1. INTRODUCTION

1.1 General

Haley & Aldrich, of Michigan Inc. (Haley & Aldrich) has prepared this *Resource Conservation and Recovery Act (RCRA) Facility Investigation Report* (RFI Report) on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) of Ypsilanti, Michigan. This RFI Report covers work performed during 2012 at the former General Motors (GM) Powertrain property located at 12200 Middlebelt Road, Livonia, Wayne County, Michigan (the Site) (Figure 1). The Site owner is referred to as RACER in this document, regardless of the time frame discussed.

Despite no history of hazardous waste being stored at the Site for more than 90 days and the Site not being subject to RCRA interim status, RACER has entered into a Performance Based Corrective Action Agreement with Region 5 of the United States Environmental Protection Agency (USEPA) for the Site.

This RFI Report describes the procedures, methods and results of the field investigations conducted during implementation of the RCRA Facility Investigation (RFI) activities proposed in the *RCRA Current Conditions Summary/RFI Work Plan* (Haley & Aldrich, December 2011; Revised May 2012) ("RFI Work Plan") and covers data collected through end of 2012.

The RFI Work Plan was approved by the USEPA via electronic mail on 11 May 2012. Proposed modifications to the scope of the RFI activities were communicated to USEPA via electronic mail dated 3 July 2012. The proposed modifications were approved by USEPA via electronic mail dated 9 July 2012. The scope of the RFI activities was again modified via electronic mail on 12 November 2012, and was approved by USEPA via electronic mail dated 13 November 2012.

The data collected to date have been evaluated to characterize the nature and extent of hazardous constituents in the environmental media at the Site. Human health and ecological risk evaluations are included in this RFI Report to provide a basis for determining whether the presence of hazardous constituents poses an unacceptable risk to human health and the environment that would warrant corrective measures.

1.2 Report Organization

This RFI Report is organized as follows:

- Section 1 provides an introduction to this report and an outline of its organization.
- Section 2 provides a brief overview of RFI activities and modifications made to the scope of work covered by the RFI Work Plan.
- Section 3 discusses the environmental setting of the Site, updated from the RFI Work Plan as appropriate, including land use, water supply/groundwater use, demographics, climate, geology, hydrogeology, surface water/drainage, and conceptual Site models for human and ecological exposures.

- Section 4 presents a discussion of the RFI results with respect to Nonresidential Screening Criteria included in Part 201 of the Michigan Natural Resources and Environmental Protection Act (MNREPA), 1994 PA 451, as amended (Part 201).
- Section 5 presents a human health risk evaluation concerning the significance of hazardous constituents in affected environmental media at the investigated areas and whether corrective measures are warranted.
- Section 6 summarizes the conclusions of the RFI.
- Section 7 lists associated references.

The tables, figures, and appendices referenced throughout this report provide supporting information pertaining to the RFI activities conducted for the Site.

2. OVERVIEW OF THE RFI

2.1 Site Description and History

As previously described in the RFI Work Plan, the Site is located at 12200 Middlebelt Road in Livonia, Michigan and is approximately 40 acres. It is generally a square-shaped tract of land situated in a mixed industrial/commercial/residential area (Figure 2). The Site is located east of Middlebelt Road between Industrial Road and Plymouth Road, in Wayne County, Michigan. It is bordered on the north by CSX Railroad tracks. Commercial property is located beyond the railroad tracks to the north. The Site is bordered to the east and to the south by residential and commercial areas and to the west by a City of Livonia Fire Station and Middlebelt Road. Beyond Middlebelt Road, to the west, is a large industrial property.

The main structure at the Site is a single story building, which until June 2010, was used for machining and assembly operations associated with automotive manufacturing. Approximately 1.2 million square feet is under roof. Former onsite activities were associated with automotive engine manufacturing and assembly, warehousing, and operation of an air compressor building, as well as an onsite wastewater treatment plant (WWTP) used for management and treatment of process wastewater. An electric utility substation operated by DTE Energy is located on the northeast portion of the Site.

The original Site building was constructed in 1971 and operated as Livonia Machining, which encompassed approximately 20 percent of the existing floor space. In 1984, the facility was expanded to accommodate engine manufacturing operations and a new warehouse.

Section 2 of the RFI Work Plan summarized individual areas of the Site which had the potential for a release of hazardous waste or hazardous constituent to the environment. These areas are referred to as Areas of Interest (AOIs). A total of 42 AOIs were identified, 36 of which were identified for further investigation. The remaining 6 AOIs warranted no further action and are not being carried forward through the Corrective Action process. The 36 AOIs subject to investigation in the RFI are summarized in Table I of this report. Further details concerning the 42 AOIs identified are provided in Table I of the RFI Work Plan.

2.2 Summary of RFI Activities and Work Plan Modifications

Section 3 of the RFI Work Plan described the scope of work that was initially planned for the Site, including discussions regarding RFI Goals and Objectives, RFI Approach, and Sampling and Analysis Plan for Areas of Interest (soil, groundwater, and non-aqueous phase liquid [NAPL]). Section 4 of the RFI Work Plan discussed plans for the evaluation of the resulting RFI data.

Field activities were conducted at the Site pursuant to the RFI Work Plan, as amended, as well as the associated *Field Sampling Plan*, and *Quality Assurance Project Plan* (QAPP) (Haley & Aldrich, December 2011; Revised May 2012).

The field activities associated with the initial phase of implementation of the RFI Work Plan were described in Table 1 of the RFI Work Plan and generally included identifying soil boring locations and clearing utilities for those locations, inspecting accessible trenches and subsurface process conveyances as specified in the Plan, conducting ground-penetrating radar (GPR) surveys of areas specified in the Plan, installing soil borings, installing temporary monitoring wells, and collecting samples of soil and samples of groundwater for laboratory analysis.

