RE: Summary of Fall 2011 Investigation Activities  
Willow Run Company Vehicle Operations Area  
Ypsilanti, Michigan

### 1.0 INTRODUCTION

Conestoga-Rovers & Associates (CRA) has prepared this memorandum to summarize the results of activities completed between September and December 2011 at Willow Run Company Vehicle Operations (CVO) Area, located in Ypsilanti, Michigan (Site).

### 2.0 COMPLETED ACTIVITIES

The following tasks were completed between September and December 2011.

#### Task 1 - Vinyl Chloride Delineation Activities

- *Off-Site Investigation*
- *Delineation of Impacts Near and Beneath Haulaway Building*
- *Sitewide Groundwater Monitoring Event*

#### Task 2 - Electromagnetic Survey

#### Task 3 - In-Situ Waste Characterization Event

#### Task 1 - Vinyl Chloride Delineation Activities

An investigation was completed along the south side of Tyler Road to assess the extent of chlorinated volatile organic compounds (CVOCs) beyond the southern property boundary. Delineation activities of soil and groundwater impacts near the Haulaway building were also completed.

The shallow groundwater at the Site has been impacted with chlorinated and non-chlorinated volatile organic compounds (VOCs). The main constituents of concerns (COCs) at the Site are trichloroethylene (TCE), cis-1,2-dichloroethylene (cis-1,2-DCE), and vinyl chloride. The on-Site groundwater monitoring

event was conducted to evaluate VOC concentrations both south and north of the groundwater divide and at the property boundary wells.

The groundwater results are compared against the Michigan Department of Environmental Quality (MDEQ) Act 451 Part 201 generic cleanup criteria (criteria). The MDEQ granted a *groundwater not in an aquifer determination for the surficial unit from which this groundwater is sampled* (letter to Ken Richards dated September 1, 2004). Accordingly, drinking water criteria for the on-Site wells are not applicable. However, the groundwater results from the perimeter and off-Site locations are compared against the Residential Drinking Water (RDW) criteria to determine whether a notice of migration (NOM) is required for the constituents in groundwater migrating off-Site.

### Off-Site Investigation

A GeoProbe was used to install three 1-inch diameter polyvinylchloride (PVC) temporary wells (TWOS-01, TWOS-03, and TWOS-04) and two 2-inch diameter PVC permanent monitoring wells (MWOS-02 and MWOS-05) at the Fons Landfill (landfill) located across Tyler Road to the south of the Site. The wells were installed outside the clay berm surrounding the northern part of landfill.

Additionally, two 2-inch diameter PVC monitoring wells, MWOS-06 and MWOS-07, were installed approximately 3-feet above a 72-inch sewer line located along the south side of Tyler Road to assess whether the sewer is acting as a preferential pathway for the impacted groundwater. The 72-inch sewer line belongs to Ypsilanti Community Utility Authority (YCUA) and the 3-foot buffer zone was part of the agreement with YCUA to protect the sewer line from damage during drilling activities. Two step out soil borings (SBOS-06A and SBOS-06C) were also completed (adjacent to MWOS-06) to confirm the location of bedding fill material associated with the sewer, prior to setting the well.

No soil samples were collected during this investigation per the access agreement obtained from the landfill. Stratigraphic logs for each location are presented in Attachment A.

Groundwater levels were obtained from the off-Site wells and are presented on Table 1. Groundwater samples were collected from TWOS-04, MWOS-05, MWOS-06, and MWOS-07, following well development activities. The remaining three wells (TWOS-01, MWOS-02, and TWOS-03) were dry; therefore, no samples were collected. A sample was collected from an off-Site well, GS-7, and the 72-inch sewer outfall located south of Tyler Pond dam, east of the Fons landfill. Groundwater samples from the landfill wells were collected for analysis of cis-1,2-DCE, TCE, and vinyl chloride. The outfall sample was analyzed for target compound list (TCL) VOCs.

### Results

The locations of all the wells are presented on Figure 1. Boring logs were used to create stratigraphic cross sections. Figure 2 presents the locations of the cross sections, and Figures 3, 4 and 5 present the cross sections.

*Soil:* No soil samples were collected for this investigation as per the access agreement obtained from the landfill.

*Groundwater:* Table 2A and 2B presents the groundwater results from the off-Site wells and the 72-inch sewer outfall, respectively. The footnotes for the criteria are presented in Attachment B.

Low level detections were observed, however, no exceedances of criteria were observed from the landfill wells. Although not directly applicable, vinyl chloride exceeded the groundwater surface water interface (GSI), non residential drinking water (NRDW) criteria at the outfall.

### Delineation of Impacts Near and Beneath Haulaway Building

A GeoProbe was used to install a monitoring well, MW19-29, to define the vinyl chloride impacts near the Haulaway Building. Two additional monitoring wells, MW19-30 and MW19-31, were installed to determine impacts beneath the building. The locations of these wells are shown on Figure 1. Soil samples were collected from each location at the 0-2 foot below ground surface (bgs) interval, the 8-10 foot bgs interval, and the two-foot interval above the water table. Soil samples were analyzed for TCL VOCs, TCL semi-volatile organic compounds (SVOCs), Site target analyte list (TAL) metals, and polychlorinated biphenyls (PCBs). The monitoring wells were developed and groundwater samples were collected for analysis of TCL VOCs, TCL SVOCs, Site TAL metals, and PCBs.

#### Results

*Soil:* Soil results compared against the MDEQ Part 201 criteria are presented on Table 3. Several VOCs, metals, and PCBs were detected in the soil samples collected from MW19-29, MW19-30, and MW19-31. However, no exceedances of criteria for VOCs, SVOCs or PCBs were observed. Arsenic exceeded the NRDW protection criteria (PC) and GSI PC at MW19-30 (10-12ft bgs), but was not detected above criteria in groundwater collected from this well.. Chromium (total), exceeded the GSI PC for hexavalent chromium at all three locations. Speciated chromium has not been fully evaluated at the Site at this point. It should be noted that if trivalent chromium criteria can be used, all the detected concentrations are below the statewide background levels. The metal concentrations may be naturally occurring or due to local/regional conditions.

*Groundwater:* Groundwater results compared to the MDEQ Part 201 criteria are presented on Table 4A. No exceedances of VOC, SVOC, and PCB criteria were observed in groundwater samples collected from monitoring wells MW19-29, MW19-30, and MW19-31. Manganese exceeded the NRDW aesthetic criteria at all locations, but was well below the 2,500 ug/L non-residential health based drinking water value. As previously discussed, drinking water criteria are not applicable within the Site and will be evaluated at the property boundary. Selenium exceeded the GSI criteria at MW19-29 in one sample but was not detected in the duplicate sample at the same interval.

