SECTION 1
INTRODUCTION AND PROCEDURES

Roy F. Weston, Inc. (WESTON®), on behalf of General Motors Corporation (GM), has completed a characterization study of subsurface material within a portion of the Linden Road Site located in Flint, Michigan. This investigation was conducted pursuant to a subsurface soil sampling plan dated 14 April 1997 submitted to the Michigan Department of Environmental Quality (MDEQ). Field sampling was conducted during the period of 28 April to 2 May 1997. For the purposes of this evaluation, Generic Commercial Subcategory I (residential criteria) and Generic Commercial Subcategory II (industrial criteria) were used as the comparison criteria. Soil analytical results were also compared to Part 201 Generic Soil Inhalation Criteria for Ambient Air (April 1997). This report presents the findings of the subsurface investigation.

1.1 PROJECT OBJECTIVE

The objective of the characterization study was to evaluate soil quality of an approximate 400-foot wide frontage zone within the site and along Linden Road to assist in evaluating the potential for remediating this area to meet the MDEQ Generic Commercial Criteria as indicated in the January 1996 Remedial Action Plan (RAP) and in the December 1996 Addendum to the RAP for the Linden Road Site. This study was intended to:

- Fully characterize the subsurface material within a 400-foot-wide zone by collecting and analyzing soil and fill samples from several representative locations.
- Describe the lithology of subsurface material at every location.
- Delineate the boundaries and thickness of any material that may need special management prior to developing the area for potential use under the Generic Commercial Criteria.

Specifically, the characterization study was completed to determine the horizontal and vertical extent of fill material present in the proposed frontage zone and to verify constituents in the subsurface material which exceed MDEQ criteria for commercial properties. The area of

investigation consisted of the Linden Road frontage parcel that extends approximately 400 feet east to west and approximately 1,300 feet north to south (approximately 13 acres).

1.2 GRID COORDINATE SYSTEM

In order to characterize the entire proposed frontage zone, samples were collected based on a site grid coordinate system as shown in Figure 1-1. Prior to sampling, a cartesian grid coordinate system was established by Michigan licensed surveyor Hubbell, Roth & Clark, Inc. of Bloomfield Hills, Michigan. The grid system was established on the eastern portion of the site, which includes the proposed frontage zone, for horizontal and vertical control. The grid covered a 400-foot-wide area that covers the maximum potential. The coordinate points were placed at 100-foot intervals north and west of the southeast corner of the site. Each grid coordinate point was marked with a wooden stake driven firmly into the ground. The approximate coordinates were written on the stake in indelible ink. The ground surface elevations were established in mean sea level (MSL) elevations.

Each of the 100-foot grid points was assigned a sample location identification number starting at the southeast corner of the study area. North-south grid columns were assigned the letters A through E proceeding westerly. East-west grid rows were assigned the numbers 1 through 14 proceeding northerly. For example, the grid coordinate number for the sample location at 100 feet west and 200 feet north of the southeast corner of the site would be identified as "B3." (The southeast corner would be "A-1.")

1.3 SAMPLING METHODS

Soil/fill sampling and description of subsurface material were performed using three different methods, the selection of which depended on the sampling location, accessibility of the location, depth to groundwater, and efficiency of the selected method required at each location. These methods included soil borings and auger probes using hollow-stem augers (HSA) mounted to a drill rig, and manually operated hand augers. All sampling locations were advanced to native material so that the thickness of any fill material could be determined. Boring logs were

completed for all sampling locations and are provided as Attachment A. A work plan outlining the procedures to be completed for characterizing the frontage parcel was submitted to the MDEQ and approval was granted verbally by MDEQ on 25 April 1997.

The planned sampling method at some of the sampling locations required relocation/change based on site conditions encountered during drilling. All such modifications to the proposed sampling locations were documented and the actual locations were measured and recorded relative to the grid coordinates. The actual sampling locations and methods are shown on Figure 1-1 and recorded on the boring logs.

Decontamination of the drill rig was completed using a high-pressure steam cleaner. Split-spoon samplers and hand augers were decontaminated using an alconox soapy-water wash followed by a tap water rinse.

1.3.1 Soil Borings

A total of 25 soil borings were drilled at locations as shown on Figure 1-1. These borings provided additional data regarding the subsurface material based on visual observations and chemical analysis. Soil borings were drilled using an all terrain vehicle (ATV)-mounted drill rig equipped with 4.25-inch ID HSA. All drilling was conducted by Mateco Drilling Company of Grand Rapids, Michigan. The soil borings were continuously sampled with either 2-inch or 2.5-inch diameter split spoon samplers following protocols outlined in ASTM Method D-1586. Sample characterization was completed by a WESTON geologist. A portion of each sample was placed in a zip-lock bag and screened for head space volatile organic readings with photoionization detector (PID).

Soil borings were drilled to the depth of at least 1 to 2 feet into native soil. A single sample representative of subsurface fill/soil was collected and retained for chemical analysis from the majority of soil boring locations. Samples selected for analysis were based upon visual observations and PID readings. Representative samples collected also included those from native soils across the site for their evaluation. All samples and sample handling procedures

were consistent with those identified in the initial Site Investigation Work Plan (WESTON, 1990).

1.3.2 Auger Probes

A total of 19 auger probes were drilled at locations shown on Figure 1-1. Auger probe sampling aided in visually characterizing subsurface material and determining the consistency of the subsurface material both vertically and laterally within the subject area. The auger probes were advanced also using the 4.25-inch HSA. Auger probes were advanced in 2-foot increments and retrieved from the hole. Then the cuttings on the auger flight were examined visually and logged by the on-site geologist. The auger probes were drilled to the depth of at least 1 to 2 feet into native soil. All cuttings were returned to the holes after characterization, field screening, and sample collection.

1.3.3 Hand Augers

A total of 25 hand augers were advanced during the study as shown on Figure 1-1. Hand auger locations were used to replace either soil borings or auger probe locations based on accessibility, ease of sampling and the locations being at or near the native material such as the depressions and marsh portions of the study area. The hand augers were advanced manually in 0.5-foot increments to native material. Hand augers were advanced to a maximum of 5 feet from the surface and penetrated approximately 1 foot of native material. At locations where surface water was present, hand auger drilling were not extended below a depth of 2 feet. Sediment in the low-lying samples were also collected using the hand auger. A single soil or sediment sample was collected as appropriate at each of the hand auger locations.

