FINAL DRAFT - RACER Buick City Remedy Recommendation Report

Buick City Site, Flint, Michigan

September 12, 2014

Revised February 15, 2016

ARCADIS

LIST OF ACRONYMS AND ABBREVIATIONS vi

PREFACE 1

1. Introduction 5

2. Recent Investigation, Studies, and Evaluations 8

2.1 LNAPL Investigations and Studies 9

2.1.1 Laser Induced Fluorescence (LIF) Investigation (2010 to 2012) 9

2.1.2 LNAPL and PCB Delineation Activities (2013 to 2014) 10

2.1.3 LNAPL Extent Evaluation (Updated 2013/2014) 10

2.1.4 LNAPL Transmissivity Testing (2011 to 2013) 12

2.1.5 LNAPL Natural Source Zone Depletion (NSZD) Testing (2012 to 2013) 13

2.1.6 Summary of Bench-Scale Testing Results (2010 to 2013) 14

2.2 Storm Sewer Investigations and Studies 15

2.2.1 NPDES Plus Monitoring Plan (NPMP) (2010 to Present) 16

2.2.2 Boom Studies (2009 to 2013) 17

2.2.3 Video Inspections (2013 and earlier) 17

3. Pathway Evaluation 17

3.1 Residential Versus Non-Residential Pathway 17

3.2 GSI Criteria Pathway 18

3.3 Drinking Water Pathway 19

3.4 Vapor Phase Exposure Pathway 19

3.4.1 Vapor Intrusion Data Evaluation 19

3.4.1.1 Applicable Criteria – Groundwater (Rule 714) 19

3.4.1.2 Applicable Criteria – Soil (Rule 724) 20

3.4.2 Vapor Intrusion - Methane 20

3.4.3 Vapor Intrusion - Institutional Controls 21

3.5 Applicable Criteria and Data Presentation 22

3.5.1 Applicable Criteria – Soil and Groundwater Samples 22

3.5.2 Applicable Criteria – LNAPL Samples 22
3.5.3 Data Presentation 23
4. Remedy Evaluation Process 23
4.1 LNAPL Prioritization 24
4.2 Costing and Evaluation of Alternatives 24
4.2.1 Preliminary Cost Evaluation Matrix 25
4.2.2 Remedial Technology Matrix 25
4.2.3 LNAPL Remedial Decision Tree 25
4.2.4 Remedy Cost Benefit Evaluation 26
4.3 Risk-Based Determination per 761.61(c) 26
5. Remedy Recommendations 28
5.1 LNAPL Remedies 28
5.2 Soil Remedies 28
5.3 Waste Management Unit (WMUs) Remedies 28
5.4 Strategy Memo for LNAPL Impacts at Storm Sewer Outfalls 002, 003, 004, and 005 29
5.5 GSI Pathway Exceedances Strategy Memo 29
5.6 Recommended Remedy Cost Estimates 30
5.7 Operations, Monitoring, and Maintenance 30
5.8 Institutional Controls 30
6. References [TO BE UPDATED UPON FINALIZATION] 31

PREFACE

Investigations conducted by RACER at the Buick City Site (Site), located in Flint, Michigan, in partnership with the EPA, have been designed to accurately and comprehensively characterize the Site (as presented in the conceptual site models) and provide a substantive basis to identify remedies that are protective of health and the environment and are cost effective. A range of remedial options have been identified and evaluated with EPA to ensure appropriate risk management objectives are met by the proposed remedies. Risks at the Buick City Site have been and will generally be addressed in order of established priority, to the extent practical. The process for establishing these priorities is explained below.

This report has been prepared as a guide to the extensive work conducted on the Site and to provide a summary overview of key analyses and the methodologies used to identify and evaluate proposed remedies. Some identified risks have been addressed concurrently with the investigation and remedy evaluation process. The appendices include summaries designed to offer a concise review of the work conducted at the Site and to offer a basic understanding of the findings and remedial recommendations. More in depth questions remaining after a review of this report will require a more in depth review of the underlying referenced background documents. References to background reports and sources of data are also identified.

The challenges associated with this Site are based primarily on the extraordinarily varied historic Site activities and unique Site conditions. Light Nonaqueous Phase Liquids (LNAPL) are the most widespread contaminants that drive the analyses and remedial options. Moreover, a wide range of LNAPL types are found on Site from gasoline to fuel oils and cutting oils. This substantial range of LNAPL types, various historic operations and varied subsurface conditions preclude the application of a common site conceptual model or remedial options. Consequently, the Site work has been divided into 21 different Areas of Interest (AOIs) and specific environmental issues in order to allow for identification and evaluation of remedies designed to match the specific characteristics of each area.

ARCADIS

For example, the Site extends over two miles from the southern end to the northern end and over that distance the subsurface materials vary from permeable sands to tight clays to historic fill with varying depths. Combining that condition with a range of LNAPL types, it is a challenge to find any two locations with similar remedial solutions. In addition, as a result of historic development patterns the majority of the Site is served by a storm sewer system that passes through the Site after serving portions of the City. This sewer system creates a potential preferential migration pathway for contamination on the Site direct to the Flint River. In order to address potential risks to surface water interim remedial measures have included bulk heading storm sewers to prevent migration to the river. It has been a challenge to implement a bulk-heading strategy and also avoid adverse impacts on the storm water service to other portions of the City.

It is also apparent that the nature and distribution of the contamination is not consistent with traditional "plume" characteristics. If traditional soil/groundwater data interpretation techniques are applied certain historical aspects of Site operations may be overlooked. For example, in several instances it was determined that an "area" of LNAPL contamination resulted from a series of discrete releases over time at different locations in the same vicinity involving different types of LNAPL. Under traditional data interpretation methods that area would have been considered a single "Plume" However, after performing further targeted investigations it was determined that a series of discrete releases had taken place necessitating more focused remedial evaluations for each release. These conditions require refocusing remedial alternatives to ensure the proposed remedial options are effective given the specific release area conditions.

As a result of these unique Site conditions no single remedy is applicable or effective for all the LNAPL and other environmental issues at the Site. More appropriate remedies are therefore, identified by evaluating the 21 separate areas/issues at the Site – however, in some areas it has been prudent to combine several historic releases into one remedial evaluation.

Moreover, the priorities for the RCRA facility investigations and corrective measures evaluation were based on risk management principles to prioritize potential releases to the Flint River and polychlorinated biphenyl (PCB) contamination. End points for each

remedial action are also based on appropriate risk reduction and risk management standards. Completion is essentially defined by achieving proper risk management objectives. It is also important to acknowledge that it is inevitable that residual LNAPL will remain in any area where weathered LNAPL is present regardless of the remedial technology applied, with the rare exception of complete excavation. Consequently, risk management principles become the overwhelmingly dominant factor in resolving LNAPL remedial issues and defining the environmentally protective and cost effective LNAPL remedies for the Site.

Finally, it is very important to understand and appreciate the fundamentally different paradigm applicable to LNAPL investigations and remedial decisions. Traditional hydrogeological investigations depend on a characterization of groundwater conditions and movement of contaminants that is different when evaluating LNAPL. Most prominent is the fact that the location and depth of LNAPL in a well may not be a direct reflection of LNAPL conditions in the surrounding material; an assumption that has been historically applicable to traditional non-LNAPL assessments in unconfined groundwater conditions. Furthermore, it is cost effectively impractical to attempt to remove all measurable LNAPL found in monitoring wells. In numerable instances such removal has been attempted, only to be abandoned after years of effort, resulting in extensive expenditures with no material change in environmental conditions. The beginning of the process of adjusting the paradigm applicable to LNAPL is reflected in the work done by the ITRC and their December 2009 publication *Evaluating LNAPL Remedial Technologies for Achieving Project Goals*.

The Site investigations, remedy recommendations, and the LNAPL Decision Flow Chart analyses presented in this report are all based on the guidance and protocols advanced by ITRC and ASTM's *LNAPL Conceptual Site Model Guidance* (E2531-06). Appreciating that these remedial approaches are appropriate requires understanding and accepting the state of the art LNAPL remedial paradigm as defined by ITRC and ASTM. The implementation of an LNAPL remedy also requires the appropriate use of the most current technical state of the art methodologies including the use of membrane Interface Probe (MIP), Laser Induced Fluorescence (LIF) and other investigation techniques such as Natural Source Zone Depletion (NSZD), transmissivity and mobile and residual

LNAPL assessments. Using these methods without understanding how they must be applied and interpreted under the ASTM and ITRC principles can lead to incorrect conclusions and inappropriate remedial strategies.

ARCADIS

1. Introduction

This report presents the remedies recommended for select areas of interest (AOIs) at the Revitalizing Auto Communities Environmental Response Trust (RACER) Buick City Site (Site), located in Flint, Michigan (**Figure 1**). These AOIs have been identified as part of the ongoing Resource Conservation Recovery Act (RCRA) Corrective Action activities at the Site. Remedy recommendations have previously been proposed in the 2008 Revised RCRA Corrective Measures Proposal (CMP) and its Addenda (2009, 2010, and 2011). To the extent any conflicts exist, the recommendations in this report relying on the most recent data and analyses supersede any prior recommendations.

This report presents the following information:

- Section 1 - Historic Site report summary and activities completed in accordance with the March 2000 and September 2011 Administrative Orders on Consent issued for the Site.
- Section 2 - Summary of recent investigations and studies completed to investigate light non-aqueous phase liquid (LNAPL) and the Site's storm sewers.
- Section 3 - Summary of the pathways evaluated and appropriate criteria for comparison.
- Section 4 – Presents a summary of the remedy evaluation process which included prioritizing the LNAPL areas (**Table 5**); using the LNAPL decision tree to identify the risks associated with each LNAPL area (template presented in **Attachment W** and AOI specific evaluations presented as Attachment 2 of **Appendices A through N**); performing a preliminary cost evaluation to identify which remedies would reduce the identified risks cost effectively (**Table 6**); evaluating remedial technologies identified as being potentially applicable at each LNAPL area (**Table 7**); summarizing the completed interim measures, possible remedies and identified risks to select appropriate remedies to address the identified risks (**Table 8**); and completing a polychlorinated biphenyls (PCB) determination for applicable LNAPL Areas (presented as Attachment 3 of **Appendices A through N,** where applicable).
- Section 5 – This section presents remedy recommendations for LNAPL and soil impacts (**Appendices A through R**), as well as strategy memos for the LNAPL

ARCADIS

Impacts at storm sewer Outfalls 002, 003, 004, 005 and groundwater/ surface water interface (GSI) pathway exceedances (**Appendices AA and BB, respectively**), and a summary of the waste management units (WMU) deferred to the U.S. EPA-lead corrective action by the Michigan Department of Environmental Quality (MDEQ) (**Appendices S through U**). Section 5 also presents the estimated costs for the recommended remedies and operations, maintenance and monitoring (OMM) (**Tables 9A through 9C**); and a discussion of the recommended Sitewide institutional controls (**Table 10**). Summary of Site Documents.

In March 2000, the former General Motors Corporation (GMC) entered into a 3008(h) Administrative Order on Consent (2000 Order) with the United States Environmental Protection Agency (U.S. EPA) for the Site. In 2000 the *Description of Current Conditions for Areas North of Leith Street* (Northend) and *Description of Current Conditions for Areas South of Leith Street* (Southend) reports were completed and submitted to the U.S. EPA. Pursuant to the 2000 Order, between 2000 and 2006 investigative work was performed to identify the nature and extent of releases of hazardous waste and/or hazardous constituents at or from the Site. The scope of work and results of these investigations are presented in the following RCRA Facility Investigation (RFI) documents:

- *RCRA Facility Investigation Work Plan* (BBL, 2001);
- *Resource Conservation and Recovery Act Facility Investigation Phase I Report* (BBL, 2002); and
- *Resource Conservation and Recovery Act Facility Investigation Phase II Report* (BBL, 2004, superseded in 2006 by BBL, 2006a).

Pursuant to the 2000 Order after the completion of RFI activities a CMP was submitted to the U.S.EPA in 2006; however, following additional field work the 2006 CMP was revised and supplemented with addenda. The following Corrective Measures Proposals were prepared for the Site:

- *RCRA Corrective Measures Proposal (CMP)* (BBL, 2006b)**;**

- *RCRA Revised Corrective Measures Proposal* (ARCADIS, 2008) , superseded 2006 CMP**;**
- *RCRA Revised Corrective Measures Proposal Addendum No. 1* (ARCADIS, 2009);
- *RCRA Revised Corrective Measures Plan Addendum No. 2* (ARCADIS, 2010a); and
- *RCRA Revised Corrective Measures Plan Addendum No. 2-1* (ARCADIS, 2011a).

The *Revised Corrective Measures Plan Addendum No. 2* (2010 CMP Addendum No. 2) was prepared to update the proposed remedies for the Northend of the Site based on the Remediation Cost Estimate Summary (RCES), which was prepared by Motors Liquidation Company (MLC) during the bankruptcy proceedings and to facilitate the preparation of the Statement of Basis for the Northend of the Site. As investigation and delineation activities had not yet been completed at the Northend of the Site, the remedies presented in the 2010 CMP Addendum No. 2 were based on the general remedies included in the RCES until sufficient data had been collected to select remedies specific to each LNAPL area.

The remedies presented in the previous CMP documents have been reviewed in conjunction with subsequently collected Site data and remedy revisions based on most recent data have been incorporated herein. The recommended remedies presented as appendices to this report in some instances supersede those remedies previously presented and in some cases establish new remedies for new areas. **Table 1** presents a cross reference between all of the proposed remedies for the Northend and Southend of the Site and the document where the remedy is proposed, which includes this report, the CMP and its addenda, and the Final Decision for the Southend of the Site.

The Final Decision for the Southend of the Site was issued by U.S. EPA in May 2010 (Southend Final Decision).

The essential remedial components in the Southend Final Decision included Multi-Phase Extraction (MPE), LNAPL Passive Recovery Trenches, Excavation of Contaminated

Soils, monitoring of in place contamination and Institutional Controls to prohibit use of groundwater and to limit access to other in place contamination. All of these elements are proposed for further remedial activities in the Northend; for example, MPE is proposed for AOI 36-1/36-2 and LNAPL Passive Recovery Trenches are proposed for AOI 10-1/10-4, AOI 36-5, AOI 83/84-1, and AOI 86-1. Institutional Controls will be applied to the entire Site with selected specific controls in certain areas of the Site.

The Southend Final Decision also required the preparation of a *Corrective Measures Implementation (CMI) Work Plan* (CMI Work Plan) (ARCADIS, 2010b), which was submitted to the U.S. EPA in August 2010. Beginning in 2011, annual CMI reports have been prepared to summarize ongoing Site CMI activities, as listed below:

- *2010 Corrective Measures Implementation Annual Report* (ARCADIS, 2011b);
- *2011 Corrective Measures Implementation Annual Report* (ARCADIS, 2012);
- *2012 Corrective Measures Implementation Annual Report* (ARCADIS, 2013).
- *2013 Corrective Measures Implementation Annual Report* (ARCADIS, 2014).

Site investigation data such as soil boring logs, monitoring well logs, laser induced fluorescence (LIF) logs that have been previously presented in the Site documents discussed above are not re-presented in this report. However, to facilitate review of the remedy recommendation memos included in **Appendices A through U** (EPA comments to these memos are included as **Appendix V**), tables of groundwater, soil and LNAPL analytical data for each AOI/issue as well as groundwater level data are presented in **Appendix X**. In addition the above referenced documents are presented in **Appendix Y** (attached CD) and are also available on websites for RACER Trust and the U.S. EPA.

- htttp://www.epa.gov/region05/cleanup/rcra/buickcity/index.html

2. Recent Investigation, Studies, and Evaluations

Additional investigation activities and studies have been completed at both the Northend and Southend of the Site since the submission of the Revised CMP Addendum No. 2-1, in order to delineate the extent of and characterize impacts; to evaluate recoverability

and natural degradation of LNAPL; and to perform bench scale studies on selected remedial technologies. These activities are summarized in this Section.

2.1 LNAPL Investigations and Studies

The Interstate Technology and Regulatory Council (ITRC) and the MDEQ identify three different conditions that characterize the potential for non-aqueous phase liquids (NAPL) movement in the subsurface (ITRC, 2009). The MDEQ definitions are presented below:

- Residual NAPL saturation: the range of NAPL saturations greater than zero NAPL saturation up to the NAPL saturation, at which NAPL capillary pressure equals pore entry pressure and includes the maximum NAPL saturation, below which NAPL is discontinuous and immobile under the applied gradient.

- Mobile NAPL: NAPL that exceeds residual saturation, and includes migrating NAPL, but not all mobile NAPL is migrating NAPL.

- Migrating NAPL: NAPL that is observed to spread or expand laterally or vertically or otherwise result in an increased volume of the NAPL extent, usually indicated by time series data or observation. Migrating NAPL does not include NAPL that appears in a well within the historical extent of the NAPL due to a fluctuating water table.

2.1.1 Laser Induced Fluorescence (LIF) Investigation (2010 to 2012)

LIF investigations were completed at the Site from 2010 to 2012 to delineate the vertical and horizontal extent of LNAPL impacts. During the investigations the LIF probe was advanced using a track-mounted direct-push rig. The first five feet of all borings were advanced using a hand auger or air-knife; therefore, LIF responses from 0 to 5 feet below ground surface were not included in the analysis. Based on a correlation of the observed fluorescence with field data indicative of LNAPL it was determined that LIF readings of less than 5 percent reference emitter (%RE) were attributable to background fluorescence and/or were relatively insignificant. Only responses greater than 5% were considered meaningful to further refine the extent of Site impacts.

LIF responses above background are indicative of the presence of LNAPL in the subsurface, but the magnitude of the response is not representative of mobile LNAPL. The magnitude of the LIF response is related to the soil type, LNAPL type (mainly the fraction of polycyclic aromatic hydrocarbons [PAHs]), and the LNAPL pore saturation. The residual LNAPL saturation of a soil is directly related to soil structure, LNAPL physical properties, and the maximum historical LNAPL saturation, which are spatially variable at an environmental site. Although a higher LIF response is indicative of a higher LNAPL saturation, the variability of the area specific LNAPL residual saturation renders LIF responses indicative of LNAPL mobility challenging. The measurable accumulation of LNAPL in a monitoring well is a decisive measure of mobile LNAPL. Summaries of the LIF investigation results are presented in the *2010, 2011, and 2012 CMI Annual Reports* (ARCADIS, 2011b, 2012, and 2013, respectively).

2.1.2 LNAPL and PCB Delineation Activities (2013 to 2014)

Additional LNAPL and PCB delineation activities were completed at the Site in 2013 and 2014. The objective of the activities was to collect additional Site data to aid in determining remedies and/or technologies to address LNAPL at the Site. The results of these investigations are included in the AOI specific LNAPL remedy recommendation memos presented in **Appendices A through N**. Tables of analytical results are presented in **Appendix X**.

2.1.3 LNAPL Extent Evaluation (Updated 2013/2014)

The areal extents of measurable LNAPL at the Site were previously defined in the 2006 RFI Phase II Report. The following process was used to update the delineation of the areal extent of the areas containing LNAPL incorporating the most recent data.

1. Additional data from monitoring wells located within the vicinity of the LNAPL areas was included in the evaluation to update the areal extent of the LNAPL (i.e. if LNAPL was measured in a monitoring well at a thickness greater than 0.1 ft the area in the vicinity of the well is included within the LNAPL extent).

2. Groundwater/LNAPL gauging data were evaluated to identify where LNAPL had been measured at a thickness of greater than 0.1 feet, more than once in the past three years for inclusion in the LNAPL area.
3. When evaluating data from monitoring wells that have been abandoned – the wells were included within the LNAPL area if LNAPL was measured at a thickness greater than 0.1 feet more than once, during the last three years it was monitored before abandonment.
4. In the vicinity of closed LNAPL removal systems available Site data was evaluated to determine whether it is still appropriate to include the abandoned well/facilities within the LNAPL area.
5. The initial extent of LNAPL is established halfway between a monitoring well where LNAPL is measurable and a monitoring well where LNAPL is not measureable. The extents are further refined by incorporating information from soil boring logs and/or LIF logs completed in the area.

Figures 2 and 3 present the previous extents of LNAPL and the revised extents for the Northend and Southend of the Site, respectively. Please note that previously the LNAPL extents were based on monitoring wells that exhibited an LNAPL thickness of 0.5 feet or greater, while the new extents are based on monitoring wells that exhibit LNAPL thicknesses of 0.1 feet or greater The thickness of 0.1 feet is conservative and is intended to ensure adequate assessment of the potentially recoverable LNAPL. In addition, the evaluation was primarily focused on the last three years of groundwater/LNAPL level data, which represent Site conditions since factory operations ceased, building demolition was completed, and the LNAPL interim measures were terminated. LNAPL delineation and characterization investigations completed during this time also provide a more robust data set that addresses seasonal variations.

In addition, as discussed in Attachment 2 of each LNAPL remedy recommendation (**Appendices A through N**) memo the LNAPL areas at the Site are stable (not migrating) based on the age of the releases (LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped [ITRC, 2012]) and well gauging data. Groundwater/LNAPL levels are presented in **Appendix X**.

2.1.4 LNAPL Transmissivity Testing (2011 to 2013)

LNAPL transmissivity testing was completed at the Site to quantify relative LNAPL recoverability, to focus LNAPL recovery efforts in areas where LNAPL recovery may be effective, and to aid in establishing the practicable limits of LNAPL recovery. LNAPL transmissivity can be used to assess the recoverability of LNAPL within a saturated zone. LNAPL transmissivity is defined as the volumetric LNAPL flow rate per unit time under a unit hydraulic gradient, through a unit width of porous media. The permeability of the saturated zone and the LNAPL fluid properties that affect recovery rates, predominantly viscosity, are inherently factored into LNAPL transmissivity. LNAPL transmissivity measurements can be used to characterize relative LNAPL mobility and potential recoverability, but cannot predict ultimate recovery volumes (ASTM E2856-12).

In 2011-2012 transmissivity testing was attempted at 11 monitoring wells located in the Southend of the Site. These wells were selected because they met the study requirements of containing greater than 0.5 foot of LNAPL and the air-LNAPL and LNAPL-water interfaces were within the well screen interval. Four quarters of transmissivity testing were completed at the Southend of the Site and the results were summarized in the *2012 Annual CMI Report* (ARCADIS 2013). In 2013 two rounds of transmissivity testing were completed at a total of 14 monitoring wells located at the Northend of the Site. The transmissivity testing locations are presented on **Figures 2 and 3** and a summary of the results is presented on **Table 2**.

Transmissivity data is compared to the following criteria to aid in determining whether LNAPL is readily recoverable.

- ITRC's suggested minimum range, indicating that LNAPL recovery may be practical, is 0.1 to 0.8 ft^2/day (ITRC, 2009).
- The MDEQ has indicated that an LNAPL transmissivity of 0.5 ft^2/day may be established as a draft standard threshold value for recovery to the maximum extent practicable (Swiger, 2013), permitting the use of LNAPL transmissivity as a quantitative recoverability metric in the State of Michigan in the absence of risk-based LNAPL concerns.

The transmissivity results are compared to these criteria and are discussed in the AOI specific LNAPL remedy recommendation memos presented in **Appendices A through N**. Transmissivity results suggested potential recoverable LNAPL in a total of five monitoring wells. One monitoring well with potentially recoverable LNAPL is located in each of the following LNAPL areas: AOI 10-1/10-4, AOI 823/84-2, AOI 83/84-5, AOI 09-B and AOI 40-A, -B & 16-C.

2.1.5 LNAPL Natural Source Zone Depletion (NSZD) Testing (2012 to 2013)

The NSZD study was completed at the Site, as one of a series of multiple lines of evidence for remedy evaluation, designed to estimate ongoing natural attenuation rates of LNAPL as a baseline for comparison to active LNAPL recovery technologies. The NSZD studies were initiated in the Southend of the Site in 2012. Due to the shallow depth to groundwater in this part of the Site, NSZD was measured through two methods; nested soil gas probes and use of experimental carbon dioxide traps from Colorado State University (CSU). Three rounds of testing were completed from February through September 2012 in accordance with the *Southend: Natural Source Zone Depletion and LNAPL Transmissivity Measurement Work Plan* (ARCADIS, 2011c).

The nested soil gas points were installed in three areas where the depth to groundwater exceeded five feet to collect data to support NSZD rate assessment via the Johnson and Lundegard method. Carbon dioxide traps provided by CSU were installed at four locations where the depth to groundwater was less than 5 feet (an insufficient depth for nested soil gas points) to collect data for NSZD rate assessment via the CSU method. In addition, nested soil gas points and carbon dioxide traps were installed at four common locations to allow comparative evaluation of NSZD rates obtained using the two techniques.

Due to the presence of concrete slabs covering the study areas at the Southend of the Site, the data from the carbon traps was not quantifiable; therefore, only the Soil Gas Results are presented in **Table 3A**. The soil gas results include calculated and estimated NSZD results. The calculated NSZD is based on the field oxygen gradient as measured in the soil gas probes. Given the variable field conditions at the Site, NSZD values were also estimated based on the assumption that oxygen is present at atmospheric

concentrations at the surface and is depleted at the water table. Oxygen is typically depleted at depths shallower than the water table. The results of this study are presented in their entirety in the *Southend Natural Source Zone Depletion Evaluation and Results* included in **Appendix Y**.

In 2013 an NSZD study was completed at the Northend of the Site using the carbon traps in locations where no concrete or asphalt surface cover was present. The results of the Northend carbon trap testing are presented on **Table 3B.** The NSZD testing locations are presented on **Figures 2 and 3** and the NSZD results are also discussed in the AOI specific LNAPL remedies presented in **Appendices A through N**.

In general these field tests demonstrated NSZD is occurring at the Site both in open areas, under slabs, and under other impervious surfaces.

2.1.6 Summary of Bench-Scale Testing Results (2010 to 2013)

Bench-scale treatability studies were conducted to evaluate the potential to recover two LNAPL types characterized as hydraulic oil and fuel oil from four AOIs at the Site. The purpose of the testing was to assess LNAPL remediation technology performance on the variable soil types and LNAPL types present at the Site. Bench-scale tests were conducted to assess the following remedial technologies:

- Physical (Hydraulic) LNAPL Recovery: Recovery of LNAPL through conventional hydraulic methods (pumping, skimming, etc.).
- Surfactant-Enhanced LNAPL Recovery: Enhanced physical recovery of LNAPL by flooding the LNAPL affected area with surfactant and extracting LNAPL.
- Thermally-Enhanced LNAPL Recovery via:
    - Hot water flooding: Enhanced physical recovery of LNAPL by flooding the LNAPL affected area with hot water and simultaneously extracting LNAPL.
    - High temperature application: The subsurface is heated above the boiling point of water to increase the volatilization of LNAPL and the

resulting vapors are removed with vapor extraction wells. Two common methods are electrical resistive heating (ERH) or thermal conductive heating (TCH).

- In-Situ Chemical Oxidation (ISCO): An oxidant is injected into the subsurface to chemically oxidize the LNAPL.
- Surfactant-Enhanced ISCO: Surfactant is injected with oxidant to increase the solubility of the LNAPL, increasing the rate of chemical oxidation.

The testing was conducted in three parts; preliminary testing, bench-scale testing, and injectability testing. Preliminary fluid property tests were conducted on Site LNAPL and groundwater to provide a basis for selecting enhanced bench-scale test conditions. Bench-scale tests were designed to evaluate the efficacy of the five remediation technologies outlined above. The injectability testing was completed to determine the feasibility of reagent injections. A summary of the bench-scale testing results are presented in the Bench-Scale Testing Matrix, presented in **Tables 4A** and **4B**. The technologies identified during bench-scale testing as potentially applicable at the Site were Thermally-Enhanced LNAPL Recovery via High Temperature Application and Surfactant Enhanced Hot Water Flooding. Please note that application of these remedies would not preclude the need for ongoing groundwater monitoring or long term monitoring requirements.

In addition in 2013 a method based on enzyme application was evaluated by a consultant offering to identify innovative remedial approaches. The laboratory testing conducted by that consultant concluded that the enzyme method produced a “highly water soluble byproduct” making LNAPL recovery even more challenging. That assessment was discontinued.

2.2 Storm Sewer Investigations and Studies

Various investigations, studies and evaluations of the Site’s storm sewers have been completed to identify areas of infiltration of LNAPL and impacted groundwater, evaluate hydraulic capacity, and identify appropriate remedies. These investigation activities have

included NPDES Plus Monitoring Plan sampling, boom studies, video inspections, the Outfall 004 Flow Study, and evaluation of the residual LNAPL impacts at the river banks.

2.2.1 NPDES Plus Monitoring Plan (NPMP) (2010 to Present)

The NPMP was implemented at the Site to evaluate compliance with Michigan Part 201 GSI criteria for the long-term protection of the Flint River. During the RCES development activities in May 2010, the U.S. EPA and MDEQ agreed to the approach of sampling of the storm sewers as a means to address potential GSI impacts in lieu of performing groundwater monitoring in wells adjacent to the sewer. It was agreed that samples collected in the sewers were representative of the aggregate groundwater quality discharging into the sewers from the surrounding groundwater and would more accurately reflect the potential risk to the Flint River. This sampling program was originally referred to as "NPDES plus" monitoring because the samples were collected at the NPDES sample locations, but samples are collected at more locations and at a greater frequency than what was required in the NPDES permit for the Site.

The NPMP consists of collecting monthly samples from Site storm sewers during dry weather conditions to evaluate whether the groundwater infiltrating into the Site storm sewers impacts the Flint River. Sampling during dry weather flow conditions provides the most accurate assessment of the condition of the groundwater infiltrating the storm sewers.

Storm sewers associated with the following National Pollutant Discharge Elimination System (NPDES) outfalls have been included in the NPMP: Outfalls 001, 002, 003, 004, 005, 006, 007, 009, 010, 011, and 013. Outfalls have been removed from the monitoring program as bulkhead and re-routing activities are completed including Outfalls 002, 004, 005, and 007 to date. Summaries of the NPMP investigation results are presented in the *2010, 2011, and 2012 CMI Annual Reports* (ARCADIS, 2011b, 2012, and 2013, respectively).

ARCADIS

2.2.2 Boom Studies (2009 to 2013)

"Boom studies" were completed in order to identify and define the portion of a sewer where oil infiltration is occurring. In general the boom studies involve installation of oil absorbent booms at selected manhole locations and inspecting the booms on a regular basis for oil accumulation. Based on the results of the initial boom evaluation, additional booms are then installed upgradient or downgradient of the initial manhole in order to identify and define the portion of the sewer where oil infiltration is occurring. Various boom studies were completed at the Site from 2009 to 2013 to identify and isolate areas of potential oil infiltration into the Outfall 002, 003, 004, and 005 storm sewer systems. Summary tables for the studies are presented in **Appendix X** and a summary memo is presented in **Appendix Y**.

2.2.3 Video Inspections (2013 and earlier)

Various video inspection activities were completed in 2013 to evaluate the Outfall 013 storm sewer prior to potential re-route activities; to evaluate a section of the Outfall 003 storm sewer for oil infiltration; and to inspect a portion of the Outfall 002 storm sewer between the Site and the Flint River for staining and/or oil infiltration. The 2013 video inspections are summarized in the *2013 CMI Annual Report* (ARCADIS, 2014).

Storm sewer video inspections completed prior to and during the RFI are discussed in the *RFI Phase II Report* (BBL, 2006a). The Storm Sewer Video Inspection Memo is presented in its entirety in **Appendix Y.**

3. Pathway Evaluation

This section provides a discussion of the evaluation of relevant pathways at the Site and appropriate criteria for comparison.

3.1 Residential Versus Non-Residential Pathway

The Buick City Site is zoned industrial and a land use restriction will be filed to require that the property use remain non-residential in the future. In addition the adjacent

downgradient properties are non-residential and primarily used as railroads or heavy manufacturing.

As such, analytical data collected from the Site and the downgradient off Site sample locations are compared to applicable Michigan Part 201 non-residential criteria, as the residential pathway is not applicable.

3.2 GSI Criteria Pathway

In the Northend the Site storm sewers are the potential GSI pathway. This pathway is evaluated as part of the NPMP where monthly samples have been collected from each of the storm sewers since September 2009 at monitoring points along the downgradient property boundary (**Figure 4**). Storm sewer samples are compared to the GSI criteria. As part of Site remedial activities, sections of the storm sewers have been bulkheaded to eliminate downstream (pipe) migration of oil or groundwater that might be infiltrating into the storm sewer and eliminate the GSI pathway. The portions of the Northend where the storm sewers have been bulkheaded are shown in grey on **Figure 5** and GSI and GSI protection (GSIP) criteria are not applicable in these areas.

In the Southend the GSI pathway is potentially complete via the Site storm sewers and direct to the Flint River. NPMP sampling is also conducted within the storm sewers in the Southend and the results are compared to GSI criteria. As mentioned above portions of the storm sewers have been bulkheaded in the Southend (shown in grey on **Figure 6**) and GSI and GSIP criteria are not applicable in these areas. However, analytical results of samples from monitoring wells RFI-09-48, RFI -84-06S, and RFI-94-02R, which are included in the annual groundwater monitoring event, are compared to GSI criteria to assess potential for contamination to reach the Flint River in excess of GSI criteria.

In accordance with MDEQ current compliance determination methodologies, if a soil or groundwater sample collected from an area contains analytes at a concentration that exceeds GSI or GSIP criteria, respectively, the exceedance will only be further evaluated if the analyte is also detected above GSI criteria in a relevant Outfall's NPMP sampling, in a sample collected at the Outfall's compliance point, or in a monitoring well near the river. The results of the NPMP sampling events are further discussed in Section 5.5.

Figures 5 and 6 also present the Site drainage areas, and the locations of the bulkheads in addition to the Site storm sewers. **Figures 7 and 8** present the locations of the known Site utilities.

3.3 Drinking Water Pathway

A groundwater use restriction is planned for the Site that will prohibit use of groundwater for any use other than sampling, investigatory, remediation, or short-term dewatering purposes (in compliance with applicable environmental standards). In addition, a groundwater use restriction is being proposed for the Site as well as the downgradient properties between the Site and the Flint River. As such, the drinking water pathway is not applicable on or off Site.

3.4 Vapor Phase Exposure Pathway

Site soil and groundwater data will be evaluated, as discussed below, to identify potential vapor phase impacts. Based on the results of the data evaluation additional investigation will be completed to further evaluate potential impacts along the property boundary, where necessary.

3.4.1 Vapor Intrusion Data Evaluation

The vapor phase pathway at the Site is being evaluated in accordance with MDEQ Part 201 Administrative Rules (Part 201 Rules). The Part 201 Rules establish the generic cleanup criteria for the hazardous substances in vapors emanating from groundwater (R 299.5714 - Rule 714) and soil (R 299.5724 – Rule 724) to indoor air and identify when Site specific screening is required, as discussed below.

3.4.1.1 Applicable Criteria – Groundwater (Rule 714)

Rule 714(2) identifies conditions where the generic MDEQ Part 201 cleanup criteria for groundwater do not apply and a site specific evaluation is required. Per Rule 714(2) if any of the following conditions apply, then a site-specific evaluation of indoor air inhalation risks must be completed:

(a) There is a structure present or planned to be constructed at the facility which does not have a concrete block or poured concrete floor and walls.
(b) The highest water table elevation of a contaminated saturated zone at the facility, considering seasonal variation, is within three meters of the ground surface.
(c) There is a sump present that is not completely isolated from the surrounding soil by its materials of construction; or there is other direct entry of contaminated groundwater into the basement.

As there are no buildings or sumps at the Site, the MDEQ Part 201 Generic criteria are applicable except at locations where the highest water table elevation is within three meters of the ground surface. In portions of the Site where a Site specific evaluation is required per Rule 714 (2)(b) the evaluation will be completed in accordance with the *Guidance Document for the Vapor Intrusion Pathway* (MDEQ, 2013).

3.4.1.2 Applicable Criteria – Soil (Rule 724)

Rule 724(2) identifies conditions for which the generic cleanup criteria for soil do not apply and a site-specific evaluation is required. If any of the conditions outlined in Rule 724(2)(a-b) apply, then a site-specific evaluation must be completed.

(a) There is a structure present or planned to be constructed at the facility which does not have a concrete block or poured concrete floor and walls.
(b) There is a sump present that is not completely isolated from the surrounding soil by its materials of construction.

As there are no buildings or sumps at the Site, the MDEQ Part 201 Generic criteria are applicable.

3.4.2 Vapor Intrusion - Methane

It is also recognized that natural biodegradation of LNAPL may also generate methane that could accumulate in the absence of oxygen. Methane generation could theoretically result in indoor air quality concerns for future structures. Although methane is likely to be

generated by the hydrocarbons left in place, the risk associated with the methane is low. Potential risks associated with methane are acute, explosive (between 5%-15% methane and greater than 11% oxygen) and asphyxiation (displacement of oxygen to below 16%), and there are no chronic human health risks. Methane is effectively respired by aerobic bacteria in soils once oxygen is present, so it is unlikely to find methane and oxygen at concentrations within explosive limits where soil gas transport is dominated by diffusive flow. In an occupied space, asphyxia may result if the oxygen concentration is reduced to approximately 16% as a result of displacement from methane generation. The concentration of methane at which asphyxiation risk becomes significant is higher than the upper explosive limit (15%) and is unlikely in spaces that are not confined. Neither acute condition is likely to occur due to the relative high concentrations of methane required to meet the acute risks, the rapid degradation of methane in the subsurface in the presence of oxygen, and the diffusion dominated subsurface environment. In addition, the soil gas sampling completed as part of the NSZD study at Buick City showed that methane was generated (maximum concentration about 2% in deep samples); however, oxygen was present at all locations and methane was not detected in the shallowest samples indicating that there was sufficient microbial population and enough oxygen to degrade the methane.

3.4.3 Vapor Intrusion - Institutional Controls

The proposed deed restrictions for the Site will include restrictions that require the property use to remain non-residential and prohibit construction of new structures, unless construction incorporates: appropriate engineering controls to eliminate potential for volatilization to indoor air or an evaluation of the vapor intrusion pathway for the new construction must be completed; and preparation of a health and safety plan. The Site does not currently contain any permanent structures; therefore, the vapor intrusion to indoor air pathway is not currently complete at the Site.

ARCADIS

3.5 Applicable Criteria and Data Presentation

3.5.1 Applicable Criteria – Soil and Groundwater Samples

Soil and groundwater samples collected at the Site were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals and/or PCBs as appropriate. The analytical data collected at the Site are compared to applicable Michigan Part 201 criteria dated December 30, 2013 and exceedances of criteria are discussed in each of the AOI specific remedy recommendation memos.

Please note that the data presented in historical Site reports were collected using approved methodologies and compared to applicable criteria *at that time*. For example groundwater samples collected during the Phase I RFI were filtered and analyzed for dissolved metals, which was in accordance with MDEQ requirements in 2001. However, subsequently the MDEQ required that groundwater samples be analyzed for total metals using low-flow sampling techniques for comparison to criteria. All data and exceedances discussed in this report are in comparison to current criteria.

Also, while soil data are compared to the Soil Saturation Concentration (CSat) criteria, CSat criteria are not risk based. CSat is a conservative predictor of where LNAPL may be present. Soils with concentrations greater than the CSat criteria have the potential to have LNAPL present; however, this is not definitive evidence of the presence of LNAPL.

3.5.2 Applicable Criteria – LNAPL Samples

LNAPL samples collected from each of the AOIs were submitted for total VOCs, SVOCs, metals, PCBs, and/or fingerprint analysis. Although there are no LNAPL specific criteria available, the LNAPL data were compared to the MDEQ Part 201 non-residential soil direct contact criteria and the RCRA Toxicity Characteristic Criteria in order to evaluate the relative hazards that may be associated with the LNAPL. Where the analytical data identify a constituent at a concentration which exceeds toxicity criteria the constituent is identified as 'potentially hazardous' in the AOI specific memos (**Appendices A through N**). LNAPL samples will be submitted for TCLP analysis for waste characterization prior to disposal.

3.5.3 Data Presentation

The remedy recommendation memos include a brief summary of the analytes exceeding State Default Background Levels and one or more criteria; the detection or range of detections exceeding criteria and the criteria per the following examples. The format used to present the exceedances lists both the detected amount and the applicable criteria; for example:

- GSIP criterion is exceeded for cobalt (3/2 mg/kg), where '3' represents the detection of cobalt above criteria and '2 mg/kg' represents the GSIP criterion, and
- GSIP criterion is exceeded for arsenic (8-16/4.6 mg/kg), where '8-16' represents the range of detections of arsenic above criteria and '4.6 mg/kg' represents the GSIP criterion.

4. Remedy Evaluation Process

This section summarizes the evaluation process used when preparing the remedy recommendations for the Site's 17 LNAPL areas, which are located within the identified AOIs and have been delineated and characterized as part of the RFI and subsequent investigations. The specific conditions at each LNAPL area are addressed in the remedy recommendation memos presented as **Appendices A through N** of this report.

The foundation for this evaluation process was developed during the preparation of the conceptual site model (CSM) for each AOI. The site investigation information, analytical test results, and the resulting understanding of the site characterization was consolidated in and presented in the CSM and illustrated in the related site plan and cross section drawings. As each cross section was developed and site information was reviewed data gaps were identified and additional field work was performed to collect the needed information. This process was iterative and in some cases resulted in multiple field events to obtain adequate data for the CSM. **Figure 9** presents the locations of the CSM cross sections and the cross section legend. The cross sections are presented in the LNAPL recommendation memos presented in **Appendices A through N.**

4.1 LNAPL Prioritization

The Site's 17 LNAPL areas were prioritized based on five risk metrics:

1) Infiltration – Is the LNAPL infiltrating into the storm sewer?
2) LNAPL Hazards – Does the LNAPL contain PCBs above or below Toxic Substances Control Act (TSCA) criteria? Is the LNAPL flammable? Are any analytes present at potentially hazardous waste levels?
3) Dissolved Phase Plume – Is there a dissolved phase plume (a plume where groundwater concentrations exceed applicable non-residential criteria or GSI criteria, where applicable) associated with the LNAPL area?
4) Offsite Footprint – Does the LNAPL area or its associated dissolved phase plume extend to off-Site properties?
5) Human Health Risk Assessment (HHRA) – Did the HHRA, as presented in the 2006 RFI Phase II Report identify any risk associated with soil, vapor or LNAPL for this LNAPL area?

Because of the risks associated with PCBs and potential releases direct to the Flint River, heavier weight was applied where these risks are present. For example, when PCBs in LNAPL have the potential to reach the Flint River via a storm sewer; those areas rank highest. Each of the LNAPL areas is ranked based on these metrics, weighting, and the available information as of March 2014 as presented in **Table 5**. As interim measures and/or remedies are implemented **Table 5** will be re-prioritized to identify the areas of highest environmental risk.

4.2 Costing and Evaluation of Alternatives

This section discusses the costing and remedial technology evaluations completed as part of the remedy recommendation process. **Table 6** presents the Preliminary Cost Evaluation Matrix (PCEM) which evaluates potential alternatives relative to whether the cost of the alternative is proportional to the effectiveness that would be achieved. The remedies potentially feasible from **Table 6** were carried forward into the Remedial Technology Matrix (**Table 7**) for further evaluation along with other remedy options identified during evaluation activities. Potentially applicable remedies identified in the

Remedial Technology Matrix (RTM) were summarized in the **Table 8**, the Remedy Cost Benefit Matrix (RCBM). The RCBM presents the potential remedies and their estimated costs in conjunction with the risks and benefits from the LNAPL Remedial Decision Tree (Decision Tree) analyses. **Tables 6, 7 and 8** are discussed in additional detail below.

4.2.1 Preliminary Cost Evaluation Matrix

The PCEM (**Table 6**) was prepared to evaluate whether potential alternatives would be feasible from a cost basis. During the bench-scale testing activities surfactant-enhanced LNAPL recovery and thermally-enhanced LNAPL recovery via high temperature application while not cost effective across the Site, were identified as potentially being applicable to address certain LNAPL areas. These technologies along with soil mixing, land farming and excavation were evaluated for each of the LNAPL areas. Technologies identified as being potentially feasible from a cost basis were carried forward into the RTM for further evaluation. . Please note that it is not possible to assess different remedies unless the volume of impacted soil is assumed for purposes of cost estimating. For this purpose we estimated volume of impacts based on where LNAPL was detected in monitoring wells at 0.1 foot or greater thickness. These estimates are not used as the basis for assessing environmental risk – but only for relative cost comparisons.

4.2.2 Remedial Technology Matrix

The RTM (**Table 7**) was developed to document the evaluation of technologies to determine which would potentially be feasible at each of the LNAPL areas at the Site and was updated on an ongoing basis as evaluations were completed. The RTM includes a summary of the key factors used in assessing the most appropriate remedy technology for each area. The RTM was used in conjunction with the LNAPL Remedial Decision Tree (discussed below) to determine the recommended remedies for each AOI.

4.2.3 LNAPL Remedial Decision Tree

The LNAPL Remedial Decision Tree was developed to provide a consistent framework for identifying LNAPL remedial drivers and determining an appropriate remedial strategy

based on a sound LNAPL conceptual site model (LCSM). This Decision Tree is predicated on the development of a LCSM in accordance with ASTM Guidance (Designation: E2531 – 06 *Standard Guide for Development of Conceptual Site Models and Remediation Strategies for Light Nonaqueous-Phase Liquids Released to the Subsurface*). The subsequent evaluation of the LCSM follows Interstate Technology & Regulatory Council (ITRC) guidance and good practices (Technical/Regulatory Guidance - *Evaluating LNAPL Remedial Technologies for Achieving Project Goals, December 2009*) The Decision Tree identifies risks driven by the chemical composition of the LNAPL (referred to as composition concerns) and/or issues associated with the presence of LNAPL that could move to a location where it could cause an unacceptable discharge (referred to as saturation concerns). If either composition or saturation concerns (or both) are identified, the decision tree provides a systematic approach for evaluation of applicable LNAPL management alternatives in the context of Site-specific LNAPL conditions.

Findings from previous and recent investigations were used to navigate through the Decision Tree, remedial drivers were identified and a LNAPL management strategy was proposed for each LNAPL area. The Decision Tree template is presented in **Appendix W**. A detailed summary of the analysis and path through the Decision Tree for each LNAPL area is provided as Attachment 2 in **Appendices A through N**.

4.2.4 Remedy Cost Benefit Evaluation

The Remedy Cost Benefit Matrix (RCBM) was developed to summarize the potentially applicable remedies and their estimated costs in conjunction with the risks and benefits from the Decision Tree analyses. Remedies were then developed to address the risks identified for each of the LNAPL areas at the Site. The RCBM (presented in **Table 8**) includes the key factors used in assessing the most appropriate remedial technology for each LNAPL area.

4.3 Risk-Based Determination per 761.61(c)

In areas where PCBs have been detected at concentrations greater than 1 part per million (ppm), each of the remedy recommendation memos include a request for a risk-

based determination per 761.61(c). The memos include AOI-specific information required in 761.61(c) and references to relevant Site reports for general Site-wide information. The request addresses the nature and extent of the PCB impacts; outlines the proposed plan for which impacts will be removed and which impacts will remain in place; proposed engineering and institutional controls; and proposed waste characterization and disposal plans. During the October 24, 2013 Meeting with RACER, U.S. EPA clarified their position in regards to TSCA issues at the Buick City Site:

> Region 5 U.S. EPA posed this question on the PCB National call 9/16/13:
>
> > The facility is requesting disposal of material at the oil/water separators at "as-found" concentrations given that this is a remedial project and the resulting oil waste at the separator, if found at < 50 ppm, is not the result of "intentional dilution" of any in-situ > 50 ppm NAPL sources that may have infiltrated the sewer. They believe the oil at the separators is Remediation Waste.
> >
> > Question 1: Can the PCB impacted oils at the separators be viewed as PCB Remediation Waste and disposed of based on an "as-found" concentration? (The 761.3 definition for PCB Remediation Waste does not specifically call out oil/NAPL, but it mentions "other debris generated as a result of any PCB spill cleanup, including, but not limited to")
> >
> > *From various responses on the PCB National Call and subsequent discussions, EPA can determine if RACER is not intentionally diluting, and due to the work being conducted under the RCRA 3008(h) Order EPA can use "enforcement discretion" to decide that PCB wastes in the Oil Water Separator are "as found" and not dilution and dispose of accordingly per TSCA.
> >
> > In finalizing proposed remedies for the LNAPL areas there are questions that arise in regards to the disposal of PCB liquids/oils and solids. Submitting a remedy recommendation report for each LNAPL area and referencing 761.61(c) within each report to cover the remediation waste, as opposed to submitting a 61(c) application for approval seems like the prudent path forward.

ARCADIS

5. Remedy Recommendations

Remedy recommendation memos were prepared for select AOIs identified as requiring further action during the RFI and subsequent investigation activities. The remedies presented as appendices to this report in some instances supersede those remedies previously proposed and in some cases establish new remedies for new areas. **Table 1** presents a cross reference between all of the proposed remedies for the Northend and Southend of the Site and the document where the remedy is proposed, which includes this report, the CMP and its addenda, and the Final Decision for the Southend of the Site. Interim measures completed at the Site are summarized in the remedy recommendation memos. Final remedies completed per the Southern Final Decision are documented in the *2010, 2011, and 2012 CMI Annual Reports* (ARCADIS, 2011b, 2012, and 2013, respectively) and are not discussed herein.

The recommended remedies are based on the data available at the time of this report. Data gaps will be addressed in remedy implementation work plans/design documents. Final remedies may be modified based on the results of data gap sampling, if necessary.

5.1 LNAPL Remedies

There are 15 LNAPL areas present at the Site. The remedy has been selected and the MPE system has been implemented at the AOI 09-B gasoline area. Recommended remedies for the 14 remaining LNAPL areas are presented in **Appendices A through N**.

5.2 Soil Remedies

During recent Site investigation activities soil impacts have been identified at AOI 38-1, AOI 40-A, AOI 83/84-3 and AOI 86-1. Recommended remedies for these soil impacts are presented in **Appendices O through R**.

5.3 Waste Management Unit (WMUs) Remedies

In April 2007, a *RCRA Waste Management Unit Closure Status Report* was submitted to the MDEQ – Waste and Hazardous Materials Division (WHMD) summarizing 10 WMU areas (including WMU #3, #7, and #10) and the proposed activities / information required

for closure (ARCADIS BBL, 2007). The reason these selected WMUs are included is explained based on prior MDEQ correspondence.

In a July 27, 2009 response letter the MDEQ determined that due to the possibility that the release may have been from the adjacent product tank and not the regulated waste tank, as well as the fact that some soil removal was conducted during a waterline repair, it would be appropriate to incorporate WMU #3 into the Site-wide corrective action being conducted pursuant to the 2011 AOC and by placing restrictive covenants on groundwater usage and soil relocation.

In a January 15, 2013 correspondence, following the completion of additional investigation activities, the MDEQ determined that the residual contamination at WMU #7 and #10 should be addressed through incorporation into the Site-wide Corrective Action activities being conducted pursuant to the 2000 AOC and by placing restrictive covenants on groundwater usage and soil relocation.

Memos summarizing investigation completed at these WMUs and recommended remedies are presented in **Appendices S, T, and U**.

5.4 Strategy Memo for LNAPL Impacts at Storm Sewer Outfalls 002, 003, 004, and 005

Once investigations addressing infiltration of LNAPL into the Outfall 002, 003, 004, and 005 storm sewers have been completed, activities needed to address the LNAPL impacts at the outfall discharge points to the Flint River will be evaluated and implemented assuming other potential sources of impact can be appropriately accounted for. Strategy recommendations are presented in **Appendix AA**.

5.5 GSI Pathway Exceedances Strategy Memo

As discussed in Section 2.2.1, the NPMP was implemented at the Site to evaluate compliance with Michigan Part 201 GSI criteria for the long-term protection of the Flint River. The NPMP identified select metals at concentrations exceeding GSI criteria. A summary of the NPMP sampling results and strategy recommendations are presented in **Appendix BB**.

ARCADIS

5.6 Recommended Remedy Cost Estimates

A summary of the recommended remedies as well as those previously recommended (Revised CMP or Revised CMP Addendum No. 2) or presented in the Southend Final Decision are presented in **Table 9A**. The estimated design, capital, and OMM costs for the Site remedies are presented in **Table 9B** with additional detailed backup information presented in **Appendix CC**. **Table 9C** presents the rationale for the long term OMM costs.

5.7 Operations, Monitoring, and Maintenance

Operations, monitoring and maintenance activities associated with each of the remedies will be included in an appropriate future submittal such as the basis of design documentation or the corrective measures implementation plan. Documentation will also include details regarding how the effectiveness of remedies will be monitored; frequency of monitoring; what items would trigger re-evaluation, repair or replacement of the remedy; as well as the time frame and end points of monitoring.

5.8 Institutional Controls

Institutional controls are being implemented Site-wide to maintain the property use constituent with the exposure assumptions used by the MDEQ in the development of generic non-residential land use based criteria and to limit or prohibit any activities that interfere with corrective actions such as maintenance of soil cover, prohibition on use of groundwater, and soil relocation obligations.

Table 10 presents each of the Site-wide institutional controls to be implemented at the Site. Future owners will be made aware and required to comply with the institutional controls that generally include; maintain non-residential land use; prohibit installation of well for potable use of groundwater; must address the potential for vapor intrusion; assumes all risks if slabs are removed; and must comply with due care, soil relocation, and all other applicable regulatory requirements. AOI specific institutional controls are presented in **Table 9** and are discussed in the respective remedy recommendation memos (**Appendices A through U**). **Figures 10 and 11** present the locations of the proposed institutional controls for the Site. Also, an example of a restrictive covenant

field for another site is presented in **Appendix Z**.

2014 Remedy Recommendation Report	*2014 RACER Buick City Remedy Recommendation Report,* ARCADIS, 2014
AOI Specific Institutional Controls -	
A	Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads.
B	Notify future owners of the presence of PCBs.
C	Restrict the area to low occupancy based on the presence of PCBs.
D	Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present to prevent direct contact with contaminated material, except with using appropriate health and safety measures, during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier upon completion of the work. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the Natural Resources and Environmental Protection Act.
E	Notify future owners to the potential presence of a listed hazardous waste beneath WMU #10.

General Notes:

Bold Exceeds 0.1 to 0.8 ft^2/day lower criterion range to produce sufficient LNAPL recoverability (ITRC 2009a).

Shaded Exceed the MDEQ standard threshold value for recovery to the maximum extent practicable of 0.5 ft^2/day.

The criteria for potential success of LNAPL recoverability is where the results are greater than **both** the ITRC range and the draft MDEQ standard threshold value.

Footnote:

A - Poor drawdown in this well. Cooper and Jacob was used to get a better fit. The Cooper Jacob method incorporates storativity, which may be occuring at this location causing poor drawdown.

Acronyms and Abbreviations:

0 = LNAPL transmissivity is assumed to be zero due to negligible LNAPL thickness in well at test commencement.

ft = feet

LNAPL = light non-aqueous phase liquid

min = minute

NA = not analyzed for various reasons including poor LNAPL discharge from formation to well, minimal LNAPL drawdown, or nonequilibrium conditions at test commencement.

"--" = not applicable

Notes:
%: percent
mg/m_3 : milligrams per cubic meter
ft bgs: feet below ground surface
gal/acre/yr: gallons per acre per year
ND: not detected
NA: not able to be calculated
1 - The C_{10}-C_{22} hydrocarbon range is typical of volatile organic compounds (VOCs) from diesel fuel.
2 - The C_6-C_{10} hydrocarbon range is typical of VOCs from gasoline.
3 - The calculated NSZD is based on field measured oxygen gradient measured in the soil gas probes.
4 - Given the variable field conditions at the Site, NSZD values were also estimated the assumption that oxygen is present at atmospheric concentrations at the surface and is depleted at the water table. Oxygen is typically depleted at depths shallower than the water table.

	RFI-86-02	Top off	3,101	19.3%	516

Note:

The NSZD raw data was corrected by analyzing for the ^{14}C isotope and removing the carbon dioxide attributed to atmospheric contributions. The NSZD Rate Corrected by ^{14}C represents the portion of NSZD attributed to LNAPL degradation.

Table 4A: **Bench-Scale Testing Matrix**
RACER Buick City Site, Flint, MI

AOI LNAPL Area	Physical LNAPL Recovery, Surfactant Enhanced Recovery, and Thermally Enhanced Recovery Testing Results							
	Sample ID	Depth (ft)	Concentration of Surfactant	NAPL Saturation (% Pore Space)				Reduction in LNAPL Saturation[1]
				Field Saturation	RSWD (residual saturation)	After Surfactant Flood	After Hot Water Flood at 200°F	
AOI 02 Hydraulic Oil	LIF-02-007 (8-10')	10.1	2.25%	14.4	14.4	14.4	---	0.00%
	LIF-02-018 (9-11)	10.1	---	2.1	2.1	---	2.1	0.0%
AOI 12 Hydraulic Oil	LIF-12-010 (20-22)	20.65	1.5%	10.3	10.3	10.3	---	0.0%
	LIF-12-010 (20-22)	21.1	---	12.4	12.4	---	12.4	0.0%
	LIF-12-018 (10-12')	11.7	2.25%	8.7	8.7	8.7	---	0.00%
	LIF-12-024 (8-10')	9.35	---	5.5	5.5	---	5.5	0.0%
AOI 16 Fuel Oil	LIF-16-017 (12-14)	13.1	1.5%	20.5	20.5	20.5	---	0.0%
	LIF-16-017 (12-14)	12.9	---	21.4	21.4	---	21.4	0.0%
	LIF-16-017 (12-14)	13.1	1.5%	20.5	20.5	20.5	---	0.0%
AOI 40-A Fuel Oil	LIF-40-011 (9-11)	10.0	1.5%	10.0	10.0	10.0	---	0.0%
	LIF-40-011 (9-11)	10.2	---	3.2	3.2	---	3.2	0.0%
	LIF-40-004 (26-28)	27.1	1.5%	20.1	20.1	**7.6**	---	62.4%
	LIF-40-004 (26-28)	27.3	---	12.0	12.0	---	**10.7**	10.7%

Notes:
1. The Reduction in LNAPL Saturation is the percent reduction of the starting (field) LNAPL pore saturation after being treated with the water drive, surfactant flood, or hot water flood.

Table 4A: **Bench-Scale Testing Matrix**
RACER Buick City Site, Flint, MI

AOI LNAPL Area	Thermally Enhanced Recovery by High Temperature Application Testing Results						
	Treatment	Baseline		(Heated for 3 Days)		Percent Reduction[3]	
		C_{10}-C_{20} [1] (mg/kg)	C_{20}-C_{34} [2] (mg/kg)	C_{10}-C_{20} [1] (mg/kg)	C_{20}-C_{34} [2] (mg/kg)	C_{10}-C_{20} [1] (mg/kg)	C_{20}-C_{34} [2] (mg/kg)
AOI 12 Hydraulic Oil	LIF-12-010 (18-20)	660	3,200	<84	1,100	87.3%	65.6%
	LIF-12-010 (18-20) Dup	700	3,500	<84	1,600	88.0%	54.3%
	Average	680	3,350	<84	1,350	87.6%	60.0%
	LIF-12-018 (10-12)	320	110	LIF-12-018 (10-12) Not Tested Because of Low TPH Concentrations			
	LIF-12-018 (10-12) Dup	280	100				
	Average	300	105				
AOI 16 Fuel Oil	LIF-16-017 (12-24)	3,500	14,000	<17	<17	99.5%	99.9%
	LIF-16-017 (12-24) Dup	3,300	12,000	<17	<17	99.5%	99.9%
	Average	3,400	13,000	<17	<17	99.5%	99.9%

Notes:

1 - The C_{10}-C_{20} hydrocarbon range is typical of diesel fuel.

2 - The C_{20}-C_{34} hydrocarbon range is typical of diesel fuel/lubricating oils.

3 - The Percent Reduction represents the percent reduction of the initial TPH concentration in soil, after the soil was thermally treated.

Notes:

1. Based on the Human Health Risk Assessment presented in the 2006 RFI Phase II Report.

See next page for rationale of metric ranking.

Site-wide restrictions will include a land use restriction to non-residential and a groundwater use restriction.

Mobility was considered as a metric; however, all Areas are stable, so mobility was not a distinguishing characteristic.

Prioritization may be adjusted if there is a redevelopment potential that requires attention.

As interim measures and remedies are implemented this table is updated and the areas are reprioritized.

February 14, 2013 - Prioritization revised to reflect bulkheading to be completed in Q1 - 2013 and to reflect the priority of addressing the areas contaminated with PCBs.

June 25, 2013 - Prioritization revised to include newly-identified Areas.

July 24, 2013 - Correction to ranking scores.

October 22, 2013 - Updated to rank newly-identified LNAPL Areas AOI 83/84-1 and AOI 83/84-5.

November 13, 2013 - Updated to incorporate detection of PCBs in LNAPL at AOI 03-1.

November 20, 2013 - Updated Metrics 3 and 4 to reflect dissolved phase plumes that exceed applicable Non-Residential criteria or GSI criteria, where applicable.

Table 5. **LNAPL Risk-Based Prioritization Evaluation**
RACER Trust, Buick City Site, Flint, Michigan

Ranking System by Metric		
Metric 1 - Is LNAPL from this area entering Site storm sewers?	6	Yes - LNAPL from this area is thought to be entering the storm sewer.
	3	LNAPL from this area is possibly entering the storm sewer.
	0	No LNAPL from this area is thought to be entering the storm sewer.
Metric 2a - LNAPL TSCA/PCB	6	Analytical data indicate that portions of the LNAPL area are TSCA.
	3	Analytical data indicate that portions of the LNAPL area are PCB containing.
	0	Analytical data indicate that the LNAPL area is non-PCB containing.
Metric 2b - LNAPL Hazardous/Flammable	2	Analytical data indicate that portions of the LNAPL area are hazardous and/or flammable.
	0	Analytical data indicate that the LNAPL area is non-hazardous.
Metric 3 - Is there a dissolved phase plume (an area which exceed applicable Non-Residential criteria or GSI criteria, where applicable)?	2	Yes - there is a dissolved phase groundwater area associated with the LNAPL area
	1	Possibly - there may be a dissolved phase groundwater area associated with the LNAPL area.
	0	No - there does not appear to be a dissolved phase groundwater area associated with the LNAPL area.
Metric 4 - Is there an offsite LNAPL or dissolved phase footprint?	2	Yes - the LNAPL and or the dissolved phase plumes are offsite.
	1	The LNAPL or dissolved phase plume footprint may be offsite.
	0	No - the LNAPL and/or associated plume do not appear to be offsite.
Metric 5 - Did the HHRA identify the LNAPL as a Risk?	2	High-end Cumulative Cancer Risk (CCR) and/or Hazard Index (HI) for potential exposure of maintenance workers or redevelopment construction workers to LNAPL exceeded USEPA risk and HI Limits based on the Human Health Risk Assessment presented in the RFI Phase II Report (BBL,2006).
	1	Bounding CCR and/or HI for potential exposure of maintenance workers or redevelopment construction workers to LNAPL exceeded USEPA risk and HI Limits based on the Human Health Risk Assessment presented in the RFI Phase II Report (BBL,2006).
	0	CCR and/or HI for potential exposure do not exceed USEPA risk and HI limits based on the Human Health Risk Assessment presented in the RFI Phase II Report (BBL,2006).
Metric 5 - Did the HHRA identify the Soil in the LNAPL Area as a Risk?	2	Bounding CCR and/or HI for potential exposure of maintenance workers or residents to soil exceeded USEPA risk and HI Limits based on the Human Health Risk Assessment presented in the RFI Phase II Report (BBL,2006).
	1	Lead concentrations in surface soil or mean concentrations in deep soil exceed industrial screening criteria based on the Human Health Risk Assessment presented in the RFI Phase II Report (BBL,2006).
	0	Soil does not require further action based on the Human Health Risk Assessment presented in the RFI Phase II Report (BBL,2006).
Metric 5 - Did the HHRA identify Vapor Intrusion as a Risk?	2	Bounding CCR and/or HI for potential exposure of routine workers to LNAPL or LNAPL and soil via vapor intrusion for a future non-OSHA commercial building exceed USEPA risk and HI limits based on the Human Health Risk Assessment presented in the RFI Phase II Report (BBL,2006).
	1	Bounding HI for potential exposure of routine workers to soil via vapor intrusion for a future non-OSHA commercial building exceeds the USEPA HI limit based on the Human Health Risk Assessment presented in the RFI Phase II Report (BBL,2006).
	0	CCR and/or HI for potential exposure do not exceed USEPA risk and HI limits based on the Human Health Risk Assessment presented in the RFI Phase II Report (BBL,2006).

Table 6. LNAPL Remediation Preliminary Cost Evaluation Matrix
RACER Trust, Buick City Site, Flint, Michigan

Priority Ranking	Area	Cubic Yards of Impacts [1]	Thermally-Enhanced LNAPL Recovery via High Temperature Application			Surfactant Enhanced Hot Water Flooding			Soil Mixing, Land Farming, Excavation Options[6]			
			Range of Costs [2] ($200 to $670 per CY)	Applicable?	Rationale	Range of Costs [4] ($200 to $500 per CY)	Applicable?	Rationale	Soil Mixing/ Landfarm ($60/CY)	Remove Pavement, Excavate, Landfill, Backfill	Applicable?	Rationale
1	AOI 86-1 Fuel Oil Area	3,000	Not evaluated due to the presence of PCBs. [3]			Not evaluated due to the presence of PCBs. [5]			Not Evaluated due to the presence of PCBs[7]	$421,000	Potentially	Excavation is potentially feasible to address shallow impacts; however,the cost of this alternative to address the entire impacted area is not proportional to the effectiveness that would be achieved.
2	AOIs 05-1/05-5 Cutting Oil Areas	28,400	Not evaluated due to the presence of PCBs. [3]			Not evaluated due to the presence of PCBs. [5]			Not Evaluated due to the presence of PCBs[7]	$11.3M	Potentially	Excavation is potentially feasible to address impacts at targeted locations; however,the cost of this alternative to address the entire impacted area is not proportional to the effectiveness that would be achieved.
3	AOI 09-B - Gasoline Area	NA	NA	NA	MPE system installed	NA	NA	MPE system installed	NA	NA	NA	MPE system installed
4	AOIs 12-A, B, & C - Hydraulic Oil Areas	20,000 to 26,000	Not evaluated due to the presence of PCBs. [3]			Not evaluated due to the presence of PCBs. [5]			Not Evaluated due to the presence of PCBs[7]	$3.1M	Potentially	Excavation is potentially easible to address impacts at targeted locations; however,the cost of this alternative to address the entire impacted area is not proportional to the effectiveness that would be achieved.
5	AOIs 10-1/10-4 Hydraulic Oil Areas	11,900	Not evaluated due to the presence of PCBs. [3]			Not evaluated due to the presence of PCBs. [5]			Not Evaluated due to the presence of PCBs[7]	$4.2M	Potentially	Excavation is potentially feasible to address impacts at targeted locations; however,the cost of this alternative to address the entire impacted area is not proportional to the effectiveness that would be achieved.
6	AOI 81-2 Cutting Oil Area	3,800	Not evaluated due to the presence of PCBs. [3]			Not evaluated due to the presence of PCBs. [5]			Not Evaluated due to the presence of PCBs[7]	$254,000	Yes	Excavation is feasible to address impacts at targeted locations; however,the cost of this alternative to address the entire impacted area is not proportional to the effectiveness that would be achieved.
7	AOI 83/84-2 Cutting Oil Area	35,400	Not evaluated due to the presence of PCBs. [3]			Not evaluated due to the presence of PCBs. [5]			Not Evaluated due to the presence of PCBs[7]	$10M	Potentially	Excavation is potentially feasible to address impacts at targeted locations; however,the cost of this alternative to address the entire impacted area is not proportional to the effectiveness that would be achieved.
8, 14, 15	AOI 36-1/36-2 LNAPL Area	193,900	$39M to $133M	No	The cost of this alternative is not proportional to the effectiveness that would be achieved. The marginal risk reduction benefit makes this option not cost effective. In addition, implementation of this technology does not preclude the necessity of groundwater monitoring and long term O&M.	$7.6M to $97M	No	The cost of this alternative is not proportional to the effectiveness that would be achieved. The marginal risk reduction benefit makes this option not cost effective. In addition, implementation of this technology does not preclude the necessity of groundwater monitoring and long term O&M.	$22.8M	$22.4M	No	The cost of soil mixing, landfarming, or excavation is not proportional to the effectiveness that would be achieved. Implementation of these technologies do not preclude the necessity of groundwater monitoring and long term O&M. The marginal risk reduction benefit does not warrant the cost.
9	AOI 83/84-1 Cutting Oil Area	6,500	$1.3M to $4.4M	No	The cost of this alternative is not proportional to the effectiveness that would be achieved. The marginal risk reduction benefit makes this option not cost effective. In addition, implementation of this technology does not preclude the necessity of groundwater monitoring and long term O&M. The City of Flint storm sewer main (Outfall 004) and a lateral run through this LNAPL area. The sewer is old and could be structurally compromised if subjected to the high temperatures required by this method.	$1.3M to $3.3M	No	The cost of this alternative is not proportional to the effectiveness that would be achieved. The marginal risk reduction benefit makes this option not cost effective. In addition, implementation of this technology does not preclude the necessity of groundwater monitoring and long term O&M. The City of Flint storm sewer main (Outfall 004) and a lateral run through this LNAPL Area. LNAPL is infiltrating the Outfall 004 sewer. The surfactant would mobilize both the LNAPL and PCBs and could increase migration into the Outfall 004 storm sewer and the Flint River.	$716,000	$731,000	Yes	Soil Mixing/excavation technologies will be further evaluated.
10	AOI 83/84-4 Cutting Oil Area	800	$160,000 to 536,000	Potentially	The City of Flint storm sewer main (Outfall 003) is located approximately 150 feet away from this LNAPL Area. Need to confirm whether this would be impacted by high temperatures.	$160,000 to 400,000	Potentially	The City of Flint storm sewer main (Outfall 003) is located approximately 150 feet away from this LNAPL Area. Need to confirm whether migration is a concern.	$95,000	$97,000	Yes	Soil Mixing/excavation technologies will be further evaluated.

Table 6. LNAPL Remediation Preliminary Cost Evaluation Matrix
RACER Trust, Buick City Site, Flint, Michigan

Priority Ranking	Area	Cubic Yards of Impacts [1]	Thermally-Enhanced LNAPL Recovery via High Temperature Application			Surfactant Enhanced Hot Water Flooding			Soil Mixing, Land Farming, Excavation Options[6]			
			Range of Costs [2] ($200 to $670 per CY)	Applicable?	Rationale	Range of Costs [4] ($200 to $500 per CY)	Applicable?	Rationale	Soil Mixing/ Landfarm ($60/CY)	Remove Pavement, Excavate, Landfill, Backfill	Applicable?	Rationale
11	AOI 40-A,B and 16-C - Fuel Oil Areas	10,100	$2M to $6.8M	No	The cost of this alternative is not proportional to the effectiveness that would be achieved. The marginal risk reduction benefit makes this option not cost effective. In addition, implementation of this technology does not preclude the necessity of groundwater monitoring and long term O&M. This LNAPL Area is adjacent to CSX property and may extend onto their property. Treatment of this LNAPL Area could compromise the integrity of their tracks.	$2M to $5M	Potentially	Based on the Southend bench scale testing results, one location in the AOI 40-A area may be conducive to this technology. This technology will be further evaluated.	$971,000	$1.1M	Potentially	Soil Mixing/excavation technologies will be further evaluated.
12	AOI 83/84-5 Cutting Oil Area	22,200	$4.4M to $14.9M	No	The cost of this alternative is not proportional to the effectiveness that would be achieved. The marginal risk reduction benefit makes this option not cost effective. In addition, implementation of this technology does not preclude the necessity of groundwater monitoring and long term O&M. A City of Flint clay tile storm sewer and other utilities may be located in this LNAPL Area. The sewer is old and is in poor condition. Subjecting the sewer to the high temperatures of this method could compromise the integrity of the sewer. A portion of this LNAPL Area may be on property owned by others (City of Flint). Treatment could compromise the integrity of utilities.	$4.4M to $11.1M	No	The cost of this alternative is not proportional to the effectiveness that would be achieved. The marginal risk reduction benefit makes this option not cost effective. In addition, implementation of this technology does not preclude the necessity of groundwater monitoring and long term O&M. A City of Flint clay tile storm sewer and other utilities may be located in this LNAPL Area. The sewer is old and is in poor condition. Surfactants will increase mobilization and could cause offsite migration.	$2.8M	$2.8M	No	The cost of soil mixing/landfarming or excavation is not proportional to the effectiveness that would be achieved. Implementation of these technologies do not preclude the necessity of groundwater monitoring and long term O&M. The marginal risk reduction benefit does not warrant the cost.
13	AOI 03-1 Quench Oil Area	3,700	Not evaluated due to the presence of PCBs. [3]			Not evaluated due to the presence of PCBs. [5]			Not Evaluated due to the presence of PCBs[7]	$395,000	Potentially	Excavation will be further evaluated.
16	AOI 02-B Hydraulic Oil Area	3,400	$680,000 to $2.3M	Potentially	This LNAPL Area is adjacent to CSX property and may extend onto their property. Treatment of this LNAPL Area could compromise the integrity of their tracks.	$680,000 to $1.7M	No.	The cost of this alternative is not proportional to the effectiveness that would be achieved. The marginal risk reduction benefit makes this option not cost effective. In addition, implementation of this technology does not preclude the necessity of groundwater monitoring and long term O&M. Also, based on the Southend bench scale testing results areas with a silty/clayey geology are not conducive to this technology.	$493,000	$498,000	Potentially	Soil Mixing/excavation technologies will be further evaluated.
17	AOI 36-5 - Fuel Oil Area	1,400	$280,000 to $940,000	Potentially	The AOI 36-5 LNAPL Area intersects the abandoned 002 storm sewer, which is being used as a passive recovery trench. This technology could compromise the integrity of the sewer.	$280,000 to $700,000	No	Technology is potentially feasible based on cost; however, based on the Southend bench scale testing results areas with a silty/clayey geology are not conducive to this technology.	$398,000	$300,000	Yes	Soil Mixing/excavation technologies will be further evaluated.