### Sitewide Groundwater Monitoring Event

Groundwater levels were collected on September 26, 2011 to assess the groundwater flow direction and gradient. Groundwater samples were collected from 13 existing wells (MW-12, MW-6, IW-9, IW-12, MW19-06, MW-5, MW19-07, MW19-08, MW19-26, MW19-27, MW19-28, IW-33, and MW19-10) as part of the groundwater monitoring event to monitor the vinyl chloride impacts as stated in the Draft Vinyl Chloride Delineation Work Plan memorandum submitted to MDEQ on August 10, 2011. The groundwater samples from these locations were analyzed for TCL VOCs.

#### Results

*Groundwater:* Figure 6 presents the groundwater elevation contours. The groundwater flow direction and hydraulic gradient is consistent with previous groundwater monitoring events.

Groundwater results are presented on Table 4B compared against the MDEQ Part 201 criteria. The groundwater results from these wells are consistent with previous groundwater sampling events.

### **Task 2 - Electromagnetic Survey**

Electromagnetic (EM) surveys were completed in 2004 and 2005 to identify and delineate buried metal debris at the Site. The EM surveys were not completed in the northwestern area of the Site and adjacent to the Haulaway building due to accessibility issues when the Site was operating. The Site is now vacant and these areas are accessible.

The EM surveys completed in October 2011 used EM 61 instruments providing a depth of penetration of approximately 10 feet bgs. The purpose of this investigation was to delineate buried refuse in the northwest area of the Site and identify potential source areas for the high concentrations of CVOCs observed at the Site (particularly near the Haulaway building). The EM surveys completed in 2011 are directly comparable to the previous EM surveys as the ranges for intensity responses are similar for each event.

Figure 7 presents the pre-2011 EM results and the areas that were scanned in the fall of 2011.

### **Task 3 - In-Situ Waste Characterization Event**

Remediation activities are planned to be completed in 2012. The purpose of the in-situ waste characterization event was to characterize the soils prior to remediation activities to refine costs for remedy selection.

Based on the work plan dated November 2, 2011, potential area of concern (PAOC) 18 was divided into six areas as shown on Figure 8. Composite soil samples were collected in each of the six areas within PAOC 18 for waste characterization analysis to evaluate the disposal costs, since excavation or partial excavation for disposal may be considered a potential remedy.

A total of 24 soil borings, ISB-01 through ISB-24, were completed in November 2011. Soil borings were completed into the confining clay layer using a GeoProbe. Soil borings closest to Tyler Pond (ISB-13, ISB-14, and ISB-17 through ISB-20) were completed to 5 feet bgs as the confining clay layer is at approximately 5 feet near the edge of the pond. Soil samples were collected from the 0-5 feet bgs interval, 5-10 feet bgs interval, 10-15 feet bgs interval, and 15-20 feet bgs interval. Samples were composited for each interval within each area. A sample was collected from the 0-5 feet bgs interval only, from the borings near the edge of the pond.

Samples were collected and analyzed for toxicity characteristic leachate procedure (TCLP) VOCs, TCLP SVOCs, TCLP metals, and total PCBs.

Previously, soil samples from PAOC 18 were collected from several depths during an August 2004 investigation to assess the waste characteristics for the purposes of disposal planning. A composite sample was collected at the 0-2 feet bgs interval and the 2-7 feet bgs interval from soil borings SB18-111, SB18-112, and SB18-113. Another saturated composite sample was collected closer to the water edge at an

approximate depth interval of 0-3 feet bgs from soil borings SB18-114 and SB18-115. These soil borings are located within Area 4 (from 2011 investigation) and are presented on Figure 8 along with the 2011 locations.