1.4 DEVIATIONS FROM SAMPLING PLAN

Based upon actual field conditions, modifications to the sampling plan were required during the study. Required sampling modifications included the following:

- The total number of samples proposed for chemical analysis was 50. The actual number of samples collected was 54.

- Due to difficulty in access, the number of soil boring locations were reduced from a proposed 28 locations to 25 locations. Auger probes were reduced from a proposed 26 locations to 19 locations, and hand auger location were increased from a proposed 16 locations to 25 locations.

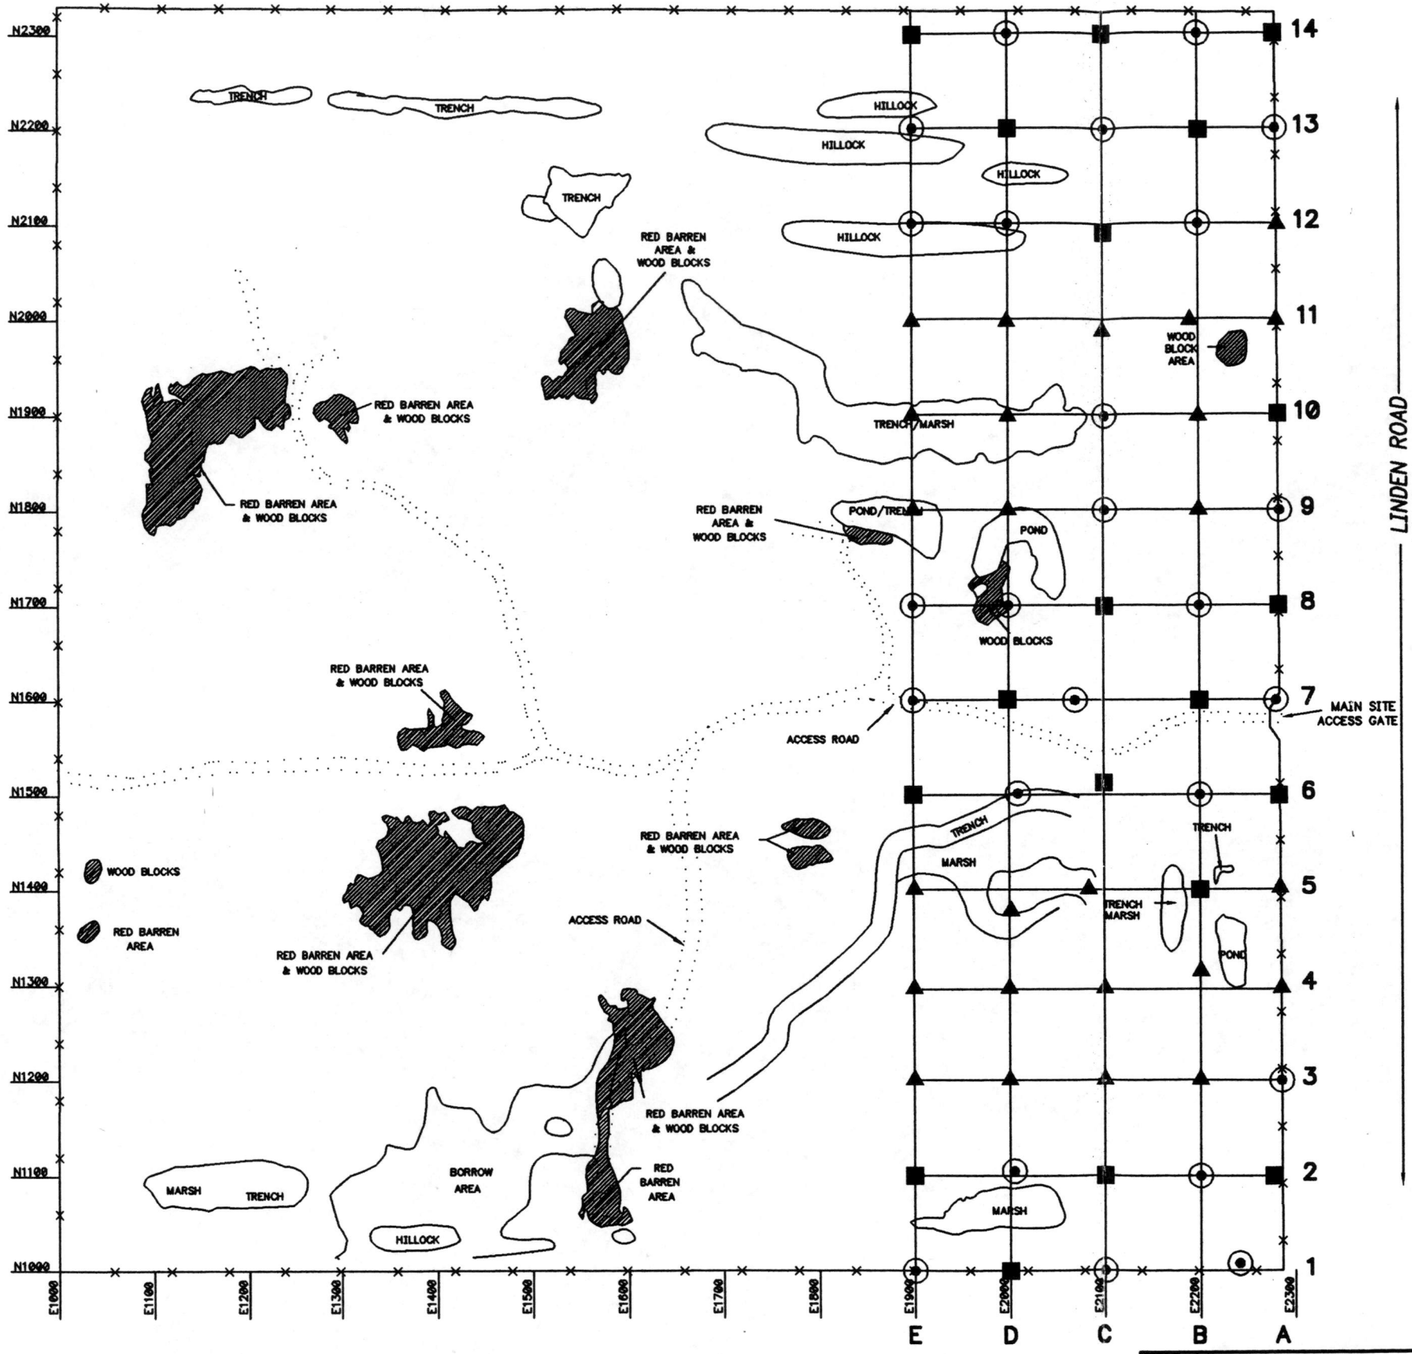

- Due to access restrictions, sample locations A-1 and B-1 were combined at a location between the two sample points (A/B-1).