The initial phase of the RFI was undertaken at the Site during the period of 4 June 2012 through 31 August 2012, and included the following activities:

- Drilling of 70 test borings, with continuous interval sampling to depths of up to 35 feet below the ground surface (bgs);
- Photoionization detector (PID) screening, visual characterization, and soil/water shake testing of soil samples;
- Collection and laboratory analysis of 61 soil samples (including QA/QC samples) from 53 locations;
- Installation of 13 temporary monitoring wells;
- Collection and laboratory analysis of 11 groundwater water samples from 11 of the 13 temporary monitoring wells;
- Inspection and video recording, where possible, of Below-Grade Process Flumes (AOI 27) and Below-Grade Process Waste Conveyances Lines (AOI 28) for the purpose of selecting locations for soil borings to be drilled along those units; and
- Conducting GPR surveys at AOI-08, AOI -17, and AOI -26;

All soil samples subject to laboratory analysis were analyzed for the following:

- Target Compound List (TCL) volatile organic compounds (VOCs);
- TCL polycyclic aromatic hydrocarbons (PAHs);
- TCL polychlorinated biphenyls; and
- Michigan 10 metals (Arsenic, Barium, Cadmium, Chromium, Copper, Lead, Mercury, Selenium, Silver, and Zinc).

All groundwater samples were submitted for laboratory analysis of the following analytes:

- TCL VOCs;
- TCL PAHs; and
- Michigan 10 metals.

Groundwater samples collected were also analyzed for the following parameters in the field:

- Dissolved Oxygen (DO);
- Oxidation-reduction potential (ORP);
- Alkalinity/acidity (pH);
- Temperature;
- Conductivity; and
- Turbidity.

Groundwater samples exhibiting turbidity reading exceeding 10 Nephelometric Turbidity Units (NTUs) were submitted for both total (unfiltered) and dissolved (filtered) metals analysis.

As agreed by USPEA, a second phase of the RFI was initiated in November 2012 to facilitate collection of additional groundwater data to further evaluate groundwater quality and groundwater stability at the Site. This work targeted 11 of the 13 Site wells. Nine of the 11 targeted wells were developed and sampled. The remaining 2 targeted were dry and could not be developed or sampled. The wells were developed in November 2012 via gentle surging and low-rate purging, and were sampled on 10 December 2012 through 12 December 2012 using ultra-low-flow sampling techniques. These samples were analyzed for arsenic and lead (both filtered and unfiltered).

Tables II through V summarize the following information pertaining to the RFI field investigation, respectively:

- Soil Boring Inventory and Completion Summary;
- Temporary Monitoring Well Inventory and Completion Summary;
- Soil Sample Collection Summary; and
- Groundwater Sample Collection Summary.

2.3 RFI Work Plan Modifications

A total of 79 soil borings were initially planned for investigation pursuant to the RFI Work Plan, and each of these borings was anticipated to be converted to a temporary monitoring well. Groundwater grab samples were to be collected from each temporary monitoring well and submitted for laboratory analyses. The results of these groundwater analyses were to be assessed for whether evidence of release of hazardous constituents was observed for the respective AOI, and subsequent soil samples and/or groundwater samples would be collected as follow-up actions, if warranted based on evidence of impact. Only a limited number of soil samples were planned to be collected during the initial phase of the RFI.

The work completed during the initial phase of the RFI represented a modification to the RFI Work Plan. These modifications resulted from conditions encountered at the Site, and were conducted with concurrence from the USEPA. The following modifications were implemented:

- Reduced number of soil borings locations due to their proximity to building features, proximity to other boring locations, the inability to clear associated utilities, negative results of GPR surveys, and/or refusal encountered during drilling (70 actual versus 79 planned);
- Reduced number of wells (13 actual versus 79 planned) and only limited groundwater being encountered due to the presence of a thick, dense clay layer observed during drilling (water at only 11 of 13 locations); and
- Increased number of soil samples (61 soil samples actual versus 30 planned) collected and analyzed to offset the anticipated reduction in groundwater data that would serve as a surrogate for identification of release at the majority of the AOIs.

Additionally, the RFI Work Plan called for the first round of groundwater samples to be collected as grab samples using a peristaltic pump, with no pre-sampling well development efforts to be performed. However, prior to sampling each of the monitoring wells in August 2012, to the extent possible depending upon well yield, each well was purged at a rate of approximately 200 to 300 mL/min, until readings of field indicator parameters (pH, temperature, conductivity, ORP, DO, and turbidity) stabilized. Stabilization was considered to be achieved when the final groundwater flow rate was achieved, and three consecutive readings for each of the parameters were within the following limits:

- pH = ±0.1 pH units of the average value of the three readings;
- Temperature = ±3 percent of the average value of the three readings;
- Conductivity = ±0.005 milliSiemen per centimeter (mS/cm) of the average value of the three readings for conductivity <1 mS/cm and ±0.01 mS/cm of the average value of the three readings for conductivity >1 mS/cm;
- ORP = ±10 millivolts (mV) of the average value of the three readings;
- DO = ±10 percent of the average value of the three readings; and
- Turbidity = ±10 percent of the average value of the three readings, or a final value of less than 5 NTU.

Only 11 of the 13 monitoring wells yielded a sustained flow of groundwater sufficient to facilitate sampling. Sampling withdrawal rates ranged approximately 100 to 200 mL/min.

As further detailed in Section 4.2, the initial round of groundwater samples exhibited the presence of only arsenic and lead at concentrations exceeding screening criteria which are discussed in Section 4.1.

Based on these findings, it was proposed to and agreed with USEPA that a second round of groundwater sample collection would be performed to further assess the presence of these constituents in Site groundwater.

It is well known that these constituents are commonly linked to the presence of sediments suspended and/or dissolved in the groundwater. Evidence of this is observed with respect to the initial round of Site groundwater results, as filtered sample results are lower than the unfiltered results. Specifically, in all but one case of comparable data sets in which one of these constituents were exceeded in the unfiltered sample, the corresponding filtered concentration was shown to be either "non-detect" or below criteria.

In cases where constituent presence in groundwater is believed to be attributed to suspended and/or dissolved sediment, conditions for obtaining groundwater samples that are more representative and appropriate for risk evaluation are often improved with well surging and further purging, and the employment of ultra-low-flow sampling techniques.

