1 Introduction

On behalf of the Revitalizing Auto Communities Environmental Response (RACER) Trust, Arcadis of Michigan, LLC (Arcadis) prepared this 2022 Annual Groundwater Monitoring Report (Annual Report) to support the Resource Conservation and Recovery Act (RCRA) Corrective Action process for RACER Trust Lansing Industrial Land, located in Lansing, Michigan (Site). The Site consists of former Plants 2, 3, and 6. This Annual Report summarizes groundwater monitoring completed between January and December 2022, consistent with the requirements of the Revised Interim Groundwater Monitoring Work Plan (IGMP; Arcadis 2019, as revised), which was approved by the Michigan Department of Environment, Great Lakes, and Energy (EGLE) on July 25, 2019.

The following sampling events were completed in accordance with the 2019 Revised IGMP:

- First quarter 2022 – A quarterly groundwater sampling and gauging event completed February 28 through March 2, 2022. Groundwater elevations were collected from a total of 68 monitoring wells and groundwater samples were collected from a total of 27 wells.
- Second quarter 2022 – Gauging of light non-aqueous phase liquid (LNAPL) wells and quarterly, semi-annual, annual, and biennial groundwater sampling and gauging event completed May 31 through June 10, 2022. Groundwater elevations were collected from a total of 203 monitoring wells, LNAPL gauging was completed at a total of 22 wells, and groundwater samples were collected from a total of 161 wells.
- Third quarter 2022 – A quarterly groundwater sampling and gauging event completed August 29 through September 3, 2022. Groundwater elevations were collected from a total of 33 monitoring wells and groundwater samples were collected from a total of 31 wells.
- Fourth quarter 2022 –Gauging of LNAPL wells and a quarterly and semi-annual groundwater sampling and gauging event completed October 31 through November 10, 2022. Annual sampling of Lansing Township municipal well sampling was also completed during the fourth quarter. Groundwater elevations were collected from a total of 112 monitoring wells, LNAPL gauging was completed at a total of 22 wells, and groundwater samples were collected from a total of 107 wells.
- Additionally, storm sewer sampling for per- and polyfluoroalkyl substances (PFAS) was completed during each 2022 quarterly event on March 1, May 12, August 2, and November 3.

A revised IGMP for 2023 is currently in review and will be in place prior to the second quarter 2023 sampling event. The 2023 Revised IGMP will incorporate storm sewer monitoring; newly installed monitoring wells; and will adjust the number of wells, constituents, and frequency of sampling consistent with the evolving risk and regulatory requirements, as approved by EGLE.

As outlined in the 2019 Revised IGMP, this Annual Report includes quarterly data (e.g., tabulated data, figures, analytical narrative) and the following information:

- Objective and scope of the sampling events
- Summary of groundwater elevations and LNAPL gauging data, including contour maps and trend plots
- Figures, tables, and a brief narrative summarizing the groundwater sampling results
- Groundwater elevation contour maps for various water bearing zones
- Updated groundwater plume stability evaluation
- Summary of Lansing Township water supply well sampling
- Conclusions and recommendations for revisions to the IGMP as appropriate.

All groundwater monitoring activities were completed in accordance with the 2019 Revised IGMP. The sampling frequencies and analytes for each well are included in **Table 1**. The locations of all site monitoring wells are provided on **Figures 1A**, **1B**, and **1C**.

The following deviations from the 2019 IGMP were observed during the 2022 monitoring activities:

- **MW-03-02** and **MW-03-04** are flush-mounted wells located in low lying areas of Plant 6 and utilized for groundwater elevation monitoring. Both monitoring wells have been unable to be located since June 2020 and may have been buried or under standing water. Arcadis will attempt to locate MW-03-02 and MW-03-04 during the 2023 sampling. Note these two wells have been proposed for abandonment. The 2023 well abandonment work plan is currently under review.
- **MW-03-08** is a perched monitoring well with flush-mount construction and was unable to be accessed due to standing water in second quarter 2022. MW-03-08 is utilized for annual groundwater elevation monitoring and biennial VOC monitoring. Arcadis will evaluate converting this well to a stick-up casing in 2023, as well as address the grade near the well to prevent future submersion.
- **MW-12-05R** was observed to be damaged and was not sampled for low level 1,4-dioxane in second quarter 2022. In August 2022, MW-12-05R was repaired, converted into a flush mount well and resurveyed in October 2022. Annual low level 1,4-dioxane sampling will next be completed in fourth quarter 2023.
- **MW-14-56** was observed to be damaged and was not sampled for 1,4-dioxane and PFAS in second quarter 2022. In August 2022, MW-14-56 was repaired, converted into a flush mount well and resurveyed in October 2022. MW-14-56 was sampled for PFAS in fourth quarter 2022. This well is next planned for annual gauging, 1,4-dioxane and PFAS sampling fourth quarter 2023.
- **MW-14-69** was dry in second quarter 2022 and has been dry since installation in 2014. This monitoring well was installed in an area with limited perched groundwater with the intent of verifying whether saturated conditions existed and if the well would produce enough water for sampling and is checked annually.
- **MW-18-96** was installed in shallow fill material at Plant 3 and contained water during development and initial sampling; however, the well has been dry since June 2020. This result suggests the clay in this area of the site is a barrier to groundwater flow.
- **MW-18-106** was sampled in second quarter 2022 but was dry in fourth quarter 2022. This is the first event with observed dry conditions. This location is scheduled to be gauged and sampled again in second quarter 2023.
- **MW-19** was noted to have had an unsecured slip cap that caused sediment to enter the well when attempting to gauge and sample for VOCs and1,4-dioxane in second quarter 2022. MW-19 was redeveloped in August 2022, but was noted to have approximately 15 feet of sediment accumulation that needed more aggressive surging to fully remove. This monitoring well was not sampled or gauged in 2022. MW-19 is scheduled for annual gauging and biennial sampling for 1,4-dioxane. Additional well development will occur in 2023 to prepare for biennial sampling in 2024.
- **MW-19-110** was installed in August 2019 at the request of the EGLE in an area of Plant 3 with limited perched groundwater with the intent of verifying whether saturated conditions existed and if the well would produce enough water for sampling. Since installation in 2019, the well has had either low water levels or been dry, resulting in no groundwater samples collected. No samples were collected at this location in 2022.

