Subject:
WMU #10 - Factory 86, Building 04, Assembly Plant Waste Storage Tanks
Summary and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

---

1. Overview

This Summary and Remedy Recommendation Memo has been prepared on behalf of Revitalizing Auto Communities Environmental Response (RACER) Trust by ARCADIS. This summarizes investigation activities completed and recommends remedies for Resource Conservation and Recovery Act of 1976 (RCRA) Waste Management Unit #10 (WMU #10) located at former Factory 86 in the Southend of the Buick City Site (the Site) located in Flint, Michigan (**Figure U-1**).

1.1 WMU #10 Background

Historically, the Factory 86, Building 04, Assembly Plant Waste Storage Tanks (WMU #10) was located at the Southend of the Site, south of Building 04 as shown on the Site Plan (**Figure U-2**). WMU #10 contained four 15,000-gallon underground storage tanks (USTs) (Tanks #76 through #79) and Tank #80 whose size and contents are unknown. The tanks were installed in 1946 and removed in 1984. Three tanks were used to store hazardous waste and one stored nonhazardous painting-related waste: Tank #76 contained waste Flo-coat primer, Tank #77 contained Flo-coat primer (D001 and D008), Tank #78 was used to store non-hazardous lubricating oil, and Tank #79 contained waste paint thinner (F003 and F005). A concrete basement-type enclosure was built around the tanks.

A release (C-0924-91) was identified at WMU #10 during UST removal activities. In 1985, approximately 2,500 to 3,000 cubic yards of underlying soil was removed along with Tanks 76 through 80. Oil was observed seeping into the excavation during the removal at a depth of approximately 10 to 15 feet below ground surface (bgs). A French drain style collection system was installed in the excavation to collect residual oil for off-site disposal. After two years of operation, only small quantities of oil were being collected by this system; therefore, due to limited recovery rates, its operation was discontinued. The quantity of oil collected is not known.

There were additional releases in the vicinity of WMU #10 including Release C-0922-91 at the Hamilton Avenue Tank Farm and a historic release from former Tanks #105 and 131 located east of WMU #10. The impacts of these releases are likely co-mingled.

1.2 WMU Closure Sampling Plan and MDEQ Response

In April 2007, a *RCRA Waste Management Unit Closure Status Report* (Closure Status Report) was submitted to the Michigan Department of Environmental Quality (MDEQ) – Waste and Hazardous Materials Division (WHMD) summarizing 10 WMU areas (including WMU #10) and the proposed activities / information required for closure (ARCADIS BBL, 2007). During subsequent communications with the MDEQ in 2009 and 2010, it was determined that separate work plans would be prepared for WMUs in the Northend and the Southend of the Site. The Southend WMU closure work plan was approved by the MDEQ on October 7, 2011.

In January 2012, investigation activities were completed at WMU #10 and investigation results were submitted to the MDEQ on April 2, 2012 in the *Southend: Certification of Closure for Closure Response Activities at RCRA Waste Management Units* report. In a January 15, 2013 correspondence, the MDEQ determined that the residual contamination at WMU #10 should be addressed through incorporation into the Site-wide Corrective Action activities being conducted pursuant to the Corrective Action Consent Order (No. R8H-5-00-2) with the U.S. Environmental Protection Agency (EPA) and by placing restrictive covenants on groundwater usage and soil relocation.

2. Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and extent of impact for the WMU #10.

Figure 3 presents the locations of the existing and abandoned monitoring wells and soil borings in the WMU #10 area.

2.1 WMU #10 Geology and Hydrogeology

- *Geology:* The soils at WMU #10 consist of primarily fine to medium sand with trace silts to a maximum depth of approximately 22 feet bgs that are interbedded by silt with trace clay. Six soil borings were completed within the footprint of WMU #10. Boring logs from three of these locations indicated evidence of a product sheen from as shallow as 13.5 feet bgs and as deep as 18.1 feet bgs. The logs for the six soil borings completed at WMU #10 are attached to this memo.

- *Groundwater Levels:* Groundwater gauging data collected show that the depth to groundwater in this area averages around seven feet bgs. Light non-aqueous phase liquid (LNAPL) was not detected in the two temporary wells installed in 2011 (WMU10-SB-4 and WMU10-SB-5) or in permanent, downgradient monitoring wells (04-1 through 04-5) through 2012. The groundwater level data are presented in **Appendix X.**

  Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the east and east-southeast.

2.2 Soil and Groundwater Analytical Data

- *Soil:* Six soil borings (WMU10-SB1 through WMU-SB6) were completed as part of closure investigation activities. Two soil samples were collected from each of the soil borings completed at WMU #10 and submitted for analysis of select D- and F-Listed waste constituents. The sample analyte list was approved by the MDEQ and the sample intervals were selected with the MDEQ on-site representative. Analytical data were compared to applicable Michigan Part 201 non-residential criteria. The two soil samples collected from WMU10-SB5 exceeded groundwater/surface water interface protection criteria (GSIP) for ethylbenzene (11/0.36 mg/kg), toluene (118/5.4 mg/kg), and/or xylenes (1.3-62/0.82 mg/kg).

- *Groundwater:* Groundwater samples collected downgradient of WMU #10 were compared to applicable Michigan Part 201 non-residential criteria. Groundwater samples collected from downgradient monitoring wells were submitted for laboratory analysis of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals and/or polychlorinated biphenyls (PCBs). Three samples collected in 2001 detected constituents at concentrations which exceed groundwater surface water interface (GSI) criteria. Ethylbenzene was detected above GSI criteria (24/18 ug/L) in a sample collected from monitoring well 04-02. Copper (dissolved) was detected above GSI criteria (25/21.6 ug/L) in a sample collected from monitoring well 04-3. Selenium was detected above GSI criteria (13/5 ug/L) in a sample collected monitoring well 04-1. It is unknown whether these exceedances are associated with WMU #10 or one of the other releases in the area. Applicable analytical data is presented in **Appendix X**.

WMU #10 is located in the Outfall 011 drainage area. Concentrations in samples collected from the Outfall 011 storm sewer as part of the Site's NPDES Plus Monitoring Program (NPMP) from 2009 through 2013 do not exceed GSI criteria. As there are no exceedances at the GSI compliance point for Outfall 011, the exceedances of GSI criteria in soil and monitoring well samples are not applicable. Please refer to **Appendix BB** for additional discussion of the GSI pathway and NPMP sampling.

3. Remedy Recommended

The remedy recommended to address the oil-impacted soils associated with WMU #10 is establishing institutional controls.

3.1 Institutional Controls

The following area-specific institutional controls, in addition to Site-wide institutional controls, will be necessary to limit potential for future exposure:

- Notify future owners to the potential presence of a listed hazardous waste beneath WMU #10.

Subject:
Response to USEPA Comments on Overview Issues Summary Document

---

1. A statement that remedies will not be implemented until USEPA approval is received will be included.

USEPA Response - No comment.

2. A brief summary of the historic reports and include references to historic reports where reader can find pertinent info (e.g. Transmissivity data has previously been presented in the 2012 CMI report).

USEPA Response - In addition, the reader would benefit from inclusion of locations/sources of the historical reports such as website addresses:

http://www.racertrust.org/Properties/Detail?Id=12950
Or
http://www.epa.gov/region05/cleanup/rcra/buickcity/index.html

ARCADIS Response – Acknowledged. This information will be included in Section 1.1 of the main Report.

3. Southend Final Decision history and perspective – how this work fits with the Final Decision.

USEPA Response - The discussion on the Southend Final Decision should also explain why the remedial approach differs for the Northend. This would address a reviewer's concern that "remedy recommendation is inconsistent with the LNAPL remedies proposed in the existing Southend Final Decision ."

ARCADIS Response – We don't consider the approach for the Northend to be inconsistent with the Southend Final Decision. Additional language will be included in Section 1 of the Report to discuss the remedial approach for the Northend.

4. The LNAPL Remedial Decision Tree (working draft 2/6/13) flowchart and how it is used in the attached AOI evaluations.

USEPA Response - Along with adding an example LNAPL Remedial Decision Tree and discussion, inclusion of references to supporting documents would help the reader understand the bases of a decision. For example, regarding option 2 (on the LNAPL Remedial Decision Tree), a reference to the bench-scale test tables and cost tables would aid in a determination of possible feasibility or infeasibility of this option.

ARCADIS Response – A template LNAPL Remedial Decision Tree has been included as Appendix W. The template also includes references to support documents where appropriate.

5. TSCA regulatory requirements and proposed approach to address PCB issues.

USEPA Response - The discussion of TSCA regulatory requirements should include references to previous discussions with EPA:

During the October 24, 2013 Meeting with RACER, EPA clarified their position in regards to TSCA issues at the Buick City Site:

1.) Region 5 EPA posed this question on the PCB National call 9/16/13:

The facility is requesting disposal of material at the oil/water separators at "as-found" concentrations given that this is a remedial project and the resulting oil

waste at the separator, if found at < 50 ppm, is not the result of “intentional dilution” of any in-situ > 50 ppm NAPL sources that may have infiltrated the sewer. They believe the oil at the separators is Remediation Waste.

Question 1: Can the PCB impacted oils at the separators be viewed as PCB Remediation Waste and disposed of based on an “as-found” concentration? (The 761.3 definition for PCB Remediation Waste does not specifically call out oil/NAPL, but it mentions “other debris generated as a result of any PCB spill cleanup, including, but not limited to:”)

*From various responses on the PCB National Call and subsequent discussions, EPA can determine if RACER is not intentionally diluting, and due to the work being conducted under the RCRA 3008(h) Order EPA can use "enforcement discretion" to decide that PCB wastes in the Oil Water Separator are "as found" and not dilution and dispose of accordingly per TSCA.

In finalizing proposed remedies for the LNAPL plumes there are questions that arise in regards to the disposal of PCB liquids/oils and solids. Submitting a remedy recommendation report for each LNAPL plume and referencing 761.61(c) within each report to cover the remediation waste, as opposed to submitting a 61(c) application for approval seems like the prudent path forward.

ARCADIS Response – As discussed during the 4/15/14 meeting USEPA will provide a summary email to be included in Appendix Y to the Remedy Report.

6. Summary of bench scale testing activities (graphic and/or text summary).

USEPA Response - Along with the graphic and/or text summary of the bench-scale test, inclusion of notes at the bottom of each table explaining the results of the bench-scale test would be helpful. In their present forms presented at the meeting on March 6, 2014, Table 4A and Table 4B are confusing. The portions of the tables that focus on the criteria for success are unclear.

ARCADIS Response – Acknowledged. Additional Information will be added to the tables.

7. Transmissivity analysis – where and why performed; conclusions; and how the results are used in the AOI specific remedies.

USEPA Response - A reference to the above text should also be included in the notes section below the table.

ARCADIS Response – Acknowledged. Additional Information will be added to the tables.

8. NSZD analysis - where and why performed; conclusions; and how applied to AOI enclosed remedy reviews. Include Southend NSZD report in Appendices.

USEPA Response - Additional notes should be included under the NSZD table explaining the results and the hydrocarbon ranges. In their present forms presented at the meeting on March 6, 2014, Table 3A and Table 3B are confusing.

ARCADIS Response – Acknowledged. Additional Information will be added to the tables.

9. Petroleum Vapor Intrusion perspective and how the potential for methane generation will be addressed. Evaluate whether there is an offsite risk which needs to be evaluated.

USEPA Response - The text should indicate clearly the necessity for a completed vapor intrusion investigation prior to implementation of engineering controls. Engineering controls alone may not be protective, depending on types and concentrations of contamination present. Also, the revised text did not include information on how off-site risk would be addressed.

ARCADIS Response – The institutional controls require future users to evaluate vapor intrusion prior to construction. Vapor intrusion at the Site property boundary is continuing to be evaluated and is further discussed in the LNAPL area specific appendices.

10. Clarify that Waste Management Units not closed by MDEQ are incorporated into USEPA Final Decision process.

USEPA Response - No comment.

11. Storm sewer discussion to include: NDPES permit, NPMP Sampling, boom study, video inspections (with reference memo), rain event flow measurements, and outfall areas that require a response to address residual LNAPL on stream banks.

USEPA Response - Addressing residual LNAPL within abandoned sewer lines should also be included as part of the residual LNAPL program described here. Although added discussion is adequate, actual material to be included as Appendix AA has not been reviewed.

ARCADIS Response – At each LNAPL Area where bulkheading is included as a portion of the remedy, the abandoned portion of the storm sewer will be monitored for LNAPL accumulation as discussed in the LNAPL Area specific appendices.

12. Remedial Technology Matrix presents technologies identified as potentially applicable for each AOI and or LNAPL area and key factors used in assessing technologies.

USEPA Response - No comment. However, the reader would benefit from citations to key decision-making tables such as this one in the Decision Tree, as appropriate. For example, under "Do feasible options exist to mitigate...," insertion of "(see Table 7)" would direct the reader to pertinent information regarding this decision.

ARCADIS Response – A template of the LNAPL Remedial Decision Tree has been included as Appendix W. The template also includes references to support documents where appropriate.

13. Remedy Cost Estimate Matrix which will include a range of potential technologies, their estimated cost, and how the costs are factored into remedy selection.

USEPA Response - No comment.

14. Institutional Controls – discuss standard Site-wide limitations and how AOI specific issues will be addressed. ICs will include no use of groundwater; owner must address VI pursuant to applicable regulatory requirements; slabs must remain and owner assumes all risks if removed; owner must comply with due care; soil relocation requirements, etc.

USEPA Response - Make IC language consistent throughout—especially regarding required evaluations of VI. Given that the ICs to be implemented are fairly universal, a generic restrictive covenant (or similar IC documentation) that addresses the ICs should be provided (with the

understanding that some minor language changes based on future property owner may be necessary).

ARCADIS Response – Acknowledged. An example restrictive covenant will be included in Appendix Z.

15. OMM Plan/Monitoring effectiveness of remedies – will be addressed as appropriate in the AOI specific memos.

USEPA Response - The revised text states that this information will be presented in statement of basis documentation. This documentation should be provided for review to allow determination if proposed OMM is appropriate. A discussion of the long term plan to assess remedy effectiveness is required, additional technical details will be provided in the subsequent CMI Workplan.

ARCADIS Response – The OMM information will be presented in the CMI design/work plan documentation (not statement of basis documentation). The general assessment of OMM (general nature, frequency, duration) requirements is included in Tables 7 and 8. The details will be fleshed out in the basis of design once the remedies have been approved. Documentation will also include details regarding how the effectiveness of remedies will be monitored; frequency of monitoring; what items would trigger re-evaluation, repair or replacement of the remedy; as well as the time frame and end points of monitoring.

ARCADIS Project No.:
B0064410.2014

Subject:
Group 1 - Response to USEPA Comments on Priority #10 – AOI 83/84-4 Cutting Oil Area, Priority #12 – AOI 83/84-5 Cutting Oil Area, Priority #13 – AOI 03-1 Quench Oil Area, and Priority #17 – AOI 36-5 Fuel Oil Area Evaluation and Remedy Recommendation Memos
Buick City Site, Flint, Michigan

This memo provides responses to the comments received from USEPA on February 5, 2014 on Priority #10 – AOI 83/84-4 Cutting Oil Area, Priority #12 – AOI 83/84-5 Cutting Oil Area, Priority #13 – AOI 03-1 Quench Oil Area, and Priority #17 – AOI 36-5 Fuel Oil Area Evaluation and Remedy Recommendation Memos (Memos).

Please note that the general comments on the Remedy Recommendations Report (Report) from each set of comments were grouped together as appropriate and one response is provided. Comments that appeared in several sets of comments have been grouped together and are addressed in the General Comments section of this memo. The comments are noted by beginning with a G then using the Priority # - Comment #. So General Comment 1 from Priority #10 memo is referred to as comment G10-1. The comments specific to a particular memo are named similarly, but they begin with an S.

General Comments

Comments G10-1, G12-1, and G17-1 - *Although the memorandum is not at the Statement of Basis stage, it should document that all reasonably applicable technologies have been identified and properly screened, that remedial timeframes for the recommended remedy are reasonable and to define the steps*

to monitor effectiveness of the remedy. Additions to the Remedy Recommendation Report summary will include a summary of the bench scale testing and also, as far as this is possible for multiple AOIs, a discussion of timeframes and monitoring of remedial effectiveness.

Response – This comment will be addressed by the addition of the Remedial Technology Matrix (RTM), the Institutional Controls Matrix (ICM), and the Bench–Scale Testing Matrix (BSTM) as tables to the main report. The RTM will summarize the technologies evaluated for each AOI and the rationale for selecting or eliminating the technology. The ICM will provide a summary of the Site-wide institutional controls to be implemented. The BSTM will present a summary of the results of bench-scale testing activities conducted at the Site.

Operations, monitoring and maintenance activities associated with each of the remedies will be included in the basis of design documentation. Documentation will also include details regarding how the effectiveness of remedies will be monitored; frequency of monitoring; what items would trigger re-evaluation, repair or replacement of the remedy; as well as the time frame and end points of monitoring.

Comments G10-2, G12-2, G13-3, and G17-2 - *Expanded discussion of various remedial technologies evaluated for this Site is recommended in Attachment 3, Section 4, Remedies Evaluated and Not Selected. Proper evaluation of site remedial technologies includes estimated effectiveness, biodegradation rates, remedial timeframes, and risk control measures. This is best addressed in the Remedy Recommendation Report summary as to not add multiple sections to the individual recommended remedy reports for the LNAPL in appendices A-Q.*

Response – This comment will be addressed by the addition of the RTM, the Preliminary Cost Evaluation Matrix (PCEM), and the Remedy Cost Benefit Matrix (RCBM) as tables to the main report.

Comments G10-3, G13-4, and G17-3 - *The 2010 Revised Corrective Measures Proposal – Addendum No. 2 states that Motors Liquidation Company (MLC) agreed to actively remediate AOIs containing light non-aqueous phase liquid (LNAPL) as part of the corrective measures for the Site. It also states that the remedial goal for this AOI is to remove LNAPL to the extent practical, and that a passive recovery trench was proposed as a remedy. The concern is that the remedy recommended is inconsistent with the LNAPL remedies proposed in the existing Southend Final Decision.*

Response – This comment will be addressed in the body of the main Report by the inclusion of a more detailed history of the development of the Corrective Measures Proposal (CMP) (and its addenda) and the Southend Statement of Basis.

Comments G10-4, G12-6, G13-2, G13-5, and G17-4 - *Although the text concisely summarizes site characteristics, it remains unclear if conclusions regarding the downgradient portion of the Site are appropriate considering other factors such as presence of oil-saturated soils above the water table, presence of free product, and accumulation of methane byproducts in vapor phase. A discussion is warranted assessing whether the recommended remedy is more effective, less costly, and can more adequately address risks in a timely manner than other remedial alternatives or combination of alternatives. This may be handled in referencing previous remedy screening exercises or summarizing each LNAPL AOI remedy screening in the Remedy Recommendation Report.*

Response – This comment will be addressed by the addition of the PCEM, RTM and RCBM as tables to the Report. In addition, conceptual site models (CSM) which present combined areal and cross-sectional views of the AOIs will be presented in the AOI specific Remedy Recommendation Memo appendices.

Comments G10-5, G12-11, G13-6, and G17-5 - *The term "institutional control" (IC) should be defined and used appropriately, but not when specifically referencing engineering controls (see Institutional Controls: A Guide to Planning, Implementing, Maintaining, and Enforcing Institutional Controls at Contaminated Sites [EPA 2012]). A combination of control measures, including both ICs and engineering controls, may be required to address risks as identified at AOI 83/84-4. Unacceptable exposure risks posed by the vapor phase may require engineering controls in addition to ICs. For proper placement of engineering controls, provide calculations and data to support the determination of where engineering controls are to be placed, including a more specific discussion of the risks posed.*

Response – This comment will be addressed by the addition of the ICM as a table to the main report as well as by including discussion of Institutional Controls (IC) and the vapor phase pathway in the main body of the report and appendices. The obligation to complete an evaluation of potentially unacceptable exposure to vapor intrusion should a future owner want to build a structure on the site will be required by a proposed Restrictive Covenant to be placed on the property.

Comments G10-6 and G13-7 - *The statement that "no feasible options exist to mitigate risk through compositional change" is not supported by reference to a completed comprehensive analysis and cost evaluation. A combination of passive and active remedial technologies in limited applications may be a plausible component of a selected remedial alternative, and may add value by reducing source area mass and durations of remedial timeframes.*

Response –This comment will be addressed by the addition of the BSTM, PCEM, RTM and RCBM as tables to the Report. An discussion of the LNAPL Remedial Decision

Tree that was developed to provide a consistent framework for identifying LNAPL remedial drivers and determining an appropriate remedial strategy based on a sound LNAPL conceptual site model (shown in Attachment 2 in the individual memos) will be included in the main report.

Comments G10-7, G12-8, G13-8, and G17-7 - *Reasonable remedial timeframes and costs of the selected alternative should be directly compared to active remedial alternatives to determine if feasible options exist. The comparison should include definition of the terms "reasonable timeframes" and "reasonable costs".*

Response – This comment will be addressed by the addition of the PCEM, RTM and RCBM as tables to the main report.

Comments G10-9, G13-10, and G17-9 - *LNAPL is present, but no evaluation appears in this document of low-cost, mass contaminant removal—its effectiveness and its impact on remediation timeframes. A discussion is warranted of the bench scale studies and how that applies to the LNAPL remedy choices. Cost estimates for additional site monitoring and modeling of biodegradation rates, and calculations of methane generation rates should be considered when assessing the overall cost associated with the proposed remedy. …A discussion is warranted regarding both small and larger scale active remediation alternatives to monitored natural attenuation (MNA), such as bio-slurping, bioventing, recovery trench, enhanced in situ biodegradation, in situ chemical oxidation, and potentially others.*

Response – This comment will be addressed by the addition of the PCEM, RTM and RCBM as tables to the Report.

Comment G12-10 - *An expanded discussion of methane generation and its potential impacts should be considered when assessing the overall cost of the proposed remedy. Also, specific information should be provided regarding existing site surface cap or coverage, and adequacy of this as an effective IC.*

Response – This comment will be addressed by the addition of the ICM as table to the main report as well as by including discussion of ICs and the vapor phase pathway in the main body of the main report. The obligation to complete an evaluation of potentially unacceptable exposure to vapor intrusion should a future owner want to build a structure on the site will be required by a proposed Restrictive Covenant to be placed on the property. AOI specific requirements regarding surface caps will be addressed in the appendices presenting the AOI specific Remedy Recommendation Memos.

Comment G13-11 and G17-10 - *Gross costs estimates for additional site monitoring, modeling of biodegradation rates, and calculations of methane generation rates should be considered when assessing the overall cost associated with the proposed remedy.*

Response – As discussed above, the obligation to complete an evaluation of potentially unacceptable exposure to vapor intrusion should a future owner want to build a structure on the site will be required by a proposed Restrictive Covenant to be placed on the property. It is acknowledged that the cost estimates for the selected remedies will include necessary monitoring.

Specific Memo Comments - #10 – AOI 83/84-4 Cutting Oil Area

Comment S10-1 - Attachment 1, Section 2.1, LNAPL Monitoring and Bailed Program, Page K1-1: *Active remediation of soils has not occurred, and no additional recovery efforts have been implemented. Further information would be helpful to the reader to support conclusions in the memorandum, and to assess other potentially applicable technologies.*

Response – Additional information about the AOI 83/84-4 area and associated investigations is available in the Site reports presented in **Appendix Y**. Also, please refer to the Preliminary Cost Evaluation Matrix (PCEM), the Remedial technology Matrix (RTM) and the Remedy Cost Benefit matrix (RCBM) provided in the main Report.