- At the auger probe locations, the use of solid stem augers was not required since the 4.25-inch HSA adequately retrieved the required volume of soil for characterization.

- During the investigation, several small soil mounds were identified at various locations across the site. In order to characterize the material of these mounds, hand augers were advanced at five of these mounds with two soil samples being selected for chemical analysis.

- At locations were the grid sample point was at deeper portions of surface water ponds, soil samples were collected from the closest accessible location.

- Minor deviations to the proposed sample locations were required due to limited access. These deviations ranged from 5 to 20 feet. Such deviations were measured and recorded on the boring logs and log books.

SECTION 2
DESCRIPTION OF SUBSURFACE MATERIAL

Fill and soil samples were collected for lithologic characterization from a total of 69 sampling locations. Of these, 25 were continuously sampled soil borings, 19 were auger probes, and 25 were hand auger samples. This section presents a generalized description of surface and subsurface conditions in the study area based upon this sampling. In general, the stratigraphic profile consists of fill material (higher elevation areas), sediment (lower elevation areas), clayey gravel, and silty clay. A general description of the surface topography and the stratigraphic units encountered within the study area is presented below.

2.1 SURFACE TOPOGRAPHY

Surface elevation of the frontage parcel varied from approximately 740 feet MSL at the northeast corner to 765.5 feet MSL at the west-central portion. The relief is approximately 7 feet in the central portion of the study area, with gradual increases to the west of the study area.

To the south of this central rise area, is a low-lying marshy area where surface water accumulates. The marshy area is typically 5 to 7 feet lower in elevation than the central rise area. Extending farther to the south, the elevation slopes gently downward with no standing surface water present. To the north of the central rise area is another low lying marshy area that contains surface water and is surrounded by small soil mounds. The elevation in this area is typically 5 to 10 feet lower than at the central rise area. The topography slopes gently down to the northeast; however, to the north-northwest are a series of small (5 to 7 feet high) east-west trending hillocks, typically 10 to 15 feet wide and separated by lower-lying areas typically 50 to 100 feet wide.

2.2 FILL MATERIAL

Fill material at the study area generally consists of clean fill and industrial fill. The areal distribution and thickness of fill material is shown on Figure 2-1.

The clean fill is typically present along the eastern edge of the study area extending from approximately A-6 to A-14. This clean fill may have been placed during construction of Linden Road and is typically brown sand and silt with clay. This fill is 1 to 3 feet thick.