Notes:
Costs presented in this table were calculated in 2012, based on ranges of costs provided by vendors at that time.

1. It is not possible to assess different remedies unless we assume for purposes of cost estimating the volume of impacts in soils. For this purpose we estimated volume of impacts based on where LNAPL was detected in monitoring wells at 0.1 foot or greater thickness. These estimates are not used as the basis for assessing environmental risk – but only for relative cost comparisons.
2. The costs represent an approximate range of estimates developed in order to determine whether the technology should be further evaluated. Estimate does not includes costs to procure electrical service to the Site or the monthly electrical bill during remedy implementation, which could be substantial.
3. Technology was not evaluated for LNAPL areas containing PCBs, as the possibility of incomplete incineration of PCB-containing LNAPL could result in the generation of dioxins.
4. The costs represent a approximate range of estimates developed in order to determine whether technology should be further evaluated.
5. Technology was not evaluated for LNAPL areas containing PCBs. Use of a surfactant will mobilize PCB-containing LNAPL and may increase migration into Site storm sewers.
6. Soil mixing , land farming, and excavation costs are ball park estimates developed in order to determine whether these options should be further evaluated
and do not include AOI specific considerations such as surface concrete removal, excavation dewatering, etc.
7. This technology not evaluated for LNAPL containing PCBs. Technology will not eliminate PCBs.

Table 7. LNAPL Remedial Technology Matrix
RACER Trust, Buick City Site, Flint, Michigan

Priority Ranking	Area of Interest	Option 1			Option 2			Option 3			Option 4			Option 5		
		Technology Under Consideration	Evaluation	Operations, Monitoring and Maintenance (OMM) [1]	Technology Under Consideration	Evaluation	OMM [1]	Technology Under Consideration	Evaluation	OMM [1]	Technology Under Consideration	Evaluation	OMM [1]	Technology Under Consideration	Evaluation	OMM [1]
1	AOI 86-1 Fuel Oil Area	Outfall 004 Pathway Elimination	A flow study was completed that confirmed that the flow from Outfall 004 can be re-routed into the Outfall 013 storm sewer. However, the City of Flint has not yet approved the re-route. Re-routing the flow will allow the Outfall 004 storm sewer to be bulkheaded and disconnected at the property boundary, eliminating this LNAPL migration pathway.	Inspect and Maintain - The re-route and associated bulkheads will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 3 years and then once every 5 years for the next 25 years.	004 Passive Recovery Trench	Following the re-routing of the Outfall 004 storm sewer, the bulkheaded section of 004 located west of MH 4-12 will be monitored for potential accumulation and removal of LNAPL.	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	Passive Recovery Trench and/or Recovery Wells	Transmissivity testing was unable to be completed at AOI 86-1 due to the lack of LNAPL present in RFI-86-02 and RFI-86-03. LNAPL has only been detected at RFI-86-02 at a thickness greater than 0.1 feet once in the last 10 years. Little (0.05 feet) to no product has been detected at RFI-86-03 in the past ten years. The very minimal amount of LNAPL present in the AOI 86-1 monitoring wells indicates that using LNAPL recovery trenches or wells are not practical means of recovery. Converting the existing storm sewer into a passive recovery trench is the preferred option.	Inspect and Remove - The trench will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	Excavation	Excavation is not a feasible option because of the proximity of the excavation to CSX railroad tracks and depth of the excavation required to address LNAPL impacts.	NA	NA	NA	NA
2	AOIs 05-1/05-5 Cutting Oil Area	Outfall 003 Pathway Elimination	The LNAPL infiltration pathway to the Outfall 003 storm sewer will be eliminated. Pathway elimination technologies may include bulkheading, re-route, replacement, lining, joint sealing or other modifications to eliminate this LNAPL migration pathway.	Inspect and Maintain - The selected technology will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 3 years and then once every 5 years for the next 25 years.	Targeted Excavation	Targeted excavations will be completed to address PCB, lead and manganese impacts at select locations at AOI 05-1/05-5.	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	Active Recovery Trench or Recovery Wells	Although transmissivity results were unable to be quantified at 43-162 and 43-165 and testing at MW-05-04 indicated recovery is not practical (0.05 ft²/day). Additional transmissivity/recovery testing will be attempted in the middle of the AOI 05-1 LNAPL Area to assess recoverability.	Operate, monitor and maintain system. OMM activities will be completed for up to 5 years.	NA	NA	NA	NA	NA	NA
3	AOI 09-B - Gasoline Area	MPE System Operation began in Spring 2013	NA	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA
4	AOIs 12-A, B, & C - Hydraulic Oil Area	Outfall 004 Pathway Elimination	A flow study was completed that confirmed that the flow from Outfall 004 can be re-routed into the Outfall 013 storm sewer. However, the City of Flint has not yet approved the re-route. Re-routing the flow will allow the Outfall 004 storm sewer to be bulkheaded and disconnected at the property boundary, eliminating this LNAPL migration pathway.	Inspect and Maintain - The re-route and associated bulkheads will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 3 years and then once every 5 years for the next 25 years.	004 Passive Recovery Trench	Following the re-routing of the Outfall 004 storm sewer, the bulkheaded section of 004 located west of MH 4-17 will be monitored for potential accumulation and removal of LNAPL.	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	Evaluate using the Building 23 Tunnel as a Passive Recovery Trench	Due to the close proximity of the Outfall 004 storm sewer to the Building 23 tunnel, it was determined that utilizing the re-routed 004 storm sewer as a passive recovery trench is the preferred option.	Inspect and Remove - The tunnel will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	Targeted Excavation of Impacted Materials	The Outfall 004 re-route will eliminate the groundwater/surface water pathway; therefore the soils do not exceed any applicable criteria.	NA	NA	NA	NA
5	AOIs 10-1/10-4 Hydraulic Oil Area	Outfall 003 Pathway Elimination	The LNAPL infiltration pathway to the Outfall 003 storm sewer will be eliminated. Pathway elimination technologies may include bulkheading, re-route, replacement, lining, joint sealing or other modifications to eliminate this LNAPL migration pathway.	Inspect and Maintain - The selected technology will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 3 years and then once every 5 years for the next 25 years.	Targeted Excavation	Targeted excavations will be completed to address PCB impacts at select locations at AOI 10-1/10-4.	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	003 Passive Recovery Trench	Following bulkhead of the MH 3-22 lateral at Outfall 003 storm sewer, the bulkheaded section will be monitored for potential accumulation and removal of LNAPL.	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	Surface Cover	The existing surface cover (asphalt) will be maintained in order to address the manganese impacted shallow soils located at AOI 10-1/10-4.	Inspect and Maintain - The surface cover will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 5 years and then once every 5 years for the next 25 years.	Active Recovery Trench or Recovery Wells	Transmissivity testing at 20-FP7 indicated recovery is practical (1.0 ft²/day); however, testing at MW-10-03 indicated recovery was impractical (0.3 ft²/day). Additional transmissivity/recovery testing will be completed in the vicinity of 20-FP7 to assess recoverability.	Operate, monitor and maintain system. OMM activities will be completed for up to 5 years.
6	AOI 81-2 Cutting Oil Area	Targeted Excavation	Targeted excavations will be completed to address PCB impacts at select locations at AOI 81-2.	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	Re-use existing system	Further evaluation of the monitoring wells in the vicinity of the former recovery trench shows that no LNAPL remains in this area; therefore there is no added value by re-using the existing system.	NA	Passive Recovery Trench and/or Recovery Wells	Transmissivity was quantified at 70-107R at 0.2 ft²/day, which is below both the ITRC's and MDEQ's thresholds for practical recovery; therefore, passive recovery trenches or wells are not practical.	NA	Surface Cover	Surface covers may be installed to address PCB impacted surface soils at locations which cannot be addressed by excavation or institutional controls.	Inspect and Maintain - The surface cover will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 5 years and then once every 5 years for the next 25 years.	NA	NA	NA
7	AOI 83/84-2 Cutting Oil Area	Outfall 003 and 005 Lateral Bulkheads	Laterals to Outfall 003 and Outfall 005 storm sewers were bulkheaded to eliminate this LNAPL migration pathway.	Inspect and Maintain - The selected technology will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 3 years and then once every 5 years for the next 25 years.	Targeted Excavation	Targeted excavation will be completed to address PCB impacts in the vicinity of RFI-83/84-49.	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	003 Passive Recovery Trench	Following bulkhead of the MH 3-10 lateral at Outfall 003 storm sewer, the bulkheaded section will be monitored for potential accumulation and removal of LNAPL.	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	005 Passive Recovery Trench	Following bulkhead of the Outfall 005 storm sewer at MH 5-12, the bulkheaded section will be monitored for potential accumulation and removal of LNAPL.	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	LNAPL/Hydraulic Recovery	The transmissivity in the southern portion of the LNPAL Area indicates recovery would be practical, but the transmissivity in the northern and eastern portions indicates recovery would not be practical.	Operate, monitor and maintain system. OMM activities will be completed for up to 5 years.
8, 14, and 15	AOI 36-1/36-2 LNAPL Area	MPE	A pilot test is planned to be completed in the southeastern portion of the AOI 36-1/36-2 LNAPL Area to address the ambient air impacts related to the gasoline constituents.	Recovery OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	Soil Vapor Extraction (SVE) /Air Sparging	SVE and air sparging were evaluated; however, due to the geology these methods would likely only remediate impacts in the immediate vicinity of the wells.	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	002 Passive Recovery Trench	Following bulkhead installation at MH 2-21 along the Outfall 002 storm sewer, the bulkheaded section will be monitored for potential accumulation and removal of LNAPL.	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	Passive Recovery Trench and/or Recovery Wells	The results of transmissivity testing completed at two locations in the AOI 36-1/36-2 LNAPL area were below the ITRC-suggested minimum threshold and the MDEQ threshold value that indicates LNAPL recovery is not practicable at these wells. Based on transmissivity data and geology at AOI36-1/36-2 a passive recovery trench would likely only drain the immediate vicinity and would not result in substantial LNAPL recovery.	Inspect and Remove - The trench will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	Surface Cover	The existing surface cover (concrete) will be maintained in order to provide protection from future exposure to the direct contact risks associated with the LNAPL and soils.	Inspect and Maintain - The surface cover will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 5 years and then once every 5 years for the next 25 years.

Table 7. LNAPL Remedial Technology Matrix
RACER Trust, Buick City Site, Flint, Michigan

Priority Ranking	Area of Interest	Option 1			Option 2			Option 3			Option 4			Option 5		
		Technology Under Consideration	Evaluation	Operations, Monitoring and Maintenance (OMM) [1]	Technology Under Consideration	Evaluation	OMM [1]	Technology Under Consideration	Evaluation	OMM [1]	Technology Under Consideration	Evaluation	OMM [1]	Technology Under Consideration	Evaluation	OMM [1]
9	AOI 83/84-1 Cutting Oil Area	Outfall 004 Pathway Elimination	A flow study was completed that confirmed that the flow from Outfall 004 can be re-routed into the Outfall 013 storm sewer. However, the City of Flint has not yet approved the re-route. Re-routing the flow will allow the Outfall 004 storm sewer to be bulkheaded and disconnected at the property boundary, eliminating this LNAPL migration pathway.	Inspect and Maintain - The re-route and associated bulkheads will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 3 years and then once every 5 years for the next 25 years.	LNAPL/Hydraulic Recovery	Transmissivity testing has not been able to be completed to date because the air/LNAPL interface and the water/LNAPL interface are within the well casing. The AOI 83/84-1 LNAPL Area has only been identified at one monitoring well location; therefore significant LNAPL recovery is unlikely.	OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	004 Passive Recovery Trench	Following the re-routing of the Outfall 004 storm sewer and bulkheading of the MH 4-19 lateral at Outfall 004 storm sewer, the bulkheaded section will be monitored for potential accumulation and removal of LNAPL.	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	Targeted Soil Mixing/Land farming	Respirometry results from the Southend indicated the addition of microbes did not increase degradation, but naturally-occurring microbes were present. Naturally-occurring microbes are oxygen limited.	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	Targeted Excavation of Impacted Materials	The Outfall 004 re-route will eliminate the groundwater/surface water pathway; therefore the soils do not exceed any applicable criteria.	NA
10	AOI 83/84-4 Cutting Oil Area	Hydraulic Recovery	The LNAPL transmissivity quantified at AOI 83/84-4 was 0.03 ft²/day, which is below both the ITRC's and MDEQ's thresholds for practical recovery. Historic LNAPL bailing activities have also recovered minimal quantities of LNAPL.	Recovery OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	Thermally Enhanced LNAPL Recovery _ High Temperature Application	The City of Flint storm sewer main (Outfall 003) is located approximately 150 feet away from this LNAPL Area. The sewers are typically not water-tight due to their age. The application of thermal treatment may compromise the sewers.	Recovery OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	Surfactant Enhanced LNAPL Recovery	Enhanced dissolution by the use of surfactant is not a viable option based on the presence of the City of Flint storm sewer main (Outfall 003) approximately 150 feet away. This could potentially increase mobility and increase the likelihood of LNAPL infiltration into the storm sewer.	Recovery OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	Targeted Soil Mixing/Land farming	Respirometry results from the Southend indicated the addition of microbes did not increase degradation, but naturally-occurring microbes were present. The naturally-occurring microbes are oxygen limited.	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	NA	NA	NA
11	AOI 40-A,B and 16-C - Fuel Oil Area	Surfactant Enhanced LNAPL Recovery	One location in the AOI 40-A area is potentially possible based on the bench scale study conducted. The surfactant increased recovery by 62.4%.	Recovery OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	Targeted Soil Mixing/Land farming	Respirometry results from the Southend indicated the addition of microbes did not increase degradation, but naturally-occurring microbes were present. The naturally-occurring microbes are oxygen limited.	Recovery OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	Hydraulic Recovery	The LNAPL transmissivity indicated that practical recovery was quantified at only one well (RFI-40-7R2 - 1.3 to 1.9 ft²/day). LNAPL transmissivity was poor at three other locations.	Recovery OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	NA	NA	NA	NA	NA	NA
12	AOI 83/84-5 Cutting Oil Area	LNAPL/Hydraulic Recovery	Although only a portion of the LNAPL Area indicates practical recovery, the proximity of the LNAPL LNAPL Area to the property boundary necessitates recovery. The LNAPL transmissivity indicated that practical recovery was quantified at only one well, MW-83/83-7, (1.6 ft²/day). LNAPL transmissivity was poor at MW-83/84-19 (0.08 ft²/day). Transmissivity will be evaluated at other locations where testing can be completed.	Recovery OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA
13	AOI 03-1 Quench Oil Area	LNAPL/Hydraulic Recovery	Transmissivity testing has not been able to be completed to date due to insufficient LNAPL. The AOI 03-1 LNAPL Area has only been identified at one monitoring well location; therefore, significant LNAPL recovery is unlikely.	Recovery OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	Targeted Excavation of Impacted Materials	Soils at AOI 03-1 only exceed GSIP criteria and the storm sewers in this area may be an intermittent GSI pathway.	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	NA	NA	NA	NA	NA	NA	NA	NA	NA
16	AOI 02-B Hydraulic Oil Area	Thermally Enhanced LNAPL Recovery _ High Temperature Application	This LNAPL Area is adjacent to CSX railroad tracks; application of this technology could compromise the tracks.	Recovery OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	Targeted Soil Mixing/Land farming	Due the lack of soil exceedances, these technologies may be eliminated from consideration. Respirometry results indicated the addition of microbes did not increase degradation, but naturally-occurring microbes were present. Naturally-occurring microbes are oxygen limited.	Recovery OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	LNAPL/Hydraulic Recovery	The high viscosity (362 cP) limits the ability to conduct transmissivity testing. It is unlikely that hydraulic recovery is practical.	Recovery OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	NA	NA	NA	NA	NA	NA
17	AOI 36-5 - Fuel Oil Area	Outfall 002 Infiltration Pathway Elimination	Outfall 002 was bulkheaded to eliminate LNAPL infiltration.	Inspect and Maintain - The re-route and associated bulkheads will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 3 years and then once every 5 years for the next 25 years.	002 Passive Recovery Trench	Following bulkhead installation at MH 2-18 along the Outfall 002 storm sewer, the bulkheaded section will be monitored for potential accumulation and removal of LNAPL.	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	Use Existing Recovery Trench and Sump System	Insufficient LNAPL has accumulated in wells within AOI 36-5 to complete transmissivity testing. LNAPL recoverably Is not feasible.	NA	Thermally-Enhanced LNAPL Recovery via High temperature Application	Other more economical options will be evaluated first. The AOI 36-5 LNAPL Area intersects the abandoned 002 storm sewer, which is being used as a passive recovery trench. This technology could compromise the integrity of the sewer.	Recovery OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	NA	NA	NA

Notes:

1. Timeframes of OMM are estimated for cost estimating purposes only and will be refined as appropriate in Corrective Measures Implementation (CMI) documentation.

2. In most cases OMM has been projected out approximately 30 years, except where unnecessary. However if monitoring reveals 3 consecutive years of compliance monitoring will be discontinued.

Table 8. Remedy Cost Benefit Matrix
RACER Trust, Buick City Site, Flint, Michigan

Priority Ranking	Area of Interest	Completed Interim Measures (IM)			Potential Remedy Component #1				Potential Remedy Component #2				Potential Remedy Component #3				Potential Remedy Component #4				Potential Remedy Component #5				LNAPL Decision Tree [1]					
																									LNAPL Compositional Concerns		LNAPL Saturation Concerns				Are Controls Required?	Remedies Recommended
					Technology	Cost	Okind [12]	OMM Cost	Technology	Cost	Okind [12]	OMM Cost	Technology	Cost	Okind [12]	OMM Cost	Technology	Cost	Okind [12]	OMM Cost	Technology	Cost	Okind [12]	OMM Cost	Risk	Cost Benefit	Migration	Mobility	Recoverability	Cost Benefit		
1	AOI 66-1 Fuel Oil Area [3]	Tank Farm (Source Area) Excavated	Two Recovery Wells ~0.5 Years of LNAPL Removal	LNAPL Bailing and Monitoring	Outfall 004 Pathway Elimination	$310,000	Inspect and Maintain - The re-route and associated bulkheads will be inspected and maintained as necessary Inspections will be completed on an annual basis for 3 years and then once every 5 years for the next 25 years.	$5,000/year	004 Passive Recovery Trench	Capital Costs included in Outfall 004 Pathway Elimination	Inspect and Remove - The last downgradient trench (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	$10,000/year [11]	Institutional Controls	$12,600	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	1) LNAPL and Impacted Groundwater Infiltration to the Outfall 004 Storm Sewer. 2) Impacted Groundwater Potentially off Site. 3) Soil Volatilization to Indoor Air Concern. 4) Potential Groundwater Volatilization to Indoor Air Concern at the Property Boundary 5) Potential Volatilization to Indoor Air Concern for a Future Structure	Compositional concerns regarding LNAPL infiltration, GSI and volatilization impacts can be addressed through engineering and institutional controls. In addition, LNAPL has only been detected in one monitoring well in the AOI 66-1 LNAPL Area at a thickness greater than 0.1 feet once in the last 10 years.	While the LNAPL is mobile in the vicinity of the storm sewer, it appears to be stable.	LNAPL from the AOI 66-1 area is infiltrating the Outfall 004 storm sewer.	The results of historic interim measures (IM) indicate that in the past LNAPL has been recovered using recovery wells and by bailing. However it is uncertain whether future LNAPL recovery is practical as minimal LNAPL is currently present at AOI 66-1.	LNAPL is not readily recoverable.	Based on the infiltration to the Outfall 004 storm sewer, engineering controls are recommended to eliminate the infiltration.	Outfall 004 Pathway Elimination 004 Passive Recovery Trench Institutional Controls - Sitewide and AOI Specific Controls A, B, and C
2	AOIs 55-1/55-5, Cutting Oil Areas [4]	Passive Recovery Trenches ~4 years of LNAPL Recovery at AOI 55-1 from 2 Passive Recovery Trenches	Recovery Wells ~4 years of LNAPL Recovery at AOI 55-5 from two wells	LNAPL Monitoring and Bailing	Outfall 003 Pathway Elimination	$2,000,000	Inspect and Maintain - The selected technology will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 3 years and then once every 5 years for the next 25 years.	$5,000/year	Targeted Excavation - PCB and Lead Containing Soils	$1,820,000	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$32,000 Capital Costs $18,000/Year	Addressing Manganese Containing Soils [13]	$65,000	NA	NA	Institutional Controls	$12,600	NA	NA	NA	NA	NA	NA	1) Possible GSI pathway to Outfall 003 2) Direct Contact with LNAPL and Soils 3) Particulate Soil Inhalation Risk 4) Groundwater Volatilization to Indoor Air Concern 5) Potential Volatilization to Indoor Air for a Future Structure	Based on the current understanding of conceptual site model the GSI, direct contact, soil inhalation and vapor phase risks can be effectively mitigated through targeted excavation and engineering and institutional controls. In addition, LNAPL recovery systems operated in this area for 15 years; therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate.	While the LNAPL is mobile in the vicinity of the storm sewer, the AOI 55-1 and 55-5 LNAPL Areas appear to be stable.	LNAPL from the AOI55-1/55-5 area is infiltrating the Outfall 003 storm sewer, which passes through the AOI55-1 LNAPL Area.	Historic IMs indicate that in the past LNAPL has been recoverable at AOI 55-1 using recovery wells, trenches and bailing (summarized below). However it is uncertain whether future LNAPL recovery is practical.	Compositional and saturation concerns can be addressed through excavation and engineering and institutional controls. Targeted excavations are proposed to address PCB, lead and manganese impacts at the AOI 55-1/55-5 LNAPL Area. Engineering and institutional controls will be implemented to eliminate LNAPL infiltration to the Outfall 003 storm sewer and address the GSI pathway. Additional LNAPL removal will not materially change the risks associated with this LNAPL Area.	Based on the infiltration to the Outfall 003 storm sewer, engineering controls are recommended to eliminate the infiltration.	Outfall 003 Pathway Elimination Targeted Excavation Institutional Controls - Sitewide and AOI Specific Controls A, B, C, and D
3	AOI 09-B - Gasoline Area [5]	LNAPL Monitoring and Bailing			MPE System Start-up Spring 2013	$1.4M ($1.1M Spent - $300,000 remaining)	OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$300,000 System OMM $36,000 Capital Costs $15,000/Year	Institutional Controls	$12,600	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	MPE System (Implemented in 2013) Institutional Controls - Sitewide
4	AOIs 12-A, -B, & -C - Hydraulic Oil Areas [6]	Product Recovery System ~2 years of LNAPL Recovery from two wells		LNAPL Monitoring and Bailing	Outfall 004 Pathway Elimination	$160,000	Inspect and Maintain - The re-route and associated bulkheads will be inspected, and maintained as necessary. Inspections will be completed on an annual basis for 3 years and then once every 5 years for the next 25 years.	$5,000/year	004 Passive Recovery Trench	Capital Costs included in Outfall 004 Pathway Elimination	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	$10,000/year [11]	Surface Cover	$35,000	Inspect and Maintain - The surface cover will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 5 years and then once every 5 years for the next 25 years.	$1,800/Year - Annual Inspections and Maintenance	Institutional Controls	$12,600	NA	NA	NA	NA	NA	NA	NA	NA	NA	1) GSI pathway to Outfall 004 2) Particulate Soil Inhalation Risk 3) Potential Volatilization to Indoor Air for a Future Structure Note the Lead Direct Contact issue has been addressed by the Southend Final Decision	The risks associated with this LNAPL Area are PCB impacted LNAPL infiltrating into the Outfall 004 storm sewer system and possible volatilization to indoor air of a future building. The infiltration to the Outfall 004 storm sewer will be addressed by re-routing the flow into the Outfall 013 storm sewer and bulkheading the Outfall 004 storm sewer in this portion of the Site. Based on the current understanding of conceptual site model, the volatilization to indoor air risk can be effectively mitigated through institutional controls	Although the LNAPL is mobile in the vicinity of the storm sewer, as a collective these LNAPL Areas appear to be stable.	LNAPL from the AOI 12-A, -B, & -C area is infiltrating the Outfall 004 storm sewer, which passes through the AOI 12-C LNAPL Area, however, the viscosity of the LNAPL in this portion of AOI 12-C is 110 cp limiting its mobility.	The results of historic IMs, bench-scale testing and engineering testing indicate that the AOI 12-A, -B, and -C Areas are not readily recoverable.	LNAPL is not readily recoverable.	Based on the infiltration to the Outfall 004 storm sewer, engineering controls are recommended to eliminate the infiltration.	Outfall 004 Pathway Elimination 004 Passive Recovery Trench Surface Cover (In addition to the cover previously installed per the Southend Final Decision) Institutional Controls - Sitewide and AOI Specific Controls A, B, C, and D
5	AOIs 10-1/10-4 Hydraulic Oil Areas [7]	Groundwater Collection Treatment System and Recovery Trench ~13 Years of LNAPL Recovery	Outfall 003 Storm Sewer Lateral Bulkheads	LNAPL Monitoring and Bailing	Outfall 003 Pathway Elimination	$2,000,000	Inspect and Maintain - The selected technology will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 3 years and then once every 5 years for the next 25 years.	$5,000/year	003 Passive Recovery Trench	Capital Costs included in Outfall 003 Pathway Elimination	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	$10,000/year [11]	Targeted Excavation	$340,000	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$1,800/Year - Annual Inspections and Maintenance	Institutional Controls	$12,600	NA	NA	Surface Cover	$25,000	Inspect and Maintain - The surface cover will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 5 years and then once every 5 years for the next 25 years.	$1,800/Year - Annual Inspections and Maintenance	Institutional Controls	$12,600	NA	NA	1) GSI pathway to Outfall 003 2) Direct Contact with LNAPL and Soils 3) Particulate Soil Inhalation Risk 4) Potential Groundwater Volatilization to Indoor Air at the Property Boundary 5) Potential Volatilization to Indoor Air for a Future Structure	Based on the current understanding of conceptual site model the GSI, direct contact, soil inhalation and vapor phase risks can be effectively mitigated through targeted excavation and engineering and institutional controls. In addition, LNAPL recovery systems operated in this area for 17 years; therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate.	While the LNAPL is mobile in the vicinity of the storm sewer, the AOI 10-1/10-4 LNAPL Area appears to be stable.	LNAPL from AOI 10-1/10-4 is infiltrating the Outfall 003 storm sewer, which passes through the AOI 10-4 LNAPL Area.	Historic IMs indicate that in the past LNAPL has been recoverable at AOI 10-1/10-4 using recovery wells, trenches and bailing. However, it is uncertain whether future LNAPL recovery is practical. The results of historic IMs indicate that LNAPL recovery is practical, however, the transmissivity at MW-10-03 indicates recovery is impractical.	Compositional and saturation concerns can be addressed through excavation and engineering and institutional controls. Targeted excavations are proposed to address PCB impacts at the AOI 10-1/10-4 LNAPL Area. Engineering and institutional controls will be implemented to eliminate LNAPL infiltration to the Outfall 003 storm sewer, to address the GSI pathway and to mitigate potential risk associated with particulate inhalation concerns. Additional LNAPL removal will not materially change the risks associated with this LNAPL Area.	Based on the infiltration to the Outfall 003 storm sewer, engineering controls to eliminate the infiltration are recommended.	Outfall 003 Pathway Elimination 003 Passive Recovery Trench Targeted Excavation Surface Cover Institutional Controls - Sitewide and AOI Specific Controls A, B, C, and D
6	AOI 81-2 Cutting Oil Area	Passive Recovery Trench - LNAPL Recovery for ~14 Years		LNAPL Monitoring and Bailing	Targeted Excavation	$280,000	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$19,000 Capital Costs $10,800/Year	Institutional Controls	$12,600	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	1) Direct Contact with LNAPL 2) Potential Volatilization to Indoor Air for a Future Structure	Based on the current understanding of conceptual site model direct contact and vapor phase risks can be effectively mitigated through targeted excavation and engineering and institutional controls. In addition, LNAPL recovery systems operated in this area for 17 years; therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate.	The AOI 81-2 LNAPL Area appears to be stable.	LNAPL is present at three monitoring wells in the AOI 81-2 LNAPL Area indicating that the LNAPL is mobile within the stable perimeter.	The results of historic IMs indicate that in the past LNAPL has been removed using a recovery trench and well, and by bailing. However it is uncertain whether future LNAPL recovery is practical. Although LNAPL was successfully recovered during the IM transmissivity at 70-107R indicates that further LNAPL recovery is impractical.	LNAPL is not readily recoverable.	Compositional and saturation concerns can be addressed through the proposed targeted excavations and engineering and institutional controls.	Targeted Excavation Institutional Controls - Sitewide and AOI Specific Controls A, B, C, and D
7	AOI 83/84-2 Cutting Oil Area	LNAPL Monitoring and Bailing	Product Recovery System - Unknown Amount of LNAPL Recovered	Outfall 003 and GSI Lateral Bulkheads	Targeted Excavation	$115,000	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$6,400 Capital Costs $2,600/Year	003 Passive Recovery Trench	$3,000	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	$10,000/year [11]	005 Passive Recovery Trench	$3,000	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	$10,000/year [11]	Surface Cover	$25,000	Inspect and Maintain - The surface cover will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 5 years and then once every 5 years for the next 25 years.	$1,800/Year - Annual Inspections and Maintenance	Institutional Controls	$12,600	NA	NA	1) Volatile Soil Inhalation Risk 2) Particulate Soil Inhalation Risk 3) Direct Contact with LNAPL 4) Potential Volatilization to Indoor Air for a Future Structure	Based on the current understanding of risk conditions, the direct contact, soil inhalation and potential volatilization to indoor air compositional concerns can be effectively mitigated through targeted excavation and engineering and institutional controls.	While the LNAPL is mobile in the vicinity of the Outfall 003 and GSI storm sewers, the AOI 83/84-2 LNAPL Area appears to be stable.	LNAPL was infiltrating the Outfall 003 and GSI storm sewers. In addition LNAPL is present at monitoring wells in the AOI 83/84-2 area indicating that the LNAPL is mobile within the stable perimeter.	The results of historic IMs indicate that in the past LNAPL may be have been recovered using a product recovery well and by bailing. Transmissivity testing completed indicated that LNAPL may be readily recoverable in the southeastern portion of the LNAPL Area, however, recovery is not practical in the northern and eastern portions of the LNAPL Area.	Although LNAPL may be recoverable in a portion of the LNAPL Area, the compositional and saturation concerns can be addressed through the proposed targeted excavation and engineering and institutional controls.	Targeted excavation and engineering and institutional controls are needed mitigate direct contact and soil inhalation risks.	Targeted Excavation Maintain Surface Cover 003 Passive Recovery Trench 005 Passive Recovery Trench Institutional Controls - Sitewide and AOI Specific Controls A, B, C, and D
8, 14, 17	AOI 26-1/AOI 26-2 LNAPL Area	Product Recovery System ~6 years of LNAPL Recovery from three recovery wells	Outfall 001 and 002 Storm Sewer Bulkheads	LNAPL Monitoring and Bailing	MPE - Southeastern Portion of the LNAPL Area	$870,000	OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$343,000/Year OMM Costs $37,000 Capital Costs $15,000/Year	Excavation - Southeastern Portion of the LNAPL Area (to 12 feet bgs)	$3,200,000	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$26,000 Capital Costs $14,400/Year	$0 - Work completed as part of the Buick City Bulkhead Installation	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	$10,000/year [11]	Surface Cover	$25,000	Inspect and Maintain - The surface cover will be inspected and maintained as necessary. Inspections will be completed on an annual basis for 5 years and then once every 5 years for the next 25 years.	$1,800/Year - Annual Inspections and Maintenance	Institutional Controls	$12,600	NA	NA	1) Soil Volatilization to Indoor Air Concerns 2) Volatile Soil Inhalation Concerns 3) Potential Volatilization to Indoor Air for a Future Structure 4) Direct Contact Concerns 5) LNAPL Infiltration to Outfall 002 Storm Sewer (Addressed by Bulkhead)	Based on the current understanding of conceptual site model soil inhalation concerns in the southeastern portion of the AOI 26-1/26-2 LNAPL Area cannot be effectively addressed through engineering or institutional controls and therefore treatment/removal is recommended.	The AOI 36-1/36-2 LNAPL Area appears to be stable.	LNAPL from the AOI 26-1/26-2 area had been infiltrating the Outfall 002 storm sewer. The Outfall 002 storm sewer has been bulkheaded to eliminate LNAPL infiltration.	Based on the high volatility of LNAPL and soil inhalation risks in the southeastern portion of the LNAPL Area, some LNAPL is likely able to be recoverable. Additionally, the results of historic interim measures (IM) indicate that some LNAPL has previously been able to be recovered in the AOI 26-1/26-2 LNAPL Area.	Implementation of an MPE system in the southeastern portion of the AOI 26-1/26-2 LNAPL Area would likely cost effectively reduce the LNAPL source mass and/or reduce exposure risks associated with volatilization. LNAPL recovery in the northwestern portion of the AOI 26-1/36-2 LNAPL Area would not reduce the exposure risks associated with volatilization due to the lower viability LNAPL constituents.	Compositional and saturation concerns can be addressed through the proposed Multiphase Extraction, and engineering (surface cover and bulkhead) and institutional controls.	Multi-phase Extraction 002 Passive Recovery Trench Maintain Surface Cover Institutional Controls - Sitewide and AOI Specific Controls A, B, and D
9	AOI 83/84-1 Cutting Oil Area [8]	No Completed Interim Measures			Outfall 004 Pathway Elimination	$130,000	Inspect and Maintain - The re-route and associated bulkheads will be inspected, and maintained as necessary Inspections will be completed on an annual basis for 3 years and then once every 5 years for the next 25 years.	$5,000/year	004 Passive Recovery Trench	Capital Costs included in Outfall 004 Pathway Elimination	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	$10,000/year [11]	Targeted Soil Mixing/Land farming [9]	$730,000	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$6,400 Capital Costs $3,600/Year	Institutional Controls	$12,600	NA	NA	1) Potential GSI pathway to Outfall 004 Storm Sewer 2) Potential Volatilization to Indoor Air for a Future Structure	Based on the current understanding of risk conditions, the potential GSI/P and volatilization to indoor air compositional concerns can be effectively mitigated through engineering and institutional controls.	Although the AOI 83/84-1 LNAPL is mobile in the vicinity of the Outfall 004 storm sewer, the AOI 83/84-1 LNAPL Area appears to be stable.	LNAPL from AOI 83/84-1 is likely infiltrating the Outfall 004 storm sewer, by way of a lateral that passes through the LNAPL Area, however, the viscosity of the LNAPL is 108 cp, limiting its mobility.	LNAPL recovery is not likely practical due to the high viscosity of the LNAPL. Also, LNAPL is present in only a one well in the AOI 83/84-1 Area.	LNAPL is not readily recoverable.	Based on the likely infiltration to the Outfall 004 storm sewer, an Engineering Control to eliminate the infiltration is recommended.	Outfall 004 Pathway Elimination 004 Passive Recovery Trench Institutional Controls - Sitewide and AOI Specific Control A
10	AOI 83/84-4 Cutting Oil Area	LNAPL Monitoring and Bailing			Thermally-Enhanced LNAPL Recovery - High Temperature Application +	$160,000 to $536,000	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$6,400 Capital Costs $3,600/Year	Targeted Soil Mixing/Land farming [9]	$100,000	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$6,400 Capital Costs $3,600/Year	Institutional Controls	$12,600	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	1) Potential GSI pathway to Outfall 003 Storm Sewer 2) Potential Volatilization to Indoor Air for a Future Structure	Based on the current understanding of risk conditions, the GSI and volatilization to indoor air concerns can be effectively mitigated through institutional controls.	The AOI 83/84-4 LNAPL Area appears to be stable.	LNAPL is present at two monitoring wells in the AOI 83/84-4 area indicating that the LNAPL is mobile within the stable perimeter.	Transmissivity testing at RFI-83/84-07 indicated that LNAPL recovery is not practicable.	LNAPL is not readily recoverable	Institutional Controls	Institutional Controls - Sitewide
11	AOI 40-A,B and 39-C - Fuel Oil Areas	LNAPL Monitoring and Bailing			Outfall 009 and 010 Bulkhead Installation (IM Approved and in Progress)	$110,000	Inspect and Maintain - The re-route and associated bulkheads will be inspected, and maintained as necessary Inspections will be completed on an annual basis for 3 years and then once every 5 years for the next 25 years.	$5,000/year	Targeted Soil Mixing/Land farming [9]	$1,000,000	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$12,600 Capital Costs $7,200/Year	Surfactant-Enhanced LNAPL Recovery	$2,000,000 to $5,000,000	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$12,600 Capital Costs $7,200/Year	Hydraulic Recovery	$45,000	OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$30,000/year for OMM activities $36,000 Capital Costs $15,000/ Year for Monitoring activities	Institutional Controls	$12,600	NA	NA	1) Potential GSI pathway to Outfall 009 and 010 Storm Sewers and Flint River 2) Direct Contact 3)Potential Groundwater Volatilization to Indoor Air Concern at the Property Boundary 4) Potential Volatilization to Indoor Air for a Future Structure	Based on the current understanding of risk conditions GSI and volatilization to indoor air risk can be effectively mitigated through engineering and institutional controls.	The AOI 40-A, -B and 39-C LNAPL Areas appear to be stable.	LNAPL has been detected in several monitoring wells in the 40-A, -B and 39-C area indicating that the LNAPL is mobile within the stable perimeter.	The results of historic interim measures, bench-scale testing and transmissivity testing indicated that LNAPL may be readily recoverable in the northern portion of the AOI 40-A LNAPL Area. However, bench-scale and transmissivity testing indicated that LNAPL recovery is not practical in the southeastern portion of the AOI 40-A LNAPL Area or in the AOI 40-B or 39-C LNAPL Areas.	Compositional and mobility concerns can be addressed through engineering and institutional controls. Although LNAPL recovery may be possible at RFI-40-782, the value of recovery does not outweigh the cost.	Based on the proximity of the AOI 40-A, -B and 16-C LNAPL Areas to the Outfall 009 and 010 storm sewers, Engineering Controls (bulkhead installation) are recommended.	Outfall 009 and 010 Bulkhead Installation Institutional Controls - Sitewide and AOI Specific Controls A and D
12	AOI 83/84-5 Cutting Oil Area	Outfall 003 Storm Sewer Lateral Bulkhead			LNAPL Removal	$250,000	OMM activities will be completed for up to 2 years. Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$80,000/year for OMM activities $36,000 Capital Costs $15,000/ Year for Monitoring activities	Institutional Controls	$12,600	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	1) Potential GSI pathway to Outfall 003 Storm Sewer 2) Potential Volatilization to Indoor Air for a Future Structure	Based on the current understanding of risk conditions, the volatilization to indoor air compositional concern can be effectively mitigated through institutional controls.	The AOI 83/84-5 LNAPL Area appears to be stable	LNAPL is present at four monitoring well 010-02 (and its replacements 02-02R and 03-02R2) since 2001, indicating the LNAPL is mobile within the stable perimeter.	Transmissivity testing completed indicated that LNAPL may be readily recoverable in the northern portion of the LNAPL Area. However, transmissivity testing indicated that LNAPL recovery is not practical in the southeastern portion of the LNAPL Area.	While the compositional concerns can be addressed through institutional controls, LNAPL has been identified at the property boundary and may extent off Site. Therefore LNAPL recovery is recommended to minimize off Site impacts.	Based on the proximity of the AOI 83/84-5 LNAPL Area to the property boundary, LNAPL Recovery and Institutional Controls are recommended.	LNAPL Removal Institutional Controls - Sitewide and AOI Specific Control A
13	AOI 03-1 Quench Oil Area	Recovery Sump with a Belt Skimmer		LNAPL Monitoring and Bailing	Excavation	$770,000	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$6,400 Capital Costs $3,600/Year	Institutional Controls	$12,600	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	1) Potential GSI pathway to Outfall 003 2) Potential Volatilization to Indoor Air Concerns for Future Structures	A historic IM addressed the suspected source area for this LNAPL Area in the southern portion of Building 30A; therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate.	The AOI 03-1 LNAPL Area appears to be stable.	LNAPL is present at monitoring well 010-02 (and its replacements 02-02R and 03-02R2) since 2001, indicating the LNAPL is mobile within the stable perimeter.	It is unlikely that future LNAPL recovery is practical as minimal LNAPL is currently present at AOI 03-1.	LNAPL is not readily recoverable	Institutional Controls	Institutional Controls - Sitewide and AOI Specific Controls B and C

16	AOI 02-B Hydraulic Oil Area	No Completed Interim Measures			Thermally-Enhanced LNAPL Recovery _ High Temperature Application [4]	$680,000 to $2.3M	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$6,400 Capital Costs $3,600/Year	Targeted Soil Mixing/Land farming [3]	~$500,000	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$6,400 Capital Costs $3,600/Year	Institutional Controls	$12,600	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	1) Potential Volatilization to Indoor Air for a Future Structure	Based on the current understanding of risk conditions, the volatilization to indoor air compositional concern can be effectively mitigated through institutional controls.	The AOI 02-B LNAPL Area appears to be stable.	The LNAPL is mobile within the stable perimeter, as it is gauged in these monitoring wells. However the viscosity of the LNAPL in this Area is 362 cp, limiting its mobility.	LNAPL is not readily recoverable. Transmissivity testing was unable to be completed as the LNAPL was too viscous to accurately measure.	LNAPL is not readily recoverable.	Institutional Controls	Institutional Controls - Sitewide
17	AOI 36-S - Fuel Oil Area	Tank Farm (Source Area) Excavated	LNAPL Recovery Trenches and Sumps – 20 Years of LNAPL Recovery	Outfall 002 Storm Sewer Bulkheaded to Eliminate LNAPL Migration Pathway	002 Passive Recovery Trench Monitoring	$0 - Work completed as part of the Outfall 002 Bulkhead Installation	Inspect and Remove - The last downgradient manhole (prior to the bulkhead) will be inspected for LNAPL. Accumulated LNAPL will be removed for offsite disposal. Inspection and removal will be completed for up to 5 years.	$10,000/year [11]	Thermally-Enhanced LNAPL Recovery _ High Temperature Application [4]	$390,000 to $940,000	Downgradient Monitoring will be completed to monitor for the presence of LNAPL and constituents of concern (COCs). Monitoring will be completed for 30 years.	$6,400 Capital Costs $3,600/Year	Institutional Controls	$12,600	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	1) LNAPL infiltration into Outfall 002 Storm Sewer (Addressed by Bulkhead) 2) Potential Volatilization to Indoor Air Concern for Future Structures	Based on the current understanding of risk conditions, the potential volatilization to indoor air risk can be effectively mitigated through institutional controls. Following removal of the source for this LNAPL Area (Tank Farm 27) an LNAPL recovery system consisting of two recovery trenches and sumps operated was installed to address LNAPL in the former source (AOI 36-S) area. As the source of this LNAPL area has been removed and partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate at AOI 36-S.	While the LNAPL is mobile in the vicinity of the storm sewer, it appears to be stable.	Historically LNAPL from AOI 36-S was infiltrating the Outfall 002 storm sewer; however, bulkheads and plugs have been installed to eliminate the Site's contribution to the storm sewer. In addition LNAPL is present in one monitoring well and one recovery well in the AOI 36-S area indicating that LNAPL is mobile within the stable perimeter.	The results of historic IMs indicate that in the past LNAPL has been recovered using recovery trenches and wells, and by flailing. However it is uncertain whether future LNAPL recovery is practical.	Compositional and mobility concerns can be addressed through engineering and institutional controls. Additionally, The LNAPL source area (Tank Farm 27) has been removed and an LNAPL recovery system has operated at AOI 36-S for approximately 20 years. Therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate. The marginal value of additional recovery does not justify the cost.	Based on LNAPL infiltration to the Outfall 002 storm sewer, Outfall 002 has been bulkheaded and monitoring of the Outfall 002 recovery trench is recommended.	002 Passive Recovery Trench Monitoring Institutional Controls - Sitewide and AOI Specific Control A

Notes:
Cost estimates for recommended remedy design and implementation are presentec in Appendix CC.

1. The LNAPL Decision Tree analysis is presented in its entirety as Attachment 2 of each of the LNAPL Remedy Recommendation memos (Appendices C through R). This table provides a brief summary of the concerns identified and the associated cost benefit discussion.

2. Remedy may include excavation or installation of surface cover dependent upon delineation activities.

3. Costs assume a discrete excavation event. However, if the excavation is completed with the 43-16S excavation activities costs would likely be minimal.

4. The system for AOI 59-B was included in the Southend Final Decision and no Remedy Recommendation Memo has been prepared for this AOI.

Area of Interest	Recommended Remedy
WMU #3	Institutional Controls - Sitewide
WMU #7	Bulkhead at Outfalls 009 and 010 (Completed) Institutional Controls - Sitewide and AOI Specific Control A
WMU #10	Institutional Controls - Sitewide and AOI Specific Control E
Storm Sewer GSI Issues	To Be Determined

Notes:
1 - Remedy included in the 2010 Final Decision for the Southend of the Buick City Site.
AOI Specific Institutional Controls -

A	Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads.
B	Notify future owners of the presence of PCBs.
C	Restrict the area to low occupancy based on the presence of PCBs.
D	Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present to prevent direct contact with contaminated material, except with using appropriate health and safety measures, during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier upon completion of the work. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the Natural Resources and Environmental Protection Act.
E	Notify future owners to the potential presence of a listed hazardous waste beneath WMU #10.

Table 9B. Estimated Design, Capital and OMM Costs for Recommended Remedies
RACER Buick City Site, Flint, Michigan

Task		Est Design and Capital Costs							Short Term OMM Costs [5]								
		2014	2015	2016	2017	2018	2019	Total Est Design and Capital Costs	2014	2015	2016	2017	2018	2019	Total OMM [5]	Total Through 2019	Long Term OMM (Post 2019) [5, 6]
Task 1 - Outfall 003/004 Oil Removal Systems		$0	$0	$0	$0	$0	$0	$0	$75,000	$75,000	$75,000	$50,000	$50,000	$50,000	$375,000	$375,000	$2,000,000

Totals		$1,846,000	$3,296,200	$4,480,600	$3,098,600	$300,000	$0	$13,021,400	$851,800	$888,400	$1,090,000	$902,800	$620,300	$523,200	$4,876,500	$17,897,900	$10,989,200

Footnotes:

1 OMM requirements from City following re-route of Outfall 004 and 013 are unknown at this time.

2 Southend Soil AOIs - AOI 02-C, AOI 09-A, AOI -09B, AOI 12-A, and AOI 29-A - required surface covers have already been installed.

3 Costs assume that recommended remedies for AOI 86-1, AOI 12-A, -B, & -C, and AOI 83/84-1 will all be implemented. Costs for the Outfall 004 Pathway Elimination Remedies are split across the LNAPL Areas.

4 Costs assume that recommended remedies for AOI 05-1/05-5 and AOI 10-1/10-4 will all be implemented. Costs for the Outfall 003 Pathway Elimination Remedies are split across the LNAPL Areas.

5 Timeframes of OMM are estimated for cost estimating purposes only and will be refined as appropriate in Corrective Measures Impementation (CMI) documentation. In most cases OMM has been projected out approximately 30 years, except where unnecessary. However if monitoring reveals 3 consecutive years of compliance monitoring will be discontinued.

6 See Table 9C for the rationale for the Long Term OMM Costs.

Table 9C. Long Term OMM Rationale
RACER Buick City Site, Flint, Michigan

Task		Rationale	Long Term OMM (Post 2019) [4]
Task 1 - Outfall 003/004 Oil Removal Systems		Includes costs for Post 2019 OMM activities as documented in the RCES Scope of Work.	$2,000,000
Task 3 -LNAPL Recovery Bench and Field-Scale Pilot Testing		NA	$0
Task 6 - Maintain Booms on Outfalls		NA	$0
Task 7 - Standard Groundwater Monitoring		Includes costs for Post 2019 OMM activities as documented in the RCES Scope of Work.	$2,925,000
Task 8 - NPDES PLUS Monitoring		Includes costs for Post 2019 OMM activities as documented in the RCES Scope of Work.	$1,925,000
Task 12 - Agency Coord./ Negotiation, Reporting & Project Management / Coordination		Includes costs for Post 2019 OMM activities as documented in the RCES Scope of Work.	$1,515,000
Supplemental Investigation		NA	$0
Addressing Soil Impacts			
	Southend	The surface cover OMM costs assumes that inspections will be completed on an annual basis for 5 years and then once every 5 years for the next 25 years. It is assumed that the first four inspection events will be completed prior to 2019 and that post 2019 6 insepction events will remain at a cost of $1,800 per event.	$10,800
	AOI 38-1		$10,800
	AOI 40-A		$10,800
	AOI 86-1		$10,800
	AOI 83/84-3		$10,800
	AOI 12-A -B, and -C		$10,800
	AOI 10-1/10-4		$10,800
	AOI 83/84-2		$10,800
	AOI 36-1/36-2		$10,800
Remedy Design, Implementation, and OMM			
1	AOI 86-1 Fuel Oil Plume [1, 2]	Long term OMM for the 004 Pathway Elimination includes inspections once every 5 years for the next 25 years at a cost of $5,000 per event. OMM of the 004 Passive recovery Trench will include inspection and removal of LNAPL once (Post 2019) at a cost of $10,000.	$35,000
2	AOIs 05-1/05-5 Cutting Oil Area [3]	Long term OMM for the 003 Pathway Elimination includes inspections once every 5 years for the next 25 years at a cost of $5,000 per event. Downgradient monitoring of the Targeted Excavations is estimated to cost $18,000/year for 30 years	$565,000
3	AOI 09-B - Gasoline Area	Downgradient monitoring of AOI 09-B is estimated to cost $15,000/year for 25 years	$375,000
4	AOIs 12-A, B, & C - Hydraulic Oil Plumes [1,2]	Long term OMM for the 004 Pathway Elimination includes inspections once every 5 years for the next 25 years at a cost of $5,000 per event Long term OMM for surface Cover will include inpections once every 5 years for the next 25 years at a cost of $1,800 per event. . OMM of the 004 Passive recovery Trench will include inspection and removal of LNAPL once (Post 2019) at a cost of $10,000.	$44,000
5	AOIs 10-1/10-4 Hydraulic Oil Area [3]	Long term OMM for the 003 Pathway Elimination includes inspections once every 5 years for the next 25 years at a cost of $5,000 per event. OMM of the 003 Passive recovery Trench will include inspection and removal of LNAPL once (Post 2019) at a cost of $10,000 Long term OMM for Surface Cover will include inpections will include 6 inspections (Post 2019) at a cost of $1,800 per event. Downgradient monitoring of the Targeted Excavations is estimated to cost $7,200/year for 26 years	$233,000

Table 9C. Long Term OMM Rationale
RACER Buick City Site, Flint, Michigan

Task		Rationale	Long Term OMM (Post 2019) [4]
6	AOI 81-2 Cutting Oil Area	Downgradient monitoring of the Targeted Excavations is estimated to cost $10,800/year for 27 years	$291,600
7	AOI 83/84-2 Cutting Oil Area	Downgradient monitoring of the Targeted Excavations is estimated to cost $3,600/year for 26 years Long term OMM for Surface Cover will include inpections will include 6 inspections (Post 2019) at a cost of $1,800 per event	$104,400
8, 14, 15	AOI 36-1/AOI 36-2 LNAPL Area	Downgradient monitoring of the MPE area is estimated to cost $15,000/year for 27 years Long term OMM for Surface Cover will include inpections will include 5 inspections (Post 2019) at a cost of $1,800 per event	$414,000
9	AOI 83/84-1 Plume [1, 2]	Long term OMM for the 004 Pathway Elimination includes inspections once every 5 years for the next 25 years at a cost of $5,000 per event. OMM of the 004 Passive recovery Trench will include inspection and removal of LNAPL once (Post 2019) at a cost of $10,000.	$35,000
10	AOI 83/84-4 Cutting Oil Plume	NA	$0
11	AOI 40-A,B and 16-C - Fuel Oil Plumes	Long term OMM for the bulkheads include inspections once every 5 years for the next 25 years at a cost of $5,000 per event.	$25,000
12	AOI 83/84-5 Area	Downgradient monitoring of the LNAPL Recovery area is estimated to cost $15,000/year for 27 years	$405,000
13	AOI 03-1 Quench Oil Plume	NA	$0
16	AOI 02-B Hydraulic Oil Plume	NA	$0
17	AOI 36-5 - Fuel Oil Area	NA	$0
	WMU #3, #7, #10	NA	$0
Outfall Exit Strategy [5]			
	Outfall 002 Exit	NA	$0
	Outfall 003 Exit	NA	$0
	Outfall 004 Exit	NA	$0
	Outfall 005 Exit	NA	$0
	Totals		$10,989,200

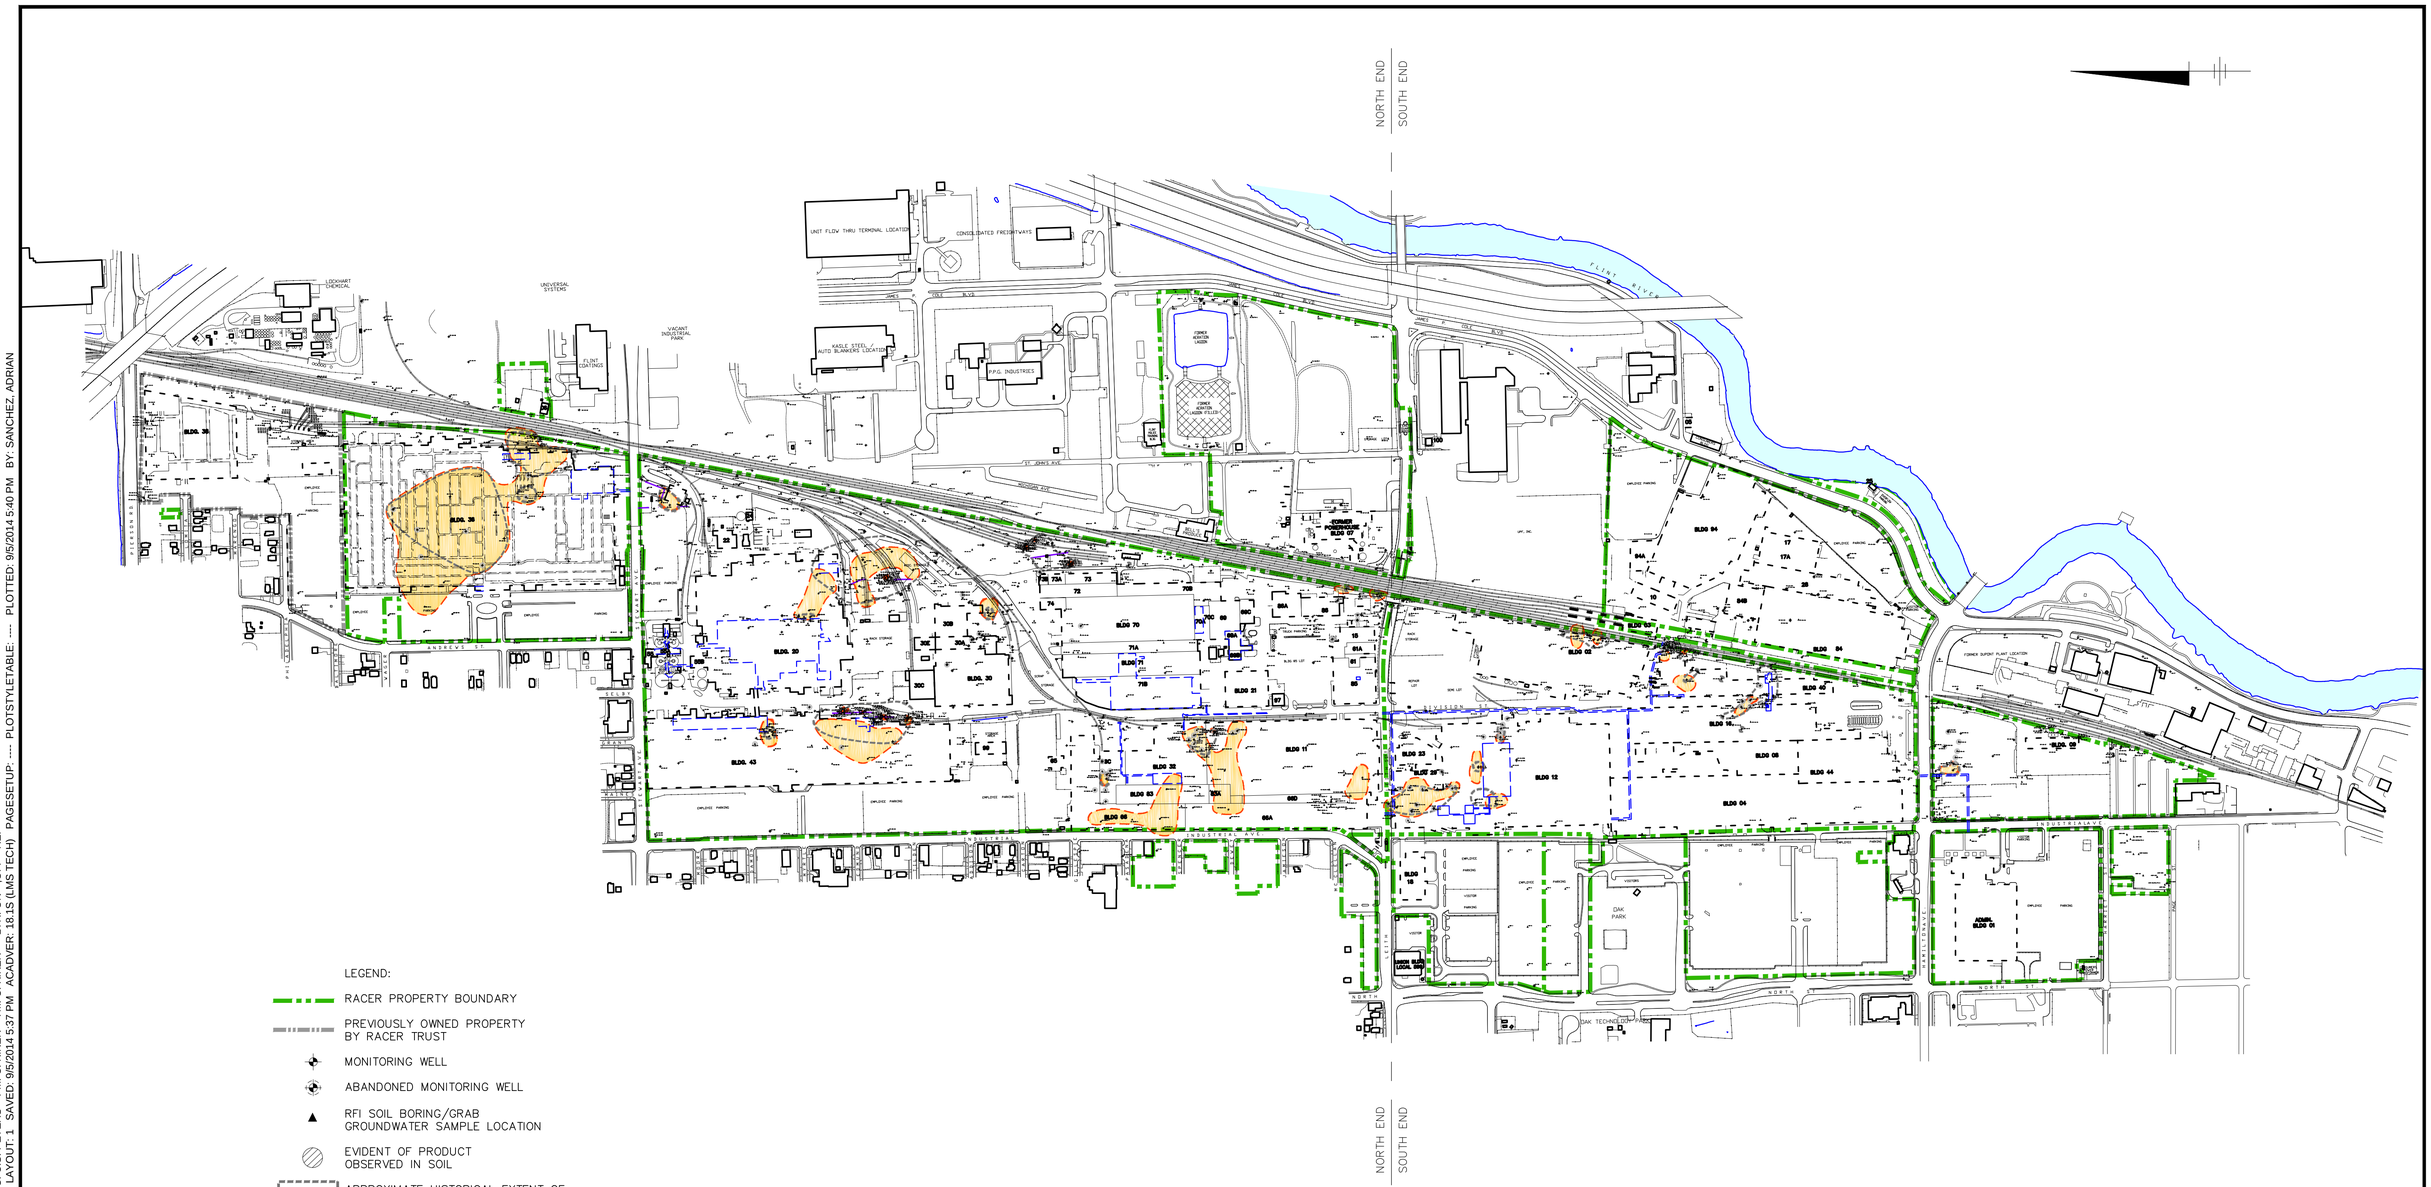
Footnotes:

1 OMM requirements from City following re-route of Outfall 004 and 013 are unknown at this time.

2 Costs assume that recommended remedies for AOI 86-1, AOI 12-A, -B, & -C, and AOI 83/84-1 will all be implemented. Costs for the Outfall 004 Pathway Elimination Remedies are split across the LNAPL Areas.

3 Costs assume that recommended remedies for AOI 05-1/05-5 and AOI 10-1/10-4 will all be implemented. Costs for the Outfall 003 Pathway Elimination Remedies are split across the LNAPL Areas.

4 Timeframes of OMM are estimated for cost estimating purposes only and will be refined as appropriate in Corrective Measures Impementation (CMI) documentation. In most cases, OMM has been projected out approximately 30 years, except where unnecessary. However, if monitoring reveals 3 consecutive years of compliance monitoring will be discontinued.



5 OMM requirements for Outfalls 002 through 005 are unknown at this time.

Table 10. Institutional Controls, Remedy Recommendation Report
RACER Buick City, Flint, Michigan

Institutional Control	General Site-wide Institutional Control Description
Land Use Restriction	*Property use must remain nonresidential.*
Groundwater Use Restriction	*Prohibit use of groundwater for any use other than sampling, investigatory, remediation, or short-term dewatering purposes.*
Surface Cover Restriction	*If Owner elects to remove any slabs, pavement or other impervious surface on the Property, Owner shall be responsible for any and all obligations under environmental laws arising from any such removal, alteration or disturbance, whether or not caused by, arising from or related to, an environmental condition.*
Vapor Intrusion Restriction	*The Owner shall not build or occupy any building on the property without first completing one of the following: Option 1) Evaluate and determine, with DEQ concurrence, the absence of an unacceptable vapor intrusion risk to human health in any existing or newly constructed site buildings, or Option 2) Install, operate and maintain a vapor barrier and/or mitigation system designed to eliminate the potential for subsurface vapor phase hazardous substances to migrate into the building at concentrations greater than applicable criteria. Continued operation and maintenance of the vapor barrier and/or mitigation system is necessary until it is determined that it is no longer necessary consistent with Option 1 above. For guidance on vapor intrusion issues, please refer to DEQ and U.S. EPA guidance applicable at the time. This prohibition does not apply to short-term occupancy of a building for purposes of construction, renovation, repair, or other short-term activities provided adequate health and safety precautions are employed during these activities and they are performed in compliance with Section 20107a of the NREPA.*
Soil Management Restriction	*The Owner shall manage contaminated soils, media and/or debris and all other soils located on the Property in accordance with the requirements of Part 111, Subtitle C of the Resource Conservation and Recovery Act, 42 U.S.C. Section 6901 et seq. (RCRA), the administrative rules promulgated pursuant to Part 111 and the RCRA, and all other relevant state and federal laws, including but not limited to MCL 324.20120c.*
Hazardous Substance Restriction	*Owner shall not "treat," "store," "dispose" or release any Hazardous Substances, on, at, or below the Property, in a manner that would require a permit under RCRA, 42 U.S.C. §§ 6901 et seq. or equivalent state Law, except pursuant to a plan or permit approved in writing by MDEQ or USEPA.*

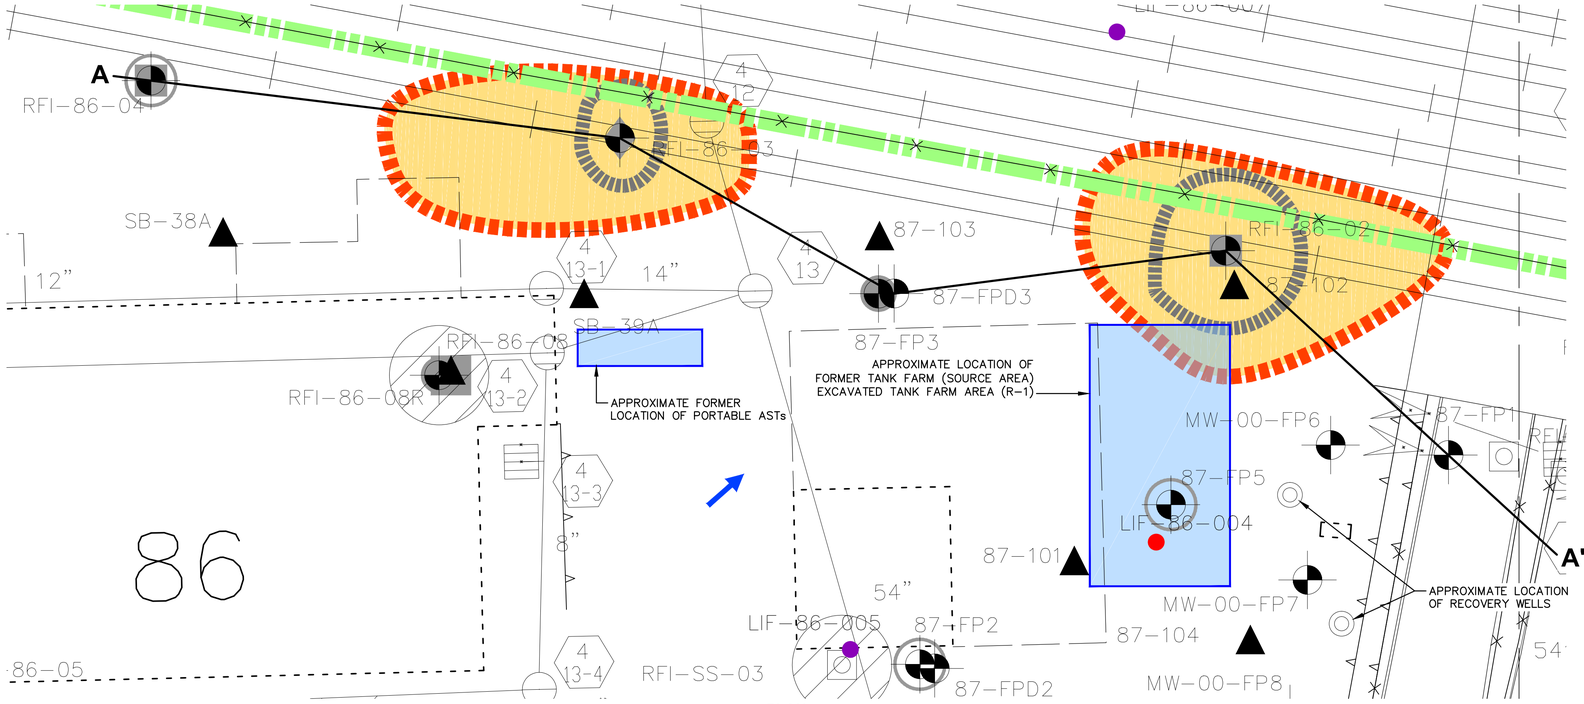
Subject:
Priority #1 - AOI 86-1 Fuel Oil LNAPL Area
Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

As part of the remedy evaluation process each of the Site's 17 light non-aqueous phase liquid (LNAPL) Areas were prioritized based on risk. The area of interest (AOI) 86-1 Fuel Oil LNAPL Area (AOI 86-1 LNAPL Area) is ranked as Priority #1 with a total potential risk score of 17 (**Table 5 of the main report**). A conceptual site model cross-section is attached (**Figure A-1)** that provides an overview of the AOI 86-1 LNAPL Area impacts.

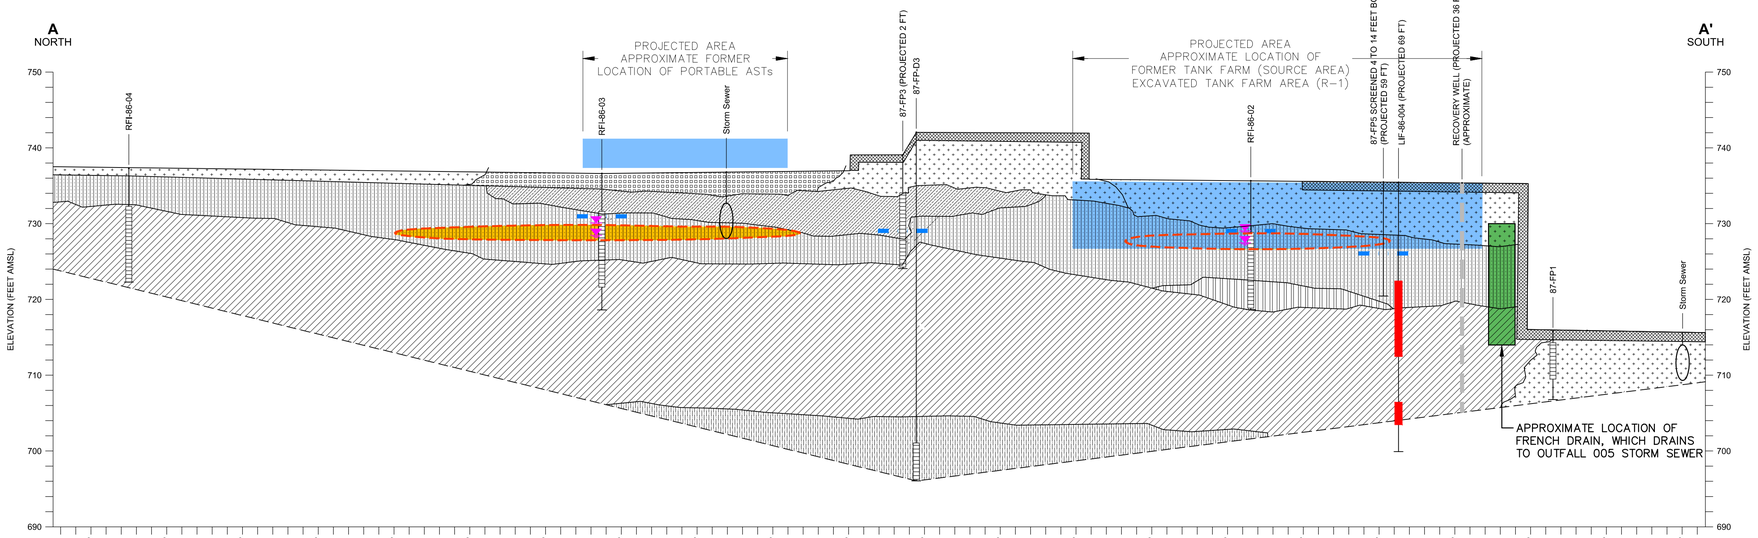


Historical IMs completed at the AOI 86-1 LNAPL Area include the tank farm removal, recovery wells, P-traps, and an LNAPL bailing program. The partial and effective removal of product completed in this area is considered a component of the AOI 86-1 remedy.

