die Storage Pad Area

AOI 6 is located in the west central portion of the Site. This area is approximately 0.8 acres in size. The area consists of one concrete pad located on the north side of the railway spur formerly used to store dies. Equipment and die cleaning activities occurred on these pads. The cleaning activities reportedly included the use of various solvents.

4.6.1 Scope and Results

The scope of the RFI field investigations at AOI 6 consisted of the collection of soil samples to define the nature and extent of hazardous constituents released into soil as a result of the former operations at AOI 6. The RFI sampling locations for soil are indicated on Figures 4.6.1 and 4.6.2.

The following paragraphs summarize the sampling activities conducted for soil at AOI 6:

Soil

During the initial RFI soil investigation two soil samples were collected during the installation of one soil boring. Both soil samples were analyzed for VOCs, SVOCs, metals, and hexavalent chromium. A sample summary is presented in Table 4.6.1.

A second round of soil sampling was completed in order to more fully delineate metals within AOI 6. This work was covered under the ASAP. An additional 17 soil borings, including one duplicate, were installed within AOI 6 and 19 soil samples were submitted for laboratory analysis. All samples were analyzed for cobalt, copper, manganese, nickel, and zinc. Sample locations are presented on Figure 4.6.2 and a sample summary is presented in Table 4.6.2.

The field activities were conducted in accordance with methods described in the RFI Work Plan and ASAP. The stratigraphic logs for the borings are provided in Appendix A.

The analytical data generated from the laboratory analyses of these RFI samples are suitable for use as documented in the data review and validation memoranda provided in Appendix E.

4.6.2 Discussion of Results

Soil sample results from the initial RFI sampling activities exceeded the soil screening criteria within AOI 6 for one compound; arsenic. The following provides more detailed information regarding the soil RFI results:

- Arsenic was reported at both soil sample locations above screening criteria ranging from 8.37 to 11 mg/kg. These results are above the RSL for Industrial soil (1.6 mg/kg).
- All other compounds analyzed were reported below the screening criteria.

Soil sample results from the second round of RFI sampling activities exceeded the soil screening criteria within AOI 6 for two compounds; copper and nickel. The following provides more detailed information regarding the soil RFI results:

- Copper was reported at 3 soil sample locations above screening criteria ranging from 42,000 to 52,000 mg/kg. These results are above the RSL for Industrial soil (40,000 mg/kg).
- Nickel was reported at 2 soil sample locations above screening criteria ranging from 23,000 to 25,000 mg/kg. These results are above the RSL for Industrial soil (14,000 mg/kg).
- All other compounds analyzed were reported below the screening criteria.

The RFI soil screening results within AOI 6 are summarized in Appendix D and on Figures 4.6.1 and 4.6.2. The data validation memoranda and analytical data summary tables are presented in Appendix C.

4.6.3 Conclusions

The results of the soil RFI within AOI 6 indicate that all compounds exceeding screening criteria have been delineated to screening criteria or adequate data have been collected for the HHRA and ERA. The soil sampling conducted during the initial RFI phase adequately characterized the constituents within AOI 6. The potential significance of all detected concentrations from the soil RFI is evaluated in the HHRA and ERA provided in Sections 6 and 7, respectively, in this Report.

4.7 AOI 7 – Southern Die Storage Pad Area

AOI 7 is located in the west central portion of the Site. This area is approximately 0.8 acres in size. The area consists of one concrete pad located on the south side of the railway spur formerly used to store dies. Equipment and die cleaning activities occurred on these pads. The cleaning activities reportedly included the use of various solvents.

4.7.1 Scope and Results

The scope of the RFI field investigations at AOI 7 consisted of the collection of soil samples to define the nature and extent of hazardous constituents released into soil as a result of the former operations at AOI 7. The RFI sampling locations for soil are indicated on Figures 4.7.1 and 4.7.2.

The following paragraphs summarize the sampling activities conducted for soil at AOI 7:

Soil

During the initial RFI soil investigation two soil samples were collected during the installation of one soil boring. Both soil samples were analyzed for VOCs, SVOCs, metals, and hexavalent chromium. A sample summary is presented in Table 4.7.1.

A second round of soil sampling was completed in order to more fully delineate metals within AOI 7. This work was covered under the ASAP. An additional 14 soil borings were installed within AOI 7 and 14 soil samples, including one duplicate, were submitted for laboratory analysis. All samples were analyzed for cobalt, copper, manganese, nickel, and zinc. Sample locations are presented on Figure 4.7.2 and a sample summary is presented in Table 4.7.2.

The field activities were conducted in accordance with methods described in the RFI Work Plan and ASAP. The stratigraphic logs for the borings are provided in Appendix A.

The analytical data generated from the laboratory analyses of these RFI samples are suitable for use as documented in the data review and validation memoranda provided in Appendix E.

4.7.2 Discussion of Results

Soil sample results from the initial RFI sampling activities exceeded the soil screening criteria within AOI 7 for one compound; arsenic. The following provides more detailed information regarding the soil RFI results:

- Arsenic was reported at one soil sample location above screening criteria at 11 mg/kg. These results are above the RSL for Industrial soil (1.6 mg/kg).
- All other compounds analyzed were reported below the screening criteria.

During the second round of RFI soil sampling activities all compounds analyzed were reported below the screening criteria.

The RFI soil screening results within AOI 7 are summarized in Appendix D and on Figures 4.7.1 and 4.7.2. The data validation memoranda and analytical data summary tables are presented in Appendix C.

4.7.3 Conclusions

The results of the soil RFI within AOI 7 indicate that all compounds exceeding screening criteria have been delineated to screening criteria or adequate data have been collected for the HHRA and ERA. The soil sampling conducted during the initial RFI phase adequately characterized the

constituents within AOI 4. The potential significance of all detected concentrations from the soil RFI is evaluated in the HHRA and ERA provided in Sections 6 and 7, respectively, in this Report.

4.8 AOI 8 – Former Fuel Oil Tank Area

AOI 8 is located in the northwestern portion of the Site. This area covers approximately 1.5 acres. This area included the former 2,310,000-gallon fuel oil tank and the earth dyke that surrounded the tank (Fisher Guide, November 1985).

4.8.1 Scope and Results

The scope of the RFI field investigations at AOI 8 consisted of the collection of soil samples to define the nature and extent of hazardous constituents released into soil as a result of the former operations at AOI 8. The RFI sampling locations for soil are indicated on Figures 4.8.1 and 4.8.2.

The following paragraphs summarize the sampling activities conducted for soil at AOI 8:

Soil

During the initial RFI soil investigation four soil samples were collected during the installation of two soil borings. All four soil samples were analyzed for VOCs, SVOCs, metals, and hexavalent chromium. A sample summary is presented in Table 4.8.1.

A second round of soil sampling was completed in order to more fully delineate metals within AOI 7. This work was covered under the ASAP. An additional 12 soil borings were installed within AOI 8 and 13 soil samples, including one duplicate, were submitted for laboratory analysis. All samples were analyzed for cobalt, copper, manganese, nickel, and zinc. Sample locations are presented on Figure 4.8.2 and a sample summary is presented in Table 4.8.2.

The field activities were conducted in accordance with methods described in the RFI Work Plan and ASAP. The stratigraphic logs for the borings are provided in Appendix A.

The analytical data generated from the laboratory analyses of these RFI samples are suitable for use as documented in the data review and validation memoranda provided in Appendix E.

4.8.2 Discussion of Results

Soil sample results from the initial RFI sampling activities exceeded the soil screening criteria within AOI 8 for one compound; arsenic. The following provides more detailed information regarding the soil RFI results:

- Arsenic was reported at three soil sample locations above screening criteria ranging from 2.2 to 26 mg/kg. These results are above the RSL for Industrial soil (1.6 mg/kg).
- All other compounds analyzed were reported below the screening criteria.

During the second round of RFI soil sampling activities all compounds analyzed were reported below the screening criteria except for copper. Copper was reported at one location above the screening criteria at 69,000 mg/kg which is above the screening criteria of 40,000 mg/kg.

The RFI soil screening results within AOI 8 are summarized in Appendix D and on Figures 4.8.1 and 4.8.2. The data validation memoranda and analytical data summary tables are presented in Appendix C.

4.8.3 Conclusions

The results of the soil RFI within AOI 8 indicate that all compounds exceeding screening criteria have been delineated to screening criteria or adequate data have been collected for the HHRA and ERA. The soil sampling conducted during the initial RFI phase adequately characterized the constituents within AOI 8. The potential significance of all detected concentrations from the soil RFI is evaluated in the HHRA and ERA provided in Sections 6 and 7, respectively, in this Report.

4.9 AOI 9 – Sitewide Groundwater

In order to evaluate concentrations of VOCs present in groundwater RACER sampled onsite and offsite monitoring wells using low-flow sampling techniques from 2011 to 2014. Groundwater water levels were also recorded at all existing monitoring wells at the Site prior to completing each sampling round.

4.9.1 Scope and Results

The scope of the RFI field investigation at AOI 9 consisted of the collection of groundwater samples to define the nature and extent of hazardous constituents released into groundwater as a result of the former operations at the site. Sample locations and results are shown on Figures 4.9.1 and 4.9.2 for all groundwater sampling events and a sample summary for all

groundwater sampling events is presented in Table 4.9.1. The following paragraphs summarize the sampling activities conducted for groundwater at AOI 9:

AOI-09 Groundwater

During the RFI groundwater investigation, over 350 groundwater samples were collected from 56 monitoring wells located on and off-Site. Samples were collected from 2011 through 2014 and analyzed for VOCs. Monitoring as part of post closure care of the landfill was also conducted but no evidence of a release has been noted and the data is not included in this RFI.

As discussed in Section 3.5 and Appendix F, the Till contact and bedrock stratigraphy appears to be a single hydrogeological unit relative to groundwater flow direction. The groundwater elevations in both the Till contact and bedrock are similar and produce similar contours. Groundwater flows generally to the northeast beneath the landfill and southern portion of the site. As described in Appendix F, the groundwater flow in the northern portion of the site is influenced by existing storm sewers. In the northern area, groundwater flow is inward toward the storm sewers (Appendix F). The storm sewers appear to prevent off-site migration of groundwater and acts similar to a gaining stream.

To better understand the vertical extent and evaluate potential volatilization to indoor air, the monitoring wells screened in each stratigraphy are summarized separately. The monitoring well locations and summary of groundwater data are provided Table 4.9.1 and summarized in Figures 4.9.1 and 4.9.2. Two areas of groundwater contamination are evident; 1) off-site and extending on-Site in the vicinity of the former WWTP and 2) adjacent to the Southern Former Die Storage Area (AOI-7). Based on groundwater flow direction, migration of contamination in groundwater is limited by the influence of the storm sewer network.

As presented in Appendix F, samples from the storm sewer were collected on 31 August 2015. Outfall 001 location is an enclosed confluence of the site sewer system prior to leaving the site. Concentrations of 1,2-dichloroethene, trichloroethene and vinyl chloride were detected in the sewer sample at concentrations less than the OMZA surface water quality criteria. These results provide additional evidence that groundwater discharges to the storm sewer.

4.9.2 Discussion of Results

Groundwater sample results from the initial RFI sampling activities from on-Site and off-Site (upgradient) exceeded the MCLs for four compounds; cis-1,2-Dichloroethene, trans-1,2-Dichloroethene, and Trichloroethene, and Vinyl Chloride. As shown in Appendix F, two areas of groundwater contamination are evident; 1) off-site and extending on-Site in the vicinity of the former WWTP and 2) adjacent to the Southern Former Die Storage Area (AOI-7). Other

compounds analyzed were reported below the screening criteria for all other monitoring wells (Table 4.9.1). The potential migration of these constituents from the site in groundwater is controlled by the existing storm sewer network. The concentrations of volatile compounds in a sample collected from the storm sewer at the property boundary were less than the OMZA surface water quality criteria.

4.9.3 Conclusions

The results of the sitewide groundwater sampling indicate that compounds exceeding the MCLs have been delineated on-Site. The contamination present in the vicinity of the former facility's WWTP appears to be related to a release on the adjacent parcel. Groundwater contamination is present adjacent to the Southern Former Die Storage Area. The potential for constituents in groundwater to migrate off-site is limited by the existing storm sewers that cross through the Site.

Section 5.0 Human Health Risk Assessment (HHRA)

5.1 Objectives of the HHRA

The purpose of the HHRA is to evaluate the potential human health risks posed by Site media under potential current and future Site conditions, assuming no additional remedial actions are taken at the Site. The specific goals of the risk assessments are:

- Identify and provide analysis of baseline risks (defined as risks that might exist if no further remediation were applied at the Site) and identify what areas of the Site may require further remedial action
- Provide a basis for determining the level of chemicals that can remain on Site and still not adversely impact public health
- Provide a basis for comparing potential health impacts of various remedial alternatives

The HHRA was conducted in accordance with the following United States EPA (USEPA) guidance:

- USEPA Risk Assessment Guidance for Superfund (RAGS): Volume 1 - Human Health Evaluation Manual (Part A), Interim Final, EPA/540/1-89/002, December 1989 (USEPA, 1989)

- USEPA RAGS: Volume 1 – Human Health Evaluation Manual Supplemental Guidance, Standard Default Exposure Factors, Interim Final, OSWER Directive 9285.6-03, March 25, 1991 (USEPA, 1991a)
- USEPA RAGS: Volume 1 – Human Health Evaluation Manual (Part B, Development of Risk-Based Preliminary Remediation Goals), Interim, EPA/540/R-92/003, December 1991 (USEPA, 1991b)
- USEPA Assessing Dermal Exposure from Soil, Region III Technical Guidance Manual Risk Assessment, EPA/903-K-95-003, December 1995 (USEPA, 1995)
- USEPA Region 4 Human Health Risk Assessment Bulletins – Supplement to RAGS, Section 4: Exposure Assessment, May 2000 (USEPA, 2000)
- USEPA RAGS: Volume 1 – Human Health Evaluation Manual (Part D, Standardized Planning, Reporting, and Review of Superfund Risk Assessments), Final, Publication 9285.7-47, December 2001 (USEPA, 2001)
- USEPA Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites, OSWER 9355.4-24, December 2002 (USEPA, 2002)
- USEPA RAGS: Volume 1 – Human Health Evaluation Manual (Part E, Supplemental Guidance For Dermal Risk Assessment), Final, EPA/540/R/99/005, OSWER Directive 9285.7-02EP, PB99-963312, July 2004 (USEPA, 2004)
- USEPA Child-Specific Exposure Factors Handbook, September 2008 (USEPA, 2008)
- USEPA RAGS: Volume 1 – Human Health Evaluation Manual (Part F, Supplemental Guidance for Inhalation Risk Assessment, Final, EPA-540-R-070-002, OSWER 9285.7-82, January 2009 (USEPA, 2009)

5.2 Site Characterization

5.2.1 Conceptual Site Model

In order to evaluate the significance of the impacted media at the Site, the potential pathways by which individuals may come in contact with these media must be determined. The combination of factors (chemical source, media of concern, release mechanisms, and potential receptors) that could produce a complete exposure pathway and lead to human uptake of chemicals at the Site are assessed in what is defined as a Conceptual Site Model (CSM). The following human receptors have been identified based on current and future use of the Site: trespasser; industrial/commercial worker; and construction/utility worker.

Potentially impacted media at the Site include surface soil and subsurface soil. Human receptors potentially exposed to impacted surface and subsurface soils include trespassers,

industrial/commercial workers, and construction/utility workers through direct contact (incidental ingestion and dermal contact) and inhalation of soil particulates/volatiles.

5.2.2 Selection of Chemicals of Potential Concern (COPCs)

This section presents the process for establishing the chemicals of potential concern (COPCs) for the Site. COPCs are chemicals related to the Site that pose the greatest potential public health risk. In general, detected chemicals are identified as COPCs based upon their concentrations and known toxicity characteristics.

Chemicals are identified as COPCs if the maximum detected Site concentration exceeds applicable screening criteria identified for each medium. The screening criteria for surface and subsurface soils were the Ohio VAP Table II: Generic Direct Contact Soil Standards for Carcinogenic and Non-Carcinogenic Chemicals of Concern, Commercial and Industrial Land Use Categories, OAC 3745-300-08 (C)(3), Ohio Voluntary Action Program, March 1, 2009 (Ohio VAP, 2009) and USEPA Regional Screening Level (RSL) Summary Table, Industrial Soil, November 2013 (USEPA, 2013).

5.2.3 Summary of Selected COPCs

All chemicals determined to be present at concentrations exceeding applicable screening criteria were identified as COPCs for the investigated medium. The COPCs were identified on a Site Wide basis for volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) and Area basis for metals as discussed below. Based on Ohio EPA's comment letter dated December 18, 2013, benzo(a)pyrene, arsenic, hexavalent chromium, and thallium do not need to be included and as such were excluded as COPCs in the risk assessment regardless if their maximum concentration was greater than the applicable screening criteria.

Site Wide

In August 2011, a total of 14 surface and subsurface soil samples were collected at the Site and analyzed for VOCs and SVOCs. In addition, one soil sample was analyzed dioxins/furans. As presented in Table 5.2.1, none of the analytes exceeded their screening value, and therefore Site Wide was not evaluated further in the HHRA.

Open Burn Area

In August 2011, a total of three subsurface soil samples were collected within the Open Burn Area and analyzed for metals. In addition, 12 surface and subsurface soil samples were collected in July 2013 and analyzed for selected metals. As presented in Table 5.2.2,

manganese was detected at a maximum concentration greater than the screening value, and therefore was identified as a COPC for the Open Burn Area.

Northern Sludge Area

In August 2011, a total of four surface and subsurface soil samples were collected within the Northern Sludge Area and analyzed for metals. In addition, 26 surface and subsurface soil samples were collected in July 2013 and analyzed for selected metals. As presented in Table 5.2.3, cobalt, copper, manganese, and nickel were detected at maximum concentrations greater than the screening values, and therefore were identified as COPCs for the Northern Sludge Area.

Southern Sludge Area

In August 2011, a total of four subsurface soil samples were collected within the Southern Sludge Area and analyzed for metals. In addition, 25 surface and subsurface soil samples were collected in July 2013 and analyzed for selected metals. As presented in Table 5.2.4, cobalt, copper, and nickel were detected at maximum concentrations greater than the screening values, and therefore were identified as COPCs for the Southern Sludge Area.