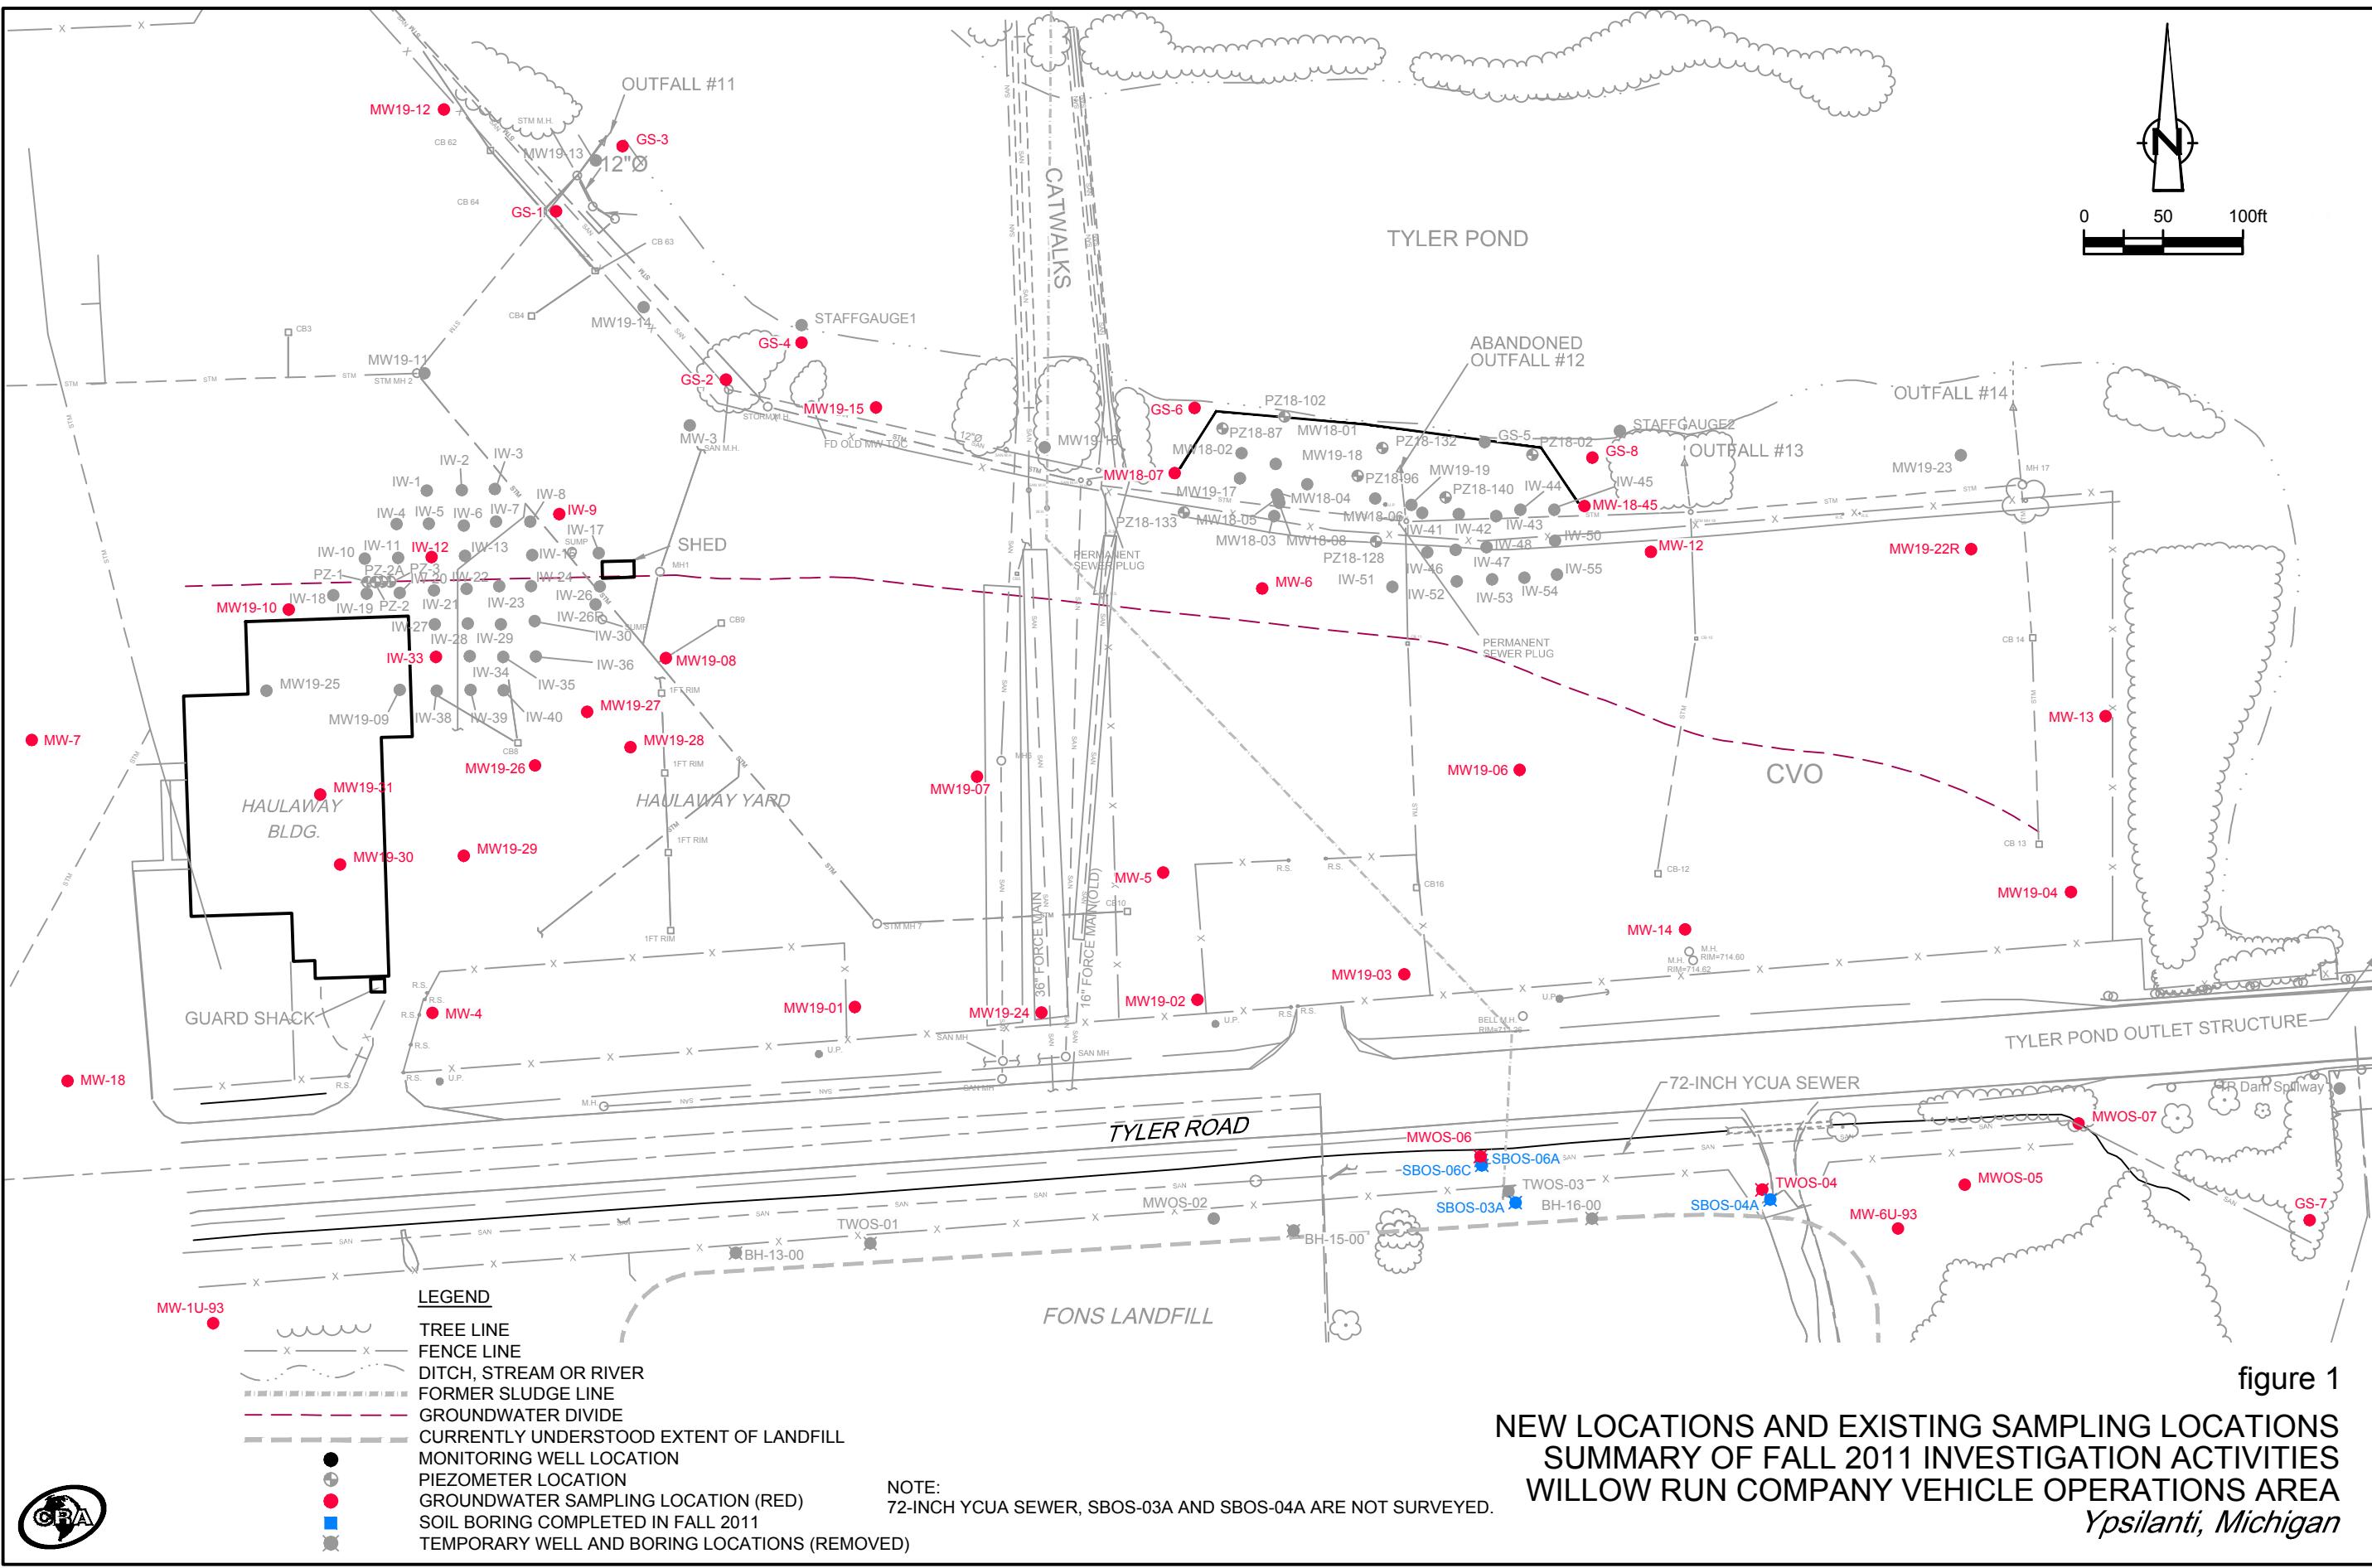

Results:

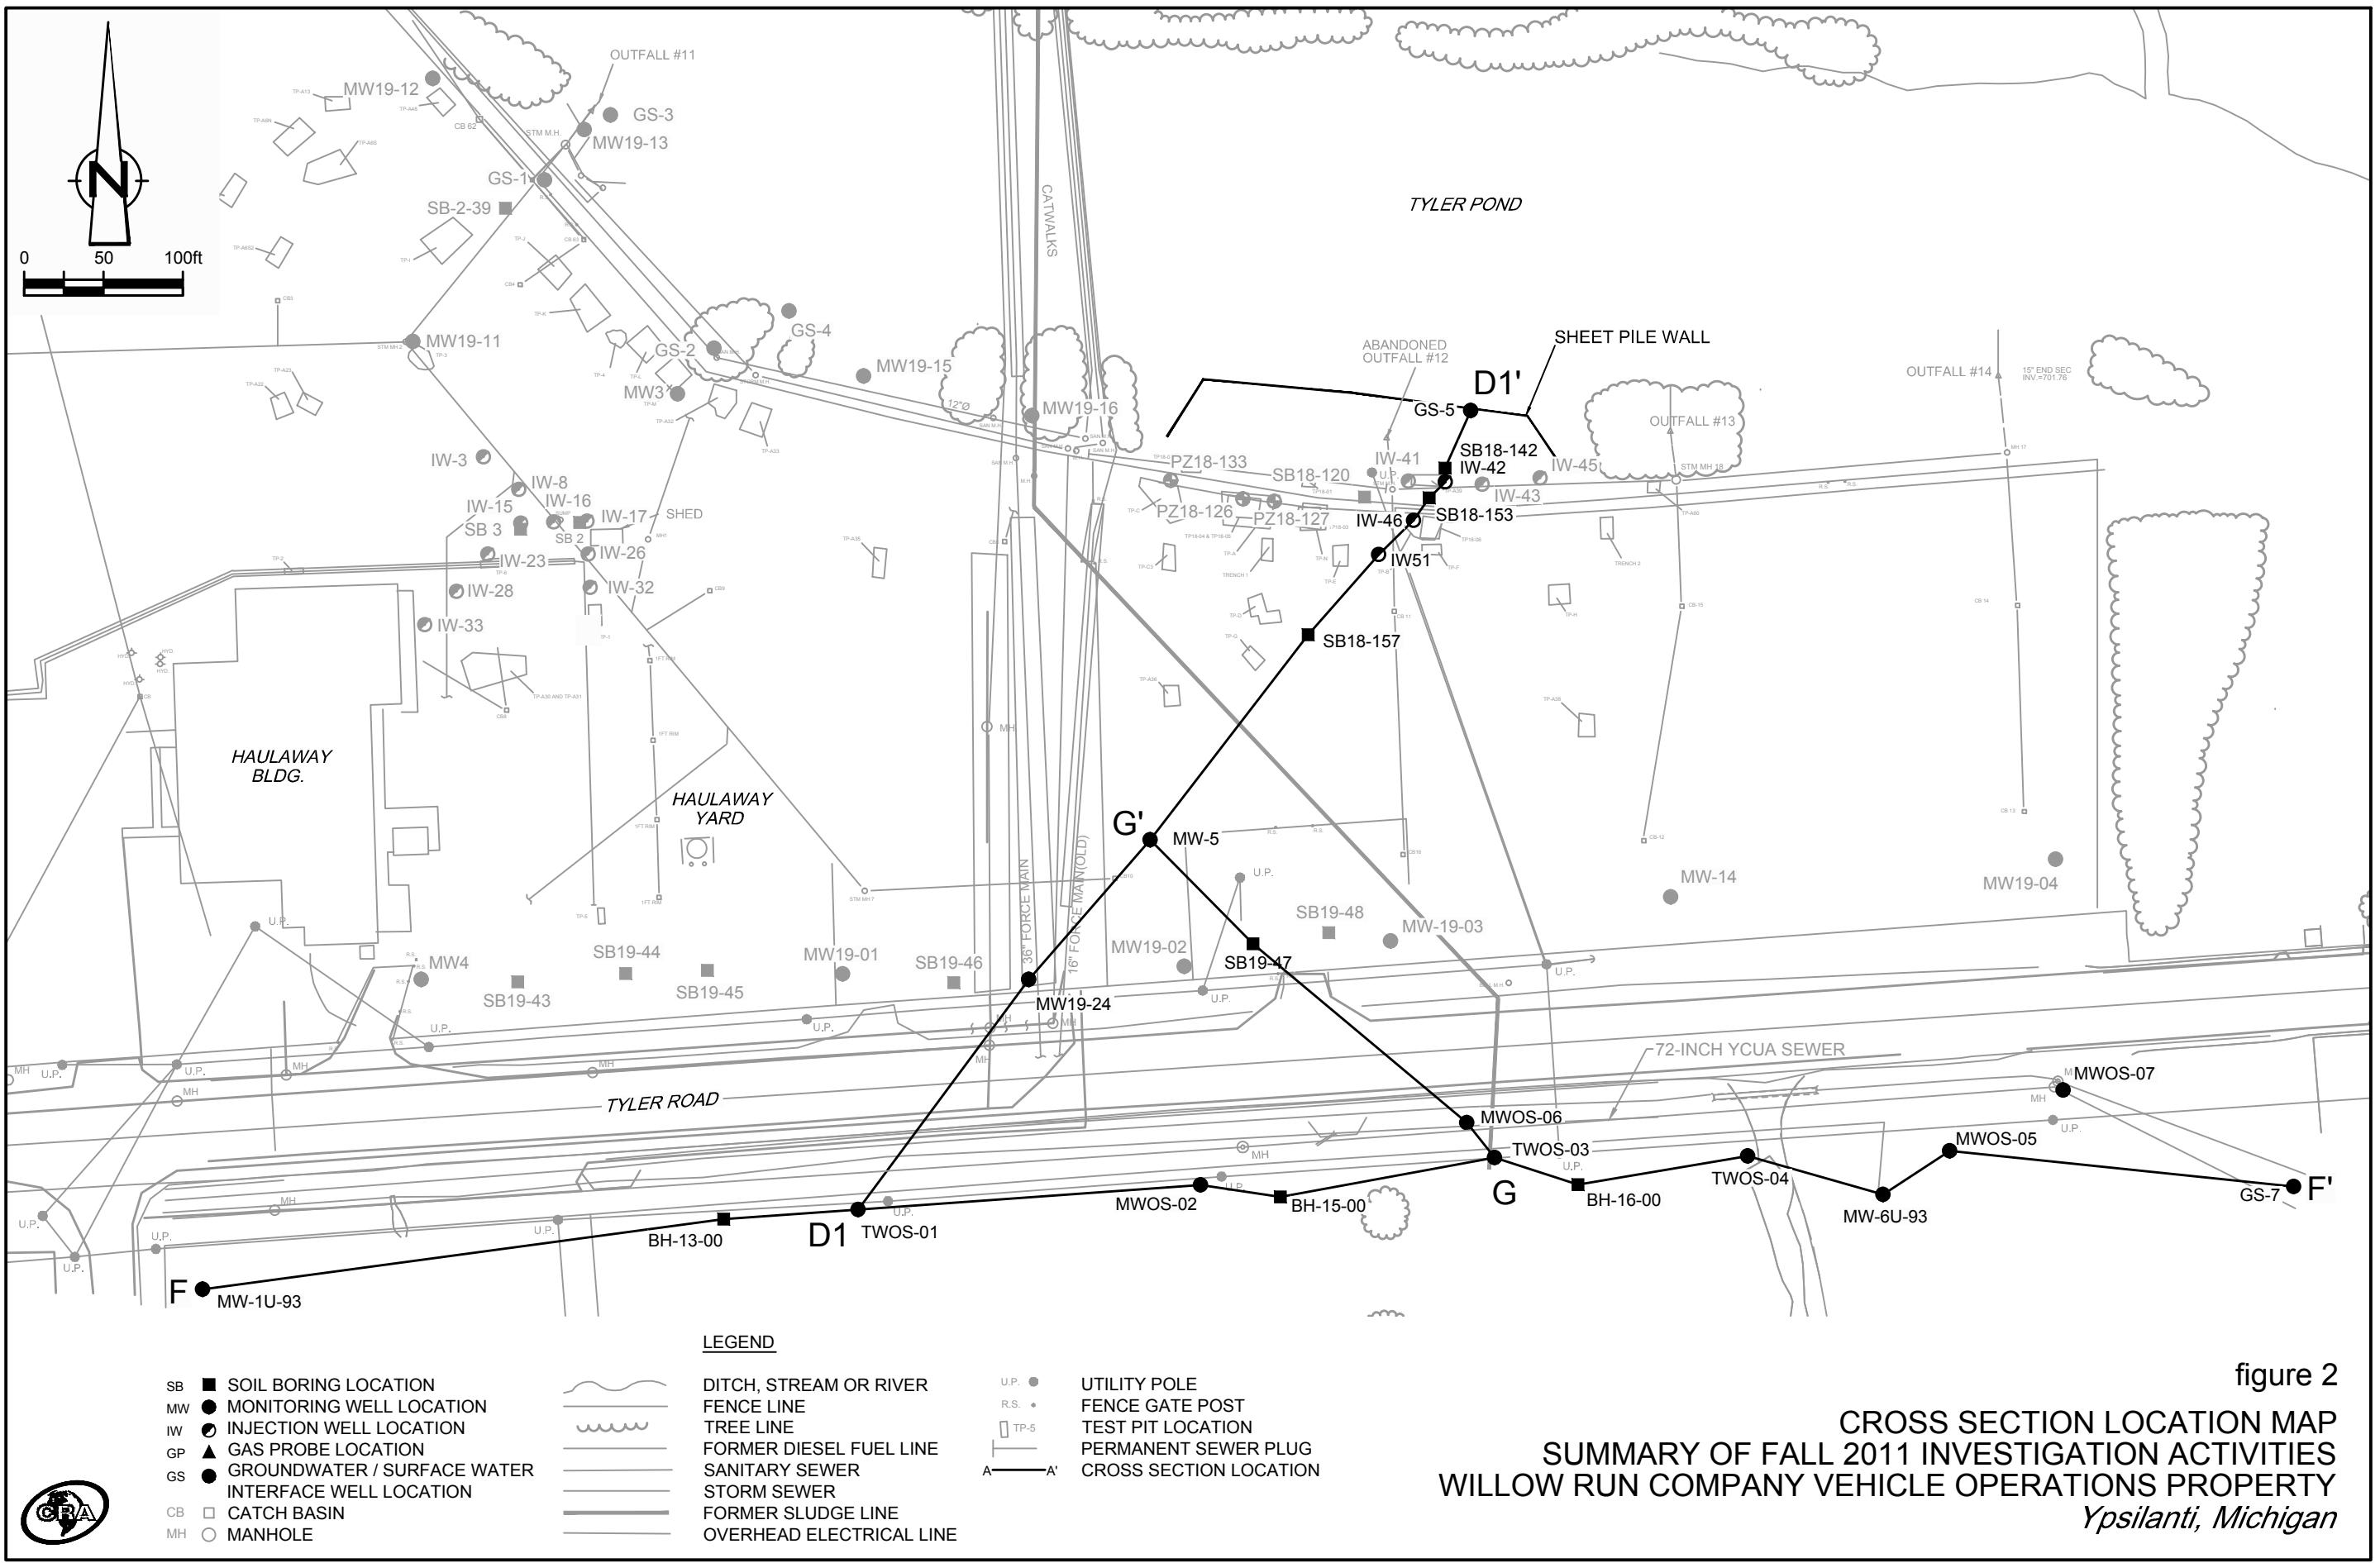

Table 5 presents the waste characterization sampling results. The VOC, SVOC and metals results are compared against the TCLP regulatory limits outlined in 40 CFR 261.24 and the PCB results are screened against a total PCB concentration of 50 ppm. Areas where the results exceed the TCLP regulatory limits are likely to be Resource Conservation Recovery Act (RCRA) hazardous waste once generated if they are not treated to reduce concentrations prior to the point of generation of the waste.

### 3.0 SUMMARY

Below is a summary of Fall 2011 investigation activities completed at the Site:

- The off-Site migration pathway for the high CVOC concentrations observed at the southern property boundary is unclear. High level detections of CVOCs are not observed at any of the off-Site wells. Underground utilities may be acting as preferential pathways for the impacted groundwater beyond the southern property boundary. A remedial action using chemical oxidation is currently being evaluated for lowering the concentrations of CVOCs in groundwater at the Site. Therefore, no further investigation is planned to be completed to determine the pathway for elevated concentrations.
- Soil and groundwater impacts near the Haulaway building are delineated. The metal concentrations observed in soil and groundwater at the locations may be naturally occurring or due to local/regional conditions.
- Groundwater results from the wells at the Site are consistent with previous groundwater sampling events.
- The anomalies identified in the EM survey are being investigated as a part of the RCRA facility investigation (RFI) field activities.
- Additional data was collected from the soils within PAOC 18 to aid in waste classification planning for analysis of remedial options.

NOTES:

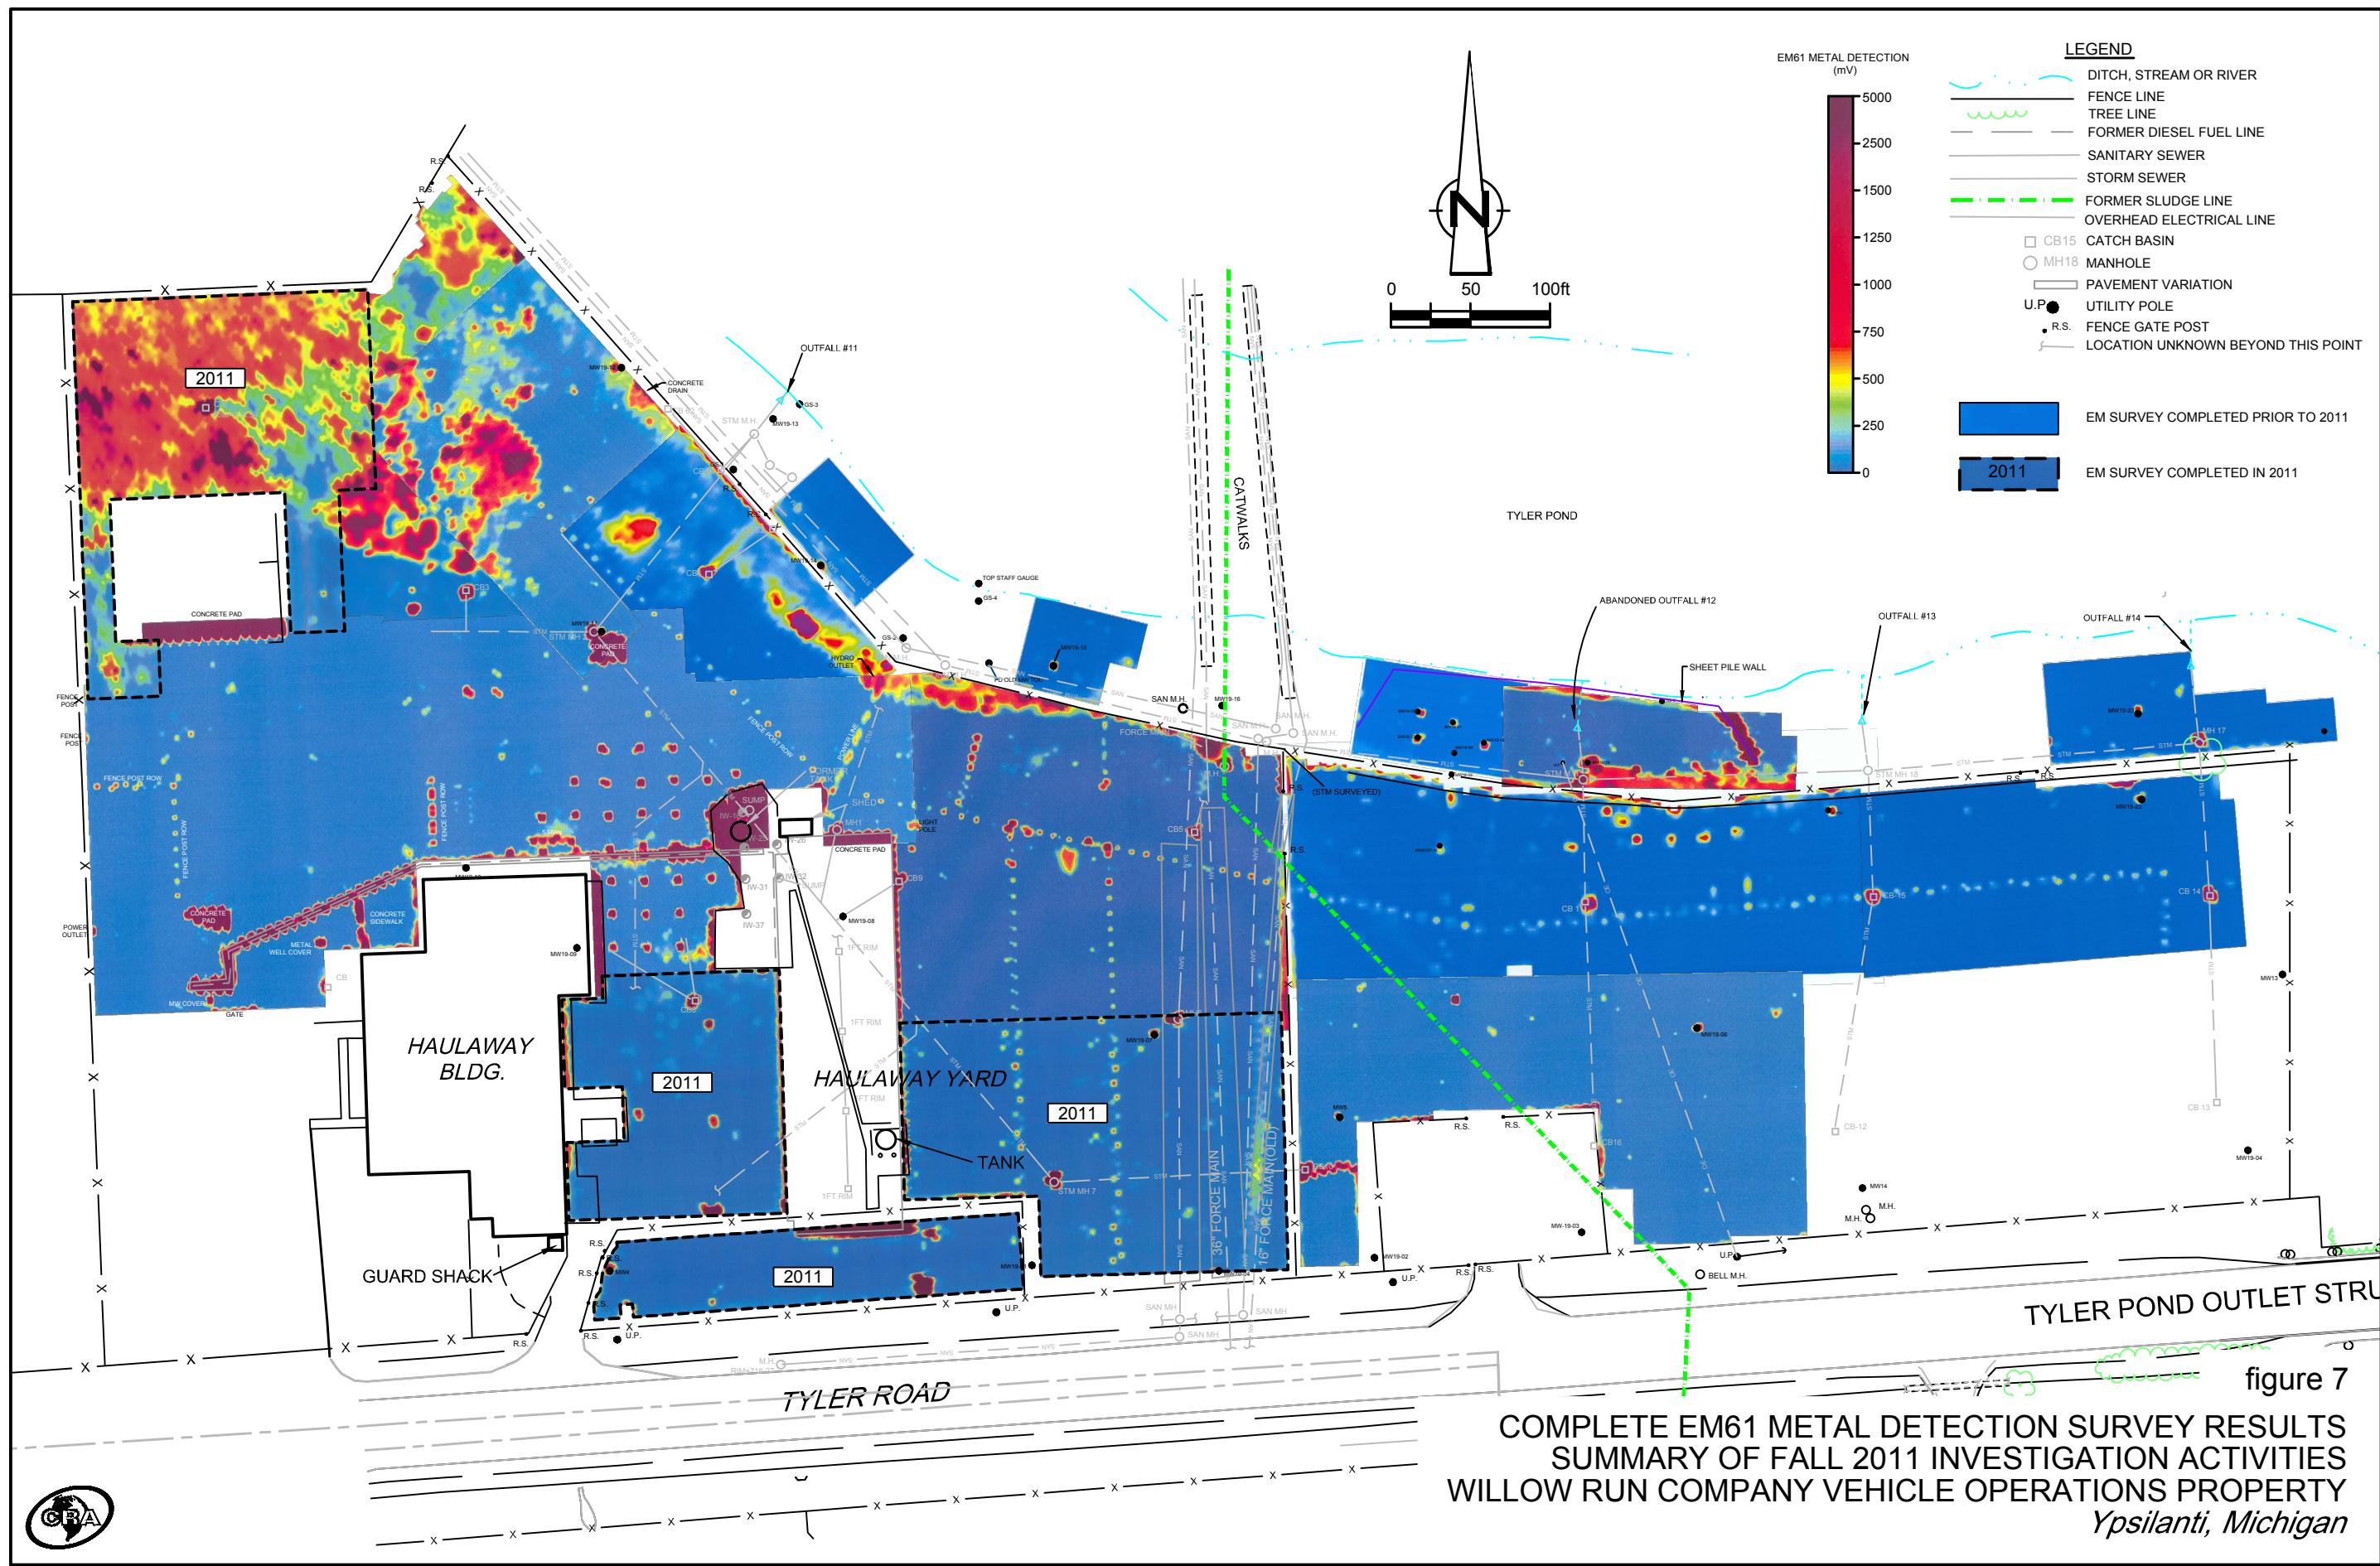

- (1) CONTINUOUS SAMPLES FOR LITHOLOGIC DESCRIPTION NOT COLLECTED. TEMPORARY WELLS WERE INSTALLED AT THESE LOCATIONS.
- (2) DRY WELL
- (3) GROUNDWATER ELEVATIONS WERE RECORDED FALL 2011.
- (4) COULD NOT ACCESS MW-1U-93,
- (5) TEMPORARY WELLS TWOS-01, TWOS-03 AND TWOS-04, WERE ABANDONED IN NOVEMBER 2011.

Notes:

The analytical data is compared to the Michigan Part 201 generic cleanup criteria developed by the MDEQ under the authority of the Natural Resources and Environmental Protection Act (1994 PA 451, as amended) dated 03/25/11.

The Michigan Part 201 criteria footnotes are presented in Attachment B.

NA - Criteria not available

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

J - The associated value is qualified as an estimated quantity.

UJ - The analyte was reported or qualified as not detected however, the sample report limit is qualified as an estimated value and may be inaccurate or imprecise.

## Notes:

The analytical data is compared to the Michigan Part 201 generic cleanup criteria developed by the MDEQ under the authority of the Natural Resources

and Environmental Protection Act (1994 PA 451, as amended) dated 03/25/11

The Michigan Part 201 criteria footnotes are presented in Attachment B.

NA - Criteria not available

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit

J - The associated value is qualified as an estimated quantity

UI - The analyte was reported or qualified as not detected however, the sample report limit is qualified as an estimated value and may be inaccurate or imprecise

## Notes:

The analytical data is compared to the Michigan Part 201 generic cleanup criteria developed by the MDEQ under the authority of the Natural Resources

and Environmental Protection Act (1994 PA 451, as amended) dated 03/25/11

The Michigan Part 201 criteria footnotes are presented in Attachment B.

NA - Criteria not available

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit

J - The associated value is qualified as an estimated quantity

UJ - The analyte was reported or qualified as not detected however, the sample report limit is qualified as an estimated value and may be inaccurate or imprecise

## Notes:

The analytical data is compared to the Michigan Part 201 generic cleanup criteria developed by the MDEQ under the authority of the Natural Resources and Environmental Protection Act (1994 PA 451, as amended) dated 03/25/11.

The Michigan Part 201 criteria footnotes are presented in Attachment B.

NA - Criteria not available

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

J - The associated value is qualified as an estimated quantity.

UJ - The analyte was reported or qualified as not detected however, the sample report limit is qualified as an estimated value and may be inaccurate or imprecise.