As such, on 13 November 2012 through 15 November 2012 the previously sampled monitoring wells were subject to gentle surging using a polyethylene well bailer, and approximately 10 well volumes of groundwater were removed. These wells were allowed to rest for approximately two weeks, and were then subject to additional purging at an approximate rate of approximately 100 to 150 mL/min until stabilization was achieved. These wells were again allowed to rest for approximately two weeks, and on 10 December 2012 through 12 December 2012 samples were collected from 9 of the 11 wells for analyses of arsenic and lead (both filtered and unfiltered analyses). These samples were collected using ultra-low-flow sampling techniques involving sampling withdrawal rates of approximately 75 to 80 mL/min. The results of these efforts are discussed in Section 4.2.

It is also appropriate to note that during the initial phase of RFI implementation, approximately 2.5 gallons of diesel fuel was spilled into a blind (no outlet) concrete and steel constructed storm trench located along the south side of the building at one of the loading docks (exterior – Teal Dock). This incident occurred on 19 June 2012 while drilling subcontractors were re-fueling their drilling equipment. The subcontractor immediately used oil booms and pumps to remove the diesel fuel and impacted water contained in the blind trench, and then removed impacted solids from the base of the trench. The subcontractor containerized all wastes from these activities in drums and disposed of the wastes off-site.

3. ENVIRONMENTAL SETTING

This section describes the environmental setting at the Site, including land use, water supply/groundwater use, demographics, climate, geology, hydrogeology, surface water/drainage, and conceptual Site models for human and ecological exposures.

3.1 Land Use

The Site is located in a mixed industrial, residential and commercial area. Residential neighborhoods are adjacent to the southern boundary of the Site and in the areas east of the Site. Towards the north and west the land is developed with light industrial and commercial properties.

3.2 Groundwater Use/ Water Supply

The City of Livonia prohibits groundwater well installations and potable use of groundwater through its City Ordinance 13.40.030 (Ord. 2823, § 1, 2009). This Ordinance governs groundwater use for more than 6 miles down gradient of the Site. The State of Michigan requires licensure of all groundwater well drillers operating in the State, and Wayne County requires permits be issued for all drinking water well installations. These various overlapping requirements provided strict control over drinking water well installations in this area.

Groundwater use near the Site was explored by reviewing publically available information gathered from the Internet. This groundwater use survey was conducted for more than a one-mile radius of the Site in October 2012 (http: // deq.state.mi.us / well-ogs / default.asp and http: // wellviewer.rsgis.msu.edu / viewer.htm). Of the 61 wells identified in the Township and Range of the Site, 12 private wells were identified in the sections adjacent to, or within a one mile radius, of the Site. Of the 12 private wells, 3 were identified as domestic wells, only 1 of which appears to be located downgradient of the Site (approximately 5,500 feet). Drinking water is supplied to the Site by the City of Livonia through the Detroit Water and Sewage Department, with the ultimate source of drinking water to the Site being the Detroit River.

3.3 Climate

The Wayne County climate is influenced by the Great Lakes and has a continental climate. It has a temperate climate with well-defined seasons. Frequent weather changes come from the passing of weather fronts and associated low and high centers of air pressure across the region. Winds are typically from the southwest, but during the winter months are dominantly from the northwest. The average January low temperature is 17^{o} F, and the average July high temperature is 84^{o} F (http://www.bestplaces.net/climate/county/michigan/wayne). The total annual rainfall and snowfall for the county are each approximately 32 inches (http: // www.bestplaces.net / climate / county / Michigan / wayne).

3.4 Demographics

As presented at: http://www.city-data.com/city/Livonia-Michigan.html, the City of Livonia, Michigan measures approximately 36 square miles, and is comprised of mostly urban area, with a population density of approximately 2,700 people per square mile. Its overall population is approximately 96,000 people, with the man/women ratio being about 48/52. The median age of this population is about 45 years old, and its estimated median annual household income in 2009 was about $66,500.

3.5 Surface Water Hydrology

Topographically, the Site is flat. The general area has a gradual gradient from west to east/southeast. On-site surface drainage appears to be primarily controlled by a storm water sewer system and likely historically affected by an abandoned tributary of the Shaw Drain. Storm water south and northeast of the Site is conveyed to Outfall 001 at the west-southwest property boundary. Storm water in the vicinity of the Site's WWTP that is located in the northeast corner of the Site is discharged to Outfall 002. The receiving waters of Outfall 001 and Outfall 002 are conveyed to the Lower Rouge River via the Shaw Drain (the nearest active surface water drainage channel). The Lower Rouge River empties into the Rouge River, which then flows southeast to the Detroit River, located more than 15 miles south east of the Site. The Detroit River eventually empties into Lake Erie.

3.6 Site Geology and Hydrogeology

Site Geologic conditions were characterized during the RFI to a depth of approximately 35 feet bgs. Descriptions of soil encountered at the 70 RFI boring locations are presented on boring logs included on compact disk in Appendix A. The focus of the RFI was to characterize the nature and extent of any release(s) of hazardous waste and/or hazardous constituents at the Site which may pose an unacceptable risk to human health and the environment. Investigation locations were selected based on field conditions, and were biased based on historical process information, Site-specific physical parameters, observed potential evidence of contamination, and observed potential evidence of preferential pathways.

Stratigraphic correlations of on-site investigative locations are illustrated in cross-sections included as Figures 4, 5, and 6, with orientations as illustrated on Figure 3. Soil descriptions and stratigraphy observed at the Site are consistent with published regional information (see Section 1.2 of RFI Work Plan). The Site and surrounding area is flat with layered lacustrine deposits consistent with a lake plain depositional environment. Below a surface dominated by concrete, fill material consists of sandy to clayey-sand. The surface fill material (dominated by sand) is generally encountered less than 10 feet bgs; however, it extends deeper adjacent to subgrade/basement structures. Across the Site, the fill material is underlain by a thick clay/silty-clay layer. Soil descriptions of the clay identify sand and gravel lenses, consistent with glacial tills.