Southern Trench Area

In August 2011, a total of four subsurface soil samples were collected within the Southern Trench Area and analyzed for metals. In addition, 12 surface and subsurface soil samples were collected in July 2013 and analyzed for selected metals. As presented in Table 5.2.5, copper, manganese, and nickel were detected at maximum concentrations greater than the screening values, and therefore were identified as COPCs for the Southern Trench Area.

Northern Trench Area

In August 2011, a total of four subsurface soil samples were collected within the Northern Trench Area and analyzed for metals. As presented in Table 5.2.6, none of the analytes exceeded their screening value, and therefore the Northern Trench Area was not evaluated further in the HHRA.

Southern Die Storage Area

In August 2011, a total of two surface and subsurface soil samples were collected within the Southern Die Storage Area and analyzed for metals. In addition, 13 surface and subsurface soil samples were collected in July 2013 and analyzed for selected metals. As presented in Table 5.2.7, copper, manganese, and nickel were detected at maximum concentrations greater

than the screening values, and therefore were identified as COPCs for the Southern Die Storage Area.

Northern Die Storage Area

In August 2011, a total of two subsurface soil samples were collected within the Northern Die Storage Area and analyzed for metals. In addition, 32 surface and subsurface soil samples were collected in July 2013 and analyzed for selected metals. As presented in Table 5.2.8, cobalt, copper, manganese, nickel, and zinc were detected at maximum concentrations greater than the screening values, and therefore were identified as COPCs for the Northern Die Storage Area.

Former Fuel Oil Tank Area

In August 2011, a total of four subsurface soil samples were collected within the Former Fuel Oil Tank Area and analyzed for metals. In addition, 23 surface and subsurface soil samples were collected in July 2013 and analyzed for selected metals. As presented in Table 5.2.9, copper, manganese, nickel, and zinc were detected at maximum concentrations greater than the screening values, and therefore were identified as COPCs for the Former Fuel Oil Tank Area.

5.3 Exposure Assessment

Exposure is defined as the contact of a receptor (i.e., person) with a chemical or physical agent. The exposure assessment is the estimation of the magnitude, frequency, duration, and routes of exposure. An exposure assessment provides a systematic analysis of the potential exposure mechanism by which a receptor may be exposed to chemical or physical agents at or originating from a study area. The objectives of an exposure assessment are as follows:

1. Characterization of exposure setting
2. Identification of potential exposure pathways
3. Quantification of exposure

5.3.1 Characterization of Exposure Setting

As part of the HHRA process, potential exposure pathways are determined through an evaluation of the physical setting of the Site and the potentially exposed populations. The consideration of Site-specific factors related to land usage is important in the development of realistic exposure scenarios and quantification of risks and hazards. The current and future potential land uses that are reasonably expected for the Site determine what populations may potentially be exposed. The Site land uses are discussed in the following subsections.

Current Land Use

Currently the Site is vacant and trespassers are currently the only potentially exposed populations. As a result, the current receptors at the Site are trespassers.

Future Land Use

Since the Site use is not expected to change, the potential future receptors for the Site is the same as the current use. Should the Site be redeveloped in the future some below-grade excavation or construction activity would be required. As a result, future potential construction/utility worker exposures to Site conditions were evaluated in the HHRA. If the Site was redeveloped, then an industrial/commercial worker exposure to Site conditions was also evaluated in the HHRA.

The future potentially exposed population includes industrial/commercial workers, construction/utility workers, and persons who may infrequently trespass on the Site.

5.3.2 Identification of Potential Exposure Pathways

An exposure pathway describes a mechanism by which humans may come into contact with Site-related COPCs. An exposure pathway is complete (i.e., it could result in a receptor contacting a COPC) if the following four elements are present:

1. A source or a release from a source (e.g., COPCs released to soil due to historical releases during plant operations)
2. A probable environmental migration route of a site-related COPC (e.g., leaching or partitioning from one medium to another)
3. An exposure point where a receptor may come in contact with a site-related COPC (e.g., surface and subsurface soil)
4. A route by which a site-related COPC may enter a potential receptor's body (e.g., ingestion, dermal contact, or inhalation)

If any of these four elements are not present, the exposure pathway is considered incomplete and does not contribute to the total exposure from the Site.

As discussed in Section 2.0, there are areas of the Site where media have been impacted due to releases during former industrial operations. Therefore, the first element necessary for a complete exposure pathway is satisfied at several areas of the Site. The remaining three elements are discussed in the following sections.

5.3.2.1 Potential Migration Routes

Many complex factors control the partitioning of a COPC in the environment; thus measured concentrations at the Site only represent Site conditions at a discrete point in time. An understanding of the general fate and transport characteristics of the COPCs are important when predicting future exposure, linking sources with currently contaminated media, and identifying potentially complete pathways to Site media. Therefore, the fate and transport analysis conducted at this stage of the exposure assessment is not intended to provide a quantitative evaluation of media-specific COPC concentrations; it is meant to identify media that are likely to receive Site-related COPCs.

The following sections provide a fate and transport evaluation to determine the relative significance of the release sources and mechanisms. The concentration and distribution of COPCs in the environment are constantly subject to change due to dispersal by wind and water, and chemical and biological degradation by microorganisms. Once released to the environment, COPCs can partition between air, water, sediment, soil, and biota, and be subsequently subjected to one or more of the following processes:

1. Transportation (e.g., convection by wind or water)
2. Physical transformation (e.g., volatilization, precipitation)
3. Chemical transformation (e.g., photolysis, hydrolysis, oxidation, reduction)
4. Biological transformation (e.g., biodegradation, metabolization by plants or animals)
5. Accumulation in one or more media

Several transport mechanisms, such as convection by wind or water of soil particles, are controlled primarily by the physical characteristics of the Site, and thus are essentially the same for all COPCs. However, other transport and transformation processes, such as volatilization, sorption, and biodegradation, depend on certain physical and chemical properties, and therefore vary for each COPC. As metals are the only COPCs, wind transport of the soil particles is the only considered transport mechanism.

5.3.2.2 Potential Exposure Points

COPCs have been identified in soils and as indicated in Sections 3.1.1 and 3.1.2, there is a potential for trespasser to be exposed to COPCs in the soils. Should the Site be redeveloped, then an industrial/commercial and construction/utility workers could be exposed to the COPCs in the soils in the future.

5.3.2.3 Potential Exposure Routes

An exposure route is the fourth element of an exposure pathway. Exposure routes are identified by: i) determining the COPC sources and receiving media, ii) analyzing the movement of the COPCs from the source (Section 3.2.1), and iii) determining the possible exposure points (Section 3.2.2).

Humans can be exposed to a variety of contaminated media, including soil, groundwater, and air that has contact with other contaminated media. As presented in Section 2.7.1, metals were identified as COPCs in surface and subsurface soils. Therefore, the potential exposure routes are based on exposure to soils at the Site. Potential exposure routes associated with Site soils include incidental ingestion, direct dermal contact, and inhalation of particulates in the ambient air.

5.3.2.4 Exposure Scenarios and Completed Exposure Pathways

Based on an understanding of the four components of an exposure pathway and the current/future conditions of the Site, human exposure pathways were identified. As discussed in Section 2.6, the potential human populations considered relevant to the HHRA for current and future Site conditions include an adolescent trespasser, industrial/commercial workers, and construction/utility workers. Access to the Site is restricted by a perimeter fence thus it is unlikely that trespassers would actively frequent the Site. However, a hypothetical Site trespasser exposure to Site media was evaluated in the HHRA.

The following media and potential human exposures (i.e., complete pathways) were identified for quantitative evaluation in the HHRA:

1. Surface and Subsurface Soil – Current/Future Condition:
    - Incidental ingestion of soils by adolescent trespassers, industrial/commercial workers, and construction/utility workers
    - Dermal contact with soils by adolescent trespassers, industrial/commercial workers, and construction/utility workers
    - Inhalation of COPC's particulates in ambient air

5.3.3 Quantification of Exposure

To quantify exposure, potential exposure scenarios were developed using guidance presented in the following USEPA documents:

- USEPA Risk Assessment Guidance for Superfund (RAGS): Volume 1 - Human Health Evaluation Manual (Part A), Interim Final, EPA/540/1-89/002, December 1989 (USEPA, 1989)
- USEPA RAGS:Volume 1 – Human Health Evaluation Manual Supplemental Guidance, Standard Default Exposure Factors, Interim Final, OSWER Directive 9285.6-03, March 25, 1991 (USEPA, 1991a)
- USEPA RAGS: Volume 1 – Human Health Evaluation Manual (Part B, Development of Risk-Based Preliminary Remediation Goals), Interim, EPA/540/R-92/003, December 1991 (USEPA, 1991b)
- USEPA Region 4 Human Health Risk Assessment Bulletins – Supplement to RAGS, Section 4: Exposure Assessment, May 2000 (USEPA, 2000)
- USEPA RAGS:Volume 1 – Human Health Evaluation Manual (Part D, Standardized Planning, Reporting, and Review of Superfund Risk Assessments), Final, Publication 9285.7-47, December 2001 (USEPA, 2001)
- USEPA Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites, OSWER 9355.4-24, December 2002 (USEPA, 2002)

Two levels of exposure scenarios are presented. The Central Tendency (CT) presents the average or mean exposure, and approximates the most probable exposure conditions. The Reasonable Maximum Exposure (RME) presents a conservative exposure scenario that generally utilizes the 90th to 95th percentile assumptions, depending upon available data.

The CT and RME values for the various exposure scenarios were determined based on the observed data distribution and the percentage of censored data points (non-detected results). The CT and RME exposure point concentrations (EPCs) are conservatively based on the

95 percent Upper Confidence Limit (UCL) of the mean. For each COPC, the 95 percent UCL was calculated using USEPA's ProUCL software Version 5.0 (2013). ProUCL 5.0 contains statistical methods to address data sets both with and without non-detects and computes the 95 percent UCL for a given data set by a variety of alternative statistical approaches (including several approaches that do not require the assumption of normality or log-normality). ProUCL 5.0 then recommends specific UCL values as being the most appropriate for that particular data set. For EPCs based on a 95 percent UCL, the distribution type and specific 95 percent UCL type selected by the ProUCL software are indicated in the EPC table. Non-detect and duplicate results were handled as follows:

- The reported detection limit (RDL) was considered for non-detect results in the calculation 95 percent UCL values
- Arithmetic mean calculations used the RDL to account for non-detect results
- Only data deemed usable based on the data validation process were included
- Duplicate samples were averaged to calculate EPCs
- In cases where more than one 95 percent UCL was calculated by ProUCL, the greater of the two values was assigned as the EPC for that analyte

Appendix A contains the ProUCL 5.0 outputs for COPCs in each Area.

The arithmetic mean, maximum, and 95 percent UCL concentrations for COPCs in soils for each Area are summarized in the following tables:

- Table5.3.1 – Open Burn Area
- Table 5.3.2 – Northern Sludge Area
- Table 5.3.3 – Southern Sludge Area
- Table 5.3.4 – Southern Trench Area
- Table 5.3.5 – Southern Die Storage Area
- Table 5.3.6 – Northern Die Storage Area
- Table 5.3.7 – Former Fuel Oil Tank Area

5.3.3.1 Specific Intake Equations

The following sections provide intake equations for ingestion, dermal, and inhalation exposure to soils, which were applied in the HHRA. In the HHRA, exposure estimates reflect chemical

concentration, contact rate, exposure time, and body weight in a term called "intake" or "dose".

Ambient Air Inhalation Intake Equation

The intake equation for calculating chemical intake from the inhalation of ambient air (USEPA, 1989) is:

$$I = \frac{C \times FT \times EF \times ED}{PEF \times AT}$$

Where:

I	=	Chemical intake (mg/m^3)
C	=	Chemical concentration in soil (mg/kg)
FT	=	Fraction of time exposed (hours/24 hours)
EF	=	Exposure frequency (days/year)
ED	=	Exposure duration (years)
PEF	=	Particulate Emission Factor (m^3/kg)
AT	=	Averaging time (averaging period, days)

Soil Incidental Ingestion Intake Equation

The intake equation for calculating chemical intake from the incidental ingestion of soil (USEPA, 1989) is:

$$I = \frac{C \times IR \times CF \times EF \times ED}{BW \times AT}$$

Where:

I	=	Chemical intake (mg/kg body weight/day)
C	=	Chemical concentration in soil (mg/kg)
IR	=	Incidental ingestion rate (mg/day)
CF	=	Conversion Factor (kg/mg)
EF	=	Exposure frequency (days/year)
ED	=	Exposure duration (years)
BW	=	Body weight (kg)
AT	=	Averaging time (averaging period, days)

Soil Dermal Contact Intake Equation

The intake equation for calculating chemical intake from dermal exposure to groundwater during excavation activities that expose groundwater (USEPA, 1989) is:

$$I = \frac{C \times CF \times SA \times AF \times ABS \times EF \times ED}{BW \times AT}$$

Where:

I	=	Chemical intake (mg/kg body weight/day)
C	=	Chemical concentration in soil (mg/kg)
CF	=	Conversion Factor (kg/mg)
SA	=	Skin surface area available for contact (cm^2)
AF	=	Adherence Factor (mg/cm^2)
ABS	=	Absorption Factor (%/100)
EF	=	Exposure frequency (days/year)
ED	=	Exposure duration (years)
BW	=	Body weight (kg)
AT	=	Averaging time (averaging period, days)

5.3.3.2 Exposure Scenario Assumptions

Different exposure scenarios were developed for each receptor population that was evaluated in the HHRA. Descriptions of each exposure scenario and associated exposure assumptions are presented in the following subsections.

Receptor characteristics had values assigned for CT and RME scenarios. In some cases these values differed between scenarios (e.g., exposure concentration, exposure frequency, etc.) and in other cases these values were the same for both CT and RME scenarios (e.g., body weight, skin surface area, soil ingestion rate, etc.). The assignment of receptor characteristics by scenarios followed standard practices used by regulating agencies and risk assessment professionals. The specific values used are presented in the following sections.

Exposure scenario assumptions applied for the trespasser, industrial/commercial worker, and construction/utility worker are presented in the following table references and summarized in the sections below:

- Table 5.3.8: Trespasser exposure to soils
- Table 5.3.9: Industrial/Commercial Worker exposure to soils
- Table 5.3.10: Construction/Utility Worker exposure to soils

Trespasser Exposure to Soils

Exposure Factor	*Units*	*Scenario*	*Trespasser*
Ingestion Rate	mg/day	CT and RME	100
Skin Surface Area	cm^2	CT and RME	3,900 [a]
Adherence Factor	mg/cm^2	CT	0.04
		RME	0.2
Absorption Factor - dermal	%/100	CT and RME	chemical-specific
Fraction of Time Exposed	unitless	CT	1.7/24 [b]
		RME	3.4/24 [b]
Conversion Factor	kg/mg	CT and RME	1.0E-06
Particulate Emission Factor	kg/m^3	CT and RME	9.24E+08
Exposure Frequency	days/year	CT	25 [c]
		RME	50 [c]
Exposure Duration	years	CT and RME	10 [d]
Body Weight	kg	CT and RME	56.8
Carcinogenic Averaging Time	days	CT and RME	25,550
Non-Carcinogenic Averaging Time	days	CT	3,650

Notes:

a The basis for SA is the 50th percentile value from Table 7-1, Recommended Values for Total Body Surface Area, Males and Females Combined. The total body surface area was multiplied by 0.25 (25 percent) to account for exposed skin.

b The basis for the FT is the 50th percentile from Table 16-1, Recommended Values for Activity Factors - Time Outdoors (total). The time spent outdoors for 11 to 16 years old of 100 min/day equates to 1.7 hours (CT) [100/60]. The RME is double the CT value for 3.4 hours.

c The basis for the EF is the 50th percentile from Table 16-1, Recommended Values for Activity Factors - Time Outdoors (total). The time spent outdoors for 11 to 16 years old of 100 min/day from out of a possible 365 days equates to 25 days (CT) [(100 min/d/1,440 total min/d)*365]. The RME is double the CT value for 50 days.

d Trespasser is a 7- through 16-year-old therefore the exposure duration is 10 years, based on USEPA Region 4 (2000).

Industrial/Commercial Worker Exposure to Soils

Exposure Factor	*Units*	*Scenario*	*Industrial/Commercial Worker*
Ingestion Rate	mg/day	CT and RME	100
Skin Surface Area	cm^2	CT and RME	3,300
Adherence Factor	mg/cm^2	CT	0.02
		RME	0.2
Absorption Factor - dermal	%/100	CT and RME	chemical-specific
Conversion Factor	kg/mg	CT and RME	1.0E-06
Fraction of Time Exposed	unitless	CT and RME	8/24
Particulate Emission Factor	kg/m^3	CT and RME	9.24E+08
Exposure Frequency	days/year	CT	219
		RME	250
Exposure Duration	years	CT	9
		RME	25
Body Weight	kg	CT and RME	70
Carcinogenic Averaging Time	days	CT and RME	25,550
Non-Carcinogenic Averaging Time	days	CT	3,285
		RME	9,125

Construction/Utility Worker Exposure to Soils

Exposure Factor	*Units*	*Scenario*	*Construction/Utility Worker*
Ingestion Rate	mg/day	CT and RME	330
Skin Surface Area	cm^2	CT and RME	3,300
Adherence Factor	mg/cm^2	CT	0.1
		RME	0.3
Absorption Factor - dermal	%/100	CT and RME	chemical-specific
Conversion Factor	kg/mg	CT and RME	1.0E-06
Fraction of Time Exposed	unitless	CT and RME	8/24
Particulate Emission Factor	kg/m^3	CT and RME	area specific [a]
Exposure Frequency	days/year	CT	120
		RME	250
Exposure Duration	years	CT and RME	1

Exposure Factor	*Units*	*Scenario*	*Construction/Utility Worker*
Body Weight	kg	CT and RME	70
Carcinogenic Averaging Time	days	CT and RME	25,550
Non-Carcinogenic Averaging Time	days	CT and RME	3655

Note:

a Refer to Table 5.3.11for derivation of particulate emission factor

The particulate emission factor (PEF) for the construction/utility worker in Table 5.3.11was calculated consistent with the methodology presented in USEPA (2002).

5.4 Toxicity Assessment

The toxicity assessment weighs the available evidence regarding the potential for particular COPCs to cause adverse effects in exposed individuals and estimates the extent of exposure and possible severity of adverse effects. To develop toxicity values, two steps are taken: hazard identification and dose-response assessment. The hazard identification determines the potential adverse effects associated with exposure to a COPC. In the dose-response assessment, numerical toxicity values are determined or selected from the available toxicity data.