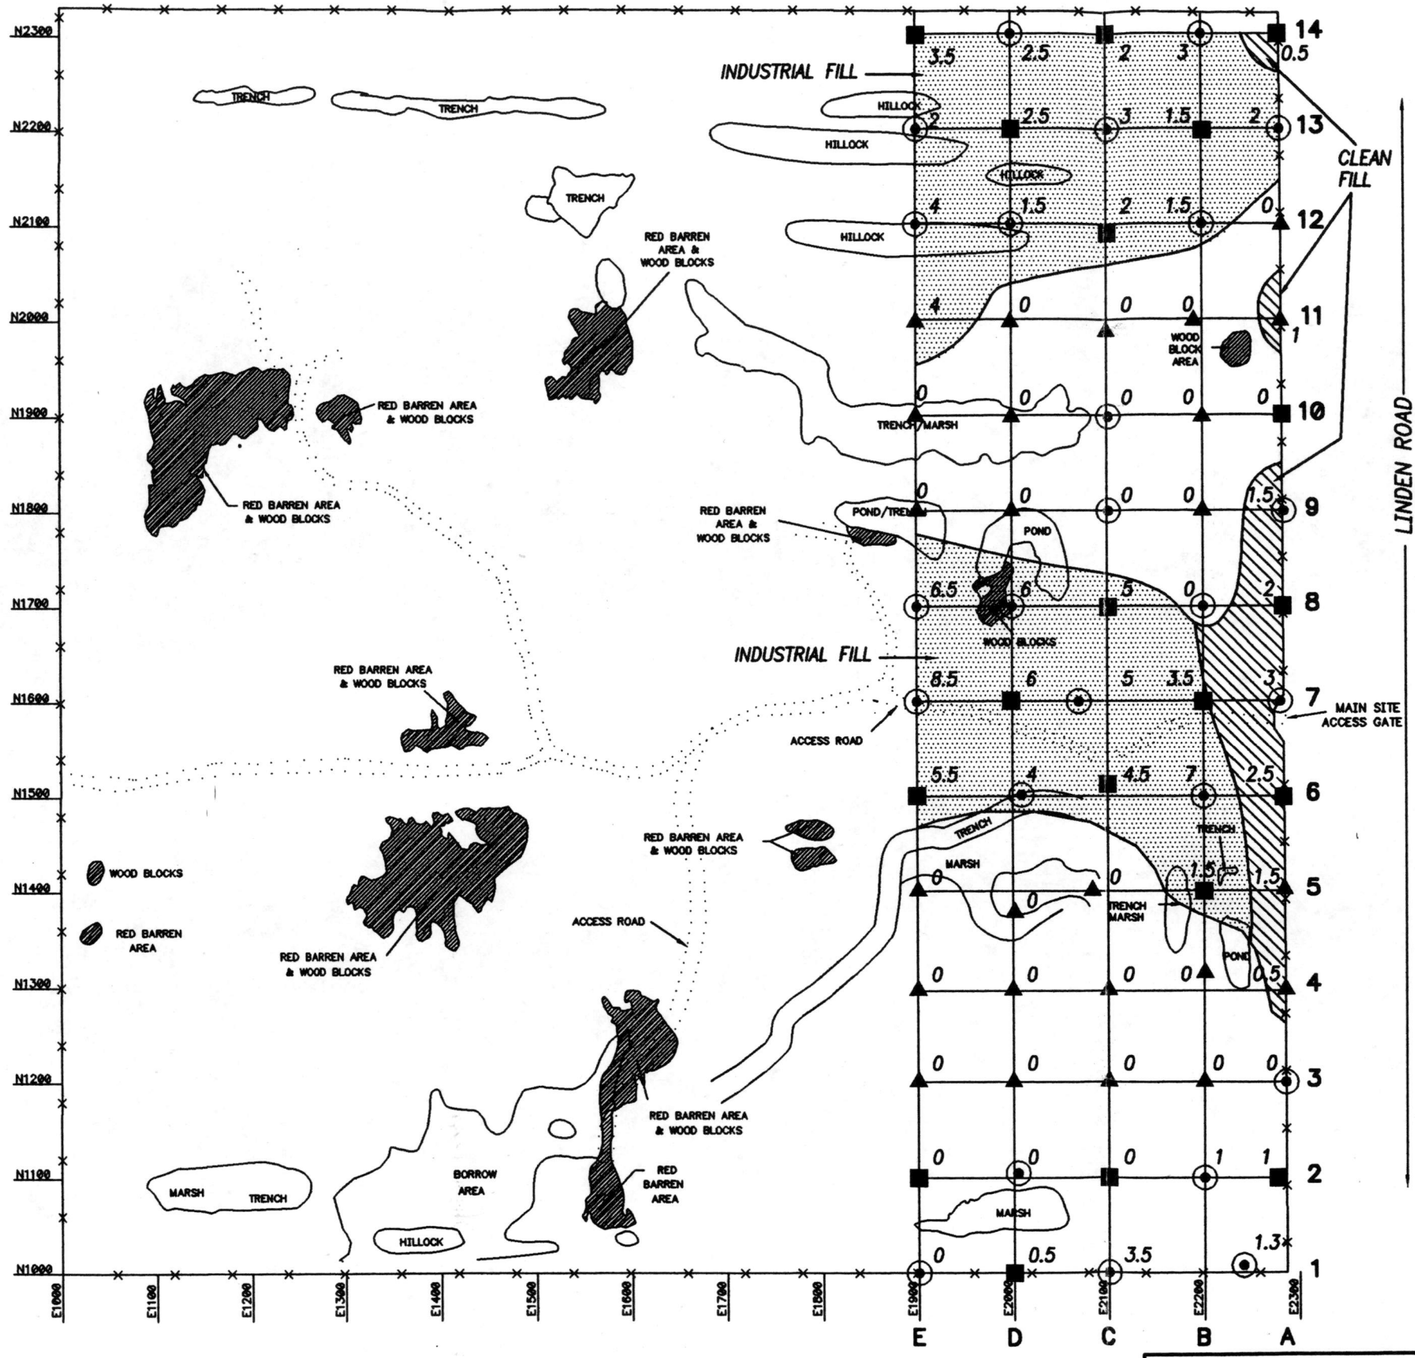

The industrial fill is primarily comprised of a brown silty clay mixed with various industrial waste such as metal grindings and parts, cinders, slag, ash, small wood blocks, and concrete. Rust-colored oxidation is prevalent in areas where metal grindings and parts were identified. The industrial fill is primarily found at the central rise area and is generally the reason for the high elevation in this area. Where present, thickness of this fill material ranges from 1 to approximately 8 feet. Limited industrial fill material was also identified along the northern portion of the site in the lower lying areas between the hillocks.

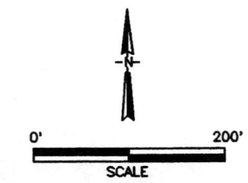

2.3 CLAYEY GRAVEL

Directly below the fill material and at the surface of the low-lying areas, is a thin perched water bearing zone. This native water-bearing zone varies across the site from clayey gravel to sandy gravel. Typically this zone is yellowish brown in color. Gravel and sand size varies from fine to coarse, and the grain shape is primarily subangular to subround. This low-yield thin perched shallow water-bearing zone is the same zone that was identified throughout the site during the initial site investigation (WESTON, 1990). At some locations to the south, a gray-brown silty clay exists directly above the water bearing zone. Thickness of the silty clay zone varies from 0 to approximately 2 feet.

2.4 SILTY CLAY

Directly below the perched water-bearing zone is a native silty clay glacial till which varies from 8 to 13 feet in thickness. The upper portion of the silty clay is mostly firm with small amounts of fine sand and gravel, and is considered to be a "confining unit" based upon its stratigraphic position beneath the perched water-bearing zone, its lateral continuity across the entire site and its low permeability of $\bar{K}_h = 7.2 \times 10^{-8}$ cm/sec *(Interim Remedial Measures Evaluation and Site Investigation Report, Linden Road Landfill Site, Flint Township, Michigan, Volume I, WESTON, March 1992).* The upper 2 to 4 feet is yellowish brown in color with some gray mottling. The silty clay grades to a gray color and becomes more plastic with depth. The glacial till is underlain by laminated glacial deposits to at least a depth of 48 feet below ground surface (bgs). These glacial deposits are comprised primarily of interlayered low-permeability silty clay and clayey silt with occasional thin (0.5 to 2.5 feet) layers of fine grained sand. The Pennsylvanian Saginaw Formation is believed to be the underlying bedrock below the glacial material at an estimated depth of 550 to 140 feet bgs. The Saginaw Formation is comprised of interbedded sandstone, shale, limestone, and coal.

SECTION 3
SAMPLING ANALYSIS

A total of 54 samples were collected for chemical analysis during the site investigation including five duplicate samples for laboratory quality assurance/quality control (QA/QC). Of the 49 investigative samples, 24 samples were collected from fill material and 25 samples were collected from native material. The large number of native soil samples is reflective of the absence of fill material in low-lying areas. Table 3-1 provides a summary of the sampling locations, total depth, sampling intervals, material type, and organic vapor (PID) readings during the field screening.

All samples retained for chemical analysis were submitted to Fire & Environmental Consulting Laboratories (FECL), located in East Lansing, Michigan. All samples were analyzed for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), Michigan-10 Metals, and polychlorinated biphenyls (PCBs).