Temporary monitoring wells were installed in soil borings with evidence of sufficient soil moisture likely to yield representative groundwater samples pursuant to the USEPA-approved modifications to the RFI Work Plan collectively discussed in Sections 1.1 and 2.3 of this report. As previously noted, only 13 of the 70 soil borings were converted to temporary monitoring wells, as only these 13 borings

exhibited evidence of wet soil conditions during drilling. Figures 3 through 7 each illustrate the location of these temporary monitoring wells. One of the 13 temporary monitoring wells was observed to be dry during the second phase RFI activities conducted in November and December 2012. One other temporary monitoring well does not consistently yield groundwater volumes sufficient for sampling. Two of the temporary monitoring wells are installed 10 feet deeper than the other wells due to adjacent building conditions (existing basement).

Consistent with previous reports, the shallow groundwater encountered at the Site is on average less than 10 feet below ground surface. Shallow groundwater potentiometric surface elevations recorded in December 2012 ranged approximately from 629 to 631 feet above mean sea level (AMSL) in the northeastern portion of the Site near the WWTP, approximately from 627 to 628 in the southwestern portion of the Site, and were nearly flat within the center of the Site at about 626 AMSL. These potentiometric surface gradient trends indicate flow toward the center of the Site. Although this is plausible, since subsurface structures (e.g., sewers) could be influencing the flow of shallow Site groundwater, it is believed that the flow of shallow Site groundwater would be limited by low hydraulic conductivity of the clay-rich glacial till layer.

3.7 Conceptual Site Model for Human Exposures

As previously discussed, the Site occupies approximately 40 acres in Livonia, Michigan that are zoned for light and heavy industry. Future land use at the Site is expected to remain commercial/industrial. As part of the final remedy for the Site, a deed restriction to maintain continued commercial/industrial use is planned for the Site, and will be pursued following the completion of the RFI. As such, workers comprise the main receptor population at the Site under both current and reasonably expected future land use.

Under current and reasonably expected future conditions, the populations with potentially significant on-site exposures are routine workers, maintenance workers, construction workers, and trespassers. It is anticipated that any subsurface maintenance work at the Site would be conducted in accordance with Due Care requirements under Section 20107a of MNREPA, and a Site Health and Safety Plan, which would contain provisions for preventing significant exposures of such workers to environmental media.

The off-site areas around the Site consist of a mixture of commercial/industrial and residential land use. Current zoning for these areas is expected to remain unchanged. As such, the largest potentially exposed populations around the Site are residents, routine workers and maintenance workers.

In summary, the potentially exposed populations at and around the Site under current and reasonably expected future land use include the following:

Onsite:

- Routine workers,
- Maintenance workers,
- Construction workers, and
- Trespassers

Off-site:

- Residents,
- Routine workers, and
- Maintenance workers

3.8 Conceptual Site Model for Ecological Exposures

The Site and the immediate surrounding area have been significantly developed with much of the ground surface covered by buildings and pavement and consisting of commercial and industrial development, residential development, and public roadways. Nearly the entire Site is covered by buildings or pavement. The limited areas along Middlebelt Road that are not covered by buildings or pavement are maintained landscaping areas. Vegetation is also present near the DTE substation.

The Site does not provide naturalized areas for wildlife. Potential receptors are limited to urban wildlife (raccoons, gophers, rodents and various avian species) or transitory presence. The Site does not provide any quality habitat for ecological receptors. Based on current and foreseeable land use of the Site and area, terrestrial and/or aquatic exposure of ecological receptors is considered nominal and/or incomplete. Therefore, further ecological assessment is not required to document no significant risk to ecological receptors.

4. INVESTIGATION RESULTS AND DISCUSSION

This section presents a summary of the results of the field investigations of the 36 AOIs considered during this RFI. As previously discussed in Section 2.2, these investigations included, the drilling of 70 test borings, collection and analysis of 61 soil samples, installation of 13 temporary monitoring wells, and collection and analysis of 11 groundwater water samples.

Section 4.1 describes the MDEQ screening criteria used during this investigation, and Section 4.2 discusses the results of investigations. The associated analytical data and screening results are presented/summarized both in table and figure formats as follows:

- Table VI– Summary of Part 201 Screening Criteria for Soil;
- Table VII – Summary of Part 201 Screening Criteria for Groundwater;
- Figure 7 – Soil and Groundwater Analytical Data;
- Appendix B-1 – Summary of Soil Analytical Data; and
- Appendix B-2 – Summary of Groundwater Analytical Data.

Additionally, GPR surveys were conducted at three of 36 AOIs (AOI-08, AOI -17, and AOI -26) to assess for the possible presence of underground storage tanks (USTs). The GPR surveys were conducted coincidently with the GPR surveys for the clearing of underground utilities, which facilitated the selection of boring locations on a real-time basis. Field event personnel accompanied the GPR surveyors for clearing of utilities and for review of the areas identified as AOI-08, AOI-17 and AOI-26. The GPR surveys were not electronically recorded, nor were documents generated by the GPR surveyor. Based on the observed response of the GPR equipment, no subsurface anomalies were detected at AOI-08, AOI-17 and AOI-26 to suggest the presence of any USTs; therefore, no borings were installed in these areas.

Also, as specified in the RFI Work Plan, Below-Grade Process Flumes (AOI 27) and Below-Grade Process Waste Conveyances Lines (AOI 28) were subject to internal videotape inspections for the purpose of selecting locations for soil borings to be drilled along those units. It was anticipated that this inspection would facilitate the identification of any potential integrity problems with the units (e.g., wall abrading, cracking, or splitting and/or joint disconnections, etc.), and if any such integrity problems were to be identified, a soil boring/temporary groundwater monitoring well would be located at the point of the identified problem. However, no such problems were identified; therefore, these units were each investigated using a random selection of sampling locations. The videotape documentation of these inspections is represented on DVDs included in Appendix E.

4.1 Identification of Potentially Significant Releases

Analytical results for soil and groundwater samples collected at the Site were compared to conservative screening criteria to determine if potentially significant releases to the environment have occurred, and if the field investigation adequately characterized these potentially significant releases. The screening

criteria for each medium are summarized below and have been identified to be applicable to the Site based on the conceptual Site model for human exposures discussed in Section 3.7.
The soil characterization data were compared with screening criteria that are developed by the MDEQ to facilitate implementation of Part 201 (Part 201 Criteria).