The compositional and saturation concerns identified for the AOI 86-1 LNAPL Area were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:

- There are exceedances of groundwater/surface water interface (GSI) and GSI protection criteria of select volatile organic compounds (VOCs) and metals in groundwater and soil samples.
- There are potential groundwater migration pathways to the Outfall 004 and 005 storm sewers.
- LNAPL is infiltrating the Outfall 004 storm sewer.

- Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios due to the biodegradation of LNAPL generating methane; however, this will be addressed by the proposed institutional controls.
- There is a potential unacceptable vapor phase exposure risk associated with impacted soil however, this will be addressed by the proposed institutional controls and additional sampling and evaluation.
- No feasible options exist to mitigate unacceptable risk through compositional change.
- The LNAPL contains low levels of polychlorinated biphenyls (PCBs) (up to 4.6 parts per million [ppm]) and chromium at concentrations that are potentially characteristically hazardous.
- The LNAPL is not migrating; however, it is mobile and infiltrating the Outfall 004 storm sewer.
- Compositional concerns associated with LNAPL infiltration and GSI can be addressed through engineering and institutional controls.



Based on the current understanding of conceptual site model risks, the remedies recommended to address the mobility, volatilization, GSI and PCB concerns associated with the AOI 86-1 LNAPL Area are to eliminate the Outfall 004 pathway, designate portions of the AOI 86-1 area as low occupancy, and establish institutional controls.

Attachment 1

LNAPL Conceptual Site Model

Priority #1 - AOI 86-1 Fuel Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model for the area of interest (AOI) 86-1 Fuel Oil light non-aqueous phase liquid (LNAPL) Area (AOI 86-1 LNAPL Area), which is located at the Buick City Site (Site) located in Flint, Michigan (**Figure A1-1**).

Please note that soil impacts were identified south of Leith Street. These impacts are not associated with the AOI 86-1 LNAPL Area and are address separately in the AOI 86-1 Soil memo presented in **Appendix R.**

1. Background

The AOI 86-1 LNAPL Area is located at the Northend of the Site just north of Leith Street along the property boundary with CSX (**Figure A1-2**) and is associated with a historic release from a tank farm located south of Buildings 86/86A and Building 87 and east of Building 15. The tank farm consisted of five 12,000-gallon underground storage tanks (USTs) that were installed in 1936 and in use until they were removed in 1977. At the time of removal, all five tanks were noted to be empty andrusted out. Some soils were reportedly excavated and disposed of along with the tanks. In 1991, seven soil borings were completed in the area of the former tank farm and soil samples were collected and analyzed for benzene, toluene, ethylbenzene, and xylenes (BTEX), lead and polynuclear aromatics (PNAs). The laboratory analyses suggested that a release of hydrocarbons had occurred.

In 1996, an oily sheen was discovered on the water in a nearby catch basin connecting to storm sewer Outfall 005. Further investigations were conducted in the vicinity of the former UST area. The results of the investigations indicated that a release of product had affected areas east, south, and west of the former UST area. However, LNAPL has only been detected in two monitoring wells (RFI-86-02 and RFI-86-03), shown on **Figure A1-2.**

Also, please note that historically LNAPL was also detected at the adjacent AOI 85-1 (Elevator Pit and Engine Test Area). LNAPL was detected and sampled during installation of temporary well RFI-85-02. A permanent well (RFI-85-02R) was subsequently installed at this location. However, LNAPL has not been observed in RFI-85-02R during subsequent groundwater sampling events. In addition, no impacts were identified in LIF boring LIF-86-003, which was co-located with RFI-85-02R to investigate the extent of

impacts. As no impacts have been identified at RFI-85-02R, there is no remedy recommended for this area; however, the data are included as part of the conceptual site model for the AOI 86-1 area.

For additional information regarding the tank farm and historic investigations please refer to the Current Conditions Report for the Northend of the Site which is presented in **Appendix Y**.

2. Former Interim Measures

2.1 Tank Farm Removal

The tank farm was removed in 1977. At the time of the removal, some soils were reportedly excavated and disposed of along with the tanks.

2.2 Recovery Wells

In the 1990s, two product recovery wells were installed to eliminate the migration of product from the AOI 86-1 LNAPL area into the catch basin connecting to Storm Sewer Outfall 005. The wells were installed to a depth of approximately 36 feet bgs adjacent to the Leith Street overpass retaining wall. Recovered product was collected in an oil/water separator and discharged to the Site's wastewater treatment plant. According to Site reports, the recovery system was successful in recovering free-phase LNAPL in this area and operation of the system was discontinued in 2001.

2.3 P-traps at Leith Street

In 2004, sheens were identified in the Outfall 005 storm sewer system. Inspection revealed that the likely source of the sheens was infiltration into the system near the two French drain manholes located on the north side of the Leith Street underpass (**Figure A-1**). P-traps were installed in both of the French drain manholes to prevent the sheen from discharging to Outfall 005. Quarterly inspections of the P-traps have been completed since 2010 and no LNAPL accumulation has been identified.

2.4 LNAPL Monitoring and Bailing Program

Following the shutdown of the product recovery wells discussed in Section 2.2, ten monitoring wells (87-FP1, 87-FP2, 87-FPD2, 87-FP3, 87-FPD3, 87-FP4, 87-FP5, MW-FP6, MW-FP7, and MW-FP8) located at AOI 86-1 were monitored as part of the Site-wide LNAPL monitoring program. These wells were gauged three times in 2001 and no product was measured at any of the wells.

From 2003 to 2005, seven monitoring wells (87-FP1, MW-00-FP6, RFI-85-02/2R, RFI-86-02, RFI-86-03, RFI-86-06D, and RFI-86-06S) located at AOI 86-1 were monitored as part of a Site-wide Quarterly LNAPL Monitoring Program. During the three year program, a total of 0.87 gallons of LNAPL was removed from

the AOI 86-1 area. Data from the 2003 to 2005 LNAPL bailing program are presented in **Appendix X**.

3. AOI 86-1 Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, LNAPL characteristics, and extent of impacts for the AOI 86-1 LNAPL Area.

Figure 2 presents the locations of the existing and abandoned monitoring wells and soil borings in the AOI 86-1 Area.

3.1 AOI 86-1 Geology and Hydrogeology

- *Geology:* The AOI 86-1 boring logs indicate that the soils are primarily fine sand and silty sand to approximately 15 feet below ground surface (bgs) and are underlain by silt/clay. The logs for monitoring wells 87-FP5, RFI-86-02 and RFI-86-03 also show visual evidence of LNAPL impacts and/or positive oil shake tests ranging from 3 to 18 feet bgs (maximum boring depth in the LNAPL area). The logs for monitoring wells 87-FP2, 87-FPD2, 87-FP3, 87-FPD3, 87-FP4, and RFI-85-02/02R did not indicate any visual evidence of impact and exhibited slightly elevated PID readings.

- *Groundwater/LNAPL Levels:* Depth to groundwater in this area ranges from 6 to 11 feet bgs. Since the completion of the Quarterly LNAPL Monitoring Program in 2005, LNAPL has been detected intermittently at monitoring wells RFI-86-02 and RFI-86-03. The greatest thicknesses of LNAPL were detected in 2007 with 3.54 feet measured at RFI-86-02 and 0.48 feet measured at RFI-86-03. RFI-86-03 is gauged during the annual groundwater sampling event and in recent years has detected little (0.03 feet) to no product. In March 2013, 0.01 feet of product was measured at RFI-86-02 at a depth of 8.06 ft bgs and no product was measured at RFI-86-03. Based on a review of historic groundwater elevations at this AOI and the observed flow direction, groundwater is infiltrating both the Outfall 004 and 005 storm sewers.

  Groundwater flow in this portion of the Site is generally to the southeast. Groundwater level data are presented in **Appendix X.**

3.2 Groundwater and Soil Analytical Data

Analytical data were compared to applicable Michigan Part 201 non-residential criteria.

3.2.1 Groundwater Analytical Data

Six monitoring wells in the vicinity of the AOI 86-1 LNAPL Area have been sampled during Site investigations. LNAPL constituents from the AOI 86-1 LNAPL Area were detected

above criteria in groundwater. This dissolved phase plume exceeds groundwater/surface water interface (GSI) criteria for chloroethane (5,200-14,000/1,100 ug/L), naphthalene (34/11 ug/L), trichloroethene (960-2,000/200 ug/L), vinyl chloride (49-430/13 ug/L), arsenic (14-47/10 ug/L) and silver (0.74/0.2 ug/L). The dissolved phase plume continues offsite to CSX property (which bisects the Site) as shown on **Figure A1-2**.

3.2.2 Soil VOC, SVOC, and Metals Analytical Data

Soil samples were collected from five locations in the immediate vicinity of the AOI 86-1 LNAPL area during Site investigations. The following soil impacts were detected.

- Trichloroethene (TCE) was detected at concentrations exceeding Non-residential Soil Volatilization to Indoor Air (NSVIA) criteria in samples collected from the RFI-86-08 (3.3-5.5/1.9 mg/kg) soil boring. These soil samples are located in the release area, but are not within the defined extents of the AOI 86-1 LNAPL Area.
- Soil samples exceed Groundwater/ Surface Water Interface Protection (GSIP) criteria for 2-methylnapthalene (7.35-7.41/4.2 mg/kg), naphthalene (1.79-1.85/0.73 mg/kg), tetrachloroethene (2.2/4 mg/kg), trichloroethylene (3.3-5.5/4 mg/kg), arsenic (8.4-34/4.6 mg/kg), cobalt (8.4-12/2 mg/kg), copper (160-460/130 mg/kg), manganese (820/98 mg/kg), mercury (0.383/0.05 mg/kg), nickel (150/120 mg/kg), selenium (0.65-0.66/0.4 mg/kg), and/or zinc (370/280mg/kg).

3.2.3 GSI Evaluation

As discussed in further detail in **Appendix BB**, GSI exceedances in the Site storm sewers are being evaluated by the ongoing NPDES Plus Monitoring Program (NPMP). AOI 86-1 is primarily serviced by the Outfall 004 storm sewer, which will be bulkheaded as part of the recommended remedies, eliminating this pathway. Outfall 005 also services the southern portion of the AOI 86-1 area. As discussed in Appendix BB additional sampling is being conducted at Outfall 005 to determine whether impacts from the AOI 86-1 area are infiltrating the Outfall 005 storm sewer. Also, data evaluations completed to date suggest that the majority of the metals impacts at the Site can be addressed a mixing zone based remedy; however, additional data collection and evaluation is needed.

3.2.4 Soil PCB Analytical Data

Polychlorinated biphenyls (PCBs) were detected in one sample at a concentration less than 1 part per million (ppm).

3.2.5 Vapor Intrusion Evaluation

Due to the presence of shallow groundwater and LNAPL (approximately 6 to 11 feet below ground surface) at AOI 86-1, groundwater data were also compared to the applicable Non-Residential Screening Values For the Vapor Intrusion Pathway presented in the *Michigan Department of Environmental Quality (MDEQ) Guidance Document for the Vapor Intrusion Pathway* (further discussed in Section 3.4 of the Report). Groundwater data from three on Site locations (87-FP2, 87-FP3, and RFI-85-06) exceed applicable volatilization to indoor air screening levels.

As there are no structures at the Site the MDEQ Part 201 criteria are appropriate for comparison of soil data. As discussed in Section 3.2.2, TCE was detected at concentrations exceeding NSVIA criteria in soil samples collected from the RFI-86-08.

3.3 LNAPL Characteristics

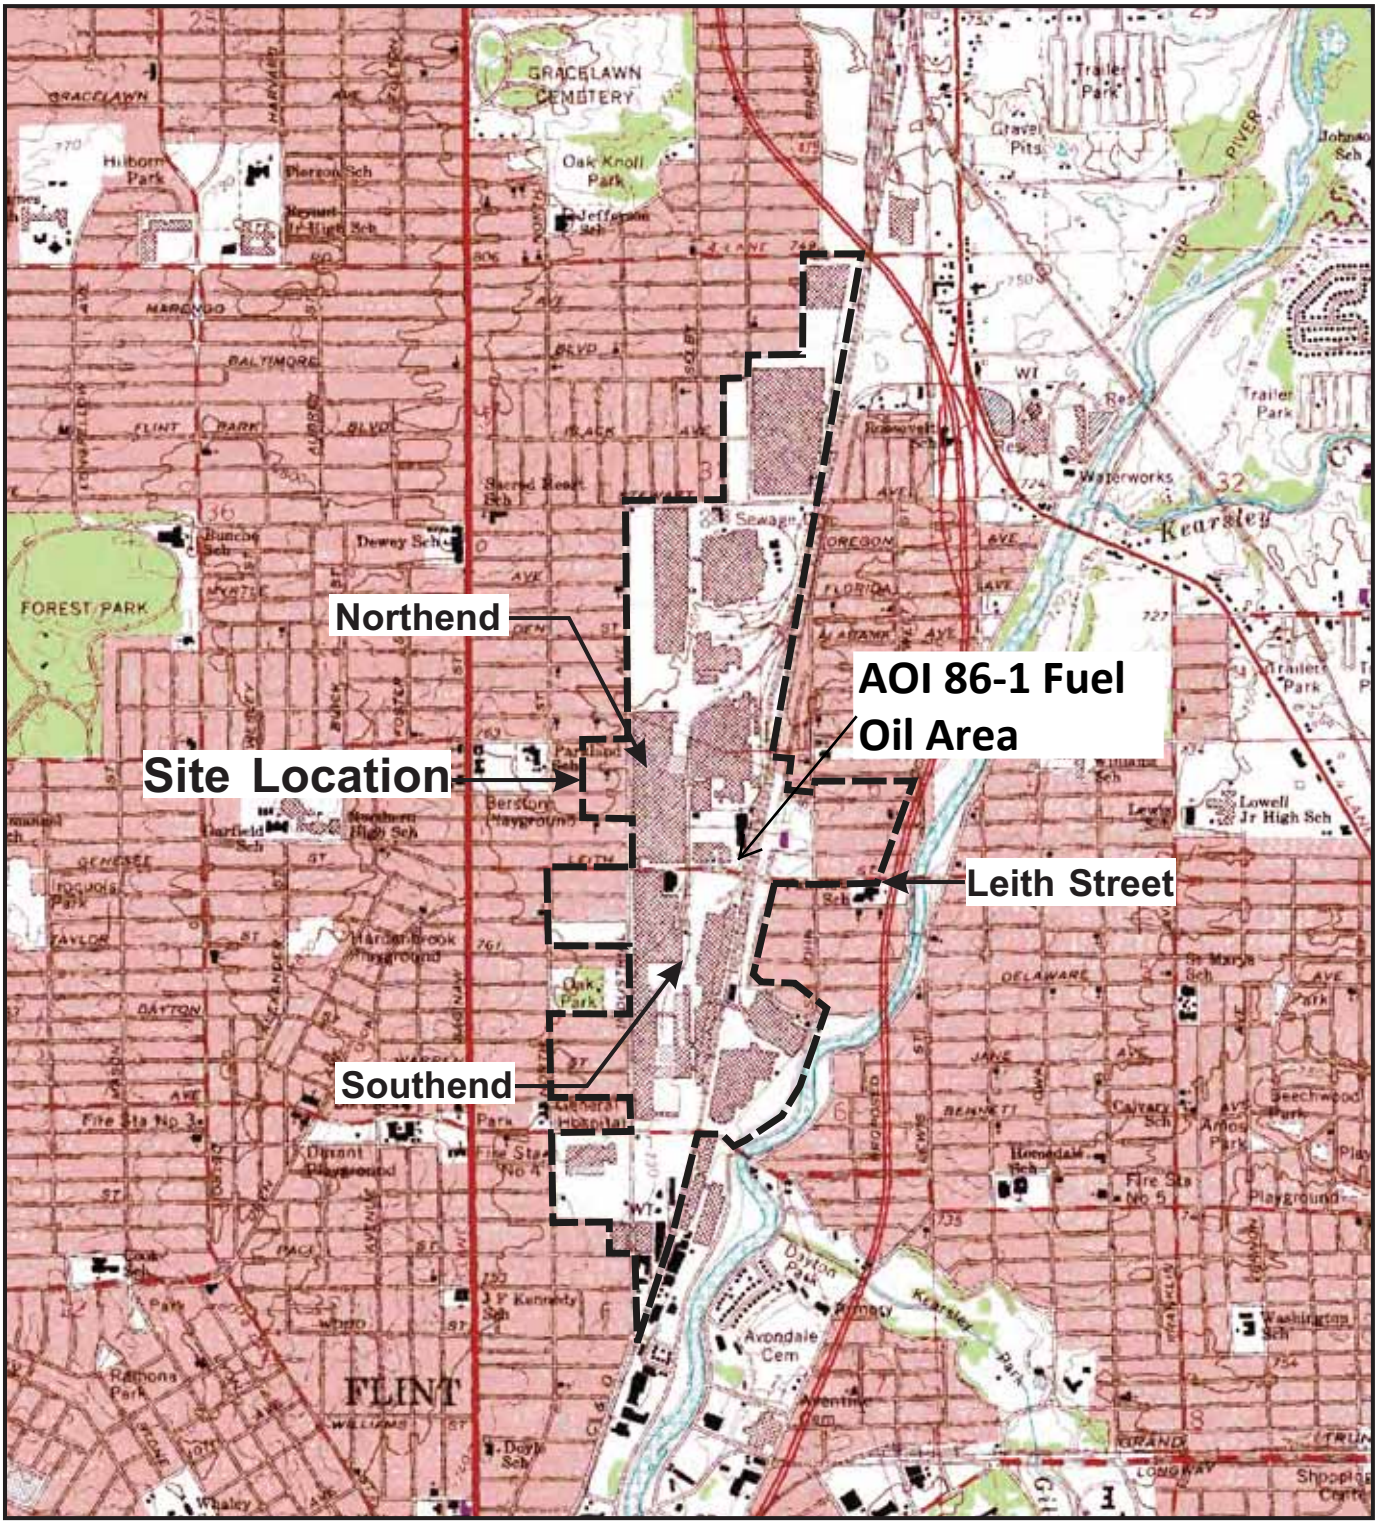
- *LNAPL Analytical Data:* LNAPL present at AOI 86-1 consists primarily of fuel oil with viscosity that ranges from 18 to 60 centipoise (cp), an interfacial tension ranging from 16 to 23 dynes/centimeter, and specific gravity ranging from 0.87 to 0.90. The LNAPL samples collected also exhibited PCBs at concentrations ranging from 0.56 to 4.6 ppm. In addition, concentrations of chromium exceed TCLP criteria; however, TCLP analysis has not been conducted.

  For reference, the viscosity (at 100 degrees Fahrenheit) of olive oil is 43.2 cp and honey is 73.6 cp (Ingersoll-Rand, 1981). Applicable LNAPL analytical data are presented in **Appendix X.**

- *LIF Data:* Nine laser-induced fluorescence (LIF) borings were completed in the vicinity of the AOI 86-1 LNAPL Area. The LIF response at the AOI 86-1 Area is consistent with the known LNAPL type, fuel oil. One boring (LIF-86-004) detected impacts (greater than 5% RE) from 13.5 to 23.1 feet bgs and 28.9 to 34.5 feet bgs. The highest responses (exceeding 100% RE) are from 13.5 to 18 feet bgs and 28.9 to 34.5 ft bgs. The impacts from 18 to 23.1 feet bgs are below 50% RE.

  LFI-86-004 is located adjacent to monitoring well 87-FP5, which is screened from 4 to 14 feet bgs and no LNAPL has been detected in this well. Historically, depth to groundwater at 87-FP5 has been 10 to 12 feet bgs. **Figure A1-2** presents the results of the LIF investigation and the extent of impacts associated with the AOI 86-1 LNAPL Area.

- *Transmissivity:* Transmissivity testing has not been completed at the AOI 86-1 LNAPL Area. There is insufficient LNAPL present to conduct transmissivity testing at this time.



- *Natural Source Zone Depletion (NSZD):* NSZD sampling was completed to establish ongoing natural attenuation rates of LNAPL at the AOI 86-1 LNAPL Area as a baseline for comparison to active LNAPL recovery technologies. Two carbon traps were installed adjacent to monitoring wells RFI-86-02 and RFI-86-03, in order to establish ongoing natural attenuation rates of LNAPL in this area. The results show that LNAPL near monitoring well RFI-86-02 and RFI-86-03 is being depleted at rates of 516 gallons per acre per year and 397 gallons per acre per year, respectively.

3.4 Extent of LNAPL

During the Remediation Cost Estimate Summary (RCES) preparation, the AOI 86-1 LNAPL area was calculated based on historical data. The footprint of the LNAPL area containing approximately 0.5 ft or greater of LNAPL was estimated to be approximately 2,300 square feet. However, during the past five annual monitoring events greater than 0.5 of product has only been detected in one well (RFI-86-02) once. Based on the LIF investigation, one boring (LIF-86-004) detected impacts from 13.5 to 23.1 feet bgs and 28.9 to 34.5 feet bgs. The highest responses are from 13.5 to 18 feet bgs and 28.9 to 34.5 feet bgs. Soil boring logs indicate positive oil in soil shake tests from depths of 3 feet bgs to 18 feet bgs.

Attachment 2

LNAPL Remedial Decision Tree

Attachment 1 LNAPL Remedial Decision Tree Priority #1 – AOI 86-1 (Fuel Oil Area)

NOTES

(#) NOTES: See Page A2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priority #1 - AOI 86-1 Fuel Oil LNAPL Area

Background: The area of interest (AOI) 86-1light non-aqueous phase liquid (LNAPL) area is located at the Northend of the Site just north of Leith Street along the property boundary with CSX and is associated with a historic release from a tank farm located south of Buildings 86/86A and Building 87 and east of Building 15. The tank farm consisted of five 12,000-gallon underground storage tanks (USTs) that were installed in 1936 and in use until they were removed in 1977.

Geology and Hydrogeology: The soils at AOI 86-1 consist of primarily sand and silty sand to a depth of approximately 15 feet bgs that is underlain by clay/silt. Depth to groundwater in this area ranges from 6 to 11 feet bgs. Groundwater flow in this portion of the Site is generally to the southeast.

LNAPL Characteristics: LIF data indicate impacts at the AOI 86-1 LNAPL Area from 13.5 to 23.1 feet bgs and 28.9 to 34.5 ft bgs and soil boring logs noted impacts from 3 to 18 feet bgs. The AOI 86-1 LNAPL area is defined by two monitoring wells, RFI-86-02 and FI-86-03, both of which are gauged during annual monitoring events. LNAPL has only been detected at RFI-86-02 at a thickness greater than 0.1 feet once in the last 10 years. Little (0.05 feet) to no product has been detected at RFI-86-03 in the past ten years. In March 2013, 0.01 feet of product was measured at RFI-86-02 at a depth of 8.06 ft bgs and no product was measured at RFI-86-03. Laboratory analysis indicates that the LNAPL viscosity ranges from 18 to 60 centipoise (cp), interfacial tension ranging from 16 to 23 dynes/centimeter, and specific gravity ranging from 0.87 to 0.90. The LNAPL samples collected also exhibited PCBs at concentrations ranging from 0.56 to 4.6 parts per million (ppm) and concentrations of chromium exceed TCLP criteria; however, TCLP analysis has not been conducted.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*

   YES – The following potential risk/exposure concerns are associated with the AOI 86-1 LNAPL area:

   - Groundwater/surface water interface (GSI): Multiple potential GSI issues were identified at AOI 86-1. Groundwater and soil samples collected from AOI 86-1 detected select VOCs and metals at concentrations exceeding GSI or GSI Protection criteria and the dissolved phase plume may continue onto the adjacent property owned by CSX.

     AOI 86-1 is serviced by the Outfall 004 and 005 storm sewers which are the only potentially complete GSI pathways in this area. In 2010 and 2011, samples were collected from the onsite compliance point for the Outfall 004 storm sewer, which is located approximately 800 feet downstream of AOI 86-1, and submitted for laboratory analysis. The Outfall 004 storm sewer samples exceeded GSI criteria for select metals; however, the AOI 86-1 LNAPL area is not the sole source of impact along the Outfall 004 storm sewer and therefore may not be the source of these exceedances. In addition, the GSI compliance point is at the discharge point to the River. As discussed in **Appendix BB** additional sampling of Outfall 005 is planned to determine whether impacts from AOI 86-1 are infiltrating the storm sewer.

     In addition, LNAPL from the AOI 86-1 LNAPL area is infiltrating the Outfall 004 storm sewer.

   - Soil Volatilization to Indoor Air: The concentrations of trichloroethene detected in soil at the AOI 86-1 LNAPL Area exceed the non-residential volatilization to indoor air criteria. Institutional controls will be implemented to control this risk/exposure scenario.

   - Potential Groundwater Volatilization to Indoor Air Concern at the Property Boundary: Groundwater data from three locations (87-FP2, 87-FP3, and RFI-85-06) exceed applicable vapor intrusion screening levels. On Site concerns will be addressed by institutional controls. Additional evaluation will be completed for off Site receptors in accordance with the MDEQ's *Guidance Document for the Vapor Intrusion Pathway.* However, as two of the locations (87-FP2 and RFI-85-06) are more than 100 feet from the property boundary and the adjacent CSX property consists of rail road tracks, which are highly unlikely to be replaced by an occupiable structure in the foreseeable future, it is likely that institutional controls will also be recommended as the off Site remedy.

   - Potential Volatilization to Indoor Air for a Future Structure*:* Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*

   NO – The following is a general discussion regarding the feasibility of various compositional change remediation strategies for the AOI 86-1 area:

   - LNAPL constituents in fuel oil at AOI 86-1 have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.

   - Targeted in-situ soil mixing/land farming would use biological additives to address the petroleum constituents; however, the PCBs would remain and could become mobilized. In addition, due to the proximity of the AOI 86-1

LNAPL area to the Site storm sewers there is a potential for the additives to enter the sewer and be discharged to the Flint River.

- Based on the results of pilot testing completed at the AOI 40-A, -B, and 16-C Fuel Oil LNAPL areas, which have a similar LNAPL type and geology to the AOI 86-1 LNAPL Area, enhanced dissolution and recovery via surfactant or hot water flushing may enhance LNAPL recovery. However, due to the proximity of the AOI 86-1 LNAPL area to the Site storm sewers there is a potential for surfactant and mobilized PCB containing LNAPL to enter the sewer and be discharged to the Flint River. Also, note that the AOI 40 LNAPL has a lower viscosity (1 to 5 centipoise) than the AOI 86-1 LNAPL (18 to 60 centipoise)
- In situ thermal remediation may be technically feasible for this area; however, it is not a viable option based on the presence of PCBs in the LNAPL and nearby City sewers.

3) *Is there a potential benefit to partial treatment/removal that outweighs costs?*

NO – Compositional concerns regarding LNAPL infiltration, GSI and volatilization impacts can be addressed through engineering and institutional controls. In addition, LNAPL has only been detected in one monitoring well in the AOI 86-1 area at a thickness greater than 0.1 feet once in the last 10 years.

4) *Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?*

NO – While the LNAPL is mobile in the vicinity of the storm sewer, the LNAPL area appears to be stable. This finding is supported by the following lines of evidence:

- Well Gauging Data: Sentinel wells located downgradient of the AOI 86-1 LNAPL area have remained free of LNAPL since monitoring began approximately 10 years ago.
- Dissolved-phase Concentration Trends in Downgradient Monitoring Wells: The monitoring wells located downgradient of the of the dissolved phase plume have not detected constituents above criteria since monitoring began approximately 10 years ago.
- Age of LNAPL Release: The source of the AOI 86-1 LNAPL area is a former tank farm, which was removed in 1977 (no active LNAPL sources for at least 35 years). LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).

5) *Is LNAPL mobile within the stable LNAPL perimeter?*

YES – LNAPL from the AOI 86-1 area is infiltrating the Outfall 004 storm sewer. The proposed remedy to address LNAPL infiltration is the re-route of the Outfall 004 storm sewer into the Outfall 013 storm sewer coupled with bulkheading of the Outfall 004 storm sewer downgradient of where the LNAPL is infiltrating.

6) *Is LNAPL readily recoverable?*

NO – The results of historic interim measures (IM) indicate that in the past LNAPL has been recovered using recovery wells and by bailing (discussed further below). However, it is uncertain whether future LNAPL recovery is practical as minimal LNAPL is currently present at AOI 86-1.

- In the 1990's, two product recovery wells were installed to eliminate the migration of product from the AOI 86-1 LNAPL area into the catch basin connecting to Storm Sewer Outfall 005. The wells were installed to a depth of approximately 36 feet bgs adjacent to the Leith Street overpass retaining wall. Recovered product was collected in an oil/water separator and discharged to the Site's wastewater treatment plant. According to Site reports, the recovery system was successful in recovering free-phase LNAPL in this area and operation of the system was discontinued prior to 2002.
- Following the shutdown of the recovery wells in 2001, ten monitoring wells (87-FP1, 87-FP2, 87-FPD2, 87-FP3, 87-FPD3, 87-FP4, 87-FP5, MW-FP6, MW-FP7, and MW-FP8) located at AOI 86-1 were monitored as part of the Site-wide LNAPL monitoring program. These wells were gauged three times in 2001 and no product was measured at any of the wells.

From 2003 to 2005, seven monitoring wells (87-FP1, MW-00-FP6, RFI-85-02/2R, RFI-86-02, RFI-86-03, RFI-86-06D, and RFI-86-06S) located at AOI 86-1 were monitored as part of a Site-wide Quarterly LNAPL Monitoring Program. During the program, a total of 0.87 gallons of LNAPL was removed from monitoring wells RFI-86-02 and RFI-86-03.

7) *Are controls required?*

YES – In addition to the re-routing of the Outfall 004 storm sewer into the Outfall 013 sewer to eliminate pathway, the following AOI-specific institutional controls, in addition to the Site-wide institutional controls, are proposed for the AOI 86-1 area to limit future exposure:

Attachment 2 Notes

Priority #1 - AOI 86-1 Fuel Oil LNAPL Area

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 5 of the main report**.
- Notify future owners of the presence of PCBs, and
- Restrict the area shown on **Figure A3-1** to low occupancy based on the presence of PCBs.

Priority #1 – AOI 86-1 Fuel Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – 761.61(c) Risk Based Cleanup and Disposal Request

---

This attachment presents the information required to support a 761.71(c) determination for the area of interest (AOI) 86-1 light non-aqueous phase liquid (LNAPL) area.

1. Area Background and History

The AOI 86-1 LNAPL area is located at the Northend of the Site, south of the former Building 86/86A area and is likely associated with historic releases from a tank farm. The AOI 86-1 LNAPL area is currently defined by two monitoring wells at AOI 86-1 (RFI-86-02 and RFI-86-03).

2. Summary of SOPs and Investigation Results

AOI 86-1 has been previously investigated as part of the Site's RCRA Facility Investigation (RFI) activities. The RFI Work Plan presents the standard operating procedures, field sampling procedures, quality assurance/quality control procedures, etc. used during the investigation. The results of the investigations (including laboratory analytical reports) were presented in the RFI Phase I and RFI Phase II reports.

3. Nature of Contamination

At AOI 86-1, samples of LNAPL, soil, and groundwater have been analyzed for polychlorinated biphenyls (PCBs). Below is a brief summary of results.

- Four LNAPL samples were collected from three monitoring wells (RFI-85-02, RFI-86-02 and RFI-86-03). PCBs were detected in all four samples at concentrations of 0.56 ppm (RFI-86-02), 1.1 ppm (RFI-85-02), and 4.6 ppm (RFI-86-03). Please note that the LNAPL sample collected from RFI-85-02 was from a temporary well. A permanent well (RFI-85-02R) was subsequently installed at this location. However, LNAPL has not been observed in RFI-85-02R during subsequent groundwater sampling events.
- A total of 45 soil samples collected from the AOI 86-1 area were analyzed for PCBs. Seven of the soil samples detected PCBs; however, only one sample was at a concentration greater than 1 ppm. The soil sample collected from RFI-86-07 detected PCBs at a concentration of 3.5 ppm. RFI-86-07 is located on the south side of Leith Street and is not related to the AOI 86-1 LNAPL

area. Soil exceedances located on the south side of Leith Street will be addressed separately in **Appendix R**.

- Nineteen groundwater samples collected from wells in the AOI 86-1 Area were analyzed for PCBs. PCBs were detected in only one of the groundwater samples at a concentration of 0.00033 milligrams per liter (mg/L).

4. Extent of Impacts

At AOI 86-1, PCB impacts are associated with the LNAPL. **Figure A3-1** shows the approximate extent of the AOI 86-1 LNAPL area. As discussed above, LNAPL has historically been detected in three monitoring wells in the AOI 86-1 area and is currently detected in only one monitoring well. PCBs were detected in four LNAPL samples at a maximum concentration of 3.5 ppm. The average depth to LNAPL is approximately 8 feet bgs. The depth of LNAPL impact ranges from 3 to 35 feet bgs.

As noted above, no LNAPL has been detected at RFI-85-02R since its installation in 2001. In addition, no impacts were identified in LIF boring LIF-86-003, which was co-located with RFI-85-02R to investigate the extent of impacts.

5. Risk Based Procedure

PCB-containing LNAPL is located in the vicinity of RFI-86-03 and historically at RFI-85-02 at concentrations that exceed 1 ppm. The existing cover will remain in place at these locations and the area will be designated as low occupancy. At RFI-85-02, the surface cover consists of 1 foot of concrete and at RFI-86-03 the surface cover consists of approximately 1 foot of gravel. The depth to LNAPL/groundwater at RFI-85-02 is typically 10 to 11 feet bgs and the depth to LNAPL groundwater at RFI-86-03 is typically 6 to 7 feet bgs. The approximate areas proposed for low occupancy restrictions are presented on **Figure A3-1**; however, additional sampling will be completed to refine the extents of PCB impacts and determine whether the impacts actually extend off Site prior to implementing the restriction.

LNAPL and/or LNAPL-impacted soils removed during remediation activities completed at AOI 86-1 will be characterized for disposal using “as found” concentrations.

AOI-specific deed restrictions, in addition to the Site-wide institutional controls, placed on AOI 86-1 will include (but are not limited to):

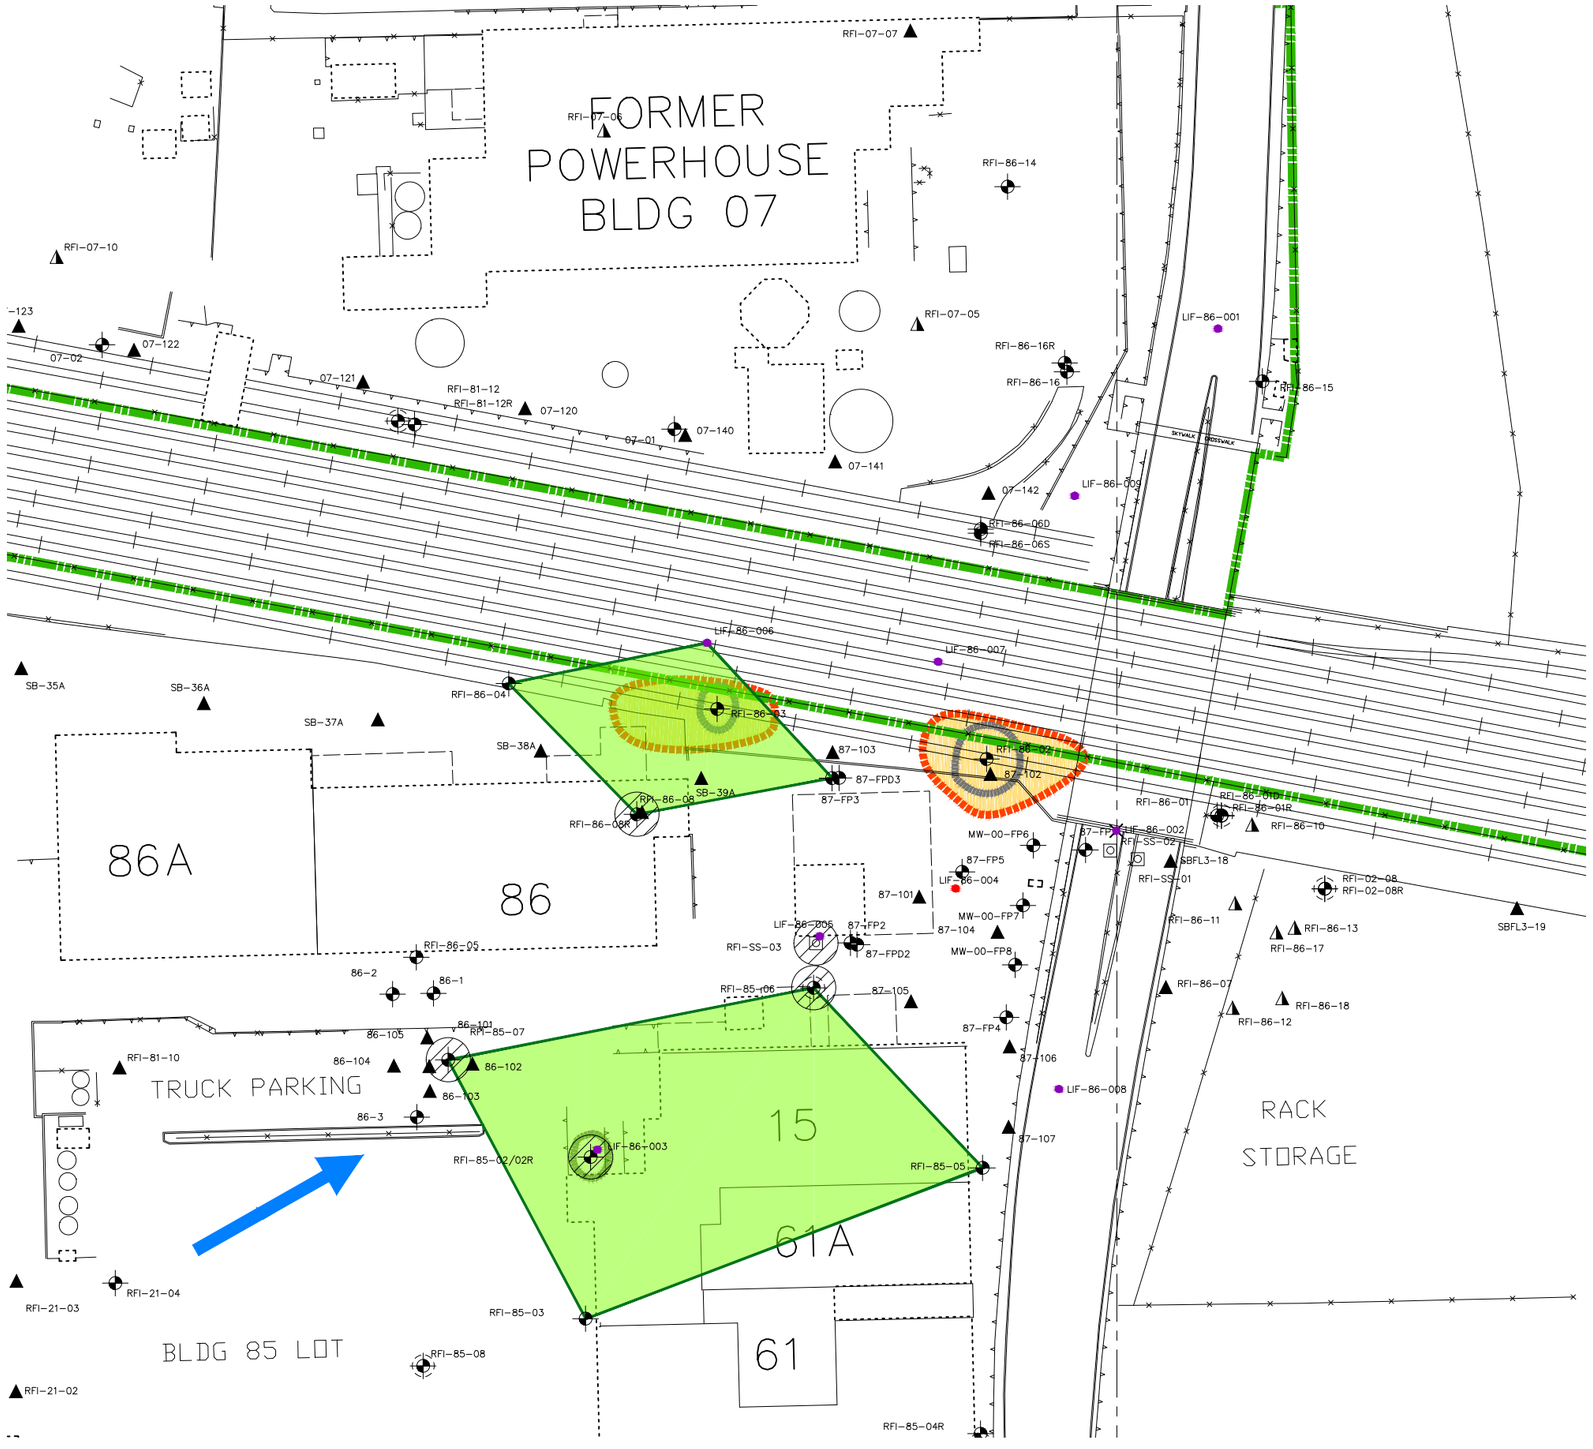
- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads (as shown on **Figure 5 of the main report**),
- Notification to future owners of the presence of PCBs, and

- Restrict the area containing PCB-impacted LNAPL to low occupancy (as shown on **Figure A3-1**).

6. Evaluation of Alternatives

The following technologies were evaluated to address LNAPL at AOI 86-1:

- Targeted in-situ soil mixing/land farming would use biological additives to address the petroleum constituents; however, the PCBs would remain and could become mobilized. In addition, due to the proximity of the AOI 86-1 LNAPL area to the Site storm sewers, there is a potential for the additives to enter the sewer and be discharged to the Flint River.



- Based on the results of pilot testing completed at the AOI 40-A, -B, and 16-C Fuel Oil LNAPL areas, which have a similar LNAPL type and geology as AOI 86-1, enhanced dissolution and recovery via surfactant or hot water flushing may enhance LNAPL recovery. However, due to the proximity of the AOI 86-1 LNAPL area to the Site storm sewers there is a potential for surfactant and mobilized PCB-containing LNAPL to enter the sewer and be discharged to the Flint River. Also, note that the AOI 40 LNAPL has a lower viscosity (1 to 5 centipoise) than the AOI 86-1 LNAPL (18 to 60 centipoise)

- In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of PCBs in the LNAPL.

- LNAPL constituents at AOI 86-1 have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.

Attachment 4

Remedy Recommendation

Priority #1 - AOI 86-1 Fuel Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 4 – Recommended Remedy

This attachment presents the recommended remedies for the area of interest (AOI) 86-1 Fuel Oil Area (AOI 86-1 light non-aqueous phase liquid [LNAPL] Area).

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in **Attachment 2** identified groundwater/surface water interface (GSI) and potential volatilization to indoor air as compositional concerns for AOI 86-1 and mobility as a saturation concern. GSI impacts to groundwater and infiltration to the Outfall 004 storm sewer are the basis for the mobility and GSI concerns. The volatilization to indoor air concern is due to two components: the biodegradation of LNAPL generating methane that could potentially result in indoor air quality concerns for future structures and trichloroethene at levels exceeding soil volatilization to indoor air criteria. In addition, the LNAPL from the AOI 86-1 area contains low concentrations of polychlorinated biphenyl (PCBs) which has also been identified as a concern.

2. Remedy Recommendation Rationale

The remedies recommended to address the compositional and saturation concerns associated with the AOI 86-1 LNAPL Area are engineering and institutional controls, which are discussed in detail in Section 3. The rationale for this selection is detailed below:

- Soil and groundwater samples collected from AOI 86-1 detected concentrations of select VOCs and metals at concentrations exceeding GSI or GSI protection (GSIP) criteria. However, downgradient monitoring wells RFI-86-06 and RFI-86-16 do not exceed GSI criteria for VOCs. In addition, VOCs have not been detected above GSI criteria in the monthly samples collected in from Outfall 004 and Outfall 005.
- The AOI 86-1 LNAPL Area contains PCBs at concentrations up to 4.6 ppm and is infiltrating the Outfall 004 storm sewer.

- Based on the current understanding of risk conditions, the potential volatilization to indoor air risk for future structures due to the biodegradation of LNAPL generating methane can be effectively mitigated through the institutional controls.
- Based on the current understanding of risk conditions, the soil volatilization to indoor air and potential groundwater volatilization to indoor air (on and off Site) can be effectively mitigated through the institutional controls.
- The two LNAPL recovery wells were installed to eliminate the migration of product from the AOI 86-1 area to the catch basin leading to storm sewer Outfall 005. The wells reportedly were successful in removing product and operation of the system was discontinued in 2001.
- From 2003 to 2005, 10 quarterly LNAPL recovery events removed a total of only 0.87gallons of LNAPL from AOI 86-1 wells.
- The AOI 86-1 LNAPL Area is defined by two monitoring wells, RFI-86-02 and FI-86-03, both of which are gauged during annual monitoring events. LNAPL has only been detected at RFI-86-02 at a thickness greater than 0.1 feet once in the last 10 years. Little (0.05 feet) to no LNAPL has been detected at RFI-86-03 in the past ten years.
- Also, LNAPL has not been identified during inspection of the P-traps located in the French drain located on the north side of Leith Street.
- The NSZD testing indicates that LNAPL is being depleted at rates ranging between approximately 397 to 516 gallons per acre per year at AOI 86-1.

3. AOI 86-1 Remedies

3.1 Completed Interim Measures

Several IMs have been completed at AOI 86-1 including the following:

- The tank farm (source area) was removed in 1977. At the time of the removal, some soils were reportedly excavated and disposed of along with the tanks.
- In the 1990s two product recovery wells were installed to eliminate the migration of LNAPL from the AOI 86-1 LNAPL Area into the catch basin connecting to Storm Sewer Outfall 005. According to Site reports, the recovery system was successful in recovering free-phase LNAPL in this area and operation of the system was discontinued in 2001.
- Following shutdown of the recovery system, from 2003 to 2005, an LNAPL monitoring and bailing program was completed helping to remove the product from AOI 86-1 monitoring wells.
- In 2004, sheens were identified in the Outfall 005 storm sewer system. Inspection revealed that the likely source of the sheens was infiltration into the system near the two French drain manholes located on the north side of the Leith Street underpass (**Figure A-**

1). P-traps were installed in both of the French drain manholes to prevent the sheen from discharging to Outfall 005. Quarterly inspections of the P-traps have been completed since 2010 and no LNAPL accumulation has been identified.

Partial removal of product has been completed in this area and is considered a component of the remedy.

3.2 Additional Remedy Recommendations

The remedies recommended to address the mobility, volatilization, GSI and PCB concerns associated with AOI 86-1 LNAPL Area are to eliminate the Outfall 004 pathway via engineering controls, to restrict the area to low occupancy use, and establish institutional controls. These combined remedies will eliminate the infiltration pathway in the short term and prevent future worker exposure to LNAPL impacts in the long term.

3.2.1 Outfall 004 Pathway Elimination

In order to address the risks associated with the LNAPL infiltration into the Outfall 004 storm sewer, the migration pathway through the storm sewer will be eliminated. The preferred option to eliminate this pathway is to re-route the flow from the Outfall 004 storm sewer to the Outfall 013 storm sewer. The re-route would be completed at the western property boundary of the Site, approximately 1,500 west of AOI 86-1, where the Outfall 004 and Outfall 013 storm sewers intersect (**Figure A4-1**). After completing the re-route, the Outfall 004 storm sewer would be bulkheaded and collared downgradient of AOI 86-1 to eliminate this migration pathway. The bulkheaded storm sewer will then be used as a passive recovery trench. A feasibility study for this option is currently underway and the final cost for this option is being evaluated.

3.2.2 004 Passive Recovery Trench

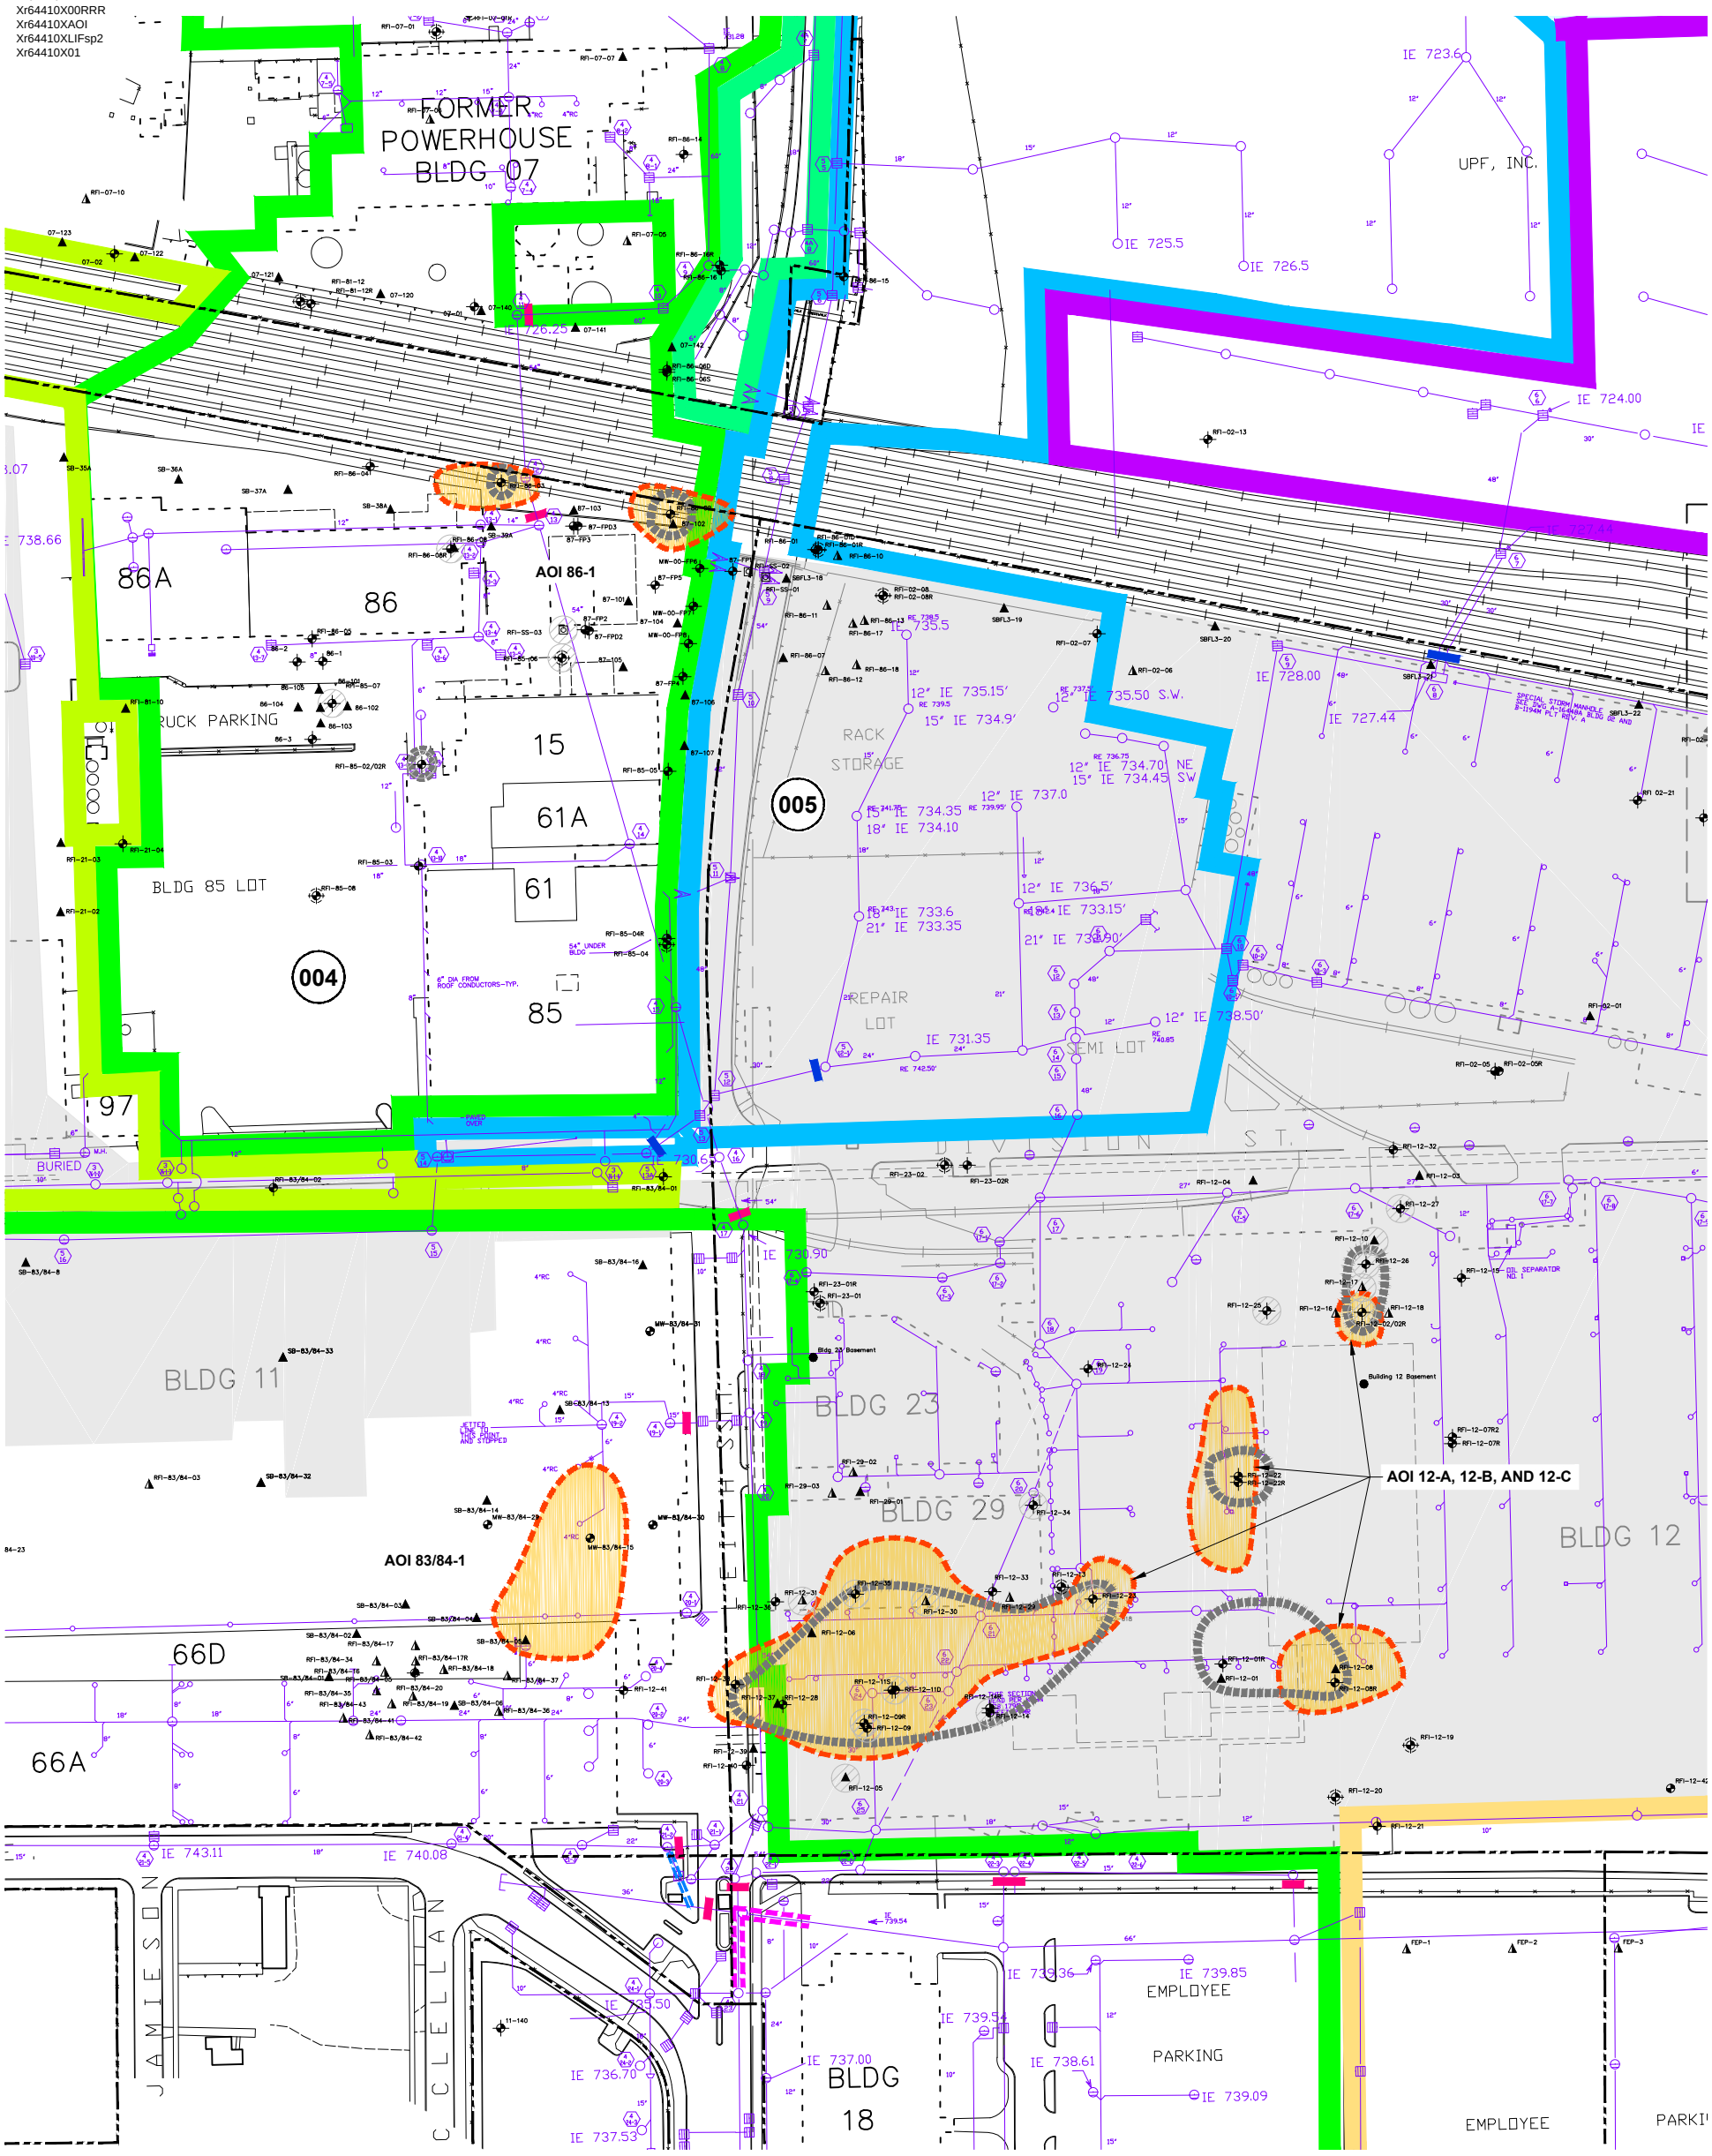
Following completion of bulkheading activities the bulkheaded storm sewer will be monitored for potential LNAPL accumulation and subsequent removal.

In addition, GSI exceedances will continue to be monitored as part of the groundwater monitoring program. Sampling will be conducted to confirm that the impacts are stable or decreasing.

3.2.3 Institutional Controls

In order to address the PCB detections in LNAPL, the AOI 86-1 Area will be restricted to low occupancy use. In addition, future owners will be notified of the presence of PCBs in this area.

The following additional AOI-specific institutional controls, in addition to the Site-wide institutional controls, will be necessary to limit potential for future exposure:



- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 5 of the main report.**
- Notify future owners of the presence of PCBs, and
- Restrict the area shown on **Figure A3-1** to low occupancy based on the presence of PCBs.

Remedy Recommendation Report
Appendix A - AOI 86-1 Fuel Oil Area - Addendum No.1
Summary of Additional Investigations
RACER Buick City Site, Flint, Michigan

Introduction

This Addendum No. 1 to Remedy Recommendation Report Appendix A presents a summary of investigation data collected at the AOI 86-1 Fuel Oil Area located north of Leith Street, from March 19, 2014 through December 31, 2015 at the Buick City Site (Site) located in Flint, Michigan. Please note that additional investigations conducted at AOI 86-1 *south of Leith Street* are addressed in the addendum to Appendix R - AOI 86-1 Soil Impacts.

Summary of Investigation Activities

Additional investigation activities were completed at AOI 86-1 to delineate the extent of LNAPL and PCB impacts along the property boundary in the vicinity of RFI-86-03; to delineate PCB impacts at RFI-85-02R; and to characterize methane concentrations in soil gas at the property boundary (**Figure A-A1-1**).

RFI-86-03 Area

Four soil borings (SB-86-01 through SB-86-04) and one temporary well (TW-86-05) were completed to refine LNAPL and PCB delineation at the RFI-86-03 Area. The four soil borings were completed along the property boundary, east of RFI-86-03 and TW-86-05 was completed approximately 10 feet to the west of RFI-86-03 (**Figure A-A1-1**). The borings and well were completed to a depth of approximately 10 feet below ground surface (ft bgs). Soil samples were collected at each soil boring from 0 to 2 and the 2 foot interval above the groundwater table and submitted to the laboratory for PCB analysis.

RFI-85-02 Area

During RFI activities PCB-containing LNAPL was detected at temporary well RFI-85-02. Subsequently a permanent monitoring well (RFI-85-02R) was installed adjacent to RFI-85-02; however, LNAPL has not been observed at RFI-85-02R. This delineation investigation included completing four soil borings (SB-86-06 through SB-86-09) in the RFI-85-02 area to delineate the extent of PCB impacts. The borings were completed to a depth of approximately 10 feet bgs. Soil samples were collected at each boring from the two foot interval above the groundwater table and submitted to the laboratory for PCB analysis.

Methane Evaluation

Two soil gas sampling probes (SGP-86-01 and SGP-86-02) were installed to evaluate methane along the property boundary adjacent to the AOI 86-1 LNAPL Areas. Two rounds of soil gas samples were collected from each probe and submitted to the laboratory for methane analysis.

Summary of Data Evaluation

RFI -86-03 Area

No indications of impact (elevated PID, staining, odors, sheens, etc.) were identified in soil borings SB-86-01 through SB-86-04. However, strong odors, staining, elevated PID readings, and sheens were identified at TW-86-05; therefore, a temporary well was installed at this location (**Figure A-A1-1**). PCBs were not detected in the soil samples collected from SB-86-01 through SB-86-04 or TW-86-05 (**Table A-A1-1**). In addition, temporary well TW-86-05 was gauged in January and August 2015 and no evidence of LNAPL was detected. The extent of LNAPL and PCBs associated with the AOI 86-1 LNAPL Area have been delineated.

RFI-85-02 Delineation

There were no indications of impact (elevated PID, staining, odors, sheens, etc) in soil borings SB-86-06 through SB-86-09 (**Figure A-A1-1**). No PCBs were detected in the soil samples collected from these borings (**Table A-A1-1**).

Methane Evaluation

Soil gas samples were collected from SGP-86-01 and SGP-86-02 in June and November 2015 (**Table A-A1-2**). Methane was detected in the June sample collected from SGP-86-01 at a concentration of 20 parts per million by volume (ppmv) which is below the screening level of 12,500 ppmv for methane. The remaining three soil gas samples did not detect methane.

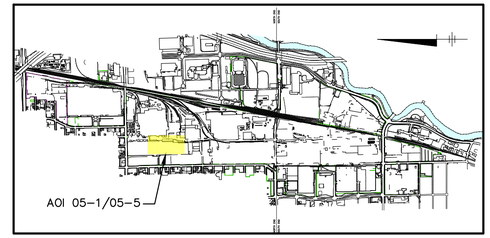
Priority #2 - AOI 05-1/05-5 Cutting Oil Areas Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

As part of the LNAPL remedy evaluation process, the Site's 17 LNAPL areas were prioritized based on risk. The AOI 05-1/05-5 areas are ranked as Priority #2 with a total potential risk score of 15 (**Table 5 of the main report**). Conceptual site model cross-sections are attached (**Figures B-1 and B-2**) that provides an overview of the AOI 05-1/05-5 LNAPL Areas impacts and interim measures (IMs).



Historical IMs completed at the AOI 05-1/05-5 LNAPL Areas include operation of three passive recovery trenches, two LNAPL recovery wells, and an LNAPL bailing program. The partial and effective removal of product completed in this area is considered a component of the remedy.

The compositional and saturation concerns identified for the AOI 05-1/05-5 LNAPL Areas were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:

- There are unacceptable groundwater/surface water interface (GSI), direct contact, particulate soil inhalation and vapor phase exposures.
- Theoretically, there is a potential unacceptable vapor phase exposure risk associated with future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.
- No feasible options exist to mitigate unacceptable risk through compositional change.
- The LNAPL is not migrating; however, it is mobile and infiltrating the Outfall 003 storm sewer.

- Historic IMs indicate that in the past LNAPL has been recoverable; however, it is uncertain whether future LNAPL recovery is practical.
- In addition to eliminating the LNAPL infiltration to the Outfall 003 storm sewer, controls are required to mitigate potential risk associated with soil inhalation, direct contact and vapor intrusion.

Based on the current understanding of the conceptual site model risks, the remedies recommended to address the compositional and saturation concerns associated with the AOI 05-1/05-5 LNAPL Area are the elimination of infiltration to the Outfall 003 storm sewer, targeted excavation, and engineering and institutional controls.

Attachment 1

LNAPL Conceptual Site Model

Priority #2 - AOI 05-1/05-5 Cutting Oil Areas Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model for the area of interest (AOI) 05-1/05-5 Cutting Oil Areas (AOI 05-1/05-5 light non-aqueous phase liquid [LNAPL] Areas), which is located at the Buick City Site (Site) in Flint, Michigan (**Figure B1-1**).

1. Background

AOI 05-1/05-5 LNAPL Areas are located at the Northend of the Site in the central portion of the former Factory 05 footprint (**Figure B1-2**). Historically, operations at former Factory 05 included manufacturing of transmission components; including the machining and heat treating of vehicle shafts and gear carriers. The AOI 05-1 LNAPL Area is presumably due to historical releases associated with metal chip processing and metal machining in this area of the factory. The AOI 05-5 LNAPL Area is thought to be associated with a historic release of approximately 5,000 gallons of oil.

Investigation data previously presented in Site reports are not re-presented in this memo. However, relevant AOI 05-1/05-5 LNAPL Areas investigation data that has not previously been presented in a Site report are attached or are presented in **Appendix X**.

2. Former Interim Measures

2.1 LNAPL Monitoring and Bailing Program

During the Site-wide LNAPL monitoring program conducted from 2001 through 2005, a total of approximately 50 gallons of LNAPL was recovered during quarterly bailing events in the AOI 05-1/05-5 LNAPL Areas.

2.2 Passive Recovery Trenches

In 1995, three passive recovery trenches were installed along the east side of Factory 05 to collect PCB-containing LNAPL from the AOI 05-1 Area. The trenches were approximately 14 feet deep, 3 feet wide and 100 feet long, lined with a geofabric and backfilled with gravel. LNAPL was removed from the trenches via 30-inch-diameter recovery wells installed at the midpoint of the trenches. The total amount of

LNAPL recovered by these trenches in unknown; however, one 350-gallon tote of LNAPL was removed from each trench in 2001. The passive recovery trenches operated from 1995 to 2010.

2.3 Recovery Wells

The AOI 05-5 LNAPL Area originated from a release of approximately 5,000 gallons of cutting oil in 1997. Three, 4-inch-diameter groundwater monitoring wells were installed to the east of the tank. Product was identified in two monitoring wells (RW-05-North and RW-05-East). Two pneumatic free product recovery pumps were installed in the wells and initially discharged to the process waste treatment sewer catch basin located adjacent to the tank. Approximately 1,000 gallons of product was recovered and discharged to the product waste catch basin. Due to the presence of PCBs in the LNAPL, the recovered fluids were subsequently piped to two product storage tanks located within Building 43. By September 2001, use of this system had been discontinued because when the system was operating, the LNAPL was reportedly chemically attacking the recovery pumps and causing them to malfunction.

3. AOI 05-1/05-5 Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and LNAPL characteristics and extent of impacts for the AOI 05-1/05-5 LNAPL Areas. **Figure B1-2** presents the locations of the existing and abandoned monitoring wells and soil borings in the AOI 05-1/05-5 Areas.

3.1 AOI 05-1/05-5 Geology and Hydrogeology

- *Geology:* The monitoring well logs from both the AOI 05-1 and AOI 05-5 LNAPL Areas indicate that the soils are primarily fine sand down to approximately 16 feet below ground surface (bgs). Generally, the logs also indicated visual evidence of LNAPL impacts from 2 to 16 feet bgs. Boring logs for recently installed borings, monitoring wells, and temporary wells are attached**.**

- *Groundwater/LNAPL Levels:* The AOI 05-1 Area is defined by 10 monitoring wells, 3 recovery wells, and 31 temporary wells in the southeastern portion of the former Factory 05 area. LNAPL has been measured consistently at 17 of the wells (43-161, 43-162, 43-163, 43-164, 43-165, MW-05-04, RFI-05-13, RFI-05-14, DH-RW-1 through 3, TW-DH-RW-01-01, TW-DH-RW-01-07, TW-DH-RW-03-02, TW-DH-RW-03-05, TW-43-165-02, and TW-43-165-04) and intermittently at 43-160. The greatest thickness of LNAPL measured at the AOI 05-1 LNAPL Area was 5.39 feet at RFI-05-14 in June 2013.

  The AOI 05-5 Area is defined by three wells (RFI-05-11, RW-05-East, and RW-05-North) and three temporary wells (TW-05-05-1, TW-05-05-2, and TW-05-05-5) in the northeastern portion of the former Factory 05 area. The greatest thickness of LNAPL at AOI 05-5 was measured at RW-05-East at 5.01 feet in 2003.

Depth to groundwater in the area ranges from 5 to 15 feet bgs. Based on historic groundwater level measurements, groundwater flow in this portion of the Site is generally to the southeast. Recent groundwater level data are presented in **Appendix X.**

3.2 Groundwater and Soil Analytical Data

Analytical data were compared to applicable Michigan Part 201 non-residential criteria.

3.2.1 Groundwater Analytical Data

Groundwater samples were collected from thirteen monitoring wells (30-120, 30-140, 43-140, 43-166, 43-167, 43-168, 43-242, RFI-05-01, RFI-05-02, RFI-05-06, RFI-05-10, RFI-05-21, and RFI-05-30) located in the AOI 05-1 LNAPL area and compared to applicable criteria. The groundwater samples exceed groundwater surface water interface (GSI) criteria for arsenic (18 to 47/10 ug/L), copper (28/22 ug/L), cyanide, (24 to 25/5.2 ug/L) mercury (0.29/ 0013 ug/L), nickel (200 to 220/120 ug/L). In addition, trichloroethene was detected in monitoring well 43-140 at concentrations ranging from 205 to 250 ug/L, which exceeds the GSI criteria of 200 ug/L; however, concentrations were below this criterion in the last groundwater sample collected.