SECTION 4
ANALYTICAL RESULTS

A total of 49 investigative samples and 5 QA/QC samples were collected for chemical analysis during the investigation. All samples were analyzed for VOCs, SVOCs, Michigan-10 Metals, and PCBs. The analytical results were summarized and compared to direct contact values of the Part 201 Generic Commercial Sub-Category I (Residential) and Commercial Sub-Category II (Industrial) land uses. Analytical results were also compared to the relevant exposure pathways for Part 201 Generic Soil Inhalation Criteria for Ambient Air. The relevant exposure pathway for this property is Soil – Direct Contact. In addition, the data were also compared to the C_{SAT} screening criteria. The results are summarized in Table 4-1, which only shows those compounds detected above laboratory reporting limits. A copy of all analytical results is provided as Attachment B. A discussion of the analytical results is provided below.

4.1 VOLATILE ORGANIC COMPOUNDS

Nine VOCs were detected above the laboratory reporting limit. These compounds and their maximum concentrations consisted of ethylbenzene (1,300 mg/kg), toluene (420 mg/kg), xylene (2,600 mg/kg), butylbenzene (10 mg/kg), sec-butylbenzene (400 mg/kg), propylbenzene (10 mg/kg), n-propylbenzene (600 mg/kg), 1,3,5-trimethylbenzene (500 mg/kg), and 1,2,4-trimethylbenzene 100 mg/kg). The highest concentrations of these compounds were detected in samples B-6 and E-8. However, none of these compounds were found at concentrations that exceeded their respective Commercial Sub-Category I and Commercial Sub-Category II Criteria for direct contact. In addition, none of the concentrations of detected compounds exceeded the Generic Soil Inhalation Criteria for ambient air or the C_{SAT} screening criteria.

4.2 SEMIVOLATILE ORGANIC COMPOUNDS

A total of 19 SVOC compounds were detected at concentrations above their respective laboratory reporting limits. These compounds primarily consisted of polynuclear aromatic hydrocarbons (PAHs). The highest concentrations of these compounds were detected at the central elevational

rise area in samples B-6, C-7, D-6, D-8, and E-8. Elevated concentrations were also found at the northwestern portion of the study area in C-13. Benzo(a)pyrene was detected at concentrations exceeding the Commercial Sub-Category II Criteria at locations C-7, C-13, D-6, and D-8. Sub-Category I Criteria was exceeded by this compound for direct contact at four additional locations (B-6, D-10, E-8, and D-12/E-11). The Sub-Category II exceedances were found for direct contact in samples collected from C-7 (4 to 5 feet) and its duplicate at 120 mg/kg and 60 mg/kg, C-13 (0 to 2 feet) at 110 mg/kg, D-6 (2 to 4 feet) at 32 mg/kg, and in D-8 (1 to 3 feet) at 30 mg/kg. All of the commercial sub-category II direct contact exceedances were found in industrial fill in the central portion of the study area except for C-13 which was found in industrial fill at the northwest portion of the study area. The sample from D-8 contained indeno(1,2,3-cd)pyrene at a concentration of 20 mg/kg which exceeds the Commercial Sub-Category I Criteria for direct contact. None of the compounds detected are present at concentrations exceeding the Generic Soil Inhalation Criteria for Ambient Air or the C_{SAT} screening criteria.

4.3 POLYCHLORINATED BIPHENYLS

Aroclor 1254 was detected in samples B-6, C-1, D-6, D-12, and E-8 at concentrations ranging from 0.7 to 16.8 mg/kg. The majority of these detections were found at the central area. None of the detected PCB concentrations exceed the Commercial Sub-Category II Criteria for direct contact. Concentrations of PCBs detected in samples from B-6 and D-12 exceed the Commercial Sub-Category I Criteria for direct contact. All PCB concentrations are below the Generic Soil Inhalation Criteria for Ambient Air and the C_{SAT} screening criteria.

4.4 MICHIGAN-10 METALS

Several Michigan-10 metals were detected in samples collected throughout the site. However, only arsenic and lead were detected at concentrations exceeding their respective comparison criteria. Arsenic was found to exceed the Commercial Sub-Category I Criteria for direct contact at 11 boring locations with concentrations ranging from 7.37 to 122 mg/kg. Commercial Sub-Category II criteria for direct contact was exceeded only at location A/B-1.

Exceedances of total lead were detected in samples B-6 (6 to 8 feet) at 861 mg/kg, D-6 (2 to 4 feet) at 931 mg/kg, E-7 (2 to 8 feet) and its duplicate at 1,170 mg/kg and 971 mg/kg, and E-8 (4 to 6 feet) and its duplicate at 621 mg/kg and 446 mg/kg. The Commercial Sub-Category I and II Criteria for lead is 400 mg/kg. These lead exceedances were found in fill in the central portion of the study area. None of the levels of lead or arsenic exceeded the Generic Soil Inhalation Criteria for Ambient Air.

SECTION 5
SUMMARY AND CONCLUSIONS

5.1 SUMMARY

During the week of 28 April to 2 May 1997, WESTON, on behalf of GM, conducted a characterization study of subsurface material along a 400-foot-wide frontage zone at the Linden Road Site in Flint, Michigan. The objective of the study was to evaluate subsurface soil within a 400-foot-wide proposed frontage zone to assist in evaluating the potential for remediating this area to meet the MDEQ Generic Commercial Criteria. A 100-foot sampling grid coordinate system was established in order to collect samples from locations representing the entire proposed frontage zone. Sampling was conducted at or near all grid coordinate locations, using a combination of soil borings, auger probes, and hand augers. In addition, several of the small surface mounds that are present throughout the site were sampled to determine their composition. A total of 54 subsurface soil/fill samples were collected for analysis from 69 sampling locations to evaluate the nature of both fill and native material. All samples were analyzed for VOCs, SVOCs, Michigan-10 Metals, and PCBs. The sampling results were compared to the MDEQ Generic Commercial Sub-Category I and II Criteria for direct contact, Part 201 Soil Inhalation Criteria for Ambient Air, and the C_{SAT} screening criteria (MDEQ, April 1997). Drilling was conducted by Mateco Drilling Company and analytical services were performed by FECL laboratories.

5.2 CONCLUSIONS

The following conclusions are made based on the findings of the sampling investigations related to the proposed frontage zone associated with the Linden Road site:

- Subsurface fill material is present in the central and northern portions of the study area. Two types of identified fill include clean fill and industrial fill. Where present, the fill thickness ranges from 0.5 to 8 feet, with the thickest portion being found at the central "high" portion of the study area. This central portion of the study area consists of mainly industrial fill.

- The native material underlying the fill material, as well as the low-lying portions of the study area, consists of clayey gravel underlain by a silty clay layer.