Comment S10-2 – Attachment 1, Section 3.1, Geology and Hydrogeology, Page K1-2: *An abbreviated hydrogeology section should be added here discussing pertinent site characteristics, such as groundwater flow direction, hydraulic gradient, proximity to subsurface features (such as, storm sewers), and preferential surface and subsurface flow features.*

Response – This comment will be addressed in the CSM cross-sectional figure, presented as **Figure I-1**. Information regarding regional and Site geology and hydrogeology can be found in the Site RFI Reports presented in **Appendix Y**.

Comment S10-3 – Attachment 1, Section 3.3, LNAPL Characteristics, LNAPL Analytical Data, Page K1-3: *The text states that "The LNAPL contains arsenic and lead at concentrations that are potentially characteristically hazardous." A discussion of why the concentrations are only "potentially" hazardous should appear in this document. The discussion should include concentrations detected, criteria to which those concentrations are compared, and how much those concentrations exceed criteria.*

Response – Text will be amended to state "Concentrations of arsenic exceed TCLP criteria; however, TCLP analysis has not been conducted.

Comment S10-4 - Attachment 1, Section 3.3, LNAPL Characteristics, Transmissivity, Page K1-3: *The text states that the transmissivity value (0.03 square feet per day) determined from an LNAPL baildown test in April 2013 is below the ITRC and Michigan Department of Environmental Quality (MDEQ) threshold for recovery. If these baildown test data have not yet been presented, the data should be included for review.*

Response – Acknowledged. Transmissivity data are presented in **Table 2 of the main report**.

Comment S10-5 - Attachment 1, Section 3.3, LNAPL Characteristics, Natural Source Zone Depletion, Page K1-3: *The text states that high levels of methane were detected during MW-83/84-7 installation, and that this indicated occurrence of natural source zone depletion (NSZD). The methane may be a natural occurrence or a result of NSZD. However, in either scenario, installation of a methane monitoring network would be necessary to demonstrate that (1) methane generated does not interfere with long-term stewardship and any proposed ICs and engineering controls, and (2) no immediate exposure risk is currently present as a result of elevated methane.*

Response – The Report will include language that future owners will conduct evaluations and address methane and vapor intrusion as necessary. In addition, the text will be revised to more clearly state that the MW-83/84-7 location is at the adjacent AOI 83/84-5 LNAPL Area (not AOI 83/84-4) and will be further addressed as part of vapor intrusion investigations being completed at AOI 83/84-5.

Comment S10-6 – Attachment 1, Section 3.3., LNAPL Characteristics, Page K1-3: *If applicable, provide and use data from the south end NSZD to extrapolate or estimate degradation rates and methane production rates within this AOI.*

Response – Not applicable.

Comment S10-7 – Table 2: *Verify concentration units and present site-specific comparison criteria. Distinguishing detected values from non-detected values (for example, via highlighting or shading) would facilitate the reader's comprehension.*

Response –The concentration units have been confirmed to be correct; however, there are no criteria for LNAPL. Locations which exceed (or do not exceed) criteria are presented on the CSM **Figure I-1**. Please note that all data tables have been moved to **Appendix X**.

Comment S10-8 – Figure 2: *Delineate or label the following items relevant to evaluation of recommendations regarding the Site: storm sewer and other underground utility locations, sentinel well locations (as referenced in the text), groundwater contours, upgradient and crossgradient source areas (AOIs) if any, and surface cap location.*

Response – **Figures 2 and 3 of the main report** show AOIs and LNAPL Extents. **Figures 5 and 6 of the main report show** the site drainage areas, storm sewers, and bulkhead locations. **Figure 2** will be updated with a groundwater flow direction arrow. Locations which exceed (or do not exceed) criteria are presented on the CSM **Figure I-1**. The CSM cross-section figure also details much of the requested information.

Comment S10-9 – Figure 2: *The Figure appears to accurately estimate the horizontal extent of LNAPL present at this AOI. However, isoconcentration lines depicting approximate limits of groundwater surface water interface (GSI) exceedances are not shown. In addition (along with isoconcentration lines), a figure identifying soil sample exceedances would help identify the extent of influence of the LNAPL on surrounding matrices.*

Response – Locations which exceed (or do not exceed) criteria are presented on the CSM **Figure I-1**.

Comment S10-10 – Attachment 2, Decision Tree: *As stated above in the general comments, the Decision Tree omits EPA approvals.*

Response – Text regarding EPA approvals has been added to the body of the main report.

Comment S10-11 – Attachment 2, Background: *Clarify capped and non-concrete and asphalt covered areas within the Site.*

Response – Surface cover materials will be noted in the background section.

Comment S10-12 – Attachment 2, Geology and Hydrogeology: *See Specific Comment 2 above regarding addition of a hydrogeology section (Section 3.1, page K1-2, Geology and Hydrogeology), and include relevant information here.*

Response – This comment will be addressed in the CSM cross-sectional figure, presented as **Figure I-1**. Information regarding regional and Site geology and hydrogeology can be found in the Site RFI Reports presented in **Appendix Y**.

Comment S10-13 – Number #1, Page K2-2: *Future site construction and active utility repairs in the areas may involve short-term site worker exposure scenarios. Consider addressing this, and whether methane explosive hazards and air monitoring requirements have been evaluated.*

Response – The main report will include language that future owners will conduct evaluations and address methane and vapor intrusion as necessary. In addition, the text will be revised to more clearly state that the MW-83/84-7 location is at the adjacent AOI 83/84-5 LNAPL Area (not AOI 83/84-4) and will be further addressed as part of vapor intrusion investigations being completed at AOI 83/84-5.

Comment S10-14 –Number #2, Page K2-2: *This section requires additional supporting documentation, such as comparisons of costs, time required for monitoring of LNAPL, and others.*

Response – This comment will be addressed by the addition of the PCEM, RTM and RCBM as tables to the main report.

Comment S10-15 – Number #2, Second bullet, Page K2-2: *Explain in terms of a technical basis why city sewers prevent implementation of this technology, and specify the associated risks.*

Response – Many of the storm sewers in the City of Flint are old clay-tile sewers. The heat generated by this technology could compromise the sewers potentially causing a collapse of the sewer pipe. Also, for sewers where there is a rubber gasket, high temperatures may compromise the seal that would allow groundwater infiltration. There are also older water lines, sanitary sewers, etc. (since this area was a manufacturing facility for over 100 years) that may be damaged by high temperatures. Also, increasing the water temperature in the storm sewer could have a negative on the Flint River ecosystem.

Comment S10-16 – Number #4, Page K2-2: *Provide or reference the well designations (numbers) and locations of the sentinel wells (Figure 2). Consider addressing issues such as proper well construction for monitoring of LNAPL, any change in groundwater elevation that potentially prevents identification of LNAPL in wells (such as, seasonally rising groundwater during data acquisition), changed conditions after the 2011 building demolition activities, preferential pathways such as the sewers/conduits, etc.*

Response - The LNAPL extent evaluation discussion in the main report was revised to include additional discussion of Site changes and seasonal fluctuations. Information regarding water level/ LNAPL gauging is presented in **Appendix X**. Also, please refer to the CSM cross-sectional figure presented in the Memos as well as **Figures 5 through 8** of the main report for additional information regarding Site structures utilities and the locations of wells.

Comment S10-17 – Number #6, Page K2-2: *Provide a summary of any recovery options evaluated and how these were screened and evaluated to support the decision.*

Response – This comment will be addressed by the addition of the PCEM, RTM and RCBM as tables to the Report.

Comment S10-18 – Attachment 2, Item 7 Are Controls Required?, Page K2-3, Bullet 1: *The text states that prohibiting use of groundwater for other than sampling, investigatory, remedial, or short-term dewatering purposes is proposed as part of the ICs and engineering controls for this AOI. Short-term dewatering without appropriate collection systems may spread hazardous constituents to areas outside of the current LNAPL plume. Inclusion of short-term dewatering with remediation is recommended only if appropriate collection systems are in place or are to be constructed. This comment also applies to Attachment 3, Section 3.1, Institutional Control, Page K3-2, Bullet 1.*

Response – Standard practice in Michigan requires all such activities be performed in compliance with applicable laws, rules and regulations.

Specific Memo Comments - #12 – AOI 83/84-5 Cutting Oil Area

Please note that four of the general comments for the Priority #12 memo where specific comments, so they are addressed here.

General Comment G12-3 - *Also required is a summary of the historical data demonstrating that the plume has stabilized and is not mobile. Effectiveness of the wells to monitor the plume should be discussed, based on proximity of the monitoring wells to the plume, hydraulic gradients, and flow direction. Although identification of the plume occurred recently, historical data from the past 10 years should be generally discussed to demonstrate plume stability and to support the conclusions presented. Groundwater analytical data obtained from the site should be compared to applicable screening values such as the Michigan Part 201 nonresidential criteria.*

> Response – Please note that this LNAPL area was identified in 2013; therefore, historic data for the AOI 83/84-5 LNAPL Area do not exist. However, as part of Site wide investigations and monitoring events data has been collected at AOI 84/8-5 and downgradient of this AOI. Groundwater/LNAPL level data are presented in **Appendix X**. Data are compared to applicable MDEQ Part 201 criteria. A summary of the available data compared to criteria is present in Attachments 1 and 2.

General Comment G12-4 - *Text presented in the third bullet of the decision tree evaluation, page N1-1, and in Attachment 3, Section 3, Remedy Recommended, states that free product recovery is recommended and light non-aqueous phase liquid (LNAPL) removal is proposed. These statements contradict information presented on Attachment 2, LNAPL Remedial Decision Tree, which illustrates use of institutional controls (ICs) only. Clarify and render consistent statements regarding the recommended remedy.*

> Response – Attachment to was revised to note that while institutional controls are recommended to address the potential volatilization to indoor air risk for a future structure, which free product recovery is recommended due to the LNAPL's proximity to the property boundary.

General Comment G12-5 - *The text should discuss the approximate geographical extent proposed for free product recovery. That portion of the 85,500 square feet impacted by LNAPL noted in the text should be distinguished from areas not to be actively remediated. Recommended as well are further investigation and evaluation of downgradient areas at which free product recovery may prove beneficial. Additional transmissivity testing and expanded investigation may be applicable, and could coincide with the proposed investigation discussed in Attachment 3, Section 3.1.*

> Response – This LNAPL area is currently being delineated and additional transmissivity testing is

planned for this area. Additional details regarding the area to be remediated will be provided in subsequent work plans or basis of design documentation.

General Comment G12-7 - *Additional discussion is necessary regarding ownership, environmental impacts, and the approach to remediation within areas with free product depicted on Figure 2, in the vicinity of Industrial Avenue.*

Response – The LNAPL area has recently been identified and is currently being delineated. Once additional delineation and investigation activities have been completed additional information will be provided in work plans or basis of design documentation. Please note that four additional monitoring have recently been installed along the property boundary and the extent of LNAPL has been refined based on the additional information.

Comment S12-1 - Attachment 1, Section 2.1, Geology and Hydrogeology, Page N1-1: *Results of Laser Induced Fluorescence (LIF) indicate LNAPL impacts as deep as 12 feet below ground surface (bgs), while the following section, Groundwater/LNAPL Levels, states that groundwater is generally at 9 feet bgs. The text should discuss historical fluctuations in groundwater elevations in relationship to measurements of free product, and whether different free product thicknesses could result from these groundwater fluctuations.*

Response – Please refer to the CSM cross-section figure for this information **Figure K-1**.

Comment S12-2 - Attachment 1, Section 2.1, Geology and Hydrogeology, Pages N1-1 and N1-2: *An abbreviated hydrogeology section should be added to this section to discuss pertinent site characteristics, such as hydraulic gradient, proximity to subsurface features (for example, storm sewers), and preferential surface and subsurface flow features.*

Response – This comment will be addressed in the CSM cross-sectional figure, presented as **Figure K-1**. Information regarding regional and Site geology and hydrogeology can be found in the Site RFI Reports presented in **Appendix Y**.

Comment S12-3 - Attachment 1, Section 2.2, Groundwater and Soil Analytical Data, Groundwater bullet, Page N1-2: *Provide the upgradient location of monitoring well 11-120, and discuss its relevance to the 83/84-5 Site. The text should include a statement recommending determination whether any historical groundwater analytical results at AOI 83/84-5 exceed Michigan Part 201 nonresidential criteria.*

Response – The location of monitoring well 11-120 is shown on **Figure K1-2**. **Attachment 1** includes a comparison of results to Michigan Part 201 nonresidential criteria, including all historical data.

Comment S12-4 - Attachment 1, Section 2.2, Groundwater and Soil Analytical Data, Soil Bullet, Page N1-2: *The text should provide an expanded discussion and data to support the statement that "mercury does not appear to be related the AOI 83/84-5 LNAPL plume."*

Response – The text in this section will be expanded to address this comment.

Comment S12-5 - Attachment 1, Section 2.3, LNAPL Characteristics, LNAPL Analytical Data, Page N1-2: *The text states that "The LNAPL contains arsenic at concentrations that are potentially characteristically hazardous." A discussion of why the concentrations are only "potentially" hazardous should appear in this document. The discussion should include concentration(s) detected, criteria to which those concentrations are compared, and how much those concentrations exceed criteria.*

Response – Text will be amended to state "Concentrations of arsenic exceed TCLP criteria; however, TCLP analysis has not been conducted.

Comment S12-6 - Attachment 1, Section 2.3, LNAPL Characteristics, Transmissivity, Page N1-3: *The text states that the transmissivity values vary from 0.08 to 1.6 square feet per day between monitoring wells MW 83/83-7 and MW 83/84-19. To determine if differences in transmissivity results can be attributed to localized subsurface heterogeneity, borehole logs should be compared to specific lithologies. Variations in lithology may directly impact free product recovery and selection and placement of remedial technologies. Application of transmissivity values in determining site data gaps and remedial technologies would also be useful here.*

Response – The conceptual Site model (**Figure K-1**) provides a cross section of the AOI 83/84-5 Area. Also, additional transmissivity testing is planned for this area after LNAPL delineation is completed.

Comment S12-7 - Attachment 1, Section 2.3, LNAPL Characteristics, Natural Source Zone Depletion, Page N1-3: *The text states that high levels of methane were detected during MW-83/84-7 installation, and that this indicated occurrence of natural source zone depletion (NSZD). The methane may be a natural occurrence or a result of NSZD. However, in either scenario, installation of a methane monitoring network would be necessary to demonstrate that (1) methane generated does not interfere with long-term stewardship and any proposed ICs/engineering controls, and (2) no immediate exposure risk is currently present as a result of elevated methane.*

Response – The report will include language that future owners will conduct evaluations and address methane and vapor intrusion as necessary. The MW-83/84-7 location will be further addressed as part of vapor intrusion investigations being completed at AOI 83/84-5. Additional

text has also been added to Section 2.2.4 of the memo to further discuss vapor intrusion.

Comment S12-8 - Attachment 1, Section 2.3, LNAPL Characteristics, Natural Source Zone Depletion, Page N1-3: *If applicable, provide and use data from the south end NSZD to extrapolate or estimate degradation rates and methane production rates within this AOI.*

Response – Not applicable.

Comment S12-9 - Attachment 1, Section 2.4, Extent of LNAPL and Impacts, LNAPL Area, Page N1-3: *Discuss how selection of the recommended remedy was influenced by the extent of LNAPL in relationship to the locations of rights of-way and potential utilities (see also Specific Comment 2).*

Response – The discussion of remedies is in Attachment 3, so a discussion in Attachment 1 would be premature. The presence of utilities and rights-of-way will be considered in the implementation of the remedy and discussed in the work plans and/or basis of design documentation.

Comment S12-10 - Table 1: *Information listed in the table indicates that Site wells were gauged in 2013 only. Provide or summarize historical monitoring and available free product data to support a claim of plume stability over time.*

Response – The monitoring wells in this area were installed in 2013; therefore, only 2013 data is available. Please note all data is now available in **Appendix X**.

Comment S12-11 - Table 2: *Verify concentration units and present site-specific comparison criteria. Distinguishing detected values from non-detected values (such as, via highlighting or shading) would facilitate the reader's comprehension of the Site.*

Response – The concentration units have been confirmed to be correct; however, there are no criteria for LNAPL. Locations which exceed (or do not exceed) criteria are presented on the CSM **Figure K-1**. Please note that all data tables have been moved to **Appendix X**.

Comment S12-12 - Figure 2: *Delineate or label the following items relevant to evaluation of recommendations regarding the Site: storm sewer and other underground utility locations, well locations, groundwater contours, upgradient and crossgradient source areas (AOIs) if any, surface cap locations, and public right-of-way.*

Response – **Figures 2 and 3 of the main report** show AOIs and LNAPL Extents. **Figures 5 and 6 of the main report show** the site drainage areas, storm sewers, and bulkhead locations. **Figure K1-2** will be updated with a groundwater flow direction arrow. Locations which exceed (or do not exceed) criteria are presented on the CSM **Figure K-1**. The CSM cross-section figure also

details much of the requested information.

Comment S12-13 - Attachment 2 Notes, Background, Page N2-2: *Clarify capped and non concrete/asphalt-covered areas within the Site. Property ownership, right-of-way, and utility issues should also be discussed within this section, and where appropriate, in the remedial alternative analysis.*

Response – Surface cover materials will be noted in the background section.

Comment S12-14 - Attachment 2 Notes, Geology and Hydrogeology, Page N2-2: *See Specific Comment 2 above regarding addition of a hydrogeology section (Section 2.1, pages N1-1 and N1-2, Geology and Hydrogeology), and include information relevant to Attachment 2.*

Response – This comment will be addressed in the CSM cross-sectional figure, presented as **Figure K-1**. Information regarding regional and Site geology and hydrogeology can be found in the Site RFI Reports presented in **Appendix Y**.

Comment S12-15 - Attachment 2 Notes, Number #1, Page N2-2: *Future site construction and active utility repairs in the areas may involve short-term site worker exposure scenarios. Address this concern and discuss whether methane explosive hazards and air monitoring requirements have been evaluated.*

Response – The main report will include language that future owners will conduct evaluations and address methane and vapor intrusion as necessary. In addition, additional investigation will be completed at AOI 83/84-5.

Comment S12-16 - Attachment 2 Notes, Number #2, Page N2-2: *Gross cost estimates for additional site monitoring, modeling of biodegradation rates, and calculations of methane generation rates should be considered and compared when assessing the overall cost associated with the proposed remedy.*

Response – Additional information regarding cost estimates is provided in RCBM (Table 8 of the Report) and **Appendix CC**.

Comment S12-17 - Attachment 2 Notes, Number #2, second bullet, Page N2-2: *Explain in terms of a technical basis why city sewers prevent implementation of this technology, and specify the associated risks.*

Response – Many of the storm sewers in the City of Flint are old clay-tile sewers. The heat generated by this technology could compromise the sewers potentially causing a collapse of the sewer pipe. Also, for sewers where there is a rubber gasket, high temperatures may compromise the seal that would allow groundwater infiltration. There are also older water lines, sanitary sewers, etc. (since this area was a manufacturing facility for over 100 years) that may be damaged by high temperatures. Also, increasing the water temperature in the storm sewer could

have a negative on the Flint River ecosystem.

Comment S12-18 - Attachment 2 Notes, Number #3, Page N2-2: *This section requires additional supporting documentation, such as comparisons of costs, time required for monitoring of LNAPL, etc. Persistence of free product in the subsurface may require an in-depth review of remedial treatment and removal strategies versus cost over time for LTM.*

Response – Additional information is provided in the ICM, PCEM, RTM and RCBM in the Report. Operations, monitoring and maintenance activities associated with each of the remedies will be included in the basis of design documentation.

Comment S12-19 - Attachment 2 Notes, Number #4, Page N2-2: *Provide or reference the well designations (numbers) and locations of wells (with reference to Figure 2) that support this conclusion. Consider addressing issues, such as proper well construction for monitoring of LNAPL, any change in groundwater elevation that potentially prevents identification of LNAPL in wells (for example, seasonally rising groundwater during data acquisition), changed conditions after the 2011 building demolition activities, preferential pathways such as the sewers and other conduits. Specifically, the text should state if a utility corridor has been identified in the Industrial Avenue right-of-way that lies within the potential free product plume or saturated soil area.*

Response – The LNAPL extent evaluation discussion in the main report was revised to include additional discussion of Site changes and seasonal fluctuations. Information regarding water level/ LNAPL gauging is presented in **Appendix X**. Also, please refer to the CSM cross-sectional figure presented in the Memos as well as **Figures 5 through 8** of the main report for additional information regarding Site structures utilities and the locations of wells. The presence of utilities and rights-of-way will be considered in the implementation of the remedy and discussed in the work plans and/or basis of design documentation.

The LNAPL area has recently been identified and is currently being delineated. Once additional delineation and investigation activities have been completed additional information will be provided in work plans or basis of design documentation. Please note that four additional monitoring have recently been installed along the property boundary and the extent of LNAPL has been refined based on the additional information.

Comment S12-20 - Attachment 2 Notes, Number #6, Page N2-3: *Provide an approximate description of the extent of each plume area for the recoverable and non recoverable transmissivity wells. Note if any additional wells at the Site are likely candidates for transmissivity testing. Identify whether MW-83/84-7 and MW-83/84-19 were appropriately evaluated based on subsurface lithology, to what depths these wells*

were screened, and how they were evaluated in support of the decision.

Response – This LNAPL area is currently being delineated and additional transmissivity testing is planned for this area. Additional details regarding the area to be remediated will be provided in subsequent work plans or basis of design documentation.

Comment S12-21 - Attachment 2 Notes, Number #7, Page N2-3: *This section requires additional supporting documentation, such as comparisons of costs, time required for monitoring of LNAPL, etc. Persistence of free product in the subsurface may require an in-depth review of remedial treatment and removal strategies versus cost over time for long-term monitoring.*

Response – Additional information is provided in the ICM, PCEM, RTM and RCBM in the Report. Operations, monitoring and maintenance activities associated with each of the remedies will be included

Comment S12-22 - Attachment 2 Notes, Number #8, Page N2-3: *This section should address controls for free product areas outside of the property boundary including Industrial Avenue. Additional control measures or an additional remedy selection may be required for areas not currently under control of the facility. This comment also applies to Attachment 3, Section 3.1, Institutional Control, Page N3-2.*

Response –As the AOI 83/84-5 LNAPL area has been recently identified and due to its proximity to the property boundary additional delineation and investigation activities are planned to further define LNAPL extents to the west and south. Additional details regarding the selected remedies and controls will be provided in the work plan or basis of design documentation.

Comment S12-23 - Attachment 2 Notes, Number #8, Page N2-3: *The text states that prohibiting use of groundwater for other than sampling, investigatory, remedial, or short-term dewatering purposes is proposed as part of the ICs and engineering controls for this AOI. Short-term dewatering, if conducted without appropriate collection systems, may spread hazardous constituents to areas outside of the current LNAPL plume. Inclusion of short-term dewatering with remediation is recommended only if appropriate collection systems are in place or are to be constructed. This comment also applies to Attachment 3, Section 3.1, Institutional Control, Page N3-2, Bullet 1.*

Response – Standard practice in Michigan requires all such activities be performed in compliance with applicable laws, rules and regulations.