In the selection of toxicity values, preference has been given to the most recently developed values because these would incorporate the most recent toxicological information and would provide the best basis upon which to assess potential health hazards/risks. Toxicity values were obtained from the USEPA IRIS (Integrated Risk Information System) database (USEPA, 2011b).

5.4.1 Non-carcinogenic Hazards

Toxicity Information for Non-carcinogenic Effects

For substances suspected to cause non-carcinogenic chronic effects, the health criteria are usually expressed as chronic intake levels or Reference Dose (RfDs) [in units of mg/(kg-day)] or Reference Concentration (RfCs) [in units of mg/m^3] below which, no adverse effects are expected. In other words, there is a level of exposure to a chemical below which no toxic effects are expected. In contrast to the toxicological model used to assess carcinogenic risk, which assumes no concentration threshold, the non-carcinogenic dose-response model postulates a "threshold".

In this risk assessment, chronic RfDs and RfCs are used as the toxicity values for non-carcinogenic health effects. Chronic RfD and RfC are defined as an estimate (with an uncertainty spanning an order of magnitude or greater) of a daily exposure level for the human population, including sensitive sub-populations, which poses no appreciable risk of deleterious effects over a lifetime of exposure. Uncertainty factors are incorporated into the RfDs or RfCs to account for extrapolations from animal toxicity data, data quality, and to protect sensitive sub-populations. The basis of an RfD or RfC is usually the highest dose/concentration level administered to laboratory animals that did not cause observable adverse effects after chronic (usually lifetime) exposure. This is called the No-Observed Adverse Effect Level (NOAEL). The NOAEL is then divided by an uncertainty (safety) factor, and sometimes an additional modifying factor, to obtain the RfD or RfC. In general, an uncertainty factor of 10 is used to account for interspecies variation and another factor of 10 to account for sensitive human populations. Additional factors of 10 are included in the uncertainty factor if the RfD is based on the Lowest-Observed Adverse Effect Level (LOAEL) instead of the NOAEL, or if data inadequacies are present (e.g., the experiment for which the RfD was derived had less than lifetime exposure). The LOAEL is the dose or concentration level administered to laboratory animals that causes the lowest adverse effect (i.e., liver toxicity - although this is species and chemical-specific) after chronic exposure.

The non-cancer toxicity data (RfDs) are used to estimate human health effects for oral and dermal exposure routes for the COPCs and are presented in Table 5.4.1. Dermal RfDs were adjusted consistent with USEPA (2004). The RfCs used for the inhalation exposure route are presented in Table 5.4.2.

5.4.2 Carcinogenic Risks

Toxicity Information for Carcinogenic Effects

Cancer Slope Factors (CSFs) and inhalation unit risk factors (URFs) are quantitative risk estimates of carcinogenic potency. Slope factors and URFs relate the lifetime probability of excess cancers to the lifetime average exposure dose/concentration of a substance. CSFs and URFs are estimated using mathematical extrapolation models, most commonly the linearized multistage (LMS) model, and are presented as risk per mg/(kg-day) (i.e., mg carcinogen per kg body weight per day) for oral CSF and risk per mg/m3 for inhalation URF. These models assume low dose-response linearity and thus may not be appropriate for some suspect carcinogens, in particular those that function as promoters. As well, the body's natural repair processes and defense mechanisms may decrease cancer risk at low exposure levels. Thus, the risks at lower exposure levels are likely overestimated using the LMS model. When adequate human epidemiology data are available, maximum likelihood estimates (MLEs) of model parameters are used to generate a CSF or URF. When only animal data are available, the CSF is derived

from the largest possible linear slope that is consistent with the data (within the upper 95 percent confidence limit). In other words, the true risk to humans, while not identifiable, is not likely to exceed the upper-bound estimate. This is a conservative estimate, and in some cases a linear slope of zero may be as appropriate for the data (i.e., no carcinogenic risk).

Known or suspect human carcinogens have been evaluated and identified by the Carcinogen Assessment Group using the USEPA Weight-of-Evidence approach for carcinogenicity classification (HEAST, 1997). The USEPA classification is based on an evaluation of the likelihood that the agent is a human carcinogen. The evidence is characterized separately for human and animal studies as follows:

Group A: Known Human Carcinogen (sufficient evidence of carcinogenicity in humans)
Group B: Probable Human Carcinogen (B1 - limited evidence of carcinogenicity in humans; B2 - sufficient evidence of carcinogenicity in animals with inadequate or lack of evidence in humans)
Group C: Possible Human Carcinogen (limited evidence of carcinogenicity in animals and inadequate or lack of human data)
Group D: Not Classifiable as to Human Carcinogenicity (inadequate or no evidence)
Group E: Evidence of Noncarcinogenicity for Humans (no evidence of carcinogenicity in animal studies)

The COPCs were classified utilizing the USEPA system. The oral and dermal cancer toxicity data (CSFs) used in the HHRA to estimate the risk of cancer for the oral and dermal exposure routes are presented in Table 5.4.3. Dermal CSFs were adjusted consistent with USEPA (2004). The URFs used for the inhalation exposure route are presented in Table 5.4.4.

5.4.3 Potential Risk from Carcinogens

A CSF or URF is applied to estimate the potential risk of cancer from exposure to carcinogenic chemicals. The CSF or URF, when multiplied by the lifetime average daily intake, provides an estimate of the probability that the intake will cause cancer during the lifetime of the exposed individual. This increased cancer risk is expressed, for example, as 1×10^{-6} or 1.0E-06 (one in one million increased cancer risk). This is an upper limit estimate of the risk, based on very conservative health-protective assumptions and conservative statistical evaluations of data from animal experiments or epidemiological studies. To state that a chemical exposure causes a 1E-06 added upper limit risk of cancer means that if 1,000,000 people are exposed to this concentration of the chemical for their lifetimes, a maximum of one additional incident of cancer may occur. This is a very conservative estimate, and, in fact, there may be no additional cases of cancer due to the chemical exposure.

5.5 Risk Characterization

The objective of this risk characterization is to integrate information developed in the exposure assessment (Section 3.0) and the toxicity assessment (Section 4.0) into a complete evaluation of the potential human health risks associated with exposure to potentially contaminated soil, groundwater, and air at the Site. The methods used in this risk characterization are based on Ohio EPA and USEPA HHRA guidance for human exposures (USEPA, 1989, 1991a, 1991b, 2000, 2001, 2002, 2004, 2008, 2009, 2011).

5.5.1 Hazard Estimates

The potential for non-cancer health effects from exposure to a COPC is evaluated by comparing an exposure level over a specified time period to a reference dose (RfD) for a similar time period. This ratio, termed the hazard quotient, is calculated according to the following general equation:

$$HQ = \frac{CDI}{RfD \text{ or } RfC}$$

Where:

HQ = The Hazard Quotient (unitless) is the ratio of the exposure dose of a chemical to a reference dose not expected to cause adverse effects from a lifetime exposure. A hazard quotient equal to or below 1.0 is considered protective of human health.

CDI = The Chronic Daily Intake is the chemical dose or concentration calculated by applying the exposure scenario assumptions and expressed as mg/(kg-day) or mg/m^3. The intake represents the average daily chemical dose or concentration over the expected period of exposure.

RfD = The Reference Dose is a daily dose believed not to cause an adverse effect from even a lifetime exposure [mg/(kg-day)]. The RfD is based on experimental data and/or epidemiological studies.

RfC = The Reference Concentration is a daily concentration believed not to cause an adverse effect from even a lifetime exposure [mg/m^3]. The RfC is based on experimental data.

The Hazard Index (HI) is the sum of Hazard Quotients for individual COPCs for a specific exposure scenario.

The calculated HIs resulting from exposure to the COPCs are compared to an HI of 1. A HI equal to or below 1.0 is considered protective of human health over a lifetime and indicates that the exposure scenarios are not of concern. Typically, an HI between 1 and 10 suggests that

exposure may reduce the margin of safety inherent in the exposure scenario and may be of possible concern for sensitive individuals. When the HI exceeds 10, there may be substantial concern for potential health effects. While any single COPC with an exposure level greater than the toxicity value will cause the HI to exceed 1, for multiple COPCs the HI can also exceed 1 due to the addition of multiple COPC HQs.

5.5.2 Cancer Risk Estimates

Exposure scenarios may involve potential exposure to more than one carcinogen. To represent the potential carcinogenic effects posed by exposure to multiple carcinogens, it is assumed, in the absence of information on synergistic or antagonistic effects, that these risks are additive. Cancer risks are calculated utilizing the following general equation:

$$\text{Cancer Risk} = \text{LADD} \times (\text{CSF or URF})$$

Where:

Cancer Risk	=	Estimated upper bound on additional risk of cancer over a lifetime in a population exposed to the carcinogen for a specified exposure period (unitless).
LADD	=	The Lifetime Average Daily Dose of the chemical calculated using exposure scenario assumptions and expressed in mg/(kg-day) for oral and dermal exposure and expressed in mg/m3 for inhalation exposure. The intake represents the total lifetime chemical dose or concentration averaged over an individual expected lifetime of 70 years.
CSF	=	The Cancer Slope Factor models the potential carcinogenic response and is expressed as $[\text{mg/(kg-day)}]^{-1}$.
URF	=	The inhalation Unit Risk Factor models the potential carcinogenic response and is expressed as $(\text{mg/m}^3)^{-1}$.

For estimating cancer risks from exposure to multiple carcinogens from a single exposure route, the following equation is used:

$$\text{Risk}_T = \sum_{i=1}^{N} \text{Risk}_i$$

Where:

Risk_T	=	Total cancer risk from route of exposure
Risk_i	=	Cancer risk for the chemical
N	=	Number of chemicals

The cumulative carcinogenic risks are presented and discussed in Section 5.3. The potential cumulative risks resulting from exposure to the COPCs are compared to the target cumulative risk of 1E-05 or 1 in 100,000.

5.5.3 Risk Quantification Summary

The hazard indices and excess lifetime cancer risks for the various exposure scenarios are presented below. Note that combined risks from dermal contact, incidental ingestion, and ambient air inhalation exposure are presented for soils.

If the industrial/commercial worker exposure to soils was above the target cancer risk level of 10^{-5} or the target HI of 1, then an evaluation to the surface soil (0 to 2 ft bgs) exposure for the industrial/commercial worker was done and presented. The EPCs for the surface soils and risk and hazard calculations were presented in Appendix B. The risk and hazard calculations were based on the same exposure assumptions and equations identified in Section 3.0.

5.5.3.1 Open Burn Area

The non-cancer hazard calculations and calculated potential lifetime cancer risks for receptors in the Open Burn Area are summarized below.

Medium	*Receptor*	*Route*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	Ingestion Dermal Inhalation	CT	NC	-	7.3E-03	No	5.5.1
			RME	NC	-	1.7E-02	No	5.5.2
	Industrial/ Commercial Worker	Ingestion Dermal Inhalation	CT	NC	-	5.6E-02	No	5.5.3
			RME	NC	-	7.2E-02	No	5.5.4
	Construction/ Utility Worker	Ingestion Dermal Inhalation	CT	NC	-	4.3E-01	No	5.5.5
			RME	NC	-	9.1E-01	No	5.5.6

Note:

NC Not Calculated

The cumulative risks/hazards calculated for Open Burn Area are presented in Section 5.4.1. A summary of the risk/hazard exceedances for the Open Burn Area is provided in

Section 5.5.1.The major contributors to risks/hazards for the Open Burn Area are presented in Section 5.6.1.

5.5.3.2 Northern Sludge Area

The non-cancer hazard calculations and calculated potential lifetime cancer risks for receptors in the Northern Sludge Area are summarized below.

Medium	*Receptor*	*Route*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	Ingestion Dermal Inhalation	CT	1.6E-09	No	9.2E-02	No	5.5.7
			RME	6.6E-09	No	2.1E-01	No	5.5.8
	Industrial/ Commercial Worker	Ingestion Dermal Inhalation	CT	6.1E-08	No	6.8E-01	No	5.5.9
			RME	1.9E-07	No	8.6E-01	No	5.5.10
	Construction/ Utility Worker	Ingestion Dermal Inhalation	CT	3.9E-07	No	3.3E+00	Yes	5.5.11
			RME	8.7E-07	No	7.0E+00	Yes	5.5.12

The cumulative risks/hazards calculated for Northern Sludge Area are presented in Section 5.4.2. A summary of the risk/hazard exceedances for the Northern Sludge Area is provided in Section 5.5.2.The major contributors to risks/hazards for the Northern Sludge Area are presented in Section 5.6.2.

5.5.3.3 Southern Sludge Area

The non-cancer hazard calculations and calculated potential lifetime cancer risks for receptors in the Southern Sludge Area are summarized below.

Medium	*Receptor*	*Route*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	Ingestion Dermal Inhalation	CT	3.2E-09	No	1.4E-01	No	5.5.13
			RME	1.3E-08	No	3.2E-01	No	5.5.14
	Industrial/ Commercial Worker	Ingestion Dermal Inhalation	CT	1.2E-07	No	1.0E+00	No	5.5.15
			RME	3.8E-07	No	1.3E+00	Yes	5.5.16
	Construction/ Utility Worker	Ingestion Dermal Inhalation	CT	7.7E-07	No	4.2E+00	Yes	5.5.17
			RME	1.6E-06	No	8.8E+00	Yes	5.5.18

The cumulative risks/hazards calculated for Southern Sludge Area are presented in Section 5.4.3. A summary of the risk/hazard exceedances for the Southern Sludge Area is provided in Section 5.5.3.The major contributors to risks/hazards for the Southern Sludge Area are presented in Section 5.6.3.

As the cumulative HI was greater than 1.0 for the industrial/commercial worker within the Southern Sludge Area, risks and hazard were re-evaluated based on soils from the 0 to 2 ft bgs. The EPCs for the COCs are presented in Table B.1 of Appendix B. The risk and hazards calculated for the industrial/commercial workers based on these EPCs are presented in Table B.2 of Appendix B. An evaluation of exposure to the surface soil (0 to 2 ft bgs) for the industrial/commercial worker is summarized below.

Medium	*Receptor*	*Route*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface Soil (0 to 2 ft bgs)	Industrial/ Commercial Worker	Ingestion Dermal Inhalation	RME	8.9E-09	No	7.3E-02	No	B.2 of Appendix B

5.5.3.4 Southern Trench Area

The non-cancer hazard calculations and calculated potential lifetime cancer risks for receptors in the Southern Trench Area are summarized below.

Medium	*Receptor*	*Route*	*Exposure*	*Carcinogenic Risk*	*Risk > 10-5*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	Ingestion Dermal Inhalation	CT	2.9E-10	No	4.7E-02	No	5.5.19
			RME	1.2E-09	No	1.0E-01	No	5.5.20
	Industrial/ Commercial Worker	Ingestion Dermal Inhalation	CT	1.1E-08	No	3.5E-01	No	5.5.21
			RME	3.4E-08	No	4.3E-01	No	5.5.22
	Construction/ Utility Worker	Ingestion Dermal Inhalation	CT	6.9E-08	No	1.8E+00	Yes	5.5.23
			RME	1.4E-07	No	3.9E+00	Yes	5.5.24

The cumulative risks/hazards calculated for Southern Trench Area are presented in Section 5.4.4. A summary of the risk/hazard exceedances for the Southern Trench Area is provided in Section 5.5.4.The major contributors to risks/hazards for the Southern Trench Area are presented in Section 5.6.4.

5.5.3.5 Southern Die Storage Area

The non-cancer hazard calculations and calculated potential lifetime cancer risks for receptors in the Southern Die Storage Area are summarized below.

Medium	*Receptor*	*Route*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	Ingestion Dermal Inhalation	CT	1.0E-09	No	1.5E-01	No	5.5.25
			RME	4.0E-09	No	3.1E-01	No	5.5.26
	Industrial/ Commercial Worker	Ingestion Dermal Inhalation	CT	3.7E-08	No	1.1E+00	Yes	5.5.27
			RME	1.2E-07	No	1.3E+00	Yes	5.5.28
	Construction/ Utility Worker	Ingestion Dermal Inhalation	CT	2.4E-07	No	3.0E+00	Yes	5.5.29
			RME	5.0E-07	No	6.2E+00	Yes	5.5.30

The cumulative risks/hazards calculated for Southern Die Storage Area are presented in Section 5.4.5. A summary of the risk/hazard exceedances for the Southern Die Storage Area is provided in Section 5.5.5.The major contributors to risks/hazards for the Southern Die Storage Area are presented in Section 5.6.5.

As the cumulative HI was greater than 1.0 for the industrial/commercial worker within the Southern Die Storage Area, risks and hazard were re-evaluated based on soils from 0 to 2 ft bgs. The EPCs for the COCs are presented in Table B.3 of Appendix B. The risk and hazards calculated for the industrial/commercial workers based on these EPCs are presented in Table B.4 of Appendix B. An evaluation of exposure to the surface soil (0 to 2 ft bgs) for the industrial/commercial worker is summarized below.

Medium	*Receptor*	*Route*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface Soil (0 to 2 ft bgs)	Industrial/ Commercial Worker	Ingestion Dermal Inhalation	RME	8.3E-08	No	7.8E-01	No	B.4 of Appendix B

5.5.3.6 Northern Die Storage Area

The non-cancer hazard calculations and calculated potential lifetime cancer risks for receptors in the Northern Die Storage Area are summarized below.

Medium	*Receptor*	*Route*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	Ingestion Dermal Inhalation	CT	9.6E-10	No	1.1E-01	No	5.5.31
			RME	3.9E-09	No	2.3E-01	No	5.5.32
	Industrial/ Commercial Worker	Ingestion Dermal Inhalation	CT	3.6E-08	No	7.9E-01	No	5.5.33
			RME	1.1E-07	No	9.4E-01	No	5.5.34
	Construction/ Utility Worker	Ingestion Dermal Inhalation	CT	2.3E-07	No	2.1E+00	Yes	5.5.35
			RME	4.8E-07	No	4.5E+00	Yes	5.5.36

The cumulative risks/hazards calculated for Northern Die Storage Area are presented in Section 5.4.6. A summary of the risk/hazard exceedances for the Northern Die Storage Area is provided in Section 5.5.6.The major contributors to risks/hazards for the Northern Die Storage Area are presented in Section 5.6.6.

5.5.3.7 Former Fuel Oil Tank Area

The non-cancer hazard calculations and calculated potential lifetime cancer risks for receptors in the Former Fuel Oil Tank Area are summarized below.