- **MW-19-113** was installed in a sand seam encountered from 16 to 23 feet below ground surface (ft bgs) on northern Plant 3 and had approximately 7 feet of water during development and initial sampling during 2019. The water level decreased dramatically during 2020 and continued to decrease until the well contained insufficient water to collect a sample beginning in fourth quarter 2020. The last groundwater sample collected from MW-19-113 was in June 2020. Low water levels were present during the second and fourth quarter 2022 gauging events (0.27 to 0.11 feet of water column, respectively). No samples were collected from this location in 2022.
- **P6-SB-35** is part of groundwater elevation monitoring during the annual event. In 2022, this well was inadvertently missed and not gauged. Nearby wells MW-13-36R and MW-14-67 were gauged including during the annual gauging event.
- **UNK-15** includes quarterly groundwater elevation monitoring. This well could not be accessed during the first quarter 2022 field event due to ice. This location was gauged during the remaining quarterly events.

2 Sampling Methods

This section discusses the groundwater and storm sewer sampling methodology used at the Site.

2.1 Groundwater Sampling Methods

All groundwater samples were collected in a manner consistent with the low-flow sampling techniques in the Arcadis Standard Operating Procedure (SOP) for low-flow sample collection, and generally consistent with EGLE's Remediation and Redevelopment Division (RRD) Op Memo 2, Attachment 5 (EGLE 2004). An emphasis was placed on collecting low-turbidity samples (less than 10 nephelometric turbidity units [NTUs]) for metals analysis. If turbidity below 10 nephelometric turbidity units (NTU) could not be achieved during sampling, the sample was filtered and the filtered and unfiltered samples were submitted for dissolved metals analysis and total metals analysis, using USEPA Method 6020. Samples collected for 1,4-dioxane, volatile organic compounds (VOCs), metals, and general chemistry were submitted under chain of custody protocol to Merit Laboratories (Merit) located in East Lansing, Michigan. Samples collected for low-concentration 1,4-dioxane analysis were submitted under chain of custody protocol to Eurofins Laboratory in Barberton, Ohio. Samples collected for PFAS analyses were submitted under chain of custody protocol to Pace Analytical Laboratory located in West Columbia, South Carolina. Laboratory analytical reports and data validation reports for Lansing Township municipal wells and all other monitoring wells are included as **Appendix A** and **B**, respectively. Groundwater low-flow sampling logs are included as **Appendix C**.

During the second quarter 2022 annual sampling event, and before sample collection, site-wide gauging was completed using electronic water level meters and LNAPL wells were gauged using an oil/water interface probe. During the first, third, and fourth quarter 2022 sampling events, gauging was limited to those wells selected for sampling and LNAPL monitoring. All gauging was completed within 24 hours with few exceptions due to access or other issues.

The most current sampling matrix provided as part of the 2019 Revised IGMP is included as **Table 1**. In general, groundwater samples were submitted for analysis for one or more of the following parameters:

- Target compound list (TCL) volatile organic compounds (VOCs) using United States Environmental Protection Agency (USEPA) Method SW8260B, Revision 2 or SW8260C, Revision 3.
- Low-concentration 1,4-dioxane using USEPA Drinking Water Method 522 (Eurofins), which provides a reporting limit (RL) of 0.20 microgram per liter (µg/L) – used for the Lansing Township municipal wells and select bedrock monitoring wells.
- 1,4-Dioxane using USEPA Method SW8260B-SIM (Merit) – used for monitoring wells other than municipal and bedrock wells.
- VOCs using USEPA Method 8260C.
- Selected metals (arsenic, total chromium, copper, lead, nickel, and vanadium) by USEPA Method 6020, and, at discrete locations, metals associated with known impacts (e.g., hexavalent chromium in Area 14 at Plant 3).
- Nutrient sampling (i.e., general chemistry), including nitrate, phosphorus and total Kjeldahl nitrogen (TKN), at select biosparge monitoring wells using Standard Method SM4500-N(org)/NH and SM4500-PE.
- Per- and polyfluoroalkyl substances (PFAS) using USEPA Method 537 modified with isotope dilution (DoD QSM 5.3).

2.1.1 Quality Control/Quality Assurance

Quality control (QC) samples were collected during the sampling event and included the following:

- One duplicate sample per every ten samples.
- One matrix spike and matrix spike duplicate (MS/MSD) sample per every 20 samples.
- One field blank sample per sampler per sampling event.
- One equipment blank sample per pump per sampling event, as well as additional equipment blank samples from the water level meters used for PFAS sampling.

Additionally, trip blanks were included with each cooler containing samples for VOC analysis. One sample delivery group per plant from each quarter underwent complete Tier I validation as defined in USEPA *Innovative Approaches to Data Validation*, USEPA Region III (USEPA 1995). Validation reports are included in **Appendix A** and **B** along with laboratory analytical reports.

2.1.2 Light Nonaqueous Phase Liquid Monitoring

LNAPL monitoring wells were gauged during the second and fourth quarter events with an oil/water interface probe. Gauging methods were consistent with the 2019 revised IGMP (Arcadis 2019).

2.2 Groundwater Elevation Monitoring

Monitoring wells were gauged during sampling using an electronic water level meter generally within a 24-hour period. To evaluate seasonality, site-wide gauging is rotated annually between the second quarter and fourth quarter events. In 2022, site-wide gauging was completed during the second quarter annual sampling event. During the first, third, and fourth quarter sampling events, gauging was limited to those wells selected for sampling. Gauging methods were consistent with the 2019 revised IGMP (Arcadis 2019).

2.3 Storm Sewer Sampling Methods

Storm sewer sampling was completed quarterly to confirm the effectiveness of storm sewer modifications and abandonments completed in Fall 2018, Winter 2019/2020, Fall 2020, and Spring 2021 (Arcadis 2021d). Storm sewer sampling was completed prior to storm sewer modifications and abandonments in 2017 at Plant 2 and in 2019 on Plants 2 and 6. Storm sewer samples required for quarterly monitoring are collected from the sump of the structure. Past samples collected for investigation purposes were collected from sumps and individual inverts as needed. Samples are collected according to the Arcadis technical guidance instruction (TGI) for PFAS sample collection and analyzed using USEPA Method 537 modified with isotope dilution (DoD QSM 5.3).

3 Results

This section summarizes the results from sampling activities completed between January and December 2022. **Table 2** presents groundwater analytical data collected during the reporting period. As a frame of reference and not indicating the criteria are applicable or that additional response is necessary, figures showing exceedances of EGLE Part 201 residential drinking water criteria (DW criteria) and Part 201 groundwater surface water interface criteria (GSI criteria), are provided as **Figures 2** through **9**. Laboratory analytical reports and data validation reports for Lansing Township municipal wells and all other monitoring wells are included as **Appendix A** and **B**, respectively. Groundwater low-flow sampling logs are included as **Appendix C**.

3.1 Groundwater Monitoring Results

A summary table of the groundwater analytical data collected during 2022 is presented in **Table 2** with exceedances of DW criteria and GSI criteria, if applicable, highlighted in gray and summarized on **Figures 2** through **9**. Results of the 2022 groundwater monitoring events are summarized below.