The following are the Part 201 Criteria* were used to evaluate the Site characterization data:

- Part 201 Nonresidential Drinking Water Protection Criteria;
- Part 201 Nonresidential Indoor and Ambient Air Criteria; and
- Part 201 Nonresidential Direct Contact Criteria;

As previously noted, groundwater samples were intended to be collected from all initial soil borings to assist in the assessment of potential groundwater impact and in the placement of future groundwater monitoring wells, if needed. However, water accumulated in only 12 of the 13 temporary monitoring wells, and volumes of groundwater sufficient for sampling were found in only 11 of the 13 temporary monitoring wells. These wells were sampled on two occasions, once in August 2012 and once in December 2012. In November 2012, prior to initiating the second round of groundwater sample collection, the targeted wells were carefully developed using gentle surging and low purge rates to remove soil particles from the wells, as discussed in Section 2.3. Following this development, the December 2012 groundwater samples were collected using ultra-low-flow sampling techniques (sample withdrawal rates less than 80 milliliters per minute or less), as a further measure to obtain representative groundwater samples for laboratory analysis of arsenic and lead.

All of the RFI groundwater data have been compared with the following Part 201 Criteria:

- Part 201 Nonresidential Drinking Water Criteria;
- Part 201 Nonresidential Volatilization to Indoor Air Inhalation Criteria;
- Part 201 Nonresidential Groundwater Contact Criteria;
- Water Solubility Levels;
- Flammability and Explosivity Levels; and
- Acute Inhalation Levels.

Constituents with at least one concentration exceeding the screening criteria anywhere at the Site were selected for display on a "data-box" figure (Figure 7).

A potentially significant release of hazardous constituents to the environment at an area is considered when the highest site-related concentrations of constituents detected in soil or groundwater at the area are higher than any of the screening criteria. The presence of constituent concentrations higher than the

* Updated by MDEQ on 28 September 2012.

screening criteria may not mean that the media necessarily poses a significant risk to human health or the environment. It only means that the potential to pose a significant risk should be further evaluated with consideration for additional site-specific factors.

4.2 RFI Results and Discussion

4.2.1 Overview

As discussed in Section 2, 36 AOIs were subject to investigation based on evidence of a past release, historic operations, visual observations, and/or file review results. Tables B-1 and B-2 of Appendix B summarize the soil and groundwater data generated as part of the RFI with respect to each AOI. These tables present the analytical results for all analytes for the soil and groundwater samples collected during the RFI. As previously noted, Figure 7 also illustrates analyte exceedences across the Site. Validation of all soil and groundwater data collected at the Site as part of the RFI was performed in accordance with the QAPP. A summary of this validation is provided in Appendix C. The Site characterization data obtained for each of the AOIs investigated during this RFI are judged to be adequate and appropriate for RCRA Corrective Action decision-making. The laboratory reports are included on compact disk in Appendix D.

4.2.2 Analyte Detections and Criteria Exceedances

As shown in Tables B-1 and B-2 of Appendix B, constituents detected at the Site as part of the RFI include primarily select metals at various locations, PAHs at one location, and select VOCs at seven locations. Of the Part 201 Criteria discussed in Section 4.1, only the following were exceeded when compared to the RFI analytical data for the Site:

- Part 201 Nonresidential Drinking Water Protection Criteria (soil); and
- Part 201 Nonresidential Drinking Water Criteria (water).

4.2.2.1 Soil Criteria Exceedances

Two soil samples exceeded the Nonresidential Drinking Water Protection Criteria of 4.6 mg/kg for arsenic:

AOI	Soil Sample ID	Interval (ft.)	Arsenic Concentration (mg/kg)
AOI-04	SB-04-157	8-10	8.58
AOI-06	SB-06-137	22-24	7.03

These arsenic concentrations also exceed the Part 201 State Default Background Screening Criteria for arsenic, which is 5.8 mg/kg. No other soil data exceeded screening criteria.

These two arsenic in soil exceedances have been further assessed in the context of the MDEQ's *Michigan Background Soil Survey 2005* (2005 Soil Survey [MDEQ, 2005]). The 2005 Soil Survey publishes ranges of background values for arsenic (among other inorganic constituents) in soil in Michigan across assigned regions (i.e., glacial lobes) and soil types (i.e., topsoil, sand, and clay), and offers a general range of background values for arsenic (among other inorganic constituents) in soil across all soil types and regions in Michigan. The Site is located the 2005 Soil Survey-assign region of the Huron-Erie Glacial Lobe. Both of the above-listed soil samples are characterized as clay, and their corresponding arsenic concentrations each fall just below the local geometric mean for Huron-Erie Glacial Lobe for clay (9 mg/kg), as per the 2005 Soil Survey. These concentrations also both fall well below the State-wide maximum arsenic background level for combined soil types (27.7 mg/kg).

Accordingly, the above-listed arsenic in soil exceedances are believed to be present as a result of natural conditions (i.e., types of soil deposits), and are not believed to be attributed to Site operations, since arsenic is not known to be have been used at the Site, nor is likely to have been a component of Site-related activities.

4.2.2.2 Groundwater Criteria Exceedances

The Nonresidential Drinking Water Criteria of 0.01 mg/L for arsenic was exceeding at six locations, as summarized below:

AOI	Temp. Well ID	August 2012 Arsenic Concentration (mg/L)		December 2012 Arsenic Concentration (mg/L)	
		Unfiltered	Filtered	Unfiltered	Filtered
AOI-06	MW-06-139	0.028/0.037	0.006/0.011	0.036	0.008
AOI-10	MW-10-124	0.071	0.007	0.091	0.009
AOI-27	MW-27-158	0.018	0.003	0.019/0.019	0.01/0.009
AOI-28	MW-28-152	0.027	Not Analyzed	0.035	0.038
AOI-33	MW-33-105	0.015	0.008	0.0072	0.004
AOI-40	MW-40-135	0.011/0.011	0.009/0.009	0.015	0.006

Note: shaded values represent criteria exceedances, and duplicate results are separated with a "/".