- None of the constituents tested were detected at levels exceeding the MDEQ Part 201 Generic Soil Inhalation Criteria for Ambient Air for residential or industrial/ commercial landuse, or the C_{SAT} screening criteria.

- VOCs were detected in only five of the 49 investigative samples analyzed. However, none of the detected VOCs exceeded the commercial Sub-Category I and II Criteria.

- One or more SVOCs were detected in several of the samples. Only one compound (benzo(a)pyrene) was detected at concentrations exceeding the Commercial Sub-Category II Criteria for direct contact in samples from four locations (C-7, C-13, D-6, and D-8). Benzo(a)pyrene concentrations exceeded the Commercial Sub-Category I criteria for direct contact in samples from the above four locations and from four additional locations including B-6, D-10, E-8, and D-12/E-11. The sample collected from location D-8 also contained indeno(1,2,3-cd)pyrene at a concentration exceeding the Commercial Sub-Category I Criteria for direct contact.

- Concentrations of PCBs detected in samples from B-6 and D-12 exceed the Commercial Sub-Category I criteria for direct contact.

- The arsenic concentration in a single sample exceeded the Commercial Sub-Category II Criteria. Arsenic was detected at a concentration of 122 mg/kg in sample A/B-1 above the Commercial Sub-Category II Criteria for direct contact of 100 mg/kg. Arsenic was detected above the Commercial Sub-Category I Criteria of 6.6 mg/kg for direct contact at several locations of the study area.

- Total lead levels exceeding the Commercial Sub-Category I and II Criteria of 400 mg/kg were detected in samples from four locations at concentrations ranging from 621 to 1,170 mg/kg.

- The findings of the current investigation indicate that by removing soil associated with selected areas of the study area, it is feasible to clean up an approximately 400-foot-wide base zone of the Linden Road site to meet the MDEQ Commercial Sub-Category I or II Criteria for the relevant exposure pathways. The removed fill material can be consolidated with the fill material in the western portion of the site which will be capped as proposed in the RAP. The areas requiring soil management are shown in Figures 5-1 and 5-2.

Delineation of Removal Areas and Volume Estimates

Figure 5-1 shows the areas requiring removal within the proposed frontage zone to clean up to or meet the Commercial Sub-Category II criteria for direct contact. The final volume of removed will depend on confirmation sampling after the initial volume is removed.

The sample locations where exceedances of Commercial Sub-Category II Criteria direct contact values for lead and/or benzo(a)pyrene were found were at sample locations B-6, D-6, C-7, E-7, D-8, and E-8. Based upon field screening and observations, contamination may be present at locations C-6, E-6, D-6, and C-8.

Assuming an average fill thickness of 7 feet, and splitting the distance between contaminated fill and noncontaminated fill (i.e., 50 feet) locations, the preliminary estimated volume of soil requiring removal at the central portion is approximately 16,500 cubic yards.

The industrial fill in the northern portion of the study area where the benzo(a)pyrene exceedance was found (C-13) is assumed to be approximately 100 feet by 100 feet long and 3 feet in depth. The estimated volume of soil requiring removal in this area is 1,100 cubic yards.