3.1.1 Perched 1,4-Dioxane Results

In accordance with the approved 2019 IGMP Table (**Table 1**), sampling of perched groundwater for 1,4-dioxane was completed as part of annual groundwater sampling event during second quarter 2022. Perched 1,4-dioxane results (**Figure 2**) are generally consistent with the results summarized in the 2021 Annual Groundwater Monitoring Report (Arcadis 2022b), except for MW-14-58R.

Monitoring well MW-14-58R is a perched monitoring well located near the western property boundary of Plant 2 was installed in October 2021 as a replacement for MW-14-58 which was damaged and subsequently abandoned. MW-14-58 was last sampled in June 2020 and had a 1,4-dioxane concentration of 38 µg/L. MW-14-58R was installed 5 to 6 feet north of MW-14-58 within similar geology to a total depth of 27 feet below ground

surface. MW-14-58R was first sampled in December 2021 with a 1,4-dioxane concentration of 430 µg/L. Resampling of MW-14-58R has shown decreasing 1,4-dioxane concentrations in 2022.

Additional evaluation of MW-14-58R, including four vertical aquifer profile (VAP) borings, and installation of four additional monitoring wells (MW-22-153, MW-22-155, MW-122-156, and MW-22-157), was completed to delineate 1,4-dioxane and better understand why the replacement well shows such a disparity in concentration. All five wells were sampled in September and October 2022 and 1,4-dioxane exceeded its residential DW criteria to the south (MW-22-156) and west (MW-22-153) but were generally lower than the concentrations observed at MW-14-58R. Concentrations off-site to the west are below criteria. A summary of the 2022 investigation results and proposed additional investigation activities for 2023 was included in the *MW-14-58R Area Data Summary and Proposed Additional Work* submittal on February 3, 2023 (Arcadis 2023a). Monitoring will continue consistent with the 2023 revised IGMP, data will be reviewed with EGLE, and we will determine if additional delineation is necessary.

3.1.2 Lower 1,4-Dioxane Results

A biosparge remedy has been implemented per the *Interim Measures Work Plan: Lower 1,4-Dioxane Biosparge* work plan (Arcadis 2018). The lower 1,4-dioxane biosparge system has been operating at Plant 3 since May 2019 and Plant 2 since August 2020. Performance monitoring of the biosparge system is summarized in the *Lower 1,4-Dioxane Biosparge Update Report* (Arcadis 2021c), submitted to EGLE on March 18, 2021 and in the *Lower 1,4-Dioxane Biosparge Progress Report and Shutdown Evaluation* (Arcadis 2023b), submitted to EGLE on March 27, 2023. Lower 1,4-dioxane concentrations (**Figure 3**) have been generally decreasing throughout the footprint of the plume in 2022.

Performance monitoring demonstrates treatment of the lower 1,4-dioxane plume within the radius of influence of the biosparge wells on Plants 2 and 3, as well as downgradient flushing. Performance reporting will continue on an annual basis. Lower 1,4-dioxane performance monitoring wells located within the area of influence of the biosparge system (e.g., MW-13-43, MW-19-121, MW-19-123, MW-20-128, and TW-14-06) have shown decreasing concentrations since system startup. The results at the perimeter of the lower 1,4-dioxane plume were reviewed for potential changes:

- *Southern Extent (the toe)* – The lower 1,4-dioxane plume is defined to the south by MW-16-74, MW-16-75, MW-16-77, MW-16-78, MW-16-79, MW-19-121, MW-21-140, and MW-21-141. These results suggest no significant expansion has occurred at the southern toe of the lower 1,4-dioxane plume since 2018. Future migration to the southeast is not expected due to the operation of the biosparge system and geologic conditions described as part of the *Lower 1,4-Dioxane Conceptual Site Model* (Arcadis 2021a).
- *Northeast Lobe (on Plant 2)* – Increasing and/or stable concentrations were observed within the northeast lobe of the lower 1,4-dioxane plume on Plant 2 during 2018-2021. Since then, stable to decreasing concentrations have been observed (e.g., at wells MW-16-84, MW-16-85, and MW-17-86), likely attributable to the operation of the biosparge system (Arcadis 2021c, 2023b).
- *MW-20-130*: Monitoring well MW-20-130 is a weather bedrock monitoring well that was installed as a deep sentinel for PFAS at the Plant 2 PFAS source area. MW-20-130 has a 1,4-dioxane concentration of 10 µg/L (November 2022). Two weathered bedrock monitoring wells were installed downgradient of MW-20-130, one to the south (MW-21-140) and one to the east (MW-21-141), and 1,4-dioxane was not detected at either well.

- Monitoring wells located near the western Plant 2 property boundary including MW-15-73 and MW-16-80 in weathered bedrock, show concentrations of 1,4-dioxane exceeding the DW criterion of 7.2 µg/L in 2022. The detected concentrations are generally consistent with previous results observed at these locations. As previously reported, detections of 1,4-dioxane at these locations could be associated, wholly or in part, with the APC site.

3.1.3 VOCs (other than 1,4-dioxane) Results

In accordance with the approved 2019 IGMP Table (**Table 1**), the annual and biennial analysis of VOCs was completed during the second quarter 2022. Of the thirty-six (36) wells that were sampled for VOCs during second quarter, five (5) wells had concentrations exceeding the DW and/or GSI criteria (**Figure 4**).

- *Plant 6 entrance at the intersection of Stanley and Osborn Streets* – A vapor intrusion investigation was completed in this area and details regarding the detection of vinyl chloride in shallow groundwater in this area was provided to EGLE in the *Plant 2, 3 and Plant 6 Vapor Intrusion Investigation Summary* (Arcadis 2021b). Vinyl chloride has been detected on-site at monitoring well MW-20-131 and off-site at MW-20-132 at concentrations above the Site-Specific Vapor Intrusion to Indoor Air Criteria (SSVIAC). A summary of the VI evaluation was provided to EGLE in June 2022 (Arcadis 2022c). An additional monitoring well was installed in September 2022 (MW-22-154) to the northeast of MW-20-132 to define the extent of SSVIAC exceedances in groundwater. Analytical results from MW-22-154 had vinyl chloride at or below criteria and ranged between non-detect (<1 µg/L) to 2 µg/L. Soil vapor sampling at SVMP-20-01, located between the Plant 6 entrance and the residential properties located to the northeast, has been non-detect for vinyl chloride.
- *Weathered bedrock wells MW-14-61, MW-17-86, and MW-19-120* – located in the northeast lobe of the lower 1,4-dioxane plume on Plant 2, these wells are monitored for VOCs semi-annually due to previously observed low detections of chlorinated VOCs (e.g., 1,2-DCE; chloroethane) related to leakage from the perched zone. VOCs were not detected in MW-14-61, MW-17-86, or MW-19-120 in 2022. VOCs will continue to be monitored in the weathered bedrock zone.