Comment S12-24 - Attachment 3, Section 3.1, LNAPL Removal, Page N3-2: *This section should also address further investigation of the site that may present favorable conditions for product recovery. The areal extent of the plume between the two wells mentioned in this section is known to have free product present; however, no transmissivity data have been obtained here. Additionally, Figure 2*

depicts impacted areas outside of the property boundary that are not addressed within this section. The section should be revised to provide a comprehensive remedial approach identifying appropriate remedial objectives, delineating site conditions, identifying data gaps, and addressing remedial challenges associated with right-of-way and public access if applicable.

Response – The memo has been updated to reflect the data from four recently installed monitoring wells at AOI 84/84-5. The conceptual Site model (**Figure K-1**) provides a cross section of the AOI 83/84-5 Area. Also, additional transmissivity testing is planned for this area after LNAPL delineation is completed.

As the AOI 83/84-5 LNAPL area has been recently identified and due to its proximity to the property boundary additional delineation and investigation activities are planned to further define LNAPL extents to the west and south. Additional details regarding the selected remedies and controls will be provided in the work plan or basis of design documentation.

Comment S12-25 - Attachment 3, Section 3.1, Institutional controls, Page N3-2: *If Figure 2 depictions are accurate, this section should address controls for free product areas outside of the property boundary including Industrial Avenue. Additional control measures or an additional remedy selection may be required for areas not currently under control of the facility.*

Response – The memo has been updated to reflect the data from four recently installed monitoring wells at AOI 84/84-5. The conceptual Site model (**Figure K-1**) provides a cross section of the AOI 83/84-5 Area. Also, additional transmissivity testing is planned for this area after LNAPL delineation is completed.

As the AOI 83/84-5 LNAPL area has been recently identified and due to its proximity to the property boundary additional delineation and investigation activities are planned to further define LNAPL extents to the west and south. Additional details regarding the selected remedies and controls will be provided in the work plan or basis of design documentation.

Comment S12-26 - Attachment 3, Section 4, Remedies Evaluated and Not Selected, Page N3 3: *This section should also address control measures and additional remedies for on-site plume areas and areas not currently under control of the facility.*

Response – This section has been eliminated and replaced by the PCEM, RTM, and RCBM.

Specific Memo Comments - #13 – AOI 03-1 Quench Oil Area

Comment S13-1 - Attachment 1, Section 3.1, Geology and Hydrogeology Page O1-2: - *An abbreviated hydrogeology section should be added here discussing pertinent site characteristics, such as groundwater*

flow direction, hydraulic gradient, proximity to subsurface features (such as storm sewers), and preferential surface and subsurface flow features.

Response – This comment will be addressed by the CSM cross-sectional Figure L-1.

Comment S13-2 - Attachment 1, Section 3.2, Groundwater and Soil Analytical Data, Groundwater Analytical Data Page O1-2: - *This Section provides discussion of groundwater concentrations detected above applicable remediation objectives. However, only metals are discussed. A brief discussion of historically present concentrations of VOCs, semivolatile organic compounds (SVOC), and PCBs (or lack thereof) should also be included.*

Response – Additional text has been added to the Remedy Recommendation Report to clarify the comparison to applicable criteria. Only exceedances of applicable criteria are discussed in the text. Please refer to **Appendix X** for all data.

Comment S13-3 - Attachment 1, Section 3.3, LNAPL Characteristics, Natural Source Zone Depletion, Page O1-4: - The text states that laboratory analytical results indicate depletion of LNAPL at a rate of approximately 400 gallons per acre per year at AOI 03-01. Provide data and any calculations performed to support this estimate of Natural Source Zone Depletion (NSZD).

Response – The NSZD results are presented in **Table 3A and 3B of the main report** and the Southend NSZD report is presented in **Appendix Y** (Pertinent Site Reports). Also, the NSZD study is explained in further detail in the 2013 Corrective Measures Implementation (CMI) report (**Appendix Y**).

Comment S13-4 - Attachment 1, Figure 2: - The Figure appears to accurately estimate the horizontal extent of LNAPL present at this AOI. However, isoconcentration lines depicting approximate limits of soil and groundwater exceedances are not provided. A figure that shows soil and groundwater sample exceedances would help identify the extent of influence of the LNAPL on surrounding matrices, and help support remedy evaluation. Delineate or label the following items relevant to evaluation of recommendations regarding the Site: storm sewer and other underground utility locations, locations of sentinel wells (as referenced in the text), groundwater contours, upgradient and crossgradient source areas (AOIs) if any, final Outfall location associated with this AOI, and surface cap location.

Response – **Figures 2 through 8 of the main report** show the AOIs, the storm sewers, drainage areas and site utilities. The AOI 03-1 CSM cross-section figure shows the locations of the soil and groundwater exceedances. **Figure 2** will be updated with a groundwater flow direction arrow. Surface cap locations (when recommended) will be presented in the remedy recommendations attachment to the memo.

Comment S13-5 - Attachment 2 Notes, Item 7) Are Controls Required?, Page O2-3, Bullet 1: - The text states that prohibiting use of groundwater for purposes other than sampling, investigation, remediation, or short-term dewatering is proposed as part of the ICs and engineering controls for this AOI. Short-term dewatering without appropriate collection systems may spread hazardous constituents to areas outside of the current LNAPL plume. Inclusion of short-term dewatering with remediation is recommended only if appropriate collection systems are in place or are to be constructed. This comment also applies to Attachment 4 Section 3.1, Institutional Control, Page O4-2, Bullet 1.

Response – Standard practice in Michigan requires all such activities be performed in compliance with applicable laws, rules and regulations.

Comment S13-6 - Attachment 2 Notes, Item 7) Are Controls Required?, Page O2-3, Bullet 3: - The text states that prohibiting excavation to protect the integrity of the barrier is proposed as part of the ICs and engineering controls for this AOI. Barriers intended to be part of ICs and engineering controls must be designated and identified as part of long-term stewardship and monitoring. Existing integrity of proposed barriers and applicable methods for evaluating the integrity will be required as part of long-term monitoring. This comment also applies to Attachment 4 Section 3.1, Institutional Control, Page O4-2, Bullet 3.

Response – Additional information is available in the Institutional Controls section of the main report and in the IC Matrix presented as **Table 10 of the main report**. In addition details regarding monitoring of recommended remedies will be included in the Corrective Measures Implementation Work Plan and/or remedy work plan documents, as appropriate.

Specific Memo Comments - #17 – AOI 36-5 Fuel Oil Area

General Comment #6 - *The document states that a recovery system was in operation for approximately 20 years, and LNAPL is still present in measurable quantities. This fact does not justify a transition to ICs and engineering controls. Existing interim measures (IM) should have been evaluated and modified as necessary during implementation. An IM that does not achieve remedial objectives or goals should induce consideration and proposal of a different remedy approach in order to meet goals.*

Response – The recovery system is a historic IM (not current) that was operated and maintained by General Motors. There is no information available regarding the remedial objectives and goals of the system; therefore, it is unknown whether or not they were met. Also, the duration of the recovery system operation is one of factors on which the remedy recommendation is based, not the sole factor. Please refer to LNAPL Decision Tree evaluation in Attachment 2 which provides

additional discussion regarding the risk factors evaluated.

Comment S17-1 – Attachment 1, Section 1, Background, Page L1-1: *This Section provides discussion of underground storage tanks (UST) that were present within this AOI. The text explicitly indicates that two tanks were removed and that a release from this AOI is the source the plume. A summary of the contents and sizes of USTs historically present within this AOI should be presented.*

Response – The number, size and contents of the USTs was added to Attachment 1. Also, please refer to the report "Description of Current Conditions for Areas North of Leith Street," dated November 26, 2000 for further discussion of USTs in AOI 36-5.

Comment S17-2 – Attachment 1, Section 3.1, Geology and Hydrogeology, Page L1-2: *An abbreviated hydrogeology section should be added here discussing pertinent site characteristics, such as groundwater flow direction, hydraulic gradient, proximity to subsurface features (such as storm sewers), and preferential surface and subsurface flow features.*

Response – Response – This comment will be addressed in the CSM cross-sectional figure, presented as **Figure N-1**.

Comment S17-3 - Attachment 1, Section 3.2, Groundwater and Soil Analytical Data, Groundwater Analytical Data, Page L1-3: *This Section provides discussion of a comparison of groundwater concentrations as of September 26, 2012 (sic), to the applicable remediation objectives. A brief discussion of historical presence of metals, VOCs, semivolatile organic compounds (SVOC), and PCBs concentrations (or lack thereof) should also be included.*

Response – Please note that September 28, 2012 was the published date of the criteria, not a comparison of groundwater data collected up to that date. All historical data was included in the comparison to criteria. Also, the criteria were recently updated on December 30, 2013, so all data (current and historical) will be compared to the most recent criteria.

Comment S17-4 - Attachment 1, Section 3.3, LNAPL Characteristics, LNAPL Analytical Data, Page L1-3: *The text states that trichloroethene (TCE) was detected at a concentration that is potentially characteristically hazardous at one location (20-503). The following items should be clarified: (1) TCE concentration there, (2) extent of impacts related to that TCE, and (3) whether any evaluation related to risks posed by that TCE occurred.*

Response – Acknowledged. Additional detail will be added to the memo to note that the concentration of TCE was 1.5 mg/kg in LNAPL and that the HHRA completed during the Phase II RFI Report did not identify any risks associated with the AOI 36-5 LNAPL Area.

Comment S17-5 - Attachment 1, Section 3.3, LNAPL Characteristics, Transmissivity, Page L1-3: *The text states that an insufficient thickness of LNAPL is present to conduct transmissivity testing. More than 3 feet of LNAPL is present in monitoring well 20-502. Specify the thickness of LNAPL required for transmissivity testing, and provide justification for not conducting transmissivity testing within this AOI.*

Response – An expanded discussion of LNAPL transmissivity testing will be included in the main report, as well as conditions that preclude the ability to conduct transmissivity testing.

Comment S17-6 - Attachment 1, Table 2: *Include notes for all acronyms used in this table.*

Response – A list of acronyms used in the data tables will be included in **Appendix X** of the Report.

Comment S17-7 - Attachment 1, Figure 2: *The Figure appears to accurately estimate the horizontal extent of LNAPL present within this AOI. However, isoconcentration lines depicting approximate limits of soil and groundwater exceedances are not provided. A figure that shows soil and groundwater sample exceedances would help identify the extent of influence of the LNAPL on surrounding matrices, and help support remedy evaluation. Delineate or label the following items relevant to evaluation of recommendations regarding the Site: storm sewer and other underground utility locations, locations of sentinel wells (as referenced in the text), groundwater contours, upgradient and crossgradient source areas (AOIs) if any, final Outfall location associated with this AOI, and surface cap location.*

Response – **Figures 2 and 3 of the main report** show AOIs and LNAPL Extents. **Figures 5 and 6 of the main report** show the site drainage areas, storm sewers, and bulkhead locations. **Figure 2** will be updated with a groundwater flow direction arrow. Locations which exceed (or do not exceed) criteria are presented on the CSM **Figure N-1**. The CSM cross-section figure also details much of the requested information.

Comment S17-8 - Attachment 2, Item 7) Are Controls Required?, Page L2-3, Bullet 1: *The text states that prohibiting use of groundwater for purposes other than sampling, investigation, remediation, or short-term dewatering is proposed as part of the ICs and engineering controls for this AOI. Short-term dewatering without appropriate collection systems may spread hazardous constituents to areas outside of the current LNAPL plume. Inclusion of short-term dewatering with remediation is recommended only if appropriate collection systems are in place or are to be constructed. This comment also applies to Attachment 4 Section 3.1, Institutional Control, Page O4-2, Bullet 1.*

Response – Standard practice in Michigan requires all such activities be performed in compliance with applicable laws, rules and regulations.

Comment S17-9 - Attachment 2 Notes, Item 9) Are Controls Required?, Page L2-3, Bullet 3: *The text states that prohibiting excavation to protect the integrity of the barrier is proposed as part of the ICs and engineering controls for this AOI. All barriers intended to be part of ICs and engineering controls must be designated and identified as such as part of long-term stewardship and monitoring. Existing integrity and applicable methods for evaluating the integrity will be required as part of long-term monitoring. This comment also applies to Attachment 3 Section 3.1, Institutional Control, Page L3-2, Bullet 3.*

Response – Additional information is available in the Institutional Controls section of the main report and in the IC Matrix presented as **Table 10 of the main report**. In addition details regarding monitoring of recommended remedies will be included in the Corrective Measures Implementation Work Plan and/or remedy work plan documents, as appropriate.

Subject:
Group #2 - Response to USEPA Comments on Priority #6 – AOI 81-2 Cutting Oil LNAPL Area, Priority #7 – AOI 83/84-2 Cutting Oil LNAPL Area, Priority #9 – AOI 83/84-1 Cutting Oil LNAPL Area, and Priority #11 – AOI 40-A, B & 16-C Fuel Oil LNAPL Areas Evaluation and Remedy Recommendation Memos
Buick City Site, Flint, Michigan

This memo provides responses to the comments received from USEPA on February 14, 2014 on Priority #6 – AOI 81-2 Cutting Oil LNAPL Area, Priority #7 – AOI 83/84-2 Cutting Oil LNAPL Area, Priority #9 – AOI 83/84-1 Cutting Oil LNAPL Area, and Priority #11 – AOI 40-A, B & 16-C Fuel Oil LNAPL Areas Evaluation and Remedy Recommendation Memos (Memos).

Please note that the general comments on the Remedy Recommendations Report (Report) from each set of comments were grouped together as appropriate and one response is provided. For the comments that appeared in several sets of comments, we have noted them by beginning with a G then using the Priority # - Comment #. For example, General Comment 1 from Priority #10 memo is referred to as comment G6-1. Specific comments are named similarly, but they begin with an S.

General Comments

Comment G6-1 - *The summary and decision tree require inclusion of targeted excavation as part of the proposed remedy selection.*

Response – Targeted excavation will be added to the cover letter, the notes for the decision tree in Attachment 2, and in Attachment 4.

Comments G6-2, G7-2, G9-1, and G11-1 - *Although the memorandum is not at the Statement of Basis stage, it should document that all reasonably applicable technologies have been identified and properly screened, that remedial timeframes for the recommended remedy are reasonable and to define the steps to monitor effectiveness of the remedy. Additions to the Remedy Recommendation Report summary will include a summary of the bench scale testing and also, as far as this is possible for multiple AOIs, a discussion of timeframes and monitoring of remedial effectiveness.*

Response – This comment will be addressed by the addition of the Remedial Technology Matrix (RTM), the Institutional Controls Matrix (ICM), and the Bench–Scale Testing Matrix (BSTM) as tables to the main report. The RTM will summarize the technologies evaluated for each AOI and the rationale for selecting or eliminating the technology. The ICM will provide a summary of the Site-wide institutional controls to be implemented. The BSTM will present a summary of the results of bench-scale testing activities conducted at the Site.

Operations, monitoring and maintenance activities associated with each of the remedies will be included in the design or work plan documentation. Documentation will also include details regarding how the effectiveness of remedies will be monitored; frequency of monitoring; what items would trigger re-evaluation, repair or replacement of the remedy; as well as the time frame and end points of monitoring.

Comments G6-3, G9-2, and G11-2 - *Expanded discussion of various remedial technologies evaluated for this Site is recommended. Remedies Evaluated and Not Selected. Proper evaluation of site remedial technologies includes estimated effectiveness, biodegradation rates, remedial timeframes, and risk control measures. This is best addressed in the Remedy Recommendation Report summary as to not add multiple sections to the individual recommended remedy reports for the LNAPL in appendices A-Q.*

Response – This comment will be addressed by the addition of the RTM as Table 7 to the Report.

Comment G6-4 - *The 2010 Revised Corrective Measures Proposal – Addendum No. 2 (ARCADIS 2010) states that Motors Liquidation Company (MLC) agreed to actively remediate AOIs containing light non-aqueous phase liquid (LNAPL) as part of the corrective measures for the Site. It also states that the remedial goal for this AOI is to remove LNAPL to the extent practical, and that a passive recovery trench was proposed as a remedy. This document should provide a discussion of why this change in initial proposed remedial strategy has occurred, and should present all pertinent data to justify this change.*

Response – This comment will be addressed in the body of the main Report, in Section 1.1, by

the inclusion of a more detailed history of the development of the Corrective Measures Proposal (CMP) (and its addenda) and the Southend Statement of Basis.

Comments G6-5 and G11-3 - *Although the text concisely summarizes site characteristics, it remains unclear if conclusions regarding the downgradient portion of the Site are appropriate considering other factors such as presence of oil-saturated soils above the water table, presence of free product, and accumulation of methane byproducts in vapor phase. A discussion is warranted assessing whether the recommended remedy is more effective, less costly, and can more adequately address risks in a timely manner than other remedial alternatives or combination of alternatives. This may be handled in referencing previous remedy screening exercises or summarizing each LNAPL AOI remedy screening in the Remedy Recommendation Report.*

Response – This comment will be addressed by the addition of the RTM, the Preliminary Remedy Cost Evaluation Matrix (PCEM), and the Remedy Cost Benefit Matrix (RCBM) as tables to the Report. In addition, conceptual site models (CSM), which present combined areal and cross-sectional views of the AOIs, will be presented in the appendices presenting the AOI-specific Remedy Recommendation Memos. A discussion of the vapor phase has been added to the amin report as well as the LNAPL remedy recommendation memos.

Comments G6-6, G7-15, G9-8, and G11-4 - *The term "institutional control" (IC) should be defined and used appropriately, but not when specifically referencing engineering controls (see Institutional Controls: A Guide to Planning, Implementing, Maintaining, and Enforcing Institutional Controls at Contaminated Sites [EPA 2012]). A combination of control measures, including both ICs and engineering controls, may be required to address risks as identified at AOI 81-2. For proper placement of engineering controls, provide calculations and data to support the determination of where engineering controls are to be placed, including a more specific discussion of the risk posed.*

Response – This comment will be addressed by the addition of the ICM as Table 10 to the main report as well as by including discussion of Institutional Controls (IC) and the vapor phase pathway in the main body of the Report. The obligation to complete an evaluation of potentially unacceptable exposure to vapor intrusion should a future owner want to build a structure on the site will be required by a proposed Restrictive Covenant to be placed on the property.

Comments G6-8 and G11-5 - *Reasonable remedial timeframes and costs of the recommended alternative should be directly compared to applicable active remedial alternatives and costs to determine if feasible options exist.*

Response – This comment will be addressed by the addition of the PCEM, the RTM and the

RCBM as tables to the main report.

Comments G6-9, G7-13, G9-6, and G11-6 - *Additional modifications to the decision tree may be required to support conclusions and recommendations of decision documents. If a combination of engineering controls and ICs is the selected alternative, EPA approval and long-term monitoring (LTM) will also be requirements and should be added to the decision tree.*

Response – Text regarding EPA approvals has been added to the body of the main report.

Comments G6-10 and G11-7 - *LNAPL is present, but no evaluation appears in this document of low-cost, mass contaminant removal, its effectiveness, and its impact on remediation timeframes. A discussion is warranted regarding both small and larger scale active remediation alternatives to monitored natural attenuation (MNA), such as bio-slurping, bioventing, recovery trench, enhanced in situ biodegradation, in situ chemical oxidation, and potentially others. A demonstration of how removal of LNAPL does not result in a decreased risk for this AOI is also warranted. A more comprehensive summary of the bench-scale testing results should be presented as part of this comparison.*

Response – We have evaluated Site conditions and selected appropriate remedies which were further evaluated and are summarized in the RTM, PCEM, and RCBM tables in the Report. In addition results of the bench-scale testing activities are summarized in the BSTM table of the Report. Also Attachments 2 and 3 summarize the risks associated with LNAPL areas and recommend remedies to appropriately address the risks.

Comments G6-11 and G11-8 - *Gross costs estimates for additional site monitoring, modeling of biodegradation rates, and calculations of methane generation rates should be considered when assessing the overall cost associated with the proposed remedy.*

Response – As discussed above, the obligation to complete an evaluation of potentially unacceptable exposure to vapor intrusion should a future owner want to build a structure on the site will be required by the proposed Restrictive Covenant to be placed on the property. It is acknowledged that the cost estimates for the selected remedies will include necessary monitoring.

Comment G6-12 - *Although it is recognized that additional information will be included as part of the 761.61(c) risk-based cleanup and disposal, some basic requirements are not currently included. The request should include (1) a remediation plan, contingency plan, and schedule for performing the target excavations; (2) a quality assurance and quality control plan that will document achievement of cleanup levels after completion of target excavation; and (3) a human health risk assessment that justifies leaving polychlorinated biphenyls (PCB) in place above criteria.*

Response – Additional information will be included in remedy implementation work plan and/or design documentation.

Comment G7-1 - *Site-specific information is an important component for evaluation of the recommended remedy, but details and specific references are lacking. Although the Memorandum is not intended to provide a comprehensive history of AOI activities, specific references to sections containing supporting information should be included so the reader can understand the bases of recommendations. Changes to the information presented in the Revised RCRA Corrective Measures Proposal Addendum No.2, 2010 (CMP) based on new site data (Arcadis 2010) should be highlighted throughout the text. Specific examples would include, but would not be limited to, modified remedy details, cost impacts, and changes to exposure risk pathways and site features.*

Response – This comment will be addressed in the body of the main Report, in Section 1.1, by the inclusion of a more detailed history of the development of the Corrective Measures Proposal (CMP) (and its addenda) and the Southend Statement of Basis. In additional please refer to the remedy and report cross reference presented in Table 1.

Comment G7-3 - *The evaluation of the recommended remedy should also address or reference each individual area, be media-specific, and address the risk and the pathway. Requiring discussion as well are specific site conditions and surface and subsurface characteristics that are bases of the proposed remedy selection, as well as the methods proposed to monitor effectiveness of the remedy.*

Response – The requested information is presented in Attachments 1 and 2 of the memo. Also, the Report contains additional information regarding the exposure pathways and risks. Methods of monitoring effectiveness of the remedy will be detailed in the Remedy Implementation Work Plan and/or basis of design documentation.

Comment G7-4 - *Additional information should be presented regarding the associated dissolved phase plume, vapor phase plume, and locations of groundwater and soil exceeding screening criteria.*

Response – There is no dissolved phase plume associated with this LNAPL Area. An evaluation of the vapor phase is presented in Attachment 1. The Attachment 3 Figure present the extent of engineering controls required to mitigate risks associated with soil impacts. In addition the locations of exceedances are noted on the CSM cross-sectional figures, presented in each memo.

Comment G7-5 - *The text should discuss specific and relevant information regarding excavation of polychlorinated biphenyl (PCB) impacted soil, PCB-containing soil remaining in place, and potential for free product to act as a continuing source. Institutional controls (IC) and engineering controls (EC) should be presented and discussed as these relate to current site conditions. Information within*

these categories will support selection of a recommended remedial approach to the site, and will be referenced during the Corrective Measures Implementation Work Plan (CMI WP) phase.

Response – Additional information can be found in Attachments 3 and/or 4 of the memos regarding PCB-impacted soils and institutional and engineering controls. Also, as discussed in Attachment 2 the LNAPL was identified as a compositional concern due to direct contact, inhalation and volatilization issues and as a saturation concern as it is mobile but not migrating. The proposed remedies address these concerns.