Medium	*Receptor*	*Route*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	Ingestion Dermal Inhalation	CT	1.0E-09	No	1.1E-01	No	5.5.37
			RME	4.2E-09	No	2.3E-01	No	5.5.38
	Industrial/ Commercial Worker	Ingestion Dermal Inhalation	CT	3.9E-08	No	7.9E-01	No	5.5.39
			RME	1.2E-07	No	9.5E-01	No	5.5.40
	Construction/ Utility Worker	Ingestion Dermal Inhalation	CT	2.5E-07	No	2.4E+00	Yes	5.5.41
			RME	5.2E-07	No	5.1E+00	Yes	5.5.42

The cumulative risks/hazards calculated for Former Fuel Oil Tank Area are presented in Section 5.4.7. A summary of the risk/hazard exceedances for the Former Fuel Oil Tank Area is

provided in Section 5.5.7.The major contributors to risks/hazards for the Former Fuel Oil Tank Area are presented in Section 5.6.7.

5.5.4 Summation of Risks

A given human population may be exposed to a chemical by several exposure routes and through more than one medium. The purpose of this section is to identify the risks associated with a population that may be exposed to Site COPCs through a combination of exposure pathways.

USEPA (1989) states that risks should be combined across exposure pathways only where both of the following conditions apply:

(a) Reasonable exposure pathway combinations are identified

(b) It appears likely that the same individuals would consistently face the "reasonable maximum exposure" (RME) through more than one pathway

Instead of encouraging the calculation of combined risks from across exposure pathways, USEPA (1989) cautions that each RME estimate includes many conservative assumptions and that combining estimates is not appropriate unless the combination itself is a RME:

"For real world situations in which contaminant concentrations vary over time and space, the same individual may or may not experience the RME for more than one pathway over the same period of time. One individual might face the RME through one pathway, and a different individual face the RME through a different pathway. Only if you can explain why the key RME assumptions for more than one pathway apply to the same individual or sub-population should the RME risks for more than one pathway be combined.

In some situations, it may be appropriate to combine one pathway's RME risks with other pathways' risk estimates that have been derived from more typical exposure parameter values". [Emphasis added].

It is improbable that the same person would experience all potential exposures associated with a site or even over the periods of years specified in the individual RME scenarios. As a result, it is considered inappropriate to add together the estimated risks and hazards for the different exposure routes and pathways, because this would result in the exaggeration of an appropriate RME for the summed exposures. The summation of the CT estimates is likely the more appropriate representation of a cumulative maximum exposure. In this HHRA, only one exposure medium and one COPC were evaluated therefore the hazard indices and excess

lifetime cancer risks presented in Section 5.3 for the individual exposure media are the same as the hazard indices and excess lifetime cancer risks presented below as only exposure to COPCs in soils were evaluated to estimate total CT and RME exposures.

The cumulative HIs and lifetime cancer risks across all applicable exposure routes for all receptors is summarized below.

5.5.4.1 Open Burn Area

Medium	*Receptor*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	CT	NC	-	7.3E-03	No	5.5.43
		RME	NC	-	1.7E-02	No	5.5.44
	Industrial/ Commercial Worker	CT	NC	-	5.6E-02	No	5.5.45
		RME	NC	-	7.2E-02	No	5.5.46
	Construction/ Utility Worker	CT	NC	-	4.3E-01	No	5.5.47
		RME	NC	-	9.1E-01	No	5.5.48

Note:

NC Not Calculated

5.5.4.2 Northern Sludge Area

Medium	*Receptor*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	CT	1.6E-09	No	9.2E-02	No	5.5.49
		RME	6.6E-09	No	2.1E-01	No	5.5.50
	Industrial/ Commercial Worker	CT	6.1E-08	No	6.8E-01	No	5.5.51
		RME	1.9E-07	No	8.6E-01	No	5.5.52
	Construction/ Utility Worker	CT	3.9E-07	No	3.3E+00	Yes	5.5.53
		RME	8.1E-07	No	7.0E+00	Yes	5.5.54

5.5.4.3 Southern Sludge Area

Medium	*Receptor*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	CT	3.2E-09	No	1.4E-01	No	5.5.55
		RME	1.3E-08	No	3.2E-01	No	5.5.56
	Industrial/ Commercial Worker	CT	1.2E-07	No	1.0E+00	No	5.5.57
		RME	3.8E-07	No	1.3E+00	Yes	5.5.58
	Construction/ Utility Worker	CT	7.7E-07	No	4.2E+00	Yes	5.5.59
		RME	1.6E-06	No	8.8E+00	Yes	5.5.60

An evaluation of the RME to surface soils (0 to 2 ft bgs) by the industrial/commercial worker is summarized below.

Medium	*Receptor*	*Route*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface Soil (0 to 2 ft bgs)	Industrial/ Commercial Worker	Ingestion Dermal Inhalation	RME	8.9E-09	No	7.3E-02	No	B.2 of Appendix B

5.5.4.4 Southern Trench Area

Medium	*Receptor*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	CT	2.9E-10	No	4.7E-02	No	5.5.61
		RME	1.2E-09	No	1.0E-01	No	5.5.62
	Industrial/ Commercial Worker	CT	1.1E-08	No	3.5E-01	No	5.5.63
		RME	3.4E-08	No	4.3E-01	No	5.5.64
	Construction/ Utility Worker	CT	6.9E-08	No	1.8E+00	Yes	5.5.65
		RME	1.4E-07	No	3.9E+00	Yes	5.5.66

5.5.4.5 Southern Die Storage Area

Medium	*Receptor*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	CT	1.0E-09	No	1.5E-01	No	5.5.67
		RME	4.0E-09	No	3.1E-01	No	5.5.68
	Industrial/ Commercial Worker	CT	3.7E-08	No	1.1E+00	Yes	5.5.69
		RME	1.2E-07	No	1.3E+00	Yes	5.5.70
	Construction/ Utility Worker	CT	2.4E-07	No	3.0E+00	Yes	5.5.71
		RME	5.0E-07	No	6.2E+00	Yes	5.5.72

An evaluation of the RME to surface soils (0 to 2 ft bgs) by the industrial/commercial worker is summarized below.

Medium	*Receptor*	*Route*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface Soil (0 to 2 ft bgs)	Industrial/ Commercial Worker	Ingestion Dermal Inhalation	RME	8.3E-08	No	7.8E-01	No	B.4 of Appendix B

5.5.4.6 Northern Die Storage Area

Medium	*Receptor*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	CT	9.6E-10	No	1.1E-01	No	5.5.73
		RME	3.9E-09	No	2.3E-01	No	5.5.74
	Industrial/ Commercial Worker	CT	3.6E-08	No	7.9E-01	No	5.5.75
		RME	1.1E-07	No	9.4E-01	No	5.5.76
	Construction/ Utility Worker	CT	2.3E-07	No	2.1E+00	Yes	5.5.77
		RME	4.8E-07	No	4.5E+00	Yes	5.5.78

5.5.4.7 Former Fuel Oil Tank Area

Medium	*Receptor*	*Exposure*	*Carcinogenic Risk*	*Risk > 10^{-5}*	*Non-Carcinogenic Hazard Index*	*HI > 1.0*	*Table Reference*
Surface and Subsurface Soil	Trespasser	CT	1.0E-09	No	1.1E-01	No	5.5.79
		RME	4.2E-09	No	2.3E-01	No	5.5.80
	Industrial/ Commercial Worker	CT	3.9E-08	No	7.9E-01	No	5.5.81
		RME	1.2E-07	No	9.5E-01	No	5.5.82
	Construction/ Utility Worker	CT	2.5E-07	No	2.4E+00	Yes	5.5.83
		RME	5.2E-07	No	5.1E+00	Yes	5.5.84

5.5.5 Summary of Exceedances

The following subsections below summarizes the instances where the calculated risk was greater than the target risk range of 10-5 or the calculated HI was greater than the target HI of 1 for the media and receptors assessed in each area.

5.5.5.1 Open Burn Area

Primary Media	*Receptor*	*Excess Cancer Risk>10^{-5} (1)*	*> Target HI =1 (1)*
		RME	*RME*
Soil	Trespasser	No	No
Soil	Industrial/Commercial Worker	No	No
Soil	Construction/Utility Worker	No	No

Note:

(1) "Yes" or "No" indicates that the cumulative HI and/or cancer risk is either greater or less than the target HI of 1 or cancer target risk of 10^{-5}, respectively.

5.5.5.2 Northern Sludge Area

Primary Media	*Receptor*	*Excess Cancer Risk>10^{-5} (1)*	*> Target HI =1 (1)*
		RME	*RME*
Soil	Trespasser	No	No
Soil	Industrial/Commercial Worker	No	No
Soil	Construction/Utility Worker	No	Yes

Note:

(1) "Yes" or "No" indicates that the cumulative HI and/or cancer risk is either greater or less than the target HI of 1 or cancer target risk of 10^{-5}, respectively.

5.5.5.3 Southern Sludge Area

Primary Media	*Receptor*	*Excess Cancer Risk>10^{-5} (1)*	*> Target HI =1 (1)*
		RME	*RME*
Soil	Trespasser	No	No
Soil	Industrial/Commercial Worker	No	Yes
Soil	Construction/Utility Worker	No	Yes

Note:

(1) "Yes" or "No" indicates that the cumulative HI and/or cancer risk is either greater or less than the target HI of 1 or cancer target risk of 10^{-5}, respectively.

5.5.5.4 Southern Trench Area

Primary Media	*Receptor*	*Excess Cancer Risk>10^{-5} (1)*	*> Target HI =1 (1)*
		RME	*RME*
Soil	Trespasser	No	No
Soil	Industrial/Commercial Worker	No	No
Soil	Construction/Utility Worker	No	Yes

Note:

(1) "Yes" or "No" indicates that the cumulative HI and/or cancer risk is either greater or less than the target HI of 1 or cancer target risk of 10^{-5}, respectively.

5.5.5.5 Southern Die Storage Area

Primary Media	*Receptor*	*Excess Cancer Risk>10^{-5} (1)*	*> Target HI =1 (1)*
		RME	*RME*
Soil	Trespasser	No	No
Soil	Industrial/Commercial Worker	No	Yes
Soil	Construction/Utility Worker	No	Yes

Note:

(1) "Yes" or "No" indicates that the cumulative HI and/or cancer risk is either greater or less than the target HI of 1 or cancer target risk of 10^{-5}, respectively.

5.5.5.6 Northern Die Storage Area

Primary Media	*Receptor*	*Excess Cancer Risk>10^{-5} (1)*	*> Target HI =1 (1)*
		RME	*RME*
Soil	Trespasser	No	No
Soil	Industrial/Commercial Worker	No	No
Soil	Construction/Utility Worker	No	Yes

Note:

(1) "Yes" or "No" indicates that the cumulative HI and/or cancer risk is either greater or less than the target HI of 1 or cancer target risk of 10^{-5}, respectively.

5.5.5.7 Former Fuel Oil Tank Area

Primary Media	*Receptor*	*Excess Cancer Risk>10^{-5} (1)*	*> Target HI =1 (1)*
		RME	*RME*
Soil	Trespasser	No	No
Soil	Industrial/Commercial Worker	No	No
Soil	Construction/Utility Worker	No	Yes

Note:

(1) "Yes" or "No" indicates that the cumulative HI and/or cancer risk is either greater or less than the target HI of 1 or cancer target risk of 10^{-5}, respectively.

5.5.6 Risk and Hazard COPC Contributions

The contribution to total risk and hazard of each COPC for a specific combined exposure scenario varies, depending on the COPC exposure point concentration and relative toxicity. Frequently, most of the risk estimated for an exposure scenario can be attributed to a few COPCs. The following sub-sections present a summary of the COPCs within each area

contributing the majority of risk and/or hazard in Site media where the combined RME scenarios exceeded the risk and hazard target levels.

The COPCs contributing the majority of RME risk and/or hazard at the Site in the applicable exposure media for the industrial/commercial worker and construction/utility worker are summarized below.

For a COPC to be considered a major contributor, the cumulative risk/hazard for the receptor must be a minimum of 5 percent of the cumulative risk/hazard.

The summary tables presented in the following subsections list the contributing COPCs along with their risk or hazard value as well as the contributing exposure route. Also presented in the summary table is the total risk or hazard associated with these contributing COPCs and the total cumulative risk or hazard associated with all COPCs identified in all exposure media in each area. The percentage that these contributing COPCs contribute to the total cumulative risk or hazard is also presented in the text in each section below.

5.5.6.1 Northern Sludge Area

Construction/Utility Worker

Media	*Contributing COPC*	*Exposure Route*	*Risk*	*HQ/HI*	*Table Reference*
Soil	Manganese	Inhalation	-	2.5E+00	5.5.85
	Nickel	Ingestion and Inhalation	-	3.9E+00	
Total RME Risk/Hazard of Contributing COPCs			-	6.4+00	
Percentage of Cumulative RME Risk/Hazard			-	~92%	
Cumulative RME Risk/Hazard Across all Media			-	7.0E+00	5.5.54

As presented in the above table, the construction/utility worker had no COPCs identified as major contributors to cumulative risk.

The RME cumulative HI of 7.0 primarily results from inhalation exposure to manganese, and ingestion and inhalation exposure to nickel in the soils within the Northern Sludge Area. Manganese and nickel resulted in HIs greater than 1.0 on a target organ basis.

5.5.6.2 Southern Sludge Area

Industrial/Commercial Worker

Media	*Contributing COPC*	*Exposure Route*	*Risk*	*HQ/HI*	*Table Reference*
Soil	Cobalt	Ingestion, Dermal, and Inhalation	-	9.6E-02	5.5.86
	Copper	Ingestion and Dermal	-	2.3E-01	
	Nickel	Ingestion, Dermal, and Inhalation	-	9.9E-01	
Total RME Risk/Hazard of Contributing COPCs			-	1.3E+00	
Percentage of Cumulative RME Risk/Hazard			-	~100%	
Cumulative RME Risk/Hazard Across all Media			-	1.3E+00	5.5.58

As presented in the above table, the industrial/commercial worker had no COPCs identified as major contributors to cumulative risk.

The RME cumulative HI of 1.3 primarily results from ingestion, dermal, and inhalation exposure to cobalt and nickel, and ingestion and dermal exposure to copper in the soils within the Southern Sludge Area. However, none of the COPCs have an HI of greater than 1.0.

As the cumulative HI was greater than 1.0for the industrial/commercial worker within the Southern Sludge Area, risks and hazard were re-evaluated based on soils from the 0 to 2 ft bgs. As shown in Table B.2 of Appendix B, the cumulative HI based on only the 0 to 2 ft bgs surface soils within the Southern Sludge Area is calculated to be 0.073 which is below the target HI of 1. Therefore the surface soils (0 to 2 ft bgs) are providing an adequate cover to protect the industrial/commercial worker from the underlying soils.

Construction/Utility Worker

Media	*Contributing COPC*	*Exposure Route*	*Risk*	*HQ/HI*	*Table Reference*
Soil	Cobalt	Inhalation, Dermal, and Inhalation	-	4.4E-01	5.5.87
	Copper	Inhalation and Dermal	-	7.4E-01	
	Nickel	Ingestion, Dermal, and Inhalation	-	7.7E+00	
Total RME Risk/Hazard of Contributing COPCs			-	8.8E+00	
Percentage of Cumulative RME Risk/Hazard			-	~100%	
Cumulative RME Risk/Hazard Across all Media			-	8.8E+00	5.5.60

As presented in the above table, the construction/utility worker had no COPCs identified as major contributors to cumulative risk.

The RME cumulative HI of 8.8primarily results from ingestion, dermal, and inhalation exposure to cobalt and nickel, and ingestion and dermal exposure to copper in the soils within the Southern Sludge Area. However, only nickel resulted in an HI of greater than 1.0 on a target organ basis.

5.5.6.3 Southern Trench Area

Construction/Utility Worker

Media	*Contributing COPC*	*Exposure Route*	*Risk*	*HQ/HI*	*Table Reference*
Soil	Copper	Ingestion and Dermal	-	4.1E-01	5.5.88
	Manganese	Inhalation	-	2.8E+00	
	Nickel	Ingestion and Inhalation	-	6.9E-01	
Total RME Risk/Hazard of Contributing COPCs			-	3.9E+00	
Percentage of Cumulative RME Risk/Hazard			-	~100%	
Cumulative RME Risk/Hazard Across all Media			-	3.9E+00	5.5.66

As presented in the above table, the construction/utility worker had no COPCs identified as major contributors to cumulative risk.

The RME cumulative HI of 3.9 primarily results from ingestion and dermal exposure to copper, inhalation exposure to manganese and ingestion and inhalation exposure to nickel in the soils within the Southern Trench Area. However, only manganese resulted in HI greater than 1.0 on target organ basis.

5.5.6.4 Southern Die Storage Area

Industrial/Commercial Worker

Media	*Contributing COPC*	*Exposure Route*	*Risk*	*HQ/HI*	*Table Reference*
Soil	Copper	Ingestion and Dermal	-	8.8E-01	5.5.89
	Manganese	Ingestion, Dermal, and Inhalation	-	7.3E-02	
	Nickel	Ingestion, Dermal, and Inhalation	-	3.1E-01	
Total RME Risk/Hazard of Contributing COPCs			-	1.3E+00	
Percentage of Cumulative RME Risk/Hazard			-	~100%	
Cumulative RME Risk/Hazard Across all Media			-	1.3E+00	5.5.70

As presented in the above table, the industrial/commercial worker had no COPCs identified as major contributors to cumulative risk.

The RME cumulative HI of 1.3 primarily results from ingestion and dermal exposure to copper, and ingestion, dermal, and inhalation exposure to manganese and nickel in the soils within the Southern Die Storage Area. However, none of these COPCs have an HI of greater than 1.0 on a target organ basis.

As the cumulative HI was greater than 1.0 for the industrial/commercial worker within the Southern Die Storage Area, risks and hazard were re-evaluated based on soils from 0 to 2 ft bgs. As shown in Table B.4 of Appendix B, the cumulative HI based on only the 0 to 2 ft bgs surface soils within the Southern Die Storage Area is calculated to be 0.78 which is below the target HI of 1. Therefore the surface soils (0 to 2 ft bgs) are providing an adequate cover to protect the industrial/commercial worker from the underlying soils.