Cyanide and mercury have not been detected in any of the LNAPL samples from either AOI 05-1 or 05-5; therefore, the groundwater exceedances of cyanide and mercury are not likely related to the LNAPL. **Figure B1-3** shows the areal extent of groundwater plumes.

3.2.2 Soil VOC, SVOC, and Metals Analytical Data

Forty-nine soil samples were collected from 22 locations in the AOI 05-1/05-5 LNAPL Area and submitted for VOC, SVOC, and/or metals analysis. Groundwater surface water interface protection (GSIP) criteria for carbazole (1.38/1.1 mg/kg), phenanthrene (3.18 to 5.6/2.1 mg/kg), arsenic (6.87 to 12/4.6 mg/kg), cobalt (7.2 to 7.6/2 mg/kg), copper (200 to 21,000/130 mg/kg), manganese (930 to 2,400/98 mg/kg), mercury (0.202 to 1.4/0.05 mg/kg), selenium (0.53/0.4 mg/kg) and silver (9.8/0.1 mg/kg) have been exceeded in select soil samples. In addition, concentrations at two locations exceed non-residential direct contact (NDC) criteria for lead (3,100 to 3,500/900 mg/kg) and one location exceeds nonresidential particulate soil inhalation criteria (NPSIC) for manganese (2,400/1,500 ug/L).

3.2.3 GSI Evaluation

The AOI 05-1/05-5 LNAPL Areas are located within the Outfall 003 storm sewer drainage basin. Storm water samples were collected from the Outfall 003 storm sewer during 36 sampling events, as part of the monthly NPDES Plus Monitoring Program (NPMP). The only constituents exhibiting

repeatable GSI exceedances in the Outfall 003 sampling have been cyanide and mercury. Nickel and trichloroethene concentrations in the NPMP samples collected from Outfall 003 (36 events) have not exceeded their respective GSI criteria. In addition, arsenic and copper exceeded GSI criteria in the NPMP samples once each.

As discussed in further detail in **Appendix BB**, GSI exceedances in the Site storm sewers are being evaluated by the NPMP sampling. Data evaluations completed to date suggest that the majority of the metals impacts in the Outfall 003 storm sewer can be addressed by a mixing zone based remedy; however, additional data collection and evaluation is needed.

3.2.4 Soil PCB Analytical Data

In 2013 and 2014, PCB delineation investigation activities were completed at the Site to refine the extent of PCB impacts in soil and LNAPL. At the AOI 05-1/05-5 LNAPL Areas, two monitoring wells, 31 temporary wells and 15 soil borings were completed as part of delineation activities. A summary of the investigation activities completed is provided below.

- At AOI 05-1 additional investigation activities were completed at DH-RW-1, DH-RW-2, DH-RW-3, and 43-165 to delineate the extent of PCBs and LNAPL. A total of 126 soil samples were collected from 13 soil borings and 28 temporary well locations and submitted for laboratory analysis of PCBs. The locations of the soil borings and temporary wells are presented on **Figure B1-4.** Although 58 of the soil samples detected PCBs, only four samples exceeded NDC criteria (22-54/16 mg/kg). The analytical results are presented in **Appendix X**.
- At AOI 05-5 two soil borings (SB-05-05 and SB-05-06) and four temporary wells (TW-05-05-01, TW-05-05-02, TW-05-05-03, and TW-05-05-04) were installed to further delineate the extent of PCBs and LNAPL. A total of 20 soil samples were submitted for PCB analysis. PCBs were detected in four samples at concentrations ranging from 3.4 to 12 ppm, which are below the NDC criteria. The locations of the soil borings and temporary wells are presented on **Figure B1-5.**
- Two monitoring wells (MW-05-10 and MW-05-13) were installed along the Outfall 003 storm sewer main to investigate impacts adjacent to the sewer main. A total of four soil samples were collected and submitted for laboratory analysis of PCBs. PCBs were not detected in these samples. The locations of the monitoring wells are presented on **Figure B1-2**. The analytical results are presented in **Appendix X**.

Also, as part of RFI activities 33 soil samples collected from 20 locations in the AOI 05-1/05-5 LNAPL Areas were submitted for PCB analysis. PCBs were detected in five soil samples at

concentrations of less than 1ppm.

3.2.5 Vapor Intrusion Evaluation

Due to the presence of shallow groundwater and LNAPL (approximately 5 to 15 feet below ground surface) at AOI 05-1/05-5, groundwater data were also compared to the applicable Non-Residential Screening Values for the Vapor Intrusion Pathway presented in the *Michigan Department of Environmental Quality (MDEQ) Guidance Document for the Vapor Intrusion Pathway* (further discussed in Section 3.4 of the Report). Groundwater data from two locations (RFI-05-20 and 43-140) in the AOI 05-1/05-5 area exceed applicable screening levels.

As there are no structures at the Site, the MDEQ Part 201 criteria are appropriate for comparison for soil data. As discussed in Section 3.2.2, manganese was detected at a concentration exceeding NPSIC criteria in a soil sample collected from RFI-05-23.

3.3 LNAPL Characteristics

- *LNAPL Analytical Data:* LNAPL present at AOI 05-1/05-5 consists primarily of cutting oil. Additional analysis indicated that:

  - At the AOI 05-1 LNAPL Area laboratory analysis indicates that the LNAPL has a viscosity of 4.2 centipoise, an interfacial tension of 14 dynes/centimeter, and a specific gravity of 0.89. PCB analysis of the LNAPL indicated that concentration and Aroclors vary greatly. While no PCBs were detected at RFI-05-13, PCB concentrations in the remaining LNAPL samples ranged from 4.6 to 200 ppm. In addition, the concentrations of arsenic, chromium, and trichloroethene at the AOI 05-1 LNAPL Area exceeded the RCRA toxicity characteristic criteria; however, TCLP analysis has not been completed.

  - At the AOI 05-5 LNAPL Area laboratory analysis indicates that the LNAPL has a viscosity of 3.5 centipoise, and interfacial tension of 15 dynes/centimeter, and a specific gravity of 0.90. PCB analysis of the LNAPL indicated that concentration and Aroclors vary greatly. While no PCBs were detected at RW-05-North, the remaining LNAPL samples detected PCBs at concentrations ranging from 134 to 159 ppm. In addition arsenic was detected at a concentration that exceeds the RCRA toxicity characteristic criteria; however, TCLP analysis has not been conducted.

For reference, the viscosity (at 68 degrees Fahrenheit) of kerosene is 2.71 cp (Ingersoll-Rand, 1981). The LNAPL analytical data are presented in **Appendix X**.

- *LIF Data:* Twenty LIF borings were completed in the AOI 05-1/05-5 LNAPL area. The LIF response is consistent with the known LNAPL types, cutting oil. The vertical range of LIF impact (greater than 5%) along the eastern side of the AOI 05-1 LNAPL Area is typically 5 to 13.5 feet bgs. In the western portion of the AOI 05-1 area (beneath the former Factory 05 building slab), the vertical impacts are primarily 11.5 to 16 feet bgs. **Figure B1-3** presents the results of the LIF investigation and the extent of impacts associated with the AOI 05-1/05-5 LNAPL Areas.

- *Transmissivity:* Transmissivity testing was performed at three monitoring well locations (43-162, 43-165, and MW-05-04) in the AOI 05-1 LNAPL Area. Testing was inconclusive at 43-162 and 43-165 and transmissivity could not be calculated. Based on LNAPL baildown test results, the LNAPL transmissivity quantified at monitoring well MW-05-04 was 0.05 square feet per day (ft^2/day), which is less than both the Interstate Technology and Regulatory Council (ITRC) and MDEQ draft threshold values for recovery making recovery impractical in this portion of the LNAPL area.

- *Natural Source Zone Depletion (NSZD):* NSZD was completed at AOI 05-1 to establish ongoing natural attenuation rates of LNAPL as a baseline for comparison to active LNAPL recovery technologies. Two carbon traps were installed in the eastern portion of the AOI 05-1 LNAPL Area which is not covered by asphalt or concrete. The NSZD results indicated that LNAPL near monitoring well 43-162 is being depleted at a rate of 797 gallons per acre per year and at monitoring well 43-163 LNAPL is being depleted at a rate of 664 gallons per acre per year.

3.4 Extent of LNAPL

During the RCES preparation, the LNAPL area of the AOI 05-1/05-5 Areas was calculated based on historical data. The footprint of the LNAPL area containing approximately 0.5 ft or greater of LNAPL was estimated to be approximately 93,800 square feet. Based on the results of the LIF investigation, additional soil borings and monitoring wells were recently installed to further delineate the extent of LNAPL at AOI 05-1/05-5. The extent of LNAPL has been revised to reflect the current extent of LNAPL (as discussed in Section 2.1.3 of the main report), which is approximately 80,000 square feet. Based on the LIF and soil boring logs, approximate depth of impacts are as follows:

- At AOI 05-1, the impacts in the western portion of the area are beneath the former Factory 05 slab at a depth of 11.5 to 16 feet bgs. In the eastern portion of the area, the impacts are from 5 to 13.5 feet. The difference in depth to impacts is attributed to the presence of the former building slab.
- At AOI 05-5, the impacts are 10 to 13 feet bgs.

LNAPL Remedial Decision Tree

Attachment 2 LNAPL Remedial Decision Tree Priority #2 – AOI 05-1/05-5 Cutting Oil Areas

NOTES

(#) NOTES: See Page B2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priority #2 - AOI 05-1/05-5 Cutting Oil Areas

Background: The area of interest (AOI) 05-1/05-5 Cutting Oil Areas (AOI 05-1/05-5 light non-aqueous phase liquids [LNAPL] Areas) are located in the central portion of the Northend of the Site near the former Factory 05 footprint. Historically, Factory 05 was primarily used for manufacturing transmission components, including machining and heat treating of vehicle shafts and gear carriers. The AOI 05-1/05-5 LNAPL Areas are presumably due to historical releases associated with operations in this area. There are currently no buildings within the AOI 05-1/05-5 LNAPL Areas.

Geology and Hydrogeology: The soils at AOI 05-1/05-5 consist primarily of fine Sand down to approximately 16 feet bgs. Depth to groundwater in this area varies greatly and has been measured as shallow as 5 feet bgs, as deep as 15 feet bgs, and averages around 10 feet bgs. Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the southeast.

LNAPL Characteristics: Soil boring and LIF logs from the AOI 05-1/05-5 Areas show evidence of LNAPL impacts from as shallow as 2 feet bgs and as deep as 16 feet bgs, across the area. A summary of the LNAPL characteristics at the AOI 05-1 and AOI 05-5 areas are provided below:

- AOI 05-1
  - The LNAPL area is measured in 17 of the wells (43-161, 43-162, 43-163, 43-164, 43-165, MW-05-04, RFI-05-13, RFI-05-14, DH-RW-1 through 3, TW-DH-RW-01-01, TW-DH-RW-01-07, TW-DH-RW-03-02, TW-DH-RW-03-05, TW-43-165-02, and TW-43-165-04) and intermittently at 43-160. The greatest thickness of LNAPL measured at the AOI 05-1 area was 5.39 feet at RFI-05-14 in June 2013.
  - Laboratory analysis indicates that the LNAPL has a viscosity of 4.2 centipoise, an interfacial tension of 14 dynes/centimeter, and a specific gravity of 0.89.
  - While no PCBs were detected at RFI-05-13, the remaining LNAPL samples detected PCBs at concentrations ranging from 4.6 to 200 ppm.
  - The concentrations of arsenic, chromium, and trichloroethene at the AOI 05-1 LNAPL Area exceeded the RCRA toxicity characteristic criteria; however, TCLP analysis has not been completed.
- AOI 05-5
  - The LNAPL area is measured in six wells (RFI-05-11, RW-05-East, RW-05-North, TW-05-05-1, TW-05-05-2, and TW-05-05-5) in the northeastern portion of the former Factory 05 area. The greatest thickness of LNAPL at AOI 05-5 was measured at RW-05-East at 5.01 feet in 2003.
  - Laboratory analysis indicates that the LNAPL has a viscosity of 3.5 centipoise, and interfacial tension of 15 dynes/centimeter, and a specific gravity of 0.90.
  - While no PCBs were detected at RW-05-North, the remaining LNAPL samples detected PCBs at concentrations ranging from 134 to 159 ppm.
  - Arsenic was detected at a concentration that exceeds the RCRA toxicity characteristic criteria; however, TCLP analysis has not been conducted.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*

   YES – The following potential risk/exposure concerns are associated with the AOI 05-1/05-5 LNAPL Areas:

   - Groundwater/surface water interface (GSI):
     - Arsenic, copper, mercury, nickel, cyanide and trichloroethene were detected at concentrations that exceed GSI criteria in monitoring wells located in the vicinity of the AOI 10-1/10-4 LNAPL Area. Groundwater in this area infiltrates the Outfall 003 storm sewer that discharges to the Flint River.
     - Carbazole, phenanthrene, arsenic, cobalt, copper, manganese, mercury, selenium and silver was detected at concentrations exceeding GSI protection criteria in soil samples.
     - LNAPL from the AOI 05-1/05-5 LNAPL Areas is infiltrating the Outfall 003 storm sewer.
   - Direct Contact: PCBs were detected in soil and LNAPL samples collected from AOI 05-1 and AOI 05-5 at concentrations exceeding the nonresidential direct contact (NDC) criteria. The shallowest LNAPL impacts are located approximately two feet below ground surface, and represent a potential concern for future construction or utility workers. Additionally, the concentration of lead detected in soil at two locations (RFI-05-18 and RFI-05-21) exceeded direct contact criteria.
   - Particulate Soil Inhalation (Ambient Air) Concerns: Manganese was detected at concentrations exceeding the nonresidential particulate soil inhalation criteria at one sample location (RFI-05-23). The exceedance is in shallow (4 to 6 ft bgs) soils located beneath asphalt. Engineering and/or institutional controls will be implemented to control this risk/exposure scenario.
   - Groundwater Volatilization to Indoor Air Concern: Groundwater data from two locations ((RFI-05-20 and 43-140) exceed applicable vapor intrusion screening levels. These exceedances will be addressed by institutional controls.
   - Potential Volatilization to Indoor Air Concerns for Future Structures: Theoretically, there is a potential unacceptable vapor phase exposure risk associated with future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

Attachment 2 Notes

Priority #2 - AOI 05-1/05-5 Cutting Oil Areas

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*
NO – The following is a general discussion regarding the feasibility of various compositional change remediation strategies for the AOI 05-1/05-5 LNAPL Areas:
    - Enhanced dissolution and recovery via surfactant or hot water flushing may be feasible; however, it is not a viable option based on the presence of PCBs in the LNAPL and the infiltration pathway to the Outfall 003 storm sewers. The use of surfactant would increase mobility and, therefore, likely increase the PCB-impacted LNAPL infiltration into the storm sewer.
    - LNAPL constituents have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.
    - Targeted in-situ soil mixing/land farming using biological additives to address the petroleum constituents may be technically feasible; however, it is not a viable option based on the presence of PCBs in the LNAPL and the infiltration pathway to the Outfall 003 storm sewers.
    - In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of PCBs in the LNAPL and nearby City sewers. In addition, it does not represent an economically feasible remedial alternative given the relatively large area that would need to be addressed in order to avoid the generation of dioxins.

3) *Is there a potential benefit to partial treatment/removal that outweighs costs?*
NO – Based on the current understanding of conceptual site model the GSI, direct contact, soil inhalation and vapor phase risks can be effectively mitigated through engineering and institutional controls. In addition, LNAPL recovery systems operated in this area for 15 years; therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate.

4) *Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?*
NO – While the LNAPL is mobile in the vicinity of the storm sewer, the AOI 05-1 and 05-5 LNAPL Areas appear to be stable. This finding is supported by the following lines of evidence:
    - Well Gauging Data: Sentinel wells located around the periphery of the AOI 05-1 and 05-5 LNAPL Areas have remained free of LNAPL since monitoring began approximately 10 years ago.
    - Age of LNAPL Release: The AOI 05-1/05-5 Areas were identified in 1994. Operations began in this portion of the Site in the 1950's and ceased in this portion of the Site ceased in 2010. LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).

5) *Is LNAPL mobile within the stable LNAPL perimeter?*
YES – LNAPL accumulates in monitoring wells and LNAPL from the AOI 05-1/05-5 area is infiltrating the Outfall 003 storm sewer, which passes through the AOI 05-1 Area.

6) *Is LNAPL readily recoverable?*
YES – Historic interim measures (IM) indicate that in the past LNAPL has been recoverable at AOI 05-1 using recovery wells, trenches and bailing (summarized below). However, it is uncertain whether future LNAPL recovery is practical.
    - During the Site-wide LNAPL monitoring program conducted from 2001 through 2005, a total of approximately 50 gallons of LNAPL was recovered during quarterly bailing events in the AOI 05-1/05-5 Area.
    - The AOI 05-5 Area originated from a release of approximately 5,000 gallons of product. In 1997, approximately 1,000 gallons of LNAPL were removed using two product recovery wells (RW-05-North and RW-05-East). Use of the wells was discontinued because the LNAPL was causing malfunction of the recovery pumps.
    - In 1995, three passive recovery trenches were installed along the east side of Building 43 to collect PCB containing LNAPL from the AOI 05-1/05-5 Area. The trenches were approximately 14 feet deep, 3 feet wide and 100 feet long, lined with a geofabric and backfilled with gravel. LNAPL was removed from the trenches via 30-inch-diameter recovery wells installed at the midpoint of the trenches. The total amount of LNAPL recovered by these trenches in unknown; however, one 350-gallon tote of LNAPL was removed from each trench in 2001. LNAPL recovery was discontinued due to pump failure from entrained grit in the LNAPL.

In addition, transmissivity testing was completed by conducting baildown tests on three monitoring wells Transmissivity testing was performed at three monitoring well locations (43-162, 43-165, and MW-05-04) in the AOI 05-1 LNAPL Area. Testing was inconclusive at 43-162 and 43-165 and transmissivity could not be calculated. Based on LNAPL baildown test results, the LNAPL transmissivity quantified at monitoring well MW-05-04 was 0.05 square feet per day (ft^2/day), which is less than both the Interstate Technology & Regulatory Council (ITRC) and Michigan

Department of Environmental Quality (MDEQ) draft threshold values for recovery making recovery impractical in that portion of the LNAPL Area.

7) *Will the potential benefit of LNAPL recovery outweigh costs?*

No – Compositional and saturation concerns can be addressed through excavation and engineering and institutional controls. Targeted excavations are proposed to address PCB impacts (further discussed in **Attachment 3**) at the AOI 05-1/05-5 LNAPL Areas. Engineering and institutional controls will be implemented to eliminate LNAPL infiltration to the Outfall 003 storm sewer, address the GSI pathway, and mitigate potential risk associated with particulate inhalation concerns. Additional LNAPL removal will not materially change the risks associated with this LNAPL Area.

8) *Are controls required?*

YES – In addition to the Site-wide Institutional Controls discussed in the main report, the following controls will be necessary to limit potential for future exposure.

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 5 in the main report**.
- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present to prevent direct contact with contaminated material, except with using appropriate health and safety measures, during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the Natural Resources and Environmental Protection Act.
- Require that any intrusive activities (i.e., excavation, repair of foundation or subsurface utilities, short-term construction and landscaping projects) into the subsurface beneath the cap must be consistent with MIOSHA requirements, including the use of a Health and Safety Plan and a trained professional to evaluate the Site data prior to initiating activities. All relevant Site data must be made available for the preparation of the Health and Safety Plan. Data may be made available as part of the Due Care Plan, RFI, or other document(s).
- Notification to future property owners to the presence of PCBs, and
- Restrict the area shown on **Figure B3-1** to low occupancy based on the presence of PCBs.

Priority #2 – AOI 05-1/05-5 Cutting Oil Areas Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – 761.61(c) Risk Based Cleanup and Disposal Request

---

This attachment presents the information required to support a 761.71(c) determination for the areas of interest (AOI) 05-1/05-5 light non-aqueous phase liquids (LNAPL) Areas.

1. Area Background and History

The AOI 05-1/05-5 LNAPL Areas are located at the Northend of the Site in the central portion of the former Factory 05 footprint. The AOI 05-1 LNAPL Area is presumably due to historical releases associated with operations and the AOI 05-5 LNAPL Area is thought to be associated with a historic release of approximately 5,000 gallons of oil in this area. LNAPL associated with the AOI 05-1/05-5 LNAPL Areas have been identified in wells 43-161, 43-162, 43-163, 43-164, 43-165, MW-05-04, RFI-05-13, RFI-05-14, RFI-05-11, RW-05-East, RW-05-North, DH-RW-1 through 3, TW-05-05-1, TW-05-05-2, TW-05-05-05 TW-DH-RW-01-01, TW-DH-RW-01-07, TW-DH-RW-03-02, TW-DH-RW-03-05, TW-43-165-02, and TW-43-165-04 (**Figure B3-1**).

2. Summary of SOPs and Investigation Results

The AOI 05-1/05-5 LNAPL Areas have been previously investigated as part of the Site's RCRA Facility Investigation activities. The RFI Work Plan presents the standard operating procedures, field sampling procedures, quality assurance/quality control procedures, etc. used during the investigation. The results of the investigations (including laboratory analytical reports) were presented in the RFI Phase I and RFI Phase II reports.

3. Nature of Contamination

At AOI 05-1/05-5, samples of LNAPL, soil and groundwater have been analyzed for PCBs. Below is a brief summary of results.

- LNAPL samples were collected from 17 monitoring wells, recovery wells, and/or temporary wells. PCBs were detected in 15 samples at concentrations ranging from 4.6 parts per million (ppm) to 200 ppm (**Figure B3-1**).

- A total of 156 soil samples collected from the AOI 05-1/05-5 Areas were analyzed for PCBs. Sixty-seven of the samples detected PCBs, 25 of which detected PCBs at levels less than 1 ppm. Four soil samples detected PCBs at a concentration greater than 25 ppm. The maximum soil detection was 54 ppm (**Figure B3-2**).
- Twelve groundwater samples collected from wells in the AOI 05-1/05-5 area were analyzed for PCBs. No PCBs were detected in the groundwater samples.

4. Extent of Impacts

The PCB impacts at AOI 05-1/05-5 LNAPL Areas are associated with the LNAPL. **Figure B3-1** shows the approximate extent of the AOI 05-1 and AOI 05-5 LNAPL Areas. The extent of PCB impacts at each area are further discussed below.

- At the AOI 05-1 LNAPL Area, additional investigation activities were completed at DH-RW-1, DH-RW-2, DH-RW-3, and 43-165 to delineate the extent of PCBs and LNAPL. A total of 126 soil samples were collected from 13 soil borings and 28 temporary well locations and submitted for laboratory analysis of PCBs. Although PCBs were detected in 58 of the soil samples, only four samples exceeded NDC criteria (22-54/16 mg/kg). PCBs concentrations in LNAPL samples ranged from 4.6 to 200 ppm. The locations of the soil borings and wells are presented on **Figure B3-2.**
- At the AOI 05-5 LNAPL Area, additional investigation activities were completed to further delineate the extent of PCBs and LNAPL. A total of 20 soil samples were submitted for PCB analysis. PCBs were detected in four samples at concentrations ranging from 3.4 to 12 ppm. LNAPL samples detected PCBs at concentrations ranging from non-detect to 159 ppm. The locations of the soil borings and temporary wells are presented on **Figure B3-3.**
- Soil samples were also collected from the two monitoring wells (MW-05-11 and MW-05-13) installed along the Outfall 003 storm sewer main to investigate impacts adjacent to the sewer main. A total of four soil samples were collected and submitted for laboratory analysis of PCBs. PCBs were not detected in these samples. The locations of the monitoring wells are presented on **Figure B3-1**.
- Based on the LIF and soil boring log data, approximate depth impacts are approximately 5 to 13.5 in the eastern side of the AOI 05-1 LNAPL Area and 11.5 to 16 feet bgs in the western portion of the AOI 05-1 area (beneath the former Factory 05 building slab).

5. Risk-Based Procedure

Targeted soil excavations are proposed at recovery wells DH-RW-1, DH-RW-2, and DH-RW-3 and monitoring wells 43-165 and RFI-05-11 to remove PCB impacts greater than 25 ppm. The PCB impacts have been delineated by soil boings and temporary wells, as shown on **Figures B3-2 and B3-3**; however, additional delineation will be completed to further refine the extents prior to excavation activities. The scope of work for additional delineation will be included in a remedy implementation work plan and/or basis of design documentation, as appropriate. The work plan will include the detailed scope for the excavation activities; however a brief summary of the plan is provided below:

- Complete investigation work necessary to refine the extents of the excavation.
- Prior to excavation, LNAPL will be removed from wells in the area of excavation to minimize accumulation during excavation.
- Complete excavation to the water table (that averages a depth of 10 feet bgs). It is planned that the excavation will be completed when the water table is at its lowest to maximize removal of impacted soils.
- LNAPL-impacted soils removed during remediation activities completed at AOI 05-1/05-5 will be characterized and disposed of using “as found” concentrations.

LNAPL removed from the wells during excavation activities are requested to be disposed of as follows:

- DH-RW-1 Excavation Area – A historic waste characterization sample collected from a tote associated with recovery well DH-RW-1 detected PCBs at a concentration of 53 ppm; however, a recent LNAPL sample collected from DH-RW-1 detected PCBs at 40 ppm. In addition, the LNAPL sample collected from delineation well TW-DH-RW-1-7 detected PCBs at a concentration of 30 ppm. It is requested that LNAPL removed from the DH-RW-1 area be disposed of at “as found” concentrations.
- DH-RW-2 Excavation Area – A historic waste characterization sample collected from a tote associated with recovery well DH-RW-2 detected PCBs at a concentration of 25 ppm and a recent LNAPL sample collected from DH-RW-2 detected PCBs at 23 ppm. It is requested that LNAPL removed from the DH-RW-2 area be disposed of at “as found” concentrations.
- DH-RW-3 Excavation Area – A historic waste characterization sample collected from a tote associated with recovery well DH-RW-3 detected PCBs at a concentration of 117 ppm and a recent LNAPL sample collected from DH-RW-3 detected PCBs at 90 ppm. In addition, the LNAPL samples collected from delineation wells TW-DH-RW-3-2 and TW-DH-RW-3-5 detected PCBs at concentrations 200 ppm and 70 ppm, respectively. LNAPL removed from the DH-RW-3 area will be disposed of as TSCA waste.

- 43-165 Excavation Area– LNAPL samples collected from wells 43-165, TW-43-165-2, and TW-43-165-4 were submitted for PCB analysis. PCBs were detected at concentrations ranging from 23 to 33 ppm. It is requested that LNAPL removed from the 43-165 area be disposed of at "as found" concentrations.
- RFI-05-11 Excavation Area – LNAPL samples collected from wells RFI-05-11, RW-05-East, RW-05-North, TW-05-05-1, and TW-05-05-2 were submitted for PCB analysis. The sample collected from RW-05-East did not exhibit detectable concentrations of PCBs; however the remaining samples detected PCBs at concentrations ranging from 25 ppm to 159 ppm. It is requested that LNAPL removed from the RFI-05-11 area be disposed of at as found concentrations.

Following completion of the targeted excavation, portions of the AOI 05-1/05-5 Areas will be restricted to low occupancy use. In the event that concentrations of PCBs exceeding the MDEQ Part 201 nonresidential direct contact criteria (16 ppm) are left in place, surface cover maintenance and restrictions will be implemented. Additional restrictions placed on the AOI 05-1/05-5 LNAPL Areas to protect future users from PCB impacts will include the Site-wide deed restrictions as noted in the main report and these AOI-specific deed restrictions:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 5 in the main report**.
- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present to prevent direct contact with contaminated material, except with using appropriate health and safety measures, during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the Natural Resources and Environmental Protection Act.
- Require that any intrusive activities (i.e., excavation, repair of foundation or subsurface utilities, short-term construction and landscaping projects) into the subsurface beneath the cap must be consistent with MIOSHA requirements, including the use of a Health and Safety Plan and a trained professional to evaluate the Site data prior to initiating activities. All relevant Site data must be made available for the preparation of the Health and Safety Plan. Data may be made available as part of the Due Care Plan, RFI, or other document(s).
- Notification to future property owners to the presence of PCBs, and

- Restrict the area shown on **Figure B3-1** to low occupancy based on the presence of PCBs.

6. Evaluation of Alternatives

The following technologies were evaluated to address LNAPL at AOI 05-1/05-5:

- Targeted in-situ soil mixing/land farming using biological additives to address the petroleum constituents may be technically feasible; however, it is not a viable option based on the presence of PCBs in the LNAPL and the infiltration pathway to the Outfall 003 storm sewers.

- In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of PCBs in the LNAPL and nearby City sewers. In addition, it does not represent an economically feasible remedial alternative given the relatively large area that would need to be addressed in order to avoid the generation of dioxins.

- AOI 05-1/05-5 LNAPL Areas constituents have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.

- Enhanced dissolution and recovery via surfactant or hot water flushing may be feasible; however, it is not a viable option based on the presence of PCBs in the LNAPL and the infiltration pathway to the Outfall 003 storm sewers. The use of surfactant would increase mobility and therefore, likely increase the PCB-impacted LNAPL infiltration into the storm sewer.

Attachment 4

Remedy Recommendation

Priority #2 – AOI 05-1/05-5 Cutting Oil Areas Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 4 – Recommended Remedy

This attachment presents the recommended remedies for the area of interest (AOI) 05-1/05-5 Cutting Oil Areas (AOI 05-1/05-5 light non-aqueous phase liquid [LNAPL] Areas).

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in **Attachment 2** identified groundwater/surface water interface (GSI), direct contact, particulate soil inhalation, groundwater volatilization to indoor air, and potential volatilization to indoor air for a future structure as compositional concerns for AOI 05-1/05-5 and mobility as a saturation concern. The PCB-impacted LNAPL from the AOI 05-1/05-5 LNAPL Areas is infiltrating the Outfall 003 storm sewer, which is the basis for the mobility and GSI concerns. The direct contact concern is due to the presence of PCBs in the LNAPL and lead in the soils. The volatilization to indoor air concerns are due to the exceedance of groundwater volatilization screening levels and the potential biodegradation of LNAPL generating methane which could result in indoor air quality concerns for future structures. The soil inhalation concern is due to the presence of manganese in soil.

2. Remedy Recommendation Rationale

The remedies recommended to address the compositional and saturation concerns associated with the AOI 05-1/05-5 Areas are elimination of infiltration to the Outfall 003 storm sewer, targeted excavation, and institutional controls, which are discussed in detail in Section 3. The rationale for this selection is detailed below:

- Although historic interim measures (IMs) indicated that LNAPL recovery may be feasible; LNAPL recovery systems have already operated at this area for approximately 15 years. Partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate to address the remaining LNAPL. Additional LNAPL removal will not materially change the risks associated with this plume so there is no cost benefit to pursuing additional LNAPL removal.

- The GSI and mobility concerns associated with the PCB-impacted LNAPL from the AOI 05-1/05-5 LNAPL Areas will be addressed by eliminating LNAPL infiltration into the Outfall 003 storm sewer and targeted removal of PCB-impacted soils. This remedy will also address the groundwater GSI concerns.
- The direct contact concerns associated with the PCBs at DH-RW-1, DH-RW-2, DH-RW-3, 43-165 and RFI-05-11 will be addressed by completing a targeted excavation, as well as implementing engineering and institutional controls, as necessary.
- The direct contact concerns associated with lead at RFI-05-21 are in surface soils (0 to 2 feet bgs) located adjacent to the proposed 43-165 excavation area; therefore, the impacts will be excavated.
- The direct contact concerns associated with lead at RFI-05-18 are from 6.9 to 8.9 ft bgs and are located beneath the former Factory 05 concrete slab; therefore, institutional controls are appropriate.
- Based on the current understanding of risk conditions, the particulate soil inhalation risk due to manganese at RFI-05-23 can be effectively mitigated by excavation or engineering controls.
- Based on the current understanding of risk conditions, the groundwater volatilization to inddor air and potential volatilization to indoor air due to the biodegradation of methane risk for future structures can be effectively mitigated through institutional controls.

3. AOI 05-1/05-5 Remedies

This section summarizes the completed and proposed remedies to address the impacts at AOI 05-1/05-5.

3.1 Completed Interim Measures

Three passive recovery trenches were installed along the east side of Factory 05 to collect LNAPL in the AOI 05-1 Area. The trenches removed LNAPL for approximately 15 years prior to being discontinued. At the AOI 05-5 LNAPL Area two recovery wells removed approximately 1,000 gallons of LNAPL prior to being discontinued. In addition, approximately 50 gallons of LNAPL was removed during the 2001 to 2005 LNAPL Bailing Program. Partial and effective removal of product has been completed in this area and is considered a component of the remedy.

3.2 Additional Remedy Recommendations

This section presents the remedies recommended to address the mobility, GSI, direct contact, soil inhalation, and volatility concerns associated with AOI 05-1/05-5 LNAPL Areas. These combined remedies will eliminate the infiltration pathway in the short term and prevent future worker exposure to LNAPL impacts in the long term.

3.2.1 Outfall 003 Pathway Elimination

In order to address the risks associated with the LNAPL infiltration into the Outfall 003 storm sewer, the pathway will be eliminated. This option may include re-routing, sealing, lining, or replacing a section of the sewer and installing collars in the backfill to eliminate the potential of migration. A feasibility study for this option is currently underway and the final cost for this option is being evaluated.

3.2.2 Targeted Excavation

3.2.2.1 PCB-Impacted Areas

In order to address the risks associated with the LNAPL containing PCBs at concentrations greater than 25 ppm, targeted excavations of LNAPL impacted soils are recommended. As discussed in **Attachment 3**, the PCB excavations are proposed to address impacts at DH-RW-1, DH-RW-2, DH-RW-3, 43-165, and RFI-05-11. The excavations will be limited by the presence of subsurface obstructions (utilities, building slabs, etc.) and additional delineation will be completed to further refine the extents prior to excavation activities. The approximate extents of excavations are presented on the **Figures B3-2 and B3-3.**

As part of a self-implementing cleanup under 40 CFR Part 761.61(c), soils containing PCBs with concentrations exceeding 25 ppm will be excavated and disposed of properly using “as found” concentrations. The excavations will take place when the water table is at its lowest to maximize removal of impacted soils. In the event that concentrations of PCBs exceeding the MDEQ Part 201 nonresidential direct contact criteria (16 ppm) are left in place, surface cover maintenance and restrictions will be implemented.

3.2.2.2 Lead Impacted Soil at RFI-05-21

The direct contact concerns associated with lead at RFI-05-21 are in surface soils (0 to 2 feet bgs) located adjacent to the proposed 43-165 excavation area; therefore, the impacts will be excavated. Additional delineation may be completed to further refine the extents prior to commencing excavation activities.

3.2.3 Manganese Impacted Soil at RFI-05-23

Based on the current understanding of risk conditions, the particulate soil inhalation risk at RFI-05-23 can be effectively mitigated by excavation or engineering controls. The impacts at RFI-05-23 are 4 to 6 ft bgs and are located adjacent to the proposed 43-165 and RFI-05-21excavation areas. Additional delineation is necessary to determine the extent of impacts and based on the results of delineation activities the manganese-impacted soils will be addressed by excavation or institutional controls, as appropriate.

3.2.4 Institutional Controls

The direct contact concerns associated with lead at RFI-05-18 occur from 6.9 to 8.9 ft bgs and are located beneath the former Factory 05 concrete slab; therefore, institutional controls are appropriate.

The following AOI-specific institutional controls, in addition to the Site-wide controls noted in the Report, will be necessary to address direct contact, soil inhalation and volatilization to limit potential for future exposure:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads as shown on **Figure 5 of the main report**.
- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present to prevent direct contact with contaminated material, except with using appropriate health and safety measures, during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the Natural Resources and Environmental Protection Act.
- Require that any intrusive activities (i.e., excavation, repair of foundation or subsurface utilities, short-term construction and landscaping projects) into the subsurface beneath the cap must be consistent with MIOSHA requirements, including the use of a Health and Safety Plan and a trained professional to evaluate the Site data prior to initiating activities. All relevant Site data must be made available for the preparation of the Health and Safety Plan. Data may be made available as part of the Due Care Plan, RFI, or other document(s).
- Notification to future property owners to the presence of PCBs, and

- Restrict the area shown on **Figure B3-1** to low occupancy based on the presence of PCBs.

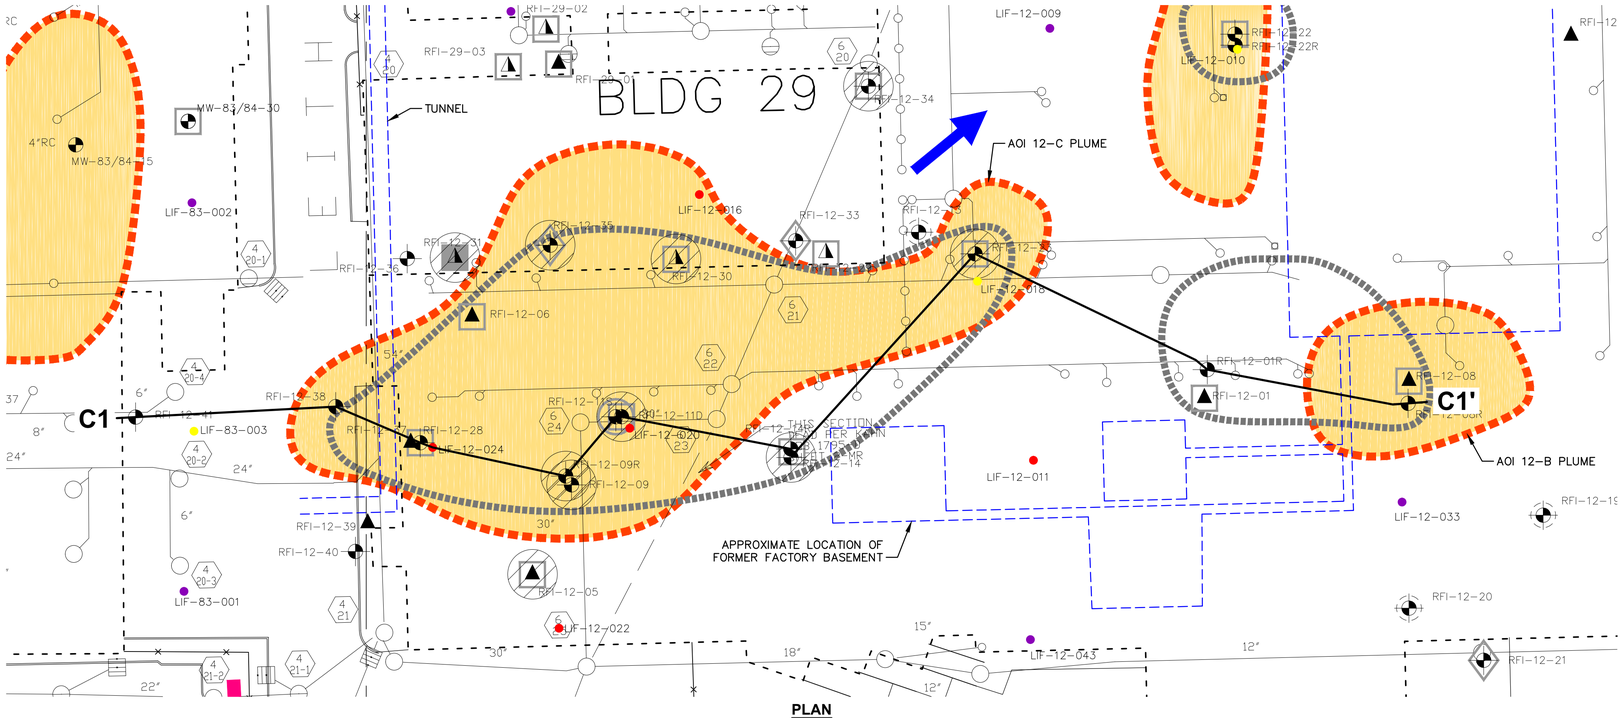
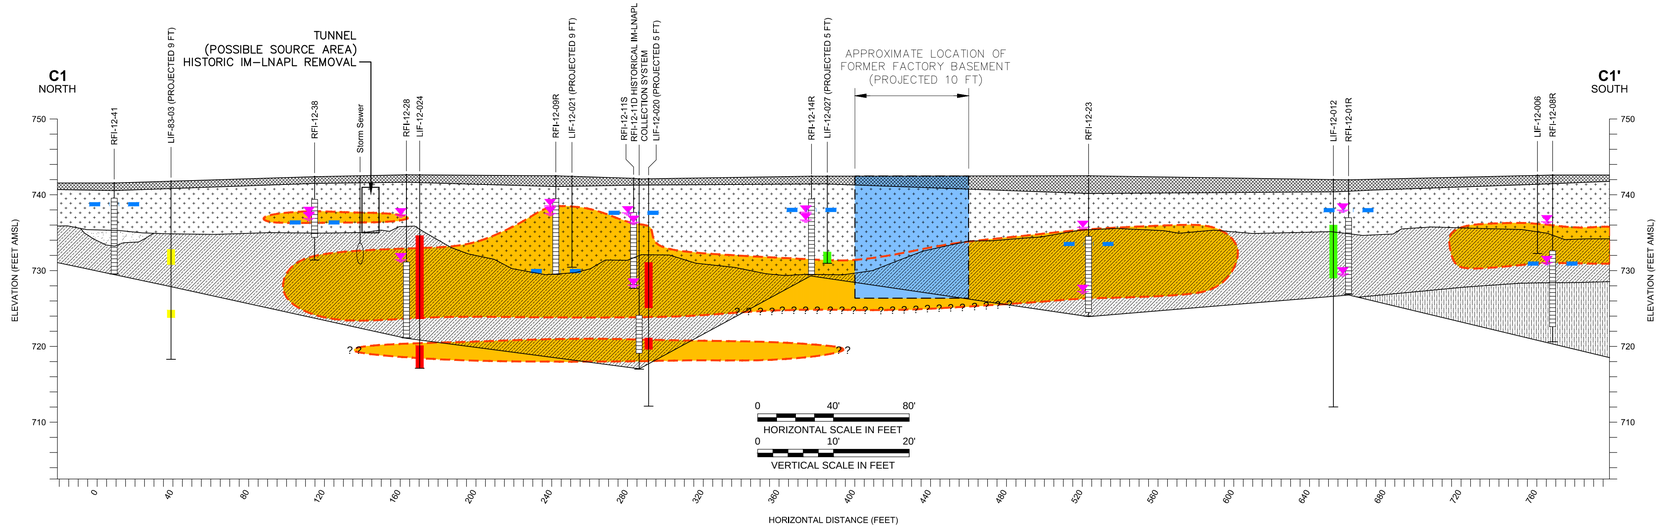
Subject:
Priority #4 - AOI 12-A, -B, &-C Hydraulic Oil LNAPL Areas
Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

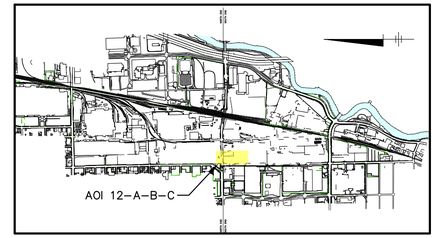
As part of the remedy evaluation process, each of the Site's 17 LNAPL Areas were prioritized based on risk. The area of interest (AOI) 12-A, -B, & -C Hydraulic Oil LNAPL Areas (AOI 12-A, -B, & -C LNAPL Areas) are ranked as Priority #4 with a total potential risk score of 12 (**Table 5 of the main report**). A conceptual site model cross-section is attached (**Figure C-1)** that provides an overview of the AOI 12-A, B, & -C LNAPL Areas impacts.



Historical IMs completed at the AOI 12-A, B, & -C LNAPL Areas include a product recovery system and an LNAPL bailing program. Partial removal of product completed in this area is considered a component of the remedy.



The compositional and saturation concerns identified for the AOI 12-A, B, & -C LNAPL Areas were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:



- Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios due to the biodegradation of LNAPL generating methane; however, this will be addressed by the proposed institutional controls.
- The unacceptable groundwater/surface water interface (GSI) risks will be addressed by the proposed Outfall 004 infiltration elimination remedy.

- The particulate soil inhalation concern can effectively be mitigated by the maintenance of existing surface cover as an engineering control.
- No feasible options exist to mitigate unacceptable risk through compositional change.
- The LNAPL is mobile and is infiltrating the Outfall 004 storm sewer.
- The LNAPL is not readily recoverable.
- LNAPL in the vicinity of monitoring well RFI-12-38 contains PCBs at a concentration of 8.6 parts per million. Due to the nature and extent of PCB impacts, it is requested that the impacts at AOI 12-A, -B, & -C be allowed to remain in place and the area be designated as low occupancy [per 761.61(a)(4)(i)(B)].

Based on the current understanding of conceptual site model risks, the remedies recommended to address the GSI, particulate soil inhalation, PCB, potential volatilization to indoor air, and mobility concerns associated with AOI 12-A, -B, & -C LNAPL Areas are to eliminate the Outfall 004 infiltration pathway, to maintain existing surface cover, to designate portions of the AOI 12-A, -B, and -C LNAPL Area as low occupancy, and to establish institutional controls.

Attachment 1

LNAPL Conceptual Site Model

Priority #4 - AOI 12-A, -B, &-C Hydraulic Oil LNAPL Areas Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model for the area of interest (AOI) 12-A, -B, & -C Hydraulic Oil light non-aqueous phase liquid (LNAPL) Areas (AOI 12-A, -B, &-C LNAPL Areas). AOI 12-A, -B, & -C is located at the Buick City Site (Site) located in Flint, Michigan (**Figure C1-1**).

1. Background

The AOI 12-A, -B, & -C LNAPL Areas are located at the Southend of the Site in the northwestern and eastern portions of the former Building 12 footprint (**Figure C1-2**). Historically, the Building 12 Area was primarily used for underbody assembly and body panel assembly. The AOI 12-A, -B, &-C LNAPL Areas are presumably due to historical releases associated with operations in this area and may be co-mingled.

Investigation data previously presented in Site reports are not re-presented in this memo. However, pertinent AOI 12-A, -B, &- C investigation data that has not previously been presented in a Site report is attached.

2. Former Interim Measures

2.1 LNAPL Monitoring and Bailing Program

During the Site-wide LNAPL monitoring program conducted from 2003 through 2005, a total of approximately 7.4 gallons of LNAPL was recovered during 10 quarterly bailing events in the AOI 12-A, -B, & -C area.

2.2 Product Recovery System

In 2003, two LNAPL collection systems were installed at RFI-12-02 and RFI-12-11D in response to the observation of LNAPL discovered in wells in the northwestern and eastern portions of the former Building 12. Due to the high viscosity of the LNAPL, the collection systems failed to collect a reasonable amount of LNAPL. The systems were dismantled prior to 2006.

3. AOI 12-A, -B, &-C Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and LNAPL characteristics and extent of impacts for the AOI 12-A, -B, & -C LNAPL Areas. Soil Impacts at AOI 12-A, -B, & -C were addressed in the U.S. EPA Final Decision and Response to Comments for Soil and Groundwater Cleanup (U.S.EPA, 2010) issued for the Southend of the Site and are not discussed herein.

Figure C1-2 presents the locations of the existing and abandoned monitoring wells and soil borings at AOI 12-A, -B, &-C.

3.1 AOI 12-A, -B, &-C Geology and Hydrogeology

- *Geology:* The soils at AOI 12-A, -B, and -C consist of primarily fill material and/or sands to a depth of 6 to 9 feet bgs that are underlain by interbedded silts and clays with occasional sand lenses. The logs also indicated evidence of LNAPL impacts from as shallow as 3 feet bgs and as deep as 23 feet bgs, across the area.

- *Groundwater/LNAPL Levels:* Groundwater/LNAPL gauging data show that the depth to groundwater in this area varies greatly and has been measured as shallow as 1.9 feet bgs, as deep as 13.8 feet bgs, and averages around 5 feet bgs. Most recently, in June 2013, product thicknesses ranged from 0.63 to 11.79 feet in the AOI 12-A, -B, & -C monitoring wells. The June 2013 groundwater level data are presented in **Appendix X.** A brief description of the extents of the AOI 12-A, -B and –C LNAPL Areas is provided below.

    - The AOI 12-A LNAPL Area is defined by six monitoring wells in the southeastern portion of AOI 12-A, -B, & -C. LNAPL thicknesses greater than 0.1 feet have been measured at two of the monitoring wells (RFI-12-02R and RFI-12-22R). At RFI-12-26 historically LNAPL thicknesses of up to 0.39 feet were measured; however, during recent years minimal LNAPL thicknesses have been measured intermittently. At the remaining three monitoring wells (RFI-12-15, RFI-12-25, and RFI-12-27), sheens and small amounts (0.01 feet) of LNAPL are measured intermittently.

    - The AOI 12-B LNAPL Area consists of two monitoring wells (RFI-12-01R and RFI-12-08R) located in the southwestern portion of AOI 12-A, -B, &-C. At RFI-12-01R, historically, LNAPL thicknesses of up to 1.72 feet were measured; however, in recent years LNAPL has not been detected at RFI-12-01R. At RFI-12-08R, LNAPL has been measured at thicknesses ranging from 0.89 to 3.42 feet.

    - The AOI 12-C LNAPL Area consists of seven monitoring wells (RFI-12-09R, RFI-12-11D, RFI-12-14, RFI-12-23, RFI-12-28, RFI-12-35, and RFI-12-38)

located in the northern portion of AOI 12-A, -B, &-C. LNAPL has generally been measured at thicknesses greater than 0.1 feet at these wells with the exception of RFI-12-14 where 0.01 to 0.02 feet of LNAPL is measured intermittently.

Based on historic groundwater level gauging data, groundwater flow in this portion of the Site is generally to the southeast However, based on the proximity of several monitoring wells within AOI 12-B to the Outfall 004 storm sewer, a portion of the groundwater within these AOIs infiltrates the Outfall 004 sewer. Groundwater level data are presented in **Appendix X.**

3.2 Groundwater and Soil Analytical Data

Analytical data were compared to applicable Michigan Part 201 non-residential criteria.

3.2.1 Groundwater Analytical Data

The groundwater data in the AOI 12-A, -B, & -C area indicates that no constituents were detected above applicable non-residential criteria.

3.2.2 Soil VOC, SVOC, and Metals Analytical Data

Soil samples collected from three borings in the AOI 12-A, -B, & -C LNAPL Areas (RFI-29-01, RFI-12-02 and RFI-12-31) exceeded applicable Nonresidential Direct Contact (NDC) criteria for lead (1,500-11,000/900 mg/kg). The lead soil impacts in this area were previously addressed by the Final Decision for the Southend of the Site.

In addition, soil samples collected from two locations (RFI-12-11D and RFI-12-34) exceed Nonresidential Particulate Soil Inhalation Criteria (NPSIC) for manganese.

3.2.3 Soil PCB Analytical Data

A review of the analytical data in the AOI 12-A, -B, & -C LNAPL Areas indicates that of the 66 samples analyzed for polychlorinated biphenyls (PCBs), only nine samples detected PCBs and all detections were less than 1 part per million (ppm).

3.2.4 Groundwater/Surface Water Interface (GSI) Evaluation

While groundwater and LNAPL are infiltrating the Outfall 004 storm sewer, NPDES Plus Monitoring Program (NPMP) sampling is no longer conducted in the Outfall 004 sewer, because the dry weather flow in this sewer is directed into the Outfall 003/004 Storm Diversion and Treatment System (oil/water separator), which ultimately discharges through Outfall 003. As such, the Outfall 003 sample represents a combination of flows from the Outfall 003 and 004

storm sewers.

NPMP impacts in the Outfall 003 storm sewer are limited to a few metals. These are discussed further in **Appendix BB**. Based on review of the available data metals are likely to be addressed using a mixing zone based remedy.

3.2.5 Vapor Intrusion Evaluation

Due to the shallow nature of groundwater and LNAPL (approximately 5 feet below ground surface) at AOI 12-A, -B & -C, groundwater data were also compared to the applicable Non-Residential Screening Values For the Vapor Intrusion Pathway presented in the *Michigan Department of Environmental Quality (MDEQ) Guidance Document for the Vapor Intrusion Pathway* (further discussed in Section 3.4 of the Report). Groundwater data do not exceed applicable screening levels.

As there are no structures at the Site, the MDEQ Part 201 criteria are appropriate for comparison of soil data. As discussed in Section 3.2.2, manganese was detected at concentrations exceeding NPSIC criteria in soil samples collected from the RFI-12-11D and RFI-12-34.

3.3 LNAPL Characteristics

- *LNAPL Analytical Data:* LNAPL present at AOI 12-A, -B, &-C consists primarily of hydraulic oil. Additional analysis indicated that:

  - At AOI 12-A, the LNAPL has a viscosity of 41 to 50 centipoise (cp), interfacial tension of 12 to 22 dynes/centimeter (cm), and a specific gravity of 0.88 to 0.93. Concentrations of arsenic and lead exceed TCLP criteria; however, TCLP analysis has not been conducted.

  - At AOI 12-C, the LNAPL contains concentrations of chromium and lead that exceed TCLP criteria; however, TCLP analysis has not been conducted. Additionally, the LNAPL contains PCBs at a concentration of 8.6 ppm. The LNAPL at AOI 12-C has a viscosity ranging from 14 cp at the southern end of the area to 110 cp at the northern end of the area, interfacial tension ranging from 21 dynes/cm at the southern end of the area to 17 dynes/cm at the northern end of the area, and specific gravity ranging from 0.089 at the southern end of the area to 0.93 at the northern end of the area.

  For reference, the viscosity (at 100 degrees Fahrenheit) of olive oil is 43.2 cp and honey is 73.6 cp (Ingersoll-Rand, 1981). The LNAPL analytical data are presented in **Appendix X**.

- *Laser Induced Florescence (LIF) Data:* Forty-seven Laser induced fluorescence (LIF) borings

were completed at AOI 12-A, -B, & -C. The LIF waveform signatures observed at AOI 12-A, -B, & -C are consistent with the known LNAPL type, hydraulic oil. The vertical range of LIF impact (greater than 5%RE) at AOI 12-A, -B, & -C is typically 6 to 15 feet bgs. There are several instances where the impact extends to depths of 22 to 28 feet bgs. **Figure C1-2** presents the results of the LIF investigation and the extent of impacts associated with the AOI 12-A, -B, &-C LNAPL areas.

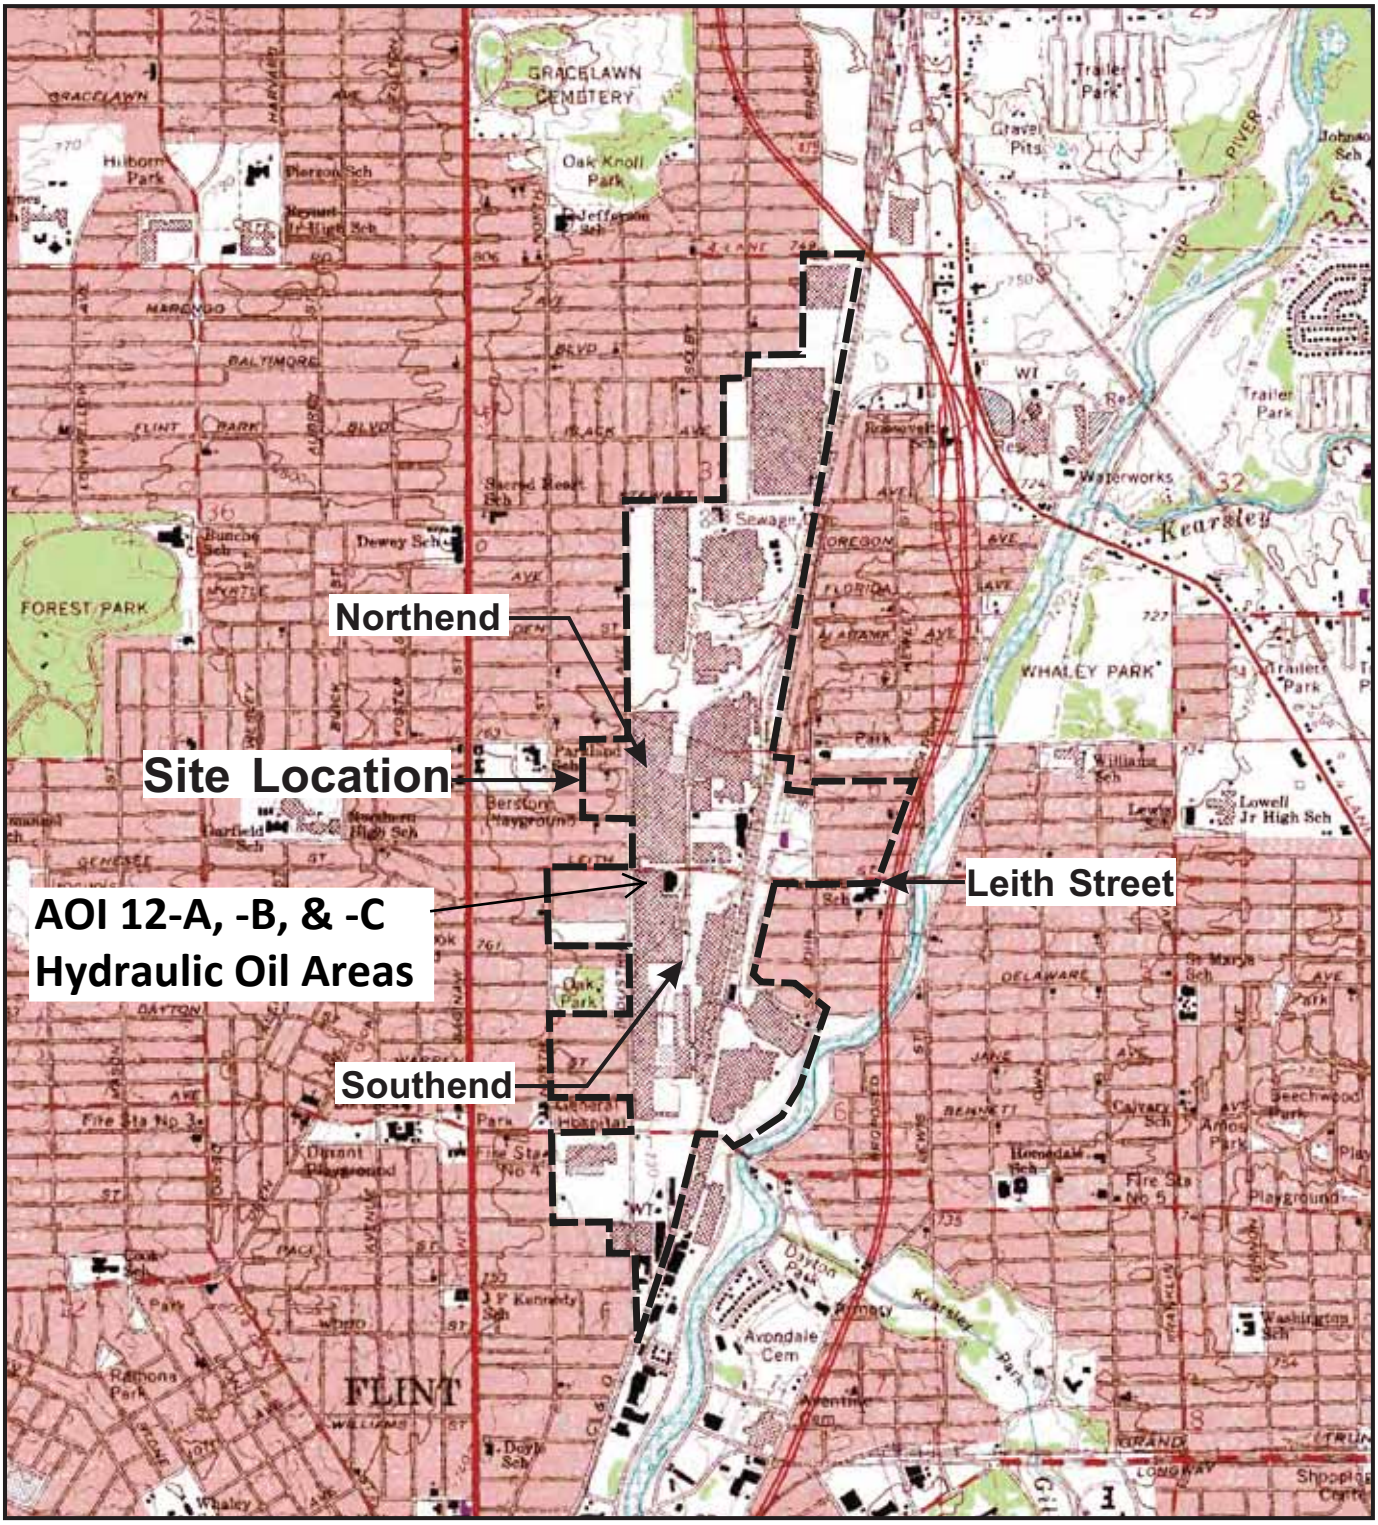
- *Transmissivity:* An LNAPL transmissivity study was completed at the AOI 12-A, -B, &-C LNAPL Areas, which consisted of completing four quarters of baildown testing at four monitoring wells (LIF-12-018, RFI-12-09R, RFI-12-23, and RFI-12-35. Based on LNAPL baildown test results, LNAPL transmissivities quantified at monitoring wells LIF-12-018, RFI-12-09R, and RFI-12-35 ranged from 0.01 to 0.1 square feet per day (ft^2/day), which is below the minimum range suggested by the Interstate Technology and Regulatory Council (ITRC) and the MDEQ draft standard threshold value.

  At RFI-12-23, transmissivity ranged from 0.2 to 0.4 ft^2/day, which is at the lower end of the minimum range suggested by ITRC and below the MDEQ draft standard threshold value indicating that LNAPL recovery is likely not practicable.

- *Natural Source Zone Depletion (NSZD):* An NSZD study was conducted at three locations (LIF-12-10, LIF-12-018, and LIF-12-24) that are located in the AOI 12-B and 12-C LNAPL areas. However, the results were inconclusive due to the presence of shallow groundwater and the concrete slab. The currently available testing technologies cannot reliably quantify the natural source zone depletion beneath a concrete slab.

3.4 Extent of LNAPL

During the RCES preparation, the AOI 12-A, -B, &-C LNAPL Area was calculated based on historical data. The footprint of the LNAPL area containing approximately 0.5 ft or greater of LNAPL was estimated to be approximately 60,400 square feet. Following additional delineation and investigation work at the AOI 12-A, -B, &-C LNAPL Area the revised (as discussed in Section 2.1.3 of the main report) extent is approximately 60,600 square feet.



Based on the LIF and soil boring log data, approximate depth impacts are as follows:

- At AOI 12-A, the depth of LNAPL impacts are approximately 5 to 13 feet bgs.
- At AOI 12-B, the depth of LNAPL impacts are approximately 6 to 13 feet in the western portion of the area and 17 to 23 feet bgs in the eastern portion
- At AOI 12-C, the depth of LNAPL impacts are approximately 6 to 16 ft bgs in the northern and

southern portions of the area and 11 to 23 feet bgs in the center of the area.

LNAPL Remedial Decision Tree

Attachment 2 LNAPL Remedial Decision Tree
Priority #4 – AOI 12 – A, B, and C (Hydraulic Oil Areas)

NOTES

(#) NOTES: See Page C2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priority #4 - AOI 12-A, -B, &-C Hydraulic Oil Areas

Background: The area of interest (AOI) 12-A, -B, & -C light non-aqueous phase liquid (LNAPL) Areas are located at the Southend of the Site in the northwestern and eastern portions of the former Building 12 footprint. Historically, the Building 12 Area was primarily used for underbody assembly and body panel assembly. The AOI 12-A, -B, &-C LNAPL Areas are presumably due to historical releases associated with operations in this area and are likely co-mingled. There are currently no buildings within the AOI 12-A, -B, &-C LNAPL Area.

Geology and Hydrogeology: The soils at AOI 12-A, -B, and -C consist of primarily fill material and/or sands to a depth of 6 to 9 feet bgs that is underlain by interbedded silts and clays with occasional sand lenses. Depth to groundwater in this area varies greatly and has been measured as shallow as 1.9 feet bgs, as deep as 13.8 feet bgs, and averages around 5 feet bgs. Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the southeast.

LNAPL Characteristics: Logs in the AOI 12-A, -B, and -C area show evidence of LNAPL impacts from as shallow as 3 feet bgs and as deep as 23 feet bgs, across the area.

- The AOI 12-A LNAPL Area is defined by six monitoring wells in the southeastern portion of the AOI 12-A, -B, & -C Area. LNAPL thicknesses greater than 0.1 feet have been measured at two of the monitoring wells (RFI-12-02R and RFI-12-22R). At RFI-12-26, historically, LNAPL thicknesses of up to 0.39 feet were measured; however, minimal LNAPL thicknesses have been measured intermittently in recent years. At the remaining three monitoring wells (RFI-12-15, RFI-12-25, and RFI-12-27), sheens and small amounts (0.01 feet) of LNAPL are measured intermittently. At AOI 12-A, the LNAPL has a viscosity of 41 to 50 centipoise (cp), interfacial tension of 12 to 22 dynes/centimeter (cm), and specific gravity of 0.88 to 0.93. At AOI 12-A, the LNAPL contains concentrations of arsenic and lead exceeding TCLP criteria; however, TCLP analysis has not been conducted.
- The AOI 12-B LNAPL Area consists of two monitoring wells (RFI-12-01R and RFI-12-08R) located in the southwestern portion of the AOI 12-A, -B, &-C area. At RFI-12-01R, historically LNAPL thicknesses of up to 1.72 feet were measured; however, in recent years LNAPL has not been detected at RFI-12-01R. At RFI-12-08R LNAPL has been measured at thicknesses ranging from 0.89 to 3.42 feet.
- The AOI 12-C LNAPL Area consists of seven monitoring wells (RFI-12-09R, RFI-12-11D, RFI-12-14, RFI-12-23, RFI-12-28, RFI-12-35, and RFI-12-38) located in the Northern portion of the AOI 12-A, -B, &-C area. LNAPL has generally been measured at thicknesses greater than 0.1 feet at these wells with the exception of RFI-12-14 where 0.01 to 0.02 feet of LNAPL is measured intermittently. At AOI 12-C, the LNAPL contains concentrations of chromium and lead that exceed TCLP criteria; however, TCLP analysis has not been conducted, and PCBs at a concentration of 8.6 parts per million (ppm). The LNAPL at AOI 12-C has a viscosity ranging from 14 cp at the southern end of the LNAPL Area to 110 cp at the northern end of the LNAPL Area, interfacial tension ranging from 21 dynes/cm at the southern end of the LNAPL Area to 17 dynes/cm at the northern end of the LNAPL Area, and specific gravity ranging from 0.089 at the southern end of the LNAPL Area to 0.93 at the northern end of the LNAPL Area.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*

   YES – The following potential risk/exposure concerns are associated with the AOI 12-A, -B, & -C LNAPL Areas:

   - Groundwater/surface water interface (GSI) Concern: LNAPL and groundwater from the AOI 12-B and -C LNAPL Areas is infiltrating the Outfall 004 storm sewer. In 2010 and 2011, samples were collected from the on-site compliance point for the Outfall 004 storm sewer approximately 1,800 feet downstream of AOI 12-B and -C and submitted for laboratory analysis. The Outfall 004 storm sewer samples exceeded GSI criteria for select metals; however, the AOI 12-B and -C LNAPL Areas are not the sole source of impact along the Outfall 004 storm sewer and therefore may not be the source of these exceedances. In addition, the GSI compliance point for the Outfall 004 is at the discharge point to the river. During dry weather flow, the flow within the Outfall 004 storm sewer is diverted to the Outfall 003 via the Outfall 003/004 Storm Water Diversion and Treatment System (oil-water separator), thus, during these periods, there is no contribution from the Site to Outfall 004.
   - Particulate Soil Inhalation (Ambient Air) Concerns: The concentration of manganese detected in soil at the AOI 12-A, -B, & -C LNAPL Areas exceeds the non-residential particulate soil inhalation criteria. The building slab will be maintained as an engineering control and an institutional control preventing its removal will be implemented.
   - Potential Volatilization to Indoor Air for a Future Structure Concern*:* Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

Attachment 2 Notes

Priority #4 - AOI 12-A, -B, &-C Hydraulic Oil Areas

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*

NO – The following is a general discussion regarding the feasibility of various compositional change remediation strategies for the AOI 12-A, -B &-C Areas:

- Bench-scale testing of five technologies was conducted on samples collected from the AOI 12-A, -B, & -C area. The results of the testing were presented in the *LNAPL Remediation Technology Bench-Scale Testing Report.* Based on the results of the bench-scale testing, the following observations are made:
  - Enhanced dissolution and recovery via surfactant or hot water flushing did not result in any additional LNAPL recovery.
  - Remedial technologies relying on direct chemical destruction of constituents of concern (COCs) are also technically infeasible, given that the desired chemical reactions occur within the aqueous phase only, and thus are rate-limited by dissolution of contaminants from the non-aqueous to aqueous phase.
  - Based on the results of simulated distillation testing, a significant portion of the LNAPL has a boiling point above 400°C and would be considered semi-volatile organic compounds (SVOCs). Steam or electric resistive heating (ERH) are not recommended for SVOCs because a higher temperature is required to volatilize these compounds.
  - In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of polychlorinated biphenyls (PCBs) in the LNAPL and nearby City sewers. In addition, it does not represent an economically feasible remedial alternative given the relatively large area that would need to be addressed.
- AOI 12-A, -B, & -C LNAPL constituents have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.

3) *Is there a potential benefit to partial treatment/removal that outweighs costs?*

NO – The risks associated with this LNAPL area are PCB-impacted LNAPL infiltrating into the Outfall 004 storm sewer system, particulate soil inhalation, and possible volatilization to indoor air of a future building. The infiltration to the Outfall 004 storm sewer will be addressed by rerouting the flow into the Outfall 013 storm sewer and bulkheading the Outfall 004 storm sewer in this portion of the Site. Outfall 004 will be rerouted prior to encountering the LNAPL impacts; thereby, eliminating impacts to Outfall 013. Following the completion of the reroute, the abandoned section of the Outfall 004 storm sewer will be used as a passive recovery trench. The 004 recovery trench will then be monitored for LNAPL accumulation and LNAPL removal activities will be conducted as necessary. Based on the current understanding of risk conditions, the soil inhalation and volatilization to indoor air risks can be effectively mitigated through engineering and institutional controls.

4) *Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?*

NO – While the LNAPL is mobile in the vicinity of the storm sewer, as a collective these LNAPL Areas appear to be stable. This finding is supported by the following lines of evidence:

- Well Gauging Data: Sentinel wells located around the periphery of the AOI 12-A, -B, & -C LNAPL Areas have remained free of LNAPL since monitoring began approximately 10 years ago.
- Age of LNAPL Release: The AOI 12-A, -B, & -C LNAPL Areas were identified between 1998 and 2001. Operations began in this portion of the Site in the 1910's and ceased in this portion of the Site ceased in late 1990's - early 2000's (no active LNAPL sources for at least 10 years). LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).

5) *Is LNAPL mobile within the stable LNAPL perimeter?*

YES – LNAPL from the AOI 12-B and -C Areas is infiltrating the Outfall 004 storm sewer, which passes through the AOI 12-C LNAPL Area; however, the viscosity of the LNAPL in this portion of AOI 12-C is 110 cp limiting its mobility. The proposed remedy to eliminate LNAPL infiltrations is the reroute of the Outfall 004 storm sewer into the Outfall 013 storm sewer.

6) *Is LNAPL readily recoverable?*

NO – The results of historic interim measures (IM), and bench-scale testing, and transmissivity testing indicate that the AOI 12-A, -B, and –C LNAPL Areas are not readily recoverable. These activities are summarized below:

- During the Site-wide LNAPL monitoring program conducted from 2003 through 2005, a total of approximately 7.4 gallons of LNAPL was recovered in 10 quarterly bailing events in the AOI 12-A, -B, and -C Areas.