Comment G7-6 - *Existing data gaps that have been identified for inclusion in the CMI WP phase should be discussed generally to ensure that no technical issues will remain to potentially impact or change the recommendation and selection of a remedy.*

Response – Additional data will be collected to refine remedies or provide supplemental information. The scope of work for any additional activities will be included in a remedy investigation work plan.

Comment G7-7 - *Expanded discussion of exposure pathways and associated risk should be presented in relation to the recommended remedies. For example, construction-specific details of bulkhead installation activities are required to support and assess determinations of Groundwater Surface Water Interface pathway, and to provide relevant information regarding recent activities at the Site.*

Response – Attachments 2 and 3 (or 4) of the memos present discussions of the exposure pathways and their associated risks. Additional exposure pathway discussions are presented in the Report in Section 3. Construction specific details of the bulkheads were included in the EPA approved work plans.

Comment G7-8 - *An expanded discussion of potential for light non-aqueous phase liquid (LNAPL) recovery and possible geographical extent of LNAPL is warranted. Recommendations regarding applications of remedial technologies at the Site should include a discussion of estimated effectiveness, biodegradation rates, and remedial timeframes. Additional information is required to identify remedial objectives, specify NFA closure requirements, and demonstrate adequacy of the selected remedy to achieve remedial objectives.*

Response – This comment will be addressed by the addition of the RTM, PCEM, RCBM and BSTM as tables to the Report. In addition, a Conceptual Site Model is presented in Attachment 1 of the memo and **Figures F-1 and F-2**.

Comment G7-9 - *Text discussing excavation of PCB-impacted soil should be expanded to briefly summarize the general purpose and objective of the removal, criteria for implementing*

excavation, investigation derived waste (IDW) management, and site restoration and monitoring activities following removal.

Response – **Attachment 3** of the memos contains additional information about excavation of PCB-impacted soils. The scope of work for these activities will be included in the Remedy Implementation Work Plan and/or basis of design documentation.

Comment G7-12 - *Reasonable remedial timeframes and costs of the recommended alternative should be discussed. Specifically, presence of free product may lead to extended long-term monitoring (LTM) timeframes. Although soil exceedances are generally discussed in the Resource Conservation and Recovery Act (RCRA) Facility Investigation Phase II report (Blasland, Bouck & Lee Inc. [BBL] 2006) and the CMP (Arcadis 2010), no conclusions or determinations are included regarding (1) presence of PCBs in saturated soil and (2) free product with potential to affect groundwater in the future.*

Response – This comment will be addressed by the addition of the RTM, PCEM, and RCBM as tables to the Report.

Comment G7-14 - *An expanded discussion of methane generation and its potential impacts should be considered when assessing the overall cost of the proposed remedy. Also, specific information should be provided or referenced regarding existing and anticipated post-excavation site surface cap and coverage, as well as adequacy of this as an EC.*

Response – This comment will be addressed by the addition of the RTM, PCEM, and RCBM as tables to the Report. The extent of the site surface caps is also noted on figures accompanying the memos. The scope of work for specific excavation activities will be included in an remedy implementation work plan and/or design documentation.

Specific Memo Comments - #6 – AOI 81-2 Cutting Oil LNAPL Area

Comment G6-7 - *The document states that a recovery system was in operation for approximately 17 years, and LNAPL is still present in measurable quantities. This fact does not justify a transition to ICs and engineering controls. Existing interim measures (IM) should have been evaluated and modified as necessary during implementation. An IM that does not achieve remedial objectives or goals should induce consideration and proposal of a different remedy approach in order to meet goals.*

Response – Operation of the recovery system at AOI 81-2 had reached a point of diminishing value after 17 years of operation; therefore, continued operation was not warranted. Also, the duration of the recovery system operation is one of factors on which the remedy recommendation is based, not the sole factor. Please refer to LNAPL Decision Tree evaluation in **Attachment 2** which provides additional discussion regarding the risk factors evaluated using the

current Site conditions. Although LNAPL is still present in measurable quantities, it is no longer appropriate to pursue product recovery at this location. Based on the risks associated with the AOI 81-2 LNAPL Area targeted excavation and institutional controls are appropriate.

Comment S6-1 - Attachment 1, Section 3.1, Geology and Hydrogeology, Page F1-2*: An abbreviated hydrogeology section should be added here discussing pertinent site characteristics, such as hydraulic gradients, proximity to subsurface features (such as storm sewers), and preferential surface and subsurface flow features. Depth to groundwater value is missing from the text.*

Response – This comment will be addressed in the CSM cross-sectional figure, presented as **Figure E-1**. Information regarding regional and Site geology and hydrogeology can be found in the Site RFI Reports presented in **Appendix Y**. The locations of the Site bulkheads are presented on **Figures 5 and 6 of the main report**.

Comment S6-2 – Attachment 1, Section 3.2, Groundwater and Soil Analytical Data, Groundwater Analytical Data, Page F1-3: *This Section provides discussion of groundwater concentrations detected above applicable remediation objectives. A brief discussion of historically present concentrations of semivolatile organic compounds (SVOC), volatile organic compounds (VOC), PCBs, and metals (or lack thereof) should also be included.*

Response – Only exceedances of applicable criteria are discussed in the text. Please refer to **Appendix X** for all data. Information regarding historical investigations can be found in the Site RFI Reports presented in **Appendix Y**

Comment S6-3 – Attachment 1, Section 3.2.2, Soil VOC, SVOC, and Metals Analytical Data, Page F1-3: *The text states that exceedances in soil detected outside the plume were addressed in the 2010 Corrective Measures Proposal Addendum #2. A reference to an applicable removal action completion report to verify that the soil exceedances have been properly addressed should be included.*

Response – The soils from 81-2 are discussed and a remedy is recommended in the 2010 CMP; however, no remedy has been implemented as the Final Decision for the Northend of the Site has not been issued.

Comment S6-4 - Attachment 1, Section 3.3, LNAPL Characteristics, LNAPL Analytical Data, Page F1-4: *The text states that arsenic was detected at a concentration potentially characteristically hazardous. The following items should be clarified: (1) arsenic concentration detected, (2) extent of impacts related to arsenic, and (3) whether any evaluation related to risks posed by arsenic occurred.*

Response – The proposed remedy is targeted excavation; therefore waste characterization analysis will be completed to ensure that the waste is properly disposed of. Also,

as discussed in our March 6, 2014 meeting, the text in this section has been updated to '*Concentrations of arsenic exceed TCLP criteria; however, TCLP analysis has not been conducted'*. Analytical data are presented in **Appendix X**.

Comment S6-5 - Attachment 1, Section 3.3, LNAPL Characteristics, Transmissivity, Page F1-5: *The text states that LNAPL transmissivity values were determined from results of four quarters of LNAPL baildown tests. If these baildown test data have not yet been presented, the data should be included for review.*

Response – One transmissivity testing event was completed at AOI 81-2.The transmissivity data are presented in **Table 2 of the main report**.

Comment S6-6 – Attachment 1, Section 3.3, LNAPL Characteristics, Natural Source Zone Depletion, Page F1-5: *The text states that a Natural Source Zone Depletion (NSZD) study was conducted in this AOI. If the NSZD study data have not yet been presented, the data should be included for review.*

Response – The NSZD data are presented in **Tables 3A and 3B of the main report. In** addition, the *Southend Natural Source Zone Depletion Evaluation and Results Memo* is presented in **Appendix Y**.

Comment S6-7 – Attachment 1, Table 2: *Verify concentration units and include notes for all acronyms used in this table.*

Response – The concentration units have been confirmed to be correct. Please refer to the acronym list in the main report and table acronyms presented in **Appendix X** for definition of qualifiers.

Comment S6-8 – Attachment 1, Figure 2: *The figure appears to accurately estimate the horizontal extent of LNAPL present at this AOI. However, isoconcentration lines depicting approximate limits of groundwater surface water interface (GSI) exceedances are not shown. In addition (along with isoconcentration lines), a figure identifying soil sample exceedances would help identify the extent of influence of the LNAPL on surrounding matrices.*

Response –The locations that exceed (or do not exceed) criteria are presented on the CSM **Figure E-1** and data tables are presented in **Appendix X**.; however, isoconcentration lines are not necessary and have not been added to the figures

Comment S6-9 – Attachment 1, Figure 3: *Revise figure to present extent of PCB concentrations in soil above applicable criteria.*

Response – There are no PCB concentrations in soil above applicable criteria. A note has been added to the **Figure E3-1** indicating that there are no exceedances.

Comment S6-10 – Attachment 1, Figures 2 and 3: *Delineate or label the following items relevant to evaluation of recommendations regarding the Site: storm sewer and other underground utility locations, locations of sentinel wells (as referenced in the text), groundwater contours, upgradient and crossgradient source areas (AOIs) if any, final Outfall location associated with this AOI, and surface cap location.*

Response – These items are shown on the CSM (**Figure E-1**), **Figures 2, 5 and 7 in the main report**, and/or figures in **Attachments 1 and 3**.

Comment S6-11 – Attachment 2 Notes, Item 8) Are Controls Required?, Page F2-3, Bullet 1: *The text states that prohibiting use of groundwater for purposes other than sampling, investigation, remediation, or short-term dewatering is proposed as part of the ICs and engineering controls for this AOI. Short-term dewatering without appropriate collection systems may spread hazardous constituents to areas outside of the current LNAPL plume. Inclusion of short-term dewatering with remediation is recommended only if appropriate collection systems are in place or are to be constructed.*

Response – Standard practice in Michigan requires all such activities be performed in compliance with applicable laws, rules and regulations.

Comment S6-12 – Attachment 2 Notes, Item 8) Are Controls Required?, Page F2-3, Bullet 3: *The text states that prohibiting excavation to protect the integrity of the barrier is proposed as part of the ICs and engineering controls for this AOI. Barriers intended to be part of ICs and engineering controls must be designated and identified as part of long-term stewardship and monitoring. The integrity of proposed existing barriers and applicable methods for evaluating the integrity will be required as part of long-term monitoring. This comment also applies to Attachment 4 Section 3.3, Institutional Controls, Page 2/3, Bullet 2*.

Response – The surface cover and low occupancy controls will be shown on **Figure E3-2**. A monitoring plan will be developed as part of the remedy implementation work plan documentation.

Specific Memo Comments - #7 – AOI 83/84-2 Cutting Oil LNAPL Area

Please note that two of the general comments for the Priority #7 memo were specific comments, so they are addressed here.

Comment G7-10 - *The text should discuss the approximate geographical extent proposed for potential free product recovery and excavation of PCB-impacted soil. That portion of the 95,400 square feet impacted by LNAPL noted in the text should be distinguished from areas not to be actively remediated.*

Response – The proposed extent of excavation will be included in **Attachment 3** and in the remedy implementation work plan. Please note that LNAPL recovery is not a proposed remedy for

this area.

Comment G7-11 - *Effectiveness of the wells to monitor the plume should be discussed based on proximity of the monitoring wells to the plume, recommended excavation of PCB-impacted soil, and hydraulic gradients and flow direction at the Site. Provide specific information regarding the integrity inspection and maintenance of the storm sewer, or provide a reference to a source addressing these activities.*

Response – Please note that the storm sewers in the AOI 83/84-2 LNAPL Area have been bulkheaded. Specific information regarding future monitoring of the remedies will be included in the remedy implementation work plan.

Comment S7-1 - Attachment 1, Section 2.1, LNAPL Monitoring and Bailing Program, Page G2-1: *Results of Laser Induced Fluorescence (LIF) indicate LNAPL impacts as deep as 12 feet below ground surface (bgs), while the following section, Groundwater/LNAPL Levels, states that groundwater is generally at 10 feet bgs. The text should reference or discuss historical fluctuations in groundwater elevations in relationship to measurements of free product, and whether different apparent free product thicknesses could result from these groundwater fluctuations.*

Response – As stated in **Attachment 1** the groundwater level has fluctuated from 6 to 14 feet bgs in this portion of the Site. Correlations between the depth to groundwater and LNAPL thicknesses are not evident at AOI 83/84-2. Groundwater/LNAPL gauging data are presented in **Appendix X**.

Comment S7-2 - Attachment 1, Section 2.2, Product Recovery System, Page G1-2: *Provide the location and current status of the Building 32 recovery well, if available, and clarify what information is available. Specifically discuss the location of the process waste system for the Site and its geographical relationship to the plume. Provide or reference the waste process system and the evaluation of it as a separate and potential source of cutting oil LNAPL. Additionally, the Memorandum text and Section 5.4.2.1 of the CMP state that two basements are associated with Building 32. Discuss location and status of these structures, and the geographical relation of these features to the plume area.*

Response – The location of the former Building 32 recovery well has been added to **Figure F1-2**. The recovery well was no longer operational as of 2001. The process waste system is located approximately a half mile northeast of former Building 32 and was investigated as part of the RCRA Facilities Investigation. **Figure F1-2** notes the former basement and tunnel locations, which were filled in during demolition.

Comment S7-3 - Attachment 1, Section 3.1, Geology and Hydrogeology, Page G1-2: *An abbreviated hydrogeology section should be added to this section to discuss pertinent site characteristics, such as hydraulic gradient, proximity to subsurface features (e.g., vaults and storm sewers), and preferential*

surface and subsurface flow features. Groundwater elevations, as well as proximities and elevations of bulkhead construction modifications, are pertinent, and should be summarized or referenced.

Response – This comment will be addressed in the CSM cross-sectional figures, presented as **Figure F-1 and F-2**. Information regarding regional and Site geology and hydrogeology can be found in the Site RFI Reports presented in **Appendix Y**. The locations of the Site bulkheads are presented on **Figures 5 and 6 of the main report**.

Comment S7-4 - Attachment 1, Section 3.2, Groundwater and Soil Analytical Data, Page G1-3**:** *Provide locations of soil exceedances, and discuss their hydrologic relationship to the 83/84-2 plume and observed soil impacts. Rationale for the claim that soil exceedances are not related to AOI 83/84-2 should be summarized. Statements in Section 3.2.1 regarding groundwater analytical data generally contradict text in RCRA Facility Investigation Phases I and II and CMP reports indicating exceedances in groundwater of screening criteria for volatile organic compounds (VOC) and inorganic constituents. Clarify the statements regarding these constituents. The text should include or reference analytical results at AOI 83/84-2 that exceed screening criteria, and should provide specific screening levels.*

Response – Locations that exceed (or do not exceed) criteria are presented on the CSM **Figures F-1 and F-2**. Please note that all data tables are presented in **Appendix X**. The soil exceedances are now all discussed in the AOI 83/84-2 LNAPL Remedy Recommendations Memo and the AOI 83/84-2 soil memo has been eliminated. Please note that while this report may differ from previous reports, both the Site conditions and MDEQ criteria and sampling/analysis protocols have changed numerous times since 2002. The evaluation of data in this memo is based on current MDEQ criteria and current site conditions. Please refer to the main report for additional discussion of applicable criteria and pathways.

Comment S7-5 - Attachment 1, Section 3.3, LNAPL Characteristics, LNAPL Analytical Data, Page G1-4: *The text states that "The LNAPL contains lead at concentrations that are potentially characteristically hazardous at MW-83/84-10." A discussion of why the concentrations are only "potentially" hazardous should appear in this document. The discussion should include a description of the recommended remedy, and an assessment of whether that remedy would address these concentrations.*

Response – The proposed remedy is targeted excavation; therefore, waste characterization analysis will be completed to ensure that the waste is properly disposed of. Also, as discussed in our March 6, 2014 meeting, the text in this section has been changed to *'The LNAPL contains lead* at concentrations that exceed RCRA toxicity characteristic criteria at one location (MW-83/84-10); *however, TCLP analysis has not been conducted'*. Analytical data are presented in **Appendix X.**

Comment S7-6 - Attachment 1, Section 3.3, LNAPL Characteristics, Natural Source Zone Depletion, Page G1-4: *The text states that natural source zone depletion (NSZD) occurs in the south end. The text does not extrapolate this or indicate likelihood of methane generation at 83/84-2 as a result of NSZD. Installation of a methane monitoring network would be necessary to demonstrate that (1) methane generated does not interfere with long-term stewardship and any proposed ICs/ECs, and (2) no immediate exposure risk is currently present as a result of elevated methane.*

Response – A methane monitoring network is not necessary to evaluate the potential methane issue as there are no buildings on Site. At locations where there are potential methane issues are identified at the property boundary methane will be further investigated. In addition, as discussed in the main report institutional controls will include language that future owners will conduct evaluations and address methane and vapor intrusion as necessary. Also, a discussion of the vapor phase pathway has been added to the main report (Section 3.4) and to Attachment 1 of each of LNAPL area memos.

Comment S7-7 - Tables 1-3: *Verify concentration units and present site-specific screening criteria. Distinguishing detected values from non-detected values (e.g., via highlighting or shading) would facilitate the reader's comprehension of the Site.*

Response – The concentration units have been confirmed to be correct; however, there are no criteria for LNAPL. Please note that all data tables have been moved to **Appendix X**.

Comment S7-8 - Figure 2: *Delineate or label the following items relevant to evaluation of recommendations regarding the site: basements, vaults, storm sewer bulkhead locations, historical recovery well locations, groundwater contours, adjacent AOIs, and surface cap locations.*

Response – These items requested are presented on shown on the CSM (**Figure F-1 and F-2**), **Figures 2, 5 and 6 of the main report**, and/or figures in **Attachments 1 and 3**.

Comment S7-9 - Attachment 2 Notes, Geology and Hydrogeology, Page G2-2: *See Specific Comment 3 above regarding addition of a hydrogeology section (Section 3.1, page G1-2, Geology and Hydrogeology), and include information relevant to Attachment 2.*

Response –This comment will be addressed in the CSM cross-sectional figures, presented as **Figure F-1 and F-2**. Information regarding regional and Site geology and hydrogeology can be found in the Site RFI Reports presented in **Appendix Y**.

Comment S7-10 - Attachment 2 Notes, Number #3, Page G2-2: *This section requires additional supporting documentation, such as comparisons of costs and time required for monitoring of LNAPL. Persistence of free product in the subsurface may require an in-depth review of remedial*

treatment/removal strategies versus cost over time for LTM. As noted, additional revisions from the EPA meeting on January 9, 2014, are required.

Response – The comparisons of cost and time of the evaluated remedies are presented in the RTM, PCEM, and RCBM tables of the main report. **Attachment 2** of the memo evaluates the compositional and saturation concerns associated with the presence of LNAPL in the subsurface to determine what risks are present and need to be addressed. The comments from the January 9, 2014 were addressed.

Comment S7-11 - Attachment 2 Notes, Number #5, Page G2-3: *Presence of LNAPL at Outfalls 003 and 005 would indicate mobility of LNAPL outside the LNAPL perimeter, and would require inspection and identification of entry points within the sewer walls that allow the utility to act as a conduit or pathway for contaminant migration to the outfalls. The text should state whether the utility corridor has been inspected, and if any compromised section of the utility was identified within the potential free product plume or saturated soil areas. Specific references to 003 and 005 bulkhead construction locations and activities are recommended. Additionally, it is not clear if the groundwater to surface water interactions along the utility conduits have been investigated or documented. Required are discussion and reference to existing information that demonstrates lack of risk from a dissolved phase discharge to the Flint River.*

Response – The Outfall 003 and 005 storm sewers intersect the LNAPL area as shown on the CSM **Figures F-1 and F-2**; therefore, this is not an indication of LNAPL mobility outside of the stable perimeter, but a preferential pathway. Eliminating the preferential pathway will eliminate the potential for exposure. Site investigation activities indicated the presence of LNAPL infiltration at both storm sewers; therefore bulkheads were installed to eliminate these pathways. The location of the Storm sewer bulkheads are presented on Figure 4 of the main Report. The NPDES Plus Monitoring Program was implemented, with EPA and MDEQ concurrence, to address GSI concerns at the Site's storm sewers. This program is discussed in further detail in Section 2.2.1 of the main report, **Attachment 1** of the AOI 83/84-2 Remedy Recommendation Memo, and **Appendix BB**.

Comment S7-12 - Attachment 2 Notes, Number #7, Page G2-3: *This section requires additional supporting documentation, such as comparisons of costs and time required for monitoring of LNAPL. Persistence of free product in the subsurface may require an in-depth review of remedial treatment/removal strategies versus cost over time for LTM.*

Response – This comment will be addressed by the addition of the RTM, PCEM, and RBCM as tables to the Report.

Comment S7-13 - Attachment 3, Number 5, Renamed to Risk Based Procedure, Page G3-2: *This section must include information regarding site conditions and details following excavation of PCB-contaminated soil. As noted within the text, to allow continued presence of PCB concentrations above 1 part per million (ppm), all requirements listed in Code of Federal Regulations (CFR) 761.61(c) must be satisfied, no unreasonable risk to human health and the environment must be demonstrated, and EPA approval must be obtained.*

Response – Specific information regarding the excavation design and subsequent area restoration will be included in the remedy implementation work plan documentation. The approximate extent of the excavation is presented on **Figure F3-2**.

Comment S7-14 - Attachment 4, Number 2, Remedy Recommendation Rationale, Page G4-1 and G4-2: *The CMP Section 2.3 and 5.3.states that Motors Liquidation Company (MLC) agreed to actively remediate AOIs containing LNAPL as part of the corrective measures for the Site. It also states that the remedial goal for this AOI is to remove LNAPL to the extent practical, and that a multiple phase extraction was proposed as a remedy. This document should provide a more detailed technical discussion explaining why this change in initial proposed remedial strategy has occurred, and should present expanded discussion of costs, timeframes, and NFA criteria related to the change.*

Response – Every proposed remedy is based on the most current site characterization and the related Conceptual Site Model. Prior remedy proposals attributable to Motors Liquidation Company are by definition outdated and essentially superseded by the best current information. Where a Conceptual Site Model supports application of MPE it has been proposed (AOI 36-1/36-2). Where Institutional Controls are appropriate they are relied on as a component of a proposed remedy. Applying ITRC and ASTM LNAPL principles supports each of the remedy recommendations which is explained in each remedy memo. A generalized comment of this nature is difficult to respond to when the CSM has been presented supporting the remedy recommendation. The focus should be on the validity and substance in support of what is proposed not why it may be different from a prior proposal made with less data than exists today. If there are specific issues of data interpretation or substance that need to be clarified please let us know.

Comment S7-15 - Attachment 4, Number 3, Remedy Recommendation, Page G4-2: *Section 3.2 is currently insufficient for evaluation because details regarding the targeted excavation are missing. Provide an expanded discussion of excavation delineation, and excavation criteria.*

Response – Specific information regarding the excavation design and extents will be included in

the remedy implementation work plan documentation; however, additional details have been added to Attachment 4.

Specific Memo Comments - #9 – AOI 83/84-1 Cutting Oil Area

Please note that four of the general comments for the Priority #9 memo were specific comments, so they are addressed here.