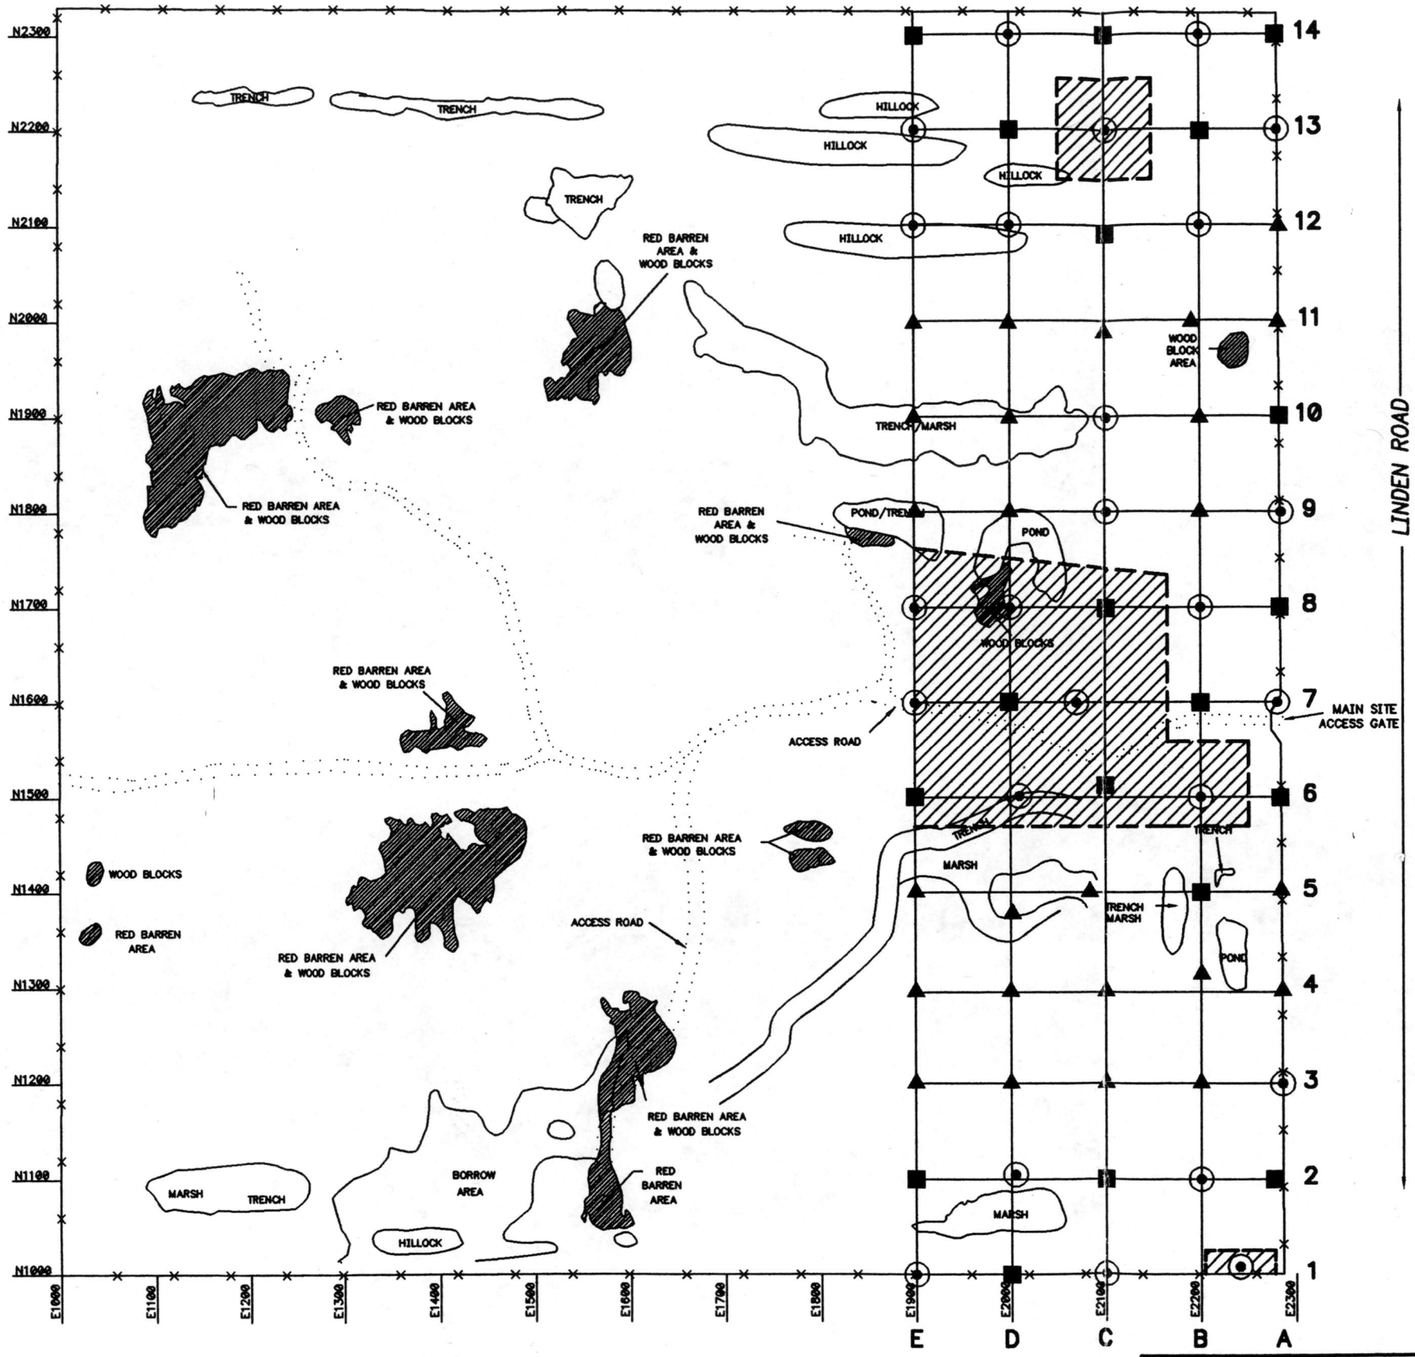

Based on the concentrations of arsenic detected at location A/B-1 in excess of the Commercial Sub-Category II Criteria of 100 mg/kg, it is assumed that soil within an area of approximately 50 feet by 25 feet and a depth of 3 feet will require removal. The estimated volume of soil requiring removal in this area is approximately 140 cubic yards. The total volume of soils requiring management in all areas identified in Figure 5-1 is approximately 17,740 cubic yards.

Figure 5-2 shows the areas within the frontage zone that require remediation to meet the Commercial Sub-Category I criteria for direct contact. As indicated before, the volume of soil removed will depend on confirmation sampling after the initial removal. The areas shown in Figure 5-2 include those areas identified in Figure 5-1 and two additional areas. The additional areas were based on arsenic exceedances at locations B-3, D-11, and Mound B-3/C-3. In evaluating areas for cleanup to meet the Commercial Sub-Category I criteria for direct contact

values, 95 percent upper confidence limits (UCL) were calculated for all the data except those from the areas delineated for cleanup under the Commercial Sub-Category II criteria, as well as those from locations B-3, D-11, and Mound B-3/C-3. The UCL (95 percent) was calculated to be 5.98 for arsenic. The UCL (95 percent) for PCB, benzo(a)pyrene, lead, and indeno(1,2,3-cd)pyrene were 0.28, 0.35, 42.58, and 0.22 mg/kg, respectively. It is estimated that the total volume of soil requiring removal for the areas shown in Figure 5-2 is 18,580 cubic yards.

Proposed Actions

Based on the findings of the recent investigation, GM intends to clean up the proposed 400-foot-wide frontage zone to meet the MDEQ Commercial Sub-Category I or II Criteria for direct contact, for Generic Soil Inhalation Criteria for ambient air, and the C_{SAT} screening criteria. This will be accomplished by excavating previously identified volumes of soil/fill material from areas identified in Figures 5-1 and 5-2. The specific sub-category will be determined at a later time, upon consultation with MDEQ. The excavated material will be consolidated with the material within the remainder of the Linden Road site which will be remediated as proposed in the Remedial Action Plan. Verification of the removal of contaminated material will be conducted through confirmation sampling at the end of excavation and removal. A plan presenting the details of the proposed excavation and removal activities will be submitted to MDEQ prior to any activities at the site.