3.1.4 Metals Results

Metals including arsenic, chromium III, chromium VI, and nickel exceeded DW Criteria in three monitoring wells on Plant 3 during 2022 (**Figure 5**).

- *CH-14-RO*: Chromium III and chromium VI were detected in this shallow well at concentrations of 7.16 milligrams per liter (mg/L) and 7.4 mg/L, respectively, exceeding the DW criteria of 0.10 mg/L for both compounds. Chromium concentrations at CH-14-RO are related to the former plating line and have been steadily decreasing since monitoring began in 2012.
- *MW-13-32*: Nickel was detected in the shallow well MW-13-32, located near the eastern boundary of Plant 3, at a concentration of 0.363 mg/L, exceeding the DW criterion of 0.1 mg/L and GSI criterion of 0.12 mg/L. As previous discussed, nickel in this area appears to migrate onto the RACER property from the adjacent railroad easement.
- *MW-02-04(3)*: Arsenic was detected in the deep overburden well MW-02-04(3), located in central Plant 3, at a concentration of 0.051 mg/L, exceeding the DW criteria of 0.01 mg/L.

These metals results are consistent with previous sampling events. An evaluation of metals stability in groundwater (Arcadis 2014b) and subsequent monitoring indicates that metals at the Site are stable and spatially limited.

3.1.5 PFAS Results

The following sections discuss the PFAS groundwater results at the Site.

3.1.5.1 PFOS Results

Perfluorooctane sulfonic acid (PFOS) concentrations exceeded the Groundwater-Surface Water Interface (GSI) criteria (12 nanograms per liter [ng/L] and DW Criteria (16 ng/l) at 16 perched monitoring wells in 2022 (**Figure 6**).

- MW-18-98: Located on the northern portion of Plant 3, this perched well contained concentrations of PFOS that increased from 33 ng/L to 440 ng/L in 2022, exceeding the DW and GSI criteria. Further north, the perched well MW-19-113 is screened in a similar depth interval and was dry in 2022 suggesting no further migration.
- *MW-18-88, MW-18-95, and eastern Plant 3 off-site wells*: Perched monitoring wells located along the eastern boundary of Plant 3 contained PFOS concentrations of 120 to 310 ng/L at MW-18-88 and 27 to 46 ng/L at MW-18-95. PFOS exceeded the GSI criterion during the first quarter only at one (MW-18-105) of the six perched monitoring wells installed in the City of Lansing's Dunnebacke and Westside Parks, located east of Plant 3.
- *MW-12-12 and MW-13-36R*: Located along the northern and eastern boundary of Plant 6, these wells contained concentrations of PFOS that exceed the DW and GSI criteria. However, PFOS detections did not exceed DW criterion at the vertical aquifer profiling (VAP) or off-site monitoring wells completed east of Plant 6 to delineate PFAS impacts.

3.1.5.2 PFOA Results

Perfluorooctanoic acid (PFOA) concentrations exceeded the DW Criterion of 8 ng/L at 28 perched monitoring wells in 2022 (**Figure 7**).

- *MW-18-88, MW-18-95, and eastern Plant 3 off-site wells*: Perched monitoring wells located along the eastern boundary of Plant 3 contained PFOA concentrations of 5.6 to 9.2 ng/L at MW-18-88 and 2.3 to 11 ng/L at MW-18-95. However, PFOA has not exceeded the DW criterion at any of the six perched sentinel monitoring wells installed in the City of Lansing's Dunnebacke and Westside Parks.
- *MW-04-05(6), MW-12-10R, MW-12-12, MW-13-36R, MW-14-67, MW-14-70, MW-20-131, MW-20-132, and MW-22-151*: Perched monitoring wells located along the northeastern and eastern boundaries of Plant 6 and off-site, contained concentrations of PFOA that exceed the DW criterion. Additional sentinel monitoring wells (MW-22-150 and MW-22-152) were installed off-site to the northeast and east of Plant 6 in March 2022 and the groundwater analytical results did not exceed the DW criterion.
- *Southeastern Plant 6 boundary wells*: Installation of fifteen additional monitoring wells (MW-21-133 through MW-21-138 and MW-22-143 to MW-22-152) was completed between March 2021 and March 2022 along the southeastern perimeter of Plant 6 and off-site. The three southern boundary wells (MW-21-136, MW-21-137, and MW-21-138) were non-detect for all PFAS contaminants in 2022. To the southeast, well MW-22-144 and MW-22-145 have or currently exceed DW Criteria. Additional investigation work was completed in September through December 2022 east of MW-22-145 including the installation of three additional wells (MW-22-158, MW-22-159 and MW-22-160) to complete delineation of PFOA (Arcadis 2023c). Off-site PFAS concentrations will continue to be monitored to evaluate concentration trends and stability.

- *MW-12-09 and MW-14-58R*: Perched monitoring wells located near the western boundary of Plant 2 both contained of PFOA ranging from 12 to 15 ng/L, exceeding the PFOA DW Criteria. The western property boundary in this area in is located southeast of the former APC Site. There is the potential that PFAS concentrations near the Plant 2 boundary and within the Rosemary right-of-way could be attributable to the APC Site or another potential nearby source.

3.1.5.3 PFNA Results

Perfluorononanoic acid (PFNA) concentrations exceeded the DW criterion value of 6 ng/L at six perched monitoring wells in 2022 (**Figure 8**). The highest concentration of PFNA was 170 ng/L observed in Plant 6 source area well P6-SB-07. Other exceedances ranged from 6.0 ng/L to 22 ng/L.

3.1.5.4 Other PFAS Compounds

The only detections of perfluorohexanesulfonic acid (PFHxS) that exceed the DW criterion value (51 ng/L) in 2022 were concentrations of 280 ng/L in perched well MW-21-139 in the Plant 2 PFAS source area, 1,600 ng/L in Plant 3 source area monitoring well CH-14-RO, and 84 ng/L in perched well MW-18-103 located along the northern boundary of Dunneback Park east of Plant 3. The PFHxS detected at MW-18-103 appears to be isolated and may be related to an off-site source to the north where large quantities of roofing shingles are piled on the ground surface, processed and recycled.

Sporadic low detections of perfluorobutanesulfonic acid (PFBS) and perfluorohexanoic acid (PFHxA) observed in monitoring wells during 2022 are below the DW criteria values of 420 ng/L and 400,000 ng/L, respectively.

In addition to PFOS, PFOA, PFNA, PFHxS, PFBS, and PFHxA, other PFAS compounds have been detected at the Site, however there are no established criteria for comparison. In general, these concentrations appear to correlate to PFOS and PFOA concentrations and decrease with distance from PFOS and PFOA source areas.