Attachment 2 Notes

Priority #4 - AOI 12-A, -B, &-C Hydraulic Oil Areas

- In 2003, two stand-alone LNAPL collection systems were installed at wells RFI-12-02 and RFI-12-11D for the purpose of controlling the migration of potential LNAPL in this area. Due to the high viscosity of the LNAPL in this area, these systems failed to collect any reasonable amount of LNAPL. As such, they were terminated and dismantled.
- In 2011, as part of bench scale testing activities, hydraulic LNAPL recovery through residual saturation analysis was evaluated. LNAPL saturation was assessed on soil cores collected from AOI 12-A, -B, &-C through the petrophysical laboratory analysis Residual Saturation by Water Drive (RSWD). A total of four RSWD tests were performed on samples collected where LNAPL is located in the subsurface. The testing showed that all four samples were at residual saturation, indicating LNAPL is immobile as defined by the ITRC (2009) under saturated conditions and limited potential to hydraulically recover LNAPL.
- The 2011-2012 transmissivity testing completed at AOI 12-C resulted in transmissivities being quantified at monitoring wells LIF-12-018, RFI-12-09R, and RFI-12-35 ranging from 0.01 to 0.1 square feet per day (ft^2/day). These results are below both the ITRC and MDEQ draft standard threshold values indicating that LNAPL recovery is not practicable at these wells. At RFI-12-23, transmissivity ranged from 0.2 to 0.4 ft^2/day indicating that LNAPL recovery is likely not practicable. The LNAPL transmissivity measured at AOI 12-A, -B, & -C are below this criterion indicating that LNAPL is minimally recoverable and LNAPL recovery efforts (through hydraulic-based remediation methods) will not result in a beneficial reduction in overall LNAPL mass.

7) Are controls required?

YES – In addition to the rerouting of the Outfall 004 storm sewer into the Outfall 013 sewer to eliminate LNAPL infiltration, the following AOI-specific engineering and institutional controls, in addition to the Site-wide institutional controls, are proposed for the AOI 12-A, -B, and –C area to limit future exposure:

- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present (as shown on **Figure C3-1**) to prevent direct contact with contaminated material, except with using appropriate health and safety measures, during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the Natural Resources and Environmental Protection Act.
- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 6 in the main report**,
- Notification to future owners of the presence of PCBs, and
- Restrict the area shown on **Figure C3-1** to low occupancy based on the presence of PCBs.

Priority #4 – AOI 12-A, -B, & -C Hydraulic Oil LNAPL Areas Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – 761.61(c) Risk Based Cleanup and Disposal Request

---

This attachment presents the information required to support a 761.71(c) determination for the area of interest (AOI) 12-A, -B, & -C Hydraulic Oil light non-aqueous phase liquids (LNAPL) Areas (AOI 12-A, -B, & -C LNAPL Areas).

1. Area Background and History

The AOI 12-A, -B, & -C LNAPL Areas are located at the Southend of the Site in the former Building 12 area and are likely associated with historic releases associated with operations. The AOI 12-A LNAPL Area is defined by six monitoring wells in the southeastern portion of the AOI 12-A, -B, & -C area (RFI-12-02R, RFI-12-26, RFI-12-15, RFI-12-22R, RFI-12-25, and RFI-12-27). The AOI 12-B LNAPL Area consists of two monitoring wells (RFI-12-01R and RFI-12-08R) located in the southwestern portion of the AOI 12-A, -B, & -C area. The AOI 12-C LNAPL Area consists of seven monitoring wells (RFI-12-09R, RFI-12-11D, RFI-12-14, RFI-12-23, RFI-12-28, RFI-12-35, and RFI-12-38) located in the Northern portion of the AOI 12-A, -B, & -C Areas.

2. Summary of SOPs and Investigation Results

AOI 12-A, -B, & -C has been previously investigated as part of the Site's RCRA Facility Investigation (RFI) activities. The RFI Work Plan presents the standard operating procedures, field sampling procedures, quality assurance/quality control procedures, etc. used during the investigation. The results of the investigations (including laboratory analytical reports) were presented in the RFI Phase I and RFI Phase II reports.

3. Nature of Contamination

At AOI 12-A, -B, & -C, samples of LNAPL, soil and groundwater have been analyzed for PCBs. Below is a brief summary of results.

- LNAPL samples were collected from seven monitoring wells (RFI-12-02, RFI-12-09, RFI-12-11D, RFI-12-22, RFI-12-23, RFI-12-35, and RFI-12-38). PCBs were only detected in the sample collected from RFI-12-38 at a concentration of 8.6 parts per million (ppm).

- A total of 73 soil samples collected from the AOI 12-A, -B, & -C area were analyzed for PCBs. PCBs were detected in the nine of the samples collected. All detections were at concentrations less than 1 ppm. The maximum detection of PCBs in soil was 0.186 ppm.
- Eleven groundwater samples collected from wells in the AOI 12-A, -B, & -C area were analyzed for PCBs. PCBs were detected in only two of the groundwater samples at a concentrations of 0.041 and 0.046 nanograms per liter (ng/L).

4. Extent of Impacts

At AOI 12-A, -B, & -C, PCB impacts are associated with the LNAPL in the vicinity of monitoring well RFI-12-38. **Figure C3-1** shows the approximate extent of the AOI 12-A, -B, & -C LNAPL Areas. Monitoring well RFI-12-38 is located in the northern portion of the AOI 12-C LNAPL Area, beneath Leith Street. The depth of LNAPL impacts at RFI-12-38 are approximately 5 to 8 feet below ground surface (bgs).

5. Risk Based Procedure

PCB-impacted LNAPL is located in the vicinity of RFI-12-38 at concentrations that exceed 1 ppm. The existing cover will remain in place at RFI-12-38 and the area will be designated as low occupancy. Monitoring well RFI-12-38 is located in Leith Street and the existing ground cover in the vicinity of RFI-12-38 consists of approximately 1 foot of asphalt/concrete. The former Building 12 slab is located south of RFI-12-38 and consists of one to three feet of concrete. The approximate areas proposed for low occupancy restriction is presented on **Figure C3-1.** However, additional sampling may be completed to refine the extents of impacts prior to implementing the restriction. In addition future owners will be notified of the presence of PCBs in this area.

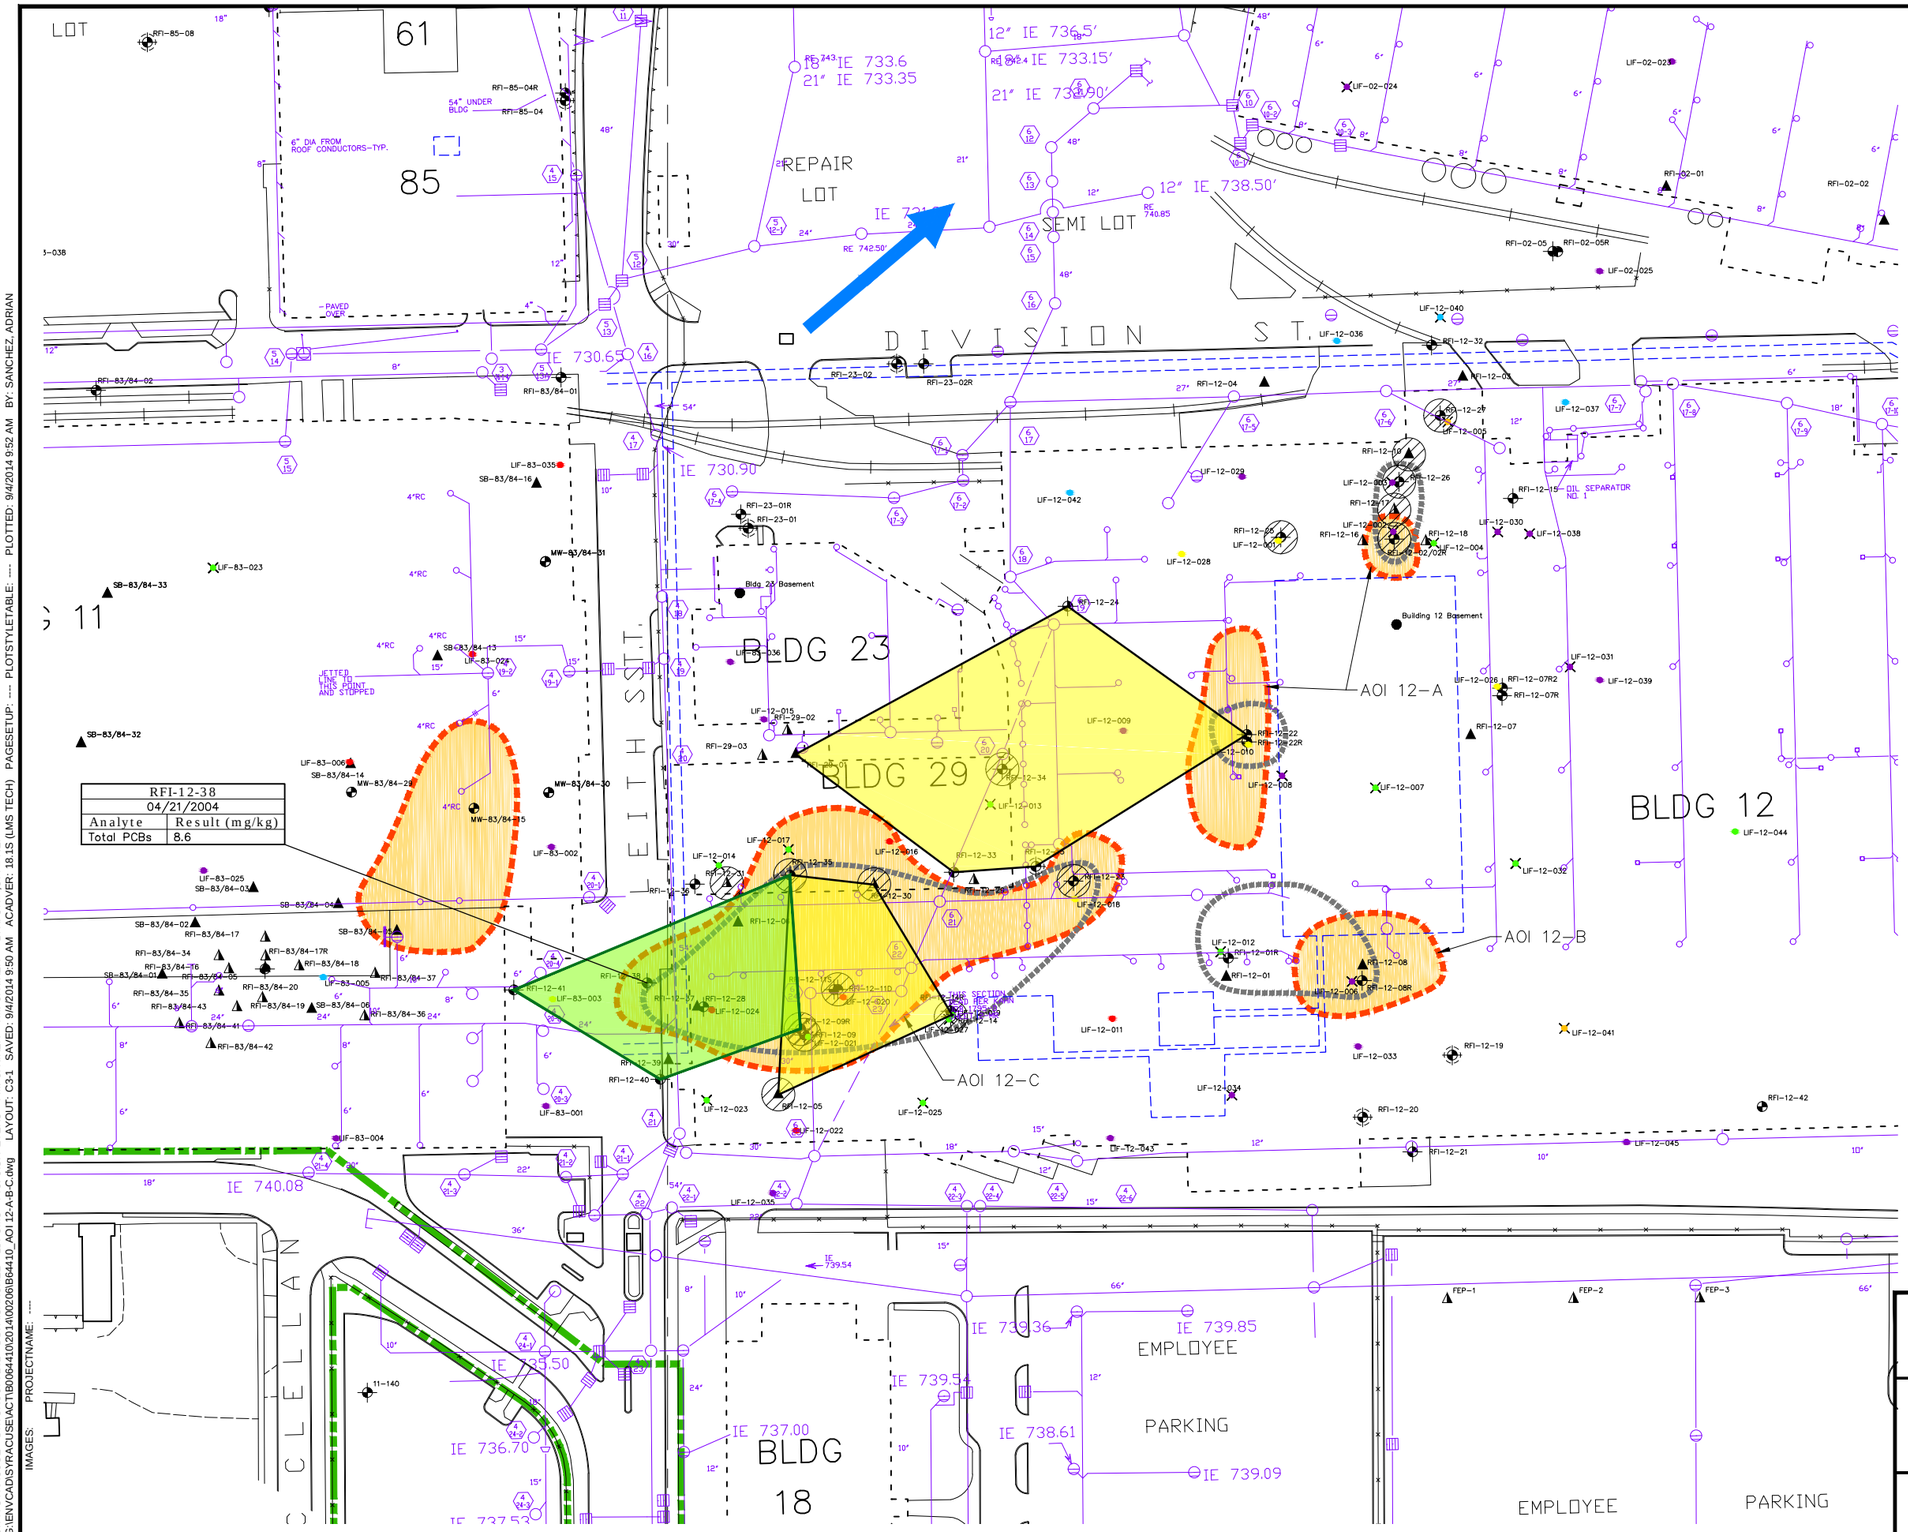
In addition, LNAPL and/or LNAPL-impacted soils removed during remediation activities completed at AOI 12-A, -B, and -C will be characterized for disposal using “as found” concentrations.

AOI-specific deed restrictions, in addition to Site-wide institutional controls, placed on AOI 12-A, -B, & -C will include (but are not limited to):

- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present (as shown on **Figure C3-1**) to prevent direct contact with contaminated material, except with using appropriate health and safety measures, during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is

conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the Natural Resources and Environmental Protection Act.

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 6 in the main report**,
- Notification to future owners of the presence of PCBs, and
- Restrict the area shown on **Figure C3-1** to low occupancy based on the presence of PCBs.



6. Evaluation of Alternatives

The following technologies were evaluated during bench-scale testing to address LNAPL at AOI 12-A, -B, & -C:

- Enhanced dissolution and recovery via surfactant or hot water flushing did not result in any additional LNAPL recovery.
- LNAPL constituents at AOI 12-A, -B, & -C have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.
- Remedial technologies relying on direct chemical destruction of constituent of concern (COCs) are also technically infeasible, given that the desired chemical reactions occur within the aqueous phase only, and thus are rate-limited by dissolution of contaminants from the non-aqueous to aqueous phase.
- Based on the results of simulated distillation testing, a significant portion of the LNAPL has a boiling point above 400°C and would be considered semi-volatile organic compounds (SVOCs). Steam or electric resistive heating (ERH) are not recommended for SVOCs because a higher temperature is required to volatilize these compounds.
- In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of PCBs in the LNAPL and nearby City sewers. In addition, it does not represent an economically feasible remedial alternative given the relatively large area that would need to be addressed.

Attachment 4

Remedy Recommendation

Priority #4 - AOI 12-A, -B, &-C Hydraulic Oil LNAPL Areas Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 4 – Recommended Remedy

This attachment presents the recommended remedies for the area of interest (AOI) 12-A, -B, & -C Hydraulic Oil light non-aqueous phase liquid (LNAPL) Areas (AOI 12-A, -B, &-C LNAPL Areas).

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in Attachment 2 identified groundwater/surface water interface (GSI), particulate soil inhalation, and potential volatilization to indoor air as compositional concerns for AOI 12-A, -B, & -C and mobility as a saturation concern. The LNAPL from the AOI 12-A, -B, &, -C area is infiltrating the Outfall 004 storm sewer, which is the basis for the mobility and GSI concerns. The particulate soil inhalation concern is due to concentrations of manganese in soil. The potential volatilization to indoor air concern is due to the biodegradation of LNAPL generating methane that could result in indoor air concerns for future structures. In addition, the LNAPL from the AOI 12-A, -B, and -C area, contains low levels of polychlorinated biphenyl (PCBs) which has also been identified as a concern.

2. Remedy Recommendation Rationale

The remedies recommended to address the compositional and saturation concerns associated with the AOI 12-A, -B, &, -C LNAPL Areas are engineering and institutional controls, which are discussed in detail in Section 3. The rationale for this selection is detailed below:

- Based on the current understanding of risk conditions, the potential volatilization to indoor air risk for future structures can be effectively mitigated through Site-wide institutional controls.
- Although the LNAPL at AOI 12-A, -B, &, -C is mobile within the stable perimeter, transmissivity testing indicates that recovery is not practical. The LNAPL transmissivities in the northern portion of the AOI12-C Area quantified at LIF-12-018, RFI-12-09R, and RFI-12-35 ranged from 0.01 to 0.1 ft^2/day, which are below both the Interstate Technology and Regulatory Council (ITRC) and the Michigan Department of Environmental Quality (MDEQ) draft standard threshold values for practical recovery. LNAPL transmissivity quantified in the southern portion of the AOI 12-C Area at monitoring well RFI-12-23 was 0.2 to 0.4 ft^2/day, which is below the MDEQ draft standard

threshold values for recovery but within the range that ITRC indicates LNAPL recovery may be practicable.

- From 2003 to 2005, 10 quarterly LNAPL recovery events removed a total of only 7.4 gallons of LNAPL from AOI 12-A, B, & -C wells.
- The two stand-alone LNAPL collection systems installed at wells RFI-12-02 and RFI-12-11D were discontinued due to failure to collect a reasonable amount of LNAPL because of the high viscosity of the LNAPL.
- PCBs were detected at a concentration of 8.6 ppm in the LNAPL sample collected from monitoring well RFI-12-38.
- LNAPL is infiltrating the Outfall 004 storm sewer.
- An NSZD study was conducted at two locations located in the AOI 12-A, -B, &-C LNAPL Area. The testing completed indicated that NSZD is occurring; however, the currently available testing technologies cannot reliably quantify the depletion beneath a concrete slab.
- The lead exceedances of nonresidential direct contact criteria (NDC) were addressed by the *Final Decision for the Southend of the Site* which was issued by U.S. EPA in May 2010 (Southend Final Decision).

3. AOI 12-A, -B, & -C Remedies

3.1 Completed Interim Measures

A Site-wide LNAPL monitoring program conducted from 2003 through 2005 removed a total of approximately 7.4 gallons of LNAPL. In addition, two LNAPL collection systems were installed in response to the observation of LNAPL discovered in wells in the northwestern and eastern portions of the former Building 12. The systems were dismantled prior to 2006 due to the high viscosity of the LNAPL. Partial removal of product has been completed in this area and is considered a component of the remedy.

3.2 Additional Remedy Recommendations

The remedies recommended to address the mobility, volatilization, GSI and PCB concerns associated with AOI 12-A, -B, & -C LNAPL Areas are to eliminate the Outfall 004 infiltration pathway via engineering controls, to restrict a portion of the area to low occupancy use, to maintain surface cover, and to establish institutional controls. These combined remedies will eliminate the infiltration pathway in the short term and prevent future worker exposure to LNAPL impacts in the long term.

3.2.1 Outfall 004 Pathway Elimination

In order to address the risks associated with the LNAPL infiltration into the Outfall 004 storm sewer, the pathway will be eliminated. The preferred option to eliminate this pathway is to re-route the

flow from the Outfall 004 storm sewer at the western property boundary into the nearby Outfall 013 storm sewer. The Outfall 004 storm sewer will then be bulkheaded and collared at the downgradient property boundary to eliminate this pathway. Outfall 004 will be rerouted prior to encountering the LNAPL impacts; therefore, eliminating impacts to Outfall 013 as shown on **Figure C4-1**. A feasibility study for this option is currently underway and the final cost for this option is being evaluated.

3.2.2 004 Passive Recovery Trench

Following the completion of the reroute, the abandoned section of the Outfall 004 storm sewer will be used as a passive recovery trench. The 004 recovery trench will then be monitored for LNAPL accumulation and LNAPL removal activities will be conducted as necessary.

3.2.3 Maintain Surface Cover

The remedy recommended to address the manganese particulate soil inhalation exceedances located beneath the existing asphalt/concrete is to maintain the surface cover over the impacted area. The area requiring surface cover is presented on **Figure C3-1**. The surface cover will be inspected and maintained to provide protection from future exposure. This surface cover area will be maintained in addition to the surface cover required to address the soil lead impacts in the Southend Final Decision.

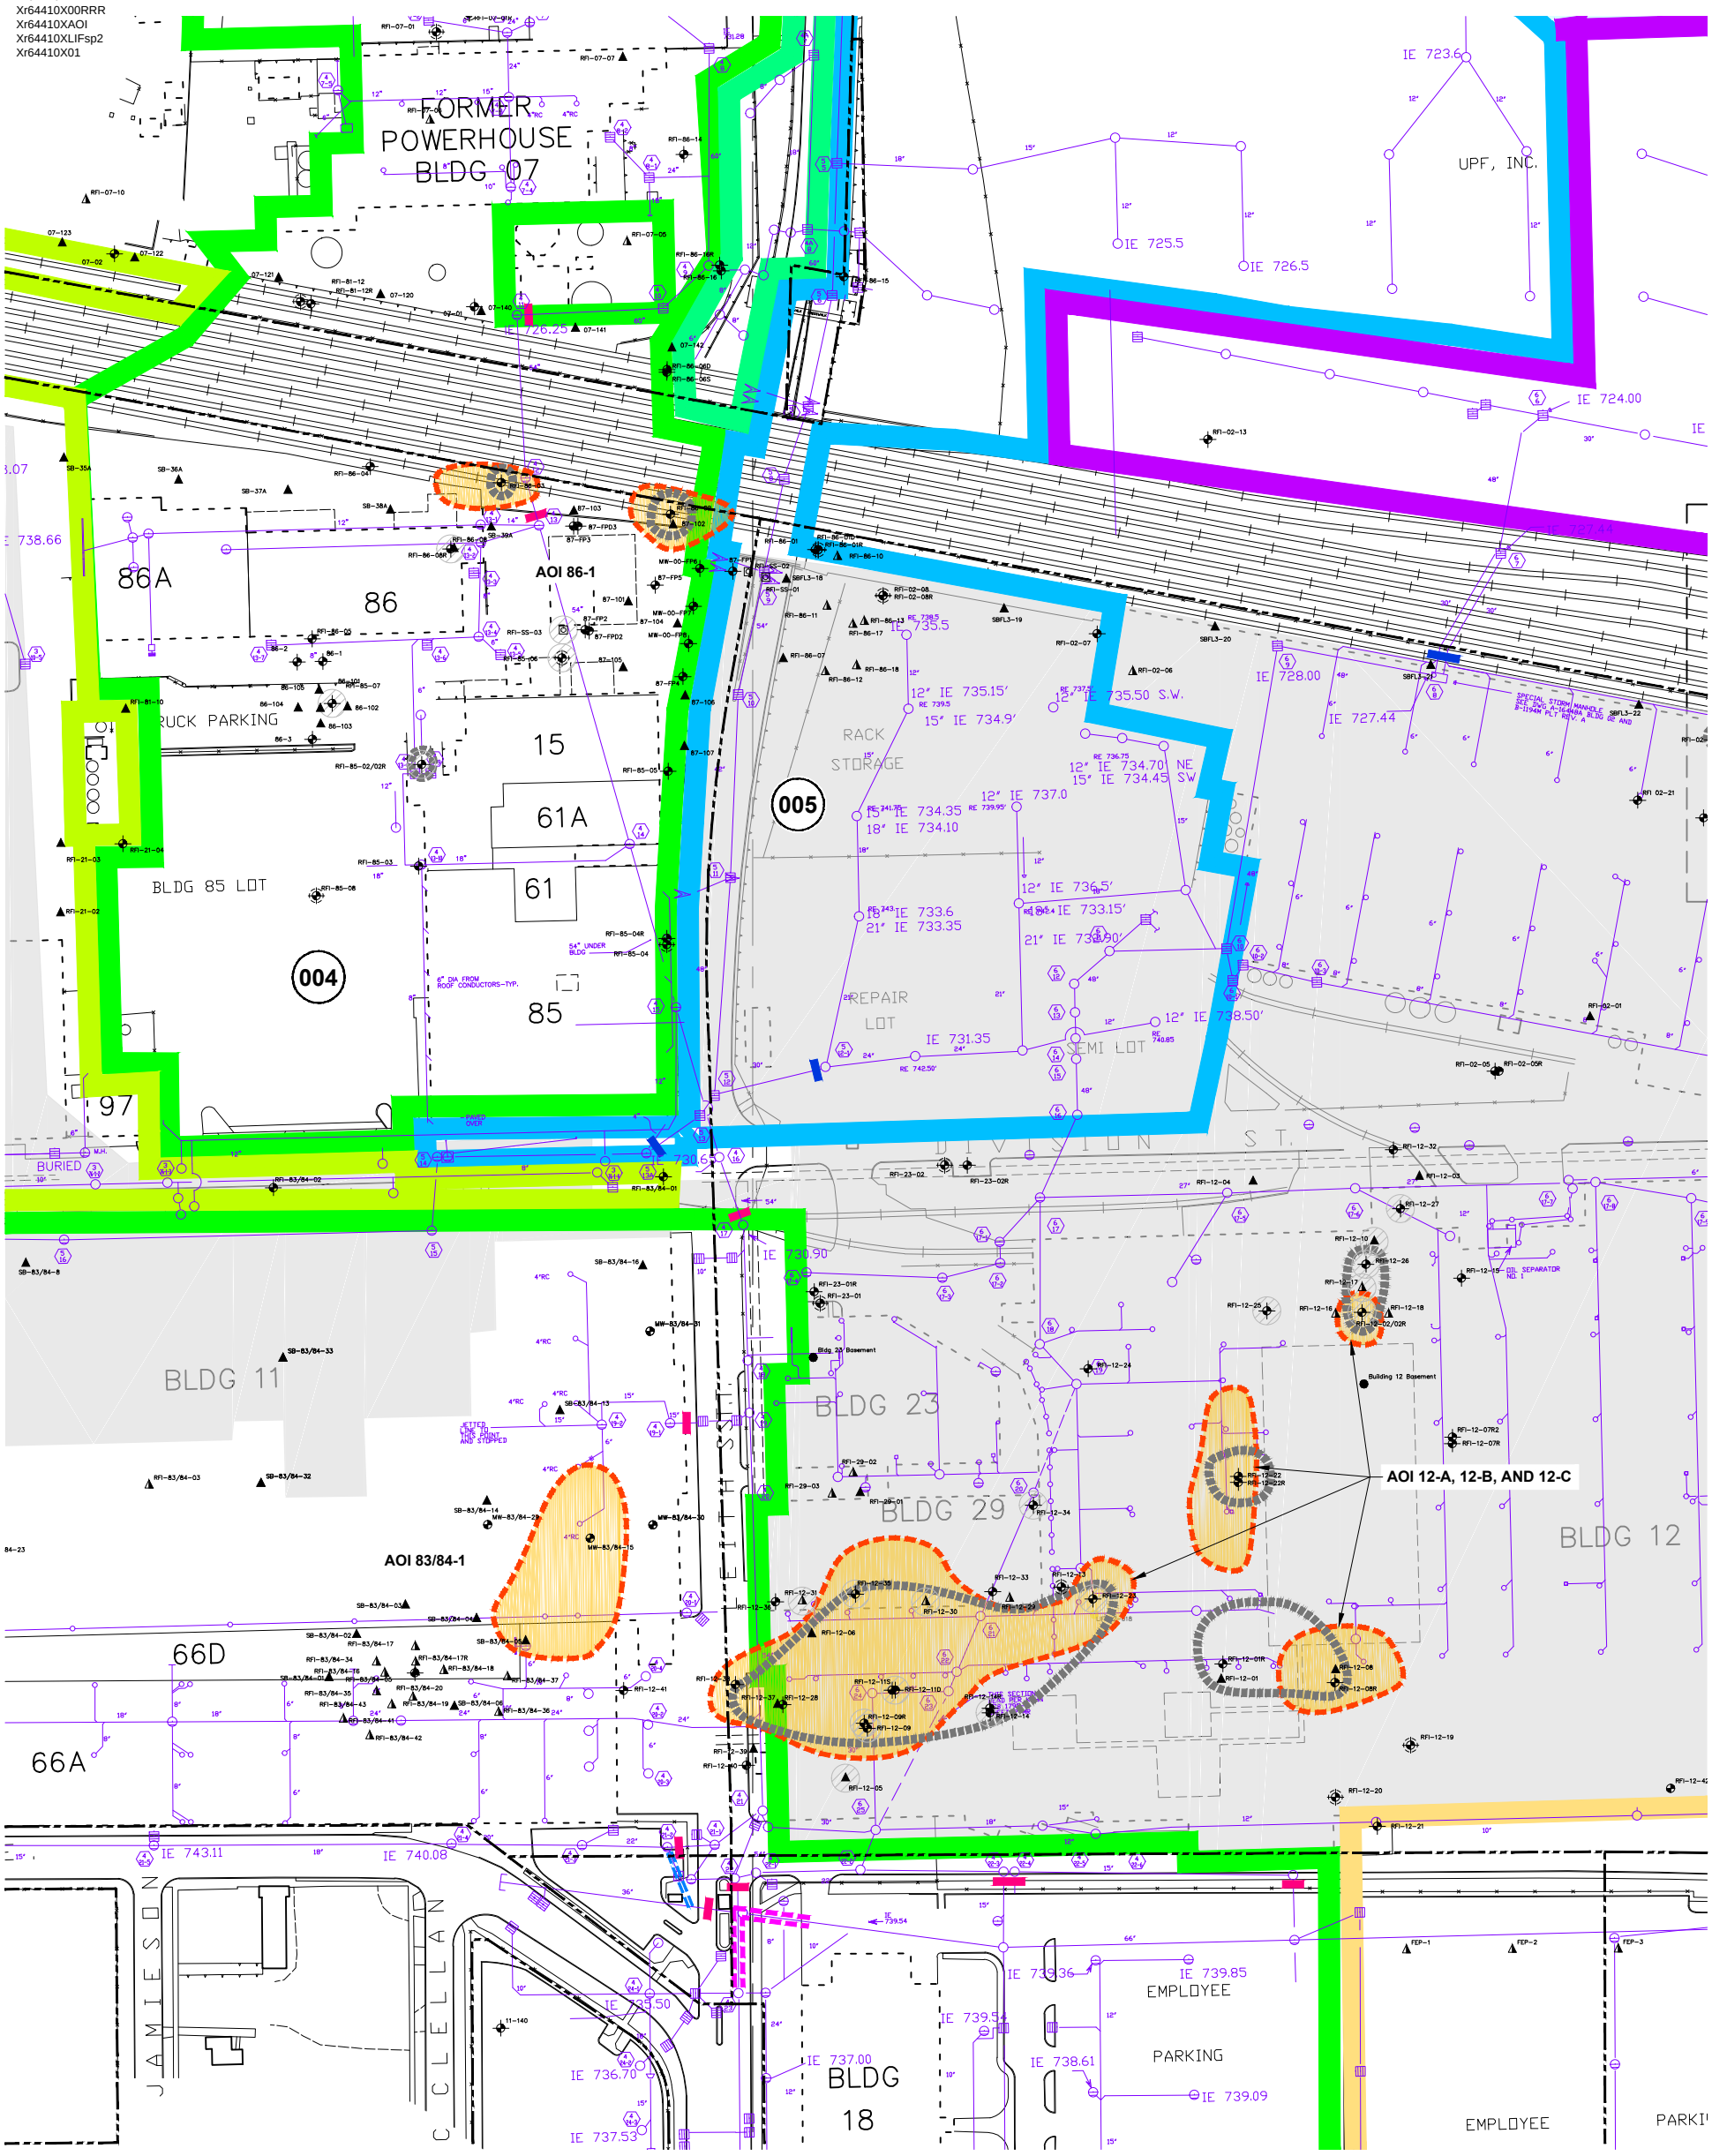
3.2.4 Institutional Controls

In order to address the PCB detection in LNAPL at the AOI 12-C LNAPL Area, a portion of the area will be restricted to low occupancy use. In addition, future owners will be notified of the presence of PCBs in this area.

The following AOI-specific institutional controls, in addition to the Site-wide institutional controls, will be necessary to limit potential for future exposure:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 6 in the main report**.
- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present (as shown on **Figure C3-1**) to prevent direct contact with contaminated material, except with using appropriate health and safety measures, during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that

demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the NREPA.



- Notify future owners of the presence of PCBs, and
- Restrict the area shown on **Figure C3-1** to low occupancy based on the presence of PCBs.

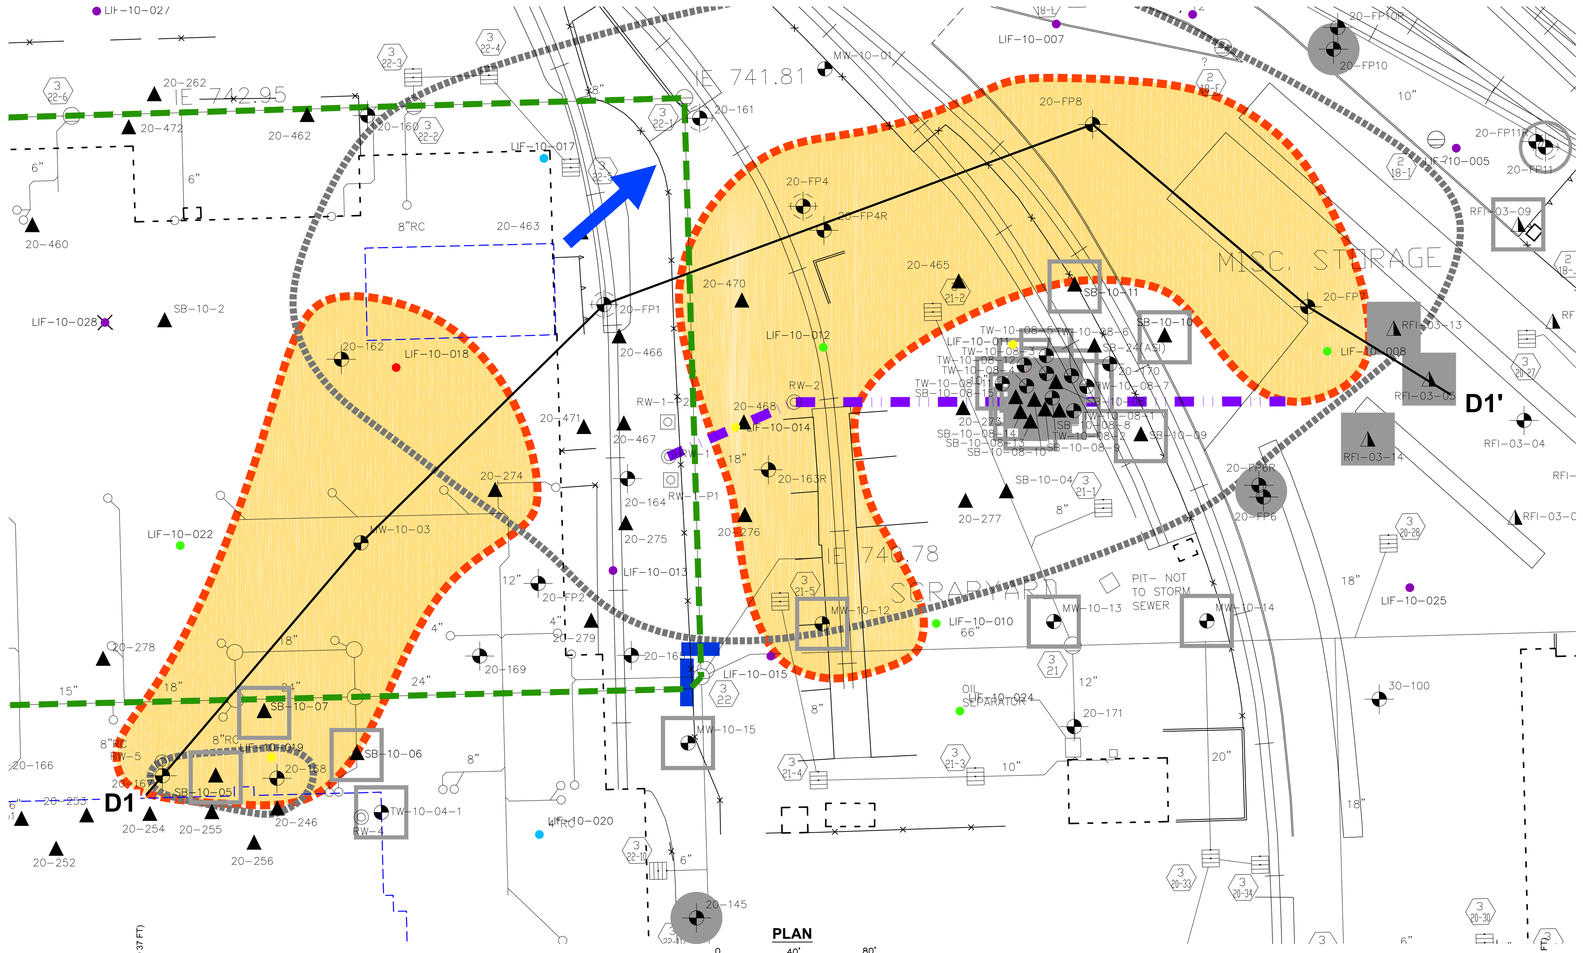
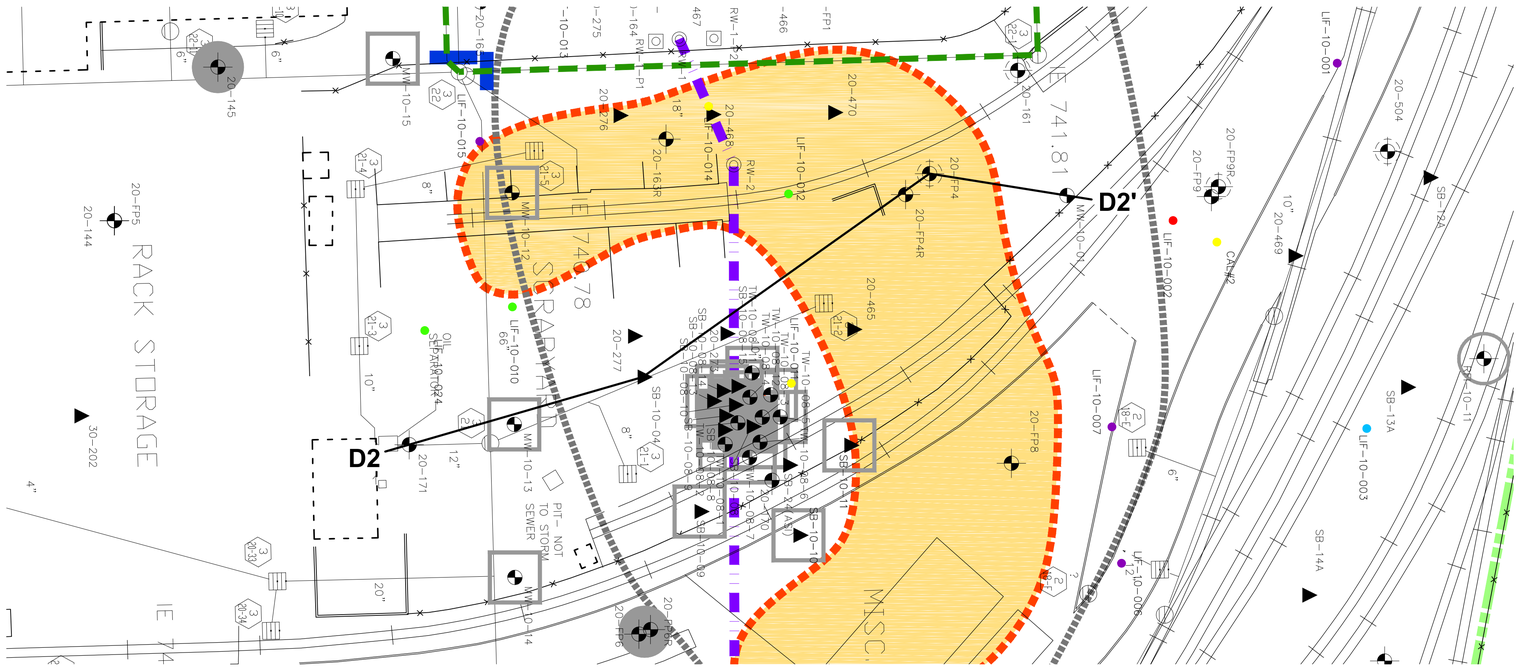
Subject:
Priority #5 - AOI 10-1/10-4 Hydraulic Oil Area
Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

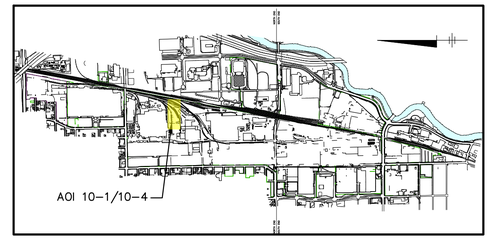
As part of the light non-aqueous phase liquid (LNAPL) remedy evaluation process the Site's 17 LNAPL areas were prioritized based on risk. The area of interest (AOI) 10-1/10-4 LNAPL Area is ranked as Priority #5 with a total potential risk score of 11 (**Table 5 of the main report**). A conceptual site model cross-section is attached (**Figures D-1 and D-2**) which provides an overview of the AOI 10-1/10-4 LNAPL Area impacts and interim measures (IMs).



Historical IMs completed at the AOI 10-1/10-4 LNAPL area include a groundwater collection and treatment system and a recovery trench and an LNAPL bailing program. The partial and effective removal of product completed in this area is considered a component of the remedy.



The compositional and saturation concerns identified for the AOI 10-1/10-4 LNAPL Area were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:



- There are unacceptable groundwater/surface water interface (GSI), particulate soil inhalation, direct contact and potential vapor phase concerns associated with the AOI 10-1/10-4 LNAPL Area.

- Targeted excavation and engineering and institutional controls are required to effectively mitigate the potential risks associated with GSI, particulate soil inhalation and direct contact exposures associated with future redevelopment scenarios.
- Due to the nature and extent of PCB impacts, it is requested that the remaining LNAPL impacts at AOI 10-1/10-4 be allowed to remain in place and the area be designated as low occupancy [per 761.61(a)(4)(i)(B)].
- There is a potential unacceptable vapor phase exposure risk associated with impacted groundwater; however, this will be addressed by the proposed institutional controls and additional sampling and evaluation.
- Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios due to the biodegradation of LNAPL generating methane; however, this will be addressed by the proposed institutional controls.
- No feasible options exist to mitigate unacceptable risk through compositional change.
- The LNAPL is not migrating; however, it is mobile and infiltrating the Outfall 003 storm sewer.
- Transmissivity testing conducted at one monitoring well (20-FP7) indicated that LNAPL may be readily recoverable in a portion of the AOI 10-1/10-4 LNAPL Area. However, LNAPL recovery systems operated at this plume for approximately 13 years with a declining rate of success; therefore partial and effective LNAPL recovery has already been completed and a transition to institutional controls is now appropriate.

Based on the current understanding of conceptual site model risks, the remedies recommended to address the compositional and saturation concerns associated with the AOI 10-1/10-4 LNAPL Area are the elimination of infiltration to the Outfall 003 storm sewer, targeted excavation, maintaining surface cover, and institutional controls.

Attachment 1

LNAPL Conceptual Site Model

Priority #5 - AOI 10-1/10-4 Hydraulic Oil Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model for the area of interest (AOI) 10-1/10-4 Hydraulic Oil Area (AOI 10-1/10-4 light non-aqueous phase liquid [LNAPL] Area), which is located at the Buick City Site (Site) located in Flint, Michigan (**Figure D1-1**).

1. Background

The AOI 10-1/10-4 LNAPL Area is located at the Northend of the Site in the southern portion of the former Factory 10 footprint (**Figure D1-2**). Historically, Factory 10 was primarily used for metal cutting and shaping operations for transmission and engine component production. The Factory 10 Area includes former Building 22 (former steam generation/compressor station), former Building 24 (fire suppression operations), a solid waste transfer station (east of former Factory 10 and south of former Building 22), and the former scrapyard area south of former Factory 10. According to Site personnel, hydraulic fluids containing polychlorinated biphenyls (PCBs) were used between 1968 and 1972 as part of hydraulic systems associated with die-cast operations. The occurrence of AOI 10-1/10-4 LNAPL Area is presumably due to historical releases associated with these operations.

Investigation data previously presented in Site reports are not re-presented in this memo. However, relevant AOI 010-1/10-4 LNAPL Area investigation data that has not previously been presented in a Site report are attached or are presented in **Appendix X**.

2. Former Interim Measures

2.1. Groundwater Collection and Treatment System

In 1991, PCB-containing LNAPL was detected at the water table beneath and south of Factory 10. In May 1997, a groundwater and LNAPL collection and treatment system was installed in this area (Factory 10 Treatment System). The Factory 10 Treatment System consisted of seven extraction wells and associated distribution pipelines connected to a series of treatment components, including acidification, coalescing filtration, ultraviolet light oxidation, precipitation, clarification, and carbon adsorption. An

organoclay filtration process was later installed and the ultraviolet light oxidation process taken out of service.

The recovery system operated at a flow rate of up to 20 gallons per minute (gpm) until 2010 when it was taken out of service as it was no longer effectively removing LNAPL.

2.2. LNAPL Recovery Trench

Subsurface investigations performed in and around the Scrapyard Area south of Factory 10 identified the presence of LNAPL containing PCBs at the water table outside the southeastern corner of Factory 10 and in the adjacent scrapyard area to the south, outside the influence of the LNAPL collection system installed in 1997. As a result, in 2003 a second LNAPL recovery system consisting of a recovery trench, four manholes, and pumps for both product recovery and groundwater drawdown was installed in January and February 2003 to recover the PCB-containing LNAPL and create hydraulic control at the downgradient edge of the LNAPL area. The recovery trench was composed of two segments: one was approximately 30 feet long and the other was approximately 210 feet long. Both trench segments are approximately 20 feet deep and 1.5 feet wide, and contain a perforated pipe lateral and pea stone backfill. Product and groundwater were pumped from four 4-foot diameter recovery manholes equally spaced along the trench.

Collected groundwater and product were pumped to the Factory 10 Treatment System. The recovery trench was taken out of service in 2010 as it was no longer effectively removing LNAPL.

2.3. LNAPL Monitoring and Bailing Program 2001

From January to July 2001, four monitoring wells (20-FP3, 20-FP6, RW1-P1, and RW2-P2) located in AOI 10-1/10-4 were monitored as part of a weekly LNAPL bailing program. A total of 13 gallons of LNAPL was removed from the four monitoring wells during the weekly program.

2.4. LNAPL Monitoring and Bailing Program 2003 - 2005

From 2003 to 2005, eight monitoring wells (20-162, 20-163, 20-168, 20-FP4R, 20-FP7, 20-FP8, RW1-P1, and RW2-P2) located in AOI 10-1/10-4 were monitored as part of a Site-wide Quarterly LNAPL Monitoring Program. A total of 17 gallons of LNAPL was removed from the eight monitoring wells during the program.

3. AOI 10-1/10-4 Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and LNAPL characteristics and extent of impacts for the AOI 10-1/10-4 LNAPL Area.

Figure D1-2 presents the locations of the existing and abandoned monitoring wells and soil borings in the AOI 10-1/10-4 Area.

3.1. AOI 10-1/10-4 Geology and Hydrogeology

- *Geology:* The soils at AOI 10-1/10-4 consist of primarily fill material/foundry sands to a depth of 15 feet bgs inside the former building footprint and 9 feet bgs outside the former building footprint. The fill material is underlain by fine to medium sands to depths of 22 feet bgs inside the former building footprint and 17 feet bgs outside the former building footprint. Outside of the former building footprint, the fine to medium sand is underlain by a clay layer ranging from 17 to 19 feet bgs. The logs also indicated evidence of LNAPL impacts from as shallow as 7 feet bgs and as deep as 17 feet bgs, across the area.

- *Groundwater/LNAPL Levels:* Nineteen monitoring wells and two recovery wells in the AOI 10-1/10-4 LNAPL Area are gauged to monitor the extent of the LNAPL Area. Depth to groundwater (or LNAPL, where present) has been measured as shallow as 3.26 feet bgs, as deep as 20.85 feet bgs, and averages around 10 feet bgs in this area.

  The extent of LNAPL is presented on **Figure D1-2**. The figure shows both the historic extent of LNAPL as defined during the RFI process and the current extent of LNAPL. The modification of the LNAPL extent is based on information obtained during investigation activities completed subsequent to the RFI and the completion of LNAPL removal IMs. The AOI 10-1/10-4 LNAPL Area is currently defined by 11 monitoring wells with consistent LNAPL accumulations and five additional wells with intermittent accumulations of LNAPL. Recent groundwater level data are presented in **Appendix X.**

  Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the south-southeast as shown on **Figure D1-2**.

3.2. Groundwater and Soil Analytical Data

Groundwater and soil data collected during Site investigations were compared to applicable Michigan Part 201 nonresidential criteria.

3.2.1. Groundwater Analytical Data

Groundwater samples collected from the AOI 10-1/10-4 LNAPL area exceed groundwater/surface water interface (GSI) criteria for select metals. Arsenic was detected above criteria at 20-FP10 and RFI-03-04 (12 to 90/10 ug/L); barium was detected above criteria at 20-FP6 (1,800/1,308 ug/L); and copper was detected above criteria at 20-145

(52/22 ug/L). One groundwater sample collected from RFI-10-11 in 2001 also exceeded GSI criteria for selenium (21/5 ug/L) and silver (1.9/0.2 ug/L); however, a sample collected in 2003 was below criteria for both selenium and silver. Cyanide was detected above criteria in samples collected from monitoring wells 20-FP10, 30-100, RFI-03-04, and RFI-10-11 (7.8 to 34/5.2 ug/L); however, cyanide has not been detected in the AOI 10-1/10-4 LNAPL samples and does not appear to be associated with the LNAPL Area.

The extent of groundwater impacts are presented on **Figure D1-3** and the groundwater analytical data is presented in **Appendix X**.

3.2.2. Soil VOC, SVOC and Metals Analytical Data

Constituent concentrations in soil samples collected from borings located south of the AOI 10-4 LNAPL Area exceed the applicable non-residential criteria for manganese. Soil samples collected from three locations (RFI-03-05, RFI-03-13, and RFI-03-14) exhibit manganese concentrations exceeding the groundwater surface water interface protection (GSIP) criteria (620 to 2,500/97mg/kg). In addition the manganese concentrations in soil samples collected from RFI-03-05 and RFI-03-13 also exceed non-residential particulate soil inhalation criteria (NPSIC) for manganese (2,400 to 2,500/1,500 mg/kg).

The soil boring locations are presented on **Figure D1-2** and the soil analytical data is presented in **Appendix X**.

3.2.3. GSI Evaluation

The AOI 10-1/10-4 LNAPL Area is located within the Outfall 003 storm sewer drainage basin. Based upon the available information, LNAPL and groundwater are infiltrating the storm sewer within this AOI. As further discussed in **Appendix BB** metals in the storm sewers at the Site are being investigated as part of the NPDES Plus Monitoring Program (NPMP). The NPMP data indicate that to date the only repeatable (more than one) exceedances of GSI criteria at Outfall 003 are for mercury and cyanide. The data evaluations completed to date suggest that the impacts can likely be addressed by a mixing zone based remedy.

3.2.4. Soil PCB Analytical Data

In 2013 and 2014 PCB delineation investigation activities were completed at the Site to refine the extent of PCB impacts in soil and LNAPL during RFI activities. At the AOI 10-1/10-4 LNAPL Area six monitoring wells, 11 temporary wells and 14 soil borings were completed

as part of delineation activities. A summary of the investigation activities completed is provided below.

- At the AOI 10-1 LNAPL Area, three soil borings (SB-10-05 through SB-10-07) and two wells (MW-10-3 and TW-10-4-1) were completed to delineate the extent of LNAPL as well as PCB concentrations in soil and LNAPL. A total of 23 soil samples were collected from four locations and submitted for laboratory analysis of PCBs. PCBs were detected in three soil samples with a maximum concentration of 1.5 mg/kg. The locations are presented on **Figure D1-2** and the soil analytical data is presented in **Appendix X**.

- At the AOI 10-4 LNAPL Area, 11 wells (MW-10-01, TW-10-08-01 through -07, TW-10-08-11, and TW-10-08-12) and 12 soil borings (SB-10-2, SB-10-4, SB-10-08 through SB-10-11, SB-10-08-08 through SB-10-08-10, and SB-10-08-13 through SB-10-08-15) were completed to define the extent of LNAPL as well as the PCB impacts in LNAPL and soil. A total of 65 soil samples were collected and submitted for laboratory analysis of PCBs.

  Thirty-three of the soil samples collected from the AOI 10-4 LNAPL Area detected PCBs at concentrations ranging from 0.3 to 127 ppm. **Figure D1-4** presents the locations of the borings and temporary wells that detected PCBs in exceedance of applicable criteria. The analytical results are presented in **Appendix X**.

- Four monitoring wells (MW-10-12 through MW-10-15) were installed along the Outfall 003 storm sewer main to determine whether the AOI10-1 or 10-4 LNAPL Areas were in hydraulic contact with the sewer main. A total of nine soil samples were collected and submitted for laboratory analysis of PCBs. The locations of the monitoring wells are presented on **Figure D1-2**. Two of the soil samples detected PCBs at concentrations ranging from 0.5 to 0.72 ppm. The analytical results are presented in **Appendix X**.

3.2.5 Vapor Intrusion Evaluation

Due to the presence of shallow groundwater and LNAPL (approximately 10 feet below ground surface) at AOI 10-1/10-4, groundwater data were also compared to the applicable Non-Residential Screening Values for the Vapor Intrusion Pathway presented in the *Michigan Department of Environmental Quality (MDEQ) Guidance Document for the Vapor Intrusion Pathway* (further discussed in Section 3.4 of the Report). Groundwater data from two locations (RFI-10-03 and RFI-10-37) in the AOI 10-1/10-4 area exceed applicable

screening levels. Additional investigation will be completed to further assess these exceedances.

As there are no structures at the Site, the MDEQ Part 201 criteria are appropriate for comparison of soil data. As discussed in Section 3.2.2, manganese was detected at concentrations exceeding NPSIC criteria in soil samples collected from RFI-03-05 and RFI-03-13.

3.3. LNAPL Characteristics

- *LNAPL Analytical Data:* LNAPL present at AOI 10-1/10-4 consists primarily of hydraulic oil. A total of nine LNAPL samples have been collected from the AOI 10-1/10-4 area and submitted for laboratory analysis of VOCs, SVOCs, PCBs and/or metals. At three of the sample locations (20-FP7, 20-FP8, and/or 20-162) concentrations of arsenic, chromium, and/or lead exceed the RCRA toxicity characteristic criteria; however, toxicity characteristic leaching analysis has not been conducted.

  The concentrations of PCBs in LNAPL range from non-detect to 600 parts per million (ppm). At the AOI 10-1 LNAPL Area one LNAPL sample (MW-10-03) detected PCBs (Aroclor 1242) at a concentration of 1.7 ppm. In addition, PCBs were detected in a sample collected of oil seeping into the former Factory 10 basement during demolition activities at a concentration of 600 ppm (Aroclor 1242). At the AOI 10-4 LNAPL Area PCBs were detected in two LNAPL samples (TW-10-08-03, and TW-10-08-04) at concentrations of 13 ppm and 40 ppm, respectively (Aroclor 1254). In addition, a historic LNAPL sample collected from 20-170 detected PCB concentration of 600 ppm (Aroclor-1254); however, LNAPL is no longer present at 20-170. The analytical results for the LNAPL samples collected as part of Site investigation activities are presented in **Appendix X**.

- *LIF Data:* Twenty-eight LIF borings were completed in the AOI 10-1/10-4 area. The LIF waveform signatures observed at AOI 10-1/10-4 are consistent with the known LNAPL type, hydraulic oil. The vertical range of LIF impact (greater than 5%RE) at AOI 10-1/10-4 is typically 8 to 15 feet bgs. **Figure D1-2** presents the results of the LIF investigation and the extent of impacts associated with the AOI 10-1/10-4 LNAPL Areas.

- *Transmissivity:* Transmissivity testing was completed by conducting baildown tests on two monitoring wells (20-FP7 and MW-10-03) in the AOI 10-1/10-4 LNAPL Area. Based on LNAPL baildown test results, LNAPL transmissivity quantified at monitoring wells 20-FP7 and MW-10-03 was 1.0 square feet per day (ft^2/day) and 0.3 ft^2/day, respectively. The LNAPL transmissivity at 20-FP7 was greater than the ITRC-suggested minimum threshold that indicates LNAPL recovery is

practicable at this well; however, the LNAPL transmissivity quantified at monitoring well MW-10-03 was 0.3 ft^2/day, which is within the lower end of the ITRC-suggested minimum threshold value, but less than the MDEQ threshold value that indicates LNAPL recovery is not practicable at this well.

- *Natural Source Zone Depletion:* NSZD testing was not attempted at AOI 10-1/10-4 due to the presence of a concrete slab. The testing completed at the Southend of the Site indicated that NSZD is occurring; however, the currently available testing technologies cannot reliably quantify the depletion beneath a concrete slab.

3.4. Extent of LNAPL

During the RCES preparation, the footprint of the AOI 10-1/10-4 LNAPL Area was calculated based on available Site data to be approximately 152,000 square feet. However, based on an evaluation of additional Site data collected (as discussed in Section 2.1.3 of the main report), the footprint is smaller than previously estimated and is now estimated at 79,500 square feet (**Figure D1-2**). Based on the LIF and soil boring log data, approximate depth to impacts are approximately 8 to 14 ft bgs in the central portion of the LNAPL Area and 7 to 11 ft bgs in the south/southeastern portion of the LNAPL Area.

LNAPL Remedial Decision Tree

Attachment 2 LNAPL Remedial Decision Tree Priority #5 – AOI 10-1/10-4 Hydraulic Oil Area

NOTES

(#) ▶ NOTES: See Page D2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priority #5 - AOI 10-1/10-4 Hydraulic Oil Area

Background: The AOI 10-1/10-4 Hydraulic Oil LNAPL Area is located in the Northend of the Site near the southern portion of the former Factory 10 footprint. Historically, the Factory 10 area was primarily used for metal cutting and shaping operations for transmission and engine component production. The AOI 10-1/10-4 LNAPL Areas are presumably due to historical releases associated with operations in this area. There are currently no buildings within the AOI 10-1/10-4 LNAPL Areas footprint.

Geology and Hydrogeology: The soils at AOI 10-1/10-4 consist primarily of fill material/foundry Sand down to approximately 15 feet bgs inside the former building footprint and approximately 9 feet bgs outside the former building footprint. The fill material is underlain by fine to medium sands to depths of 22 feet bgs inside the former building footprint and 17 feet bgs outside the former building footprint. Outside of the former building footprint, the fine to medium sand is underlain by a clay layer ranging from 17 to 19 feet bgs. Depth to groundwater in this area varies greatly and has been measured as shallow as 3.26 feet bgs, as deep as 20.85 feet bgs, and averages around 10 feet bgs. Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the south-southeast.

LNAPL Characteristics: Logs indicate evidence of LNAPL impacts from as shallow as 7 feet bgs and as deep as 17 feet bgs, across the area. The AOI 10-1/10-4 LNAPL Area includes 11 monitoring wells with consistent accumulations of LNALPL and five additional wells with intermittent LNAPL accumulations. LNAPL samples collected from the AOI 10-1/10-4 LNAPL Area detected total arsenic, chromium, and lead concentrations exceeding the RCRA toxicity characteristic criteria at 20-FP7, 20-FP8, and/or 20-162; however, the LNAPL has not been submitted for TCLP analysis. PCBs have also been detected in LNAPL at concentrations up to 600 ppm.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*

   YES – The following potential risk/exposure concerns are associated with the AOI 10-1/10-4 LNAPL Area:

   - Groundwater/surface water interface (GSI):
     - Arsenic, barium, copper, selenium, silver, and cyanide were detected at concentrations that exceed GSI criteria in monitoring wells located in the vicinity of the AOI 10-1/10-4 LNAPL Area. Groundwater in this area infiltrates the Outfall 003 storm sewer that discharges to the Flint River.
     - Manganese was detected at concentrations exceeding GSI protection criteria in soil samples located south of the AOI 10-1/10-4 LNAPL Area.
     - LNAPL from the AOI 10-1/10-4 Area is infiltrating the Outfall 003 storm sewer. In 2013, bulkheads and plugs were installed along laterals of the Outfall 003 storm sewer to eliminate infiltration pathways along the laterals.
   - Direct Contact: Soil and LNAPL samples collected from the AOI 10-1/10-4 LNAPL Area detected PCBs at concentrations exceeding the soil nonresidential direct contact (NDC) criteria. The exceedances of NDC criteria are located from 4 to 10 feet below ground surface (bgs) in the soil samples and the shallowest LNAPL impacts are located approximately seven feet below ground surface which represents a potential concern for future construction or utility workers.
   - Particulate Soil Inhalation (Ambient Air) Concerns: Manganese was detected at concentrations exceeding the nonresidential particulate soil inhalation criteria at two sample locations south of the AOI 10-1/10-4 LNAPL Area. The exceedances are in shallow soils located beneath concrete/asphalt. Engineering and institutional controls will be implemented to control this risk/exposure scenario.
   - Potential Groundwater Volatilization to Indoor Air Concern at the Property Boundary: Groundwater data from two locations (RFI-10-03 and RFI-10-37) exceed applicable vapor intrusion screening levels. On Site concerns will be addressed by institutional controls. Additional evaluation will be completed for off Site receptors in accordance with the MDEQ's *Guidance Document for the Vapor Intrusion Pathway.* However, as the adjacent CSX property consists of rail road tracks, which are highly unlikely to be replaced by an occupiable structure in the foreseeable future, it is likely that institutional controls will also be recommended as the off Site remedy.
   - Potential Volatilization to Indoor Air Concerns for Future Structures: Theoretically, there is a potential unacceptable vapor phase exposure risk associated with future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*

   NO – The following is a general discussion regarding the feasibility of various compositional change remediation strategies for the AOI 10-1/10-4 Area:

   - Enhanced dissolution and recovery via surfactant or hot water flushing may be feasible; however, it is not a viable option based on the presence of PCBs in the LNAPL and the infiltration pathway to the Outfall 003

storm sewers. The use of surfactant would increase mobility and therefore, likely increase PCB-containing LNAPL infiltration into the storm sewer.

- Targeted in-situ soil mixing/land farming using biological additives to address the petroleum constituents may be technically feasible; however, it is not a viable option based on the presence of PCBs in the LNAPL and the infiltration pathway to the Outfall 003 storm sewers.
- LNAPL constituents have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.
- In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of PCBs in the LNAPL and nearby City sewers. In addition, it does not represent an economically feasible remedial alternative given the relatively large area that would need to be addressed in order to avoid the generation of dioxins.

3) *Is there a potential benefit to partial treatment/removal that outweighs costs?*

NO – Based on the current understanding of conceptual site model the GSI, direct contact, particulate soil inhalation and vapor phase risks can be effectively mitigated through targeted excavation, engineering and institutional controls. In addition, LNAPL recovery systems operated in this area for 13 years; therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate.

4) *Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?*

NO – While the LNAPL is mobile in the vicinity of the storm sewer, the AOI 10-1/10-4 LNAPL Area appears to be stable. This finding is supported by the following lines of evidence:

- Well Gauging Data: Sentinel wells located around the periphery of the AOI 10-1/10-4 LNAPL Area have remained free of LNAPL since monitoring began approximately 10 years ago.
- Age of LNAPL Release: The AOI 10-1/10-4 LNAPL Area was identified in 1991. Operations began in this portion of the Site in the 1950's and ceased in this portion of the Site ceased in 2010. LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).

5) *Is LNAPL mobile within the stable LNAPL perimeter?*

YES – LNAPL from the AOI 10-1/10-4 area is infiltrating the Outfall 003 storm sewer, which passes through the AOI 10-1/10-4 LNAPL Area.

6) *Is LNAPL readily recoverable?*

YES – Historic interim measures (IM) indicate that in the past LNAPL has been recoverable at AOI 10-1/10-4 using recovery wells, trenches and bailing (summarized below). However it is uncertain whether future LNAPL recovery is practical.

- A groundwater and LNAPL treatment system operated at AOI 10-1/10-4 from 1997 to 2010. The system recovered an unknown amount of LNAPL but operated at a rate of up to 20 gallons per minute (gpm).
- In 2003, a passive recovery trench was installed adjacent to the scrapyard yard to collect PCB-containing LNAPL from the AOI 10-1/10-4 LNAPL Area and create hydraulic control. The trench was approximately 240 feet long and LNAPL was removed from the trenches via 4-foot-diameter recovery wells, piped to the groundwater treatment system and treated. The total amount of LNAPL recovered by these trenches in unknown.
- During the Site-wide LNAPL monitoring program conducted from 2001 through 2005, a total of approximately 30 gallons of LNAPL was recovered during quarterly bailing events in the AOI 10-1/10-4 area.

In addition, transmissivity testing was completed by conducting baildown tests on two monitoring wells (20-FP7 and MW-10-03) in the AOI 10-1/10-4 LNAPL Area. Based on LNAPL baildown test results, LNAPL transmissivity quantified at monitoring wells 20-FP7 and MW-10-03 was 1.0 square feet per day (ft^2/day) and 0.3 ft^2/day, respectively. The LNAPL transmissivity at 20-FP7 was 1 ft^2/day, which is greater than the ITRC and MDEQ suggested threshold values indicating that LNAPL recovery is potentially feasible at this well. At MW-10-03 the LNAPL transmissivity was 0.3 ft^2/day, which is within the lower end of the ITRC suggested minimum threshold value and below the MDEQ value indicating that LNAPL recovery is not practicable at this well.

7) *Will potential benefit of LNAPL recovery outweigh costs?*

No – Compositional and saturation concerns can be addressed through targeted excavation and engineering and institutional controls. Targeted excavations are proposed to address PCB impacts (further discussed in **Attachment 3**) at the AOI 10-1/10-4 LNAPL Area. Engineering and institutional controls will be implemented to eliminate LNAPL infiltration to the Outfall 003 storm sewer, address the GSI pathway and mitigate potential risk associated with particulate inhalation concerns. Additional LNAPL removal will not materially change the risks associated with this LNAPL Area.

Attachment 2 Notes

Priority #5 - AOI 10-1/10-4 Hydraulic Oil Area

8) Are controls required?

YES – In addition to the Site-wide Institutional Controls discussed in the main report, the following controls will be necessary to limit potential for future exposure.

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 5 in the main report**.
- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present (as shown on **Figure D3-3**) to prevent direct contact with contaminated material, except with using appropriate health and safety measures, during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the Natural Resources and Environmental Protection Act.
- Require that any intrusive activities (i.e., excavation, repair of foundation or subsurface utilities, short-term construction and landscaping projects) into the subsurface beneath the cap must be consistent with MIOSHA requirements, including the use of a Health and Safety Plan and a trained professional to evaluate the Site data prior to initiating activities. All relevant Site data must be made available for the preparation of the Health and Safety Plan. Data may be made available as part of the Due Care Plan, RFI, or other document(s).
- Notification to future property owners to the presence of PCBs, and
- Restrict the area shown on **Figure D3-3** to low occupancy based on the presence of PCBs.

Attachment 3

761.61(c) Risk Based Cleanup and Disposal Request

Priority #5 – AOI 10-1/10-4 Hydraulic Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – 761.61(c) Risk Based Cleanup and Disposal Request

---

This attachment presents the information required to support a 761.71(c) determination for the area of interest (AOI) 10-1/10-4 light non-aqueous phase liquid (LNAPL) Area.

1. Area Background and History

The AOI 10-1/10-4 LNAPL Area is located at the Northend of the Site in the former Factory 10 area and is likely associated with historic releases associated with operations. LNAPL associated with the AOI 10-1/10-4 LNAPL Area has been identified in monitoring wells 20-162, 20-163R, 20-167, 20-168, 20-FP4R, 20-FP7, 20-FP8, MW-10-03, MW-10-12, TW-10-08-3, and TW-10-08-4.

2. Summary of SOPs and Investigation Results

AOI 10-1/10-4 has been previously investigated as part of the Site's RCRA Facility Investigation activities. The RFI Work Plan presents the standard operating procedures, field sampling procedures, quality assurance/quality control procedures, etc. used during the investigation. The results of the investigations (including laboratory analytical reports) were presented in the RFI Phase I and RFI Phase II reports.

3. Nature of Contamination

At AOI 10-1/10-4, samples of LNAPL, soil and groundwater have been analyzed for PCBs. Below is a brief summary of results.

- LNAPL samples collected from six monitoring wells (20-162, 20-FP7, 20-FP8, MW-10-03, TW-10-08-3, and TW-10-08-4) have been submitted for PCB analysis. PCBs were detected in three of the samples MW-10-03 (1.7 parts per million [ppm]), TW-10-08-3 (13 ppm) and TW-10-08-4 (40ppm) (**Figure D3-1**). In addition historic LNAPL sample collected form 20-170 contained concentrations of PCBs at 600 ppm and a historical oil sample collected from the former Factory 10 basement during demolition activities also detected PCBs at a concentration of 600 ppm.
- A total of 97 soil samples collected from the AOI 10-1/10-4 area were analyzed for PCBs. PCBs were detected in 38 soil samples, and in 11 of those samples PCBs concentrations were less than

1 ppm. Four soil samples collected from three locations detected PCBs at a concentration greater than 25 ppm. The maximum soil detection was 127 ppm. (**Figure D3-2**)

- Seven groundwater samples collected from wells in the AOI 10-1/10-4 area were analyzed for PCBs; however, PCBs were not detected.

4. Extent of Impacts

The PCB impacts at AOI 10-1/10-4 are associated with the LNAPL. **Figure D3-1** shows the approximate extent of the AOI 10-1 and 10-4 LNAPL areas. The extent of PCB impacts at each area is further discussed below.

- At the AOI 10-1 LNAPL Area three soil borings (SB-10-05 through SB-10-07) and two wells (MW-10-3 and TW-10-4-1) were completed to delineate the extent of LNAPL as well as PCB concentrations in soil and LNAPL. A total of 23 soil samples were collected from four locations and submitted for laboratory analysis of PCBs. PCBs were detected in three soil samples with a maximum concentration of 1.5 mg/kg.

  One LNAPL sample (MW-10-03) collected at AOI 10-1 detected PCBs (Aroclor 1242) at a concentration of 1.7 ppm. In addition, a sample collected of oil seeping into the former Factory 10 basement during demolition activities detected PCBs (Aroclor 1242) at a concentration of 600 ppm. The locations are presented on **Figure D3-1.**

- At the AOI 10-4 LNAPL Area, 11 wells (MW-10-01, TW-10-08-01 through -07, TW-10-08-11, and TW-10-08-12) and 12 soil borings (SB-10-2, SB-10-4, SB-10-08 through SB-10-11, SB-10-08-08 through SB-10-08-10, and SB-10-08-13 through SB-10-08-15) were completed to define the extent of LNAPL as well as the PCB impacts in LNAPL and soil in the vicinity of monitoring well 20-170. A total of 65 soil samples were collected and submitted for laboratory analysis of PCBs. PCBs were detected in 33 of the soil samples collected from the AOI 10-4 LNAPL Area at concentrations ranging from 0.3 to 127 ppm.