Matrix: Soil

Analysis	Results	Units	MDL	Method	Analyst	Date Run
Organics (Continued)						
GC/MS for Semi-Volatile Organic (Continued)						
Dibenzo(ah)anthracene	Not detected	mg/kg	0.3	8270	JB	05/06/97
Dibenzofuran	Not detected	mg/kg	0.3	8270	JB	05/06/97
Di-n-butyl phthalate	Not detected	mg/kg	0.3	8270	JB	05/06/97
1,2-Dichlorobenzene	Not detected	mg/kg	0.3	8270	JB	05/06/97
1,3-Dichlorobenzene	Not detected	mg/kg	0.3	8270	JB	05/06/97
1,4-Dichlorobenzene	Not detected	mg/kg	0.3	8270	JB	05/06/97
3,3'-Dichlorobenzidine	Not detected	mg/kg	0.3	8270	JB	05/06/97
2,4-Dichlorophenol	Not detected	mg/kg	0.3	8270	JB	05/06/97
2,6-Dichlorophenol	Not detected	mg/kg	0.3	8270	JB	05/06/97
Diethyl phthalate	Not detected	mg/kg	0.3	8270	JB	05/06/97
p-Dimethylaminoazobenzene	Not detected	mg/kg	0.3	8270	JB	05/06/97
7,12-Dimethylbenz(a)anthacene	Not detected	mg/kg	0.3	8270	JB	05/06/97
a-,a-Dimethylphenethylamine	Not detected	mg/kg	0.3	8270	JB	05/06/97
2,4-Dimethylphenol	Not detected	mg/kg	0.3	8270	JB	05/06/97
Dimethyl phthalate	Not detected	mg/kg	0.3	8270	JB	05/06/97
4,6-Dinitro-2-methylphenol	Not detected	mg/kg	0.3	8270	JB	05/06/97
2,4-Dinitrophenol	Not detected	mg/kg	0.3	8270	JB	05/06/97
2,4-Dinitrotoluene	Not detected	mg/kg	0.3	8270	JB	05/06/97
2,6-Dinitrotoluene	Not detected	mg/kg	0.3	8270	JB	05/06/97
Diphenylamine	Not detected	mg/kg	0.3	8270	JB	05/06/97
1,2-Diphenylhydrazine	Not detected	mg/kg	0.3	8270	JB	05/06/97
Di-n-octyl phthalate	Not detected	mg/kg	0.3	8270	JB	05/06/97
Ethyl methanesulfonate	Not detected	mg/kg	0.3	8270	JB	05/06/97
Fluoranthene	Not detected	mg/kg	0.3	8270	JB	05/06/97
Fluorene	Not detected	mg/kg	0.3	8270	JB	05/06/97
Hexachlorobenzene	Not detected	mg/kg	0.3	8270	JB	05/06/97
Hexachlorobutadiene	Not detected	mg/kg	0.3	8270	JB	05/06/97
Hexachlorocyclopentadiene	Not detected	mg/kg	0.3	8270	JB	05/06/97
Hexachloroethane	Not detected	mg/kg	0.3	8270	JB	05/06/97
Indeno(1,2,3-cd)pyrene	Not detected	mg/kg	0.3	8270	JB	05/06/97
Isophorone	Not detected	mg/kg	0.3	8270	JB	05/06/97
3-Methylcholanthrene	Not detected	mg/kg	0.3	8270	JB	05/06/97
Methyl methanesulfonate	Not detected	mg/kg	0.3	8270	JB	05/06/97
2-Methylnaphthalene	Not detected	mg/kg	0.3	8270	JB	05/06/97
Naphthalene	Not detected	mg/kg	0.3	8270	JB	05/06/97

Carbon tetrachloride	Not detected	mg/L	0.001	8260	VFM	05/03/97
Chlorobenzene	Not detected	mg/L	0.001	8260	VFM	05/03/9
Chloroethane	Not detected	mg/L	0.001	8260	VFM	05/03/9
2-Chloroethylvinyl ether	Not detected	mg/L	0.001	8260	VFM	05/03/97
Chloroform	Not detected	mg/L	0.001	8260	VFM	05/03/9
Chloromethane	Not detected	mg/L	0.001	8260	VFM	05/03/9
Dibromochloromethane	Not detected	mg/L	0.001	8260	VFM	05/03/97
1,2-Dichlorobenzene	Not detected	mg/L	0.001	8260	VFM	05/03/9
1,3-Dichlorobenzene	Not detected	mg/L	0.001	8260	VFM	05/03/9
1,4-Dichlorobenzene	Not detected	mg/L	0.001	8260	VFM	05/03/97
1,1-Dichloroethane	Not detected	mg/L	0.001	8260	VFM	05/03/9
1,2-Dichloroethane	Not detected	mg/L	0.001	8260	VFM	05/03/9
1,1-Dichloroethene	Not detected	mg/L	0.001	8260	VFM	05/03/97
cis-1,2-Dichloroethene	Not detected	mg/L	0.001	8260	VFM	05/03/97
trans-1,2-Dichloroethene	Not detected	mg/L	0.001	8260	VFM	05/03/9
1,2-Dichloropropane	Not detected	mg/L	0.001	8260	VFM	05/03/97
cis-1,3-Dichloropropene	Not detected	mg/L	0.001	8260	VFM	05/03/97
trans-1,3-Dichloropropene	Not detected	mg/L	0.001	8260	VFM	05/03/9
Ethylbenzene	Not detected	mg/L	0.001	8260	VFM	05/03/9

Analytical Laboratory Report
Roy F. Weston
May 13, 1997

FECL #: AA46207 (Continued)
Tag: Trip Blank
Date/Time Collected:
Matrix: Liquid

Analysis	Results	Units	MDL	Method	Analyst	Date Run
Organics (Continued)						
Volatile Organics (Continued)						
Methylene Chloride	Not detected	mg/L	0.001	8260	VFM	05/03/97
Styrene	Not detected	mg/L	0.001	8260	VFM	05/03/97
1,1,2,2-Tetrachloroethane	Not detected	mg/L	0.001	8260	VFM	05/03/97
Tetrachloroethene	Not detected	mg/L	0.001	8260	VFM	05/03/97
Toluene	Not detected	mg/L	0.001	8260	VFM	05/03/97
1,1,1-Trichloroethane	Not detected	mg/L	0.001	8260	VFM	05/03/97
1,1,2-Trichloroethane	Not detected	mg/L	0.001	8260	VFM	05/03/97
Trichloroethene	Not detected	mg/L	0.001	8260	VFM	05/03/97
Trichlorofluoromethane	Not detected	mg/L	0.001	8260	VFM	05/03/97
Vinyl Chloride	Not detected	mg/L	0.001	8260	VFM	05/03/97
p,m-Xylene	Not detected	mg/L	0.001	8260	VFM	05/03/97
o-Xylene	Not detected	mg/L	0.001	8260	VFM	05/03/97
Acetone	Not detected	mg/L	0.05	8260	VFM	05/03/97
2-Butanone	Not detected	mg/L	0.05	8260	VFM	05/03/97
Carbon disulfide	Not detected	mg/L	0.05	8260	VFM	05/03/97
2-Hexanone	Not detected	mg/L	0.05	8260	VFM	05/03/97
4-Methyl-2-pentanone	Not detected	mg/L	0.05	8260	VFM	05/03/97

Note: Methods may be modified for improved performance.
Results reported on a dry weight basis, where applicable.
Results relate only to items tested.
Report shall not be reproduced except in full, without the written approval of FECL.