3.1.5.5 Storm Sewer Analytical Results

Storm sewer PFAS analytical results from 2022 are summarized on **Tables 7** through **9** with exceedances of Rule 57 criteria highlighted in gray. Third and fourth quarter data are also summarized on **Figures 16** through **18**. Results of the third and fourth quarter 2022 sampling events are summarized below.

- P2-MH-2 exceeded the Rule 57 criteria for PFOS of 12.0 ng/L during third quarter 2022 with a detection of 14 ng/L. No other outfall exceedances occurred on Plant 2 in third and fourth quarter 2022.
- P3-MH-284 exceeded the Rule 57 criteria for PFOS during third quarter 2022 with a detection of 16 ng/L. No other outfall exceedances occurred on Plant 3 in the third and fourth quarter 2022.
- Rule 57 criteria for PFOS was exceeded near Plant 6 as listed below. No other exceedances occurred on Plant 6 in third and fourth quarter 2022.
  - MichAve-MH-4 exceeded in the third quarter with a detection of 15 ng/L.
  - Osborn-MH-1 exceeded in fourth quarter with a detection of 14 ng/L.
  - Verlinden-MH-2 exceeded in the third quarter with a detection of 15 ng/L.

3.1.6 Municipal Well and Bedrock Monitoring Well Sampling Results

The results of the Lansing Township well sampling indicate 1,4-dioxane concentrations of 0.16 J µg/L in Lansing Township well TWP-90-03 and 0.31 µg/L in TWP-90-04 (**Appendix A**). These concentrations are consistent with those detected in December 2021 (0.13 J in TWP-90-03, 0.23 ng/L in TWP-90-04). TWP-90-05 was inaccessible due to maintenance and was unable to be sampled in 2022. The locations of the municipal wells are shown and the bedrock 1,4-dioxane results are summarized on **Figure 9.**

Analytical results for the municipal wells are included in **Table 2**. Widespread 1,4-dioxane detections are potentially related to a 1,4-dioxane "background condition" in and around Lansing, as demonstrated by the low-level 1,4-dioxane sampling completed at the Site in 2017. Sporadic detections of 1,4-dioxane in the bedrock monitoring wells installed along the core of the plume ranged from 0.19 µg/L to 1.7 µg/L and did not exceed DW Criteria in 2022. Annual sampling of Lansing Township wells will continue to monitor for 1,4-dioxane.

3.2 Light Nonaqueous Phase Liquid Monitoring

LNAPL is present in the central portion of Plant 2 (Area 5-2) and in the north-central portion of Plant 3 (Area 17). LNAPL monitoring well locations and approximate extent of LNAPL are presented on **Figures 1A** and **1B**. LNAPL thicknesses were generally consistent with previous observations and are provided in **Table 3**. LNAPL trend graphs are included in **Appendix D**. The trend graphs indicate that, when present, LNAPL thickness generally gradually increases until it reaches equilibrium within the well and then stabilizes. For the deeper LNAPL, wells take longer to equilibrate with the confined LNAPL conditions relative to the static water level within the formation. The comprehensive *Plant 2 LNAPL Conceptual Site Model* was provided to EGLE for review on February 20, 2020 (Arcadis 2020). Based on the monitoring results, there is no indication of LNAPL migration.

3.3 Groundwater Elevation Monitoring

A site-wide groundwater elevation survey was completed during the annual event (second quarter 2022). Additional groundwater elevation measurements were collected at sampled wells during the semi-annual and quarterly events. **Table 4** summarizes groundwater elevation measurements collected at the Site. Groundwater elevation contour maps (**Figures 10** through **13**), LNAPL trend graphs (**Appendix D**), and groundwater elevation hydrographs (**Appendix E**) are provided for review. Trends within each water-bearing zone are discussed below.

3.3.1 Perched Zone

The groundwater elevation hydrographs included in **Appendix E** indicate that potentiometric surface elevations in the perched zone have been stable to increasing during the period of monitoring beginning in 2012. Storm sewer modifications were completed at Plant 3 during November 2018 and at Plant 2 in 2019 and 2020. Comparison of potentiometric surface elevations observed on Plant 3 prior to storm sewer modifications and post-modification potentiometric surface elevations generally show minor fluctuations (both increasing and decreasing) that are within the range of seasonal variation. Perched potentiometric surface elevations on Plant 2 generally show a gradual increasing trend since 2012 and a slight increase in groundwater elevation following the 2019 storm sewer modifications as levels stabilized. It is unclear whether the small changes in groundwater elevation on Plant 2 are influences by storm sewer modifications, or part of longer-term trends related to decommissioning of the plants. Groundwater elevations at Plant 6 perched monitoring wells have been generally stable since 2012.

Due to the predominance of clay-rich sediment, the perched zone is interbedded and has an overall low permeability and is characterized by isolated sand zones within layers of silt and clay. The potentiometric surface measured within the perched zones is presented on **Figure 10** (Plants 2 and 6) and **Figure 11** (Plant 3). Both figures include potentiometric surface contours for all wells less than 25 feet deep. The lower conductivity clay and silt that dominate this zone result in high horizontal and vertical gradients. Sand zones are discontinuous and often do not correlate from well to well, and minor variations in well screen elevation have a significant impact on the potentiometric surface. Therefore, although the contour maps represent the overall shallow potentiometric surface, they are of limited use to determine groundwater flow direction.

3.3.2 Deep Overburden

Saturated deep overburden is present only at Plant 3 within a southwest-northeast trending bedrock valley. Groundwater present within the deep overburden is hydraulically connected to the weathered bedrock and bedrock zones. The groundwater elevation hydrographs included in **Appendix E** show that deep overburden water levels appear to be decreasing since 2020 following a period of steady increases 2016 to 2020. The variations observed in deep overburden water levels are likely changes in precipitation, as well as long-term changes in municipal pumping.

Figure 12 presents potentiometric surface elevation contours for deep overburden wells located on Plant 3. In the northern portion of Plant 3, the apparent groundwater gradient is northwesterly. In the southwestern portion of Plant 3 there is a groundwater high below the former “coliseum” source area with an apparent gradient to the southeast.

3.3.3 Weathered Bedrock and Bedrock

Potentiometric surface trend graphs for select bedrock and weathered bedrock wells are included in **Appendix E**. Following a period of increasing elevations from 2016 to 2020, the bedrock and weathered bedrock elevations have been decreasing since 2021 with an overall increase in vertical gradient (0.41 ft/ft downward) within the Saginaw Formation. The variable potentiometric surface is likely attributed to changes in municipal pumping patterns, both long-term and seasonally.