Construction/Utility Worker

Media	*Contributing COPC*	*Exposure Route*	*Risk*	*HQ/HI*	*Table Reference*
Soil	Copper	Inhalation and Dermal	-	2.9E+00	5.5.90
	Manganese	Inhalation	-	9.3E-01	
	Nickel	Ingestion and Inhalation	-	2.4E+00	
Total RME Risk/Hazard of Contributing COPCs			-	6.2E+00	
Percentage of Cumulative RME Risk/Hazard			-	~100%	
Cumulative RME Risk/Hazard Across all Media			-	6.2E+00	5.5.84

As presented in the above table, the construction/utility worker had no COPCs identified as major contributors to cumulative risk.

The RME cumulative HI of 7.6 primarily results ingestion and dermal exposure to copper and thallium, inhalation exposure to manganese, and ingestion and inhalation exposure to nickel in the soils within the Southern Die Storage Area.

5.5.6.5 Northern Die Storage Area

Construction/Utility Worker

Media	*Contributing COPC*	*Exposure Route*	*Risk*	*HQ/HI*	*Table Reference*
Soil	Cobalt	Ingestion and Inhalation	-	2.8E-01	5.5.91
	Copper	Ingestion	-	1.5E+00	
	Nickel	Ingestion and Inhalation	-	2.3E+00	
	Zinc	Ingestion	-	4.3E-01	
Total RME Risk/Hazard of Contributing COPCs			-	4.5E+00	
Percentage of Cumulative RME Risk/Hazard			-	~100%	
Cumulative RME Risk/Hazard Across all Media			-	4.5E+00	5.5.78

As presented in the above table, the construction/utility worker had no COPCs identified as major contributors to cumulative risk.

The RME cumulative HI of 4.5 primarily results from ingestion exposure to copper and zinc, ingestion and inhalation exposure to cobalt and nickel in the soils within the Northern Die Storage Area. Only copper and nickel have an HI of greater than 1.0 on a target organ basis.

5.5.6.6 Former Fuel Oil Tank Area

Construction/Utility Worker

Media	*Contributing COPC*	*Exposure Route*	*Risk*	*HQ/HI*	*Table Reference*
Soil	Copper	Inhalation and Dermal	-	1.7E+00	5.5.92
	Manganese	Inhalation	-	7.8E-01	
	Nickel	Ingestion and Inhalation	-	2.5E+00	
Total RME Risk/Hazard of Contributing COPCs			-	4.9E+00	
Percentage of Cumulative RME Risk/Hazard			-	~96%	
Cumulative RME Risk/Hazard Across all Media			-	5.1E+00	5.5.84

As presented in the above table, the construction/utility worker had no COPCs identified as major contributors to cumulative risk.

The RME cumulative HI of 5.1primarily results ingestion and dermal exposure to copper, inhalation exposure to manganese, and ingestion and inhalation exposure to nickel in the soils within the Former Fuel Oil Tank Area. It should be noted that only copper and nickel have HIs greater than 1.0 whereas manganese had an HI less than 1.0.

5.5.7 Uncertainty Analysis

The purpose of this section is to provide a summary and discussion regarding the uncertainties associated with the HHRA evaluation. The various uncertainties are discussed below in the following sections.

5.5.7.1 Sampling Procedure Bias

The sampling strategy is a factor that impacts the health evaluation for chemicals at the Site. Often in the sampling procedures, samples are taken from locations that are visibly contaminated or where contamination would be expected and not from areas of the Site that are potentially uncontaminated. This creates a sampling bias toward worst-case (higher) exposure point concentrations in the media sampled. The utilization of such biased data in the HHRA increases the conservative or health-protective nature of the health risk and hazard assessment.

The data used to estimate the 95 percent UCL (EPC for both the CT and RME scenarios) were, primarily, collected in such a biased manner. Sampling rounds generally focused on additional characterization of the more heavily contaminated areas, thus introducing a high bias in both CT and RME scenarios.

5.5.7.2 Exposure Point Concentration Estimates

Exposure point concentrations were estimated using USEPA methods. For media that were sampled directly, the uncertainty in the data is governed by sampling and analysis protocols and the statistical reduction of these data. The maximum or 95 percent UCL of the data was used in the risk assessment. These are conservative measures of the average, as defined by USEPA in their definition of the RME.

Exposure point concentrations for media that were not measured directly will have more uncertainty because they have been estimated using modeling. The uncertainty in the estimation of COPC concentration of media such as outdoor air is different for each model. CRA

used USEPA-approved models to estimate these media concentrations, and although there is uncertainty, the overall effect on the risk assessment is generally to overestimate media concentrations as a conservative method of evaluation.

COPC concentrations were assumed to remain constant over the exposure duration assumed in the risk assessment. COPC concentrations could either increase or decrease over this time.

5.5.7.3 Exposure Scenario Assumptions

This section evaluates the uncertainty associated with the primary exposure scenario assumptions such as land use and frequency of exposure. Because the assumptions used in the scenarios are often not objectively based but rather are subjective estimates based on judgment, conservatism, and experience applied to available data, the tendency is to select conservative, health-protective values to guard against under-estimating exposure (and associated risks). This leads to a general over-estimation of exposure. When each individual exposure is over-estimated, the net effect is compounded. That is, the total exposure is over-estimated to an even greater degree than the individual exposures. Exposure scenarios are, therefore, conservative in nature, and thereby provide the necessary safety factor for protection of human health. It is very likely that the calculated exposure concentrations are greater than the actual exposure concentrations.

The intent of the HHRA was to estimate the potential point exposures for both the "average" [Central Tendency (CT) or Mean] and the reasonable maximum exposure (RME) exposure scenarios. In order to accomplish this goal, a series of standardized USEPA exposure assumptions were utilized, where available and applicable. In the absence of available or applicable exposure assumptions, professional judgment was used to establish necessary assumptions protective of human health. The CT exposure scenario represents an "average" exposure scenario that is reasonably expected to occur. The RME scenario represents the reasonable maximum exposure expected to occur. The exposure scenarios (CT and RME) were developed to evaluate possible risk under both current and future land use conditions.

5.5.7.4 Dose Response

One of the major uncertainties in estimating Site-specific risk is the application of published toxicity information. Factors introducing uncertainty associated with toxicity value application are as follows:

1. Applicability of animal toxicity data - chemicals may be assumed to be human carcinogens based on animal studies even when there is limited or no available evidence that the chemical is a human carcinogen

2. Differences in chemical concentrations - CSFs are derived from high concentration animal studies and therefore may not be applicable to low concentration exposures
3. Assumptions in toxicity values (Non-carcinogenic Hazard) - RfDs are also established with conservative safety factors compared to actual studies

5.5.7.5 Theoretical Nature of Risk Estimates

A human health risk assessment assigns a numerical value to the excess probability (above background cancer rates) of a case of cancer developing in a population exposed to a specified amount of chemical that is a known or suspect carcinogen. This numerical value is presented as an upper limit excess cancer risk such as 1.0E-06, or one additional cancer case in a one million people exposed to the chemical and at the specific chemical concentration for their entire lifetime, which is assumed to be 70 years. The models that are applied to calculate the numerical risk value is typically reflect the uncertainty associated with the data sets used to estimate the slope factors so true value could be lower. The Cancer Risk Model and the assumptions used to estimate exposure are protective of the most sensitive populations. The true risk is expected to be lower than that calculated, and may quite reasonably be zero. Thus risk estimates are overestimated by the HHRA methodology itself.

5.5.7.6 Synergistic, Additive, and Antagonistic Effects

Receptor exposure to a mixture of chemicals can in some cases lead to synergistic, additive, or antagonistic health effects. Synergistic effects occur when chemicals interact in the receptor and cause an effect significantly greater than the sum of the effects of the individual chemicals. Potential synergistic effects were not evaluated in the HHRA, and thus if such effects do occur with these COPCs, it may result in an underestimation of the calculated risks and hazards. Alternatively, chemicals may interact in the receptor in such a way as to cause an overall effect that is less than the sum of effects of the individual chemicals. These potential antagonistic effects were not evaluated in the HHRA, and thus, if such effects do occur with these COPCs, it may result in an overestimation of the calculated risks and hazards.

CRA assumed that non-carcinogenic effects in the HHRA were additive, such that individual chemical non-carcinogenic hazards were added to obtain a total hazard estimate. All compounds were treated as if each could affect the receptor in a similar manner although where each COPC has a different mode of action, then presumably the resulting hazard would be non-additive. For a conservative assessment, the potential non-carcinogenic hazard ratios for each COPC were added to yield a total risk or hazard. Although the non-carcinogenic hazards for individual chemicals were aggregated, there is no basis to suspect the toxic effects

are additive. This suggests that the total calculated hazards estimated for the potential Site receptors may be higher than will actually occur.

5.6 Conclusions

Based on the information presented in the HHRA, the following conclusions are made:

1. The HHRA evaluated the human health risks/hazards for potential human exposure to COPCs in Site soil as a result of historical activities at the Site. The current zoning of the Site is industrial/commercial. The Site is currently vacant.
2. The exposure pathway evaluated based on the COPCs identified and the land use of the Site included: trespasser (adolescent), industrial/commercial worker, and construction/utility worker incidental ingestion, dermal contact, and inhalation of particulate in ambient air due to exposure with Site soil.
3. The calculated cancer risk and non-cancer hazard for the trespasser exposure to COPCs in soils did not exceed the target cancer risk of 10^{-5} and target non-cancer hazard of 1.0, respectively within any of the areas.
4. The calculated cancer risk and non-cancer hazard for the industrial/commercial worker exposure to COPCs in soils did not exceed the target cancer risk of 10^{-5} and target non-cancer hazard of 1.0, respectively within the Open Burn Area, Northern Sludge Area, Southern Trench Area, Northern Die Storage Area, and Former Fuel Oil Tank Area.
5. The calculated cancer risk and non-cancer hazard for the industrial/commercial worker exposure to COPCs in soils did not exceed the target cancer risk of 10^{-5}however, did exceed the target non-cancer hazard of 1.0, respectively within the Southern Sludge Area and Southern Die Storage Area. As the cumulative non-cancer hazard for the industrial/commercial worker exposure to COPCs was above 1.0 for these two areas, the exposure was re-evaluated using soil interval of 0 to 2 ft bgs. The results of this evaluation determined that the target non-cancer HI was below 1.0 within both the Southern Sludge Area and Southern Die Storage Area. Therefore the surface soils (0 to 2 ft bgs) within both areas are providing an adequate cover to protect the industrial/commercial worker from the underlying soils.
6. The calculated cancer risk for the construction/utility worker exposure to COPCs in soils did not exceed the target cancer risk of 10^{-5} within any of the areas; however, the non-cancer target of 1.0 was exceeded in all areas except the Open Burn Area. Manganese and nickel within the soils were the major contributors to the hazard exceedance of 1.0 within the Northern Sludge Area. Nickel within the soils was the major contributor to the hazard exceedance of 1.0 within the Southern Sludge Area. Manganese within the soils was the major contributor to the hazard exceedance of 1.0 within the Southern Trench Area.

Copper and nickel within the soils was the major contributor to the hazard exceedance of 1.0 within the Southern Die Storage Area, Northern Die Storage Area, and Former Fuel Oil Tank Area.

Section 6.0 Level 1 Scoping Risk Assessment

This following Scoping ERA was conducted in accordance with the Ohio EPA DHWM "Guidance for Conducting RCRA Ecological Risk Assessments" March 2003.

6.1. The Relevance of the Level 1 Scoping ERA to the ERA Process

As described in the Ohio EPA guidance (OEPA 2003), ERAs are iterative analyses proceeding from conservative and simplistic default analyses to less conservative, more complicated analyses that rely on Site-specific data. The first step in the process is a Level I Scoping ERA (Level I ERA). The Level I ERA essentially determines whether there are ecological habitats, chemical releases, ***and*** complete exposure pathways between the two. At a minimum, all three factors are necessary for ecological risk to occur at, or in the vicinity of, the Site. Thus, a Level I ERA consists primarily of a Site visit and habitat assessment coupled with review of available information pertaining to the nature and extent of chemical releases at the Site.

If the Level I ERA determines that there is no potential for ecological risk as a result of Site conditions, no further action is required. If the Level I ERA indicates that ecological risk potentially exists at the Site, the ERA should proceed to a Level II Screening ERA. A Level II Screening ERA screens existing Site data against conservative ecological screening values (ESV). In turn, the screening analysis identifies chemicals of potential ecological concern (COPEC), evaluates potentially impacted aquatic habitats, completes a list of ecological receptors, and refines the ecological CSM.

If ecological risk cannot be dismissed based on this analysis, then a Level III Baseline ERA would be conducted, and if necessary, a Level IV Field Baseline ERA as well. A Level III Baseline ERA consists of four tasks: 1) exposures assessment, 2) toxicity assessment, 3) risk characterization, and 4) uncertainty analysis. A Level IV Field Baseline ERA, if necessary, consists of (but is not limited to) more refined and Site-specific analyses such as tissue analysis/bioaccumulation studies, population/community assays, and toxicity tests.

In general, each step in the ERA process ends with a science management decision point (SMDP). These SMDPs can produce one of three conclusions:

1. Risks are acceptable, and no further action is warranted
2. Risks are unacceptable, and remediation is warranted
3. Risks are uncertain, and further ERA analyses are warranted

6.2 Existing Data Summary

The following presents a brief summary of existing data with respect to Site History and the nature and extent of potentially hazardous substances. More detailed site history and background information can be found in previous sections of this report and "Site Summary Report"(CRA 2007).

6.2.1 Site Location and Physical Setting

The Site is located east and southeast of the Northern Ohio Industrial Park at 1400 Lowell Street in Elyria, Lorain County, Ohio. In total, the Site is about 92.5 acres. About 4.5 acres of the Site are taken up by a closed landfill (EPA ID NO. OHD004201091). Topography on the Site ranges from approximately 750 feet above mean sea level in the western portion of the Site to approximately 742 feet in the northeastern portion of the Site.

An aerial photograph provided as Figure 6.1 shows that the Site consists of mature forest in the southern portion, upland meadow in disturbed areas in the northern and southern portions, and wetland areas in the eastern and northeastern portions of the Site. Some of the upland meadow is mowed whereas other parts are naturalizing as old field habitat or thicket. Small drainage ditches occur on the Site that discharge offsite to the east via a storm drain system and to the north via a railroad side ditch. The Site is approximately 100 acres in size and is bounded to the west and north by commercial / industrial areas and railroad tracks, agricultural areas to the south, and relatively mature forest to the east.

As shown on the NRCS Web Soil Survey (Figure 6.2), the following soil series are mapped on the Site:

- BtB: Bogart loam; 2 to 6 percent slopes; moderately well drained; unknown hydric
- FcA: Fitchville silt loam; 0 to 2 percent slopes; somewhat poorly drained; partially hydric
- HsA: Haskins loam; 0 to 2 percent slopes; somewhat poorly drained; partially hydric
- HtA: Haskins-Urban land complex; nearly level; somewhat poorly drained; partially hydric
- Ly: Luray silty clay loam; very poorly drained; hydric
- Mo: Mermill loam; very poorly drained; partially hydric
- Mr: Miner silty clay loam; very poorly drained; partially hydric

The northern half of the Site is mapped as Haskins-Urban land complex (HtA). The majority of the southern half of the Site is mapped as Luray silty clay loam (Ly). Bogart loam (BtB), Haskins loam (HsA), Mermill loam (Mo) and Miner silty clay loam (Mr) are mapped in the western portion of the southern half of the Site. With the exception of Luray silty clay loam, which is listed as hydric, and Bogart loam which is listed as unknown hydric, the remainder of the soil series mapped on the Site are listed as partially hydric. Soils classified as partially hydric may contain inclusions of other soil series that are listed as hydric and are typically located within depressions.

The National Wetland Inventory (NWI) map for the Site (Figure 6.3) indicates the presence of palustrine forested wetlands. The map indicated there may be broad-leaved deciduous, seasonally flooded (PFO1C) wetlands in the southwest corner of the Site. There may also be palustrine scrub-shrub, broad-leaved deciduous, seasonally flooded (PSS1C) wetlands in the southeast corner of the Site. CRA's site visit on October 4, 2011 confirmed the presence of the PFO1C wetlands in the southwest corner of the Site, as well as the presence of a vernal pool in the vicinity. CRA's site visit did not confirm the presence of PSS1C wetlands in the southeast corner of the Site. However, CRA did observe a vernal pool in this portion of the Site. CRA also observed the presence of PFO1C / PSS1C offsite to the east.

A Site Plan showing the existing features and site drainage is provided as Figure 6.4.

6.2.2 Current and Future Site Land Use

Except for the approximately 5 acres that are the footprint of the closed landfill, the current land use is fallow. Although the land is zoned commercial/industrial, there are no plans to develop the land in the near future. Thus, the reasonably expected future uses are as fallow land. There are no current uses of the groundwater or surface water from the Site.

6.3 Known or Suspected Hazardous Substance Releases

As described above, northern parts of the Site were used for temporary storage of metal contaminated sludge and contained a large fuel oil tank. Dies and equipment were also stored on site, and the latter were washed there with solvents. Therefore, a number of hazardous materials could have been released during these activities. The following subsections summarize what is known about the current extent and distribution of chemicals on the Site.

6.3.1 Soil

While a small number of soil and sub-soil samples have been taken at the Site (e.g., see Figure 4 of Site Summary Report CRA 2007), very few pertain to surface soil layers (the top foot or so), which are of most relevance to ecological risk. In 1990, the USEPA conducted a screening site inspection (SSI) and collected sub-soil samples from each of three areas (Open Burn Area, Northern Sludge Area, and Southern Sludge Area). The USEPA soil samples contained a number of Target Analyte List (TAL) and Target Compound List (TCL) compounds with concentrations above Site background levels (Ecology, 1991).

6.3.2 Surface Water and Sediments

As far as could be determined, no surface water or sediment samples have been collected from the Site. Surface water resources at the Site are very meager and potentially ephemeral. There may have been two sub-soil samples taken from the Northern Sludge area, samples S-3 and S-4 (see Figure 4 and 5 of CRA 2007). Sample S-3 was taken 2 to 2.5 feet below ground surface, while S-4 was taken 1 ft below the ground surface. Both of these samples, especially S-4, have high levels of antimony (385 mg/kg), cadmium (20.9 mg/kg), chromium (34,500 mg/kg), copper (12,800 mg/kg), and nickel (24,300 mg/kg). Both samples are also probably in the large ר-shaped wetland area in the Northeastern part of the Site (see section 6.3. below), so these samples are actually sub-sediment samples.