Comment G9-3 - *A summary is necessary of any historical data demonstrating that the plume at AOI 83/84-1 has stabilized and is not mobile. Required as well is a discussion of whether the historical data suffice to characterize the nature and extent of the plume at AOI 83/84-1. Effectiveness of the wells to monitor the plume should be discussed, based on proximities of the monitoring wells to the plume and to the sewer system (specifically Outfall 004), hydraulic gradients, and flow direction. Groundwater analytical data obtained at the Site should be compared to applicable screening values such as the Michigan Part 201 nonresidential criteria.*

Response – The rationale is provided in the memo demonstrating that the LNAPL area is not migrating. The AOI 83/84-1 LNAPL Area was recently identified; however, monitoring wells in the vicinity of the LNAPL Area have been monitored as part of ongoing RFI activities since 2001. Sitewide groundwater level data are presented in **Appendix X**. A conceptual site model of AOI 83/84-1 is presented as **Figure H-1** and a summary of the available data compared to applicable criteria is presented in **Attachment 1** of the memo.

Comment G9-4 - *A discussion is warranted assessing whether the recommended remedy is more effective, less costly, and can more adequately address risks in a timely manner than other remedial alternatives or combination of alternatives. Information obtained from the feasibility study and cost evaluations of this remedial alternative should be discussed.*

Response – This comment will be addressed by the addition of the PCEM, RTM and RCBM as tables to the main report.

Comment G9-5 - *Reasonable remedial timeframes and costs of the recommended alternative should be discussed, including definitions of the terms "reasonable timeframes" and "reasonable costs."*

Response – It is not clear what is sought regarding defining terms we do not use in the remedy proposal. As far as we know there is no measurable "reasonable timeline" or "reasonable costs" standard for all remedies. Rather we suggest that the length of remedial activities and cost is a site specific individual determination based on a valid site conceptual model. If there are specific schedule or cost issues please identify them. In the meantime the information we

relied on for remedial alternative analysis and recommendations is presented in the PCEM, RTM and RCBM tables to the main report.

Comment G9-7 - *The assessment of the proposed remedy should include an expanded discussion of vapor phase and a discussion of concerns regarding potential effects of volatilization to indoor air. Also included should be specific information about the existing site surface cap or coverage, and adequacy of this as an effective EC.*

Response – A discussion of vapor phase pathway is included in the main body of the report and in **Attachment 1** of the LNAPL Remedy Recommendation Memos. Existing surface cover is discussed in the Background section of **Attachment 2**.

Comment S9-1 - Attachment 1, Section 2.1, Geology and Hydrogeology, Page H1-2**:** *Results of Laser Induced Fluorescence (LIF) indicate LNAPL impacts as deep as 17 feet below ground surface (bgs), while the following section, Groundwater/LNAPL Levels, states that groundwater is generally at 7 to 8 feet bgs. The text should discuss historical fluctuations in groundwater elevations in relationship to measurements of free product, and whether different free product thicknesses could result from these groundwater fluctuations.*

Response – Historically the groundwater level fluctuated from 6 to 8 feet bgs in this portion of the Site. Groundwater level data are presented in **Appendix X**. LNAPL can be found deeper than the groundwater as evidenced by the LIF readings form LIF-83-006.

Comment S9-2 - Attachment 1, Section 2.1, Geology and Hydrogeology, Pages H1-2: *An abbreviated hydrogeology section should be added to this section to discuss pertinent site characteristics, such as hydraulic gradient, proximity to subsurface features (for example, Outfall 004), and preferential surface and subsurface flow features.*

Response – This comment will be addressed in the CSM cross-sectional figure, presented as **Figure H-1**. Information regarding regional and Site geology and hydrogeology can be found in the Site RFI Reports presented in **Appendix Y**.

Comment S9-3 - Attachment 1, Section 2.2, Groundwater and Soil Analytical Data, Page H1-2: *In addition to the monitoring wells listed in Table 1, indicate specific locations of monitoring wells that were sources of groundwater data used to assess AOI 83/84-1. The text should include details about any historical groundwater analytical results at AOI 83/84-1 that exceed Michigan Part 201 nonresidential criteria.*

Response – Locations which exceed (or do not exceed) criteria are presented on the CSM **Figure H-1**. Please note that all data tables are presented in **Appendix X.**

Comment S9-4 - Attachment 1, Section 2.2, Groundwater and Soil Analytical Data, Soil Bullet, Page H1-2: *The text should include an expanded discussion of the phenanthrene detected at concentrations exceeding groundwater surface water interface (GSI) protection criteria. Specifically, Table 2 should also list analytical data from both the soil samples and water samples collected at Outfall 004.*

Response – Phenanthrene exceedances of GSIP were not collected from Outfall 004. The samples with the GSIP exceedances were collected from AOI 83/84-1. However, the GSI compliance point for a storm sewer is at the discharge point, which is located over a 1,000 feet east of AOI 83/84-1 (see **Figure 4 of the main report**). Analyses of the NPMP samples collected from the Outfall 004 monitoring point do not exceed criteria; therefore, the Site is in compliance.. GSI is monitored by the NPMP program which is discussed in **Appendix BB**. **Figures 5 and 6 of the main report** show the site drainage areas, storm sewers, discharge points and bulkhead locations. All data tables are presented in **Appendix X**.

Comment S9-5 - Attachment 1, Section 2.3, LNAPL Characteristics, Natural Source Zone Depletion, Page H1-3: *If applicable, provide and use data from the Southend Natural Source Zone Depletion (NSZD) study to extrapolate or estimate degradation rates and methane production rates within this AOI.*

Response – Not applicable.

Comment S9-6 - Attachment 1, Section 2.4, Extent of LNAPL, Page H1-3: *Discuss how the footprint of the LNAPL plume was estimated for AOI 83/84-1, specifically regarding how the plume extent was refined with LIF data. Additionally, discuss the LIF data in terms of vertical range of impact, and provide LIF boring logs. As an example, the response reading from LIF-83-006 is depicted above 200 percent reference emitter (%RE), yet the corresponding borehole log for SB83/84-14 does not indicate any staining. Well screen depths and potential for future transmissivity testing should be discussed as means of more accurately measuring/estimating thickness of the LNAPL plume.*

Response – As discussed in Section 2.1.1 of the Report LIF responses above background are indicative of the presence of LNAPL in the subsurface, but the magnitude of the response is not representative of mobile LNAPL. The magnitude of the LIF response is related to the soil type, LNAPL type (mainly the fraction of polycyclic aromatic hydrocarbons [PAHs]), and the LNAPL pore saturation. The residual LNAPL saturation of a soil is directly related to soil structure, LNAPL physical properties, and the maximum historical LNAPL saturation, which are spatially variable at an environmental site.

Section 2.1.3 of the Report presents the method for estimating the extent of LNAPL. LIF boring logs are presented in the CMI Annual reports included in **Appendix Y**. Furthermore transmissivity

testing is not applicable to determining LNAPL thickness. See ASTM E2856-12.

Comment S9-7 - Table 1: *Information listed in the table indicates that Site wells were gauged in 2013 only. Provide or summarize historical monitoring and available free product data for the former Factory 83/84 Area to support a claim of plume stability over time. See General Comment 3.*

Response – The monitoring wells at the AOI 83/84-1 LNAPL Area were installed in 2013; therefore, only 2013 data is available. Please note that Site-wide groundwater monitoring data are presented in **Appendix X** of the Report.

Comment S9-8 - Table 1: *MW-83/84-15 is the only monitoring well within the AOI 83/84-1 plume. No information appears regarding MW-83/84-15 during November 2013. It is unclear whether these data were not obtained or were inadvertently omitted.*

Response – MW-83/84-15 was not gauged in November 2013. Groundwater level data are presented in **Appendix X**.

Comment S9-9 - Table 2: *Verify concentration units and present site-specific screening criteria. Distinguishing detected values from non-detected values (e.g., via highlighting or shading) would facilitate the reader's comprehension of the Site.*

Response – The concentration units have been confirmed to be correct; however, there are no criteria for LNAPL. Locations of soil and/or groundwater which exceed (or do not exceed) applicable criteria are presented on the CSM **Figure H-1**. Please note that all data tables have been moved to **Appendix X**.

Comment S9-10 - Figure 2: *Delineate or label the following items relevant to evaluation of recommendations regarding the Site: storm sewers (specifically Outfalls 004 and 013) and other underground utility locations, well locations, groundwater contours, surface cap locations, and public right-of-ways. Include all applicable items in the legend.*

Response – **Figures 2 and 3 of the main report** show AOIs and LNAPL Extents. **Figures 5 and 6 of the main report** show the site drainage areas, storm sewers, and bulkhead locations. **Figure H1-2** will be updated with a groundwater flow direction arrow. Locations which exceed (or do not exceed) criteria are presented on the CSM **Figure H-1**. The CSM cross-section figure also details much of the requested information.

Comment S9-11 - Figure 2: *See Specific Comment 6 above regarding LIF data and boring logs. Present data from all 12 LIF borings regarding vertical range of impact.*

Response – The LIF logs are presented in the Annual CMI reports which are presented in

Appendix Y.

Comment S9-12 - Attachment 2 Notes, Geology and Hydrogeology, Page H2-2: *See Specific Comment 2 above regarding addition of an abbreviated hydrogeology section (Section 2.1, page H1-2, Geology and Hydrogeology), and include information relevant to Attachment 2.*

Response – This comment will be addressed in the CSM cross-sectional figure, presented as **Figure H-1**. Information regarding regional and Site geology and hydrogeology can be found in the Site RFI Reports presented in **Appendix Y**.

Comment S9-13 - Attachment 2 Notes, LNAPL Characteristics, Page H2-2: *This section notes that based on LIF borings, LNAPL impacts range from 5 to 17 feet bgs within AOI 83/84-1; however, Section 2.3, page H1-3, LIF Data, as well as Section 2.4, Extent of LNAPL, note that vertical range of LIF impacts is 6 to 17 feet bgs. Clarify the vertical range of impacts, and discuss use of LIF data to determine the extent of LNAPL within this AOI.*

Response – Data corrected in **Attachment 2** to read 6 to 17 feet bgs. Section 2.1.3 of the Report presents the method for estimating the extent of LNAPL.

Comment S9-14 - Attachment 2 Notes, Number 1, Page H2-2: *Future site construction associated with re-routing and bulkheading Outfall 004, as well as active utility repairs in the area of AOI 83/84-1, may involve short-term site worker exposure scenarios. Address this concern and discuss whether methane explosive hazards and air monitoring requirements have been evaluated.*

Response – These issues are addressed by the institutional controls presented in the main report.

Comment S9-15 - Attachment 2 Notes, Number 2, Page H2-2: *Feasibilities of the various remediation strategies that would result in compositional change within AOI 83/84-1 should be evaluated based on re-routing and bulkheading of Outfall 004, which would eliminate the GSI pathway.*

Response – Once the re-route is completed the risks for the AOI 83/84-1 plume will have been addressed, which negates the need for instituting compositional change remedies. The remedial objective is to eliminate migration in the sewer to the Flint River, not to simply remove LNAPL within the stable perimeter. In addition the bulkheaded storm sewer is planned to be used as a passive recovery trench which could be compromised by instituting compositional change remedies.

Comment S9-16 - Attachment 2 Notes, Number 4, Page H2-2: *See General Comment 3. Assess the mobility of LNAPL in the vicinity of Outfall 004 considering the stability of the plume within 83/84-1.*

Response – The Outfall 004 storm sewer intersects the LNAPL area as shown on the CSM;

therefore, this is not an indication of LNAPL migration outside of the stable perimeter, but rather a preferential pathway of mobile LNAPL within the stable perimeter. The AOI 83/84-1 LNAPL Area was recently identified; however, monitoring wells in the vicinity of the LNAPL Area have been monitored as part of ongoing RFI activities since 2001. Sitewide groundwater level data are presented in **Appendix X**. A conceptual site model of AOI 83/84-1 is presented as **Figure H-1** and a summary of the available data compared to applicable criteria is presented in **Attachment 1** of the memo.

Comment S9-17 - Attachment 2 Notes, Number 4, Bullet 1, Page H2-2: *Provide or reference the well designations (numbers) and locations of wells (with reference to Figure 2) that support this conclusion.*

Response – See **Figures 2 and 5 of the main report** for downgradient wells.

Comment S9-18 - Attachment 2 Notes, Number 6, Page H2-3: *No transmissivity data conclusively support the conclusion that LNAPL is not readily recoverable from AOI 83/84-1. Additional soil boring and monitoring well data would allow further evaluation of this alternative.*

Response – That is correct. Transmissivity testing was not able to be completed at MW-83/84-30. A second monitoring well will be installed in this area.

Comment S9-19 - Attachment 2 Notes, Number 7, Page H2-3: *This section requires additional supporting information regarding each IC or EC. Additional information about the method for establishing each IC or EC should appear in Attachment 3, Section 3.2.*

Response – Institutional controls are discussed in more detail in the main report. The location of the Engineering controls will be included on a figure included in Attachment 3. Additional information will be discussed in further detail in work plans and/or basis of design documents. Also, an example deed restriction is presented in **Appendix Z**.

Comment S9-20 - Attachment 2 Notes, Number 7, Bullet 1, Page H2-3: *The text states that prohibiting use of groundwater for any use other than sampling, investigatory, remediation, or short-term dewatering purposes is proposed as part of the ICs and ECs for this AOI. Short-term dewatering, if conducted without appropriate collection systems, may spread hazardous constituents to areas outside of the current LNAPL plume. Inclusion of short-term dewatering with remediation is recommended only if appropriate collection systems are in place or are to be constructed. This comment also applies to Attachment 3, Section 3.2, Institutional Controls, Page H3-2, Bullet 1.*

Response – Standard practice in Michigan requires all such activities be performed in compliance with applicable laws, rules and regulations.

Comment S9-21 - Attachment 2 Notes, Number 7, Bullets 3 and 4, Page H2-3**:** *The text states that excavation or other intrusive activities should be prohibited unless appropriate health and safety measures are implemented. Address site worker exposure concerns and discuss whether methane explosive hazards and air monitoring requirements have been evaluated in Attachment 3, Section 3.2.*

Response –The Report will include language that future owners will conduct evaluations and address methane and vapor intrusion as necessary. Standard practice in Michigan requires all such activities be performed in compliance with applicable laws, rules and regulations

Comment S9-22 - Attachment 3, Section 3.1, Outfall 004 Infiltration Pathway Elimination, Page H3-2: *This section should include information obtained from the feasibility study and costs associated with this option. The section should also be revised to describe a comprehensive remedial approach identifying appropriate remedial objectives, delineating site conditions, identifying data gaps, and addressing challenges to remediation associated with site worker exposure and right-of-way and public access if applicable. Also discussed should be considerations regarding long-term monitoring associated with this remedy.*

Response – Feasibility and cost information are presented in the RTM, PCEM, and RCBM. Information regarding the remedy implementation will be provided in the basis of design documentation.

Comment S9-23 - Attachment 3, Section 3.1, Institutional controls, Page H3-2**:** *See General Comments 1 and 8 above pertaining to monitoring effectiveness of ICs and provision of data to support placement of ECs. Provide additional supporting information for each IC or EC, including the method for establishing these controls.*

Response –Please see responses to comments G9-1 and G9-8. Also an example of a restrictive covenant is presented in **Appendix Z**.

This comment will be addressed by the addition of the RTM and ICM as tables to the main report. The RTM will summarize the technologies evaluated for each AOI, the approximate time frame to complete the remedy, OMM activities, and the rationale for selecting or eliminating the technology. The ICM will provide a summary of the Site-wide institutional controls to be implemented.

OMM activities associated with the selected remedies will be included in the design or work plan documentation. Documentation will also include details regarding how the effectiveness of remedies will be monitored; frequency of monitoring; what items would trigger re-evaluation, repair or replacement of the remedy; as well as the time frame and end points of monitoring.

Specific Memo Comments - #11 – AOI 40-A, B & 16-C Fuel Oil LNAPL Areas

Comment S11-1 – Attachment 1, Section 1, Background, Page J1-1: *The text states that underground storage tanks (UST) are presumably the source of plumes identified in this AOI. A summary of the contents, sizes, locations, and years of service of USTs historically present within this AOI should be presented.*

> Response – The size and contents of the tanks were added to the background section and the approximate locations of the USTs were added to **Figure J1-2** of Attachment 1. The reader is referred to the Current Conditions Report – South of Leith Street presented in **Appendix Y** for additional information

Comment S11-2 – Attachment 1, Section 3.1, Geology and Hydrogeology, Page J1-2: *An abbreviated hydrogeology section should be added here discussing pertinent site characteristics, such as groundwater flow direction, hydraulic gradients, proximity to subsurface features (such as storm sewers), and preferential surface and subsurface flow features.*

> Response – This comment will be addressed in the CSM cross-sectional figure, presented as **Figure J-1**. Information regarding regional and Site geology and hydrogeology can be found in the Site RFI Reports presented in **Appendix Y**.

Comment S11-3 - Attachment 1, Section 3.2, Groundwater and Soil Analytical Data, Groundwater Analytical Data, Page J1-2: *This Section provides discussion of groundwater concentrations detected above applicable remediation objectives. However, only benzene, ethylbenzene, arsenic, beryllium, and cyanide are listed as exceeding groundwater-surface water interface (GSI) criteria. Attachment 2, Item 1 states that isopropylbenzene, xylene, and copper were also detected in groundwater samples at concentrations exceeding GSI criteria. Revise Attachments 1 and 2 to render information consistent. In addition, a brief discussion of historically present concentrations of semivolatile organic compounds (SVOC) and polychlorinated biphenyls (PCB) (or lack thereof) should also be included.*

> Response – The text in Attachments 1 and/or 2 will be corrected. Only exceedances of applicable criteria are discussed in the text. Please refer to **Appendix X** for data summary tables.

Comment S11-4 - Attachment 1, Section 3.2, Groundwater and Soil Analytical Data, Groundwater Analytical Data, Page J1-2: *The text states that only benzene and arsenic were detected in LNAPL samples from this AOI, and that the other exceedances may be related to other site impacts or releases. Although it is understood that LNAPL is the focus of this evaluation, dissolved phase risks that are present and not related to LNAPL will still require corrective measures in order to achieve an NFA for this AOI.*

Response – All of the groundwater exceedances discussed in this section exceed GSI criteria. The GSI storm sewer pathway is addressed in this memo. In addition, the potential direct groundwater discharge pathway from AOI 40-A, -B, &16-C to the Flint River will be addressed in **Appendix BB**.

Comment S11-5 - Attachment 1, Section 3.3, LNAPL Characteristics, LNAPL Analytical Data, Page J1-3: *The text states that benzene, arsenic, and lead were detected at concentrations potentially characteristically hazardous. The following items should be clarified: (1) concentrations detected, (2) extent of impacts related to detections, and (3) whether any evaluation related to risks posed by those constituents occurred.*

Response – The proposed remedy is targeted excavation; therefore waste characterization analysis will be completed to ensure that the waste is properly disposed of. Also, as discussed in our March 6, 2014 meeting the text in this section has been changed to '*Concentrations of arsenic and lead exceed TCLP criteria at RFI-16-10; however, TCLP analysis has not been conducted*'. Analytical data are presented in **Appendix X**.

Comment S11-6 - Attachment 1, Section 3.3, LNAPL Characteristics, Transmissivity, Page J1-3: *The text states that LNAPL transmissivity values were determined from results of four quarters of LNAPL baildown tests. If these baildown test data have not yet been presented, the data should be included for review.*

Response – The transmissivity results were previously presented in the 2012 CMI Report (included in **Appendix Y**). Also the transmissivity data are summarized in Table 2 of the main report.

Comment S11-7 - Attachment 1, Section 3.3, LNAPL Characteristics, Natural Source Zone Depletion, Page J1-4: *The text states that a Natural Source Zone Depletion (NSZD) study was conducted in this AOI. If the NSZD study data have not yet been presented, the data should be included for review.*

Response – The NSZD data are presented in **Tables 3A and 3B of the main report** and a summary memo is included in **Appendix Y**.

Comment S11-8 - Attachment 1, Table 2: *Elevated detection limits (greater than applicable comparison criteria) are shown for samples RFI-40-03 and RFI-40-09. A brief discussion of whether the analytical data presented resulted from sample dilution should be included somewhere in the document. In addition, notes for all acronyms used in this table should be included.*

Response – The elevated detection limits are due to matrix interference. A list of all acronyms used in the data tables will be included in **Appendix X** of the Report.

Comment S11-9 - Attachment 1, Figure 2: *The figure appears to inaccurately estimate the horizontal extent of LNAPL present at this AOI. For example, LIF-40-006 is shown on the figure as >200 percent response but is not included in the current LNAPL plume extent. Clarification on use of LIF data to determine LNAPL extent at this AOI is required. A subsequent revision to Figure 2 may be required.*

> Response – The extent of LNAPL is correct on Figure 2. A high LIF response does not indicate the presence of measurable LNAPL. An LIF response indicates the presence of NAPL impact, which may be residual NAPL or measurable LNAPL. Section 2.1.3 of the Report presents the method for estimating the extent of LNAPL.

Comment S11-10 - Attachment 1, Figure 3: *The document indicates that benzene was identified in groundwater samples exceeding GSI criteria. However, an associated benzene plume is not shown on this figure. Moreover, the three small inorganics plumes shown on the north end of the AOI are not accompanied on the figure by sample results at locations between each plume. Revise the figure to present extent of benzene plume and re-evaluate extent of inorganics plumes.*

> Response – Plumes identifying VOC and SVOC exceedances of GSI criteria were added to **Figure J1-3**. The three small organic plumes are separate because they exceed for different constituents (40-3 – arsenic and cyanide, 40-4 –arsenic and silver [no cyanide detected] and 40-6 – cyanide only). The analytical data are presented in **Appendix X**.

Comment S11-11 - Attachment 1, Figures 2 and 3: *Delineate or label the following items relevant to evaluation of recommendations regarding the Site: storm sewer and other underground utility locations, locations of sentinel wells (as referenced in the text), groundwater contours, upgradient and crossgradient source areas (AOIs) if any, final Outfall location associated with this AOI, and surface cap location.*

> Response – **Figures 2 and 3 of the main report** show AOIs and LNAPL Extents. **Figures 5 and 6 of the main report** show the site drainage areas, storm sewers, and bulkhead locations. **Figures 7 and 8 of the main report** show the known utilities. **Figure J1-2** will be updated with a groundwater flow direction arrow. Locations which exceed (or do not exceed) criteria are presented on the CSM, **Figure J-1**.

Comment S11-12 - Attachment 2 Notes, Item 9) Are Controls Required?, Page J2-3, Bullet 1: *The text states that prohibiting use of groundwater for purposes other than sampling, investigation, remediation, or short-term dewatering is proposed as part of the ICs and engineering controls for this AOI. Short-term dewatering without appropriate collection systems may spread hazardous constituents to areas outside of the current LNAPL plume. Inclusion of short-term dewatering with remediation is recommended only if appropriate collection systems are in place or are to be constructed. This comment also applies to*

Attachment 3 Section 3.2, Institutional Controls, Page J3-2, Bullet 1.

Response – Standard practice in Michigan requires all such activities be performed in compliance with applicable laws, rules and regulations.

Comment S11-13 - Attachment 2 Notes, Item 9) Are Controls Required?, Page J2-3, Bullet 3: *The text states that prohibiting excavation to protect the integrity of the barrier is proposed as part of the ICs and engineering controls for this AOI. Barriers intended to be part of ICs and engineering controls must be designated and identified as part of long-term stewardship and monitoring. Existing integrity of proposed barriers and applicable methods for evaluating the integrity will be required as part of long-term monitoring. This comment also applies to Attachment 3 Section 3.2, Institutional Controls, Page J3-2, Bullet 3.*

Response – A monitoring plan will be developed as part of the Remedy Implementation Work Plan documentation. Standard practice in Michigan requires all such activities be performed in compliance with applicable laws, rules and regulations.