The only other screening criteria exceedences for groundwater involved lead (0.004 mg/L) at six locations, as summarized below:

AOI	Temp. Well ID	August 2012 Lead Concentration (mg/L)		December 2012 Lead Concentration (mg/L)	
		Unfiltered	Filtered	Unfiltered	Filtered
AOI-02	MW-02-129	0.005	0.022	0.003 U	0.003 U
AOI-06	MW-06-137	0.005	Not Analyzed	0.003 U	0.003 U
AOI-10	MW-10-124	0.006	0.003 U	0.003 U	0.003 U
AOI-27	MW-27-158	0.012	0.003 U	0.003 U / 0.003 U	0.003 U / 0.003 U
AOI-33	MW-33-105	0.029	0.003 U	0.003 U	0.003 U
AOI-38	MW-38-101	0.007	0.003 U	0.003 U	0.003 U

Note: shaded values represent criteria exceedances; U – indicates that the analyte was not detected, and the value shown is the reporting limit.

Upon comparing corresponding data for the August 2012 groundwater sampling event to the December 2012 groundwater sampling event, it is observed that in most cases, the concentrations of arsenic increased slightly within the relative same order of magnitude on a well-to-well comparison. It is further observed that lead exceeded the noted criteria in the samples collected in August 2012; however, lead was not detected in the groundwater samples collected from these wells in December 2012. It is believed that the sampling methods, including careful well development techniques and ultra-low-flow sampling, employed in the December 2012 event produced data most representative of the conditions at the Site.

The December 2012 data indicate Site groundwater is not contaminated with lead above the associated screening criterion, and all but one unfiltered groundwater sample exceeded the Nonresidential Drinking Water Criterion for arsenic. However, like noted above regarding soil, the concentrations of arsenic detected in groundwater are believed to be present as a result of natural conditions (i.e., types of soil deposits), and are not believed to be attributed to Site operations. This conclusion is based on the following points:

- Arsenic is not known to be have been used at the Site, nor is likely to have been a component of Site-related activities;
- All but one exceedance of the Nonresidential Drinking Water Criterion for arsenic are associated unfiltered samples, indicating the presence of arsenic in Site groundwater is associated nearly exclusively with filterable soil particulates;
- Variability of arsenic concentrations between sampling events and among samples of each event is low (i.e., similar order of magnitude on a well-to-well comparison);
- All exceedances of Nonresidential Drinking Water Criteria for arsenic are within the collective range of concentrations typical of well water of Wayne

County and the adjacent Washtenaw County (greater than 0.05 mg/L), as described in MDEQ public outreach information[†].

5. HUMAN HEALTH RISK EVALUATION

As previously explained, the RFI field investigation was designed to determine if a release of hazardous waste or hazardous constituents had occurred, and where a potentially significant release was identified, to characterize the nature and extent of hazardous constituents in the environmental media.

During the implementation of the RFI, the Site characterization data collected for each AOI were compared with conservative risk-based screening criteria to identify whether a potentially significant release of hazardous constituents to the environment may have occurred. Section 4 concluded that adequate data had been collected from each AOI to support a risk evaluation.

The significance of potential exposures to Site-related concentrations of constituents in potential exposure media was evaluated based on current and reasonably expected future land use at and around the Site. Potential exposure media include soil and groundwater. There is no exposure to surface water and/or sediment, since there are no surface water bodies on the property and no significant impact on off-site surface water bodies.

Soil characterization data pertaining to the Site were compared with Part 201 Criteria as discussed in Section 4.1, and as detailed in Section 4.2.2, only a limited number of exceedances of the following criteria were found:

- Part 201 Nonresidential Drinking Water Protection Criteria (soil); and
- Part 201 Nonresidential Drinking Water Criteria (groundwater).

The only potential pathways of concern involving these screening criteria include potable use of groundwater at or in the vicinity of the Site (i.e., on-site and off-site routine workers, maintenance workers, and construction workers, as well as local residents and Site trespassers).

Currently there is no evidence of exposure as these pathways are incomplete due to the following reasons:

- No current use of groundwater at the Site;
- Drinking water is supplied to the Site and the surrounding area by the City of Livonia through the Detroit Water and Sewage Department, with the ultimate source of drinking water to the Site being the Detroit River;
- No water wells present within ½-mile radius of the Site;
- City of Livonia prohibits groundwater well installations and potable use of groundwater through its City Ordinance 13.40.030 (Ord. 2823, § 1, 2009);
- Wayne County requires permits be issued for all drinking water well installations; and
- State of Michigan requires licensure of all groundwater well drillers operating in the State.

Concern for the future state of the potable use of groundwater at or in the vicinity of the Site is collectively addressed by Due Care compliance under Section 20107a of MNREPA, and the fact that State and County permits are needed for well installations regionally surrounding the Site, as well as the City of Livonia's prohibition of drinking water well installations within the City limits. As noted previously, these overlapping requirements provide strict control over drinking water well installations in this area.

Additionally, as noted in Section 4.2.2, the levels of arsenic found in groundwater at the Site are believed to be present as a result of natural conditions (i.e., types of soil deposits), and are not attributed to Site-related activities.

Also, baseline institutional controls, involving land and groundwater use restrictions, are planned for this Site. It is expected that these controls will adequately address any concerns for potential future use of Site groundwater. These controls will be established through deed restrictions, and are expected to include restrictions that will maintain continued nonresidential, commercial/industrial use of the Site, and will prohibit any future use of groundwater at the Site for any purpose, beyond sampling and other related investigatory testing. These restrictions will run with the property in perpetuity, unless USEPA approves the removal of these restrictions.

6. SUMMARY AND CONCLUSIONS

An RFI of the Site has been conducted to determine whether the AOIs identified in the RFI Work Plan have released hazardous waste or hazardous constituents that pose a significant risk to human health or the environment. As a result of the extensive RFI, potentially significant releases to on-site soil and groundwater were identified and characterized at the Site. The nature and extent of hazardous constituents in the environmental media characterized during the RFI are discussed in Section 4.