Currently, the drainage system from the Landfill collects surface water from the landfill surface. This water is collected passively and then conveyed, at an NPDES discharge location, to the downstream portion of the central drainage ditch, which runs running east-west across the Site. Sampling of this collected water for NPDES permitting shows that it meets these limits, which should be protective of aquatic life. The central drainage ditch does not constitute significant aquatic habitat. Moreover, a short distance downstream of the NPDES discharge, the ditch water discharges offsite to the east via an underground storm drain system.

6.3.3 Groundwater

Groundwater has been investigated during the RFI. A number of VOCs and heavy metals have been detected in the Site's groundwater. Groundwater flows mostly to the east, and migration is controlled by the existing storm water sewer network along the middle eastern site boundary (e.g., see Figure 2 and 3 of CRA 2007). Thus, groundwater likely does not discharge to surface waters or marshes at the Site.

6.3.4 Contaminants of Interest

The primary contaminants of interest at the site are heavy metals, notably antimony, chromium (both trivalent and hexavalent), copper, and nickel in soil. Chlorinated VOCs are also found in groundwater, although these VOCs are typically more problematic in terms of human health than ecological risk.

6.3.5 Rare/Threatened/Endangered Species

As per OEPA guidance, the potential presence of threatened and endangered (T&E) species was considered. CRA submitted letters to the Ohio Department of Natural Resources (ODNR), Division of Wildlife and to the U.S. Fish & Wildlife Service (USFWS) on October 12 and October 19, 2011. These letters requested information related to documented occurrences of state or federally listed threatened, endangered, rare or candidate plant or animal species in the vicinity of the Site.

In a response dated October 13, 2011, the ODNR indicated that they are unaware of any of the following at or within a one-mile radius of the Site: unique ecological sites, geologic features, animal assemblages, scenic rivers, state wildlife areas, nature preserves, parks, forests or national wildlife refuges

In a correspondence dated October 25, 2011, the USFWS indicated that the Site lies within the range of the Indiana bat (*Myotis sodalis*), which is a federally listed endangered species. Because the bat sleeps under the bark of mature trees, the USFWS recommended that upland woodlots and associated trees should be saved wherever possible. Since this project is not proposing any earth disturbance, there will be no impacts to the Indiana bat or its habitat.

The USFWS correspondence indicated that the Site lies within the range of the piping plover (*Charadrius melodus*) and Kirtland's warbler (*Setophaga kirtlandii*). Both are federally listed endangered species. The Site also lies within the range of the bald eagle (*Haliaeetus leucocephalus*), a federally protected species. However, due to the project type, location, and onsite habitat, the piping plover and bald eagle would not be expected within the project area and no impacts to these species are expected. The USFWS recommended that precautions be taken to avoid impacting the Kirtland's warbler from late April through May and from late August to early October during their migration period. Since this project is not proposing any earth disturbance, there will be no potential for impacts to the Kirtland's warbler or its habitat.

Copies of the ODNR and USFWS correspondence are provided in Appendix B.

6.4 Site Visit and Onsite Habitat Characterization

As part of the ERA, CRA conducted a site visit in order to evaluate the presence or absence of important ecological resources and receptors on the Site. Two ecologists, Dr. Daniel Smith[1] and Christine Potts[2], visited the Site on October 4, 2011. This narrative provides a summary of CRA's assessment of on-site habitats. The habitats present on the Site are shown on the Habitat Cover Type Map (Figure 6.5) and are discussed in further detail in the following paragraphs. Color photographs depicting the habitat cover types and overall site conditions are provided in Appendix A. Table 6.1 lists the species occurring within each habitat cover type.

6.4.1 Onsite Habitat Cover Types

6.4.1.1 Mature Deciduous Woods

Mature upland forest occurs in the southern portion of the Site and consists primarily of red maple (*Acer rubrum*), white ash (*Fraxinus americana*), northern red oak (*Quercus rubra*), white oak (*Quercus alba*), sycamore (*Platanus occidentalis*), shagbark hickory (*Carya ovata*), American basswood (*Tilia americana*), Japanese privet (*Ligustrum obtusifolium*), Japanese honeysuckle (*Lonicera japonica*), multiflora rose (*Rosa multiflora*) and poison ivy (*Rhus radicans*). The herbaceous vegetation is sparse due to dense shading by the overstory canopy and consists of Virginia creeper (*Parthenocissus quinquefolia*) and jumpseed (*Polygonum virginianum*). Grazing by deer, which are apparently abundant, may also reduce ground cover. In the upland woods in the westernmost portion of the Site, the larger trees have been logged from the area.

6.4.1.2 Forested Wetlands/Vernal Pools

A small area of forested wetlands occurs in the northern portion of the Site, north of the central drainage ditch and west of the existing railroad tracks. This area was sparsely vegetated and appeared to be seasonally wet.

Forested wetlands also occur along the western and southern site boundaries. The overstory is comprised of red maple, green ash (*Fraxinus pensylvanica*), swamp white oak (*Quercus bicolor*), and slippery elm (*Ulmus rubra*). The understory consists of multiflora rose and greenbrier (*Smilax rotundifolia*). Herbaceous vegetation is sparse due to dense shading by the overstory canopy and consists of jumpseed, lady's thumb (*Polygonum persicaria*), fox sedge (*Carex vulpinoidea*), and Gray's sedge (*Carex grayi*).

[1] Dr. Smith is an ecologist with a BS in Molecular Biology, M. S. In Zoology, and Ph.D. in Limnology.
[2] Ms. Potts is a wetlands scientist with a B.S. in Environmental Science and a M.S. in Aquatic Biology.
Both have extensive experience in ecological risk assessments and habitat evaluations.

A few vernal pools were observed in the southern portion of the Site. These areas contained standing water up to 8 inches deep, were predominately unvegetated, and had a clay substrate.

6.4.1.3 Upland Meadow and Thicket

Upland meadow habitat occurs in previously disturbed areas in the northern and southern portions of the Site (historical sludge disposal areas). Some of the upland meadow is mowed whereas other parts are naturalizing as old field or thicket. Vegetation in the meadow habitat consists of Autumn olive (*Elaeagnus umbellata*) and eastern cottonwood (*Populus deltoides*) saplings, goldenrods (*Solidago* spp.), common dandelion (*Taraxacum officinale*), English plantain (*Plantago lanceolata*), wild carrot (*Daucus carota*), yarrow (*Achillea millefolium*), Canada thistle (*Cirsium arvense*), yellow wood sorrel (*Oxalis europaea*), foxtail grass (*Setaria* sp.), as well as other grasses.

Vegetation in the thicket habitat, which occurs primarily in the former open burn area, consists of autumn olive saplings, gray dogwood (*Cornus racemosa*), common blackberry (*Rubus allegheniensis*), Japanese honeysuckle (*Lonicera japonica*), Canada thistle, teasel (*Dipsacus sylvestris*), intermediate dogbane (*Apocynum medium*), common milkweed (*Asclepias syriaca*), and white snakeroot (*Eupatorium rugosum*).

6.4.1.4 Mowed Lawn

An existing RCRA closed landfill occurs in the west-central portion of the Site. The landfill contains solidified wastewater treatment sludge from the historical electroplating operations on the Site. The habitat in the landfill area consists of mowed lawn which is composed of Kentucky bluegrass (*Poa pratensis*), crabgrass (*Digitaria sanguinalis*), English plantain, crown vetch (*Coronilla varia*), red clover (*Trifolium pratense*), common dandelion and foxtail grass.

A stormwater collection system, consisting of a series of rip-rap lined ditches, collects stormwater runoff from the landfill and discharges to the open ditch in the central portion of the Site. This ditch is discussed in the following section.

6.4.1.5 Wooded Hedgerow/Open Drainage Ditches

Several intermittent, open drainage ditches occur on the Site. The central ditch collects stormwater runoff from the railroad tracks to the north and from the stormwater collection system on the landfill. The central ditch flows east across the central portion of the Site within a wooded hedgerow consisting of gray dogwood, autumn olive, eastern cottonwood, white ash, and northern red oak. The eastern ditch is primarily an unvegetated depression that flows north within wooded uplands, adjacent to the eastern site boundary, and eventually joins the

central ditch at an existing sump. At this location, both the central and eastern ditches discharge offsite to the east via an underground storm drain system.

The open ditch in the northeast portion of the Site flows north-northwest along the west side of the existing railroad tracks. The ditch ends at the gravel railroad bed at the northeast corner of the Site, but very small flow of water was detected at the other end (the north) of the railroad bed. After this, the water discharges offsite to the north to a drainage ditch/creek that travels just north of the property and just south of the bank of railroad tracks to the north. The drainage ditch/creek eventually flows northeast into an offsite pipe, which apparently continues east toward the Black River alongside the tracks.

6.4.1.6 Areas of Ponded Water

A few areas of ponded water adjoin the open ditch in the northeast portion of the Site, west of the railroad tracks. Another area of ponded water adjoins the open drainage ditch in the southeastern portion of the Site. The vegetation in these ponded areas consists of black willow (*Salix nigra*), broad-leaved cattail (*Typha latifolia*), reed canary grass (*Phalaris arundinacea*) and duckweed (*Lemna* sp). Both ponded areas were very small and shallow. Water depth in both was probably less than 2 feet deep.

6.4.1.7 Emergent and Scrub-Shrub Wetlands

Emergent and scrub-shrub wetlands occur in the northeast portion of the Site and adjoin the open drainage that flows north-northwest to the west of the existing railroad tracks. These wetlands are composed primarily of black willow, multiflora rose, reed canary grass, broad-leaved cattail, common rush (*Juncus effusus*) and soft-stemmed bulrush (*Scirpus validus*).

6.4.1.8 Sparsely Vegetated Areas

Sparsely vegetated areas occur on and along the existing concrete pads, railroad tracks and gravel access roads. The vegetation in these areas consists of path rush (*Juncus tenuis*), common reed, eastern cottonwood (saplings) and common mullein (*Verbascum thapsus*).

6.4.1.9 Wildlife Observed on the Site

During CRA's October 4, 2011 site visit, wildlife observed on the Site were those typical of the habitats present and included white-tailed deer (*Odocoileus virginianus*), groundhog (*Marmota monax*), eastern gray squirrel (*Sciurus carolinensis*), eastern cottontail rabbit (*Sylvilagus floridanus*), blue jay (*Cyanocitta cristata*), northern cardinal (*Cardinalis cardinalis*), chipping sparrow (*Spizella passerina*), American robin (*Turdus migratorius*), Carolina wren (*Thryothorus*

ludovicianus) and tufted titmouse (*Parus bicolor*). CRA also observed a pickerel frog (*Rana palustris*) along the drainage ditch in the northeastern portion of the Site and heard spring peepers (*Hyla crucifer*) calling from the emergent wetlands in this portion of the Site.

6.5 Site Visit Summary

As described above, about 1/3rd of the Site is relatively undisturbed forest south of the landfill site. There is no historical record that wastes were ever placed in these forested areas, and no evidence of dumping was observed during the field visit. Much of the northern two-thirds of the Site however was used to store sludge or is now taken up by the landfill. The former sludge pond areas are now densely vegetated. There was no evidence of phytotoxicity or areas of stressed or absent vegetation. Most of the former two sludge areas is now upland meadow habitat, which is now transitioning to old field/thicket habitat. However, portions of the northern sludge area are apparently mowed and are densely vegetated with herbs and grasses. The southern sludge area abuts a wet area and a very small, very shallow pond. The eastern edge of the northern sludge area is an emergent scrub-shrub wetland and is contiguous to the open water ditch and small ponded area.

Even though it had rained about 4 inches in the week prior to CRA's field visit, the extent of ponded water areas was very small. The maximum water depths of these areas were also small, less than 2 feet. Nonetheless, the standing water in the deeper parts of ponded and wetter areas is probably semi-permanent since they were vegetated with marsh species (e.g., cattail, rush, duckweed). At the same time, the ponded areas and ditches are probably too small and isolated to support even very small fish, and none were noted in the Site Visit.

The surface water drainage from the lower half of the Site is collected in a storm drain that exits toward the Black River. Groundwater from much of the Site is also drawn to this location (Figures 2 and 3 of CRA 2007). Since the water in the catch basin was 6 to 10 feet below the ground surface, the terminus of this storm drain collection system had to be some distance to the east. Most likely, it hooks into storm drains in urbanized areas to the east, which discharge to the West Fork of the Black River. Drainage from the lower half of the upper portion of the Site apparently also travels via groundwater flow to the southeast, probably draining into the same stormwater sump.

However, some of the drainage from the upper part of the northern half of the Site likely drains, again by groundwater flow, to the drainage ditch/creek to the north. On the day of the Site walk, very slight flow to the north was noted in the ditch in the northeast portion of the Site. However, the water filled ditch ended at the gravel railroad bed at the northeastern corner of the Site. A very small amount of water was seen exiting the opposite (northern) end

of the gravel railroad bed, suggesting that the ditch water was traveling from south to north through the fine gravel and sand of railroad bed. After this, the very small flow of water continued to the drainage ditch/creek running west-east along the bank of the railroad tracks.

According to Ohio ERA guidance, ecologically important areas are those that are protected by law or serve some important ecological function. Although no formal wetland delineation was conducted, several on-Site areas are likely wetlands and, thus, would be classified as ecologically important areas. These areas had standing water, primarily wetland vegetation, and based on maps from the Soil Conservation Service, hydric or partially hydric soils. These likely wetland areas included the ㄱ-shaped area, approximately 8 acres, of emergent and scrub/shrub wetland in the northeast of the Site. This also includes the very small pond (<1/10th acre) adjacent to the Southern sludge area (Figure 6.5). There were also some small areas of forested wetland at the periphery of the Southern portion of the Site (Figure 6.5), and some wet areas associated with the drainage ditches. Except for the ㄱ-shaped area, all of these wetland areas are very small.

6.6 Identification of Complete Exposure Pathways between Site-Related Chemicals and Ecologically Important Resources

The intent of the Ohio EPA guidance is that the Phase I Scoping Assessment should, if warranted, determine that Sites with little potential for ecological risks be dismissed from further consideration. Thus, an explicit prerequisite for conducting a Level II ERA is that important ecological resources are potentially influenced by the Site's chemicals. This requires that the following three phenomena co-occur:

1. Occurrence of Important Ecological Resources on or near Site
2. Occurrence of hazardous substances at the Site
3. Complete exposure pathways between 1 and 2

According to the available information, conditions 1 and 2 are both true for the Site. There are wetlands on the Site, and there are also hazardous chemicals as well. However, the sampling of soil, surface water, and sediments is not sufficient to determine whether there are complete exposure pathways between these two. At the same time, the close proximity of the Southern and Northern Sludge Areas to wetlands constitutes circumstantial evidence that exposure pathways are complete. Moreover, the very limited sampling of surficial material, although usually in subsurface material below the top 1 foot to which ecological receptors are exposed, in these two Sludge areas suggest that high levels of certain metals, especially antimony, chromium, copper, and nickel, remain in subsurface material in both Sludge Areas. This very limited information also suggests that exposure pathways may be complete. However, the

absence of samples in biologically relevant strata of the sediments, usually assumed to be the top 2 to 6 inches, or in surface water precludes certainty about whether exposure pathways are complete.

6.7 Conclusions of the ERA

To be conservative, Ohio guidance suggests that uncertainty about the completeness of exposure pathways should be treated the same as compelling evidence that pathways are complete. That is, uncertainty should produce a recommendation to proceed to a Level II ERA. Strictly following this guidance, then, the available evidence would potentially require that a Level II ERA should be done.

At the same time, the following five factors should be noted. First, the on-site wetlands (wet meadow, scrub-shrub, and very shallow marsh) that could potentially be affected by metals contamination are all densely vegetated. Only very small areas of open water noted during our survey, even though the Site-survey occurred after a rainy period. As with the wet areas, these open water areas were also densely vegetated with submerged vegetation. Thus, the primary ecological function of these sensitive ecological areas is habitat for wetland plants. As illustrated by the dense and apparently complete vegetative cover, none of these sensitive showed any evidence of phytotoxicity (e.g., stressed vegetation, bare spots, etc.) On the contrary, plant growth was thick and robust. Hence, no apparent impacts on this most important ecological function were noted during the survey.

Second, while densely vegetated, shallow wetlands will support a variety of aquatic biota (e.g., mosquitoes) and semi-aquatic animals (amphibia), the animal communities of densely vegetated wetlands tend to be dominated by ephiphytic and water column species (Smith and Cooper 2011). As such, these species are not highly exposed to sediment contamination, where heavy metals typically sequester. Consequently, much of resident fauna of the on-site wetland ecosystems would not be significantly exposed to high concentrations of metals, even if they do occur in sediments in these wetlands.

Third, none of these metals bioaccumulate readily in food chains. There is therefore reduced potential for impacts to herbivorous animals feeding on wetland vegetation, even if underlying sediments were highly contaminated.

Fourth, very dense vegetation, and lack of above ground outlet channels for the northern wetland, greatly reduced the potential for off-site transport of metals to more sensitive downstream aquatic systems.

Fifth, it is doubtful whether further ERA analyses would, or should, lead to any action even if those additional analyses demonstrated that sediment contamination occurred and was causing ecological risks. Besides the costs of additional sampling and ERA analyses, remediation of these wetlands would be expensive and could cause interim ecological damages to the wetland plant community and its attendant biota. These certain costs of remediation would have to be balanced against the potential benefits of remediation. The latter are likely to be limited to increased health of the relatively unimportant infaunal macroinvertebrate community, even if ecological risks were found to be unacceptable. Given that RACER funds for all investigation and remediation are limited, the uncertainty about potential ecological impacts in these wetlands must be considered in the context of potential impacts posed by other risks at this Site and at other RACER sites.

For these reasons, we make no recommendation about whether more sampling and analyses are warranted. This decision is most appropriately an issue of risk management and public policy. As risk manager and, potentially, also the source of funding for additional ERA analyses, OEPA should make this decision based on the evidence provided above.

Section 7.0 Summary and Conclusions

The RFI included field investigations at the following 9 AOIs, as described in the RFI Work Plan:

- AOI 1 – Open Burn Area
- AOI 2 – Northern Sludge Area
- AOI 3 – Southern Sludge Area
- AOI 4 – Northern Trenches Area
- AOI 5 – Southern Trenches Area
- AOI 6 – Northern Die Storage Pad Area
- AOI 7 – Southern Die Storage Pad Area
- AOI 8 – Former Fuel Oil Tank Area
- AOI 9 – Sitewide Groundwater

The objective of the field investigations was to determine whether a significant release of hazardous constituents to soil had occurred from these AOIs.