## Notes:

The analytical data is compared to the Michigan Part 201 generic cleanup criteria developed by the MDEQ under the authority of the Natural Resources and Environmental Protection Act (1994 PA 451, as amended) dated 03/25/11

The Michigan Part 201 criteria footnotes are presented in Attachment B.

## Notes:

The analytical data is compared to the Michigan Part 201 generic cleanup criteria developed by the MDEQ under the authority of the Natural Resources and Environmental Protection Act (1994 PA 451, as amended) dated 03/25/11

The Michigan Part 201 criteria footnotes are presented in Attachment B.

NA - Criteria not available

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

## Notes:

The analytical data is compared against 40 CFR Part 261.24 - Maximum Concentration of Contaminants for Toxicity Characteristic developed by EPA

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

EPA - Environmental Protection Agency

TCLP - Toxicity Characteristic Leachate Procedure

TSCA - Toxicity Control Substance Act

CRITERIA FOOTNOTES

**FOOTNOTES FOR MDEQ PART 201 CRITERIA  
DOCUMENT RELEASE DATE: MARCH 25, 2011**

NLL - Hazardous substance is not likely to leach under most soil conditions.

NLV - Hazardous substance is not likely to volatilize under most conditions.

ID - Insufficient data to develop criterion.

A - Criterion is the state of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399, MCL 325.1005.

E - Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA). A notice of aesthetic impact may be employed as an institutional control mechanism if groundwater concentrations exceed the aesthetic drinking water criterion, but do not exceed the applicable health-based drinking water value provided in the table.

C - Value presented is a screening level based on the chemical-specific generic soil saturation concentration (C<sub>sat</sub>) since the calculated risk-based criterion is greater than C<sub>sat</sub>. Concentrations greater than

D - Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

R - The data is qualified as unusable. (Note: Analyte may or may not be present).

M - Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

S - Criterion defaults to the hazardous substance - specific water solubility limit.

X - The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source.

W - Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan drinking water standard of 80 ug/L. Concentrations of trihalomethanes in soil shall be added together to determine compliance with the drinking water protection criterion of 1,600 ug/kg.

DD - Hazardous substance causes developmental effects. Residential direct contact criteria are protective of both prenatal and postnatal exposure. Nonresidential direct contact criteria are protective for a pregnant adult receptor.