  Two LNAPL samples (TW-10-08-03, and TW-10-08-04) collected at AOI 10-4 detected PCBs (Aroclor 1254) at concentrations of 13 ppm and 40 ppm, respectively. In addition a historic LNAPL sample collected from 20-170 detected PCBs (Aroclor-1254) at a concentration of 600 ppm; however, LNAPL is no longer present at 20-170.

  To date, LNAPL has been only been detected in the two of the nine temporary wells, indicating that the volume of LNAPL impacts at the 20-170 area may be minimal. The locations are presented on **Figure D3-2.**

- Soil samples were also collected from four monitoring well locations (MW-10-12 through MW-10-15) installed to investigate the presence/absence of LNAPL adjacent to the Outfall 003 storm sewer main. A total of nine soil samples were collected from the monitoring wells. PCBs were detected in two of the soil samples at concentrations ranging from 0.5 to 0.72 ppm.

- Based on the LIF and soil boring log data, approximate depth impacts are approximately 8 to 14 ft bgs in the central portion of the LNAPL Area and 7 to 11 ft bgs in the south/southeastern portion of the LNAPL Area.

5. Risk-Based Procedure

In order to address the PCB impacts associated with monitoring well 20-170 a targeted excavation is proposed to be completed to remove impacts greater than 25 ppm. The PCB impacts at 20-170 have been delineated by soil borings and temporary wells, as shown on **Figure D3-2**; however, additional delineation may be completed to further refine the extents prior to excavation activities. The scope of work for additional delineation will be included in a remedy implementation work plan and/or basis of design documentation, as appropriate. The work plan will include the detailed scope for the excavation activities; however, a brief summary of the plan is provided below

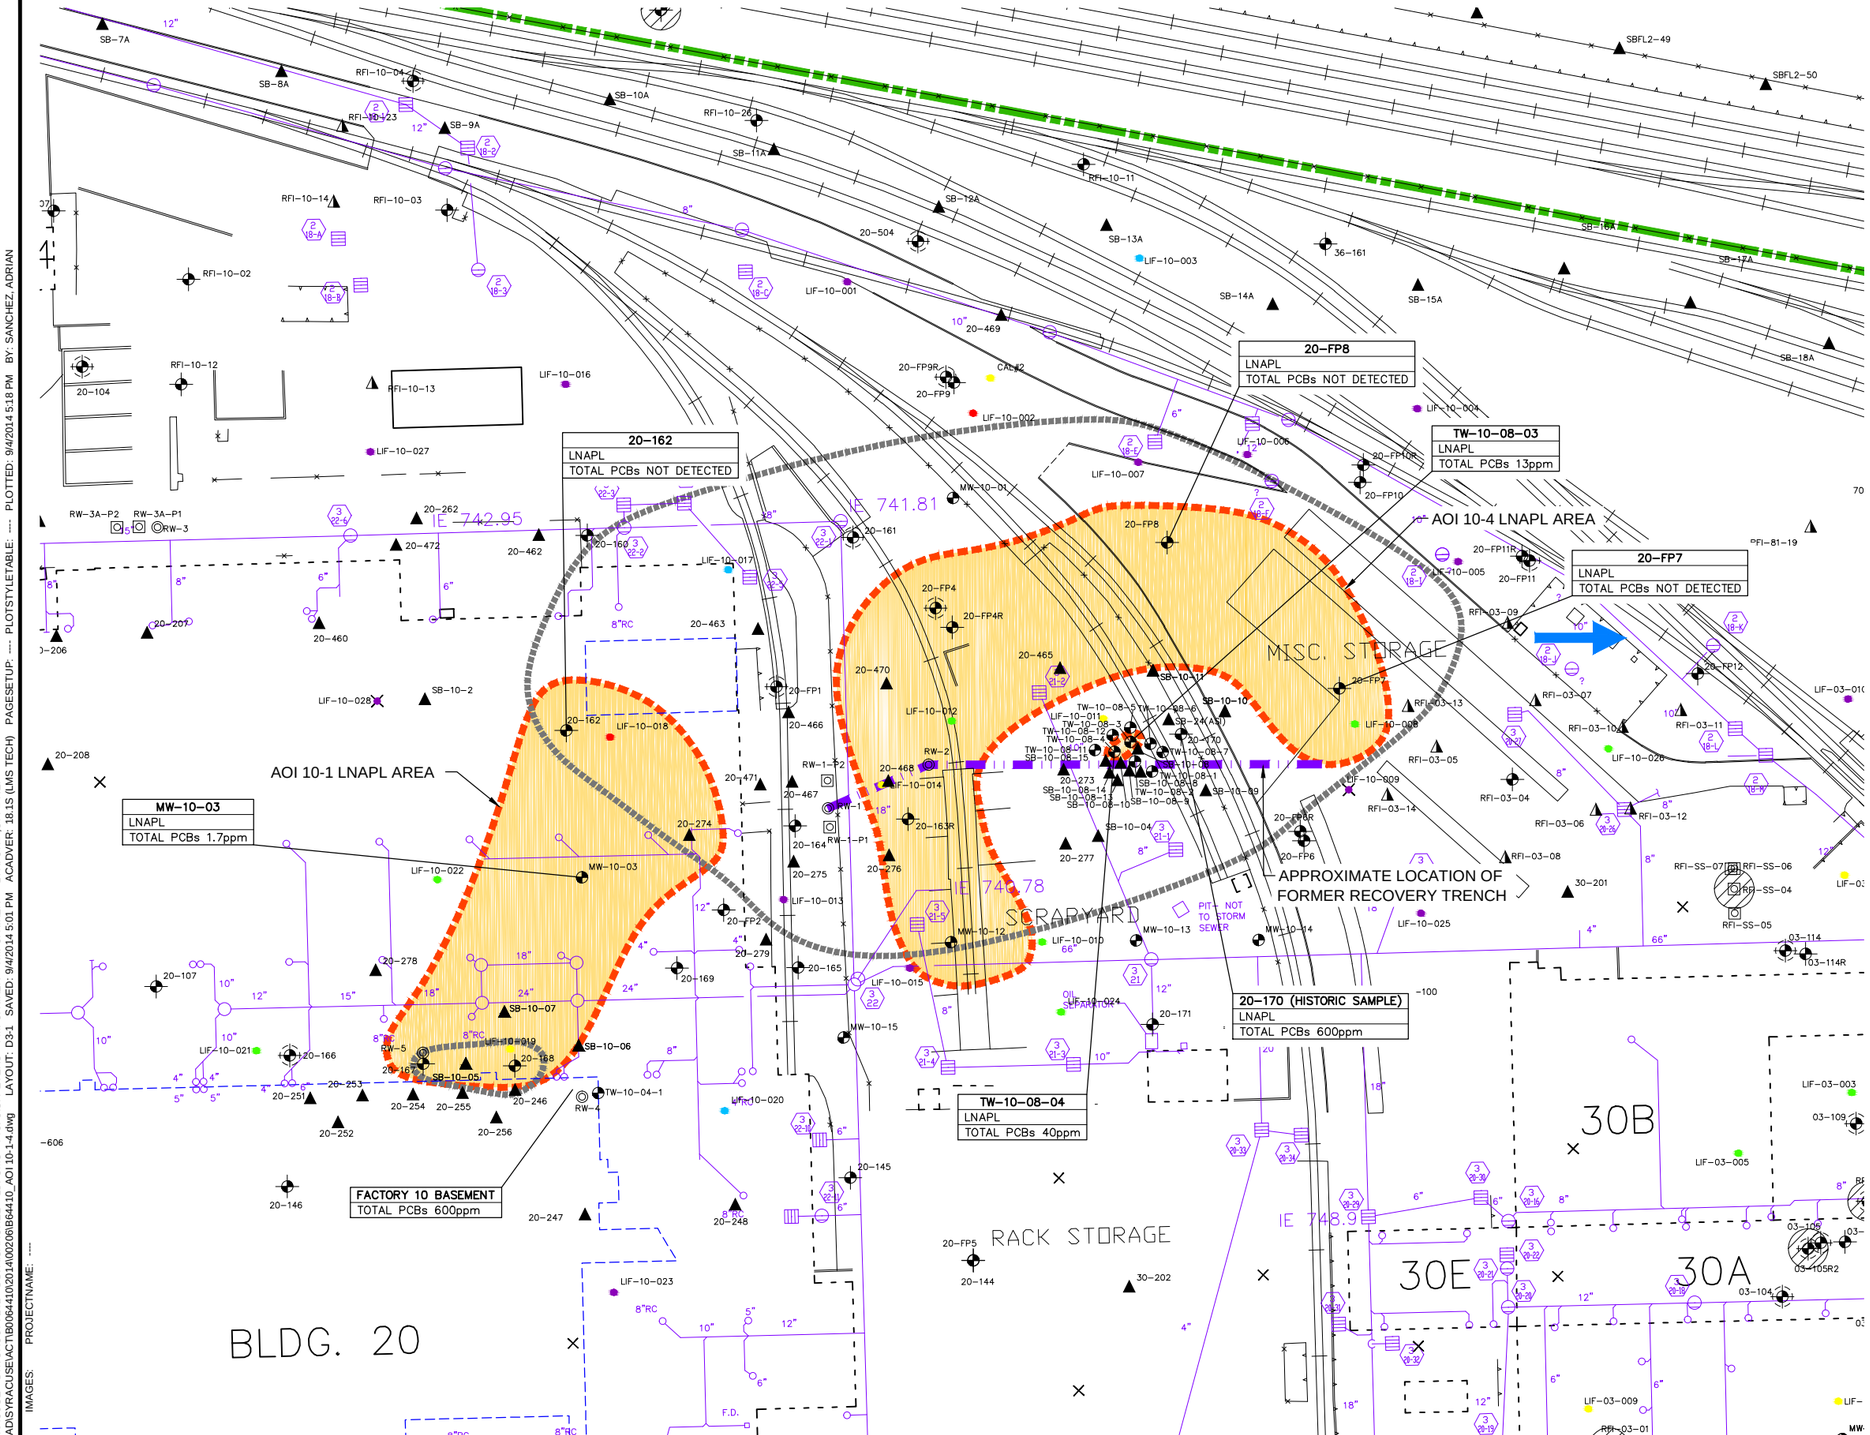
- Complete investigation work necessary to refine the extents of the excavation.
- Prior to excavation, LNAPL will be removed from wells in the area of excavation, and disposed of at “as found” concentrations, to minimize accumulation during excavation.
- Complete excavation to the water table (that averages a depth of 10 feet bgs). It is planned that the excavation will be completed when the water table is at its lowest to maximize removal of impacted soils.
- LNAPL-impacted soils removed during remediation activities completed at AOI 10-1/10-4 will be characterized and disposed of using “as found” concentrations.

Following completion of the targeted excavation a portion of the AOI 10-1/10-4 Area will be restricted to low occupancy use. Additional deed restrictions placed on the AOI 10-1/10-4 LNAPL Area to protect future users from PCB impacts will include the Site-wide deed restrictions as noted in the main report and these AOI-specific deed restrictions:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 5 in the main report**.
- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover

that is present (as shown on **Figure D3-3**) to prevent direct contact with contaminated material, except with using appropriate health and safety measures, during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the Natural Resources and Environmental Protection Act.

- Require that any intrusive activities (i.e., excavation, repair of foundation or subsurface utilities, short-term construction and landscaping projects) into the subsurface beneath the cap must be consistent with MIOSHA requirements, including the use of a Health and Safety Plan and a trained professional to evaluate the Site data prior to initiating activities. All relevant Site data must be made available for the preparation of the Health and Safety Plan. Data may be made available as part of the Due Care Plan, RFI, or other document(s).
- Notification to future property owners to the presence of PCBs, and
- Restrict the area shown on **Figure D3-3** to low occupancy based on the presence of PCBs.



6. Evaluation of Alternatives

The following technologies were evaluated to address LNAPL at AOI 10-1/10-4:

- AOI 10-1/10-4 LNAPL constituents have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.
- Enhanced dissolution and recovery via surfactant or hot water flushing may be feasible; however, it is not a viable option based on the presence of PCBs in the LNAPL and the infiltration pathway to the Outfall 003 storm sewers. The use of surfactant would increase mobility and therefore, likely increase the PCB impacted LNAPL infiltration into the storm sewer.
- Targeted in-situ soil mixing/land farming using biological additives to address the petroleum constituents may be technically feasible; however, it is not a viable option based on the presence of PCBs in the LNAPL and the infiltration pathway to the Outfall 003 storm sewers.
- In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of PCBs in the LNAPL and nearby City sewers. In addition, it does not represent an economically feasible remedial alternative given the relatively large area that would need to be addressed in order to avoid the generation of dioxins.

Remedy Recommendation

Priority #5 - AOI 10-1/10-4 Hydraulic Oil Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 4 – Recommended Remedy

This attachment presents the recommended remedies for the area of interest (AOI) 10-1/10-4 Hydraulic Oil Area (AOI 10-1/10-4 light non-aqueous phase liquid [LNAPL] Area).

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in **Attachment 2** identified groundwater/surface water interface (GSI), direct contact, particulate soil inhalation, and potential volatilization to indoor air as compositional concerns for AOI 10-1/10-4 and mobility as a saturation concern. The PCB-impacted LNAPL from the AOI 10-1/10-4 area is infiltrating the Outfall 003 storm sewer, which is the basis for the direct contact, mobility, and GSI concerns. The particulate soil inhalation concern is due to the presence of manganese in shallow soils. The potential volatilization to indoor air concerns are due to the biodegradation of LNAPL generating methane that could result in indoor air concerns for future structures and trichloroethene detected at concentrations exceeding screening levels.

2. Remedy Recommendation Rationale

The remedies recommended to address the compositional and saturation concerns associated with the AOI 10-1/10-4 LNAPL Area include elimination of infiltration to the Outfall 003 storm sewer, targeted excavation, maintaining surface cover and institutional controls, which are discussed in detail in Section 3. The rationale for this selection is detailed below:

- Although historic interim measures (IMs) and LNAPL transmissivity data indicated that LNAPL recovery may be feasible; LNAPL recovery systems have already operated at this area for approximately 13 years. Partial and effective LNAPL removal has already been completed and a transition to groundwater monitoring and institutional controls is now appropriate to address the remaining LNAPL. Additional LNAPL removal will not materially change the risks associated with this area so there is no cost benefit to pursuing additional LNAPL removal.

- The GSI and mobility concerns associated with the PCB-impacted LNAPL at the AOI 10-1/10-4 area will be addressed by eliminating LNAPL infiltration into the Outfall 003 storm sewer. This remedy will also address the groundwater GSI concerns.

- The direct contact concerns associated with the PCBs will be addressed by completing a targeted excavation, as well as implementing engineering and institutional controls, as necessary.

- The particulate soil inhalation risk can be effectively mitigated through engineering and institutional controls as the impacts are located beneath existing surface cover (asphalt/concrete).

- Based on the current understanding of risk conditions, the potential volatilization to indoor air risk for future structures can be effectively mitigated through institutional controls.

- Although additional investigations will be completed, based on the current understanding of risk conditions the potential groundwater volatilization to indoor air (on and off Site) can be effectively mitigated through the Site-wide institutional controls.

3. AOI 10-1/10-4 Remedies

This section summarizes the completed and proposed remedies to address the impacts at AOI 10-1/10-4.

3.1 Completed Interim Measures

A groundwater and LNAPL collection and treatment system and a recovery trench were previously operated to collect product and groundwater for approximately 13 years until they were no longer effectively removing product. An LNAPL bailing program also operated for several years removing the product. The partial and effective removal of product has been completed in this area and is considered a component of the remedy.

3.2 Additional Remedy Recommendations

The remedies recommended to address the compositional and saturation concerns associated with the AOI 10-1/10-4 LNAPL Area are the elimination of infiltration to the Outfall 003 storm sewer, targeted excavation, and engineering and institutional controls. These combined remedies will eliminate the infiltration pathway in the short term and prevent future worker exposure to LNAPL impacts in the long term.

3.2.1 Outfall 003 Pathway Elimination

In order to address the risks associated with the LNAPL infiltration into the Outfall 003 storm sewer, the pathway will be eliminated. This option may include re-routing, sealing, lining, or replacing a section of the sewer and installing collars in the backfill to eliminate the potential of migration. A feasibility study for this option is currently underway and the final cost for this option is being evaluated.

3.2.2 Targeted Excavation

In order to address the risks associated with the LNAPL containing PCBs at concentrations greater than 25 ppm, targeted excavations of LNAPL impacted soils is recommended. As discussed in **Attachment 3**, the targeted excavation is proposed to address the PCB impacts at 20-170, as shown on **Figure D3-2**. Additional delineation will be completed to further refine the extents prior to excavation activities.

As part of a self-implementing cleanup under 40 CFR Part 761.61(c), soils exceeding 25 ppm of PCBs will be excavated and disposed of properly using "as found" concentrations. The excavations will take place when the water table is at its lowest to maximize removal of impacted soils.

3.2.3 Maintain Surface Cover

The remedy recommended to address particulate soil inhalation impacts in shallow soil beneath the existing asphalt/concrete is to maintain the surface cover over the impacted area. The area requiring surface cover is presented on **Figure D3-3**. The surface cover will be inspected and maintained to provide protection from future exposure.

3.2.4 Institutional Controls

The following AOI-specific institutional controls, in addition to the Site-wide controls noted in the Report, will be necessary to limit potential for future exposure:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads as shown on **Figure 5 of the main report**.
- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present (as shown on **Figure D3-3**) to prevent direct contact with contaminated material, except with using appropriate health and safety measures, during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original

barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the Natural Resources and Environmental Protection Act.

- Require that any intrusive activities (i.e., excavation, repair of foundation or subsurface utilities, short-term construction and landscaping projects) into the subsurface beneath the cap must be consistent with MIOSHA requirements, including the use of a Health and Safety Plan and a trained professional to evaluate the Site data prior to initiating activities. All relevant Site data must be made available for the preparation of the Health and Safety Plan. Data may be made available as part of the Due Care Plan, RFI, or other document(s).
- Notification to future property owners to the presence of PCBs, and
- Restrict the area shown on **Figure D3-3** to low occupancy based on the presence of PCBs.

Appendix D - AOI 10-1/10-4 Hydraulic Oil Area - Addendum No.1
Summary of Additional Investigations
RACER Buick City Site, Flint, Michigan

Introduction

This Addendum No. 1 to Remedy Recommendation Report Appendix D presents a summary of the investigation data collected at the AOI 10-1/10-4 Hydraulic Oil Area from March 19, 2014 through December 31, 2015 at the Buick City Site (Site) located in Flint, Michigan.

Summary of Investigation Activities

Additional investigation activities were completed at AOI 10-1/10-4 to refine the extent of polychlorinated biphenyl (PCB) impacts observed at monitoring well 20-170 and to delineate LNAPL in the vicinity of temporary well TW-10-08-02 (**Figure D-A1-1**).

20-170 Area

At the 20-170 Area four step-out soil borings (SB-10-16/TW-10-16, SB-10/17/TW-10-17, SB-10-18, and SB-10-19) were completed to delineate PCB impacted soils. As light non-aqueous phase liquid (LNAPL) was identified at the two of the borings (SB-10-16 and SB-10-17), the locations were completed as temporary

wells (**Figure D-A1-1**). The borings and temporary wells were completed to depth of 15 feet below ground surface (ft bgs). Soil samples were collected from each location from 4 to 6, 6 to 8, and 8 to 10 ft bgs. An additional deeper sample interval was also collected at SB-10-16/TW-10-16, SB-10-18 and SB-10-19 to vertically delineate impacts. All soil samples were submitted to the laboratory for analysis of PCBs

TW-10-08-2 Area

At the TW-10-08-2 Area four temporary wells (TW-10-08-16, TW-10-08-17, TW-10-20 and TW-10-21) were installed to delineate LNAPL identified at TW-10-08-2 (**Figure D-A1-1**). The temporary wells were completed to a depth of approximately 15 feet bgs. Soil samples were collected from TW-10-08-16, TW-10-08-17, and TW-10-21 from 4 to 6, 6 to 8, and 8 to 10 ft bgs and submitted to the laboratory for PCB analysis.

In addition, LNAPL samples were collected from TW-10-08-1, TW-10-08-2, and TW-10-08-17 and submitted to the laboratory for PCB analysis.

Summary of Data Evaluation

20-170 Area

At the 20-170 Area a total of 15 soil samples were submitted for PCB analysis. PCBs were detected in one sample collected at SB-10-17 (8 to 10 ft bgs) at a concentration of 0.7 milligrams per kilogram (mg/kg) and two samples collected at SB-10-19 at concentrations of 19 mg/kg (6 to 8 ft bgs) and 4.3 mg/kg (8 to 10 ft bgs) (**Table D-A1-1**).

TW-10-08-2 Area

At the TW-10-08-2 Area a total of nine soil samples were submitted for PCB analysis. PCBs were detected in one sample collected from TW-10-08-16 (4 to 6 ft bgs) at a concentration of 13 mg/kg, one sample collected from TW-10-08-17 (6 to 8 ft bgs) at a concentration of 8 mg/kg, and two samples collected from TW-10-21 at concentrations of 21 mg/kg (4 to 6 ft bgs) and 1 mg/kg (6 to 8 ft bgs) (**Table D-A1-1**).

In addition, temporary wells TW-10-08-16, TW-10-08-17, TW-10-16, TW-10-17, TW-10-20, and TW-10-21 were gauged several times in 2014 and 2015. LNAPL was only detected at a thickness greater than 0.1 inches at TW-10-08-17. A sample of the LNAPL at TW-10-08-17 was collected along with samples from previously existing wells TW-10-08-1 and TW-10-08-2 and submitted for PCB analysis. PCBS were detected

in the LNAPL samples at concentrations of 272 mg/kg at TW-10-08-1, 1,413 mg/kg at TW-10-08-2, and192 mg/kg at TW-10-08-17 (**Table D-A1-2**).

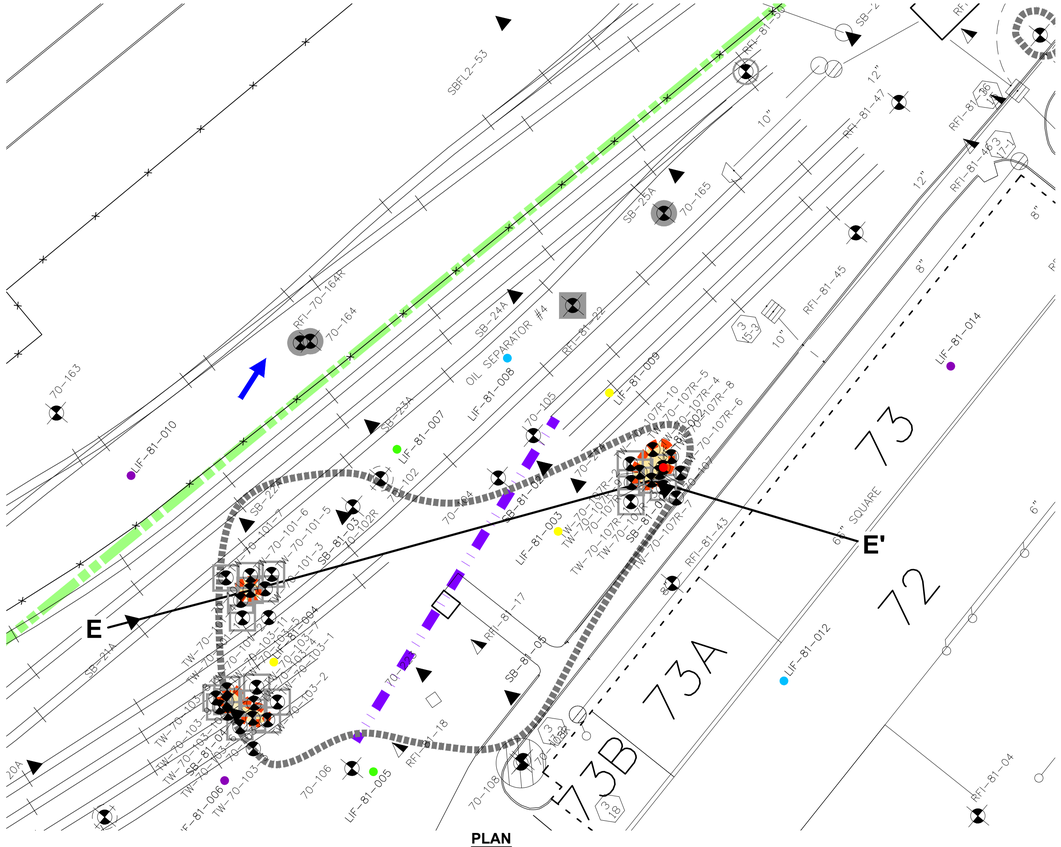
Subject:
Priority #6 - AOI 81-2 Cutting Oil LNAPL Area
Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

As part of the light non-aqueous phase liquid (LNAPL) remedy evaluation process the Site's 17 LNAPL areas were prioritized based on risk. The Area of Interest (AOI) 81-2 Cutting Oil LNAPL Area (AOI 81-2 LNAPL Area) is ranked as Priority #6 with a total potential risk score of 10 (**Table 5 of the main report**). A conceptual site model cross-section is attached (**Figure E-1**) which provides an overview of the AOI 81-2 LNAPL Area impacts and interim measures (IMs).

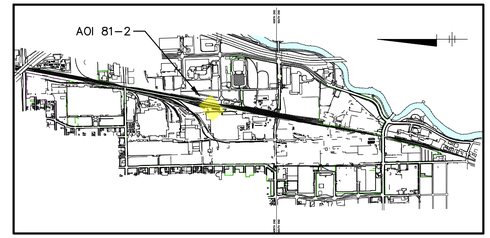


Historical IMs completed at the AOI 81-2 LNAPL Area include a recovery trench and an LNAPL bailing program. The partial and effective removal of product completed in this area is considered a component of the remedy.

The compositional and saturation concerns identified for the AOI 81-2 LNAPL Area were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:

- Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios due to the biodegradation of LNAPL generating methane; however, this will be addressed by the proposed institutional controls.

- PCBs were detected in LNAPL samples collected from the AOI 81-2 LNAPL Area at concentrations ranging from 70 to 183 parts per million (ppm), which exceeds the Michigan Department of Environmental Quality's nonresidential direct contact (NDC) criteria for soils.
- No feasible options exist to mitigate unacceptable risk through compositional change.
- The LNAPL is not migrating and not infiltrating the Outfall 003 storm sewer.
- PCBs were detected in soil delineation samples collected from the AOI 81-2 LNAPL Area at concentrations ranging from 0.3 to 11 parts per million (ppm). PCB are detected in surface soils at concentrations between 1 ppm and 5 ppm in the vicinity of 70-101, 70-103, RFI-81-22, SB-81-02, and SB-81-04.
- LNAPL transmissivity quantified at monitoring well 70-107R was 0.2 square feet per day (ft^2/day), which is at the lower end of the minimum range suggested by ITRC and below the MDEQ draft standard threshold value, indicating that LNAPL recovery is not likely practical.
- An LNAPL recovery system consisting of a recovery trench and well operated in this area for approximately 17 years; therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate.



Based on the current understanding of conceptual site model, risks associated with direct contact and potential volatilization concerns can be effectively mitigated through targeted excavation and institutional controls.

Attachment 1

LNAPL Conceptual Site Model

Priority #6 - AOI 81-2 Cutting Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model for the area of interest (AOI) 81-2 Cutting Oil light non-aqueous phase liquid (LNAPL) Area (AOI 81-2 LNAPL Area). AOI 81-2 is located at the Buick City Site (Site) located in Flint, Michigan (**Figure E1-1**).

1. Background

The AOI 81-2 LNAPL Area is located east of the former Factory 81 in the eastern central portion of the Northend of the Site (**Figure E1-2**). Historically, the former Factory 81 Area was primarily used as a gray iron foundry prior to 1981. From 1981 to 2010, the area was used for welding, machining, and assembly of torque converters. The AOI 81-2 LNAPL Area is located east of the former Factory 81 - Buildings 70 and 73, which were historically used for storage of scrap materials (oil-saturated foundry sand and scrap metal). Historic operations in the northern portion of former Building 70 included the production of sand cores for foundry molds that included the use of gas/oil-fired core ovens and various core making methods. One of the core making methods used “hot boxes” to convey hot sand. According to Site personnel, from the 1960s through approximately 1972, polychlorinated biphenyl (PCB) containing hydraulic fluids were used within the “hot box” hydraulic systems. The presence of AOI 81-2 LNAPL Area is presumably due to historical releases associated with operations in this area.

Investigation data previously presented in Site reports are not re-presented in this memo. However, pertinent AOI 81-2 investigation data that has not previously been presented in a Site report is attached to this memo.

2. AOI 81-2 Site Setting and Data Summary

2.1 Former Interim Measures

2.1.1. LNAPL Monitoring and Bailing Program (2001)

From April to July 2001, three monitoring wells (70-101, 70-103, and 70-108) located in AOI 81-2 were monitored as part of a weekly LNAPL bailing program. A total of six gallons of LNAPL were removed from the three monitoring wells during the weekly program.

2.1.2. LNAPL Monitoring and Bailing Program (2003 - 2005)

During the 2003 to 2005 Site-wide LNAPL monitoring and bailing program LNAPL was recovered from four monitoring wells (70-101, 70-103, 70-107R, and 70-108) at AOI 81-2. A total of approximately 5.32 gallons of LNAPL was recovered during the quarterly bailing events.

2.1.3. Passive Recovery Trench

LNAPL was identified at the northeast corner of Factory 81 during the 1995 Fenceline Investigation. In 1996 a LNAPL recovery trench was installed at AOI 81-2. This recovery trench was approximately 9 feet deep, 3 feet wide, 200 feet long, and backfilled with gravel, with perforated pipe laterals. LNAPL was recovered from the trench via a 4-foot-diameter recovery well installed near the midpoint of the recovery trench. An automated belt-skimming device in the recovery well collected LNAPL from the recovery trench and transferred it to a temporary storage tank. The total amount of LNAPL recovered by this trench is unknown. By 2010, the system became ineffective in removing significant quantities of LNAPL due to the lack of recoverable LNAPL within the capture zone, and operation of the system was discontinued.

3. AOI 81-2 Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and LNAPL characteristics and extent of impacts for the AOI 81-2 LNAPL Area.

Figure E1-2 presents the locations of the existing and abandoned monitoring wells and soil borings in the AOI 81-2 Area.

3.1. AOI 81-2 Geology and Hydrogeology

- *Geology:* The soils at AOI 81-2 consist of primarily fine to medium sand to silty sands to a depth of 12.5 feet bgs that are underlain by silty clays/clay. The boring logs also indicated evidence of LNAPL impacts from as shallow as 3 feet bgs and as deep as 9 feet bgs, across the area.

- *Groundwater/LNAPL Levels:* Twelve monitoring wells (70-101, 70-102, 70-103, 70-104, 70-105, 70-106, 70-107, 70-107R, 70-108R, 70165, RFI-81-43, and RFI-81-45) at AOI 81-2 are gauged to monitor the extent of the LNAPL. Depth to groundwater (or LNAPL, where present) has varied greatly; it has been measured as shallow as 2.82 feet bgs, as deep as 12.65 feet bgs, and averages around 5 feet bgs. Historically, LNAPL has been gauged in five monitoring wells (70-101, 70-102R, 70-103, 70-107R, 70-108) and the recovery well associated with the recovery trench. However, following 17 years of operation of the passive recovery trench, LNAPL has only been detected in 70-101, 70-103 and 70-107R.

  The greatest thickness of LNAPL measured at the AOI 81-2 LNAPL Area was 7.95 feet at 70-107R in 2004. Most recently, in June 2013, product thicknesses ranged from 0.03 to 2.33 feet in the AOI 81-2 LNAPL Area monitoring wells. The March and June 2013 groundwater level data are presented in **Appendix X.**

  Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the south-southeast.

3.2. Groundwater and Soil Analytical Data

Analytical data were compared to applicable Michigan Part 201 non-residential criteria. Groundwater surface water interface pathway was determined to be not applicable at the AOI 81-2 LNAPL Area as the storm sewer is upgradient.

3.2.1. Groundwater Analytical Data

Groundwater concentrations in the AOI 81-2 LNAPL Area do not exceed applicable non-residential criteria.

3.2.2. Soil VOC, SVOC, and Metals Analytical Data

Soil samples collected from borings in the AOI 81-2 LNAPL Area near or within the plume do not exceed applicable non-residential criteria. Outside of the AOI 81-2 LNAPL Area there are exceedances of non-residential direct contact criteria and non-residential soil volatilization criteria, which were previously addressed in the *2010 Corrective Measure Proposal Addendum #2.*

3.2.3. Soil PCB Analytical Data

As part of PCB investigation activities completed in 2013 and 2014, five soil borings (SB-81-01 through SB-81-05) were installed adjacent to monitoring wells 70-107R, 70-105, 70-102,

70-103, and 70-108, respectively, to vertically characterize PCB impacts to soils at the AOI 81-2 LNAPL Area. Five soil samples were collected from each boring from 0 to 11 feet bgs and submitted for PCB analysis. PCBs were not detected in the soil samples collected from borings SB-81-01, SB-81-03, and SB-81-05. At SB-81-02, PCBs were detected at the following concentrations: 4 parts per million (ppm) from 0 to 2 ft bgs; 5 ppm from 3 to 5 ft bgs; and 3 ppm from 5 to 7 ft bgs. At SB-81-04, PCBs were detected at the following concentrations: 3 ppm from 0 to 2 ft bgs; 10 ppm from 3 to 5 ft bgs; 4 ppm from 5 to 7 ft bgs; and 3 ppm from 7 to 9 ft bgs.

To further delineate the concentrations of PCBs associated with the LNAPL at monitoring wells 70-101, 70-103, and 70-107R, twenty-eight (28) temporary wells (TW-70-101-1 through TW-70-101-7, TW-70-103-1 through TW-70-103-11, and TW-70-107R-1 through TW-70-107R-10) were installed. At each temporary well location, three soil samples were collected and submitted for PCB analysis to vertically profile the PCB impacts in soil. The locations of the temporary wells are presented on **Figure E1-2**. A total of 86 soil samples were collected from the temporary wells. PCBs were detected in 35 of the soil samples at concentrations ranging from 0.3 to 11 ppm.

The analytical results are presented in **Appendix X**.

3.2.4. GSI Evaluation

The AOI 81-2 LNAPL Area is located within the Outfall 003 storm sewer drainage basin. Based upon the available information, LNAPL is not infiltrating the storm sewer in the vicinity of this AOI, but groundwater has the potential to infiltrate the storm sewer. As further discussed in **Appendix BB** metals in the storm sewers at the Site are being investigated as part of the NPDES Plus Monitoring Program (NPMP).

3.2.5. Vapor Intrusion

Due to the presence of shallow groundwater and LNAPL (approximately 5 feet below ground surface) at the AOI 81-2 LNAPL Area, groundwater data were also compared to the applicable Non-Residential Screening Values for the Vapor Intrusion Pathway presented in the *Michigan Department of Environmental Quality (MDEQ) Guidance Document for the Vapor Intrusion Pathway* (further discussed in Section 3.4 of the Report). Groundwater concentrations do not exceed applicable screening levels.

As there are no structures at the Site the MDEQ Part 201 criteria are appropriate for

comparison of soil data. Soil data did not exceed applicable screening levels.

3.3. LNAPL Characteristics

- *LNAPL Analytical Data:* LNAPL present at AOI 81-2 consists primarily of cutting oil. Additional analysis indicated that:

  - The LNAPL has a viscosity of 46 centipoise (cp), interfacial tension of 5.6 dynes/centimeter (cm), and a specific gravity of 0.91.

  - The LNAPL contains concentrations of arsenic that exceed TCLP criteria; however, TCLP analysis has not been conducted.

  - PCBs have been detected in six LNAPL samples at concentrations greater than the Toxic Substance Control Act (TSCA) level of 50 ppm and nonresidential direct contact criterion (NDC) of 16 ppm. PCBs were detected at monitoring well 70-101 (70 ppm), 70-105 (110 ppm), 70-107R (100 ppm), TW-70-103-05 (83 ppm) TW-70-107R-02 (90 ppm), and TW-70-107R-04 (183 ppm).

  For reference, the viscosity (at 100 degrees Fahrenheit) of olive oil is 43.2 cp and honey is 73.6 cp (Ingersoll-Rand, 1981). The recently collected LNAPL analytical data are presented in **Appendix X**.

- *LIF Data:* Thirteen LIF borings were completed in the AOI 81-2 LNAPL Area. The LIF waveform signatures observed at AOI 81-2 are consistent with the known LNAPL type, cutting oil. The vertical range of LIF impact (greater than 5%RE) at AOI 81-2 is typically 5 to 9 feet bgs. There is one instance where the impact extends to a depth of 11 feet bgs. **Figure E1-2** presents the results of the LIF investigation and the extent of impacts associated with the AOI 81-2 LNAPL Area.

- *Transmissivity:* Transmissivity testing was completed at the AOI 81-2 LNAPL Area in April 2013. Based on LNAPL baildown test results at 70-107R, LNAPL transmissivity was quantified as 0.2 square feet per day (ft^2/day), which is at the lower end of the minimum range suggested by ITRC and below the MDEQ standard threshold value.

- *Natural Source Zone Depletion (NSZD):* NSZD was completed at the AOI 81-2 LNAPL Area to establish ongoing natural attenuation rates of LNAPL as a baseline for comparison to active LNAPL recovery technologies. Two carbon traps were installed at the AOI 81-2 LNAPL Area and submitted to the laboratory for analysis. The results show that LNAPL in the western section of the AOI 81-2 LNAPL Area is being depleted at a rate of 3,448 gallons per acre per year and in the

eastern section of the AOI 81-2 LNAPL Area at a rate of 176 gallons per acre per year.

3.4. Extent of LNAPL

During the RCES preparation, the AOI 81-2 LNAPL Area was calculated based on historical data. The footprint of the LNAPL area containing approximately 0.5 ft or greater of LNAPL was estimated to be approximately 28,000 square feet. The current footprint of the LNAPL area was updated (as discussed in section 2.1.3 of the main report) and is estimated to be approximately 6,200 square feet. Based on the LIF and soil boring log data, approximate depth impacts are approximately 3 to 9 ft bgs.

LNAPL Remedial Decision Tree

Attachment 2 LNAPL Remedial Decision Tree Priority #6 – AOI 81-2 Cutting Oil Area

NOTES

(#) NOTES: See Page E2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priority #6 - AOI 81-2 Cutting Oil LNAPL Area

Background: The area of interest (AOI 81-2) cutting oil light non-aqueous phase liquid (LNAPL) Area (AOI 81-2 LNAPL Area) is located in the central portion of the Northend of the Site, northeast of the former Factory 81 footprint. Historically, the Factory 81 area was primarily used as a gray iron foundry prior to 1981. From 1981 to 2010, the area was used for welding, machining, and assembly of torque converters. The AOI 81-2 LNAPL Area is located east of the former Factory 81, east of Buildings 70 and 73, which were historically used for storage of scrap materials (oil-saturated foundry sand and scrap metal). The presence of the AOI 81-2 LNAPL Area is presumably due to historical releases associated with operations in this area. There are no buildings within the AOI 81-2 LNAPL Area.

Geology and Hydrogeology: The soils at AOI 81-2 consists primarily of fine to medium sand to silty sands to a depth of 12.5 feet bgs that are underlain by silty clays/clay. Depth to groundwater (or LNAPL, where present) averages around 5 feet bgs, but has varied greatly and has been measured as shallow as 2.82 feet bgs and as deep as 12.65 feet bgs. Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the south-southeast.

LNAPL Characteristics: LIF logs in the AOI 81-2 LNAPL Area show evidence of LNAPL impacts as shallow as 3 feet bgs and as deep as 9 feet bgs. Historically, LNAPL has been gauged in five monitoring wells (70-101, 70-102R, 70-103, 70-107R, and 70-108) and the recovery well associated with the recovery trench. However, following 17 years of operation of the passive recovery trench, LNAPL has only been detected in monitoring wells 70-101, 70-103 and 70-107R and their associated temporary wells. Historically, at 70-103 thicknesses of up to 1.20 feet of product were measured; however, during recent years, minimal LNAPL (~0.05 feet) has been measured. At AOI 81-2, the LNAPL has a viscosity of 46 centipoise (cp), interfacial tension of 5.6 dynes/centimeter (cm), and a specific gravity of 0.91. The LNAPL also contains arsenic at concentrations that exceed RCRA toxicity characteristic criteria at one location (70-107R); however, TCLP analysis has not been conducted.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*

YES – The following potential risk/exposure concerns are associated with the AOI 81-2 LNAPL Area:

- Direct Contact: The concentrations of PCBs detected in LNAPL at the AOI 81-2 LNAPL Area range from 70 to 183 parts per million (ppm), which exceed the non-residential direct contact criteria (NDC) for soil. The shallowest LNAPL impacts are located approximately three feet below ground surface, and represent a potential concern for future construction or utility workers. Soil samples collected from borings located adjacent to monitoring wells containing LNAPL detected PCBs at concentrations less than the MDEQ non-residential direct contact criterion of 16 mg/kg. This exposure risk will be addressed by completing a targeted excavation as presented in the 761.61 (c) determination in **Attachment 3**.
- Potential Volatilization to Indoor Air Concerns for Future Structures: Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane generated during biodegradation of LNAPL for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*

NO – The following is a general discussion regarding the feasibility of various compositional change remediation strategies for the AOI 81-2 LNAPL Area:

- Enhanced dissolution and recovery via surfactant or hot water flushing is not likely feasible. Bench-scale testing completed on similar LNAPL (hydraulic oil) at the Southend of the Site did not result in any increased recovery. In addition, it is not a viable option based on the presence of PCBs in the LNAPL and the proximity to the nearby storm sewer. The use of surfactant would increase mobility and therefore, likely increase the potential for PCB-impacted LNAPL infiltration into the storm sewer.
- LNAPL constituents at AOI 81-2 have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.
- In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of PCBs in the LNAPL and nearby City sewers. In addition, it does not represent an economically feasible remedial alternative given the relatively large area that would need to be addressed in order to avoid the generation of dioxins.

Attachment 2 Notes

Priority #6 - AOI 81-2 Cutting Oil LNAPL Area

- Targeted in-situ soil mixing/land farming would use biological additives to address the petroleum constituents; however, the PCBs would remain. In addition, due to the proximity of the AOI 81-2 LNAPL Area to the Site storm sewers, there is a potential for the additives to enter the sewer and be discharged to the Flint River.

3) Is there a potential benefit to partial treatment/removal that outweighs costs?

NO – The compositional concerns can be addressed as follows:

- Potential Volatilization to Indoor Air - Based on the current understanding of risk conditions, the potential future volatilization to indoor air risk can be effectively mitigated through institutional controls.
- Direct contact – The direct contact concerns associated with PCBs in LNAPL will be addressed by completing targeted excavations as presented in **Attachment 3**. Soil samples collected from borings located adjacent to monitoring wells containing LNAPL detected PCBs at concentrations less than the MDEQ non-residential direct contact criterion of 16 mg/kg.

Additionally, an LNAPL recovery system consisting of a recovery trench and well operated in this area for approximately 17 years; therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate.

4) Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?

NO – The AOI 81-2 LNAPL Area appears to be stable. This finding is supported by the following lines of evidence:

- Well Gauging Data: Sentinel wells located around the periphery of the AOI 81-2 LNAPL Area have remained free of LNAPL since monitoring began approximately 10 years ago.
- Age of LNAPL Release: The AOI 81-2 LNAPL Area was identified in approximately 1995. Operations began in this portion of the Site in the 1950's and ceased in this portion of the Site ceased in 2010. LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).

5) *Is LNAPL mobile within the stable LNAPL perimeter?*

YES – LNAPL is currently present at three monitoring wells in the AOI 81-2 area indicating that the LNAPL is mobile within the stable perimeter.

6) Is LNAPL readily recoverable?

NO - The results of historic interim measures (IM) indicate that in the past LNAPL has been recovered using a recovery trench and well, and by bailing. However it is uncertain whether future LNAPL recovery is practical. Although LNAPL was successfully recovered during the IM, LNAPL transmissivity quantified at monitoring well 70-107R was 0.2 square feet per day (ft^2/day), which is at the lower end of the minimum range suggested by ITRC and below the MDEQ standard threshold value.

7) Are controls required?

YES – The following AOI-specific institutional are proposed, in addition to the Site-wide institutional controls, for the AOI 81-2 LNAPL Area to limit future exposure:

- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present (as shown on **Figure E3-2**) to prevent direct contact with contaminated material except with using appropriate health and safety measures during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the NREPA.
- Notify future owners of the presence of PCBs, and
- Restrict the area containing PCB-impacted LNAPL to low occupancy (as shown on **Figure E3-2**).

761.61(c) Risk Based Cleanup and Disposal Request

Priority #6 – AOI 81-2 Cutting Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – 761.61(c) Risk Based Cleanup and Disposal Request

---

This attachment presents the information required to support a 761.71(c) determination for the Area of Interest (AOI) 81-2 Cutting Oil light non-aqueous plume liquid (LNAPL) Area (AOI 81-2 LNAPL Area).

1. Area Background and History

The AOI 81-2 LNAPL Area is located at the Northend of the Site in the former Factory 81 area and is likely associated with historic releases associated with operations. LNAPL was identified at AOI 81-2 during the 1995 Fenceline Investigation. A LNAPL recovery trench and well were installed in 1996 and operated until 2010. The total amount of LNAPL recovered by this trench is unknown. By 2010, the system became ineffective in removing significant quantities of LNAPL due to the lack of recoverable LNAPL within the capture zone and operation of the system was discontinued.

Historically, LNAPL has been gauged at AOI 81-2 in five monitoring wells (70-101, 70-102R, 70-103, 70-107R, 70-108) and the recovery well associated with the recovery trench. However, following 17 years of operation of the passive recovery trench at AOI 81-2, LNAPL has only been detected in 70-101, 70-103 and 70-107R, and their associated temporary wells (discussed below). During recent years minimal product (~0.05 feet) has been detected at monitoring well 70-103.

2. Summary of SOPs and Investigation Results

AOI 81-2 has been previously investigated as part of the Site's RCRA Facility Investigation (RFI) activities. The RFI Work Plan presents the standard operating procedures, field sampling procedures, quality assurance/quality control procedures, etc. used during the investigation. The results of the investigations (including laboratory analytical reports) were presented in the RFI Phase I and RFI Phase II reports (**Appendix Y**).

3. Nature of Contamination

At AOI 81-2, samples of LNAPL, soil, and groundwater have been analyzed for polychlorinated biphenyls (PCBs). Below is a brief summary of results.

- LNAPL samples from three monitoring wells (70-101, 70-105, and 70-107R) were submitted for PCB analysis. PCBs were detected at concentrations ranging from 70 part per million (ppm) to 110 ppm.
- LNAPL samples collected from three temporary wells also detected PCBs: TW-70-103-5 (83 ppm), TW-70-107R-2 (90 ppm), and TW-70-107R-4 (183 ppm)
- Ninety-eighty soil samples collected from soil borings in the AOI 81-2 Area were analyzed for PCBs. Forty-seven of the samples detected PCBs and five samples detected PCBs at levels less than 1 ppm. The maximum detection of PCBs in soil was 11 ppm.
- In surface soils (0 to 2 ft below ground surface [bgs]) PCBs were detected at concentrations greater than 1 ppm, in the vicinity of monitoring wells 70-101, 70-103 and RFI-81-22, as well as soil borings SB-81-02 and SB-81-04. The maximum detection of PCBs in surface soils was less than 5 ppm.
- One groundwater sample collected from a well in the AOI 81-2 area was analyzed for PCBs. PCBs were not detected in the groundwater sample.

4. Extent of Impacts

At AOI 81-2, PCB impacts are primarily associated with the LNAPL. **Figure E3-1** shows the approximate current extent of LNAPL. As discussed above, LNAPL was historically gauged in five monitoring wells in the AOI 81-2 LNAPL Area and is currently detected in three monitoring wells (701-01, 701-03, and 701-107R) and four temporary wells (TW-70-107R-2, TW-70-107R-4, TW-70-107R5, and TW-70-103-5). The concentrations of PCBs detected in the LNAPL samples vary from 70 to 183 ppm within the AOI 81-2 LNAPL area.

In order to further delineate the PCB impacts at AOI 81-2, five soil borings (SB-81-01 through SB-81-05) were installed adjacent to monitoring wells 70-107R, 70-105, 70-102, 70-103, and 70-108, respectively, to vertically characterize PCB impacts to soils. Five soil samples were collected from each boring from 0 to 11 feet bgs and submitted for PCB analysis. The soil samples collected from borings SB-81-01, SB-81-03, and SB-81-05 did not detect PCBs. Three soil samples collected from SB-81-02 detected PCBs at concentrations ranging from 3 to 5 ppm and four soil samples collected from SB-81-04 detected PCBs at concentrations ranging from 3 to 10 ppm.

To further delineate the concentrations of PCBs in LNAPL at monitoring wells 70-101, 70-103, and 70-107R, 28 temporary wells (TW-70-101-1 through TW-70-101-7, TW-70-103-1 through TW-70-103-11, and TW-70-107R-1 through TW-70-107R-10) were installed. Soil samples were collected from 25 of the temporary well locations and submitted for PCB analysis to vertically profile the PCB impacts in soil. A total of 68 soil samples were collected from the temporary wells. PCBs were detected in 32 of the soil samples at concentrations ranging from 0.3 to 11 ppm. To date, LNAPL has been detected in four of the

28 temporary wells (TW-70-107R-2, TW-70-107R-4, TW-70-107R-5 and TW70-103-5) installed at AOI 81-2. LNAPL samples from TW-70-103-5, TW-70-107R-2, and TW-70-107R-4 were analyzed for PCBs. The analytical results detected PCBs at concentrations ranging from 83 to 183 ppm. The temporary well data further suggest that the remaining LNAPL at AOI 81-2 is limited.

Based on the PCB soil delineation data, well gauging data and the LIF investigation, the PCB impacts at the AOI 81-2 LNAPL Area range from 0 to 9 feet bgs. The locations of the soil borings and temporary wells are presented on **Figure E3-1**.

5. Risk-Based Procedure

Targeted excavation is proposed to address PCB impacts at 70-101, 70-103, and 70-107R. The LNAPL impacts at 70-101 are delineated by TW-70-101-3, TW-70-101-4, and TW-70-101-6, shown on **Figure E3-2**. The LNAPL impacts at 70-103 are delineated by TW-70-103-1 through TW-70-103-4 and TW-70-103-08 through TW-70-103-11. The LNAPL impacts are partially delineated at 70-107R. LNAPL has been detected intermittently at three temporary wells (TW-70-107R-2, TW-70-107R-4, and TW-70-107R-5). These wells will continue to be monitored and additional delineation wells will be installed as necessary. The scope of work for additional delineation will be included in a remedy implementation work plan. The work plan will include the detailed scope for the excavation activities; however a brief summary of the plan is provided below:

- Complete investigation work necessary to refine the extents of the excavation.
- Prior to excavation, LNAPL will be removed from wells in the area of excavation to minimize accumulation during excavation.
- Complete excavation to the water table. It is planned that the excavation will be completed when the water table is at its lowest to maximize removal of impacted soils.
- LNAPL-impacted soils removed during remediation activities completed at AOI 81-2 will be characterized and disposed of using “as found” concentrations.

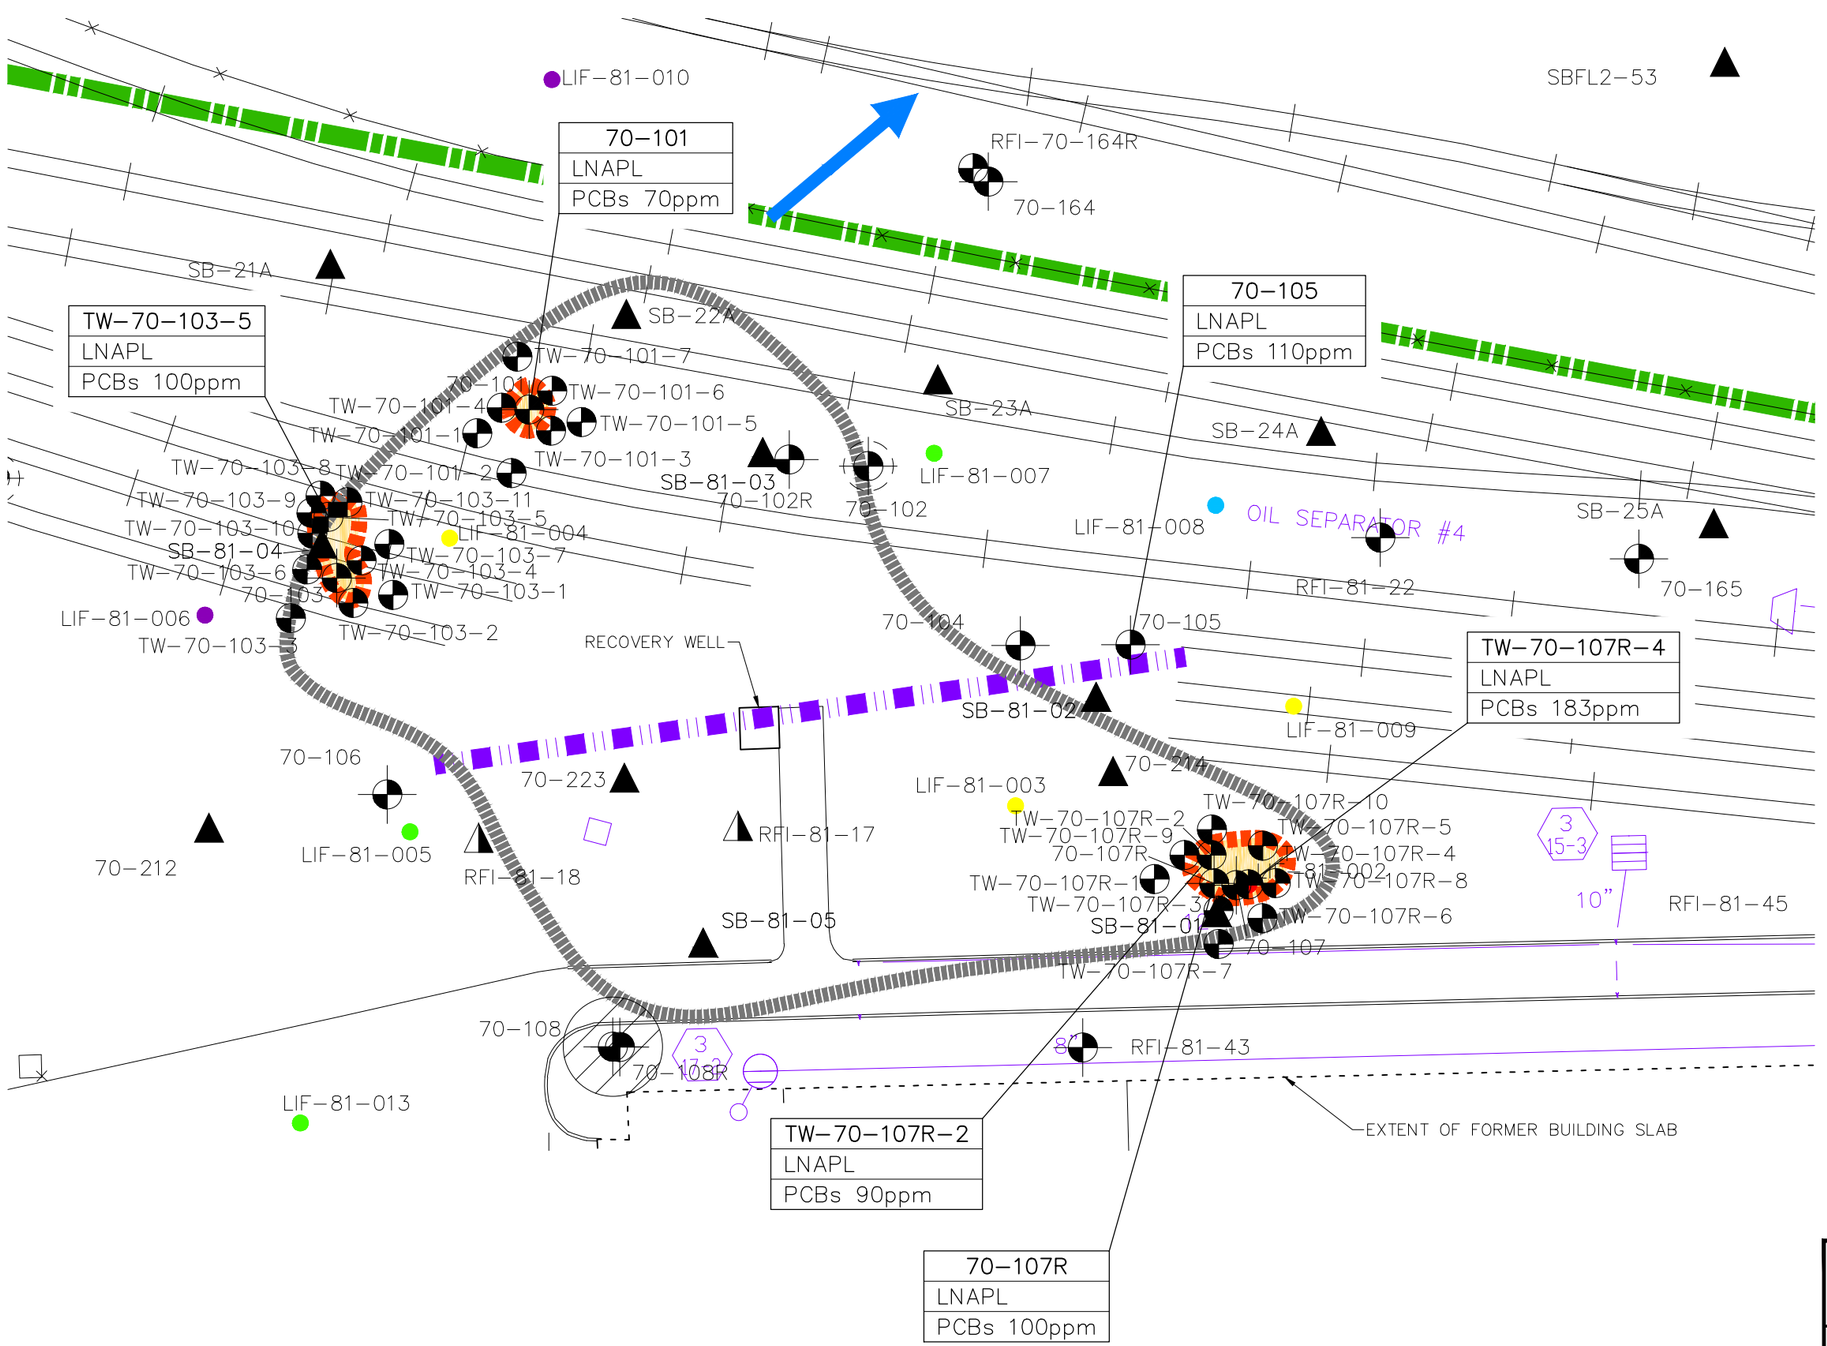
Following completion of the targeted excavation, a portion of the AOI 81-2 LNAPL Area will be restricted to low occupancy use (**Figure E3-2**). Additional deed restrictions placed on the AOI 81-2 LNAPL Area to protect future users from PCB impacts will include the Site-wide deed restrictions as noted in the main report and these AOI-specific deed restrictions:

- Notification to future owners of the presence of PCBs , and
- Restrict the area containing PCB-impacted LNAPL or soils to low occupancy (as shown on **Figure E3- 2**).

6. Evaluation of Alternatives

The following technologies were evaluated to address LNAPL at AOI 81-2:

- Enhanced dissolution and recovery via surfactant or hot water flushing is not likely feasible. Bench-scale testing completed on similar LNAPL (hydraulic oil) at the Southend of the Site did not result in any increased recovery. In addition, it is not a viable option based on the presence of PCBs in the LNAPL and the proximity to the nearby storm sewer. The use of surfactant would increase mobility and therefore, likely increase the potential for PCB-impacted LNAPL infiltration into the storm sewer.



- Targeted in-situ soil mixing/land farming would use biological additives to address the petroleum constituents; however, the PCBs would remain. In addition, due to the proximity of the AOI 81-2 LNAPL Area to the Site storm sewers there is a potential for the additives to enter the sewer and be discharged to the Flint River.

- In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of PCBs in the LNAPL and nearby City sewers. In addition, it does not represent an economically feasible remedial alternative given the relatively large area that would need to be addressed in order to avoid the generation of dioxins.

- AOI 82-1 LNAPL constituents (including PCBs) have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.

Attachment 4

Remedy Recommendation

Priority #6 - AOI 81-2 Cutting Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 4 – Recommended Remedy

This attachment presents the recommended remedies for the area of interest (AOI) 81-2 Cutting Oil light non-aqueous phase liquid (LNAPL) Area (AOI 81-2 LNAPL Area).

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in **Attachment 2** identified direct contact for PCBs and potential volatilization to indoor air associated with methane generated during the biodegradation of LNAPL at AOI 81-2 LNAPL Area as compositional concerns and mobility as a saturation concern.

2. Remedy Recommendation Rationale

The remedies recommended to address the compositional and saturation concerns associated with the AOI 81-2 LNAPL Area are targeted excavations and institutional controls, which are discussed in detail in Section 3. The rationale for this selection is detailed below:

- Prior to and during the RFI PCBs were detected in three LNAPL samples at concentrations greater than the Toxic Substance Control Act (TSCA) level of 50 ppm and nonresidential direct contact criterion (NDC) of 16 ppm. PCBs were detected at monitoring well 70-101 (70 ppm), 70-105 (110 ppm), and 70-107R (100 ppm).
- Temporary wells were installed and soil samples were collected to delineate impacts at 70-101, 70-103, and 70-107R. The concentrations of PCBs in soil samples ranged from non-detect to 11 parts per million (ppm). LNAPL was detected in four temporary wells and samples were able to be collected from three location. The concentrations of PCBs in LNAPL are TW-70-103-05 (83 ppm) TW-70-107R-02 (90 ppm), and TW-70-107R-04 (183 ppm).
- PCBs have been detected in surface soil samples (0 to 2 ft bgs) in the vicinity of monitoring wells 70-101, 70-103, and RFI-81-22 and soil borings SB-81-02 and SB-81-04 at concentrations less than 5 ppm.

- Based on the current understanding of risk conditions, the potential volatilization to indoor air risk for future structures due to the biodegradation of LNAPL generating methane can be effectively mitigated through Site-wide institutional controls.
- The AOI 81-2 is downgradient of the Outfall 003 storm sewer; therefore, the GSI pathway is not applicable.
- Although the LNAPL at AOI 81-2 is mobile within the stable perimeter, transmissivity testing indicates that recovery is likely not practical. The LNAPL transmissivity quantified at 70-107R was 0.2 ft^2/day, which is greater than the lower Interstate Technology & Regulatory Council (ITRC) threshold value, but below the Michigan Department of Environmental Quality (MDEQ) threshold value for recovery which indicates that LNAPL recovery is not likely practicable. Further, LNAPL recovery at 70-107R would not decrease the risk associated with the AOI 8-2 LNAPL Area.
- Historically, LNAPL has been gauged in wells five monitoring wells (70-101, 70-102R, 70-103, 70-107R, and 70-108) and the recovery well associated with the recovery trench. However, following 17 years of operation of the passive recovery trench, LNAPL has only been detected in 70-101, 70-103 and 70-107R. Therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate.
- NSZD results show that LNAPL in the western section of the AOI 81-2 LNAPL Area is being depleted at a rate of 3,448 gallons per acre per year and in the eastern section of the AOI 81-2 LNAPL Area at a rate of 176 gallons per acre per year.

3. AOI 81-2 Remedies

This section summarizes the completed and proposed remedies to address the impacts at AOI 81-2.

3.1 Completed Interim Measures

An LNAPL monitoring and bailing program operated for several years removing the product from four monitoring wells located with the AOI 81-2 LNAPL Area. Groundwater and LNAPL recovery trenches were also installed at the northeast corner of Factory 81 during the 1995 Fenceline Investigation. The total amount of LNAPL recovered by this trench is unknown. By 2010 the system became ineffective in removing significant quantities of LNAPL due to the lack of recoverable LNAPL within the capture zone, and operation of the system was discontinued. The partial and effective removal of product has been completed in this area and is considered a component of the remedy.

3.2 Additional Remedy Recommendations

The remedies recommended to address the compositional and saturation concerns associated with AOI 81-2 LNAPL Area are historic IMs, targeted excavation and institutional controls. These remedies will remove PCB impacts in the vicinity of monitoring wells 70-101, 70-103, and 70-107R in the

short term and will prevent future worker exposure to soil and LNAPL impacts in the long term.

3.2.1 Targeted Excavation

In order to address the risks associated with the LNAPL containing PCBs at concentrations greater than 25 ppm, targeted excavations of LNAPL impacted soils are recommended. As discussed in **Attachment 3**, the targeted excavations are proposed to address the PCB impacts at 70-101, 70-103, and 70-107R, as shown on **Figure E3-2**. Additional delineation will be completed to further refine the extents prior to excavation activities.

As part of a self-implementing cleanup under 40 CFR Part 761.61(c), soils containing PCBs with concentrations exceeding 25 ppm will be excavated and disposed of properly using "as found" concentrations. The excavations will take place when the water table is at its lowest to maximize removal of impacted soils.

3.2.2 Surface Soil Impacts

The remedy to address surface soil impacts (concentrations of PCBs less than 16 ppm) will be selected on a case by case basis once the extent of impacts has been defined. In the areas of the targeted excavations, the surface soil impacts may be included in the excavation area. Alternately, surface soil impacts may also be addressed by installing a cover over the impacted area, or restricting the area to low occupancy use.

3.2.3 Institutional Controls

The following AOI-specific institutional controls, in addition to the Site-wide institutional controls, will be necessary to limit potential for future exposure:

- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present (**Figure E3-2**) to prevent direct contact with contaminated material except with using appropriate health and safety measures during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the NREPA.
- Notify the future property owners of the presence of PCBs, and
- Restrict the area shown on **Figure E3-2** to low occupancy based on the presence of PCBs.

Remedy Recommendation Report
Appendix E - AOI 81-2 Cutting Oil Area - Addendum No.1
Summary of Additional Investigations
RACER Buick City Site, Flint, Michigan

Introduction

This Addendum No. 1 to Remedy Recommendation Report Appendix E presents a summary of the investigation data collected at the AOI 81-2 Cutting Oil Area from March 19, 2014 through December 31, 2015 at the Buick City Site (Site) located in Flint, Michigan.

Summary of Investigation Activities

Additional investigation activities were completed at AOI 81-2 to delineate the extent of LNAPL and refine the extent of polychlorinated biphenyl (PCB) impacts identified at the monitoring well 70-101, 70-103, and 70-107R Areas; to refine the extent of PCB impacts in surface soils at the 70-101, 70-103, RFI-81-22, SB-81-02, and SB-81-04 areas; and to characterize methane concentrations in soil gas at the property boundary (**Figures E-A1-1**).

70-101 Area

At the 70-101 area four temporary wells (TW-70-101-8 through TW-70-101-10 and TW-70-101-16) were installed to refine the LNAPL delineation (**Figure E-A1-1**). The four temporary wells were completed to a depth of approximately 10 feet below ground surface (ft bgs). Soil samples were collected at each temporary well from 0 to 2, 3 to 5, and 7 to 9 ft bgs and submitted to the laboratory for PCB analysis. Three additional wells (TW-70-101-17 through TW-70-101-19) were attempted to delineate LNAPL extents near the property boundary; however, shallow refusal was encountered in this area and wells were not installed.

In addition ten shallow soil borings (SB-70-101-11 through SB-70-101-15, and SB-70-101-17 through SB-70-101-21) were completed to delineate PCB impacts in surface soils in the 70-101 area (**Figure E-A1-1**). Shallow soil samples were also collected from TW-70-101-17 and TW-70-101-19, prior to meeting refusal. Soil samples were collected at each boring from 0 to 2 and 2 to 4 ft bgs and submitted to the laboratory for analysis of PCBs.

LNAPL samples were collected from TW-70-101-2, TW-70-101-7, and TW-70-101-8 and submitted to the laboratory for PCB analysis.

70-103 Area

At the 70-103 area eight additional temporary wells (TW-70-103-12 through TW-70-103-17 TW-70-103-19, and TW-701-03-20) were installed to refine the LNAPL delineation (**Figure E-A1-1**). The temporary wells were completed to a depth of approximately 10 feet bgs. Soil samples were collected at each temporary well location from 0 to 2, 3 to 5, and 7 to 9 ft bgs and submitted to the laboratory for PCB analysis.

In addition four shallow soil borings (SB-70-103-18 through SB-70-103-21) were completed to delineate PCB impacts in surface soils in the 70-103 area (**Figure E-A1-1**). Soil samples were collected at each boring from 0 to 2 and 2 to 4 ft bgs and submitted to the laboratory for analysis of PCBs.

In addition, LNAPL samples were collected from monitoring wells 70-103 and TW-70-103-08 and submitted to the laboratory for PCB analysis.

70-107R Area

At the 70-107 area two additional temporary wells (TW-70-107R-11 and TW-70-107R-12) were completed to refine the LNAPL delineation (**Figure E-A1-1**). The wells were completed to a depth of approximately 10 feet bgs. Soil samples were collected from each temporary well location from 0 to 2, 3 to 5, and 7 to 9 ft bgs and submitted to the laboratory for PCB analysis.

In addition three shallow soil borings (SB-70-107R-13 through SB-70-107R-15) were completed to delineate PCB impacts in surface soils in the 70-107 area (**Figure E-A1-1**). Soil samples were collected at each boring from 0 to 2 and 2 to 4 ft bgs and submitted to the laboratory for analysis of PCBs.

SB-81-01 Area

At the SB-81-01 area one soil boring (SB-81-10) was completed to delineate PCB impacts in surface soils. The soil boring was completed 10 feet north of SB-81-01 (**Figure E-A1-1**). Soil samples were collected from 0 to 2 and 2 to 4 ft bgs and submitted to the laboratory for PCB analysis.

SB-81-02 Area

At the SB-81-02 area four step-out soil borings (SB-81-11 through SB-81-14) were completed to delineate PCB impacts in surface soils. The step-out borings were completed 10 feet in each direction from SB-81-02 (**Figure E-A1-2**). Soil samples were collected at each boring from the 0 to 2 and 2 to 4 ft bgs interval and submitted to the laboratory for PCB analysis.

RFI-81-22 Area

At the RFI-81-22 area four step-out soil borings (SB-81-06 through SB-81-09) were completed to delineate PCB impacts in surface soils. The step-out borings were completed 10 feet in each direction from RFI-81-22 (**Figure E-A1-1**). Soil samples were collected at each soil boring from the 0 to 2 and 2 to 4 ft bgs interval and submitted to the laboratory for PCB analysis.

Soil Gas Evaluation

Two soil gas sampling probes (SGP-81-01 and SGP-81-02) were installed to evaluate methane along the property boundary adjacent to the AOI 81-2 LNAPL Areas. Two rounds of soil gas samples were collected

from each probe (in June and November 2015) and submitted to the laboratory for methane analysis. In addition the second round of samples were also analyzed for volatile organic compounds (VOCs).

Summary of Data Evaluation

70-101 Area

At the 70-101 Area a total of 35 soil samples were submitted for PCB analysis. PCBs were detected in 16 samples collected from 12 locations. Where detected PCB concentrations in soil samples ranged from 0.12 milligrams per kilogram (mg/kg) to 15 mg/kg (**Table E-A1-1**).

Temporary wells TW-70-101-8 through TW-70-101-10 and TW-70-101-16 (**Figure E-A1-1**) were gauged several times in 2014 and 2015. LNAPL was only detected at a thickness greater than 0.1 inches at TW-70-101-8. LNAPL samples were collected from previously installed wells TW-70-101-2, TW-70-101-7, as well as TW-70-101-8 and submitted to the laboratory for PCB analysis. PCBS were detected in the LNAPL samples at concentrations of 67 mg/kg at TW-70-101-2, 81 mg/kg at TW-70-101-7, and 9 mg/kg at TW-70-101-8 (**Table E-A1-3**).

70-103 Area

At the 70-103 Area a total of 32 soil samples were submitted for PCB analysis. PCBs were detected in 17 soil samples collected from nine locations. Where detected PCB concentrations of PCBs in soil samples ranged from 0.2 mg/kg to 7.8 mg/kg (**Table E-A1-1**).