For areas where a potentially significant release was identified, further phases of field investigations to characterize the nature and extent of the releases were conducted under

additional work plans. The findings from the field investigations are discussed in Section 4.0 of this Report. The potential health significance of the constituents found in soil was evaluated in a human health risk assessment and a Level 1 ecological risk assessment. The results of the human health risk assessment are discussed in Section 5.0 of this Report and the results of the Level 1 ecological risk assessment are discussed in Section 6.0 of this Report.

7.1 Summary of AOI Results

AOI 1 - Open Burn Area

AOI 1 is located in the north central portion of the Site. This area is approximately 4.8 acres in size. This area was used for open burning and placement of general facility trash from 1947 to 1974. Materials were burned and/or placed in this area. This area is now covered with soil and is overgrown.

After a thorough review of the available information, RACER has concluded that AOI 1 has not been used for disposal of waste. Only two of the fourteen borehole logs for AOI 1 make any mention of blue/gray clay and then only in trace amounts. The upper two feet of soil within AOI 1 appear to be providing an adequate cover to protect the industrial/commercial worker from the underlying soils.

The HHRA concluded that the calculated cancer risk and non-cancer hazard for the industrial/commercial worker exposure to COPCs in soils did not exceed the target cancer risk of 10^{-5} and target non-cancer hazard of 1.0 within the OBA. Since the material in AOI 1 does not exceed risk targets, no further action is required.

AOI 2 - Northern Sludge Area

AOI 2 is located in the northeastern portion of the Site. This area is approximately 6.8 acres in size. This area was used for placement of WWTP sludges from 1956 to 1967. Approximately 25,000 cubic yards of material were placed within AOI 2. Currently this area is overgrown.

AOI 2 has been used historically for waste disposal. Thirteen of fifteen borehole logs for AOI 2 indicate the presence of a turquoise-blue sand layer. The turquoise-blue sand was identified at the one foot interval in two borehole logs, at the two foot interval in five borehole logs, at the three foot interval in six borehole logs, and at the five foot interval in six borehole logs. Multiple borehole logs identify two separate layers of turquoise-blue sand generally in the upper three feet and once again at five feet bgs. The turquoise-blue sand layer is indicative of historical waste disposal at the Site.

The HHRA concluded that the calculated cancer risk and non-cancer hazard for the industrial/commercial worker exposure to COPCs in soils did not exceed the target cancer risk of 10^{-5} and target non-cancer hazard of 1.0, respectively within AOI 2. Since the material in AOI 2 does not exceed risk targets, no further action is required.

However, RACER is evaluating the need for additional cover over portions within AOI 2. After review, it appears that only the northern half of AOI 2 will require an additional one foot of cover.

AOI 3 - Southern Sludge Area

AOI 3 was used for placement of WWTP sludges from 1972 to 1977. Approximately 40,000 cubic yards of material were placed within AOI 3. AOI 3 is located in the east central portion of the Site. The SSA is approximately 6.5 acres in size and is currently overgrown with vegetation.

AOI 3 has been used historically for waste disposal. Ten of twenty-one borehole logs for AOI 3 indicate the presence of blue or grayish blue clay. The bluish clay layer was located, in general, from two to six feet below ground surface (bgs). The bluish clay layer is indicative of waste disposal at the Site. However, after a thorough review of the available information, RACER has concluded that AOI 3 has a minimum of two feet of clean material covering the area. Borehole logs for this area do not indicate any waste disposal in the upper two feet in any of the soil borings.

CRA's Human Health Risk Assessment (HHRA) concluded that the calculated cancer risk and non-cancer hazard for the industrial/commercial worker exposure to chemicals of potential concern (COPCs) in soils did not exceed the target cancer risk of 10^{-5} however, did exceed the target non-cancer hazard of 1.0, within AOI 3. As the cumulative non-cancer hazard for the industrial/commercial worker exposure to COPCs was above 1.0 for this area, the exposure was re-evaluated using soil interval of 0 to 2 ft bgs. The results of this evaluation determined that the target non-cancer HI was below 1.0 within AOI 3. Therefore the surface soils (0 to 2 ft bgs) within this area are providing an adequate cover to protect the industrial/commercial worker from the underlying soils and AOI 3 poses no unacceptable risk. Deed restrictions will be used to ensure this cover is maintained.

AOI 4 - Northern Trench Area

AOI 4 is located in the northwestern portion of the Site. This area is approximately 0.8 acre in size. AOI 4 does not appear to have been used for waste disposal. The initial round of soil sampling concluded that AOI 4 poses no unacceptable risk to the Site.

AOI 5 - Southern Trench Area

AOI 5 is located in the west central portion of the Site. This area is approximately 0.7 acre in size.

After a thorough review of the available information, AOI 5 has been used historically for waste disposal. Three of the nine borehole logs for AOI 5 indicate layers of slag and blue/gray clay within the upper two foot interval. These layers ranged from 0.6 to 2 feet in thickness. The bluish clay layer is indicative of waste disposal at the Site.

The HHRA concluded that the calculated cancer risk and non-cancer hazard for the industrial/commercial worker exposure to COPCs in soils did not exceed the target cancer risk of 10^{-5} and target non-cancer hazard of 1.0, respectively within AOI 5. Since the material in AOI 5 does not exceed risk targets, no further action is required.

However, RACER is evaluating the need for additional cover over portions of AOI 5 where "hot Spots" were located within the upper two foot interval.

AOI 6 - Northern Die Storage Pad

AOI 6 is located in the west central portion of the Site and is approximately 0.8 acres in size. AOI 6 is located on the north side of the railway spur and was used to store dies. There is no known evidence of waste disposal associated with AOI 6.

After a thorough review of the available information, AOI 6 contains some areas of historical waste disposal. The area of waste disposal appears to include the majority of the eastern portion of the area investigated. Thirteen of the seventeen borehole logs for AOI 6 mention either a blue or rust color to the soil within the upper six feet. It appears that the blue and/or rust color in the soils is indicative of waste disposal. Several borehole logs indicate the blue and/or rust discoloration in the upper two foot interval.

The HHRA concluded that the calculated cancer risk and non-cancer hazard for the industrial/commercial worker exposure to COPCs in soils did not exceed the target cancer risk of 10^{-5} and target non-cancer hazard of 1.0, respectively within AOI 6. Since the material in AOI 6 does not exceed risk targets, no further action is required.

However, RACER is evaluating the need for additional cover over portions of AOI 6 where "hot Spots" were located within the upper two foot interval.

AOI 7 - Southern Die Storage Pad

AOI 7 is located in the west central portion of the Site and is approximately 0.8 acres in size. AOI 7 is located on the south side of the railway spur and was used to store dies. There is no known evidence of waste disposal associated with AOI 7.

After a thorough review of the available information, AOI 7 contains impacted soil and not buried waste. The majority of AOI 7 is covered with a concrete pad and most of the borehole logs indicate fill and crushed gravel in the upper four to six feet. Only three of the twelve borehole logs for AOI 7 mention a blue color to the soil and then only in trace amounts.

The HHRA concluded that the calculated cancer risk and non-cancer hazard for the industrial/commercial worker exposure to COPCs in soils did not exceed the target cancer risk of 10^{-5} however, did exceed the target non-cancer hazard of 1.0, within AOI 7. As the cumulative non-cancer hazard for the industrial/commercial worker exposure to COPCs was above 1.0 for this area, the exposure was re-evaluated using soil interval of 0 to 2 ft bgs. The results of this evaluation determined that the target non-cancer HI was below 1.0 within AOI 7.

Therefore, the surface soils (0 to 2 ft bgs) within this area are providing an adequate cover to protect the industrial/commercial worker from the underlying soils and AOI 7 poses no unacceptable risk. Deed restrictions will be used to ensure this cover is maintained.

AOI 8 - Former Fuel Oil Tank

AOI 8 is located in the northwestern portion of the Site. This area covers approximately 1.5 acres. This area included the former 2,310,000-gallon fuel oil tank and the earthen dyke that surrounded the tank.

After a thorough review of the available information, AOI 8 was used historically for disposal of waste. Ten of the twelve borehole logs for AOI 8 indicate layers of slag and blue/gray clay within the upper four feet. The blue/gray clay layer is indicative of historical waste disposal at the Site. However, the area of waste disposal within the upper two feet appears to follow the path between BH65-13 through BH69-13 only. This is the only area within AOI 8 that identified waste disposal within the upper two feet.

The HHRA concluded that the calculated cancer risk and non-cancer hazard for the industrial/commercial worker exposure to COPCs in soils did not exceed the target cancer risk of 10^{-5} and target non-cancer hazard of 1.0 within AOI 8. Since the material in AOI 8 does not exceed risk targets, no further action is required.

However, RACER is evaluating the need for additional cover over portions of AOI 8 where "hot Spots" were located within the upper two foot interval.

AOI 9 – Sitewide Groundwater

Eight rounds of groundwater sampling were completed through 2014. Groundwater exceeded the MCLs in each of the eight sampling events. Two areas of groundwater contamination are evident; 1) off-site and extending on-Site in the vicinity of the former WWTP and 2) adjacent to the Southern Former Die Storage Area (AOI-7). The off-Site migration of volatile organic compounds in groundwater is prevented, in part by the existing storm-sewers.

Because groundwater concentrations exceed MCL at one or more locations, potential exposure through future use of groundwater as a potable source is assumed to result in unacceptable risk. There are no habitable structures currently on-Site. However, due to the presence of volatile organic compounds in shallow groundwater at the upgradient property boundary, the potential for unacceptable vapor intrusion is assumed unless otherwise demonstrated prior to future construction.

7.2 Recommendations

Based on the findings and conclusions of the RFI, RACER plans to proceed with the following:

1. Submit a restriction for the use of groundwater to the property deed.
2. Submit a soil mitigation plan to protect future construction/utility workers.
3. Submit a restriction to the property deed to restrict disturbing soil cover over the AOIs.
    - Develop a plan to remove and dispose potential “hot spots” of surface sludge should they occur.
4. Develop a groundwater monitoring plan for the stability or improvement monitoring of sitewide groundwater conditions.

MAP INFORMATION

Map Scale: 1:6,280 if printed on A size (8.5" × 11") sheet.

The soil surveys that comprise your AOI were mapped at 1:15,840.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for accurate map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: UTM Zone 17N NAD83

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Lorain County, Ohio
Survey Area Data: Version 11, Jan 7, 2009

Date(s) aerial images were photographed: 6/29/2004; 6/30/2004

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Notes:

(1) Minimum/maximum detected concentration.
(2) Based on data collected from sampling locations: SB-200, SB-201, SB-202, SB-203, SB-204, SB-205, SB-206, SB-207, SB-208, SB-209, SB-210, SB-211, SB-212, SB-213.
(3) Table II: Generic Direct Contact Soil Standards for Carcinogenic and Non-Carcinogenic Chemicals of Concern, Commercial and Industrial Land Use Categories, OAC 3745-300-08 (C)(3), Ohio Voluntary Action Program, March 1, 2009.
Note: Carcinogenic analytes were adjusted by a factor of 10, risk = 1 x10^{-6}. Non-carcinogenic analytes were adjusted by a factor of 10, HI = 0.1.
(4) Regional Screening Level (RSL) Summary Table (TR = 1E-6, HQ = 0.1), Industrial Soil, November 2013.
(5) The screening criterion is the lowest of Ohio VAP or RSL.
(6) Rationale Codes
Selection Reason : Maximum detected above Screening Criterion (ASC)
Deletion Reason : Maximum detected below Screening Criterion (BSC)
As identified in OEPA Letter (dated December 18, 2013); analyte Not a Chemical of Potential Concern (NCOPC)
(7) No criterion for this analyte, therefore substituted cyclohexane criterion.
(8) No criterion for this analyte, therefore substituted lowest PAH (2-methylnaphthalene) criterion.
(9) No criterion for this analyte, therefore substituted 2,3,7,8-TCDD criterion and applied toxicity equivalent factors (TEF).

Definitions:

C = Carcinogenic
N = Non-Carcinogenic
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
-- = Not Available
N/A = Not Applicable
J = Associated value is estimated

Notes:
(1) Minimum/maximum detected concentration.
(2) Based on data collected from sampling locations: BH51-13, BH52-13, BH53-13, BH54-13, BH55-13, BH56-13, BH57-13, BH58-13, BH59-13, SB-202, SB-203.
(3) Table II: Generic Direct Contact Soil Standards for Carcinogenic and Non-Carcinogenic Chemicals of Concern, Commercial and Industrial Land Use Categories, OAC 3745-300-08 (C)(3), Ohio Voluntary Action Program, March 1, 2009.
Note: Carcinogenic analytes were adjusted by a factor of 10, risk = 1 x10^{-6}. Non-carcinogenic analytes were adjusted by a factor of 10, HI = 0.1.
(4) Regional Screening Level (RSL) Summary Table (TR = 1E-6, HQ = 0.1), Industrial Soil, November 2013.
(5) The screening criterion is the lowest of Ohio VAP or RSL.
(6) Rationale Codes
Selection Reason : Maximum detected above Screening Criterion (ASC)
Deletion Reason : Maximum detected below Screening Criterion (BSC)
Analyte Not Detected (ND) and therefore not present
Essential Nutrient (NUT)
As identified in OEPA Letter (dated December 18, 2013); analyte Not a Chemical of Potential Concern (NCOPC)

Definitions:
C = Carcinogenic
N = Non-Carcinogenic
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
-- = Not Available
N/A = Not Applicable
J = Associated value is estimated
ND = Not detected.

Notes:
(1) Minimum/maximum detected concentration.
(2) Based on data collected from sampling locations: BH34-13, BH35-13, BH36-13, BH37-13, BH38-13, BH39-41, BH40-13, BH41-13, BH42-13, BH43-13, BH44-13, BH45-13, BH46-13, BH47-13, BH48-13, BH49-13, BH50-13, SB-201.
(3) Table II: Generic Direct Contact Soil Standards for Carcinogenic and Non-Carcinogenic Chemicals of Concern, Commercial and Industrial Land Use Categories, OAC 3745-300-08 (C)(3), Ohio Voluntary Action Program, March 1, 2009.
Note: Carcinogenic analytes were adjusted by a factor of 10, risk = 1 x10^{-6}. Non-carcinogenic analytes were adjusted by a factor of 10, HI = 0.1.
(4) Regional Screening Level (RSL) Summary Table (TR = 1E-6, HQ = 0.1), Industrial Soil, November 2013.
(5) The screening criterion is the lowest of Ohio VAP or RSL.
(6) Rationale Codes
Selection Reason : Maximum detected above Screening Criterion (ASC)
Deletion Reason : Maximum detected below Screening Criterion (BSC)
Analyte Not Detected (ND) and therefore not present
Essential Nutrient (NUT)
As identified in OEPA Letter (dated December 18, 2013); analyte Not a Chemical of Potential Concern (NCOPC)

Definitions:
C = Carcinogenic
N = Non-Carcinogenic
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
-- = Not Available
N/A = Not Applicable
J = Associated value is estimated
ND = Not detected.

TABLE 5.3.1

EXPOSURE POINT CONCENTRATION (EPC) SUMMARY FOR CHEMICALS OF POTENTIAL CONCERN IN SOIL
OPEN BURN AREA
RISK ASSESSMENT
RACER TRUST PROPERTY
ELYRIA, OHIO

Scenario Timeframe: Current/ Future
Medium: Soil
Exposure Medium: Soil

Chemical of Potential Concern	*Units*	*Arithmetic Mean*	*95% UCL of Normal Data*	*Maximum Detected Concentration*	*Maximum Qualifier*	*EPC Units*	*Reasonable Maximum Exposure*			*Central Tendency*		
							Medium EPC Value	*Medium EPC Statistic*	*Medium EPC Rationale*	*Medium EPC Value*	*Medium EPC Statistic*	*Medium EPC Rationale*
Metals												
Manganese	mg/kg	9.75E+02	1.37E+03	3.40E+03		mg/kg	1.37E+03	95% UCL-N	W-Test (4)	1.37E+03	95% UCL-N	W-Test (4)

Notes:

For data sets with non-detects, the Kaplan-Meier method was used (per USEPA 2006).
W-Test : Developed by Shapiro and Wilk for data sets with under 50 samples.
Refer to USEPA Supplemental Guidance to RAGS: Calculating the Concentration Term (RAGS, 1992), OSWER Directive 9285.7-081, May 1992.
Statistics: Maximum Detected Value (Max); 95% UCL of Normal Data (95% UCL-N); 95% UCL of Log-transformed Data (95% UCL-L);
95% UCL of Gamma distributed data (95% UCL-G); Non-parametric method used to Determine 95% UCL (95% UCL-NP).
(1) Data set is neither normally, gamma or lognormally distributed. A non-parametric UCL is required.
(2) Data set is lognormally distributed.
(3) Data set is gamma distributed.
(4) Shapiro-Wilk W Test was used for data sets where n<=50.

	FT	Fraction Time Exposed	unitless	3.4/24	USEPA, 2011 (8)	1.7/24	USEPA, 2011 (8)	CS x FT x EF x ED x 1/PEF x 1/AT
	EF	Exposure Frequency	days/year	50	USEPA, 2011 (2)	25	USEPA, 2011 (2)	
	ED	Exposure Duration	years	10	USEPA, 2000 (3)	10	USEPA, 2000 (3)	
	AT-C	Averaging Time (cancer)	days	25,550	USEPA, 1989	25,550	USEPA, 1989	
	AT-N	Averaging Time (non-cancer)	days	3,650	USEPA, 1989	3,650	USEPA, 1989	
	PEF	Particulate Emission Factor	m^3/kg	9.24E+08	OEPA, 2008	9.24E+08	OEPA, 2008	

Notes:

(1) For soil concentrations within each area of concern, refer to Table 3.1 through to Table 3.7.
(2) The basis for the EF is the 50th percentile from Table 16-1, Recommended Values for Activity Factors - Time Outdoors (total).
The time spent outdoors for 11-16 years old of 100 min/day from out of a possible 365 days equates to 25 days (CT) [(100 min/d /1440 total min/d)*365]. The RME is double the CT value for 50 days.
(3) Trespasser is a 7 through 16 year old therefore the exposure duration is 10 years, based on USEPA Region 4 (2000).
(4) The basis for BW is the mean value for 11-16 years old from Table 5-1, Recommended Values for Body Weights.
(5) Current default assumption of 100% with the exception of arsenic at 60%.
(6) The basis for SA is the 50th percentile value from Table 7-1, Recommended Values for Total Body Surface Area, Males and Females combined.