Comment S11-14 - Attachment 3, Section 3.1, Bulkhead Installation, Page J3-2: *Although performing bulkhead installation will reduce LNAPL migration to the Flint River via Outfalls, it is not clear if the groundwater-surface water interaction of groundwater that does not migrate via Outfalls has been investigated or documented. Required are a brief discussion and reference to existing information that demonstrates lack of risk from a dissolved phase discharge to the Flint River.*

Response – Acknowledged. Further evaluation of the GSI monitoring data suggest that the groundwater between AOI 40-A, -B & 16-C and the Flint River requires further assessment and will be addressed as part of the Storm Sewer GSI Strategy discussed in **Appendix BB**.

Subject:
Group 3 - Response to USEPA Comments on Priority #1 – AOI 86-1 Fuel Oil LNAPL Area, Priority #4 – AOIs 12-A, B & C Hydraulic Oil LNAPL Areas, AOI 38-1 Soil Impact Area, AOI 83/84-2 Soil Impact Area, Waste Management Unit #3, Waste Management Unit #7, and Waste Management Unit #10 Evaluation and Remedy Recommendation Memos
Buick City Site, Flint, Michigan

This memo provides responses to the comments received from USEPA on March 17, 2014 on Priority #1 – AOI 86-1 Fuel Oil LNAPL Area, Priority #4 – AOIs 12-A, B & C Hydraulic Oil LNAPL Areas, AOI 38-1 Soil Impact Area, AOI 83/84-2 Soil Impact Area, and Waste Management Unit (WMU) #3, WMU #7, and WMU #10 Evaluation and Remedy Recommendation Memos (Memos).

Comments - #1 – AOI 86-1 Fuel Oil LNAPL Area

Comment G1-1 - *The evaluation and presentation of migration pathways in the areas of Outfalls 004 and 005 are mentioned only in a few sentences and do not fully demonstrate that future potential migration at Outfall 005 sewer has been assessed. Although the recommended remedy addresses Outfall 004 specifically, no additional information discusses potential impacts from the implementation of that remedy. The text should address these issues to aid in the evaluation of the recommended remedy, and should reference each area historically identified at AOI 86-1. The text should clarify if the two outfalls (i.e., Outfalls 004 and 005) are impacted from releases associated with this AOI, and if the newly re-routed Outfall and the existing 005 Outfall will be monitored for potential future impacts.*

In addition, the relocation route of Outfall 004 should be presented and should be specifically identified prior to remedy selection. General monitoring locations of Groundwater Surface Water Interface (GSI) exceedances should be noted because these locations are known.

Response : Additional information will be added to Attachments 1 and 4 to discuss further discuss Outfall 005. In addition the language in Attachment 4 will be revised to clarify the proposed remedy for AOI 86-1. There is no relocation proposed at AOI 86-1. The Outfall 004 reroute is being completed on the opposite side of the Site, approximately 1,500 feet from AOI 86-1. Following the completion of the Outfall 004 reroute the remaining portion of the Outfall 004 storm sewer which passes through AOI 86-1 will then be bulkheaded to eliminate the pathway. A figure will also be added to the memo to show the location of the planned re-route and bulkhead activities.

Operations, monitoring and maintenance of the remedies will be discussed in the remedy design documents/work plans.

Locations which exceed (or do not exceed) criteria are presented on the conceptual site model (CSM) **Figure A-1**.

Comments G1-2 - *The text should discuss specific and relevant information concerning potential for impacted soils to act as a continuing source of groundwater contamination, such as the polychlorinated biphenyls (PCB) impacted soil remaining in place and soils possibly saturated with free product and fuel. Institutional controls (IC) and engineering controls (EC) are presented and discussed as these relate to future site conditions, but no conclusions appear pertaining to areas impacted from sewer relocation. Specifically defining potential for future source migration and product reformation would provide a basis for selecting and estimating costs of a recommended approach to remediating the site in the Corrective Measures Implementation CMI Work Plan phase.*

Response: EPA to provide additional guidance on this comment.

Comments G1-3 - *The text should include a brief summary of the general purpose and objective of storm sewer relocation, investigation derived waste (IDW) management if required, and site restoration and monitoring activities following removal. Additionally, effects on the recommended remedy by the PCB-impacted soil and contaminated groundwater should be discussed.*

Response: The language in Attachment 4 will be revised to clarify the proposed remedy for AOI 86-1. There are no relocation activities proposed at AOI 86-1. The Outfall 004 reroute is being

completed on the opposite side of the Site, approximately 1,500 feet from AOI 86-1. Following the completion of the Outfall 004 reroute the remaining portion of the Outfall 004 storm sewer which passes through AOI 86-1 will then be bulkheaded to eliminate the pathway. Additional details and specification site restoration and monitoring activities will be provided in subsequent AOI 86-1 remedy design documents/work plans.

Comment G1-4 - *This document includes no discussion or description of impacts from AOI 86-1 on the CSX property, or potential for presence of complete off-site exposure pathways and receptors.*

Response: The potential off-site pathway associated with groundwater GSI impact is discussed in the memo and shown on **Figure A1-2**. Regarding LNAPL impacts, additional delineation is planned to determine whether the LNAPL impacts extend off-Site to CSX property prior to remedy implementation. Additional text will be added to Attachment 4 to clarify this point.

Comments G1-5 - *The text generally does not match the historical sizes and contents of the underground storage tanks (UST) discussed in Table 5-11, RCRA Facility Investigation (RFI) Report Phase I (Blasland, Bouck & Lee, Inc. [BBL] 2002). Clarify these discrepancies and, where historical contaminant or free product data are cited, discuss relationships of monitoring well locations to those UST locations.*

Response: There appears to have been a typo on the Table 5-11. According to all other Site documentation all of the USTs were 12,000 gallons. Please refer to the CSM Figure A-1 for the approximate location of former USTs and monitoring well locations.

Comment S1-1 – Attachment 1, Section 1, Background, first and second paragraphs, page A1-1: *This section discusses USTs that were present within this AOI. The text implies that the five USTs were removed, and that historical releases from them are the source of the groundwater plume at AOI 86-1 despite identification of impacts upgradient of the current plume area. Also, a summary of uses and contents of the USTs, and locations of piping, the pump basin, and the nearby catch basin associated with the UST area should appear. Various locations of free product and soil and groundwater impacts should also be discussed relevant to the location of the proposed remedy. If relevant historical information is available in previous site reports, locations and types of data presented therein should be referenced.*

Response: A list of the UST contents and a reference to previous site reports was included in Attachment 1. Please refer to the CSM **Figure A-1** for the approximate location of former USTs monitoring wells and soil/groundwater impacts.

Comment S1-2 – Attachment 1, Section 2.1, Former Interim Measures, Recovery Wells, page A1-2: *Provide the volumes of light non-aqueous phase liquid (LNAPL) recovered from the two free product recovery wells referenced in this section (if available), in addition to locations and designation numbers of the wells. Additionally, indicate which wells yielded free product from years 2003 to 2005. Although historical conclusions concerning overall effectiveness of the recovery efforts appear in this section, the text does not include determinations of potential for future migration, and this information should be added.*

Response: Available documentation does not include any information regarding volumes recovered or recovery well designation numbers. The approximate locations of the recovery wells are shown on the CSM cross section, **Figure A-1**. There is no additional information available regarding the free product recovery wells. The 2003-2005 LNAPL recovery information is presented in **Appendix X**.

As discussed in Attachment 2 of the memo, based on available Site information the LNAPL at AOI 86-1 is mobile in the vicinity of the Outfall 004 storm sewer, but is not migrating.

Comment S1-3 – Attachment 1, Section 3.2, Groundwater and Soil Analytical Data, page A1-3: *Use of the term "several" should be quantified, as the numbers relate to the 24 locations sampled.*

Response – The language in Section 3.2 has been modified to present additional detail. In addition please refer to the CSM Figure A-1 which presents a summary of the sample locations where impacts were identified.

Comment S1-4 - Attachment 1, Section 3.3, Groundwater and Soil Analytical Data, page A1-4: *A general statement should appear regarding the importance and relevance to LNAPL characteristics of the highest laser-induced fluorescence (LIF) responses at LIF 86-004 (at 13.5 to 18 and at 28.9 to 34.5 feet below ground surface). The areal depiction of historical LNAPL does not include areas directly west of the dissolved plume where historical observations of free product and where high LIF responses occurred. The text does not include determinations concerning whether historical presence of free product in wells, such as those depicted northwest of the plume area, are related to the plume area.*

Response: The high LIF response at LIF-86-004 does not indicate the presence of measurable LNAPL. No LNAPL has been measured at monitoring well 87-FP5 which is immediately adjacent to LIF-86-004; therefore, there is no historical LNAPL extent shown on the figure.

LNAPL was detected in one temporary well installed to investigate a former elevator located northwest of AOI 86-1. However, LNAPL was not detected in the permanent well (RFI-85-02/02R) installed at the same location. In addition the LIF boring completed at this location indicated no response. This information is presented in Attachment 1.

Comment S1-5 - Attachment 2 Notes, LNAPL Characteristics, page A2-2: *A discussion should appear regarding areal relationships of historical free product within the areas upgradient and west of the free product and dissolved plume areas. Areas where LIF response was high and areas between other historical free product wells also require discussion.*

Response: The available information is presented in Attachment 1 and on **Figure A1-2**.

Comment S1-6 – Attachment 2 Notes, LNAPL Characteristics, page A2-2: *Provide details about specific impacts from the soil and the dissolved groundwater plume that could affect implementation of the recommended remedy.*

Response: Currently there are no specific impacts that are expected to affect implementation of the remedy. In the event that any concerns are identified they will be addressed in the remedy design documents/work plans.

Comment S1-7 – Attachment 3, 760.1 Risk Based Cleanup and Disposal Request, page A3 1: *Provide a discussion regarding effect(s) of excavation and Outfall 004 relocation activities on the recommended remedy and the associated engineering controls and institutional controls for the areas of contamination.*

Response: There are no relocation activities planned at AOI 86-1. The Outfall 004 reroute is being completed on the opposite side of the Site, approximately 1,500 feet from AOI 86-1. Following the completion of the Outfall 004 reroute the remaining portion of the Outfall 004 storm sewer which passes through AOI 86-1 will then be bulkheaded to eliminate the pathway. A figure will also be added to the memo to show the location of the planned re-route and bulkhead activities.

Comment S1-8 – Figure 1, PCB Concentrations in LNAPL and Extent of Low Occupancy Restrictions: *Figure 1 should depict approximate areas within low occupancy, restricted areas in AOI 86-1 where relocation activities will occur.*

Response: – There are no relocation activities planned at AOI 86-1. The Outfall 004 reroute is being completed on the opposite side of the Site, approximately 1,500 feet from AOI 86-1. Following the completion of the Outfall 004 reroute the remaining portion of the Outfall 004 storm

sewer which passes through AOI 86-1 will then be bulkheaded to eliminate the pathway. A figure will also be added to the memo to show the location of the planned re-route and bulkhead activities. The proposed area restricted to low occupancy is included on **Figure A3-1**.

Comment S1-9 – Attachment 4, Remedy Recommended Rationale, second bullet, page A4 1: *The bulleted information indicating that the free product system was discontinued in 2002 contradicts previous text stating that this occurred in 2001.*

Response – This information will be corrected.

Comments - #4 – AOIs 12-A, B & C Hydraulic Oil LNAPL Areas

Comment S4-1 - Attachment 1, Section 2.4, Extent of LNAPL, Page C1-4: *The memorandum presents estimated areas of light non-aqueous phase liquid (LNAPL) based on historical data. Aside from historical measurements of LNAPL thickness exceeding 0.5 foot, it is unclear how this estimate was derived. Specifically, it is unclear how results of Laser Induced Fluorescence (LIF) were incorporated into this estimate and eventual depictions of estimated LNAPL plumes shown on Figure 2. The text should reference or discuss relationships of LIF results to LNAPL plume delineation. Revisions to estimated LNAPL plume areas and associated figures may be required.*

Response – Please refer to Section 2.1.3 (LNAPL Extent Evaluation) of the main report for additional information on how the LNAPL extents were determined.

Comment S4-2 - Attachment 2 Notes, Item 3) Is there a potential benefit to partial treatment/removal that outweighs costs?, Page C2-3: *The memorandum states that LNAPL mobility into Outfall 004 will be addressed by re-routing the flow to Outfall 013 and bulkheading Outfall 004. The eventual fate of LNAPL present within this AOI (area of interest) is unclear. Also unclear is how flow associated with this AOI will potentially impact Outfall 013. The memorandum should be revised to discuss the fate of LNAPL present after bulkheading has been completed and any potential impacts on Outfall 013 as a result of re-routing flow. This comment also applies to additional references throughout the memorandum that discuss Outfall 004 bulkheading and re-routing.*

Response – The following information will be added to the memo to provide additional clarification.

- Outfall 004 will be rerouted prior to encountering the LNAPL impacts; therefore, there will not be any impacts to Outfall 013.

- Following the completion of the reroute, the abandoned section of the Outfall 004 storm sewer will be used as a passive recovery trench. The 004 recovery trench will then be monitored for LNAPL accumulation and LNAPL removal activities will be conducted as necessary.

- A figure showing the location of the proposed Outfall 004 re-route and bulkhead locations.

Comments - AOI 38-1 Soil Investigation Area

Comment S38-1-1 - Attachment 1, History of Northern Parcel, Page 2/12: *The document indicates that an 8,000-gallon underground storage tank (UST) may have been present at the northern end of Building 38, and closure documents indicate former presence of three additional USTs within the area of interest (AOI). The documented and suspected locations of all USTs and associated investigative soil borings should be shown on Figure 2. The text should also indicate (if possible) whether the USTs were removed or abandoned in place, and what type of investigation methodologies were used to try and locate the 8,000-gallon UST (such as, test pits, ground-penetrating radar).*

Response - Regarding the 8,000 gallon UST – The 2001 Description of Current Conditions Report for the Northend of the Site indicates that the tank was 'Not Used' on a historic Site Drawing. The report also indicated that the tank was removed, but closure documentation was not available.

Regarding the three USTs – The USTs were removed in 1988. The investigation and removal of the USTs are documented in the following reports, which are presented as appendices to the Current Conditions Report – North of Leith Street.

- 1997 Summary Report Building 38- Tank 001/38 by Global Environmental Engineering, Inc.,
- 1997 Closure Report Tank 002/38 by Global Environmental Engineering, Inc., and
- 1997 Summary Report Building 38- Tank 123/38 by Global Environmental Engineering, Inc.

This additional information along with the approximate locations of the former USTs will be included in the memo.

Comments - AOI 83/84-2 Soil Impact Area

As discussed below the soil and LNAPL remedies for AOI 83/84-2 will be combined and presented in **Appendix F**.

Comments G83/84-2-1 - *The recommended remedy for AOI 83/84-2 presented in the Soil Investigation Summary and Remedy Selection should be developed in conjunction with the recommended remedies associated with the Cutting Oil Plume at AOI 83/84-2 because the two areas significantly overlap. Specifically, the targeted polychlorinated biphenyls (PCB) -contaminated soil excavation area is common to both. The recommendation is to incorporate this portion of AOI 83/84-2 into AOI 83/84-2 Cutting Oil Plume because Appendix G recommends identical approaches for institutional controls (IC). This would allow for optimization of remedy recommendations and a streamlined review process.*

> Response: The soil and LNAPL remedies for AOI 83/84-2 will be combined and presented in **Appendix F**. The comments provided below will be incorporated the **Appendix F** remedy recommendation.

Comment G83/84-2-2 - *The text should include or reference analytical results at AOI 83/84-2 that exceed screening criteria, specifically including arsenic, lead, manganese, and phenanthrene. The text should also provide the specific screening level criteria where applicable. No conclusions or determinations are included concerning the presence of chromium in soil, although soil exceedances for chromium are discussed generally in the RCRA Facility Investigation (RFI) Phase I and Phase II reports (Blasland, Bouck & Lee, Inc. [BBL] 2002, BBL 2006) and in the RCRA Revised Corrective Action Measures Proposal, Addendum No.2 – Northend Corrective Measures and Site-wide Groundwater Monitoring (Arcadis 2010).*

> Response: The text in **Attachment 1** will be edited to include a more detailed discussion of criteria and exceedances. Locations which exceed criteria are shown on the CSM **Figures F-1 and F-2**. Pertinent data are provided in data tables presented in **Appendix X**. The chromium impacts will be addressed in the **Appendix F** remedy recommendation.

Comment S83/84-2-1 – Section 2, Soil Data Summary, page S2: *Section 2 states that soil exceedances for arsenic, lead, manganese, and phenanthrene are thought to be associated with the light non-aqueous phase liquid (LNAPL) at AOI 83/84-2, which is discussed in Appendix G (Arcadis 2013). Provide the pertinent investigation data that are referenced as an attachment to the memorandum, as well as a*

detailed discussion of the rationale for excluding arsenic, lead, manganese, and phenanthrene from the remedy recommendation. Include a summary of soil exceedances with a figure that depicts locations, concentrations, and depths of contamination. Refer to General Comment #2.

Response: A discussion of the arsenic, lead, manganese and phenanthrene exceedances are discussed in **Appendix F**. The **Attachment 1** text will be edited to include a more detailed discussion of criteria and exceedances. Locations which exceed criteria are shown on the CSM **Figures F-1 and F-2**. Pertinent data are provided in data tables presented in **Appendix X**.

Comment S83/84-2-2 – Section 3, Remedy Recommendation Rationale, bullets 1 & 2, page S2: *Refer to Specific Comment #1*.

Response: The soil and LNAPL remedies for AOI 83/84-2 will be combined and presented in **Appendix F**. The comments provided below will be incorporated the **Appendix F** remedy recommendation.

Comment S83/84-2-3 - Section 4.1, Engineering Controls, page S3: *Provide details about the current surface cover within the impacted area, as well as any details regarding subsurface infrastructure or obstructions (i.e., utilities and a vault) that may affect the recommended remedy during targeted PCB-contaminated soil excavation activities. Additionally, discuss the areal extent of the surface cover and its relationship to the cutting oil plume, PCB-contaminated soil, and other impacted soil, as well as maintenance requirements and stormwater controls in place within the impacted area.*

Response: Additional information was included in the memo regarding the surface cover, infrastructure and extents of remedies. The existing surface cover is the former Factory 83/84 slab. The extents of the slab in the vicinity of AOI 83/84-2 are shown on the memo figures and the extent of the former building is shown in its entirety on **Figures 2 and 5 of the main report**. Maintenance requirements of the surface cover will be discussed in the remedy design documents/work plans. Storm sewers in the AOI 83/84-2 area have been bulkheaded.

Comment S83/84-2-4 - Section 4.2, Institutional Controls, Bullet #2, page S3: *Provide a discussion regarding the effect of targeted excavation activities on the recommended ICs for the impacted area of soil contamination.*

Response: The targeted excavation will not affect the recommended ICs for this area.

Comments - Waste Management Unit #3 Subsurface Investigation Summary and Remedy Recommendation

Comment SWMU3-1 – Section 1.1, WMU #3 Background, Page V1: *The sizes of tanks that were present in this waste management unit (WMU) should be presented.*

Response: The size of the tanks will be added.

Comment SWMU3-2 – Section 1.1, WMU #3 Background, Page V2: *The text offers rationale for incorporating this WMU into the Site-wide corrective action activities by identifying an adjacent product tank as the possible source of the documented release and of subsequent impacts on soil and groundwater. The text also states that soil removal associated with water line repair has occurred. A brief description of the adjacent tank, contents, and size should appear.*

Additionally, locations of the adjacent tank and soil removal during water line repair should be shown on Figure 3.

Response: Additional language will be added to clarify this section. WMU #3 consisted of 2 ASTs which were removed in 1985. In 1986 the release was identified at WMU #3 while completing excavation activities associated with a sprinkler repair. There is not an 'adjacent tank'. The exact location of the sprinkler repair is unknown. Only that it was located in WMU #3 which is indicated on **Figure S-3**.

Comment SWMU3-3 – Section 2.1, Soil Sample Collection, Page V3: *The text states that soil samples collected were either (1) biased toward evidence of impact identified from field observations and photoionization detector (PID) readings, or (2) if no evidence of impact was observed, collected from the 2-foot interval below the slab and the 2-foot interval above the groundwater table. The text also states that PID readings in the soil borings ranged from 0.1 to 24.8 parts per million (ppm). Soil boring WMU-3A was not sampled according to rationale provided. The highest PID reading was observed from approximately 5 to 6 feet below ground surface (bgs) in this boring, yet no sample was collected. One of the samples collected from this boring (between 9 and 10 feet bgs) with a lower PID reading contained a 1,1,1-trichloroethane concentration exceeding criteria. An explanation for deviation from sampling methodology should be provided, or additional soil sampling should be conducted in order to determine if the proposed remedy will be sufficient.*

Response: There was not a deviation from the sampling methodology. The sample was collected in accordance with sampling protocol which permitted biased sampling if there was a strong odor,

visual staining or elevated PID. The sample was biased towards evidence of impact (a strong odor and elevated PID of 14.5) that was identified in the 9 to 10 foot interval as noted on the boring log.

Comments - WMU #7 - Building 41A, Assembly Plant Waste Storage Tank Area Investigation Summary and Remedy Recommendation Memo

Comment SWMU7-1 – Section 2.1, WMU #7 Geology and Hydrogeology, Page W3: *The text states that a sheen was identified in all three borings ranging from 7 to 13.8 feet below ground surface (bgs). However, according to Section 2.2, no soil samples were collected from this interval. To properly evaluate risk associated with potential contamination within this waste management unit (WMU), additional soil samples should be collected from materials that exhibit the highest potential for contamination. Without proper identification of all contaminants possibly present, determination of appropriate institutional and engineering controls may not be feasible.*

Response – The soil sample intervals at WMU #7 were made in consultation with the onsite MDEQ representative and based on the best available field information during closure investigation activities. It is acknowledged that a data gap exists and the shallow impacted soil at WMU #7 will be sampled to confirm that the proposed remedy is appropriate.

Comment SWMU7-2 – Section 2.2, Soil and Groundwater Analytical Data, Page W3: *The text states that groundwater samples collected from a downgradient monitoring well contained cyanide concentrations exceeding groundwater-surface water interface (GSI) criteria. However, soil samples were not analyzed for cyanide. The nature and extent of cyanide present within this WMU should be determined prior to recommendation of a remedy.*

Response – The analyte list for the WMU #7 soil samples was based on the former contents of the USTs. The source of the cyanide detected downgradient of WMU #7 is not known. There have been multiple other documented releases located in the vicinity of WMU #7 including Releases C-0375-01, C-0320-01, C-0470-97, and C-0633-91 which could represent possible sources of cyanide. In addition, as discussed in the AOI 40-A, -B, & 16-C LNAPL memo, the exceedance of GSI criteria will be addressed by bulkheading activities. However, as shallow soil sampling is proposed in the response to Comment #1, cyanide will be included in the analytical parameter list.