Temporary wells TW-70-103-12 through TW-70-103-17 TW-70-103-19, and TW-701-03-20 (**Figure E-A1-1**) were gauged several times in 2014 and 2015. LNAPL was only detected at a thickness greater than 0.1 inches at TW-70-103-13. LNAPL samples were collected from previously installed wells 70-103 and TW-70-103-08 and submitted to the laboratory for PCB analysis. PCBS were detected in the LNAPL samples at concentrations of 18 mg/kg at 70-103 and 71 mg/kg at TW-70-103-8 (**Table E-A1-3**).

70-107R Area

At the 70-107R Area a total of 11 soil samples were submitted for PCB analysis. PCBs were detected at in six samples collected from five locations. Where detected PCB concentrations in soil samples ranged from 0.25 mg/kg to 7.5 mg/kg (**Table E-A1-1**).

Temporary wells TW-70-107R-11 and TW-70-107R-12 (**Figure E-A1-1**) were gauged several times in 2014 and 2015. LNAPL was only detected at a thickness greater than 0.1 inches at TW-70-107R-11. LNAPL samples were not collected due to insufficient sample volume at TW-70-107R-11.

SB-81-01 Area

Two soil samples were collected from boring SB-81-10 (**Figure E-A1-1**) and submitted for PCB analysis. PCBs were not detected in either sample.

SB-81-02 Area

At the SB-81-02 Area (**Figure E-A1-1**) a total of eight soil samples were submitted for PCB analysis. PCBs were detected at in seven samples collected from four locations. Where detected PCB concentrations in soil samples ranged from 0.72 mg/kg to 10.2 mg/kg (**Table E-A1-1**).

RFI-81-22 Area

At the RFI-81-22 Area (**Figure E-A1-1**) a total of eight soil samples were submitted for PCB analysis. PCBs were detected at in two samples collected from one location. Detected concentrations of PCBs in soil samples ranged from 2.4 mg/kg to 3.2 mg/kg (**Table E-A1-1**).

Soil Gas Evaluation

Two soil gas sampling probes (SGP-81-01 and SGP-81-02) were installed to evaluate methane along the property boundary adjacent to the AOI 81-2 LNAPL Areas. Two rounds of soil gas samples were collected from each probe in June and November 2015 and submitted to the laboratory for methane analysis. In addition the second round of samples were also analyzed for volatile organic compounds (VOCs). (**Table E-A1-2**). Neither methane nor any VOCs were detected in the four soil gas samples.

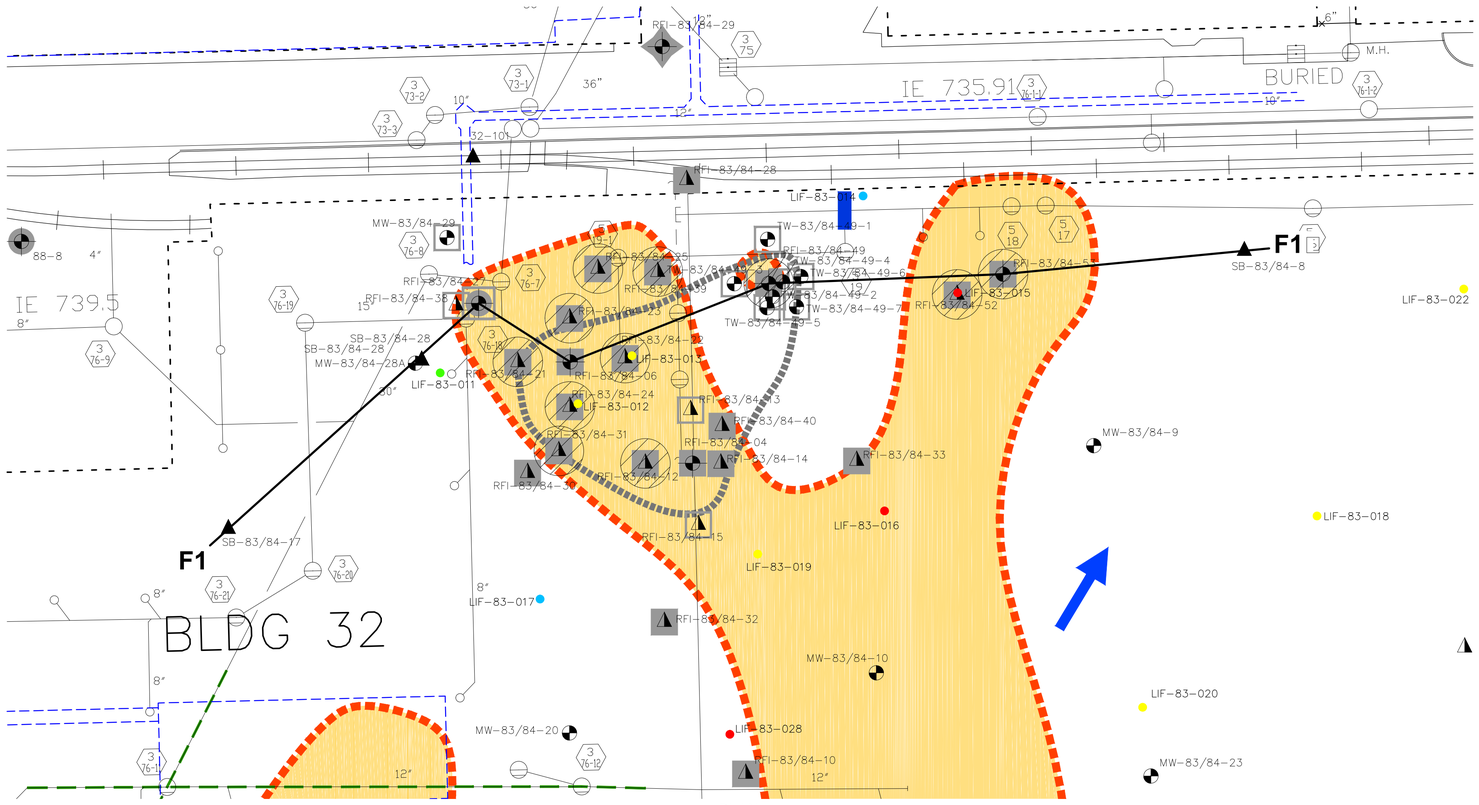
Subject:
Priority #7 - AOI 83/84-2 Cutting Oil LNAPL Area
Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

As part of the light non-aqueous phase liquid (LNAPL) remedy evaluation process, the Site's 17 LNAPL areas were prioritized based on risk. The area of interest (AOI) AOI 83/84-2 Cutting Oil LNAPL Area (AOI 83/84-2 LNAPL Area) is ranked as Priority #7 with a total potential risk score of 7 (**Table 5 of the main report**). A conceptual site model cross-section is attached (**Figures F-1 and F-2**) that provides an overview of the AOI 83/84-2 LNAPL Area impacts.

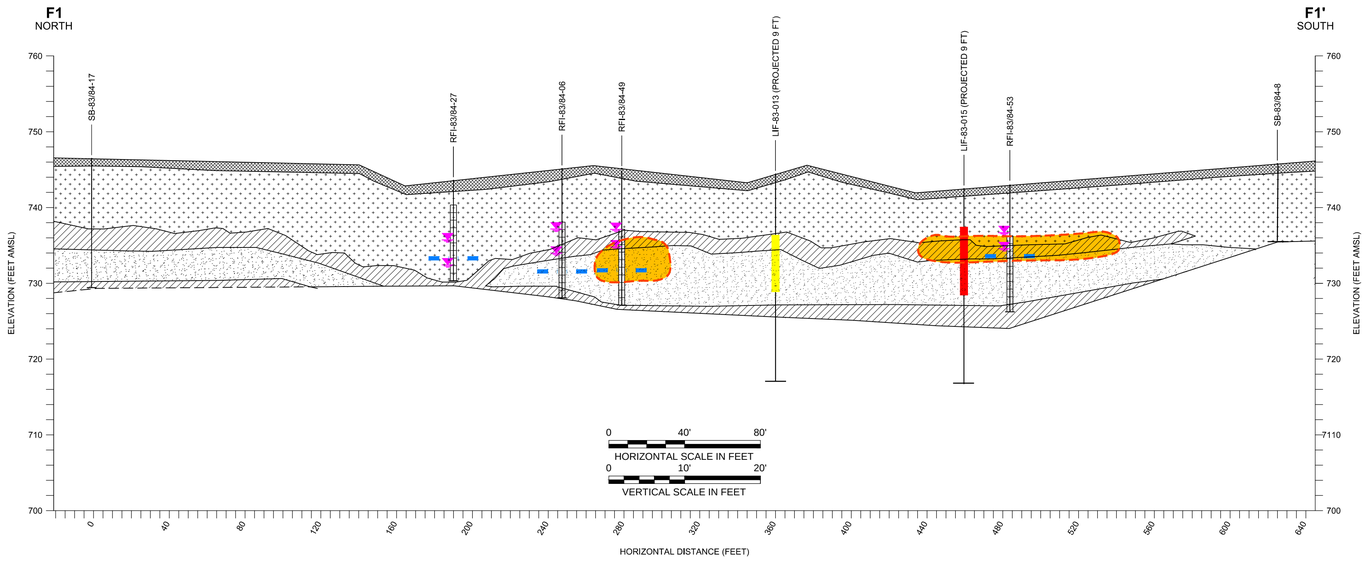


Historical interim measures (IMs) completed at the AOI 83/84-2 LNAPL Area include a product recovery ell an LNAPL bailing program, and bulkheading at the Outfall 003 and Outfall 005 storm sewers. Partial removal of LNAPL completed in this area is considered a component of the remedy.

The compositional and saturation concerns identified for the AOI 83/84-2 LNAPL Area were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:

- Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios due to the biodegradation of LNAPL generating methane; however, this will be addressed by the proposed institutional controls.

- Engineering controls are required to effectively mitigate the potential risks associated with particulate soil inhalation and direct contact exposures associated with future redevelopment scenarios.
- Additional evaluation of the volatile soil inhalation criteria exceedance is required to determine an appropriate remedy recommendation.
- No feasible options exist to mitigate unacceptable risk through compositional change.
- The LNAPL may be readily recoverable in the southern portion of the plume.
- The Outfall 003 and 005 storm sewers have been bulkheaded in this portion of the Site, so the mobility concerns have been addressed and the GSI pathway is not applicable at this AOI.
- PCBs were detected in LNAPL samples collected from the AOI 83/84-2 LNAPL Area at concentrations ranging from 6.1 to 62.4 parts per million (ppm). A targeted excavation in the area surrounding RFI-83/84-49 will remove the highest concentration of PCBs at 62.4 ppm. Due to the nature and extent of PCB impacts, it is requested that the remaining PCB impacts at AOI 83/84-2 be allowed to remain in place and the area be designated as low occupancy [per 761.61(a)(4)(i)(B)].



Based on the current understanding of conceptual site model risks, engineering and institution controls can effectively mitigate the risks associated with particulate soil inhalation, direct contact, and potential volatilization to indoor air concerns for a future structure. The mobility concerns have been addressed through bulkheading activities. Additionally, a targeted excavation will be completed at RFI-83/84-49 to remove PCB-impacted soils/LNAPL in this area.

Attachment 1

LNAPL Conceptual Site Model

Priority #7 - AOI 83/84-2 Cutting Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model for the Area of Interest (AOI) 83/84-2 Cutting Oil light non-aqueous phase liquid (LNAPL) Area (AOI 83/84-2 LNAPL Area). The AOI 83/84-2 LNAPL Area is located at the Northend of the Buick City Site (Site), located in Flint, Michigan (**Figure F1-1**).

1. Background

AOI 83/84-2 is located in the southern portion of Building 32, which is part of the former Factory 83/84 Area located in the southwestern portion of the Northend of the Site (**Figure F1-2**). Historically, the former Factory 83/84 Area was used for the manufacture of front- and rear-axle assemblies prior to 1981. From 1981 to 2010, the area was used for manufacturing "white metals" components such as water pumps, pistons, and manifolds. Former Building 32 includes two basement areas where product was observed on standing water in the tunnel of former Building 32. The presence of the AOI 83/84-2 LNAPL Area is presumably due to historical releases associated with operations in this area.

Historic operations in former Building 32 included both "wet" and "dry" operations involving various metal chip conveyors trenches, process fluid recirculation and/or recovery sumps and pits, product supply sumps and storage areas, and metal chip processing.

Investigation data previously presented in Site reports are not re-presented in this memo. However, pertinent AOI 83/84-2 investigation data that has not previously been presented in a Site report is attached.

2. Former Interim Measures

2.1. LNAPL Monitoring and Bailing Program

During the Site-wide LNAPL monitoring program conducted from 2003 through 2005, a total of approximately 7 gallons of LNAPL was recovered during quarterly bailing events in the AOI 83/84-2 Area.

2.2. Product Recovery System

In response to the observation of LNAPL beneath the floor of former Building 32, a recovery well was installed in April 1990. There is limited information on the design of this system. The proposed design included a 24-inch-diameter recovery well with a 10-foot well screen. An automated belt-skimming device in the recovery well was proposed to be installed. The collected product was then to be routed to the Site's process waste system. The total amount of LNAPL recovered by this well is unknown.

3. AOI 83/84-2 Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and LNAPL characteristics and extent of impacts for the AOI 83/84-2 LNAPL Area.

Figure F1-2 presents the locations of the existing and abandoned monitoring wells and soil borings in the AOI 83/84-2 Area.

3.1. AOI 83/84-2 Geology and Hydrogeology

- *Geology:* The soils at AOI 83/84-2 consists primarily of fine to medium sand to silty sands to a depth of approximately 8 feet below ground surface (bgs) that are underlain by interbedded sands and silty clays/clays to depths of 25 feet bgs. The logs also indicated evidence of LNAPL impacts from as shallow as 5 feet bgs and as deep as 15 feet bgs, across the area.

- *Groundwater/LNAPL Levels:* Thirteen monitoring wells at the AOI 83/84-2 LNAPL Area are gauged to monitor the extent of the LNAPL area. Depth to groundwater (or LNAPL, where present) in this area is generally 10 feet bgs; although it has been measured as shallow as 6.03 feet bgs and as deep as 14.21 feet bgs. The AOI 83/84-2 LNAPL Area is currently defined by six monitoring wells at AOI 83/84-2 (RFI-83/84-04, RFI-83/84-06, RFI-83/84-27, RFI-83/84-49, RFI-83/84-53, and MW-83/84-10) with measured LNAPL thicknesses greater than 0.1 feet. Additionally, LNAPL has also been measured at a thickness of 0.02 feet at MW-83/84-22. During the last three years, thicknesses of LNAPL have ranged from approximately 0.05 feet (RFI-83/84-04) to 6.96 feet (RFI-83/84-27). Correlations between the depth to groundwater and LNAPL thicknesses are not evident at AOI 83/84-2. The groundwater/LNAPL gauging data are presented in **Appendix X.**

  Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the southeast.

3.2. Groundwater and Soil Analytical Data

Groundwater and soil data collected during Site investigations were compared to applicable Michigan Part 201 nonresidential criteria.

3.2.1 Groundwater Analytical Data

Groundwater concentrations from the AOI 83/84-2 Area do not exceed the applicable nonresidential criteria. All pertinent groundwater data is presented in **Appendix X**.

3.2.2 Soil VOC, SVOC and Metals Analytical Data

Concentrations in various soil samples collected from borings at AOI 83/84-2 exceed applicable non-residential direct contact criteria (NDC) for benzo(a)anthracene (81.2/80 mg/kg), benzo(a)pyrene (8.3-66.1/8 mg/kg), dibenzo(a,h)anthracene (16.9/8 mg/kg) , arsenic(47/37 mg/kg) and lead (1,200-6,500/900 mg/kg); non-residential infinite source volatile inhalation criteria (NISVI) for phenanthrene (192/190mg/kg); and non-residential particulate soil inhalation criteria (NPSIC) for manganese (1,800-3,500/1,500 mg/kg).

Based on the Human Health Risk Assessment (HHRA) presented in the 2010 Corrective Measures Proposal, chromium was identified as a concern for the redevelopment construction worker. The chromium concentration exceeded the health-based goal for redevelopment construction workers at one location within AOI 83/84-2 from 1 to 3 feet bgs.

The soil exceedances of NDC criteria are located beneath the former Factory 83/84 concrete slab. The depth of impacts range from directly beneath the slab up to 9 feet below ground surface. The soil boring and monitoring well locations are presented on **Figure F1-2**.

3.2.3 Soil PCB Analytical Data

In addition to the soil samples collected at AOI 83/84-2 during RFI activities, soil samples were collected from seven temporary well locations (TW-83/84-49-1 through TW-83/84-49-7) which were installed to delineate the LNAPL identified at RFI-83/84-49 (discussed further in Section 3.3, below). At each temporary well location, four to six soil samples were collected and submitted for PCB analysis to vertically profile the PCB impacts in soil. The locations of the temporary wells are presented on **Figure F1-3**. A total of 41 soil samples were collected from the original RFI-83/84-49 location and the seven temporary wells and an additional 44 soil samples were collected during the RFI for a total of 85 soil samples. Six of the soil samples detected PCBs at concentrations ranging from 0.1 to 3.6 ppm. All pertinent soil data is

presented in **Appendix X**.

3.2.4 GSI Evaluation

The Outfall 003 and 005 storm sewers have been bulkheaded in this portion of the Site, so the mobility concerns have been addressed and the GSI pathway is not applicable at this AOI.

3.2.5 Vapor Intrusion Evaluation

Due to the presence of shallow groundwater and LNAPL (approximately 8 feet below ground surface) at AOI 83/84-2, groundwater data were also compared to the applicable Non-Residential Screening Values for the Vapor Intrusion Pathway presented in the *Michigan Department of Environmental Quality (MDEQ) Guidance Document for the Vapor Intrusion Pathway* (further discussed in Section 3.4 of the Report). Groundwater concentrations do not exceed applicable screening levels.

As there are no structures at the Site, the MDEQ Part 201 criteria are appropriate for comparison of soil data. As discussed in Section 3.2.2, phenanthrene was detected at concentrations exceeding NISVI criteria at RFI-83/84-22 and manganese was detected at concentrations exceeding NPSIC criteria in soil samples collected from the RFI-83/84-21, RFI-83/84-23, RFI-83/84-24, and RFI 83/84-39.

3.3. LNAPL Characteristics

- *LNAPL Analytical Data:* LNAPL present at AOI 83/84-2 consists primarily of cutting oil. Additional analysis indicated that:

  - The LNAPL has a viscosity ranging from 37.6 centipoise (cp) (RFI-83/84-06) to 102.94 cp (RFI-83/84-53), interfacial tension ranging from 23 dynes/centimeter (cm) (RFI-83/84-49) to 27 dynes/cm (RFI-83/84-06), and a specific gravity ranging from 0.89 (RFI-83/84-06) to 0.90 (RFI-83/84-49).

  - The LNAPL contains lead at concentrations that exceed RCRA toxicity characteristic criteria at one location (MW-83/84-10); however, TCLP analysis has not been conducted.

  - Five LNAPL samples were collected from the AOI 83/84-2 and submitted for polychlorinated biphenyls (PCB) analysis. PCBs were detected in four of the samples at concentrations ranging from 1 to 62.4 parts per million. PCBs were detected in LNAPL at a concentration that is greater than the Toxic Substance Control Act (TSCA) level of 50

parts per million (ppm) at one location RFI-83/84-49.

For reference, the viscosity (at 100 degrees Fahrenheit) of olive oil is 43.2 cp and honey is 73.6 cp (Ingersoll-Rand, 1981). The LNAPL analytical data are presented in **Appendix X**.

- *LIF Data:* Eleven LIF borings were completed in the AOI 83/84-2 Area. The LIF waveform signatures observed at AOI 83/84-2 are consistent with the known LNAPL type, cutting oil. The vertical range of LIF impact (greater than 5%RE) at AOI 83/84-2 is typically 5 to 15 feet bgs in the eastern portion of the LNAPL area and 5 to 12 feet in the western portion of the LNAPL area. **Figure F1-2** presents the results of the LIF investigation and the extent of impacts associated with the AOI 83/84-2 LNAPL Area.

- *Transmissivity:* An LNAPL transmissivity study was completed at the AOI 83/84-2 LNAPL Area in April and August 2013, which consisted of completing baildown testing at three monitoring wells (MW-83/84-10, RFI-83/84-27 and RFI-83/84-53). Based on LNAPL baildown test results, LNAPL transmissivities quantified at monitoring well MW-83/84-10 (located in the western portion of the LNAPL Area) was 0.03 square feet per day (ft^2/day); at RFI-83/84-27 (located in the northern portion of the LNAPL area) was 0.02 ft^2/day; and at RFI-83/84-53 (located in the southern portion of the LNAPL area) was 4.1 ft^2/day. The transmissivity data in the northern and western portion of the LNAPL area are less than both the Interstate Technology and Regulatory Council (ITRC) and MDEQ threshold values for recovery. The LNAPL transmissivity from the southern portion of the LNAPL Area is greater than both the ITRC and MDEQ threshold values for recovery which indicates LNAPL recovery is likely practical at this location.

- *Natural Source Zone Depletion:* NSZD testing was not attempted at AOI 83/84-2 due to the presence of a concrete slab. The testing completed at the Southend of the Site indicated that NSZD is occurring; however, the currently available testing technologies cannot reliably quantify the depletion beneath a concrete slab.

3.4. Extent of LNAPL

During the RCES preparation, the AOI 83/84-2 LNAPL area (with greater than 0.5 ft of LNAPL) was calculated to be approximately 49,500 square feet based on historical data. Following additional delineation and investigation work at the AOI 83/84-2 LNAPL Area the revised (as discussed in Section 2.1.3 of the main report) extent is approximately 82,000 square feet.(with 0.1 ft or greater of LNAPL). Based on the LIF and soil boring log data, approximate depth impacts are approximately 5 to 15 ft bgs.

LNAPL Remedial Decision Tree

Attachment 2 LNAPL Remedial Decision Tree Priority #7 – AOI 83/84-2 Cutting Oil Area

NOTES

(#) NOTES: See Page F2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priority #7 - AOI 83/84-2 Cutting Oil Area

Background: The area of interest (AOI) 83/84-2 Cutting Oil light non-aqueous phase liquid (LNAPL) Area (AOI 83/84-2 LNAPL Area) is located in the southern portion of Building 32, which is part of the former Factory 83/84 Area located in the southwestern portion of the Northend of the Site. Historically, the former Factory 83/84 Area was used for the manufacture of front- and rear-axle assemblies. From 1981 to 2010, the area was used for manufacturing "white metals" components such as water pumps, pistons, and manifolds. Former Building 32 includes two basement areas where product was observed on standing water in the tunnel of former Building 32. The presence of the AOI 83/84-2 LNAPL Area is presumably due to historical releases associated with operations in this area. There are currently no buildings within the AOI 83/84-2 LNAPL Area and the area is beneath the former Building 32 slab.

Geology and Hydrogeology: The soils at AOI 83/84-2 consists of primarily fine to medium sand to silty sands to a depth of approximately 8 feet bgs that are underlain by interbedded sands and silty clays/clays to depths of 25 feet bgs. Depth to groundwater in this area varies greatly and has been measured as shallow as 6.03 feet bgs, as deep as 14.56 feet bgs, and averages around 8 to 10 feet bgs. Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the southeast.

LNAPL Characteristics: Logs in the AOI 83/84-2 LNAPL Area show evidence of LNAPL impacts from 5 to 15 feet bgs in the eastern portion of the LNAPL Area and 5 to 12 feet in the western portion of the LNAPL Area. Thicknesses of product greater than 0.1 feet have been measured at six of the monitoring wells (RFI-83/84-04, RFI-83/84-06, RFI-83/84-27, RFI-83/84-49 RFI-83/84-53, and MW-83/84-10). During the last three years, thicknesses of LNAPL have ranged from approximately 0.05 feet (RFI-83/84-04) to 6.96 feet. At AOI 83/84-2, the LNAPL has a viscosity ranging from 37.6 centipoise (cp) (RFI-83/84-06) to 102.94 cp (RFI-83/84-53), interfacial tension ranging from 23 dynes/centimeter (cm) (RFI-83/84-49) to 27 dynes/cm (RFI-83/84-06), and a specific gravity ranging from 0.89 (RFI-83/84-06) to 0.90 (RFI-83/84-49). In addition, the LNAPL also contains lead at concentrations that exceed RCRA toxicity characteristic criteria at one location (MW-83/84-10); however, TCLP analysis has not been conducted. PCBs were detected in four of the LNAPL samples at concentrations ranging from 1 to 62.4 parts per million.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*

   YES – The following potential risk/exposure concerns are associated with the AOI 83/84-2 LNAPL Area:

   - Particulate Soil Inhalation (Ambient Air) Concerns: The concentrations manganese detected in soil at the AOI 83/84-2 exceed the particulate soil inhalation criteria. Engineering and institutional controls will be implemented to control this exposure risk.
   - Volatile Soil Inhalation (Ambient Air) Concerns: The concentrations of phenanthrene detected in soil at AOI 83/84-22 exceed the infinite source volatile inhalation criteria. Additional evaluation of this exceedance will be completed to determine an appropriate remedy recommendation.
   - Direct Contact: Select SVOCs and metals were detected in soil at concentrations that exceed direct contact criteria. In addition, concentrations of PCBs in LNAPL exceed direct contact criteria. The AOI 83/84-2 LNAPL Area is located beneath the former Factory 83/84 slab. The shallowest LNAPL impacts are located approximately 5 feet below ground surface, and represent a potential concern for future construction or utility workers. This PCB exposure risk will be addressed by completing a targeted excavation as presented in the 761.61 (c) determination in **Attachment 3** and the SVOCs, arsenic, chromium, and lead exposure risk will be addressed by maintaining the surface cover and institutional controls.
   - Potential Volatilization to Indoor Air Concerns for Future Structures: Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*

   NO – The following is a general discussion regarding the feasibility of various compositional change remediation strategies for the AOI 83/84-2 area:

   - Enhanced dissolution and recovery via surfactant or hot water flushing is not likely feasible. Bench-scale testing completed on similar LNAPL (hydraulic oil) at the Southend of the Site did not result in any increased recovery. In addition use of surfactants would also mobilize the PCBs in the LNAPL.
   - LNAPL constituents of cutting oil have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.

- In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of PCBs in the LNAPL. In addition, it does not represent an economically feasible remedial alternative given the large area that would need to be addressed.
- Targeted in-situ soil mixing/land farming using biological additives to address the petroleum constituents; is not a viable option due to the presence of PCBs.

3) Is there a potential benefit to partial treatment/removal that outweighs costs?

NO – The compositional concerns can be addressed as follows:

- Particulate Soil Inhalation - Based on the current understanding of risk conditions, the soil inhalation risk can be effectively mitigated through engineering and institutional controls.
- Volatile Soil Inhalation – Additional evaluation is required to determine an appropriate remedy; however, this exceedance is located in a soil sample collected from 3 to 5 feet bgs which appears to be above the LNAPL impact and likely unrelated. Therefore, partial treatment or removal of LNAPL would not address this risk.
- Direct Contact – The direct contact concerns associated with SVOCs, arsenic, chromium, and lead will be addressed by maintaining the existing surface cover and institutional controls. The direct contact concerns associated with PCBs will be addressed by completing an excavation as presented in **Attachment 3.**
- Potential Volatilization to Indoor Air Concerns for Future Structures - Based on the current understanding of risk conditions, the potential volatilization to indoor air risk can be effectively mitigated through institutional controls.

4) Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?

NO – While the LNAPL is mobile in the vicinity of the Outfall 003 and 005 storm sewers, the AOI 83/84-2 LNAPL Area appears to be stable. This finding is supported by the following lines of evidence:

- Well Gauging Data: Sentinel wells located downgradient of the AOI 83/84-2 LNAPL Area have remained free of LNAPL since monitoring began approximately 10 years ago.
- Age of LNAPL Release: The AOI 83/84-2 LNAPL area was identified in 1990. Operations began in this portion of the Site in the 1950's and ceased in this portion of the Site ceased in 2010. LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).

5) *Is LNAPL mobile within the stable LNAPL perimeter?*

YES – LNAPL was infiltrating the Outfall 003 and 005 storm sewers, which have been bulkheaded in this area. In addition, LNAPL is present at monitoring wells in the AOI 83/84-2 area indicating that the LNAPL is mobile within the stable perimeter.

6) Is LNAPL readily recoverable?

YES – The results of historic interim measures (IM) indicate that portions of the AOI 83/84-2 LNAPL Area may be readily recoverable. These activities are summarized below:

- During the Site-wide LNAPL monitoring program conducted from 2003 through 2004, a total of approximately 7 gallons of LNAPL was recovered during quarterly bailing events in the AOI 83/84-2 area.
- In 1990, a product recovery well was installed to recover LNAPL beneath the floor of former Building 32. The LNAPL was then piped to the Site's process waste system. The total amount of LNAPL recovered is unknown.

In addition, the LNAPL transmissivity quantified at RFI-83/84-53 was 4.1 ft^2/day indicating that recovery is likely practical in the southern portion of the LNAPL area. However, the LNAPL transmissivity quantified at MW-83/84-10 and RFI-83/84-27 are below both the ITRC and MDEQ draft standard threshold values, indicating that recover is not practical in the northern and eastern portions of the LNAPL area.

7) Will the potential benefit of LNAPL recovery outweigh costs?

NO – Compositional and saturation concerns can be addressed through the proposed targeted excavation and engineering and institutional controls.

8) Are controls required?

YES – The following AOI-specific institutional and engineering controls, in addition to the Site-wide institutional controls, are proposed for the AOI 83/84-2 area to limit future exposure:

Attachment 2 Notes

Priority #7 - AOI 83/84-2 Cutting Oil Area

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads (as shown on **Figure 5 of the main report**).
- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present (as shown on **Figure F3-1**) to prevent direct contact with contaminated material except with using appropriate health and safety measures during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the NREPA.
- Notify future owners of the presence of PCBs, and
- Restrict the area containing PCB-impacted LNAPL to low occupancy (as shown on **Figure F3-2**).

761.61(c) Risk Based Cleanup and Disposal Request

Priority #7 – AOI 83/84-2 Cutting Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – 761.61(c) Risk Based Cleanup and Disposal Request

---

This attachment presents the information required to support a 761.71(c) determination for the Area of Interest (AOI) 83/84-2 light non-aqueous phase liquid (LNAPL) Area.

1. Area Background and History

The AOI 83/84-2 LNAPL Area is located at the Northend of the Site in the former Factory 83/84 area and is likely associated with historic releases associated with operations. LNAPL associated with the AOI 83/84-2 LNAPL Area has been identified in monitoring wells RFI-83/84-04, RFI-83/84-06, RFI-83/84-27, RFI-83/84-49, RFI-83/84-53, MW-83/84-10, and MW-83/84-22.

2. Summary of SOPs and Investigation Results

AOI 83/84-2 has been previously investigated as part of the Site's RCRA Facility Investigation activities. In 2013, additional sampling was conducted to refine the conceptual site model. The RFI Work Plan presents the standard operating procedures, field sampling procedures, quality assurance/quality control procedures, etc. used during the investigation. The results of the investigations (including laboratory analytical reports) are presented in this report, as well as the RFI Phase I and RFI Phase II reports.

3. Nature of Contamination

At AOI 83/84-2, samples of LNAPL, soil and groundwater have been analyzed for PCBs. Below is a brief summary of results.

- LNAPL samples were collected from five monitoring wells (MW-83/84-10, RFI-83/84-06, RFI-83/84-27, RFI-83/84-49, and RFI-83/84-53) (**Figure F3-1**). PCBs were detected in four of the samples at concentrations ranging from 1 part per million (ppm) to 62.4 ppm.
- A total of 85 soil samples collected from the AOI 83/84-2 Area were analyzed for PCBs. PCBs were detected in 15 of the samples, 14 of which detected PCBs at concentrations less than 1 ppm. The maximum detection of PCBs in soil was 3.6 ppm.

- Three groundwater samples collected from side gradient and downgradient wells (RFI-83/84-02, RFI-83/84-27, and RFI-83/84-29) in the AOI 83/84-2 Area were analyzed for PCBs. No PCBs were detected in the groundwater samples.

4. Extent of Impacts

At AOI 83/84-2, PCB impacts are associated with the LNAPL. **Figure F3-1** shows the approximate extent of the AOI 83/84-2 LNAPL Area. As discussed above, LNAPL has been detected in seven monitoring wells at AOI 83/84-2. The concentrations of PCBs detected in the LNAPL samples vary within the AOI 83/84-2 LNAPL Area. PCBs were not detected at RFI-83/84-27 and were detected at concentrations of 1 ppm at RFI-83/84-53, 6.1 ppm at RFI-83/84-06, 16 ppm at MW-83/84-10, and 62.4 ppm at RFI-83/84-49.

In order to further delineate the PCB impacts at RFI-83/84-49, seven temporary wells were installed (**Figure F3-2**). At each temporary well location, four to six soil samples were collected and submitted for PCB analysis to vertically profile the PCB impacts in soil. A total of 41 soil samples were collected from the original RFI-83/84-49 location and the seven temporary wells. Six of the soil samples detected PCBs at concentrations ranging from 0.1 to 3.6 ppm. To date, no LNAPL has been detected in the seven temporary wells, suggesting that the LNAPL mobility in the vicinity of RFI-83/84-49 is minimal.

The depth to LNAPL is approximately 8 to 10 feet bgs in both the eastern and western portions of the LNAPL area. The depth of impacts is typically 5 to 15 feet bgs in the eastern portion of the LNAPL area and 5 to 12 feet in the western portion of the LNAPL area.

5. Risk Based Procedure

A targeted excavation is proposed to address the PCB impacts at RFI-83/84-49 to remove impacts greater than 25 ppm. The PCB impacts have been delineated by temporary wells as shown on **Figure F3-2**; however, due to the presence of subsurface obstructions (utilities and a vault) to the north and east, the extent of the excavation is expected to be as shown on **Figure F3-2.**

The scope of work for additional delineation will be included in a remedy implementation work plan. The work plan will include the detailed scope for the excavation activities; however a brief summary of the plan is provided below:

- Complete investigation work necessary to refine the extents of the excavation.
- Prior to excavation, LNAPL will be removed from wells in the area of excavation to minimize accumulation during excavation.
- Complete excavation to the water table (that averages a depth of 10 feet bgs). It is planned that the excavation will be completed when the water table is at its lowest to maximize removal of impacted soils.
- LNAPL-impacted soils removed during remediation activities will be characterized and disposed of using “as found” concentrations.

Following completion of the targeted excavation, a portion of AOI 83/84-2 will be restricted to low occupancy use. Additional deed restrictions placed on the AOI 83/84-2 LNAPL Area to protect future users from PCB impacts will include the Site-wide deed restrictions as noted in the main report and these AOI-specific deed restrictions:

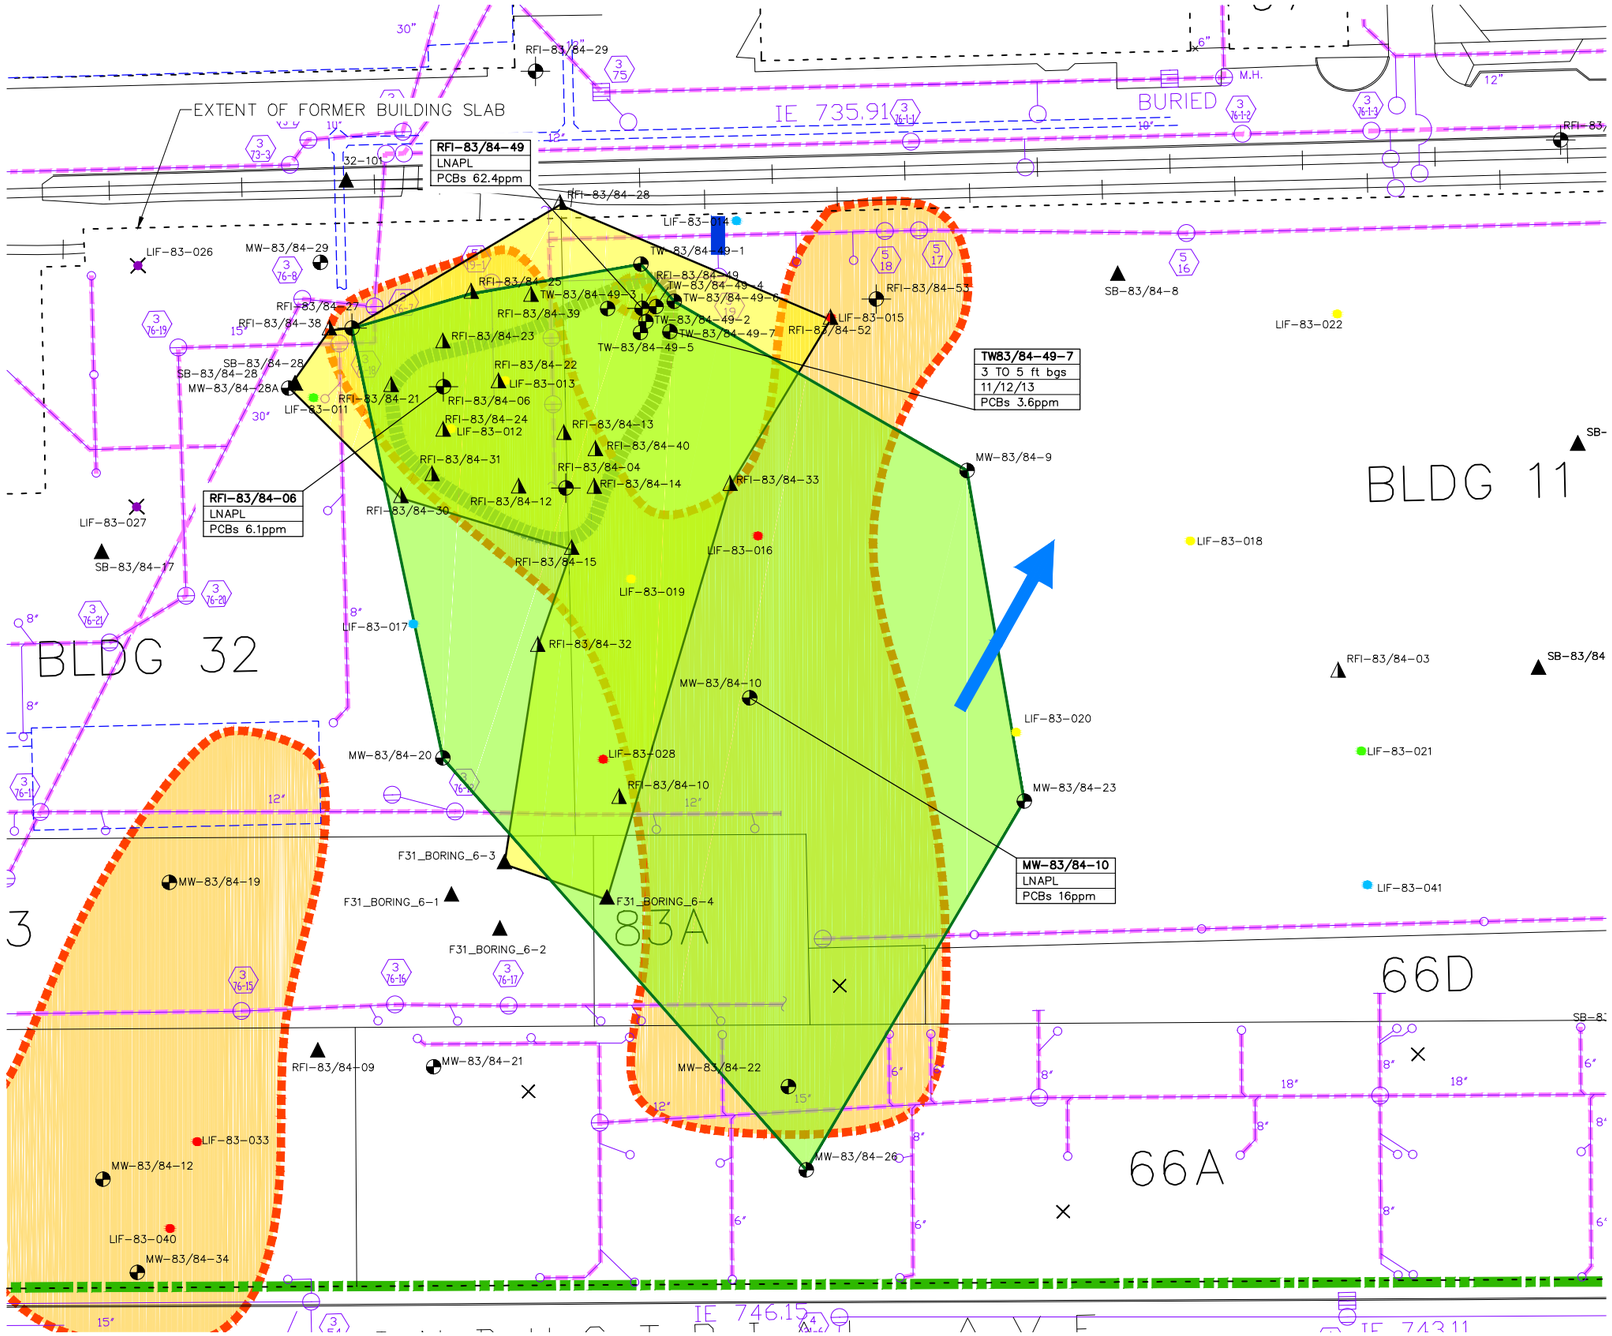
- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads (as shown on **Figure 5 of the main report**).
- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present (as shown on **Figure F3-1**) to prevent direct contact with contaminated material except with using appropriate health and safety measures during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the NREPA.
- Notification to future owners of the presence of PCBs, and
- Restrict the area containing PCB-impacted LNAPL to low occupancy (as shown on **Figure F3-1**).

6. Evaluation of Alternatives

The following technologies were evaluated to address LNAPL at AOI 83/84-2:

- Targeted in-situ soil mixing/land farming uses biological additives to address the petroleum constituents; however, the PCBs would remain and could become mobilized.

- Enhanced dissolution and recovery via surfactant or hot water flushing is not likely feasible. Bench-scale testing completed on similar LNAPL (hydraulic oil) at the Southend of



the Site did not result in any increased recovery. In addition, use of surfactants would also mobilize the PCBs in the LNAPL.

- In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of PCBs in the LNAPL. In addition, it does not represent an economically feasible remedial alternative given the relatively large area that would need to be addressed in order to avoid the generation of dioxins.

- LNAPL constituents at AOI 83/84-2 have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.

Attachment 4

Remedy Recommendation

Priority #7 - AOI 83/84-2 Cutting Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 4 – Recommended Remedy

This attachment presents the recommended remedies for the area of interest (AOI) 83/84-2 Cutting Oil light non-aqueous phase liquid (LNAPL) Area (AOI 83/84-2 LNAPL Area).

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in **Attachment 2** identified particulate soil inhalation, volatile soil inhalation, direct contact and potential volatilization to indoor air for future structures as compositional concerns for AOI 83/84-2. Mobility was identified as a saturation concern due to the infiltration of LNAPL to the Outfall 003 or Outfall 005 storm sewers; however, the storm sewers in the AOI 83/84-2 area have been bulkheaded.

2. Remedy Recommendation Rationale

The remedies recommended to address the compositional and saturation concerns associated with the AOI 83/84-2 LNAPL Area are targeted excavation and engineering and institutional controls. These remedies are further discussed in Section 3. The rationale for these selections is detailed below:

- The soil exceedances of non-residential particulate soil inhalation criteria (NPSIC) and non-residential direct contact (NDC) criteria are located beneath the former Factory 83/84 concrete slab. These exceedances can be effectively managed through engineering and institutional controls.
- The soil exceedance of non-residential infinite source volatile inhalation (NISVI) criteria for phenanthrene requires additional evaluation.
- Based on the current understanding of risk conditions, the potential volatilization to indoor air risk for future structures due to the biodegradation of LNAPL generating methane can be effectively mitigated through Site-wide institutional controls.
- The Outfall 003 and 005 storm sewers have been bulkheaded in this portion of the Site, so the mobility concerns have been addressed and the GSI pathway is not applicable.

- Nine quarterly LNAPL recovery events removed a total of only 7 gallons of LNAPL from AOI 83/84-2 wells from 2003 to 2005 and an unknown volume of LNAPL was recovered from a product recovery well.
- Although the LNAPL at AOI 83/84-2 is mobile within the stable perimeter, transmissivity testing indicates that recovery is not practical in the northern and western portions of the LNAPL area. In the southern portion of the AOI 83/84-2 LNAPL Area, transmissivity at RFI-83/84-53 was quantified at 4.1 ft^2/day. This value is greater than both the Interstate Technology and Regulatory Council (ITRC) and Michigan Department of Environmental Quality (MDEQ) draft threshold values for recovery, which indicates that LNAPL recovery is practicable at this location. However, LNAPL recovery at RFI-83/84-53 would not decrease the risk associated with the AOI 83/84-2 LNAPL Area.

3. AOI 83/84-2 Remedies

This section summarizes the completed and proposed remedies to address the impacts at AOI 83/84-2.

3.1 Completed Interim Measures

3.1.1 LNAPL Recovery

A Site-wide LNAPL monitoring program recovered a total of approximately 7 gallons of LNAPL in the AOI 83/84-2 area. In addition, in response to the observation of LNAPL beneath the floor of former Building 32, a recovery well was installed. The total amount of LNAPL recovered by this well is unknown. Partial removal of product has been completed in this area and is considered a component of the remedy.

3.1.2 Outfall 003 and 005 Bulkheads

As part of a recently completed IM, a bulkhead was installed at a lateral of the Outfall 003 storm sewer to eliminate the LNAPL infiltration from AOI 83/84-2. This bulkheading activity was completed in this portion of the Site in Spring 2013. Bulkheads have also been installed along the Outfall 005 storm sewer at manhole 5-19 and 5-13 to eliminate infiltration from the AOI 83/84-2 and Factory 83/84 Area. These bulkheads serve to eliminate LNAPL infiltration and the GSI pathway in the AOI 83/84-2 LNAPL Area. The locations of the bulkheads are presented on **Figure 5 of the main report**.

3.2 Additional Remedy Recommendations

The remedies recommended to address the compositional and mobility concerns associated with AOI 83/84-2 LNAPL Area are historic IMs, targeted excavation, and engineering and

institutional controls. These remedies will eliminate the infiltration pathway to the storm sewers and remove PCB impacts in the vicinity of monitoring well RFI-83/84-49 in the short term and will prevent future worker exposure to soil and LNAPL impacts in the long term.

3.2.1 Targeted Excavation

A targeted excavation is proposed to address the PCB impacts at RFI-83/84-49. As discussed in greater detail in **Attachment 3,** the PCB impacts have been delineated by temporary wells (TW-83/84-49-1, TW-83/84-49-2, TW-83/84-49-3, and TW-83/84-49-4); however, the extent of the excavation will be limited by the presence of subsurface obstructions (utilities and a vault) to the north and east**.** The proposed excavation area is shown on **Figure F3-2**.

3.2.2 003 and 005 Passive Recovery Trench Monitoring

After completion of re-routing activities the Outfall 003 and 005 bulkheads will have created two closed sections of pipe which will be used as passive recovery trenches. These trenches will be monitored for LNAPL accumulation and LNAPL will be removed, as necessary.

3.2.3 Maintaining Surface Cover

The remedy recommended to address soil impacts due to direct contact and particulate soil inhalation concerns is to maintain the existing Factory 83/84 slab over the impacted area. The area requiring surface cover is presented on **Figure F3-1**. The surface cover will be inspected and maintained to provide protection from future exposure.

3.2.4 Institutional Controls

The following AOI-specific institutional controls, in addition to the Site-wide institutional controls, will be necessary to limit potential for future exposure:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 5 in the main report**.
- Prohibit any excavation or other intrusive activity that could affect the integrity of the existing surface cover that is present (as shown on **Figure F3-1**) to prevent direct contact with contaminated material except with using appropriate health and safety measures during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could

affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the NREPA.

- Notify future owners to the presence of PCBs, and
- Restrict the area containing PCB-impacted LNAPL to low occupancy (as shown on **Figure F3-1**).

Remedy Recommendation Report
Appendix F – AOI 83/84-2 Cutting Oil Area - Addendum No.1
Summary of Additional Investigations
RACER Buick City Site, Flint, Michigan

Introduction

This Addendum No. 1 to Remedy Recommendation Report Appendix F presents a summary of the investigation data collected at the AOI 83/84-2 Cutting Oil Area from March 19, 2014 through December 31, 2015 at the Buick City Site (Site) located in Flint, Michigan.

Summary of Investigation Activities

Additional investigation activities were completed at AOI 83/84-2 to refine the extents of polychlorinated biphenyls (PCB) impacts and delineate LNAPL in the vicinity of monitoring well RFI-83/84-49 (**Figure F-A1-1**). Two temporary wells (TW-83/84-49-8 and TW-83/84-49-9) were installed to delineate LNAPL at RFI-83/84-49. The wells were completed to a depth of 15 feet below ground surface (ft bgs). Soil samples were collected at each temporary well from 7 to 9, 9 to 11, and 11 to 13 ft bgs and submitted to the laboratory for polychlorinated biphenyls (PCB) analysis.

In addition, LNAPL samples were collected from TW-83/84-49-3, TW-83/84-49-8, and TW-83/84-49-9 and submitted to the laboratory for PCB analysis.

Summary of Data Evaluation

A total of six soil samples were submitted for PCB analysis. PCBs were detected in two samples collected from TW-83/84-49-8 at concentrations of 0.05 mg/kg (9 to 11 ft bgs) and 0.6 mg/kg (11 to 13 ft bgs) and two samples collected from TW-83/84-49-9 at concentrations of 0.4 mg/kg (9 to 11 ft bgs) and 0.44 mg/kg (11 to 13 mg/kg) (**Table F-A1-1**).

In addition, temporary wells TW-83/84-49-8 and TW-83/84-49-9 were gauged four times in 2015. LNAPL was detected at a maximum thickness of 0.41 feet at TW-83/84-49-8 and 6.1 feet at TW-83/84-49-9. Samples of LNAPL were collected from TW-83/84-49-8 and TW-83/84-49-9 along with a sample from previously existing well TW-83/84-49-3 and submitted for PCB analysis. PCBS were detected in the LNAPL samples at concentrations of 3.3 mg/kg at TW-83/84-49-3, 33 mg/kg at TW-83/84-49-8, and 26 mg/kg at TW-83/84-49-9 (**Table F-A1-2**).

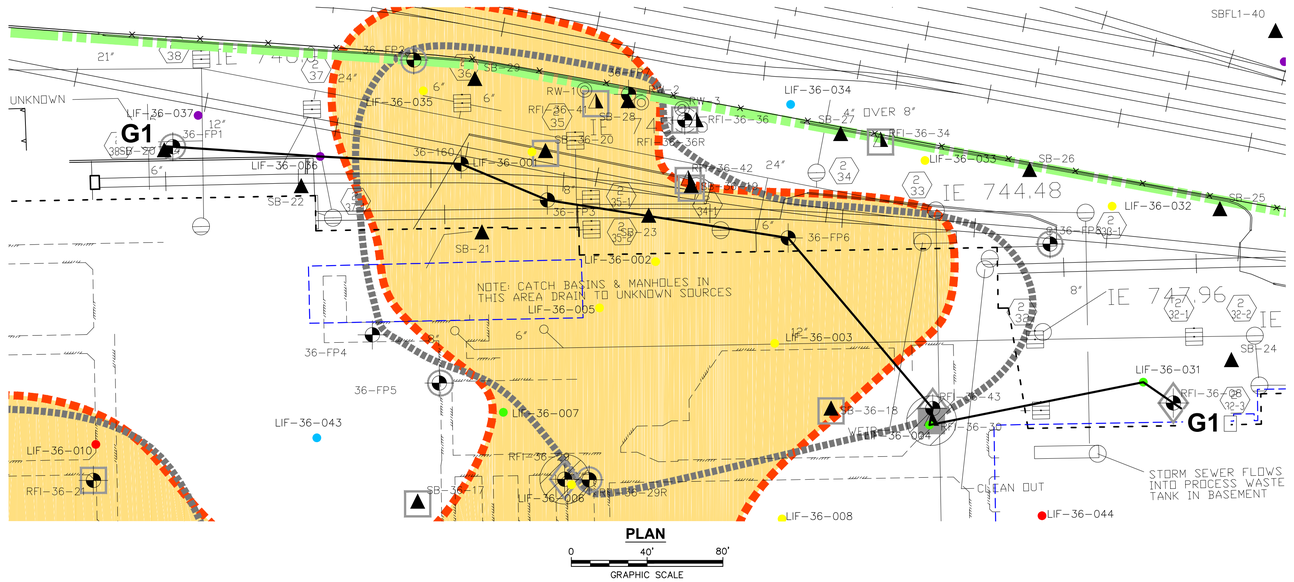
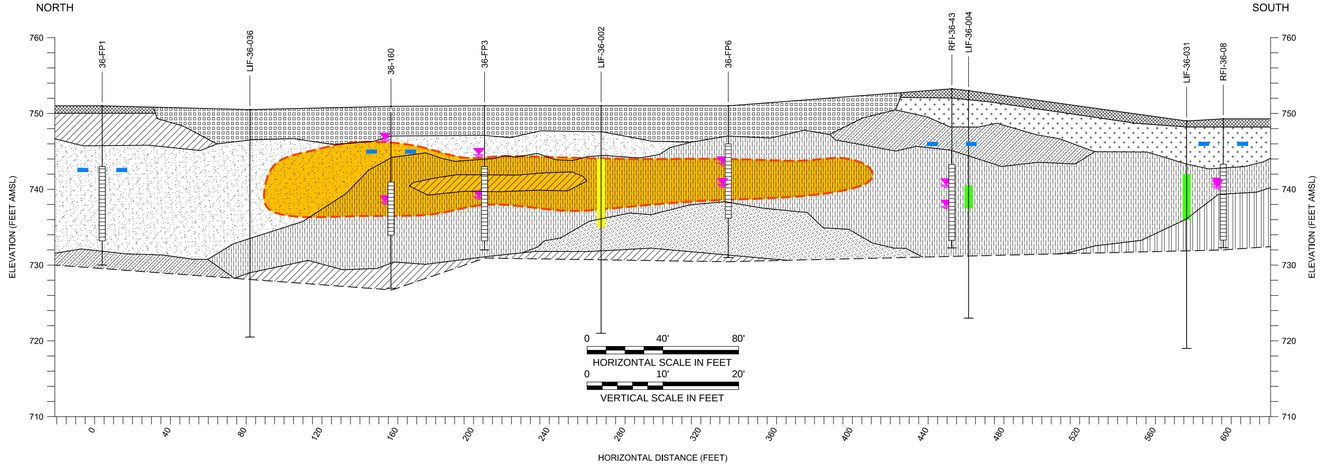
Subject:
Priorities #8, 14, & 15 - AOI 36-1/36-2 LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

As part of the light non-aqueous phase liquid (LNAPL) remedy evaluation process the Site's 17 LNAPL areas were prioritized based on risk. The AOI 36-1/36-2 LNAPL is ranked as Priorities #8, 14 & 15 with a combined total potential risk score of 8 (**Table 5 of the main report**). Two conceptual site model cross-sections are attached (**Figures G-1 and G-2**) which provide an overview of the AOI 36-1/36-2 LNAPL Area impacts and interim measures (IMs).

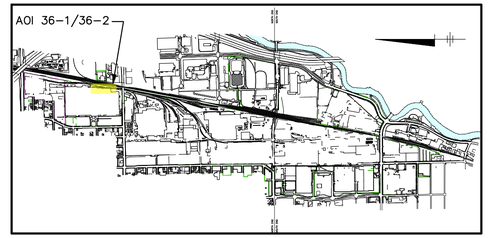


Historical IMs completed at the AOI 36-1/36-2 LNAPL area include the Factory 36 Treatment System and an LNAPL bailing program. The partial and effective removal of product was completed in this area is considered a component of the remedy.

The compositional and saturation concerns identified for the AOI 36-1/36-2LNAPL Area were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:



- There are unacceptable volatilization to indoor air for LNAPL and soil concerns for AOI 36-1, direct contact concerns for soil and LNAPL at AOI 36-1, volatile soil inhalation (ambient air) concerns, and mobility concerns for the AOI 36-1/36-2 LNAPL Area.



- Multi-phase extraction (MPE) in the central portion of the AOI 36-1/36-2 LNAPL Area is a feasible option to mitigate unacceptable risk through compositional change, due to the relatively high volatility and low viscosity of the LNAPL.
- Based on the current understanding of risk conditions, the potential volatilization to indoor air risk for future structures and direct contact concerns can be effectively mitigated through engineering and institutional controls.
- LNAPL from the AOI 36-1/36-2 area was infiltrating the Outfall 002 Storm Sewer, which has since been bulkheaded to eliminate this pathway.
- LNAPL transmissivity in the northwestern portion of the AOI 36-1/36-2 LNAPL Area indicates recovery is not practical. In addition LNAPL recovery will not result in a beneficial reduction in overall LNAPL mass or exposure risk in this area.

The remedies recommended to address the compositional and saturation concerns associated with the AOI 36-1/36-2 LNAPL Area are the 002 Passive Recovery Trench Monitoring, Multi-phase Extraction, and Engineering and Institutional Controls.

Attachment 1

LNAPL Conceptual Site Model

Priority #8, 14, & 15 - AOI 36-1/36-2 LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model for the Area of Interest (AOI) 36-1/36-2 light non-aqueous phase liquid (LNAPL) Area (AOI 36-1/36-2), which is located at the Northend of the Buick City Site (Site) located in Flint, Michigan (**Figure G1-1**).

1. Background

Historically, three LNAPL areas (AOI 36-1 Mineral Seal/Hydraulic Oil [MS/HO] Area, AOI 36-1 Gasoline Area, and AOI 36-2 Exterior MS/HO Area) have been identified at the former Factory 36 Area. However, based on the results of recently completed Site investigation activities these three LNAPL areas appear to be a single co-mingled LNAPL area. A review of the LIF responses and analytical data in all three areas indicated that the LNAPL at AOI 36-1 Gasoline Area and AOI 36-2 MS/HO Area, located in the central and southeastern portion of the AOI 36-1/36-2 LNAPL Area consists of a mixture of weathered gasoline, hydraulic oil, and diesel and the AOI 36-1 MS/HO LNAPL, located in the northwestern portion, consists primarily of a hydraulic oil/ degraded heavy fuel oil. Due to the commingled nature of the areas, the three areas have been combined into one LNAPL area identified as the AOI 36-1/36-2 LNAPL Area.

The AOI 36-1/36-2 LNAPL Area is associated with multiple historic releases in the former Factory 36 area. Releases in the northern and central portion of former Factory 36 were associated with engine manufacturing and metal machining processes. The release in the southeastern portion of former Factory 36 was associated with separating oils from metal machining chips. The gasoline release in the south central portion of Factory 36 is likely associated with engine testing processes.

Investigation data previously presented in Site reports are not re-presented in this memo. However, relevant AOI 36-1/36-2 LNAPL Area investigation data that has not previously been presented in a Site report are attached or are presented in **Appendix X**.

2. Former Interim Measures (IMs)

2.1 LNAPL Monitoring and Bailing Program

During the Site-wide LNAPL monitoring program conducted from 2001 through 2005, a total of approximately 150 gallons of LNAPL was recovered by bailing from the AOI 36-1/36-2 LNAPL Area.

2.2 Factory 36 Treatment System

From 2005 to 2010 a groundwater and LNAPL recovery system was operated as an IM along the east side of former Factory 36. The purpose of this IM was to control potential offsite migration of LNAPL and Site-related constituents and to collect free-phase LNAPL. This system consisted of three 12-inch diameter wells and pumps for both product recovery and groundwater drawdown. The system was discontinued in 2010 due to the minimal amount of LNAPL being collected (approximately 314 gallons of LNAPL were collected in the five years of operation).

3. AOI 36-1/36-2 LNAPL Area Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and LNAPL characteristics and extent of impacts for AOI 36-1/36-2 LNAPL Area. **Figure G1-2** presents the locations of the existing and abandoned monitoring wells and soil borings in the AOI 36-1/36-2 LNAPL Area.

3.1 AOI 36-1 LNAPL Area Geology and Hydrogeology

- *Geology*: Soil boring and monitoring well logs in the AOI 36-1/36-2 LNAPL Area indicate that the soils are primarily interbedded fine sands, silts and clays down to approximately 27 feet below ground surface (bgs). The logs also indicated evidence of impact as shallow as 4 feet bgs and as deep as 19 feet bgs in the central and southeastern portion of the AOI 36-1/36-2 LNAPL Area and as shallow as 5 feet bgs and as deep as 24 feet bgs in the northwestern portion of the AOI 36-1/36-2 LNAPL Area.

- *Groundwater/LNAPL Levels:* LNAPL at the AOI 36-1/36-2 LNAPL Area has accumulated to measurable thicknesses in 17 monitoring wells (36-160, 36-FP-2, 36-FP-3, 36-FP-6, 36-FP-7, MW-36-4, MW-36-6, MW-36-7, RFI-36-06, RFI-36-07, RFI-36-15, RFI-36-16, RFI-36-21, RFI-36-22, RFI-36-23, RFI-36-29R, and RFI-36-49). At RFI-36-07 LNAPL was not measureable in 2013; however, 0.05 of product was measured in 2012 and 0.47 feet was measured in 2011 (**Figure G1-2**).

  The depth to groundwater in the central portion of the LNAPL ara ranges from 8 to 11 feet, The depth to groundwater in the southeastern portion of the LNAPL Area ranges from 9 to 15 feet bgs.

The depth to groundwater in the northwestern portion of the LNAPL Area ranges from 11 to 21 feet bgs. The greatest thickness of LNAPL at AOI 36-1/36-2 was 7.04 feet measured in 2005 at 36-FP6.

Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the east and northeast. A summary of recent groundwater level data collected is presented in **Appendix X**.

3.2 Groundwater and Soil Analytical Data

Analytical data were compared to applicable Michigan Part 201 non-residential criteria. The storm sewers in the AOI 36-1/36-2 LNAPL Area have been bulkheaded - eliminating the groundwater to surface water pathway; therefore, the groundwater surface water pathway is not applicable at this AOI.

3.2.1 Groundwater Analytical Data

Groundwater data in the AOI 36-1/36-2 LNAPL Area show that no constituents were detected above applicable regulatory cleanup criteria.

3.2.2 Soil Volatile Organic Compound (VOC), Semi-Volatile Organic Compound (SVOC), and Metals Analytical Data

Select soil samples collected from five borings in the AOI 36-1/36-2 LNAPL Area exceeded applicable non-residential criteria. Benzene was detected above the Ambient Air Non-residential Infinite Source Volatile Soil Inhalation (NISVI) criteria (47-240/45 mg/kg) and Non-residential Soil Volatilization to Indoor Air (NSVIA) criteria (9.3-240/8.4 mg/kg). Ethylbenzene was detected above NSVIA (680/460 mg/kg) and Csat criteria (158-680/140 mg/kg). Toluene was detected above NISVI (4,100/3,300 mg/kg), NSVIA (780-4,100/610 mg/kg), and Csat criteria (510-4,100/250 mg/kg. Xylenes were detected above Csat criteria (176-680/150 mg/kg); 1,2,4-trimethylbenzene Csat criteria (230-290/110 mg/kg); and 1,3,5-trimethylbenzene Csat criteria (100/94 mg/kg). In addition, arsenic was detected in one soil sample above Non-residential Direct Contact (NDC) criteria (39/37 mg/kg).

3.2.3 Groundwater Surface Water Interface (GSI) Evaluation

As discussed in further detail in **Appendix BB**, GSI exceedances in the Site storm sewers are being evaluated by the ongoing NPDES Plus Monitoring Program (NPMP). The AOI 36-1/36-2 area was primarily serviced by the Outfall 002 storm sewer; however, there are also laterals for the Outfall 001 and 003 storm sewers located on the north and west side of the former Factory 36 slab, respectively. In 2014 the Outfall 001 laterals were bulkheaded north of AOI 36-1 (**Figure 5 of the main report**). In 2013 the Outfall 002 storm sewer was bulkheaded at the property boundary to eliminate LNAPL infiltration. The

Also, the Outfall 003 lateral at the AOI 36-1/36-2 area is 6 to 9 feet above the water table; therefore, the GSI pathway is not applicable.

3.2.4 Soil PCB Analytical Data

Polychlorinated biphenyls (PCBs) were detected in three of 46 soil samples collected from the AOI 36-1/36-2 area. Detect concentrations of PCBs were less than 1 part per million (ppm).

3.2.5 Vapor Intrusion Evaluation

The depth to groundwater in the AOI 36-1/36-2 area is generally deeper than 10 feet; however, south of the LNAPL area in the vicinity of monitoring well RFI-36-08 has been gauged as shallow as 2.7 feet bgs. Therefore, In addition to the MDEQ Part 201 criteria groundwater data in the vicinity of RFI-36-08 were also compared to the applicable Non-Residential Screening Values for the Vapor Intrusion Pathway presented in the *Michigan Department of Environmental Quality (MDEQ) Guidance Document for the Vapor Intrusion Pathway* (further discussed in Section 3.4 of the Report). Groundwater data from RFI-36-08 exceed applicable screening levels.

As there are no structures at the Site, the MDEQ Part 201 criteria are appropriate for comparison of soil data. As discussed in Section 3.2.2, benzene and toluene were detected at concentrations exceeding NSVIA and NISVI criteria and ethylbenzene was detected at concentrations exceeding NSVIA criteria in soil samples collected from RF-36-07, RFI-36-30, SB-36-12, and/or SB-36-13.

3.3 LNAPL Characteristics

- *LNAPL Analytical Data:* Eleven LNAPL samples have been collected from the AOI 36-1/36-2 Area and submitted for analysis. Laboratory results indicate the following:

    - In the northwestern portion of the AOI 36-1/36-2 LNAPL Area (formerly known as the AOI 36-1 MS/HO area) the LNAPL has a viscosity of 18.5 centipoise (cp) and a specific gravity of 0.88, and an ignitability of greater than 200 degrees Fahrenheit. In addition, trichloroethene was found at 4.19 parts per million (ppm), which exceeds RCRA toxicity characteristic criteria; however, TCLP analysis has not been completed.
    - In the central portion of the LNAPL Area (formerly known as the AOI 36-1 Gasoline area) the LNAPL has a viscosity of 2.2 cp, an interfacial tension of 0.54 dynes/centimeter, a specific gravity of 0.83, and an ignitability of 50 degrees Fahrenheit. In addition benzene is present at concentrations up to 2,900 ppm, which exceeds RCRA toxicity characteristic criteria; however, TCLP analysis has not been

conducted.

- In the southeastern portion of the LNAPL Area (formerly known as the AOI 36-2 MS/HO area) the LNAPL has a viscosity of 24.3 cp, an interfacial tension of 24 dynes/centimeter, a specific gravity of 0.90, and an ignitability of greater than 200 degrees Fahrenheit. In addition benzene has been detected at concentrations up to 1,300 ppm, which exceeds RCRA toxicity characteristic criteria; however, TCLP analysis has not been conducted.

For reference, the viscosity (at 100 degrees Fahrenheit) of olive oil is 43.2 cp (Ingersoll-Rand, 1981).

- *Human Health Risk Assessment (HHRA):* The HHRA, which was presented in the RCRA Facility Investigation (RFI) Phase II Report (BBL, 2006), identified a volatilization to indoor air concern at AOI 36-1 (location shown on **Figure G1-2**). The potential exposure of routine workers to soil and LNAPL via vapor intrusion was identified as a risk. The HHRA also identified LNAPL at AOI 36-1 as a direct contact concern for construction workers and maintenance workers. The majority of the AOI 36-1/36-2 LNAPL area is located beneath the former Factory 36 concrete slab. The shallowest LNAPL impacts are located approximately eight feet below ground surface, and represent a potential concern for future construction or utility workers.

  The HHRA did not identify and risks at AOI 36-2.

- *LIF Data:* Fifty-six laser-induced fluorescence (LIF) borings were completed in the AOI 36-1/36-2 LNAPL Area. The LIF response at the central and southeastern portion of the AOI 36-1/36-2 LNAPL Area is consistent with the known LNAPL types, weathered gasoline mixed with hydraulic oil and diesel and the LIF response in the northwestern portion of the AOI 36-1/36-2 LNAPL Area is consistent with the known LNAPL type, degraded heavy fuel oil/hydraulic oil. **Figure G1-2** presents the results of the LIF investigation and the extent of impacts associated with the AOI 36-1/36-2 LNAPL Area. LIF data indicate that in the northwestern portion of the LNAPL Area vertical impacts are primarily 10 to 22 feet bgs, with some impacts as shallow as 5 feet bgs. In the southeastern portion of the LNAPL Area vertical impacts are primarily 5 to 18 feet bgs; however, impacts were detected at one location at a depth of 35 feet bgs.

- *Transmissivity:* Transmissivity testing was completed at one monitoring well (36-FP7) in the southeastern portion of the AOI 36-1/36-2 LNAPL Area and one monitoring well (MW-36-06) in the northwestern portion of the AOI 36-1/36-2 LNAPL Area. Based on LNAPL baildown test results, LNAPL transmissivity quantified at monitoring well 36-FP7 was 0.2 square feet per day (ft^2/day) and at monitoring well MW-36-06, which had 5.18 feet of measurable LNAPL, was

0.03 ft^2/day, which are less than the Interstate Technology and regulatory Council (ITRC) suggested minimum threshold and the Michigan Department of Environmental Quality (MDEQ) threshold value that indicates LNAPL recovery is not practicable at these wells. The transmissivity data are presented in **Table 2 of the main report.**

- *Natural Source Zone Depletion (NSZD):* NSZD was completed in the eastern portion of the AOI 36-1/36-2 LNAPL Area, outside of the former Factory 36 footprint, to establish ongoing natural attenuation rates of LNAPL as a baseline for comparison to active LNAPL recovery technologies. One carbon trap was installed in an area that is not covered by asphalt or concrete. The results show that LNAPL near monitoring well RFI-36-42 is being depleted at a rate of 3,217 gallons per acre per year. The NSZD data are presented in **Table 3B of the main report.**

3.4 Extent of LNAPL

During the RCES preparation, the AOI 36-1/36-2 LNAPL area was calculated based on historical data. The footprint of the LNAPL area containing approximately 0.5 ft or greater of LNAPL was estimated to be a total of approximately 303,500 square feet. Also, based on the results of recent LNAPL investigations the extent of AOI 36-1/36-2 LNAPL Area has been redefined (as discussed in Section 2.1.3 of the main report and based on in-well LNAPL thicknesses of 0.1 ft or greater); therefore, the current footprint of the LNAPL area is estimated to be approximately 429,300 square feet.

Based on the LIF and soil boring logs for boring RFI-36-07 in the central portion of the AOI 36-1/36-2 LNAPL Area, impacts were detected from 4 to 19 feet bgs; however, only the soil samples collected from the 8 to 14 feet bgs interval detected concentrations that exceeded the applicable cleanup criteria. In the northwestern portion of the AOI 36-1/36-2 LNAPL Area, impacts were detected from 5 to 24 feet bgs (with the impacts detected deeper toward the northwest); however, only the soil sample collected from the 14 to 16 feet bgs interval detected a concentration that exceeded the applicable cleanup criteria.

LNAPL Remedial Decision Tree
Priorities #8, 14 & 15 – AOI 36-1/36-2 LNAPL Area

NOTES

(#) NOTES: See Page G2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priorities #8, 14, & 15 - AOI 36-1/36-2 LNAPL Area

Background: The AOI 36-1/36-2 LNAPL Area is located at the Northend of the Site in the former Factory 36 Area. Historically, the former Factory 36 Area was primarily used for engine manufacturing and metal machining processes. The occurrence of the AOI 36-1/36-2 plume is presumably due to historical releases associated with operations in this area. There are currently no buildings within the AOI 36-1/36-2 LNAPL Area. Previously there were three LNAPL Areas (the AOI 36-1 Gasoline Area, the AOI 36-2 Exterior Mineral Seal/Hydraulic Oil [MS/HO] Area, and the AOI 36-1 MS/HO Area) identified in the Factory 36 Area. However, based on the results of recently completed Site investigation activities the LNAPL areas appear to be co-mingled and are discussed herein as the AOI 36-1/36-2 LNAPL Area.