Similar to the perched zone, the depth of a monitoring well within the weathered bedrock or bedrock zones plays a large role in the potentiometric surface observed at that location. Large vertical gradients occur in formations with vertical anisotropy and indicate a lack of vertical groundwater communication. Traditional groundwater elevation contour maps were not prepared for the weathered bedrock wells because they would be of limited use for interpreting groundwater flow direction and transport.

For the bedrock (and by extension, the weathered bedrock), the effective head or “corrected” potentiometric surface elevation can be calculated based on the observed vertical gradients. As indicated in **Table 5**, the vertical gradient tends to be limited near the coliseum and increases to the south to 0.43 ft/ft downward at wells MW-15-72/MW-12-05R (located in central Plant 2) before stabilizing to 0.53 ft/ft downward at wells MW-13-52/MW-13-50 (located on western Plant 6). This variation in vertical gradient appears to coincide with the transition between bedrock formations. Near the former coliseum (former stamping area basement) in the western portion of Plant 3, where the bedrock encountered consists of the more uniform and permeable Grand River Formation, the vertical gradient is negligible. To the south, within the interbedded sandstone and shale of the Saginaw Formation, there is a significant vertical gradient due to the vertical anisotropy created by the interbedded shale and sandstone of the Saginaw Formation. Review of the bedrock wells and other deep boring logs suggests an approximate

geologic contact between the Grand River and Saginaw Formations oriented roughly southwest to northeast. **Figure 13** includes the interpreted location of the geologic contact.

To calculate the effective head for the bedrock, an average downward gradient 0.41 ft/ft was applied to bedrock monitoring wells installed within the Saginaw Formation (**Table 5**) as follows:

$$GW_{eff} = GW – (dh/dl * \Delta Elev)$$

Where:

GW_{eff} = effective groundwater elevation

GW = measured groundwater elevation

dh/dl = vertical gradient

ΔElev = change in elevation between deepest well and measured well

As shown on **Figure 13**, the corrected bedrock groundwater elevation contours are a good match for the distribution of the lower 1,4-dioxane plume located within the weathered bedrock zone. Groundwater flow is generally to the southeast, but as documented in the December 5, 2019 *Update Meeting Presentation* provided to EGLE, the gradient in the central part of Plant 2 has become flatter and more variable in recent years with an west to east flow component beneath the Plant 2 LNAPL area.

4 Groundwater Plume Stability

A preliminary groundwater plume stability assessment was completed at the Site in April 2014 (Arcadis 2014a). The primary objective of that assessment was to provide an initial evaluation of plume stability and determine the suitability of monitored plume stability as a remedial alternative. The preliminary plume stability assessment used data collected between October 2011 and first quarter 2014 as well as geochemical data collected during the August and September 2013 events.

The plume stability assessment has been updated annually and incorporated into the annual reports. Stability assessments have been generally consistent and demonstrate that historical increasing trends are primarily limited to 1,4-dioxane in weathered bedrock wells and metals in perched wells mobilized by changes in groundwater geochemistry associated with the Site. Operation of the biosparge system in weathered bedrock has decreased concentrations in the lower 1,4-dioxane plume significantly since 2020. The plume stability assessment presented in this section represents an updated analysis of time-series concentration trends using data collected through fourth quarter 2022.

The updated statistical analysis of dissolved-phase constituent of concern (COC) concentrations with time was completed using the Mann-Kendall slope trend test, consistent with the methodology used in previous evaluations. The updated analysis for 2022 includes all wells that that meet the following criteria:

- At least four sampling events have been completed.
- At least 65 percent of the sampling results were greater than detection limits (minimum of three sampling results greater than detection limits).
- At least one detection in the dataset exceeded the lowest relevant criteria.

Guidance for conducting the Mann-Kendall test have been provided in Section 17.3.2 of the US EPA guidance document (USEPA 2009). The Mann-Kendall trend test is a non-parametric test to evaluate if a statistically significant unidirectional (consistently increasing or decreasing) trend was observed during the monitoring period. Correlations were accepted as significant for p-values less than or equal to the alpha value, 0.10 (with a confidence level of 90 percent). Additional information regarding the Mann-Kendall analysis and methods is provided in the 2014 *Preliminary Groundwater Geochemical and Plume Stability Assessment* (Arcadis 2014a) and in **Appendix F**. **Table 6** presents a comprehensive summary Mann-Kendall trend analysis results. The overall trend results are shown on **Figures 14** and **15** for perched and weathered bedrock zones, respectively. **Appendix F** presents plots of concentrations through time for all well/COC pairs that met criteria for statistical trend analysis.

4.1 Perched Zone

4.1.1 1,4-Dioxane

The 1,4-dioxane plume generally appears to be stable to decreasing within the perched zone, with the exception of MW-03-06 on central Plant 6, which has shown variable concentrations of <2 ug/L up to 8 µg/L. The concentration at MW-03-06 was 5 µg/L in 2022.

4.1.2 Volatile Organic Compounds

Concentrations of VOCs in the perched zone are sporadic, and a large plume footprint has not been observed; rather, VOC concentrations in groundwater greater than DW criteria are limited to discrete source areas (e.g., Area 2, Area 9) and areas immediately surrounding observed LNAPL at Plants 2 and 3. VOC data showed decreasing trends across the site with the exception of MW-14-54 in Area 2, which has increasing trends noted for several aromatic hydrocarbons.

4.1.3 Metals

During previous plume stability assessments, most statistical analyses for concentrations of metals in perched zone monitoring wells were determined to be decreasing or exhibit no significant trend, suggesting overall stability in metals greater than criteria. The trend evaluation for metals focused on monitoring wells near the Site boundary to evaluate the potential for off-site metal impacts. Of the perimeter wells, only MWBP-10-UST5-6 indicated an increasing trend for arsenic. The increasing trend for arsenic in this well is for the time period from 2013 through 2022. Since the observed maximum concentration of 0.051 mg/L in December 2017, concentrations have been decreasing and was at criteria (0.010 mg/L) in June 2022. Elevated arsenic in this area is related to reducing conditions associated with the underground storage tanks formally located in Area 6.

4.1.4 PFOS, PFOA, PFNA, and PFHxS

Thirty-two monitoring wells met the criteria for Mann-Kendall analysis for PFOA, PFOS, PFNA, and/or PFHxS during 2022. Statistical trend analysis indicates that three wells (MW-13-36R, MW-18-88, MW-18-103) have statistically increasing trends and all other wells with PFAS concentrations exceeding criteria demonstrate stable to decreasing trends. An increasing trend was observed at MW-13-36R for PFOA near the eastern boundary of Plant 6. This monitoring well showed an increase in concentration from 70 µg/L in November 2021 to 81 µg/L in

March 2022 and was at 74 µg/L in June 2022. Additional monitoring of PFOA east of Plant 6 will be completed during 2023. PFOA is currently defined east of Plant 6 by permanent monitoring wells.