The total body surface area was multiplied by 0.25 (25 percent) to account for exposed skin.

(7) As identified in OEPA Letter (dated December 18, 2013); absorption factor of 0.001 should be used.

(8) The basis for the FT is the 50th percentile from Table 16-1, Recommended Values for Activity Factors - Time Outdoors (total).
The time spent outdoors for 11-16 years old of 100 min/day equates to 1.7 hrs (CT) [100/60]. The RME is double the CT value for 3.4 hrs.

Q/C_{sr}/ inverse of ratio of the 1-h geometric mean air concentration =	13.19	Equation 5-6, USEPA, 2002
A/ constant (unitless) =	12.9351	USEPA, 2002
B/ constant (unitless) =	5.7383	USEPA, 2002
C/ constant (unitless) =	71.7711	USEPA, 2002
A_s/ areal extent of site surface soil contamination (acres) =	95.6	Site-Specific
F_D/ dispersion correction factor (unitless) =	0.185	USEPA, 2002
T/ total time over which construction occurs (s) =	3.15E+07	USEPA, 2002 (site-specific, within a 1 year construction campaign)
A_R/ surface area of contaminated road segment (m^2) =	3,792	USEPA, 2002 (A_R = LR*WR*0.092903 m^2/ft^2)
LR - length of road segment (ft) =	2041	USEPA, 2002
WR - width of road segment (ft) =	20	USEPA, 2002
W/ mean vehicle weight (tons) =	8	USEPA, 2002, Assumes 20 two-ton cars and 10 twenty-ton trucks (W = (20*2+10*20)/30)
p/ number of days with at least 0.01 inches of precipitation (days/yr) =	180	USEPA, 2002
VKT/ sum of fleet vehicle kilometres travelled during the exposure duration (km) =	2,333	Assuming that the area is configured as a square with the unpaved construction access road segment dividing the square evenly, the road length would be equal to the square root of 386,879 m^2, also equal to 622 m or 0.622 km. Assuming that each vehicle travels the length of the road once per day, 5 days per week for a total of 125 days, (30*0.622*125).

TABLE 6.1
HABITAT COVER TYPES and VEGETATION INVENTORY

RACER Property
Elyria, Lorain County, Ohio

Mowed Lawn

Coronilla varia	Crown vetch
Daucus carota	Wild carrot
Digitaria sanguinalis	Crabgrass
Plantago lanceolata	English plantain
Poa pratensis	Kentucky bluegrass
Setaria sp.	Foxtail grass
Taraxacum officinale	Common dandelion
Trifolium pratense	Red clover

Sparsely Vegetated Areas (Concrete Pads; Railroad Tracks; Access Roads)

Juncus tenuis	Path rush
Phragmites australis	Common reed
Populus deltoides	Eastern cottonwood (saplings)
Vernascum thapsus	Common mullein

Wooded Hedgerow (Open Drainage Ditches)

Cornus racemosa	Gray dogwood
Dipsacus sylvestris	Teasel
Eleaganus umbellata	Autumn olive
Fraxinus americana	White ash
Phalaris arundinacea	Reed canary grass
Polygonum virginianum	Jumpseed
Populus deltoides	Eastern cottonwood
Quercus rubra	Northern red oak
Rosa multiflora	Multiflora rose
Setaria sp.	Foxtail grass
Solidago sp.	Goldenrod
Verbascum thapsus	Common mullein
Vitis sp.	Grape

Forested Wetlands / Vernal Pools

Acer rubrum	Red maple
Carex grayi	Gray's sedge
Carex vulpinoidea	Fox sedge
Fraxinus pensylvanica	Green ash
Lindera benzoin	Spicebush
Polygonum persicaria	Lady's thumb
Quercus bicolor	Swamp white oak
Rosa multiflora	Multiflora rose
Smilax rotundifolia	Greenbrier
Ulmus rubra	Slippery elm

Thicket

Apocynum medium	Intermediate dogbane
Asclepias syriaca	Common milkweed
Cirsium arvense	Canada thistle
Cornus racemosa	Gray dogwood
Daucus carota	Wild carrot
Dipsacus sylvestris	Teasel
Elaeagnus umbellata	Autumn olive
Eupatorium rugosum	White snakeroot
Lonicera japonica	Japanese honeysuckle
Rubus allegheniensis	Common blackberry

Areas of Ponded Water

Lemna sp.	Duckweed
Phalaris arundinacea	Reed canary grass
Salix nigra	Black willow
Typha latifolia	Broad-leaved cattail

Emergent & Scrub-Shrub Wetlands

Juncus effusus	Common rush
Phalaris arundinacea	Reed canary grass
Rosa multiflora	Multiflora rose
Salix nigra	Black willow
Scirpus validus	Soft-stemmed bulrush
Typha latifolia	Broad-leaved cattail

Mature Deciduous Woods

Acer rubrum	Red maple
Carya ovata	Shagbark hickory
Fraxinus americana	White ash
Ligustrum obtusifolium	Japanese privet
Lonicera japonica	Japanese honeysuckle
Parthenocissus quinquefolia	Virginia creeper
Platanus occidentalis	Sycamore
Polygonum virginianum	Jumpseed
Quercus alba	White oak
Quercus rubra	Northern red oak
Rhus radicans	Poison ivy
Rosa multiflora	Multiflora rose
Tilia americana	American basswood

Upland Meadow (Periodically Mowed & Unmowed)

Achillea millefolium	Yarrow
Apocynum medium	Intermediate dogbane
Cirsium arvense	Canada thistle
Daucus carota	Wild carrot
Dipsacus sylvestris	Teasel
Elaeagnus umbellata	Autumn olive (saplings)
Oxalis europaea	Yellow wood sorrell
Plantago lanceolata	English plantain
Populus deltoides	Eastern cottonwood (saplings)
Setaria sp.	Foxtail grass
Solidago sp.	Goldenrod
Taraxacum officinale	Common dandelion
Asclepias syriaca	Common milkweed

OVERBURDEN LOG 012616-WI.GPJ CRA_CORP.GDT 4/15/14

STRATIGRAPHIC AND INSTRUMENTATION LOG (OVERBURDEN)

PROJECT NAME: ELYRIA RFI
PROJECT NUMBER: 012616-T02
CLIENT: RACER LLC
LOCATION: LORAIN COUNTY, OHIO

HOLE DESIGNATION: MW-28S
DATE COMPLETED: March 11, 2014
DRILLING METHOD: SONIC
FIELD PERSONNEL: D. NEWTON

DEPTH ft BGS	STRATIGRAPHIC DESCRIPTION & REMARKS	DEPTH ft BGS	MONITORING WELL	SAMPLE NUMBER	SAMPLE INTERVAL	SAMPLE REC (%)	SAMPLE 'N' VALUE	SAMPLE PID (ppm)
0	SM/GP-SILTY SAND AND GRAVEL (FILL), fines, red-orange clay tile, trace fine brick, coarse gravel, grayish brown, dry		CONCRETE; BENTONITE CHIPS; 2" PVC WELL CASING; 8" BOREHOLE	1RS		100		--
10	- fill material, roots, medium sand, increase in cobble content, wet at 10.0ft BGS		2" PVC WELL SCREEN; SAND PACK	2RS		100		--
12	- SANDSTONE at 12.0ft BGS	12.00						
	END OF BOREHOLE @ 12.0ft BGS							

WELL DETAILS
Screened interval:
7.00 to 12.00ft BGS
Length: 5ft
Diameter: 2in
Slot Size: 0.010
Material: PVC
Seal:
1.00 to 4.00ft BGS
Material: BENTONITE CHIPS
Sand Pack:
4.00 to 7.00ft BGS
Material: SAND

Definitions/Glossary

Client: Conestoga-Rovers & Associates, Inc.
Project/Site: 12616-T02, Racer Elyria

TestAmerica Job ID: 240-12614-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.
F	MS or MSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Laboratory: TestAmerica Canton

Narrative

CASE NARRATIVE

Client: Conestoga-Rovers & Associates, Inc.

Project: 12616-T02, Racer Elyria

Report Number: 240-12614-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 06/23/2012; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 3.0 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 06/28/2012, 06/29/2012, 06/30/2012, 07/02/2012 and 07/03/2012.

Methylene Chloride was detected in method blank MB 240-49715/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

1,1-Dichloroethene and 2-Butanone (MEK) failed the recovery criteria low for the MS/MSD of sample GW-12616-062212-DN-40 (240-12614-40) in batch 240-49465.

Samples GW-12616-062112-DN-25 (240-12614-25)[20X], GW-12616-062112-DN-34 (240-12614-33)[2X] and RB-12616-062212-DN-39 (240-12614-39)[4X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the VOCs analyses.

Job ID: 240-12614-1 (Continued)

Laboratory: TestAmerica Canton (Continued)

All other quality control parameters were within the acceptance limits.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

CASE NARRATIVE

Client: Conestoga-Rovers & Associates, Inc.

Project: 12616-T02-003, Racer Elyria

Report Number: 240-22640-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 03/30/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 4.4 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples WG-12616-032713-DN-01 (240-22640-1), WG-12616-032713-DN-02 (240-22640-2), WG-12616-032713-DN-03 (240-22640-3), WG-12616-032713-DN-04 (240-22640-4), WG-12616-032713-DN-05 (240-22640-5), WG-12616-032813-DN-06 (240-22640-6), WG-12616-032813-DN-07 (240-22640-7), WG-12616-032813-DN-08 (240-22640-8), WG-12616-032813-DN-09 (240-22640-9), WG-12616-032813-DN-10 (240-22640-10), WG-12616-032813-DN-11 (240-22640-11), WG-12616-032813-DN-12 (240-22640-12), WG-12616-032813-DN-13 (240-22640-13), WG-12616-032913-DN-14 (240-22640-14), WG-12616-032913-DN-15 (240-22640-15), WG-12616-032913-DN-16 (240-22640-16), WG-12616-032913-DN-17 (240-22640-17), WG-12616-032913-DN-18 (240-22640-18), WG-12616-032913-DN-19 (240-22640-19) and WG-12616-032913-DN-20 (240-22640-20) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 04/06/2013 and 04/07/2013.

The MSD in batch 80819 was outside the 12 hour tune limit by one minute.

No difficulties were encountered during the VOCs analyses.

All quality control parameters were within the acceptance limits.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.
E	Result exceeded calibration range.
F	MS or MSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

CASE NARRATIVE

Client: Conestoga-Rovers & Associates, Inc.

Project: 12616-T02-003, Racer Elyria

Report Number: 240-22797-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 04/04/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.2 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples WG-12616-040113-DN-21 (240-22797-1), WG-12616-040113-DN-22 (240-22797-2), WG-12616-040113-DN-23 (240-22797-3), WG-12616-040113-DN-24 (240-22797-4), WG-12616-040113-DN-25 (240-22797-5), WG-12616-040113-DN-26 (240-22797-6), WG-12616-040213-DN-27 (240-22797-7), WG-12616-040213-DN-28 (240-22797-8), WG-12616-040213-DN-29 (240-22797-9), WG-12616-040213-DN-30 (240-22797-10), WG-12616-040213-DN-31 (240-22797-11), WG-12616-040213-DN-32 (240-22797-12), WG-12616-040213-DN-33 (240-22797-13), WG-12616-040213-DN-34 (240-22797-14), WG-12616-040213-DN-35 (240-22797-15), WG-12616-040313-DN-36 (240-22797-16), WG-12616-040313-DN-37 (240-22797-17), WG-12616-040313-DN-38 (240-22797-18), WG-12616-040313-DN-39 (240-22797-19), WG-12616-040313-DN-40 (240-22797-20), WG-12616-040313-DN-41 (240-22797-21), WG-12616-040313-DN-42 (240-22797-22), WG-12616-040313-DN-43 (240-22797-23), WG-12616-040313-DN-44 (240-22797-24), WG-12616-040313-DN-45 (240-22797-25), TB-12616-001 (240-22797-26) and RB-12616-040313-DN-46 (240-22797-27) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 04/09/2013, 04/10/2013 and 04/11/2013.

Methylene Chloride was detected in method blanks 240-81352/5, 240-81169/5, and 240-81471/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated

Job ID: 240-22797-1 (Continued)

Laboratory: TestAmerica Canton (Continued)

sample reported a result above the MDL and/or RL, the result has been “B” flagged.

Trichloroethene failed the recovery criteria low for the MS/MSD of sample WG-12616-040113-DN-25(240-22797-5) in batch 240-81169.

Samples WG-12616-040113-DN-25 (240-22797-5)[12.5X], WG-12616-040213-DN-34 (240-22797-14)[2X], WG-12616-040313-DN-40 (240-22797-20)[5X], WG-12616-040313-DN-42 (240-22797-22)[5X] and WG-12616-040313-DN-43 (240-22797-23)[25X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the VOCs analyses.

All other quality control parameters were within the acceptance limits.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.

General Chemistry

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Laboratory: TestAmerica Canton

Narrative

CASE NARRATIVE

Client: Conestoga-Rovers & Associates, Inc.

Project: 12616-T02-004, Racer Elyria

Report Number: 240-23749-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 04/27/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 5.9 C.

TCLP VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples S-12616-042613-DN-01 (240-23749-1) and WG-12616-042613-DN-01 (240-23749-2) were analyzed for TCLP volatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 1311/8260B. The samples were leached on 04/30/2013 and analyzed on 05/01/2013.

Insufficient sample volume was available to meet method-mandated requirements for matrix spike/matrix spike duplicate (MS/MSD) analyses for batch 83859.

No difficulties were encountered during the VOCs analyses.

All other quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Sample S-12616-042613-DN-01 (240-23749-1) was analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 04/27/2013 and analyzed on 04/30/2013.

Job ID: 240-23749-1 (Continued)

Laboratory: TestAmerica Canton (Continued)

Several analytes were detected in method blank MB 240-83859/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the VOCs analysis.

All other quality control parameters were within the acceptance limits.

TCLP SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples S-12616-042613-DN-01 (240-23749-1) and WG-12616-042613-DN-01 (240-23749-2) were analyzed for TCLP semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Methods 1311/8270C. The samples were leached on 04/30/2013, prepared on 05/03/2013 and analyzed on 05/07/2013.

No difficulties were encountered during the SVOCs analyses.

All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)

Sample S-12616-042613-DN-01 (240-23749-1) was analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 05/06/2013 and analyzed on 05/08/2013.

The following sample required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: S-12616-042613-DN-01 (240-23749-1). Lot # S65830

No difficulties were encountered during the PCBs analysis.

All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)

Sample WG-12616-042613-DN-01 (240-23749-2) was analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 05/02/2013 and analyzed on 05/08/2013.

No difficulties were encountered during the PCBs analysis.

All quality control parameters were within the acceptance limits.

TCLP METALS (ICP)

Samples S-12616-042613-DN-01 (240-23749-1) and WG-12616-042613-DN-01 (240-23749-2) were analyzed for TCLP metals (ICP) in accordance with EPA SW-846 Methods 1311/ 6010B. The samples were leached on 04/30/2013, prepared on 05/01/2013 and analyzed on 05/02/2013.

Barium and Selenium were detected in method blank LB 240-84195/1-D at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TCLP MERCURY

Samples S-12616-042613-DN-01 (240-23749-1) and WG-12616-042613-DN-01 (240-23749-2) were analyzed for TCLP mercury in accordance with EPA SW-846 Methods 1311/7470A. The samples were leached on 04/30/2013, prepared on 05/01/2013 and analyzed on 05/02/2013.

No difficulties were encountered during the mercury analyses.

Job ID: 240-23749-1 (Continued)

Laboratory: TestAmerica Canton (Continued)

All quality control parameters were within the acceptance limits.

FLASHPOINT

Sample WG-12616-042613-DN-01 (240-23749-2) was analyzed for flashpoint in accordance with EPA SW-846 Method 1010. The samples were analyzed on 05/03/2013.

No difficulties were encountered during the flashpoint analysis.

All quality control parameters were within the acceptance limits.

PH

Sample WG-12616-042613-DN-01 (240-23749-2) was analyzed for pH in accordance with EPA SW-846 Method 9040C. The samples were analyzed past the method recommended 15 minute holding time on 04/27/2013.

No difficulties were encountered during the pH analysis.

All quality control parameters were within the acceptance limits.

Method Summary

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F	RPD of the MS and MSD exceeds the control limits
F	MS or MSD exceeds the control limits
B	Compound was found in the blank and sample.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

CASE NARRATIVE

Client: Conestoga-Rovers & Associates, Inc.

Project: 12616-T02, Racer Elyria

Report Number: 240-26413-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 07/02/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 1.5 C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 07/05/2013, 07/08/2013, 07/09/2013 and 07/11/2013.

There is no MS/MSD in batch 93295 due to an instrument fault.

Methylene Chloride was detected in method blank MB 240-92808/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Methylene Chloride was detected in method blank MB 240-93295/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

1,2,4-Trichlorobenzene exceeded the RPD limit for the MSD of sample WG-12616-062413-DN-01MSD (240-26413-1) in batch 240-92696.

Job ID: 240-26413-1 (Continued)

Laboratory: TestAmerica Canton (Continued)

Several analytes failed the recovery criteria low for the MSD of sample WG-12616-062813-DN-39MSD (240-26413-39) in batch 240-92969. Several analytes exceeded the RPD limit.

Samples WG-12616-062713-DN-25 (240-26413-25)[12.5X], WG-12616-062713-DN-30 (240-26413-30)[1.67X], WG-12616-062713-DN-31 (240-26413-31)[1.67X], WG-12616-062913-DN-42 (240-26413-42)[20X], WG-12616-062913-DN-43 (240-26413-43)[3.33X] and WG-12616-062913-DN-45 (240-26413-45)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the VOCs analysis.

All other quality control parameters were within the acceptance limits.

Surrogate Summary

Client: Conestoga-Rovers & Associates, Inc.
Project/Site: 12616-T02, Racer Elyria

TestAmerica Job ID: 240-26413-1

Method: 8260B - Volatile Organic Compounds (GC/MS) (Continued)

Matrix: Water

Prep Type: Total/NA

		Percent Surrogate Recovery (Acceptance Limits)