Comments - WMU #10 - Factory 86, Building 04, Assembly Plant Waste Storage Tanks Summary and Remedy Recommendation Memo

Comment SWMU10-1 – Section 2.2, Soil and Groundwater Analytical Data, Page X3: *The text states that samples were submitted for analyses for select D- and F-listed waste constituents. Given that the size and contents of one of the underground storage tanks (UST) are unknown, a broader suite of analytes should have been selected. Without proper identification of all contaminants possibly present, determination of appropriate institutional and engineering controls may not be feasible.*

Moreover, tables and boring logs identify the depths at which these samples were collected. Not submitted for analyses were samples of soils exhibiting sheen and emitting odor (SB4 – 16 and 18 feet below ground surface [bgs], SB5 – between 13.5 and 15 feet bgs, and SB6 – between 12 and 14 feet bgs). The text should include rationale for sample collections at various depths.

Response: The soil sample analyte list and sample intervals were developed in consultation with the MDEQ and were based on the best available information during closure activities. The text will be updated to include this information. Also, as discussed in the memo a release was identified during the removal of the USTs in 1985. Approximately 2,500 to 3,000 cubic yards of underlying soil was removed along with Tanks 76 through 80. Oil was observed seeping into the excavation (approximately 10 to 15 feet below ground surface) and a French drain style collection system was installed in the excavation to collect residual oil for off-site disposal. In addition, select down/side gradient monitoring wells (04-1, 04-2, 04-3, 04-4, 04-5, and/or RFI-44-05) were sampled and/or gauged during RFI activities and subsequent annual monitoring events through 2012 (approximately 28 years following the identification of the release). LNAPL has not been detected in the down/side gradient monitoring wells. One VOC (ethylbenzene) was detected above GSI criteria at one well (04-2) in 2001 and select metals were detected above GSI criteria at RFI-44-05 in 2002/2003. These sample locations are located in the Outfall 011 drainage area and the monthly NPMP samples collected from the Outfall 011 GSI compliance have not detected any analytes above GSI criteria.

Subject:
Group 4 - Response to USEPA Comments on AOI 40-A Soil Investigation Summary and Remedy Recommendation Memo, AOI 83/84-3 Lead Soil Impacts Investigation Summary and Remedy Recommendation Memo, and AOI 86-1 Soil Investigation Summary and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

This memo provides responses to the comments received from United States Environmental Protection Act (U.S. EPA) on April 10, 2014 on the area of interest (AOI) 40-A Soil Investigation Summary and Remedy Recommendation Memo, AOI 83/84-3 Lead Soil Impacts Investigation Summary and Remedy Recommendation Memo, and AOI 86-1 Soil Investigation Summary and Remedy Recommendation Memo (Memos).

AOI 40-A Soil Investigation Summary and Remedy Recommendation Memo Comments

Comment S40A-1 – Section 2, Soil Data Summary, Page 2/3: *The text states that pertinent AOI 40-A investigation data are attached. Other than a listing of concentration ranges compared to criteria, investigation data were not attached to this memo. Given the information provided, it is unclear if the extent of surface cover proposed is sufficient.*

Response: Pertinent Site data will be provided in **Appendix X** of the main report.

Comment S40A-2 – Section 3, Remedy Recommendation Rationale, Bullet 1, Page 2/3: *The memo appears to acknowledge that a cancer risk is posed by cumulative concentrations of semivolatile organic*

compounds (SVOC) in soil. Missing is the actual risk value and an indication whether the risk associated with this location has been delineated (horizontally and vertically). The text should be revised to include this information.

Response: This statement was incorrect and has been removed from the memo.

Comment S40A-3 – Section 3, Remedy Recommendation Rationale, Bullet 2, Page 2/3: *Although bulkheading will effectively reduce the direct groundwater-surface water interface risk from surface soil exceedances via the Outfall, the ultimate fate of groundwater impacted by these soils after completion of bulkheading is uncertain. A discussion of post-bulkheading activities or monitoring should appear.*

Response: Acknowledged. Further evaluation of the GSI monitoring data suggest that the groundwater between AOI 40-A and the Flint River requires further assessment and will be addressed as part of the Storm Sewer GSI Strategy discussed in **Appendix BB**. Monitoring and maintenance activities associated with the remedies will be included in the remedy implementation work plan documentation. The text will be revised to include this information.

AOI 83/84-3 Lead Soil Impacts Investigation Summary and Remedy Recommendation Memo Comments

Comment G83/84-3-1 - *The recommended remedy for AOI 83/84-3 presented in the Lead Soil Impacts Investigation Summary and Remedy Selection should be developed in conjunction with the recommended remedies and sewer bulk heading work associated with the Cutting Oil Plume at AOI 83/84-1 because the two areas appear to overlap. The remedies recommended for AOI 83/84-1 plume may encroach or coincide with lead-impacted soils within AOI 83/84-3. Incorporation of these two AOIs is suggested because the recommended institutional controls (IC) for the two AOIs are similar. This would optimize remedy recommendations and streamline the review process.*

Response: Additional language will be added to both the AOI 83/84-1 LNAPL remedy and the AOI 83/84-3 soil remedy in order to address how the remedies will interact.

Comments G83/84-3-2 - *Areas not available for further characterization due to site conditions (e.g., subsurface slabs) should be identified explicitly and discussed, with any relationship of these features to lead contaminants in AOI 83/84-3 soils noted.*

Response: Additional language was added to note the possible subfloor that was encountered at SB-83/84-04. Although refusal was met at several other locations during the 2012/2013 sampling event, a hand auger was being used to collect samples so the refusal could be

due to any number of subsurface conditions. A review of historic boring logs (completed using a drilling rig) from the AOI 83/84-3 lead soil area did not note subsurface slabs in the area.

Comment S83/84-3-1 - Section 1.1, Background, page 1.4: *This Section states that lead concentrations found in soil are compared to the Michigan Department of Environmental Quality (MDEQ) non-residential Direct Contact (NRDC) criterion; however, throughout the remainder of the document, "NDC" is listed for comparison to soil concentrations. Revise the text to be consistent.*

Response: Text will be revised to refer to the criteria as NDC.

Comment S83/84-3-2 - Section 2.1 Sample Collection, page 2/4: *No boring logs are attached for review of soil characterization or field observations. The term "shallow" should be defined and discussed as it relates to the existing ground surface and the 4- to 5-foot subsurface slabs encountered during soil boring refusals.*

Response: The logs for boring completed during 2012/2013 will be attached to the final memo. Historic boring logs are presented in the RFI Reports which are included in **Appendix Y**. The depth of impacts will be noted in the text. Also, additional language was added to note the possible subfloor that was encountered at SB-83/84-04. Although refusal was met at several other locations during the 2012/2013 sampling event, a hand auger was being used to collect samples so the refusal could be due to any number of subsurface conditions. A review of historic boring logs (completed using a drilling rig) from the AOI 83/84-3 lead soil area did not note subsurface slabs in the area.

Comment S83/84-3-3 - Section 2.3 Investigation Conclusions, page 2/4: *It remains unclear whether the nature and extent are fully defined at the AOI. If concentrations of lead in sampled soils do not exceed the NDC lead criterion, these results should be discussed to demonstrate that the AOI is fully characterized. Surface coverage of existing slabs and subsurface features should be discussed relative to soil boring locations. Specific data from historical documents provide the basis to identify and delineate the nature and extent of lead in soils at AOI 83/84-3, and thus should be presented.*

Response: The extent of impact is presented on **Figure Q-2**. Additional language will be added to clarify the extent of surface cover. Historic data will be presented or historic reports referenced, as appropriate.

Comment S83/84-3-4 - Section 3 Remedy Recommendations Rationale, page 2/4: *Specify the location of the existing factory slab in the legend. Discuss use of the 4- to 5 foot drop in elevation to determine extent, if no samples were collected beyond the edge of the slab and exceedances were detected down to 8 feet below ground surface.*

Response: Additional language will be added to clarify the use of the slab as delineation of exceedances. Figure 2 will also include the extent of the concrete slab. The exceedance from 6 to 8 feet bgs was located at SB-83/84-04, which is delineated by samples collected from RFI-83/84-18, RFI-83/84-37, SB-83/84-03, SB-83/84-14, and MW-83/84-15.

Comment S83/84-3-5 - Figure 2, Soil Impacts: *Soil borehole numbers are not fully legible. Provide the current surface cover elevations within the impacted area based on the former factory slab, and also indicate any subsurface infrastructure or obstructions such as concrete slabs that may affect implementation of the recommended remedy at AOI 83/84-1 and AOI 83/84-3. Depth of slab to groundwater and NDC are not depicted or discussed within the text.*

Response: The soil boring numbers will be clarified and extent of the slab will be indicated on Figure 2. Additional detail will be added to the memo to discuss the elevation and thickness of the slab and the ground surface to the south of the slab.

Comment S83/84-3-6 - Section 4.2, Institutional Controls, Bullet #2, page S3: *Discuss the effect of recommended remedy activities at AOI 83/84-1 on the recommended ICs for the impacted area of soil contamination at AOI 83/84-3.*

Response: Additional language will be added to both the AOI 83/84-1 LNAPL remedy and the AOI 83/84-3 soil remedy in order to address how the remedies will interact.

AOI 86-1 Soil Investigation Summary and Remedy Recommendation Memo Comments

Comments G86-1-1 - *The polychlorinated biphenyls (PCB) contamination appears to be localized and within the upper 2.7 feet of soil. Cost/benefit of limited excavation and disposal within this area should be evaluated to support a decision whether or not to eliminate this potential exposure pathway—particularly because of the proximity to the roadway and retaining wall that likely will require future maintenance or expansion. Consider also a recommendation for deferral of this limited excavation and disposal until roadway/retaining wall maintenance/expansion must occur.*

Response: The adjacent roadway is a facility road and there are no plans for maintenance or expansion. As engineering and institutional controls are already necessary at AOI 86-1 to address metals impacts, these controls will also address the PCB impacts.

Comment G86-1-2 - *The text should discuss specific and relevant information concerning potential for metal- and PCB-impacted soils to act as a continuing source of groundwater contamination. Discussion about mobility of the contaminants—particularly with the proposed cap that would both prevent direct contact and minimize water infiltration—should be included to further support the remedy recommendation.*

Response: The PCB impacts are shallow and above the water table. In addition PCBs do not readily dissolve in water so the PCB impacts will not act as a continuing source of GW contamination. The text will be modified to not that the surface cover will also minimize water infiltration.

Comments G86-1-3 - *This document includes no discussion or description of impacts from AOI 86-1 on the CSX property, or potential for presence of complete off-site exposure pathways and receptors.*

Response: Additional investigation is required to delineate the impacts on CSX property. In the event that exceedances of applicable criteria are identified on CSX property the impacts will be addressed in accordance with the Final Decision for the Southend of the Site - Corrective Measures to Address Offsite Soil Contamination.

Comment S86-1-1 - Page 3, Section 5, Remedy Recommended: *Provide a discussion regarding effect(s) of previous storm sewer bulkheading activities on the recommended remedy. For instance, confirm that soils in this area were not disturbed during the activities.*

Response: The text will be revised to indicate that the soils in this area were not disturbed during bulkheading activities and to reference **Figure 6 of the main report** which presents the bulkhead locations.

Comment S86-1-2 - Page 3, Section 5.1, Engineering Controls: *Clarify whether the "Proposed Area for Surface Cover Requirement" on Figure 2 is the same as the existing slab referenced in this text. If not, please depict the existing slab on Figure 2.*

Response: The slab will be noted on **Figure R-2**.

Comment S86-1-3 - Figure 2: *Figure 2 is mislabeled as Figure 1.*

Response: The figure number will be corrected.

Comment S86-1-4 - Figure 2: *Recommendation is to focus the map more closely on the site because detail is lost at this scale and soil boring identifications are partially obscured by the shading that depicts the "Proposed Area for Surface Cover Requirement." Also, data should be included regarding the three small areas with exceedences (e.g., RFI-86-1, RFI-86-01R).*

Response: **Figure R- 2** will be zoomed in to focus on the area south of Leith Street.

Comment S86-1-5 - Figure 2: *Consider adding detail showing the storm sewer bulkheads and relocation in relationship to the area recommended for engineering controls (EC) and institutional controls (IC).*

Response: The storm sewer bulkheads are presented on **Figure 6 of the main report**. The storm sewer relocation associated with the AOI 86-1 LNAPL area is actually being completed on the west side of the Site, not at AOI 86-1, as further discussed in the AOI 86-1 LNAPL Area memo presented in **Appendix A**.

Subject:
Group 5 - Response to USEPA Comments on the Priority #2 - AOI 05-1/05-5 Cutting Oil Area, Priority #5 - AOI 10-1/10-4 Hydraulic Oil Area, Priority #8, #14, and #15 AOI 36-1/36-2 LNAPL Area and Priority #16 - AOI 02-B Hydraulic Oil Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

This memo provides responses to the comments received from USEPA on May 13, 2014 and May 20, 2014 on the Priority #2 - AOI 05-1/05-5 Cutting Oil Area, Priority #5 - AOI 10-1/10-4 Hydraulic Oil Area, Priority #8, #14, and #15 AOI 36-1/36-2 LNAPL Area, and Priority #16 - AOI 02-B Hydraulic Oil Area Evaluation and Remedy Recommendation Memos (Memos).

Please note that the general comments begin with a G followed by the Priority # - Comment #. So General Comment 1 from Priority #2 memo is referred to as comment G2-1. Specific comments are named similarly, but they begin with an S.

Comments - #2 - AOI 05-1/05-5 Cutting Oil Area

Comment G2-1 -*The memorandum includes historical interim measures (IM) as part of the remedy recommendation, and it states that although light non-aqueous phase liquid (LNAPL) recovery has been possible, future LNAPL recovery is uncertain. Throughout the memorandum, inadequate rationale is presented to support this statement. Refer to specific comments 1 and 5 for further information regarding this general comment.*

Response: Available data do not indicate that future LNAPL recovery is feasible; however, the available data is limited as the majority of the monitoring wells at AOI 05-1 did not meet the transmissivity testing criteria or resulted in inconclusive transmissivity tests. Therefore, future LNAPL recovery is uncertain. One monitoring well will be installed in the interior of the LNAPL plume to evaluate the central portion of the plume and complete transmissivity testing if possible. The existing monitoring wells at AOI 05 will also be evaluated in 2014 to determine if there are additional locations where transmissivity testing can be completed.

Comment G2-2 -*Cross-sections, tables, and boring logs were not included with this memorandum.*

Response: The cross section and boring logs will be included with the final memo. Data tables will be presented in **Appendix X** of the Report.

Comment G2-3 - *Figures included in this memorandum do not show all proposed locations of recommended remedies.*

Response: The figures will be edited to include the locations of the recommended remedies.

Comment S2-1 - *Attachment 1, Section 2.3, Recovery Wells, Page 2/6: The text states that use of LNAPL recovery wells was discontinued because the LNAPL was causing the recovery pumps to malfunction. However, 1,000 gallons of LNAPL was removed in 1997. A discussion of how AOI 05-5 LNAPL characteristics cause such malfunction should be included either within this memorandum or as part of the remedy evaluation matrix. Potential remedies to be evaluated should still include recovery wells because these were effective. Different equipment (pumps or skimmers) that do not malfunction because of the LNAPL may be implemented more successfully.*

Response: Available information regarding the recovery wells will be added to Section 2.3 of Attachment 1. Additional LNAPL recovery at the AOI 05-5 LNAPL Area will not decrease the risk associated with AOI 05-5. The proposed remedies will more effectively reduce risks associated with the AOI 05-5 LNAPL Area.

Comment S2-2 - *Attachment 1, Section 3.1, Geology and Hydrogeology, Bullet 1, Page 2/6: The text states that fine sand is present to approximately 16 feet below ground surface (bgs). Attachment 2 states that fine sand is present to approximately 17.5 feet bgs. Revise to make consistent.*

Response: The information in Attachment 2 has been corrected.

Comment S2-3 - *Section 3.3, LNAPL Characteristics, LNAPL Analytical Data, Bullet 1, Page 4/6: The LNAPL characteristics indicate that some contaminants exceed RCRA toxicity characteristic criteria, and that toxicity characteristic leaching procedure (TCLP) analysis has not occurred. TCLP or synthetic*

precipitation leaching procedure (SPLP) extraction and analysis should be conducted to evaluate potential for leaching of those contaminants.

Response: TCLP analysis will be completed prior to implementing removal remedies.

Comment S2-4 - *Attachment 1, Section 3.3, LNAPL Characteristics, Transmissivity, Bullet 3, Page 5/6: The text states that LNAPL transmissivity as quantified at MW-05-04 was 0.05 square feet per day, which is below applicable thresholds for practical recovery. Transmissivity data obtained from only one monitoring well in an AOI with an impacted LNAPL area of approximately 80,000 square feet is not representative. Conclusions regarding practicality of LNAPL recovery by use of these data should be qualified or removed from the memorandum.*

Response: As discussed in Section 2.1.4 of the Report, transmissivity testing was conducted at locations that met the study requirements. Transmissivity testing was attempted at the three locations within the plume that met the requirements; however, as discussed in the memo, the testing was inconclusive at two locations and could not be quantified. The information from MW-05-04 is relevant and will remain in the report; however, it will be noted that the result indicates that recovery is impractical in this portion of the plume. Further, the smaller LNAPL areas of AOI 05-1 and AOI 05-5 are recommended to be targeted for excavation, which is much more effective at removing LNAPL mass than hydraulic recovery.

Comment S2-5 - *Attachment 4, Section 2, Remedy Recommendation Rationale, Bullet 1, Page 1/4: Although the text states that additional LNAPL removal would not change risks associated with the plume, this would reduce both the footprint of potential vapor phase risk and LNAPL mobility. The text should be revised.*

Response: Additional hydraulic LNAPL recovery will not significantly change the LNAPL footprint that could potentially generate a vapor phase risk due to methane generation through biodegradation nor direct contact due to PCBs in soil/LNAPL. While recovering additional LNAPL will reduce saturation, the volume that can be recovered, based on the results of the baildown tests, would have negligible effects on LNAPL mobility and the LNAPL mobility risks are more effectively addressed by the recommended remedies.

Comments - #5 AOI 10-1/10-4 Hydraulic Oil Area

Comment G5-1 - *Cross-sections, tables, and boring logs were not included with this memorandum.*

Response: The cross section and boring logs are included with the final memo. Data tables will be

presented in **Appendix X** of the main report.

Comment G5-2 - *Figures included in this memorandum do not show all proposed locations of recommended remedies.*

Response: The memo figures have been edited to include the locations of the recommended remedies.

Comment S5-1 -*Attachment 1, Section 2.1, Groundwater Collection and Treatment System, Page 2/6: The text states that the recovery system was taken out of service in 2010 because it was no longer effectively removing light non-aqueous phase liquid (LNAPL). It is unclear whether placement of the system in relation to existing LNAPL or the system itself was no longer effective.*

Response: The system was operational but was no longer effectively recovering LNAPL.

Comment S5-2 - *Attachment 1, Section 2.2, LNAPL Recovery Trench, Page 2/6: The text states that the recovery system was taken out of service in 2010 because it was no longer effectively removing LNAPL. It is unclear whether placement of the system in relation to existing LNAPL or the system itself was no longer effective.*

Response: The system was operational but was no longer effectively recovering LNAPL. The location of the recovery trench has also been added to the **Attachment 1 – Figure D1-2**.

Comment S5-3 - *Attachment 1, Section 3.2.1, Groundwater Analytical Data, Page 4/6: Figure 3 apparently does not adequately delineate the extent of groundwater impacts (e.g., impacts associated with groundwater analytical results from wells 20-145 and 30-100). Additional groundwater sampling is required to delineate the extent of groundwater impacts satisfactorily.*

Response: The AOI 10-1/10-4 LNAPL Area is located within the Outfall 003 storm sewer drainage basin where the GSI pathway is groundwater infiltration to the storm sewer. As discussed in Section 2.2.1 of the main report and **Appendix BB**, the NPMP program was implemented to determine whether the groundwater infiltrating into the Site storm sewers impacts the Flint River. During the RCES development activities in May 2010, the USEPA and MDEQ agreed to the approach of sampling of the storm sewers as a means to address potential GSI impacts in lieu of performing groundwater monitoring in wells adjacent to the sewer. It was agreed that samples collected in the sewers were representative of the aggregate groundwater quality discharging into the sewers from the surrounding groundwater and would more accurately reflect the potential risk to the Flint River. As such the GSI exceedances identified at 20-145 and 30-100 will be monitored and addressed as part of the NPMP program.

Comment S5-4 - *Attachment 1, Section 3.3, LNAPL Characteristics, LNAPL Analytical Data, Bullet 1, Page 5/6: Analytical results from LNAPL indicate that some contaminants exceed Resource Conservation and Recovery Act (RCRA) toxicity characteristic criteria. Moreover, toxicity characteristic leaching procedure (TCLP) analysis has not been conducted. TCLP or synthetic precipitation leaching procedure (SPLP) extraction and analysis should occur to evaluate potential for leaching of such contaminants.*

Response: TCLP analysis will be completed prior to implementing removal remedies.

Comment S5-5 - *Attachment 4, Section 2, Remedy Recommendation Rationale, Bullet 1, Page 1/4: Although the text states that additional LNAPL removal will not change risks associated with the plume, removal of additional LNAPL would reduce both the footprint of potential vapor phase risk and LNAPL mobility. The text should be revised accordingly.*

Response: Additional hydraulic LNAPL recovery will not significantly change the LNAPL footprint that could potentially generate a vapor phase risk due to methane generation through biodegradation. While recovering additional LNAPL will reduce saturation, the volume that can be recovered, based on the results of the baildown tests, would have a negligible effect on LNAPL mobility nor result in reducing risks associated with the LNAPL. Further, the LNAPL risks are appropriately addressed by the recommended remedies.

Comments - #8, 14, & 15 - AOI 36-1/36-2 LNAPL Area

Comment G8-1: The working document and the relationship between the Respondent (RACER) and the U.S. EPA is the September 30, 2011 RCRA 3008(h) Administrative Order on Consent and EPA looks to this to insure compliance and keep the cleanup on track.

Response: Acknowledged.

Comment G8-2: The multi-phase extraction system and the pilot test associated with it need to be carried forward and not limited to some of the conditions inserted into the recommended remedy in Attachment 3, Section 3.4. The statement that the "The feasibility and cost of the remedy will be dependent upon the results of the pilot test" and that the additional sampling proposed and the screening of this sampling prior to the pilot test suggest there's a scenario where the pilot test will not happen.

There are too many contingencies to this proposal, we have substantial data already in hand to understand the site conditions, and the technology on site to do the removal, and in sandy soil, and an

LNAPL that is accessible and removable. This needs to move forward as a proposed remedy.

Response:The pilot test work plan is currently being developed. We understand the concern – the purpose of the pilot test is to develop field information used to size the system, develop operating parameters and establish the endpoint for the system.

Comment G8-3: The insertion of the previous Historic Interim Measures, now defunct, as part of a proposed remedy is unnecessary. The function of these IMs has been completed, there was measurable removal using them and there is not a need to carry them forward as a proposed remedy.

Response: The memo text and **Table 8 of the main report** have been modified to more clearly note the completed IMs and the recommended remedies.

Comment S8-1 - Submittal Letter, Page 1/2: The letter states that two conceptual site model cross-sections (G-1 and G-2) are attached. G-1 and G-2 were not included as attachments.

Response: Acknowledged. The CSM cross sections will be included with the final report.