Increasing trends are also observed for PFOA and PFOS at Plant 3 at monitoring well MW-18-88. An increase in PFOA and PFOS at well MW-18-88 was observed during the third quarter 2021 (PFOA concentration of 17 ng/L and PFOS concentration of 860 ng/L) and then fell back to within the historical range during the 4th quarter 2021 and subsequent 2022 quarterly sampling events (PFOA ranging between 5.5 to 9.2 ng/L and PFOS ranging between 120 to 310 ng/L). Increasing trends are not observed at the six perched sentinel monitoring wells installed further east within the City of Lansing's Dunnebacke and Westside Parks except for PFHxS at MW-18-103, which has PFHxS concentrations up to 84 ng/L, compared to a range of 0.59 J to 3.7 ng/L observed at the other five off-site perched sentinel wells. The presence of PFHxS at MW-18-103 appears to be isolated and may be related to an off-site source area.

4.2 Deep Overburden and Weathered Bedrock

4.2.1 1,4-Dioxane

Prior to the operation of the biosparge system concentrations within the lower 1,4-dioxane were decreasing to stable trends in the northern portion of the plume on Plant 3, and stable to increasing trends towards the toe of the plume and the Plant 2 LNAPL area. Since the biosparge startup, concentrations throughout the lower 1,4-dioxane plume are stable to decreasing. Three weathered bedrock wells exhibited increasing trends for 1,4-dioxane on Plants 2 (MW-14-56 and MW-15-73) and 3 (MW-13-34). Notable trends within the lower 1,4-dioxane plume include the following:

- *MW-13-34*: MW-13-34 is a weathered bedrock well at Plant 3 that has exhibited an increasing trend for 1,4-dioxane since sampling began in 2013 ranging from approximately 20 µg/L up to 130 µg/L, but in recent quarters has fluctuated around 80 ug/L. A nested well installed in deep overburden, MW-13-48, previously exhibited an increasing trend but has been decreasing since 2015 (from a max of 380 µg/L down to 24 µg/L). This difference may be due to the groundwater preferential pathway downgradient of the Plant 3 biosparge transect with clean water flushing through the higher permeability zone associated with MW-13-48.
- *MW-14-56:* A weathered bedrock well located along the western property boundary of Plant 2, shows an increasing trend (6 to 15 µg/L) for 1,4-dioxane. 1,4-Dioxane impacts at this well may be related to deep 1,.4-dioxane associated with the APC Site located upgradient of this location. MW-14-56 was damaged in second quarter 2022 and was not sampled. The well was repaired and will next be sampled next in fourth quarter 2023.
- *MW-15-73:* MW-15-73 is located within the weathered bedrock at the west extent of the lower 1,4-dioxane plume in the central part of Plant 2. Well MW-15-73 has shown consistent detections of 1,4-dioxane since 2016, with the five most recent samples (December 2018 through June 2022) exceeding the DW criterion of 7.2 µg/L. Work completed during the installation of MW-15-73 and installation of the Biosparge system (Arcadis 2021c) has shown a clean zone between the lower 1,4-dioxane plume and MW-15-73 suggesting the increasing trend could be attributed to contributions from the APC Site.

5 Conclusions

This Annual Report summarizes the groundwater monitoring activities completed between January and December 2022, consistent with the 2019 Revised IGMP. Based on the results of the sampling and review of the plume stability evaluation, the following conclusions are offered:

- *Lower 1,4-Dioxane:* Installation of the biosparge system for the lower 1,4-dioxane plume has been completed per the *Interim Measures Work Plan: Lower 1,4-Dioxane Biosparge* work plan (Arcadis 2018). The Plant 3 biosparge system began operating in May of 2019, and the Plant 2 biosparge system began operating in August of 2020. Since the biosparge startup, concentrations across the lower 1,4-dioxane plume are stable to decreasing. Three weathered bedrock wells exhibit increasing trends for 1,4-dioxane on Plants 2 (MW-14-56 and MW-15-73) and 3 (MW-13-34). Deep impacts along the western Plant 2 property boundary (MW-14-56 and MW-15-73) are likely related to the upgradient APC facility.
- *Perched 1,4-Dioxane:* Elevated detections of 1,4-dioxane at MW-14-58R and associated wells on western Plant 2 will continue to be monitored through second quarter 2023 at which time the available information will be evaluated and a recommendation for next steps will be developed.
- *1,4-Dioxane in Bedrock:* Sporadic detections of 1,4-dioxane in deeper bedrock monitoring wells installed along the core of the plume ranged from 0.19 µg/L to 0.86 µg/L and did not exceed drinking water criteria in 2022.
  - Lansing Township wells TWP-90-03 and TWP-90-04 were sampled in November 2022 and analyzed for 1,4-dioxane using USEPA Method 522 for drinking water. Concentrations of 0.16 and 0.31 µg/L, respectively, were reported and are consistent with previous sampling results. The low-level detections of 1,4-dioxane in the region may result from several regional and/or numerous nonpoint sources. Annual sampling of Lansing Township wells will continue in 2023.
- *VOC and Metals:* Groundwater sample results indicate that concentrations of several VOCs and metals exceed residential drinking water criteria during at least one sampling event at the Site. Elevated concentrations of VOCs are observed within a few perched monitoring wells centrally located on Plants 2 and 6 and impacts do not appear to be migrating radially. Elevated concentrations of metals are, in most cases, a result of natural geochemical conditions and/or slight shifts in geochemistry associated with the presence of VOCs. The exception is nickel on the eastern boundary of Plant 3, which is attributed to off-site conditions.
- *PFAS Compounds:* PFOS, PFOA, PFNA, and PFHxS concentrations exceeded DW Criteria and PFOS exceeded the GSI criterion in perched monitoring wells during 2022 groundwater monitoring events. Concentrations PFAS in perched groundwater at Plants 2, 3, and 6, show stable to decreasing trends, with the exception of two wells on Plant 3 and one eastern perimeter well on Plant 6. Additional sampling will continue in 2023 to monitor PFAS impacts.
- *Stormwater PFAS:* The quarterly storm sewer sampling indicates the storm sewer modifications at Plant 2 and 3 have successfully reduced PFAS discharge to concentrations at or below the Rule 57 criteria. Plant 6 modifications have reduced PFAS concentrations to near Rule 57 Criteria and will continue to be monitored for changes.
- *LNAPL:* LNAPL extent and thicknesses are consistent with previous annual reports, there is no indication of LNAPL migration.