As discussed in Section 4, the site characterization data obtained for each of the areas investigated during the RFI and discussed herein are judged to be adequate and appropriate for RCRA Corrective Action decision-making.

All Site data were compared to applicable criteria identified in Section 4.1, consistent with the conceptual Site model for human exposures discussed in Section 3.7. The only applicable Part 201 Criteria found to be exceeded when compared to the RFI analytical data for the Site involved arsenic in soil only at two locations above the Part 201 Nonresidential Drinking Water Protection Criteria; and arsenic and lead in groundwater at select locations above the Part 201 Nonresidential Drinking Water Criteria. Each of these exceedances was within the same order of magnitude of the corresponding criteria.

Well development and ultra-low-flow sampling techniques affected the concentrations of both lead and arsenic, relative to samples collected in August 2012 versus December 2012. In most cases, the arsenic concentrations increased slightly within the relative same order of magnitude on a well-to-well comparison. While lead was previously detected in amounts that exceeded the noted criteria in August 2012, none of the unfiltered groundwater samples collected in December 2012 showed detections of lead.

Additionally, as noted in Section 4.2.2, the levels of arsenic found in groundwater at the Site are believed to present as a result of natural conditions (i.e., types of soil deposits), and are not attributed to Site-related activities.

The only potential pathways of concern involving these screening criteria include the potable use of groundwater at or in the vicinity of the Site. Currently, groundwater at or in the vicinity of the Site is not being used, and the future state of these pathways is addressed by the restrictions discussed in Sections 3.2 and 6. Additionally, it is expected that further concerns for potential future use of Site groundwater will be addressed through Due Care compliance and deed restrictions that will prohibit future use of Site groundwater.

Per the conceptual Site model for ecological exposures presented in Section 3.8, terrestrial and/or aquatic exposure of ecological receptors is considered nominal and/or incomplete. Therefore, further action pertaining to ecological receptors is not warranted.

- Summary

Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group. No qualification of the data is recommended.

GC/MS Instrument Performance Check

GC/MS instrument performance checks for the instruments used in the analysis of project samples fell within method specific criteria without exception. No qualification of the data is recommended.

Initial Calibration Procedures

Initial instrument calibration procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. Nc Qualification of the data is recommended.

Continuing Calibration Procedures

Continuing calibration verification (CCV) procedures for the analysis of project samples were consistent with the guidelines prescribed by EPA protocols. No Qualification of the data is recommended.

Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is less than or equal to 10 times (10X) the amount in any blank for metals and the common organic laboratory contaminants (methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters), or 5 times (5X) the amount for other target compounds. Target analytes were not detected in associated blank samples (trip, equipment, method) prepared and analyzed concurrently with the project samples. No qualification of the data is recommended.

System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. No qualification of the data is recommended.

Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria. No qualification of the data is recommended.

Internal Standard Recoveries

Internal Standard compounds were added to each sample matrix prior to the analysis of organic parameters to quantify the amount of the target compounds detected within each sample. The calculated response of each IS compound fell within the QA/QC criteria of +100% and – 50% of the corresponding CCV standard. No qualification of the data is recommended.

Duplicate Sample Analysis

The replicate percent difference (RPD) was evaluated for each duplicate sample pair to monitor the reproducibility of the data. The RPD for each sample pair was within the QA/QC limit of 30% for aqueous samples and 50% for solid matrices, for those target analytes with sample concentrations >5X the MDL. No qualification of the data is recommended.

Field Duplicate Sample Analysis

The overall variability attributable to the sampling procedure, sample matrix, and laboratory procedures, was evaluated by assessing the relative percent difference (RPD) data from field duplicate samples. All calculated RPD values were within matrix specific data quality objectives, with the exception of results qualified "J" as shown in the table(s) below:

	Original Sample ID.	FD Sample ID.		Flag Original and FD
Target Analyte(s)	SB150(07-20-12)(2-4)	DUP2(07-20-12)	%RPD	sample results with:
Copper, Total	2.8 mg/kg	4.72 mg/kg	51%	J

Action:

If the sample matrix is solid and the %RPD is greater than 50%, the original sample results are qualified "J". If the sample matrix is water or air and the %RPD is greater than 35%, the original sample results are qualified "J".

ICP Interference Check Sample Performance

The results of the ICP Interference Check Samples analyzed concurrently with the project samples were all within the acceptance criteria +/- 20% of true value as prescribed by USEPA guidance. No qualification of the data is recommended.

ICP Serial Dilution Replicate Percent Difference

The results of the ICP Serial Dilution samples analyzed concurrently with the project samples were in accordance with the EPA QA acceptance criteria of less than 10% RPD for those target analytes with sample concentrations >50X the MDL. No qualification of the data is recommended.

Target Compound Identification

GC/MS qualitative analysis for organic parameters was performed to remove mis-identifications of the target compounds. The relative retention times (RRT) of all reported target compounds were within +/- 0.06 RRT units of the associated calibration standard RRT, and all ions present in the reference standard spectrum at a relative intensity greater than 10 percent were also present in the sample spectrum. No qualification of the data is recommended.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Samples that contain results between the MDL and RL were flagged as estimated, "J", by the laboratory. The data user should be aware that there is a possibility of false positive or mis-identification at the quantitation levels. The laboratory also qualified results when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

The results of the ICP Interference Check Samples analyzed concurrently with the project samples were all within the acceptance criteria +/- 20% of true value as prescribed by USEPA guidance. No qualification of the data is recommended.

ICP Serial Dilution Replicate Percent Difference

The results of the ICP Serial Dilution samples analyzed concurrently with the project samples were in accordance with the EPA QA acceptance criteria of less than 10% RPD for those target analytes with sample concentrations >50X the MDL. No qualification of the data is recommended.