Comment S8-2 - Section 3.3, LNAPL Characteristics, LNAPL Analytical Data, Bullets 1-3, Pages 3-4/5: The text states that trichloroethene (TCE) and benzene were detected in the light non-aqueous phase liquid (LNAPL) at concentrations greater than Resource Conservation and Recovery Act (RCRA) toxicity characteristic criteria, and that toxicity characteristic leaching procedure (TCLP) analysis has not been completed. TCLP analysis for TCE and benzene should be performed.

Response: TCLP analysis will be completed prior to implementing removal remedies.

Comment S8-3 -Section 3.3, LNAPL Characteristics, LNAPL Analytical Data, Bullet 2, Pages 3-4/5: The text states that LNAPL from the central portion of the LNAPL Area has an ignitability of 50 degrees Fahrenheit. 40 Code of Federal Regulations (CFR) 261.21 states that a liquid with a flashpoint of less than 140 degrees Fahrenheit exhibits the characteristic of ignitability and is therefore a hazardous waste. A hazardous waste determination (per 40 CFR 262.11) should occur prior to recommendation of a remedy for this AOI.

Response: The LNAPL in this portion of the Site is primarily gasoline and is expected to be a recovered petroleum product (RPP) waste stream that will go to a refinery for processing into product per 40 CFR 261.4(a)(12)(I & ii) and/or 40 CFR 261.4(a)(18)(i & ii). All waste generated

during remedial activities will be characterized and disposed of per all applicable regulations.

Comment S8-4 - Section 3.3, LNAPL Characteristics, Transmissivity, Page 4/5: The text states that LNAPL from the southeastern and northwestern portions of the LNAPL Area was tested for transmissivity. The LNAPL present in the central LNAPL Area did not undergo transmissivity testing. Recommendations for a remedy for the central LNAPL Area should not be based on existing AOI transmissivity results unless transmissivity testing is completed in the central portion of the LNAPL Area.

Response: There is insufficient LNAPL present (<0.05 ft) in the monitoring well located in the central portion of the LNAPL area to conduct transmissivity testing. The remedy proposed for this area was not based on the results of the transmissivity testing.

Comment S8-5 - Attachment 1, Figure 2: The figure appears to inaccurately estimate the horizontal extent of LNAPL present at this AOI. Laser-induced fluorescence (LIF) borings north of the LNAPL extent are shown on the figure as >200 percent response but are not included in the current LNAPL plume extent. Clarification on use of LIF data to determine the current LNAPL extent at this AOI is required.

Response: High LIF response does not indicate the presence of measurable LNAPL. As discussed in Section 2.1.1 of the main report, LIF responses above background are indicative of the presence of LNAPL in the subsurface, but the magnitude of the response is not representative of mobile LNAPL. The magnitude of the LIF response is related to the soil type, LNAPL type (mainly the fraction of polycyclic aromatic hydrocarbons [PAHs]), and the LNAPL pore saturation. The residual LNAPL saturation of a soil is directly related to soil structure, LNAPL physical properties, and the maximum historical LNAPL saturation, which are spatially variable at an environmental site. The LNAPL extents are based on measurable LNAPL. Please refer to Section 2.1.3 (LNAPL Extent Evaluation) of the main report for additional information on how the LNAPL extents were determined.

Comment S8-6 - Attachment 3 Recommended Remedy, Figure 1: The figure does not indicate the location of the proposed multiphase extraction remedy. The figure also does not indicate what actions are recommended for the LNAPL present east and west of the proposed surface cover.

Response: The footprint of the MPE plume will be determined following completion of the pilot testing and investigation activities. This information will be provided in basis of design documentation. The memo will be edited to include a discussion of the portions of the plume which extend beyond the former building footprint to the west and east.

Comment S8-7 - In Figure 1 and Figure 2 the AOI 35-1/36-2 plume doesn't include a graphic showing the differentiation between the plumes compositions explained in the text. This is important information to display that is also relevant to the remedy choices.

Response: The Figure G1-2 will be revised to include the composition of the LNAPL areas.

Comment S8-8 - Attachment 1, Section 3.2 states that "Analytical data were compared to applicable Michigan Part 201 non-residential criteria. The storm sewers in the AOI 36-1/36-2 LNAPL Area have been bulkheaded; therefore, the groundwater surface water pathway is not relevant." All pathways are relevant, the groundwater to surface water pathway always can be a conduit for pollution from the site to reach the river.

Response: Acknowledged. The text will be modified to indicate that the pathway is no longer applicable in this portion of the Site.

Comment S8-9 - Attachment 1, Section 3.3 states regarding the NSZD data "The results show that LNAPL near monitoring well RFI-36-42 is being depleted at a rate of 3,217 gallons per acre per year." The NSZD data is experimental data and preliminary information that is not applicable to EPA guidance documents. EPA would not want to use NSZD data to make decisions, or as a baseline for any active LNAPL remedies, or use to screen any remedies out.

Response – The decision to recommend or rule out remedies at the Site are based on a review of all of the information available. NSZD is a useful piece of information, but would not be used as the single reason to select or rule out a remedy.

Comment S8-10 - Attachment 3, Section 3.5 states "The remedy recommended to address shallow soil impacts beneath the direct contact concerns is to maintain the existing Factory 36 slab over the impacted area" The areas of the plume to the northeast under the parking lot and in the southeast are beyond the Factory 36 slab and it is unclear if these areas are addressed in terms of eliminating direct contact with soils.

Response: The text will be edited to clarify the location of the direct contact concerns and current surface cover conditions at the Site.

Comment S8-11 - Attachment 3, Section 3.8 states "Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the

NREPA,…" EPA's proposed remedy envisions area identified as surface cover areas will continue to have these same protections going forward. Any changes to remedies finalized need to be reopened in a formalized process consistent with the RCRA 3008(h) Administrative Order on Consent between RACER and U.S. EPA at Buick City.

Response: For redevelopment purposes the Declaration of Restrictive Covenant (DRC) is designed to accommodate potential changes in site conditions to facilitate redevelopment of the site. Any modifications to the DRC designed to facilitate such redevelopment must be approved by the regulatory agencies.

Typical language (copied below) from the DRC approved by EPA for Livonia and Pontiac will be included in the DRC for Buick City.

Modification/ Release/Rescission: Grantor or Owner may request in writing to MDEQ and USEPA, at the addresses provided in herein, modifications to, or release or rescission of, this Restrictive Covenant. This Restrictive Covenant may be modified, released or rescinded only with the written approval of MDEQ and USEPA. Any approved modification to, or release or rescission of, this Restrictive Covenant shall be filed with the appropriate Registrar of Deeds by the Grantor or Owner and a certified copy shall be returned to MDEQ and USEPA at the addresses provided herein.

Comments - #16 AOI 02-B Hydraulic Oil Area

Comment S16-1 Summary, Page N1: The summary of the decision tree evaluation notes that storm sewers in AOI 02-B have been bulkheaded; however, Attachment 2 notes that an outfall was bulkheaded during RFI activities. Please clarify whether a single outfall or multiple storm sewers have been bulkheaded. Additionally, provide a discussion regarding the effects of bulkheading, and revise Figure 2 to depict the location of the storm sewer or outfall and bulkhead(s).

Response: The Outfall 006 storm sewer main (which services this portion of the Site) was bulkheaded during the RFI prior to the CSX property boundary. The location of the bulkhead is presented on **Figure 6 of the main report**. The location of the storm sewers in the vicinity of the AOI 02-B LNAPL Area are also presented on the CSM **Figure M-1**.

Comment S16-1 Section 1, Background, Page N1-1: The text states that investigation data are attached or presented in Appendix X. Investigation data were not attached to the memorandum, and it is unclear to

what report Appendix X is appended. Correct the Appendix reference or provide a specific report reference including title and date, and include the title of the appendix.

Response: Data tables will be presented in **Appendix X** of this report.

Comment S16-1 Section 3.2, Groundwater and Soil Analytical Data, Page N1-2: This section notes that neither groundwater nor soil analytical data exceed applicable Michigan Part 201 non-residential criteria. The discussion should provide a timeframe indicating when the analytical data were acquired and the trends associated with the data (i.e., what, historically, the analytical data demonstrate).

Response: Data tables will be presented in **Appendix X** of this Report. The data tables include the dates that the samples were collected. The majority of the Site data were collected during RFI activities conducted from 2001 to 2005; however, Site data collected through March 19, 2014 are evaluated in this report. Also, the main report includes a discussion of how the applicable criteria were identified.

*Comment S16-1 Section 3.3, LNAPL Characteristics, LIF Data, Page N1-2**:** Discuss how the footprint of the light non-aqueous phase liquid (LNAPL) plume at AOI 02-B was estimated, specifically regarding how the horizontal plume extent was refined by reference to laser-induced fluorescence (LIF) data. Additionally, discuss the LIF data in terms of vertical range of impact, and provide LIF boring logs.*

Response: Please refer to Section 2.1.3 (LNAPL Extent Evaluation) of the main report for additional information on how the LNAPL extents were determined. Section 2.1.1 of the Report discusses the LIF investigations and in which reports LIF data are presented. Pertinent data reports are presented in **Appendix Y**. The range of LIF impacts are discussed in Attachment 1 of the memo.

Comment S16-1 Attachment 1, Figure 2: The figure appears to inaccurately estimate the horizontal extent of LNAPL present at this AOI. For example, LIF borings LIF-02-006, LIF-02-007, LIF-02-018, and LIF-02-019 are shown on the figure as >200 percent response but are not included in the current LNAPL plume extent. Clarification on use of LIF data to determine the current LNAPL extent at this AOI is required. Moreover, additional discussion is needed relating the geographic location of LIF-02-019 and groundwater flow in the vicinity of LIF-02-019 to the historical LNAPL plume depicted on Figure 2. A subsequent revision to Figure 2 may be required.

Response: High LIF response does not indicate the presence of measurable LNAPL. The LNAPL extents are based on measurable LNAPL. Please refer to Section 2.1.3 (LNAPL Extent Evaluation) of the main report for additional information on how the LNAPL extents were determined. Regarding LIF-02-019, based on the locations and LIF response this area of impact

does not appear related to the AOI 02-B LNAPL Area. A monitoring well will be completed in this area to determine if LNAPL is present in this area.

Comment S16-1 Attachment 2 Notes, #4, Page N2-2: Clarify locations and well numbers of sentinel wells around the periphery of AOI 02-B.

Response: Sentinel wells for future monitoring will be identified as part of the groundwater monitoring program presented in the CMI Work Plan.

Comment S16-1 Attachment 3 Recommended Remedy, 2. Remedy Recommendation Rationale, fifth bullet, Page N3-1: Specify locations of the storm sewer bulkheads noted in this bullet, and proximities of these to the AOI 02-B Hydraulic Oil Plume.

Response: The locations of all storm sewer bulkheads will be presented on **Figures 5 and 6 of the main report**. A reference to **Figure 6** will be added to Attachment 3.

Comment S16-1 Attachment 3 Recommended Remedy, 3.1 Institutional Controls, Page N3-2: Given that the extent of the LNAPL plume that poses potential vapor phase risk extends beyond the site property, the site-wide institutional controls proposed will not be adequate. Additional controls placed on adjacent property should be included as part of the recommended remedy.

Response: Attachment 1 – Section 2.2.4 discusses the evaluation of the groundwater and soil did not exceed vapor intrusion screening levels. In addition, the adjacent CSX property consists of rail road tracks and it is highly unlikely that the tracks will be replaced by an occupiable structure in the foreseeable future. Therefore, no further investigation is recommended.

Appendix W

LNAPL Remedial Decision Tree Template

LNAPL Remedial Decision Tree - LNAPL Conceptual Site Model Development
RACER Buick City Template
Flint, Michigan

LNAPL CONCEPTUAL SITE MODEL (LCSM) DEVELOPMENT – MENU OF OPTIONS

	Potential Parameters/Considerations	Potential Evaluation Methods	Discussion
LNAPL Body Delineation/ Characterization	1. LNAPL body geometry: horizontal/ vertical extents, position relative to water table 2. Relative intensity of impacts (hot spots)	1. Installation of wells/borings, laser-induced flourescence (LIF), resistivity 2. Soil sampling (TPH, LNAPL saturations), groundwater sampling, LIF, resistivity	
Geology/ Hydrogeology	1. General Stratigraphy 2. Impacted Soil Types 3. Hydraulic Gradients 4. LNAPL Gradient 5. Hydraulic Conductivity	1,2. Field screening of soil borings, laboratory grain size analysis 3,4. Well gauging 5. Slug tests, pumping tests, laboratory testing	
LNAPL Physical/ Chemical Properties	1. LNAPL viscosity 2. LNAPL specific gravity 3. LNAPL type/age 4. LNAPL chemical composition	1,2. Laboratory physical property testing 3. Laboratory forensic testing/fingerprinting 4. Laboratory chemical analytical testing	
Dissolved and Vapor Phase Impacts	1. Groundwater concentrations of LNAPL constituents 2. Soil gas concentrations of LNAPL constituents 3. Soil gas explosivity	1. Groundwater sampling/laboratory testing 2. Soil gas sampling/laboratory testing 3. Field screening of well headspace and/or soil gas samples using handheld lower explosive limit (LEL) meter	1. Focus on wells without LNAPL. The potential benefit of sampling groundwater under LNAPL should be weighed against the risk of obtaining LNAPL-contaminated samples (LNAPL presence may not be readily apparent in a groundwater sample). 2. The need for soil gas sampling and the potential parameter list can be screened based on the volatility of the LNAPL and/or specific constituents (e.g., test for constituents with Henry's law constant > $1e^{-5}$ atm-m^3/mol and vapor pressure > 0.05 Torr)
LNAPL Mobility	1. Age of LNAPL body 2. Soil TPH concentrations 3. LNAPL saturations and residual saturations 4. LNAPL transmissivity 5. Recovery system performance 6. Dissolved phase trends *Typically involves a weight of evidence approach where multiple lines of evidence are considered (due to the complexity of multi-phase flow in the subsurface and the technical limitations of the potential evaluation methods).	2. Comparison against appropriate C_{res} value or conversion of TPH concentrations to saturations and comparison to typical residual saturation values (see ASTM E2531-06) 3. Soil core sampling and laboratory petrophysical testing (e.g., pore fluid saturation testing, water drive testing) 4. Field LNAPL baildown testing, pumping tests, field dye tracer testing (see ASTM E2856-11) 5. LNAPL recovery system cumulative recovery/ recovery rate plots, decline curve analysis 6. Groundwater concentration trends of LNAPL parameters	1. Older LNAPL is less likely to be mobile 2,3. LNAPL saturations exceeding residual levels provide a line of evidence of LNAPL mobility 4. LNAPL transmissivity > 0.5 ft^2/day provides a line of evidence of LNAPL mobility (see Swiger 2013) 5. Poor recovery system performance may provide strong evidence that remaining LNAPL is at residual levels/immobile (if the system has been effectively implemented and operated) 6. Dissolved phase trends provide an indication of the state of the LNAPL body (e.g., stable dissolved phase trends = stable LNAPL)
LNAPL Migration	1. LNAPL body expansion and migration *LNAPL migration differs from the LNAPL mobility consideration above in that is only considers the potential for LNAPL mobility around the perimeter of an LNAPL body (i.e., its ability to migrate or expand into areas that are not already impacted).	1. One or more LNAPL mobility lines of evidence indicates potential mobility along LNAPL body perimeter 2. LNAPL observations in sentry wells installed in clean soil 3. Estimate critical LNAPL head (pore entry displacement pressure) at LNAPL periphery	3. Critical LNAPL head (pore entry displacement pressure) exceeded at LNAPL periphery represents a potential for LNAPL body expansion/ migration
LNAPL Recoverability	1. Potential LNAPL recovery rates 2. Fraction of LNAPL body that may be recoverable *Most of the potential evaluation methods listed above for LNAPL mobility will also provide evidence relating to the potential recoverability of the LNAPL.	1. LNAPL recovery pilot results, LNAPL transmissivity estimation, full-scale LNAPL recovery system performance 2. Comparison of LNAPL saturations and residual saturations	1. LNAPL recovery may be considered technically practicable where LNAPL recovery rates exceed a minimum level and/or where LNAPL transmissivity > 0.5 ft^2/day (see Swiger 2013) 2. Regardless of the technical practicability of LNAPL recovery, any recovery activity will only have a significant effect on an LNAPL body where LNAPL saturations significantly exceed residual levels (i.e., significant recoverable fraction)
Potential Remedial Drivers	1. Risk (compositional concerns) 2. LNAPL mobility/migration (saturation concerns) 3. Non-risk (non-technical) factors such as aesthetic (e.g., visual, olfactory), regulatory or other considerations (e.g., property transaction condition)	1. Will vary from comparison of existing site data to generic criteria, to quantitative human health and ecological risk assessment (depending on complexity of site and magnitude of potential risks) 2. See LNAPL mobility and LNAPL migration lines of evidence and approaches above 3. Review applicable LNAPL regulations 3. Establish site goals	

NOTES/REFERENCES:

The “menu” provided above presents potential elements of an LCSM, potential evaluation methods and potential metrics (where applicable). The need to quantify specific items above should be based on a preliminary consideration of site-specific goals and site complexity. *It will not be necessary to quantify all items above at all sites.*

Table C-1 of ITRC’s Technical Regulatory Document entitled Evaluating LNAPL Remedial Technologies for Achieving Project Goals provides more detail on LCSM components and presents a three level tiered approach to LCSM development based on increasing levels of site complexity

Table X4.1 of ASTM Standard E2531-6 provides detailed information on LNAPL site data collection methods and their applicability.

Swiger, N., 2013. Nonaqueous Phase Liquids (NAPL) Management. Presentation at the American Institute of Professional Geologists (AIPG), Michigan Section, March 2013 Meeting.

LNAPL Remedial Decision Tree
RACER Buick City Template
Flint, Michigan

LNAPL Compositional Concerns (potential exposure/risk issues):
- Explosive hazards (vapor accumulation in confined spaces/ utilities, open excavations)
- Dissolved-phase concentrations (migration toward surface water bodies or groundwater supply wells)
- Vapor-phase concentrations (vapor intrusion/long-term exposure risk)
- Direct contact or ingestion

EVALUATE LNAPL CONCERNS FROM LCSM

LNAPL Concerns = Remedial Drivers

Compositional Concerns
Risk-based drivers such as unacceptable levels of dissolved or vapor-phase impacts

Saturation Concerns
Drivers relating to the mitigation of LNAPL migration and/or reduction of LNAPL mobility

LNAPL Saturation Concerns (mobility and migration issues)
- Potential for LNAPL to spread and create new or increased risk (migration toward surface water, property boundary, underground utilities)
- Aesthetic/Nuisance issues

1

Risk: Are unacceptable dissolved phase, vapor phase or direct contact exposures associated with the LNAPL under any use scenarios?

- No → No Action Necessary
- Yes → Do feasible options exist to mitigate unacceptable risk through compositional change? (9)
  - No → Cost-Benefit: Is there potential benefit to partial treatment/removal that outweighs costs? (5)
    - Yes → Implement treatment/removal action (6)
    - No → Are controls required? (7)
  - Yes → Can institutional/engineering controls provide effective risk mitigation? (10)
    - No → Cost-Benefit: Is there potential benefit to partial treatment/removal that outweighs costs? (5)
    - Yes → Implement treatment/removal action (6)

Migration: Is LNAPL migrating or potentially migrating (i.e., mobile along perimeter)? (2)

- No → **Mobility**: Is LNAPL potentially mobile within stable LNAPL perimeter? (3)
  - No → Are controls required? (7)
  - Yes → **Recoverability**: Is LNAPL readily recoverable? (4)
    - No → Are controls required? (7)
    - Yes → Cost-Benefit: Will potential benefit of LNAPL recovery outweigh costs? (5)
      - No → Are controls required? (7)
      - Yes → Implement LNAPL Recovery Remedy (6)
- Yes → Do feasible options exist to mitigate migration through LNAPL recovery or mass control? (6)
  - No → Are controls required? (7)
  - Yes → Implement LNAPL Recovery Remedy (6)

Are controls required? (7)

- Yes → Implement Controls → Implement Long-Term Stewardship/ Monitoring Plan (**as required**) (8)
- No → Implement Long-Term Stewardship/ Monitoring Plan (**as required**) (8)

Implement Long-Term Stewardship/ Monitoring Plan (**as required**) (8) → Corrective Action Complete

(#) NOTES

Note:
Template modified on June 20, 2014 from February 6, 2013 working draft.

LNAPL Remedial Decision Tree Notes
RACER Buick City Template
Flint, Michigan

1 The LCSM may identify both risk and mobility/migration issues at a given site. Consequently, compositional change techniques (to mitigate risk) and saturation reduction techniques (to mitigate mobility/migration concerns) may represent concurrent considerations that may require independent remedies.

2 Migration is only likely to be occurring where releases are active or shortly after cessation where a LNAPL gradient/head is present. Due to the complexity of multi-phase flow in porous media and the limitations of available assessment methods, LNAPL migration potential should be evaluated using multiple lines of evidence (see LCSM Menu – Page 1)

3 LNAPL Mobility – Is LNAPL present at saturations exceeding residual values? Example lines of evidence listed in LCSM Menu – Page 1.

4 The presence of readily recoverable LNAPL as defined by transmissivity > 0.5 ft^2/day does not necessarily indicate that a significant fraction of an LNAPL body would be beneficially affected through LNAPL recovery (Swiger 2013). An understanding of the fraction of the LNAPL body that may be recoverable is necessary in order to establish a realistic expectation of the actual benefit of any LNAPL recovery activity and a determination of whether the LNAPL body is “readily recoverable.” See Table 2 of the main report.

5 The potential benefit of LNAPL remediation should be weighed against the potential costs in terms of the associated expenditure of financial and natural resources, the risks involved in implementation, and the contamination potentially resulting from the remedial action (i.e., sustainability considerations). For situations where LNAPL bodies are stable with no associated risk, the net environmental benefit of active engineered LNAPL remedial systems should be scrutinized. See Table 8 of the main report.

6 Establish LNAPL recovery objectives and science-based achievable/measureable LNAPL recovery end-points prior to implementing LNAPL remediation (e.g., reduction of LNAPL transmissivity to less than 0.5 ft^2/day to meet a saturation objective).

7 Considering the significant technical limitations of LNAPL mass recovery or compositional change, engineering and/or institutional controls should be considered in conjunction with or in lieu of remedial action. See Tables 6, 7, and 10 of the main report.

8 Perform any necessary monitoring to confirm LNAPL remedial goals are/were met. See Table 8 of the main report.

9 LNAPL compositional change remediation is implemented to reduce the concentration or mole fraction of specific compounds in LNAPL that contribute to dissolved and or vapor phase concerns (i.e., air sparging and soil vapor extraction to reduce the mole fraction of benzene in LNAPL). Phase change technologies can be used to target immobile LNAPL, unlike conventional LNAPL mass recovery technologies such as LNAPL skimming. Examples of compositional change techniques may include air sparging, enhanced biodegradation, in situ thermal treatment, and in-situ chemical oxidation. Some phase change remedial technologies will accomplish both LNAPL mass recovery (saturation objective) and compositional change objectives simultaneously. See Table 7 of the main report.

10 Examples of potentially effective removal actions include excavation with off-site disposal, excavation with ex-situ thermal treatment and in-situ thermal treatment (e.g., electrical resistance heating with high vacuum extraction). See Table 7 of the main report.