Based on these conclusions, no immediate action is recommended at this time. Results of the monitoring program do not suggest changes are required for the previously submitted *Plant 2 LNAPL Conceptual Site Model* (Arcadis 2020), or the *Lower 1,4-Dioxane Conceptual Site Model* (Arcadis 2021a). Further, there are no apparent risks of exposure noted for the surrounding residential neighborhoods. Groundwater and storm sewer PFAS monitoring will continue consistent with the 2023 revised IGMP.

6 Proposed IGMP Modifications

A revised interim groundwater monitoring plan (2023 Revised Interim Groundwater Monitoring Plan) has been submitted to, and reviewed by, EGLE. The revised plan is in the final stages of revision and is expected to be incorporated into the quarterly sampling beginning second quarter 2023.

Table 2
Summary of Groundwater Analytical Results - January to December 2022
RACER Trust Plants 2, 3, and 6
Lansing, Michigan

Data Flagging:

Bold font	represents data where detections were noted above the laboratory method detection limit.
Gray shading	represents result exceeding either or both the EGLE Part 201 Generic Cleanup Criteria and Screening Levels (dated January 10, 2018) or the EGLE GSI Criteria (Updated June 25, 2018)

Notes:

1. EGLE Part 201 Residential Drinking Water Criteria and Groundwater Surface Water Interface Criteria from the Generic Cleanup Criteria and Screening Levels (dated January 10, 2018) are used for comparison with all VOC and Inorganic data and revised criteria values (dated December 21, 2020) are used for comparison with all PFAS data.

2. 1,4-Dioxane is compared to a drinking water criteria of 7.2 µg/L per the *MDEQ Establishment of Cleanup Criteria for 1,4 -Dioxane: Emergency Rules* dated October 27, 2016.

Abbreviations:

- - = Not listed in the EGLE Criteria Tables.
* = Analyzed for low-level 1,4-Dioxane via EPA Method 522
Deg. C. = degrees Celsius
EGLE = Michigan Department of Environment, Great Lakes, and Energy
mg/L = milligrams per liter
NA = Not Analyzed
NR = Not Recorded
NTU = Nephelometric Turbidity Unit
s.u. = standard unit
ug/L = micrograms per liter
µS/cm = microSiemens per centimeter

Lab and Validation Data Qualifiers:

B = An estimated value between the instrument detection limit and the reporting limit.
E= Analyte exceeded calibration range. Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
F1 = Matrix spike and/or matrix spike duplicate recovery is outside acceptance limits.
J = The compound was positively identified, but the associated numerical value is an estimated concentration only.
U = The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
X = Elevated reporting limit due to matrix interference.
Y = Elevated reporting limit due to high target concentration.

Notes:
Where LNAPL was observed, groundwater elevations have been corrected using a measured LNAPL density of 0.8995 gram per milliliter.
UNK-14 previously reported was abandoned in November 2021
* - When gauging, LNAPL and water started coming out of the casing riser.

Abbreviations:
LNAPL = light nonaqueous phase liquid
msl = mean sea level
NAPL = nonaqueous phase liquid
NM = not measured
NP = no product
TOC = top of casing
RACER = Revitalizing Auto Communities Environmental Response

bgs = below ground surface
DRY = well was dry and depth to water could not be gauged
LNAPL = light nonaqueous phase liquid
msl = mean sea level
NM = not measured
NS = not surveyed
RACER = Revitalizing Auto Communities Environmental Response
TOC = top of casing

Notes:
*Well is not actively sampled, per the current approved Interim Groundwater Monitoring Plan (IGMP)
< = less than the posted reporting limit
% = percent
CV = coefficient of variation; low values indicate stable concentrations. Values near or greater than 1 suggest variability and/or a temporal trend.
DCE = dichloroethene
n = number of samples included in analysis
NA = not applicable due to elevated proportion of non-detect concentrations
p-value: values less than 0.1 indicate a statistically significant trend at 90% confidence.
S-Statistic: positive values suggest increasing trend, negative values suggest decreasing trend, values near zero indicate stability or variability.
TCE = trichloroethene
VC = vinyl chloride
1. All concentrations are micrograms per liter
2. Total DCE = sum of cis-1,2-DCE, trans-1,2-DCE, and 1,1-DCE. Non-detect concentrations taken as zero.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

Case Narrative
Arcadis U.S., Inc.
Lot Number: XC03034

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples was in compliance with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). For undiluted analysis. For undiluted analysis, the extract is prepared for injection by adding 182 uL of sample extract + 8 uL of reagent water + 10 uL of internal standard solution to a polypropylene autosampler vial. An extra correction factor of 0.91 (182 uL / 200 uL = 0.91) applies. The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1/0.91.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: Drinking Water: VOC (excluding BTEX, MTBE, Naphthalene, & 1,2-dichloroethane) EPA 524.2, E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

Samples XC03034-002, XC03034-004, XC03034-005, XC03034-006, XC03034-007, XC03034-008, XC03034-009, XC03034-010, XC03034-011 had surrogates recovered outside of the acceptance limits due to confirmed matrix interference.

The MS/MSD associated with sample XC03034-002 had compounds recovered outside of the acceptance limits. The LCS was recovered within the required acceptance limits; therefore, this demonstrates a matrix effect and data quality is not impacted.

Case Narrative
Arcadis U.S., Inc.
Lot Number: XC03037

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples was in compliance with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). For undiluted analysis. For undiluted analysis, the extract is prepared for injection by adding 182 uL of sample extract + 8 uL of reagent water + 10 uL of internal standard solution to a polypropylene autosampler vial. An extra correction factor of 0.91 (182 uL / 200 uL = 0.91) applies. The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1/0.91.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein, acrylonitrile, and 2-chlorovinylethyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

Analytical Laboratory Report

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

Report Narrative

VOC pH check result corrected.

VOCs removed from samples .06 - .09 per client request

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.

Case Narrative
Arcadis U.S., Inc.
Lot Number: XD06118

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples was in compliance with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). For undiluted analysis. For undiluted analysis, the extract is prepared for injection by adding 182 uL of sample extract + 8 uL of reagent water + 10 uL of internal standard solution to a polypropylene autosampler vial. An extra correction factor of 0.91 (182 uL / 200 uL = 0.91) applies. The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1/0.91.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: Drinking Water: VOC (excluding BTEX, MTBE, Naphthalene, & 1,2-dichloroethane) EPA 524.2, E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

The MS/MSD associated with sample XD06118-004 had compounds recovered outside of the acceptance limits. The LCS was recovered within the required acceptance limits; therefore, this demonstrates a matrix effect and data quality is not impacted.

Samples XD06118-008, XD06118-009, XD06118-010, XD06118-011, XD06118-012 had surrogates recovered above the acceptance limits. This reflects a high bias for compounds associated with this surrogate. There were no detections for these compounds in the sample; therefore, there is no impact on data quality and no corrective action is required.