Sample Data Reporting Format

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

Data Qualifiers

Samples that contain results between the MDL and RL were flagged as estimated, "J", by the laboratory. The data user should be aware that there is a possibility of false positive or mis-identification at the quantitation levels. The laboratory also qualified results when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

Summary

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

PROJECT: RACER GMPT LIVONIA
Merit IDs: S52934.01-S52934.02

Field Sampling: Megan Castles-Humphrey performed the fieldwork.

Analytical Bottles: All bottles were sent with the appropriate preservation in it. Please see the bottle list attached.

Sample Receiving: All samples were received by the laboratory on ice (06/21/2012). Dates and signatures can be found on the Chain of Custody Records. The sample receipts specify the actual tags and bottles received and logged into the laboratory "vlims" system.

ANALYSES

Metals: All metal analyses were performed according to Method 6020. The metal digestion was performed according to Method 3050B. The QC requirements were followed for this specific project and method-specified criteria were met. *Outliers*: None

Notes: Dilution test not applicable if measured concentration is less than 100 times MDL.

Mercury: All mercury QC requirements were met according to the specifications in Method 7471A. *Outliers*: None

Semivolatile Organics: The organic method utilized for this SDG was 8270C (GC/MS). The QC requirements were followed for this specific project and method-specified criteria were met.

Outliers:
- The blank had the surrogate Terphenyl-D14 outside of control limits.

Volatile Organics: The organic method utilized for this SDG was 8260B (GC/MS). The QC requirements were followed for this specific project and method-specified criteria were met.

Outliers:
Run-Batch 120625A3:
- The LCS/LCSD had high RPD for the compounds Acetone, Acrylonitrile, 2-Butanone (MEK), Chloroethane, and Tetrahydrofuran.

- The blank contained 86.0 ug/kg of 2-Butanone (MEK) and 66.0 ug/kg of Methylene Chloride. 2-Butanone (MEK) and Methylene Chloride were not found in associated samples.
- The CCC had the compound Acetone outside of control limits.

PCBs: The organic method utilized for this SDG was 8082A (GC/ECD). The QC requirements were followed for this specific project and method-specified criteria were met. *Outliers*: None

Total Solids: All total solids QC requirements were met according to the specifications in Method 2540B. *Outliers*: None

Data Reporting: The analytical reports are reflective of what is on a given Chain-of-Custody record (COC). Merit's IDs were assigned to the samples as they were delivered and accepted by our log-in staff.

PROJECT: RACER GMPT LIVONIA
Merit IDs: S52959.01-S52959.03

Field Sampling: Megan Castles-Humphrey performed the fieldwork.

Analytical Bottles: All bottles were sent with the appropriate preservation in it. Please see the bottle list attached.

Sample Receiving: All samples were received by the laboratory on ice (06/25/2012). Dates and signatures can be found on the Chain of Custody Records. The sample receipts specify the actual tags and bottles received and logged into the laboratory "vlims" system.

ANALYSES

Metals: All metal analyses were performed according to Method 6020. The metal digestion was performed according to Method 3050B. The QC requirements were followed for this specific project and method-specified criteria were met. *Outliers*: None

Mercury: All mercury QC requirements were met according to the specifications in Method 7471A. *Outliers*: None

Semivolatile Organics: The organic method utilized for this SDG was 8270C (GC/MS). The QC requirements were followed for this specific project and method-specified criteria were met.

Outliers:
- The blank had the surrogate Terphenyl-D14 outside of control limits.

Volatile Organics: The organic method utilized for this SDG was 8260B (GC/MS). The QC requirements were followed for this specific project and method-specified criteria were met.

Outliers:
Run-Batch 120625A3:
- The LCS/LCSD had high RPD for the compounds Acetone, Acrylonitrile, 2-Butanone (MEK), Chloroethane, and Tetrahydrofuran.
- The blank contained 86.0 ug/kg of 2-Butanone (MEK) and 66.0 ug/kg of Methylene Chloride. 2-Butanone (MEK) and Methylene Chloride were not found in associated samples.
- The CCC had the compound Acetone outside of control limits.

Note: See Calibration Raw Data for Calibration Injection Times, File IDs, Area/RT Reports, and TICs

NOTES:

Average RF Fit : A* = <RF>C*
Other Curve Fit: A* = k(0) + k(1)C* + k(2)(C*)^2
Notation: A*=As/Ai (normalized peak area/height)
C*=Cs/Ci (normalized concentration)
Internal Standards are highlighted and the column entries indicate the standard concentraion.

Curve Fits: A - average RF fit
Q - quadratic fit
QO - quadratic fit, forced origin
L - linear fit
LO - linear fit, forced origin

CASE NARRATIVE
CLIENT: HALEY & ALDRICH
PROJECT: RACER GMPT LIVONIA
Merit IDs: S52983.01-S52983.03

Field Sampling: Megan Castles-Humphrey performed the fieldwork.

Analytical Bottles: All bottles were sent with the appropriate preservation in it. Please see the bottle list attached.

Sample Receiving: All samples were received by the laboratory on ice (06/26/2012). Dates and signatures can be found on the Chain of Custody Records. The sample receipts specify the actual tags and bottles received and logged into the laboratory "vlims" system.

ANALYSES

Metals: All metal analyses were performed according to Method 6020. The metal digestion was performed according to Method 3050B. The QC requirements were followed for this specific project and method-specified criteria were met.

Outliers:
- The MS had low recovery for Barium. Post digestion spike performed and passed.
- The MS/MSD had high RPD for Barium.

Mercury: All mercury QC requirements were met according to the specifications in Method 7471A. *Outliers*: None

Semivolatile Organics: The organic method utilized for this SDG was 8270C (GC/MS). The QC requirements were followed for this specific project and method-specified criteria were met. *Outliers*: None

Volatile Organics: The organic method utilized for this SDG was 8260B (GC/MS). The QC requirements were followed for this specific project and method-specified criteria were met.

Outliers:
Run-Batch 120703A5:
- The blank contained 109.0 ug/kg of Tetrahydrofuran. Tetrahydrofuran was not found in associated samples.
- The CCC had the compounds Acetone, 2-Butanone (MEK), and Tetrahydrofuran outside of control limits.