Geology and Hydrogeology: The soils at the AOI 36-1/36-2 Area consist primarily of interbedded fine sands, silts and clays down to approximately 27 feet bgs. Depth to groundwater has been measured as shallow as 9 feet bgs and as deep as 15 feet bgs in the southeastern portion of the AOI 36-1/36-2 LNAPL Area, as shallow as 8 and as deep as 16 feet bgs in the central portion, and as shallow as 11 and as deep as 21 feet bgs in the northwestern portion of the AOI 36-1/36-2 LNAPL Area. Based on historic groundwater level gauging data, groundwater flow in this portion of the Site is generally to the east and northeast.

LNAPL Characteristics: Logs in the AOI 36-1/36-2 LNAPL Area show evidence of LNAPL impacts from as shallow as 4 feet bgs and 19 feet bgs in the southeastern and central portions and as shallow as 11 feet bgs and as deep as 24 feet bgs in the northwestern portion of the AOI 36-1/36-2 LNAPL Area. Eleven LNAPL samples have been collected from the AOI 36-1/36-2 Area and submitted for analysis. Laboratory results indicate the following:

- In the northwestern portion of the AOI 36-1/36-2 LNAPL Area (formerly known as the AOI 36-1 MS/HO area) the LNAPL has a viscosity of 18.5 centipoise (cp) and a specific gravity of 0.88, and an ignitability of greater than 200 degrees Fahrenheit. In addition, trichloroethene was found at 4.19 parts per million (ppm), which exceeds RCRA toxicity characteristic criteria; however, TCLP analysis has not been conducted.
- In the central portion of the AOI 36-1/36-2 Area (formerly known as the AOI 36-1 Gasoline area) the LNAPL has a viscosity of 2.2 cp, an interfacial tension of 0.54 dynes/centimeter, a specific gravity of 0.83, and an ignitability of 50 degrees Fahrenheit. In addition, benzene is present at concentrations up to 2,900 ppm, which exceeds RCRA toxicity characteristic criteria; however, TCLP analysis has not been conducted.
- In the southeastern portion of the LNAPL Area (formerly known as the AOI 36-2 MS/HO area) the LNAPL has a viscosity of 24.3 cp, an interfacial tension of 24 dynes/centimeter, a specific gravity of 0.90, and an ignitability of greater than 200 degrees Fahrenheit. In addition benzene has been detected at concentrations up to 1,300 ppm, which exceeds RCRA toxicity characteristic criteria; however, TCLP analysis has not been conducted.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*

YES – The following potential risk/exposure concerns are associated with the AOI 36-1/36-2 LNAPL Area:

- Soil Volatilization to Indoor Air Concerns*:* Soil samples collected from RFI-36-07, RFI-36-30, SB-36-12, and SB-36-13, located in the central portion of the AOI 36-1/36-2 LNAPL Area, exceed Non-residential Soil Volatilization to Indoor Air (NSVIA) criteria for benzene, ethylbenzene, and/or toluene.

  Volatilization to indoor air concern was also identified at AOI 36-1 in the Human Health Risk Assessment (HHRA) presented in the RCRA Facility Investigation (RFI) Phase II Report (BBL, 2006). In the HHRA, the potential exposure of routine workers to soil and LNAPL via vapor intrusion was identified as a risk.

- Volatile Soil Inhalation (Ambient Air) Concerns: Soil samples collected from RFI-36-07 and SB-36-13, located in the southeastern portion of the AOI 36-1/36-2 LNAPL Area, exceed Non-residential Infinite Source Volatile Soil Inhalation (NISVI) criteria for benzene and/or toluene.

- Direct Contact Concerns: The HHRA identified LNAPL as a direct contact concern for construction workers and maintenance workers at AOI 36-1. The majority of the AOI 36-1/36-2 LNAPL area is located beneath the former Factory 36 concrete slab. The shallowest LNAPL impacts are located approximately eight feet below ground surface, and represent a potential concern for future construction or utility workers. Arsenic was detected in the LNAPL in the northwestern portion of the AOI 36-1/36-2 LNAPL Area at RFI-36-15 at a concentration exceeding direct contact criteria; however, the exceedance is at a depth of 14 to 16 ft bgs and, therefore, not a direct contact concern.

- Potential Volatilization to Indoor Air Concerns for Future Structures*:* Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

Attachment 2 Notes

Priorities #8, 14, & 15 - AOI 36-1/36-2 LNAPL Area

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*
   YES – LNAPL constituents in the central portion of the AOI 36-1/36-2 LNAPL Area have high volatility making multi-phase extraction (MPE) a feasible option as contaminant would readily partition in the vapor phase. LNAPL constituents in the northwestern portion of the AOI 36-1/36-2 LNAPL Area are less volatile; therefore, compositional change may be impractical.
3) *Can institutional/engineering controls provide effective risk mitigation?*
   YES and NO – Based on the understanding of site conditions, the remaining vapor phase, and direct contact risk can be effectively mitigated through institutional controls.
4) *Is there potential benefit to partial treatment/removal that outweighs costs?*
   YES – Based on the current understanding of the conceptual site model volatile soil inhalation (ambient air) concerns in the central portion of the AOI 36-1/36-2 LNAPL Area cannot be effectively addressed through engineering or institutional controls and therefore treatment/removal is recommended.
5) *Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?*
   NO – The AOI 36-1/36-2 LNAPL Area appears to be stable. This finding is supported by the following lines of evidence:
   - Well Gauging Data: Sentinel wells located downgradient of the of the AOI 36-1/36-2 LNAPL Area have remained free of LNAPL since monitoring began approximately 10 years ago.
   - Age of LNAPL Release: The AOI 36-1/36-2 LNAPL Area was identified between 1998 and 2001. Operations began in this portion of the Site in the 1950's and ceased in this portion of the Site in early 2009. LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).
6) *Is LNAPL mobile within the stable LNAPL perimeter?*
   YES – LNAPL from the AOI 36-1/36-2 Area accumulates in monitoring wells and had been infiltrating the Outfall 002 storm sewer. The Outfall 002 storm sewer has been bulkheaded to eliminate the LNAPL migration pathway.
7) *Is LNAPL readily recoverable?*
   YES and NO– Based on the high volatility of LNAPL and interbedded sands in the central portion of the LNAPL Area, some LNAPL mass is likely able to be recoverable through MPE. However, the results of historic interim measures (IM) indicate that limited LNAPL has been recovered in the AOI 36-1/36-2 LNAPL Area through hydraulic recovery, which is consistent with recent transmissivity testing. These activities are summarized below:

   - During the Site-wide LNAPL monitoring program conducted from 2001 through 2005, a total of approximately 150 gallons of LNAPL was recovered during quarterly bailing events.
   - Between 2005 and 2010, approximately 314 gallons of LNAPL were removed using three product recovery wells in the southeastern portion of the AOI 36-1/36-2 LNAPL Area.

   Based on the transmissivity testing results of 0.03 ft^2/day at MW-36-06 in the northwestern portion of the AOI 36-1/36-2 LNAPL Area, hydraulic recovery is not practical. The transmissivity result is below both the ITRC and MDEQ draft standard threshold values indicating that LNAPL recovery is not practicable. LNAPL recovery efforts (through hydraulic-based remediation methods) will not likely result in a beneficial reduction in overall LNAPL mass or exposure risk in the northwestern portion of the AOI 36-1/36-2 LNAPL Area.
8) *Will the potential benefit of LNAPL recovery outweigh costs?*
   YES – Implementation of an MPE system in the central portion of the AOI 36-1/36-2 LNAPL Area would be likely to cost effectively reduce the LNAPL source mass and/or reduce exposure risks associated with volatilization because of the volatile gasoline component. LNAPL recovery in the northwestern portion of the AOI 36-1/36-2 LNAPL Area would not reduce the exposure risks associated with volatilization due to the lower volatility LNAPL constituents.
9) *Are controls required?*
   YES – In addition to the Site-wide Institutional Controls discussed in the main report the following institutional and engineering controls are proposed for the AOI 36-1/36-2 LNAPL Area to limit future exposure:
   - Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 5 in the main report**.
   - Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present (as shown on **Figure G3-1**) to prevent direct contact with contaminated material, except with using appropriate health and safety measures, during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates

that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the Natural Resources and Environmental Protection Act.

- Require that any intrusive activities (i.e., excavation, repair of foundation or subsurface utilities, short-term construction and landscaping projects) into the subsurface beneath the cap must be consistent with MIOSHA requirements, including the use of a Health and Safety Plan and a trained professional to evaluate the Site data prior to initiating activities. All relevant Site data must be made available for the preparation of the Health and Safety Plan. Data may be made available as part of the Due Care Plan, RFI, or other document(s).

Attachment 3

Remedy Recommendations

Priorities #8, 14, & 15 – AOI 36-1/36-2 LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – Recommended Remedy

This attachment presents the recommended remedies for the area of interest (AOI) 36-1/36-2 light non-aqueous phase liquid (LNAPL) Area.

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in **Attachment 2** identified soil volatilization to indoor air, volatile soil inhalation (ambient air), direct contact, and potential volatilization to indoor air for future structures as compositional concerns for AOI 36-1/36-2 LNAPL Area. The mobility concern was due to the infiltration of LNAPL to the Outfall 002 storm sewer.

2. Remedy Recommendation Rationale

The remedies recommended to address the compositional and saturation concerns associated with the AOI 36-1/36-2 LNAPL Area are 002 Passive Recovery Trench Monitoring, Multi-phase Extraction, and Engineering and Institutional Controls, which are discussed in detail in Section 3. The rationale for this selection is detailed below:

- Soil samples collected from the central portion of the AOI 36-1/36-2 LNAPL Area exceed Nonresidential Soil Volatilization to Indoor Air (NSVIA).
- The Human Health Risk Assessment (HHRA) presented in the RCRA Facility Investigation (RFI) Phase 2 Report (BBL, 2006) identified the potential exposure of routine workers to soil and LNAPL via vapor intrusion at AOI 36-1 as a risk under future use scenarios that do not require the application of OSHA regulations.
- The nonresidential infinite source volatile soil inhalation (NISVI) ambient air concern is due to the presence of benzene, ethylbenzene, and/or toluene in soil in the central portion of the AOI 36-1/36-2 LNAPL Area.
- In addition, the biodegradation of LNAPL may generate methane which could result in potential indoor air concerns for future structures.

- The HHRA also identified LNAPL as a direct contact concern for construction workers and maintenance workers at AOI 36-1 (shown on **Figure G3-1**).
- The HHRA did not identify any concerns at AOI 36-2.
- There is also an exceedance of direct contact criteria for arsenic in a soil sample collected from 14 to 16 ft bgs in the northwestern portion of the AOI 36-1/36-2 LNAPL Area.
- Based on the current understanding of risk conditions, the direct contact risk and potential volatilization to indoor air risk for future structures can be effectively mitigated through engineering and institutional controls.
- The LNAPL in the central portion of the LNAPL Area includes a weathered gasoline component with high volatility constituents amenable to an MPE remedy.
- The Outfall 001 and 002 storm sewers have been bulkheaded in this portion of the Site, so the GSI pathway is not applicable.

3. AOI 36-1/36-2 Remedies

This section summarizes the completed and proposed remedies to address the impacts at AOI 36-1/36-2.

3.1 Completed Interim Measures

3.1.1 LNAPL Recovery

From 2005 to 2010 a groundwater and LNAPL recovery system was operated as an IM along the east side of former Factory 36 (**Figure G3-1**). The purpose of this IM was to control potential offsite migration of LNAPL and Site-related constituents and to collect free-phase LNAPL. This system consisted of three 12-inch diameter wells and pumps for both product recovery and groundwater drawdown. The system was discontinued in 2010 due to the minimal amount of LNAPL being collected (approximately 314 gallons of LNAPL were collected in the five years of operation).

An LNAPL bailing program was also completed from 2001 to 2005 which removed approximately 150 gallons of product.

The partial removal of product has been completed in this area and is considered a component of the remedy.

3.1.2 *Outfall 001 and 002 Storm Sewer Bulkheads*

Bulkheads were installed at the Outfall 002 in Spring 2013 in order to eliminate the LNAPL infiltration from AOI 36-1/36-2 and AOI 36-5. Additional bulkheading was completed in May 2014 in the adjacent Outfall 001 drainage area to eliminate the GSI pathway in the AOI 36-1/36-2 LNAPL Area. The locations of the

bulkheads are presented on **Figure 5 of the main report**.

3.2 Additional Remedy Recommendations

The remedies recommended to address the compositional and mobility concerns associated with AOI 36-1/36-2 LNAPL Area are 002 Passive Recovery Trench Monitoring, Multi-phase Extraction, and Engineering and Institutional Controls. The combination of remedies will effectively mitigate the risks at the AOI 36-1/36-2 LNAPL Area. These combined remedies will reduce the LNAPL source mass in the short term and reduce exposure risks associated with the vapor and be protective of future workers in the long term.

3.2.1 002 Passive Recovery Trench Monitoring

Following completion of bulkheading activities at Outfall 002 the bulkheaded storm sewer is being monitored for potential LNAPL accumulation and removal.

3.2.2 Multi-phase Extraction

A multi-phase extraction (MPE) system is the preferred method to address volatile soil inhalation (ambient air) impacts present in the central portion of the AOI 36-1/36-2 LNAPL Area. An MPE system was selected due to the high volatility and low viscosity of the LNAPL and the somewhat sandy soils in this portion of the LNAPL Area.

MPE involves the removal of liquid phase and soil vapor phase by the application of a vacuum. Liquid phase product is stored then disposed of; groundwater is treated then disposed; and soil vapor is treated then discharged via a permit to the environment. The oxygen supplied to the subsurface also increases aerobic biodegradation. The MPE system currently in use at AOI 09-B will be moved to AOI 36-1 and retrofitted to address this area.

A pilot test will be completed in order to develop field information used to size the system, develop operating parameters, and establish the endpoint for the system. The results will also be used to confirm that MPE is feasible based on the ability of the system to depress the groundwater table to expose the smear zone and recover petroleum hydrocarbon in the vapor phase.

Also, as some of the Site data is 10 or more years old, additional field investigations will be completed prior to or during pilot testing to confirm current Site conditions and to acquire any additional data need for the system design.

3.2.3 Maintaining Surface Cover

The remedy recommended to address the direct contact concerns identified at AOI 36-1 in the HHRA, is to maintain the existing Factory 36 slab as surface cover over the impacted area. Recent investigations (completed subsequent to the HHRA) identified LNAPL beyond the factory slab at AOI 36-1 (in the northwestern portion of the AOI 36-1/36-2 LNAPL Area). The surface cover west of the Factory 36 slab is consists of asphalt. The area requiring surface cover is presented on **Figure G3-1**. The surface cover will be inspected and maintained to provide protection from future exposure. Please note that as the HHRA did not identify any risks at AOI 36-2, the portion of the AOI 36-1/36-2 LNAPL Area that extends beyond the Factory 36 slab to the southeast does not require surface cover.

3.2.4 Institutional Controls

The following AOI-specific institutional controls, in addition to the Site-wide controls noted in the Report, will be necessary to limit potential for future exposure:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 5 in the main report**.

- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present (as shown on **Figure G3-1**) to prevent direct contact with contaminated material, except with using appropriate health and safety measures, during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the Natural Resources and Environmental Protection Act.

- Require that any intrusive activities (i.e., excavation, repair of foundation or subsurface utilities, short-term construction and landscaping projects) into the subsurface beneath the cap (As shown on **Figure G3-1**) must be consistent with MIOSHA requirements, including the use of a Health and Safety Plan and a trained professional to evaluate the Site data prior to initiating activities. All relevant Site data must be made available for the preparation of the Health and Safety Plan. Data may be made available as part of the Due Care Plan, RFI, or other document(s).

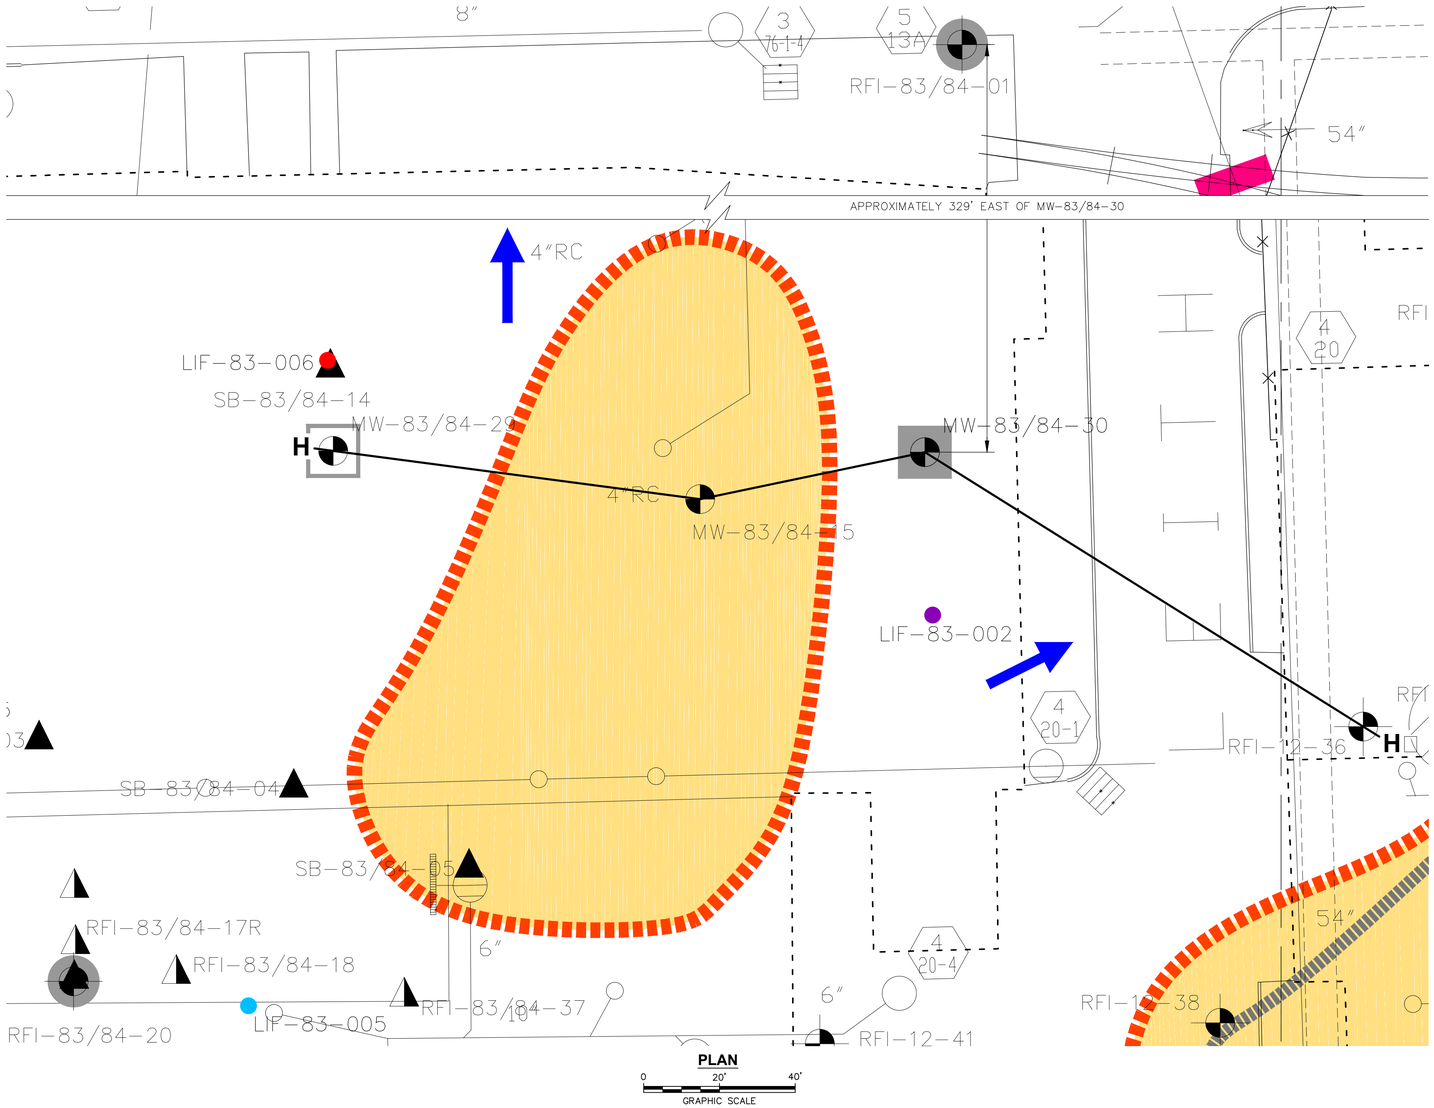
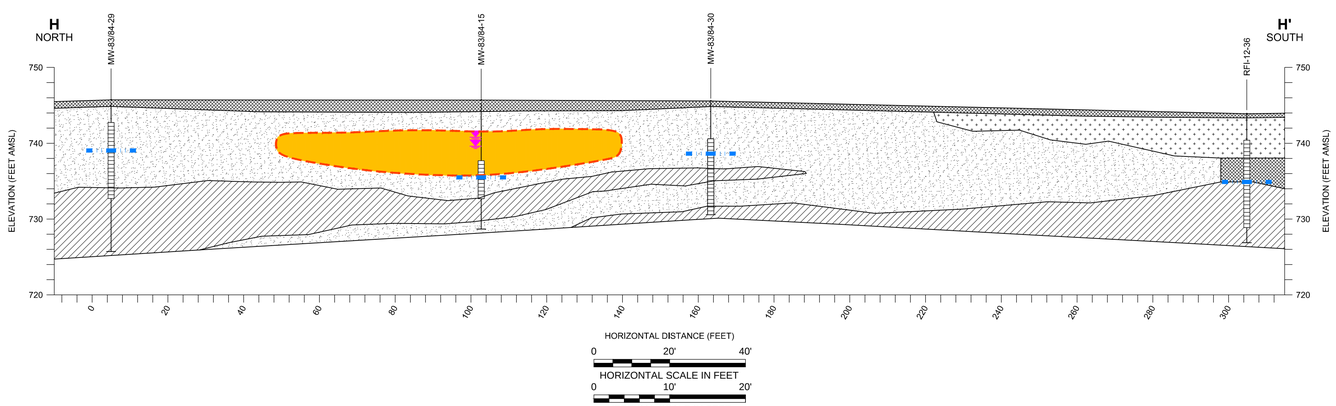
Subject:
Priority #9 - AOI 83/84-1 Cutting Oil Area
Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

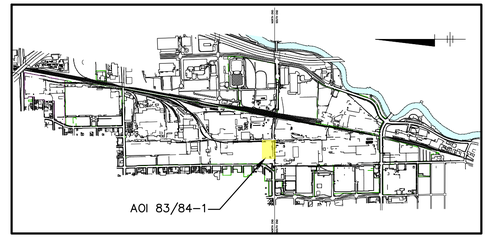
As part of the light non-aqueous phase liquid (LNAPL) remedy evaluation process the Site's 17 LNAPL areas were prioritized based on risk. The area of interest (AOI) 83/84-4 1 Cutting Oil LNAPL Area (AOI 83/84-1 LNAPL Area) is ranked as Priority #9 with a total potential risk score of 6 (**Table 5 of the main report**). A conceptual site model cross-section is attached (**Figure H-1**) that provides an overview of the AOI 83/84-1 LNAPL Area impacts.



The compositional and saturation concerns identified for the AOI 83/84-1 LNAPL Area were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:



- Theoretically, there is a potential unacceptable vapor phase exposure associated with methane for future redevelopment scenarios due to the biodegradation of LNAPL generating methane; however, this will be addressed by the proposed institutional controls.
- Although there are groundwater/surface water interface (GSI) exceedances of select semi-volatile organic compounds (SVOCs) and/or metals in soil and groundwater samples, these constituents are not detected in the NPDES Plus Monitoring Program (NPMP) samples collected from the Outfall 004 storm sewer. Therefore, the GSI pathway is not complete for these exceedances.



However, there is a GSI concern associated with the LNAPL infiltrating the Outfall 004 storm sewer that needs to be addressed.

- No feasible options exist to mitigate unacceptable risk through compositional change.
- The LNAPL is not migrating; however, it is mobile and is likely infiltrating the Outfall 004 storm sewer.
- The LNAPL may not be readily recoverable.

Based on the current understanding of conceptual site model, risks associated with volatilization concerns can be effectively mitigated through institutional controls. Additionally, the Outfall 004 infiltration pathway elimination is recommended to address the LNAPL infiltration concern.

Attachment 1

LNAPL Conceptual Site Model

Priority #9 - AOI 83/84-1 Cutting Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model for the area of interest (AOI) 83/84-1 Cutting Oil light non-aqueous phase liquid (LNAPL) Area (AOI 83/84-1 LNAPL Area). AOI 83/84-1 LNAPL Area is located at the Northend of the Buick City Site (Site) located in Flint, Michigan (**Figure H1-1**).

1. Background

The AOI 83/84-1 LNAPL Area is located at the former Factory 83/84 Area in the southwestern portion of the Northend of the Site (**Figure H1-2**). Historically, operations at former Factory 83/84 primarily consisted of manufacturing axle assemblies until 1981. After 1981 manufacturing consisted of "white metals" components such as water pumps, pistons, and manifolds. Historic operations at AOI 83/84-1 included both "wet" and "dry" operations involving various metal chip conveyors trenches, process fluid recirculation and/or recovery sumps and pits, product supply sumps and storage areas, and metal chip processing. The AOI 83/84-1 LNAPL Area is presumably due to historical releases associated with operations in this area.

The AOI 83/84-1 LNAPL Area was identified during Site investigation activities completed in 2013. Investigation data previously presented in Site reports are not re-presented in this memo. However, pertinent AOI 83/84-1 investigation data that has not previously been presented in a Site report is attached.

2. AOI 83/84-1 Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and LNAPL characteristics and extent of impacts for the AOI 83/84-1 LNAPL Area.

Figure H1-2 presents the locations of the existing and abandoned monitoring wells and soil borings in the AOI 83/84-1 area.

2.1. AOI 83/84-1 Geology and Hydrogeology

- *Geology:* The soils at the AOI 83/84-1 LNAPL Area consist of primarily fine to medium sand interbedded with silt and clay to a depth of approximately 17 feet below ground surface (bgs).

- *Groundwater/LNAPL Levels:* Six monitoring wells at the AOI 83/84-1 LNAPL Area are gauged to monitor the extent of the LNAPL. Depth to groundwater in this area is approximately 7 to 8 feet bgs. The AOI 83/84-1 LNAPL Area includes one monitoring well (MW-83/84-15), where LNAPL was gauged at a maximum thickness of 4.46 feet in September 2013. During two gauging events, the thickness of LNAPL at MW-83/84-15 has ranged from 2.20 feet to 4.46 feet.

  Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the east-southeast. The groundwater level data are presented in **Appendix X.**

2.2. Groundwater and Soil Analytical Data

Analytical data were compared to applicable Michigan Part 201 nonresidential criteria.

2.2.1. Groundwater Analytical Data

Two groundwater samples were collected in the vicinity of the AOI 83/84-1 LNAPL Area. RFI-83/84-20 is located approximately 175 feet upgradient of the AOI 83/84-1 LNAPL Area and RFI-83/84-01 is located approximately 260 feet downgradient. Groundwater sample concentrations for arsenic (14-23/10 ug/L), cyanide (50-51/5.2 ug/L), selenium (5.6/5 ug/L) and silver (0.47-1.4/0.2 ug/L) exceeded groundwater surface water interface (GSI) criteria.

2.2.2. Soil Volatile Organic Compound (VOC), Semi-Volatile Organic Compound (SVOC), and Metals Analytical Data

Soil samples collected from AOI 83/84-1 detected phenanthrene (2.6-3.8/2.1 mg/kg) and dibenzofuran (1.8/1.7 mg/kg) concentrations exceeding groundwater surface water interface protection (GSIP) criteria at MW-83/84-30.

2.2.3 GSI Evaluation

As discussed in further detail in Appendix BB, GSI exceedances in the Site storm sewers are being evaluated by the ongoing NPDES Plus Monitoring Program (NPMP). The Outfall 004 storm sewer services AOI 83/84-1. The monthly NPMP samples collected from the Outfall 004 storm sewer as part of the NPMP have not exhibited concentrations of SVOCs, arsenic, cyanide, selenium or silver above GSI criteria at the downgradient monitoring point.

2.2.4 Soil PCB Analytical Data

Polychlorinated biphenyls (PCBs) were not detected in the soil samples collected from the AOI 83/84-1 LNAPL Area.

2.2.5 Vapor Intrusion Evaluation

Due to the presence of shallow groundwater and LNAPL (approximately 7 to 8 feet below ground surface) at AOI 83/84-1, groundwater data were also compared to the applicable Non-Residential Screening Values For the Vapor Intrusion Pathway presented in the *Michigan Department of Environmental Quality (MDEQ) Guidance Document for the Vapor Intrusion Pathway* (further discussed in Section 3.4 of the Report). Groundwater concentrations do not exceed applicable screening levels.

As there are no structures at the Site the MDEQ Part 201 criteria are appropriate for comparison of soil data. Soil concentrations did not exceed applicable screening levels.

2.3. LNAPL Characteristics

- *LNAPL Analytical Data:* LNAPL present at AOI 83/84-1 consists primarily of cutting oil. Additional analysis indicated that:
  - The LNAPL has a viscosity of 108.24 centipoise (cp) and a specific gravity of 0.903.
  - Polychlorinated biphenyls (PCBs) were not detected in the LNAPL.

  For reference, the viscosity (at 100 degrees Fahrenheit) of honey is 73.6 cp (Ingersoll-Rand, 1981). LNAPL analytical data are presented in **Appendix X**.

- *LIF Data:* Twelve LIF borings were completed in the AOI 83/84-1 area. The vertical range of LIF impact (greater than 5%RE) at AOI 83/84-1 is typically 6 to 17 feet bgs. **Figure H1-2** presents the results of the LIF investigation and the extent of impacts associated with the AOI 83/84-1 LNAPL area.

- *Transmissivity:* An LNAPL transmissivity study was unable to be completed at the AOI 83/84-1 area because LNAPL is present above the top of the well screen.

- *Natural Source Zone Depletion (NSZD):* An NSZD study was not conducted at the AOI 83/84-1 area due to the presence of the concrete slab from former Factory 83/84. The testing completed at the Southend of the Site indicated that NSZD is occurring; however, the currently

available testing technologies cannot reliably quantify the depletion beneath a concrete slab.

2.4. Extent of LNAPL

The footprint of the LNAPL area containing approximately 0.1 ft or greater of LNAPL in a monitoring well (as discussed in Section 2.1.3 of the main report) is estimated to be approximately 15,800 square feet. Based on the LIF data, approximate depth impacts are approximately 6 to 17 ft bgs.

LNAPL Remedial Decision Tree

Attachment 2 LNAPL Remedial Decision Tree Priority #9 – AOI 83/84-1 Cutting Oil Area

NOTES

(#) NOTES: See Page H2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priority #9 – AOI 83/84-1 Cutting Oil LNAPL Area

Background: The area of interest (AOI) 83/84-1 cutting oil light non-aqueous phase liquid (LNAPL) Area (AOI 83/84-1 LNAPL Area) is located in the former Factory 83/84 area in the southwestern portion of the Northend of the Site. Historic operations included both "wet" and "dry" operations involving various metal chip conveyors trenches, process fluid recirculation and/or recovery sumps and pits, product supply sumps and storage areas, and metal chip processing. The AOI 83/84-1 LNAPL Area is presumably due to historical releases associated with operations in this area. There are currently no buildings within the AOI 83/84-1 LNAPL Area. The AOI 83/84-1 LNAPL Area is covered by the former Factory 83/84 slab.

Geology and Hydrogeology: The soils at AOI 83/84-1 primarily consist of fine to medium sand interbedded with silt and clay approximately 17 feet bgs. Depth to groundwater in this area varies and has been measured as shallow as 7.10 feet bgs, as deep as 10.54 feet bgs, and is generally between 7 and 8 feet bgs. Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the east-southeast.

LNAPL Characteristics: LIF boring logs in the AOI 83/84-1 LNAPL Area show evidence of LNAPL impacts from as shallow as 5 feet bgs and as deep as 17 feet bgs. The AOI 83/84-1 LNAPL Area consists of one monitoring well (MW-83/84-15) where LNAPL was measured at thicknesses of up to 4.46 feet. The LNAPL has a viscosity of 108.24 centipoise (cp) and a specific gravity of 0.903.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*

   YES – The following potential risk/exposure concerns are associated with the AOI 83/84-1 LNAPL Area:
   - Groundwater Surface Water Interface (GSI): Samples collected from the AOI 83/84-1 LNAPL Area detected select SVOCs and metals at concentrations exceeding GSI or GSI Protection criteria. The Outfall 004 storm sewer is the only potentially complete GSI pathway at AOI 83/84-1. Samples collected from the Outfall 004 storm sewer as part of the monthly NPDES Plus Monitoring Program (NPMP) sampling program did not detect SVOCs or arsenic, cyanide, selenium, or silver above GSI criteria. Therefore, the GSI pathway is not complete for these exceedances. However, there is a GSI concern associated with the LNAPL infiltrating the Outfall 004 storm sewer that needs to be addressed.
   - Potential Volatilization to Indoor Air for Future Structures: Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*

   YES – Targeted in-situ soil mixing/land farming to address the petroleum constituents may be technically feasible. However, other options evaluated were not feasible as discussed below.

   - Enhanced dissolution and recovery via surfactant or hot water flushing it is not a viable option based on the presence of nearby City sewers. The use of surfactant would increase mobility and therefore, likely increase LNAPL infiltration into the storm sewer.
   - AOI 83/84-1 LNAPL constituents have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.
   - In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of nearby City sewers.

3) *Can institutional/engineering controls provide effective risk mitigation*

   YES – Based on the current understanding of risk conditions, the potential GSI infiltration and volatilization to indoor air risk can be effectively mitigated through engineering and institutional controls.

4) *Is there a potential benefit to partial treatment/removal that outweighs costs?*

   NO – Based on the current understanding of risk conditions, the potential GSI infiltration and volatilization to indoor air risk can be effectively mitigated through engineering and institutional controls.

5) *Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?*

   NO – Although the AOI 83/84-1 LNAPL is mobile in the vicinity of the Outfall 004 storm sewer, the LNAPL area appears to be stable. This finding is supported by the following lines of evidence:
   - Well Gauging Data: Monitoring wells located downgradient of the AOI 83/84-1 LNAPL Area (see **Figure 2 of the main report**) have remained free of LNAPL since monitoring began approximately 10 years ago.

Attachment 2 Notes

Priority #9 – AOI 83/84-1 Cutting Oil LNAPL Area

- Age of LNAPL Release: The AOI 83/84-1 LNAPL Area was identified in 2013. Operations began in this portion of the Site in the early 1900s and ceased in this portion of the Site ceased in mid 2000s. LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).

6) *Is LNAPL mobile within the stable LNAPL perimeter?*

YES – LNAPL from AOI 83/84-1 is likely infiltrating the Outfall 004 storm sewer, by way of a lateral that passes through the area; however, the viscosity of the LNAPL is 108 cp, limiting its mobility. In order to address the risks associated with the LNAPL infiltration into the Outfall 004 storm sewer, the pathway will be eliminated. Bulkheading or rerouting portions of the Outfall 004 storm sewer are being evaluated to eliminate this pathway.

7) Is LNAPL readily recoverable?

NO – LNAPL recovery is not likely practical due to the high viscosity of the LNAPL. Also, LNAPL is present in only in one well in the AOI 83/84-1 LNAPL Area.

8) Are controls required?

YES – The following AOI-specific institutional controls are proposed, in addition to the Site-wide institutional controls, for the AOI 83/84-1 LNAPL Area to limit future exposure:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads as noted on **Figure 5 of the main report**.

Attachment 3

Remedy Recommendations

Priority #9 - AOI 83/84-1 Cutting Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – Recommended Remedy

This attachment presents the recommended remedies for the area of interest (AOI) 83/84-1 Cutting Oil light non-aqueous phase liquid (LNAPL) Area (AOI 83/84-1 LNAPL Area).

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in **Attachment 2** identified potential volatilization to indoor air and groundwater surface water interface (GSI) infiltration as compositional concerns for AOI 83/84-1 and mobility as a saturation concern. The volatilization to indoor air concern is due to the biodegradation of LNAPL generating methane that could theoretically result in an indoor air concern for future structures. In addition, the LNAPL from the AOI 83/84-1 area is infiltrating the Outfall 004 storm sewer, which is the basis for the GSI and mobility concerns.

2. Remedy Recommendation Rationale

The remedy recommended to address the compositional and saturation concerns associated with the AOI 83/84-1 LNAPL area is engineering and institutional controls, which are discussed in detail in Section 3. The rationale for this selection is detailed below:

- Based on the current understanding of risk conditions, the potential volatilization to indoor air risk for future structures due to the biodegradation of LNAPL generating methane can be effectively mitigated through Site-wide institutional controls.
- Soil and groundwater samples collected from AOI 83/84-1 detected concentrations of select SVOCs, arsenic, cyanide, selenium, and/or silver at concentrations exceeding GSI or GSI protection criteria. The Outfall 004 storm sewer is the only potentially complete GSI pathway at AOI 83/84-1. Samples collected from the Outfall 004 storm sewer as part of the monthly NPDES Plus Monitoring Plan (NPMP) sampling program did not detect SVOCs, arsenic, cyanide, selenium, or silver above GSI criteria. Therefore, the GSI pathway is not complete for these exceedances. However, there is a GSI concern associated with the LNAPL infiltrating the Outfall 004 storm sewer that needs to be addressed.
- The AOI 83/84-1 LNAPL Area is likely infiltrating the Outfall 004 storm sewer.

- Although the AOI 83/84-1 LNAPL Area was only recently identified, monitoring wells located downgradient of the area have been gauged as part of Site investigation activities for more than 10 years and no LNAPL has been observed, indicating that the LNAPL in this AOI is not migrating.

3. AOI 83/84-1 Remedies

The remedies recommended to address the compositional and mobility concerns associated with AOI 83/84-1 LNAPL Area are to eliminate the Outfall 004 infiltration pathway and establish institutional controls. These combined remedies will eliminate the infiltration pathway in the short term and prevent future worker exposure to LNAPL impacts in the long term.

3.1 Outfall 004 Pathway Elimination

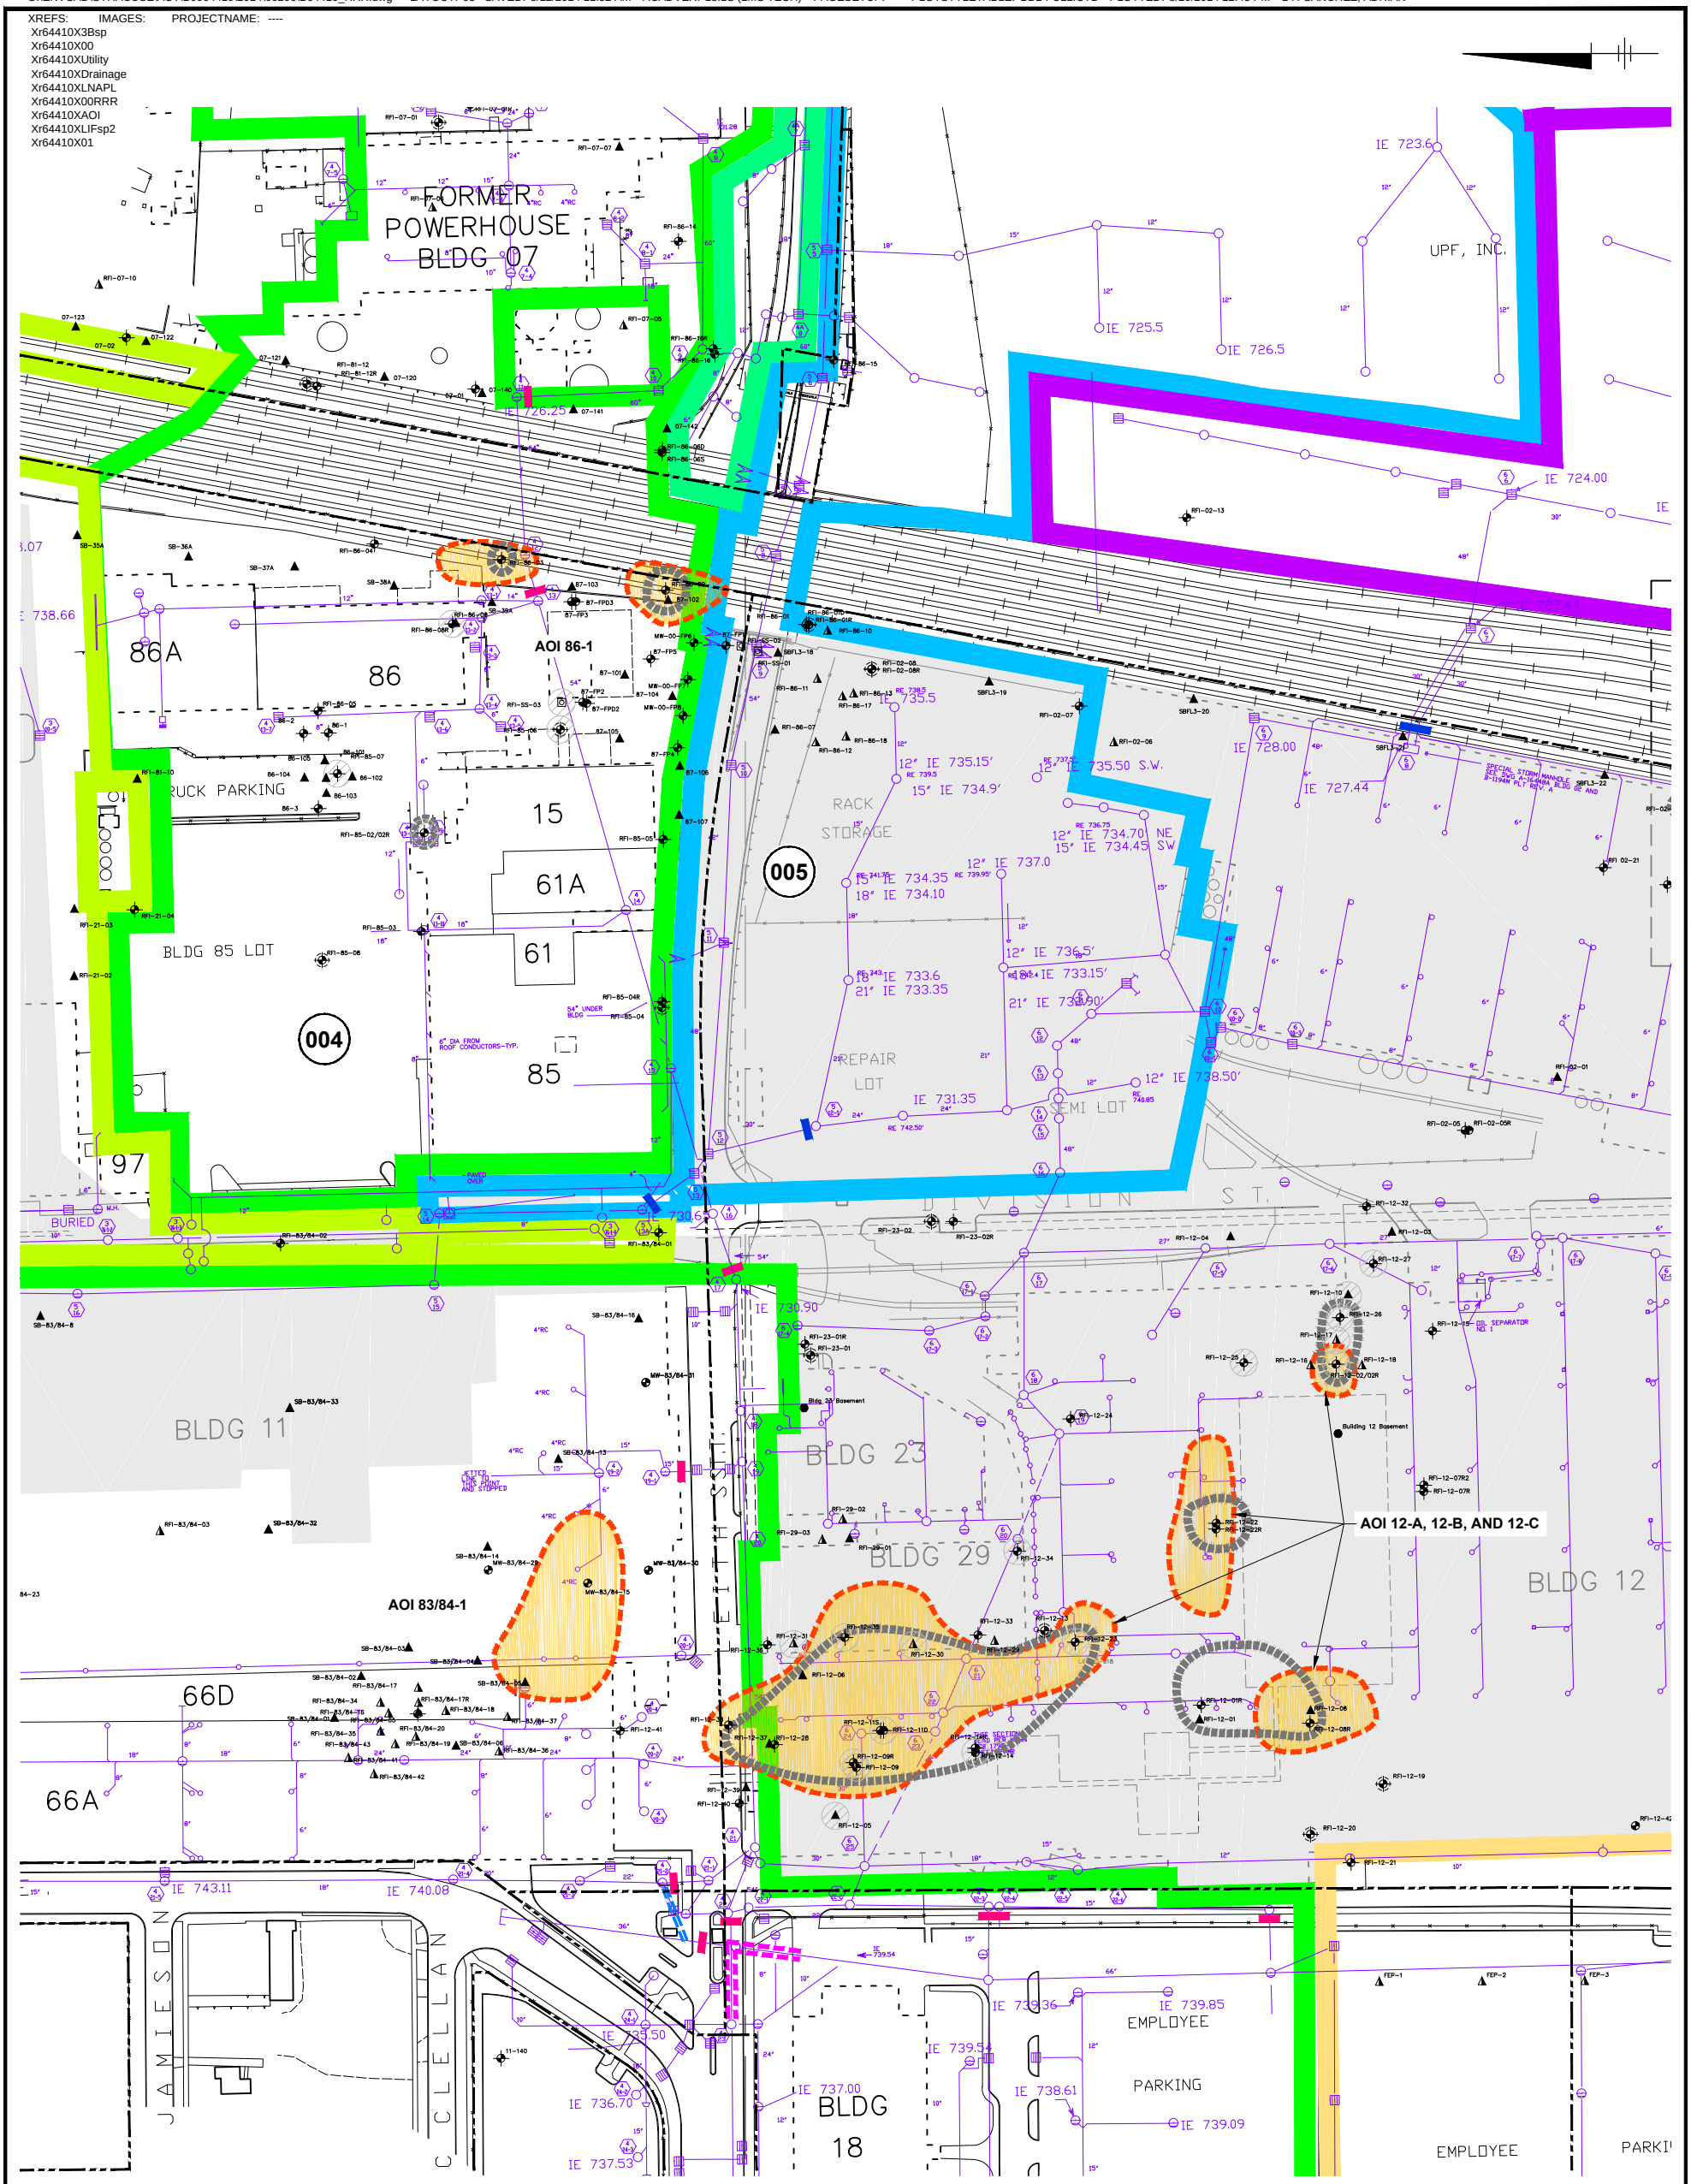
In order to address the risks associated with the LNAPL infiltration into the Outfall 004 storm sewer, the pathway will be eliminated. The preferred option to eliminate this pathway is to re-route the flow from the Outfall 004 storm sewer at the western property boundary into the nearby Outfall 013 storm sewer. The Outfall 004 storm sewer will then be bulkheaded and collared at the downgradient property boundary to eliminate this pathway as shown on **Figure H3-1**. A feasibility study for this option is currently underway and the final cost for this option is being evaluated.

3.2 004 Passive Recovery Trench Monitoring

After completion of re-routing activities the Outfall 004 bulkheads will have created two closed sections of pipe which will be used as passive recovery trenches. These trenches will be monitored for LNAPL accumulation and LNAPL will be removed, as necessary.

3.3 Institutional Controls

The following AOI-specific institutional controls, in addition to the Site-wide controls noted in the Report, will be necessary to limit potential for future exposure:



- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 5 of the main report** in **Attachment 3**.

Remedy Recommendation Report
Appendix H - AOI 83/84-1 Cutting Oil Area - Addendum No.1
Summary of Additional Investigations
RACER Buick City Site, Flint, Michigan

Introduction

This Addendum No. 1 to Remedy Recommendation Report Appendix H presents a summary of investigation data collected at the AOI 83/84-1 Cutting Oil Area from March 19, 2014 through December 31, 2015 at the Buick City Site (Site) located in Flint, Michigan.

Summary of Investigation Activities

Additional investigation activities conducted at AOI 83/84-1 consisted of conducting baildown testing and transmissivity evaluations. During the 2013 transmissivity event MW-83/84-15 did not meet the baildown testing requirements of having the air/LNAPL and LNAPL/water interfaces within the screened interval. Therefore, in December 2014 monitoring well MW-83/84-15R was installed at the AOI 83/84-1 LNAPL Area and screened from 3 to 13 feet below ground surface. In May 2015, MW-83/84-15 and MW-83/84-15R were gauged to determine if these wells met the requirements of transmissivity testing. The LNAPL-water interface at both wells was within the screened interval; however the air-LNAPL interface was only within

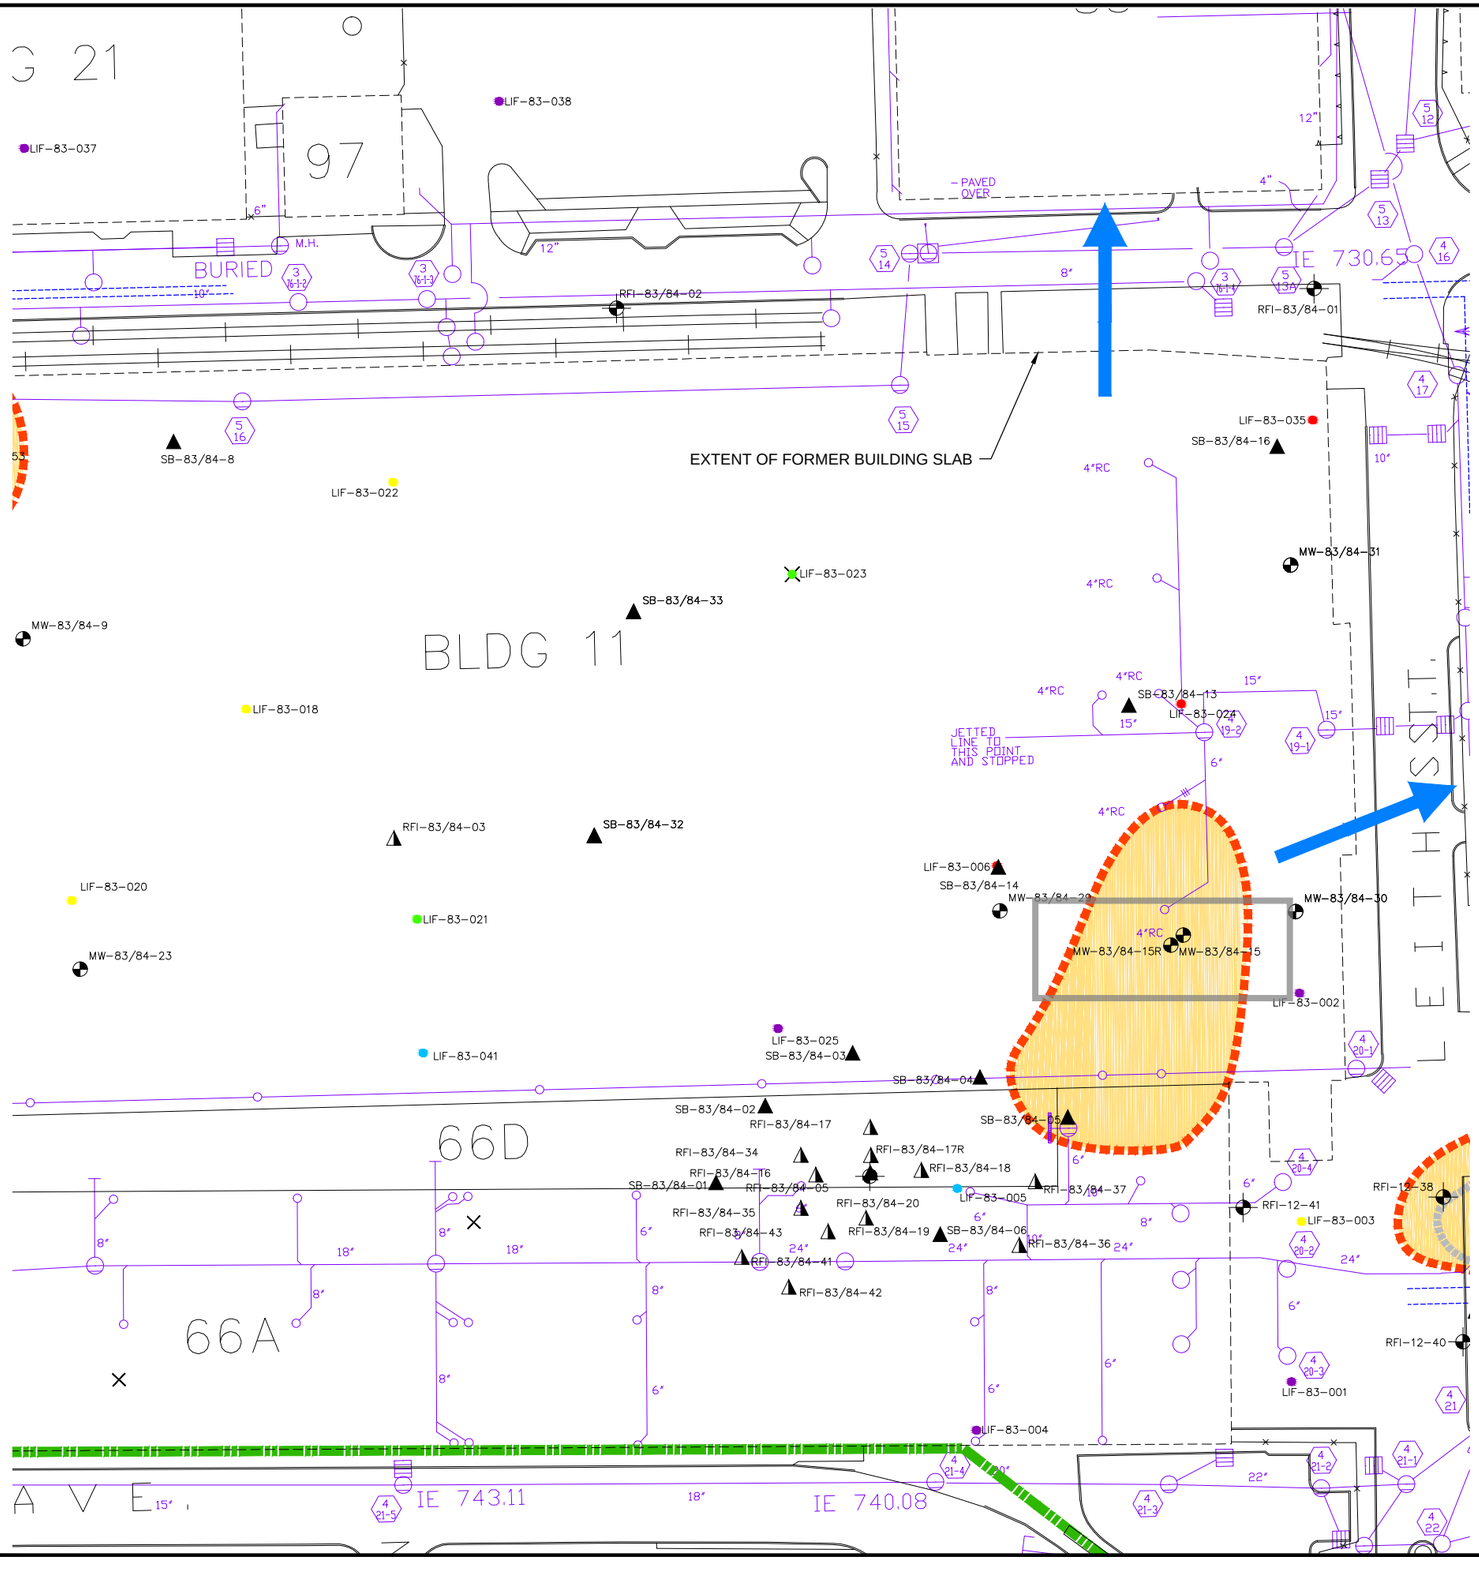
the screened interval at MW-83/84-15R. In June 2015 transmissivity testing was completed at both MW-83/84-15 and MW-83/84-15R. (**Figure H-A1-1**).

Summary of Data Evaluation

LNAPL Baildown test results were analyzed using the American Petroleum Institute (API) LNAPL Transmissivity Workbook (API Tool, API 2012) to calculate LNAPL transmissivity within the depth interval at which LNAPL is observed:

- B&R: Bouwer and Rice (1976)/Bouwer (1989), and
- C&J: Cooper and Jacob (1946)/Jacob and Lohman (1952).

Each of these solutions involves different assumptions regarding the response of fluid levels within the well to the removal of LNAPL. The B&R method was developed utilizing the assumption of steady, radial flow of LNAPL to the test well after test initiation, making it ideally suited for tests involving longer LNAPL purging times. The C&J method is better suited for tests involving more rapid LNAPL removal periods, or tests that do not exhibit steady state flow conditions because they incorporate transient storage effects. Additionally, the B&R method requires that there is a consistent relationship between changes in LNAPL drawdown and LNAPL thickness (the j-ratio) (API 2012 and ASTM International 2013). If there is significant variability in the j-ratio over the course of a test, analysis with the B&R method may be not be judged as appropriate, and only the C&J solution may be applied for analysis.



LNAPL transmissivity quantified by each method at MW-83/84-15 ranged from 0.24 to 0.71 ft^2/day and at MW-83/ 84-15R was 0.34 ft^2/day (**Table H-A1-1**).

The Michigan Department of Environmental Quality (MDEQ) published technical resource materials (MDEQ, 2014) that establish an LNAPL transmissivity 0.5 square feet per day (ft^2/day) as a lower-bound threshold where LNAPL recovery using hydraulic methods (e.g., LNAPL pumping, dual-phase extraction, and LNAPL skimming) is not typically practicable.

Table H-A1-1 2015 LNAPL Transmissivity Evaluation Results
Remedy Recommendation Report Appendix H - AOI 83/84-1 LNAPL Area - Addendum No.1
RACER Buick City Site, Flint, Michigan

Well ID	Date	Initial LNAPL Thickness (ft)	Test Duration (min)	Final LNAPL Thickness (ft)	LNAPL Transmissivity, T_n (ft^2/day)	
					Bouwer & Rice	Cooper & Jacob
AOI 83/84-1						
MW-83/84-15	6/11/2015	4.84	1430	3.4	0.24	0.71
MW-83/84-15R	8/14/2015	4.9	358	2.73	0.34	0.34

General Notes:
Bold Exceeds 0.1 to 0.8 ft^2/day lower criterion range to produce sufficient LNAPL recoverability (ITRC 2009a).
Underlined exceeds 0.5 ft^2/day which is the MDEQ established LNAPL transmissivity lower bound threshold below which LNAPL recovery using hydraulic tool is not typically practical

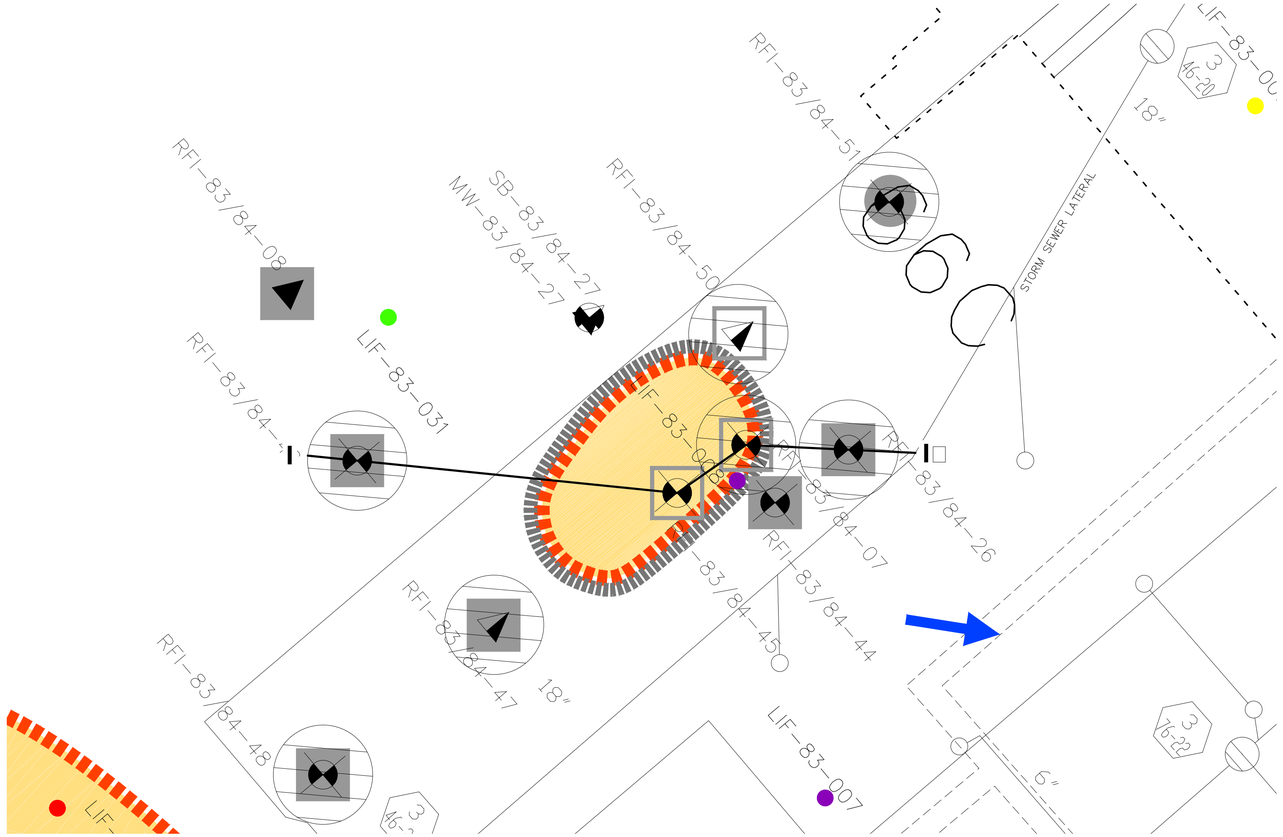
Priority #10 - AOI 83/84-4 Cutting Oil Area
Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

As part of the light non-aqueous phase liquid (LNAPL) remedy evaluation process the Site's 17 LNAPL areas were prioritized based on risk. The area of interest (AOI) 83/84-4 Cutting Oil LNAPL Area (AOI 83/84-4 LNAPL Area) is ranked as Priority #10 with a total potential risk score of 5 (**Table 5 of the main report**). A conceptual site model cross-section is attached (**Figure I-1**) that provides an overview of the AOI 83/84-4 LNAPL Area impacts and interim measures (IMs).

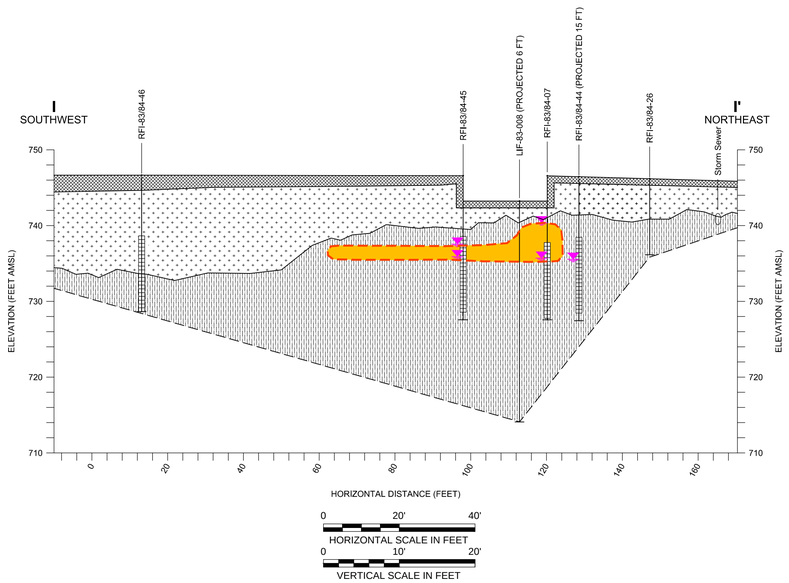


Historical IMs completed at the AOI 83/84-4 LNAPL Area include an LNAPL bailing program.

The compositional and saturation concerns identified for the AOI 03-1 LNAPL Area were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:

- There are potentially unacceptable groundwater surface water interface (GSI) and vapor phase concerns associated with the AOI 83/84-4 LNAPL Area.
- While there is a lateral for the Outfall 003 storm sewer located downgradient of both the AOI 83/84-4 LNAPL area and RFI-83/84-51, a review of Site data indicate that the groundwater table is rarely in connection with the storm sewer lateral.

- Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.
- No feasible options exist to mitigate unacceptable risk through compositional change.
- The LNAPL is not migrating or readily recoverable.



Based on the current understanding of the conceptual site model, the compositional and saturation concerns associated with AOI 83/84-4 area can effectively be mitigated through institutional controls.

LNAPL Conceptual Site Model

Priority #10 - AOI 83/84-4 Cutting Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model for the Area of Interest (AOI) 83/84-4 Cutting Oil light non-aqueous phase liquid (LNAPL) Area (AOI 83/84-4 LNAPL Area). The AOI 83/84-4 LNAPL Area is located at the Buick City Site (Site) located in Flint, Michigan (**Figure I1-1**).

1. Background

AOI 83/84-4 is located in the Building 66C portion of the former Factory 83/84 Area in the southwestern portion of the Northend of the Site (**Figure 2**). Historically, the former Factory 83/84 Area was primarily used as a gray iron foundry prior to 1981. From 1981 to 2010, the area was historically used for welding, machining and assembly of torque converters. Historic operations at AOI 83/84-4 involved "wet" machining operations including various metal chip conveyors trenches, process fluid recirculation and/or recovery sumps and pits, product supply sumps and storage areas, and metal chip processing. AOI 83/84-4 also included an inactive rail loading area and associated floor sumps. The floor of the loading area was saturated with oil and the sumps contained oil. LNAPL accumulation at AOI 83/84-4 is presumably due to historical releases associated with operations in this area.

Investigation data previously presented in Site reports are not re-presented in this memo. However, pertinent AOI 83/84-4 investigation data that has not previously been presented in a Site report is attached.

2. Former Interim Measures

2.1 LNAPL Monitoring and Bailing Program

During the Site-wide LNAPL monitoring program conducted from 2003 through 2004, a total of approximately 2.49 gallons of LNAPL was recovered during quarterly bailing events in the AOI 83/84-4 LNAPL Area.

3. AOI 83/84-4 Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and LNAPL characteristics and extent of impacts for the AOI 83/84-4 LNAPL area.

Figure I1-2 presents the locations of the existing and abandoned monitoring wells and soil borings in the AOI 83/84-4 area.

3.1 AOI 83/84-4 Geology and Hydrogeology

- *Geology:* The soils at AOI 83/84-4 consist of primarily fine to medium Sand to Silty sands interbedded with silts to a depth of approximately 13 feet bgs that are underlain by Silt with some clay. The boring logs also indicated evidence of impacts from as shallow as 3 feet bgs and as deep as 13 feet bgs.

- *Groundwater/LNAPL Levels:* Seven monitoring wells (RFI-83/84-07, RFI-83/84-26, RFI-83/84-44, RFI-83/84-45, RFI-83/84-46, RFI-83/84-48, and RFI-83/84-51) at the AOI 83/84-4 LNAPL Area are gauged to monitor the extent of the LNAPL. Depth to groundwater (or LNAPL, where present) in this area is generally 10 feet bgs. The AOI 83/84-4 LNAPL area is defined by two monitoring wells (RFI-83/84-07 and RFI-83/84-45). The greatest thickness of LNAPL measured at RFI-83/84-07 was 5.23 feet in 2012. Most recently, in June 2013, LNAPL thicknesses ranged from 1.15 to 1.29 feet in the AOI 83/84-4 monitoring wells. The March and June 2013 groundwater level data are presented in **Appendix X.**

  Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the south and southeast.

3.2 Groundwater and Soil Analytical Data

Groundwater and soil analytical data collected in the vicinity of the AOI 83/84-4 LNAPL Area were compared to applicable Michigan Part 201 nonresidential criteria. Pertinent analytical data is presented in **Appendix X**.

3.2.1 Groundwater Analytical Data

Groundwater samples were collected from one monitoring well (RFI-83/84-51) located at AOI 83/84-4. A groundwater sample exceeded groundwater surface water interface (GSI) criteria for arsenic (110/10ug/L), beryllium (140/32.3ug/L), copper (31/21.6ug/L) and silver (1.9/0.2ug/L). RRFI-83/84-51 is located side gradient of the AOI 83/84-4 LNAPL Area with respect to groundwater flow, not downgradient. A lateral for the Outfall 003 storm sewer is located downgradient of both the AOI 83/84-4 LNAPL Area and RFI-83/84-51, which

based on a comparison of groundwater and storm sewer elevations indicates that groundwater table is rarely in hydraulic connection with the storm sewer lateral. Only one groundwater level measurement collected in the last 10 years showed the groundwater level above the invert elevation of the Outfall 003 lateral. In addition, downgradient Outfall 003 and 005 storm sewers in the Factory 83/84 Area have been bulkheaded and do not present a GSI pathway.

3.2.2 Soil Volatile Organic Compounds (VOCs), Semi-Volatile Organic Compounds (SVOCs), and Metals Analytical Data

Soil samples were collected from 10 locations at AOI 83/84-4. The soil samples exceeded groundwater surface water interface protection (GSIP) criteria for 2-Methylnapthalene (5.05/1 mg/kg), carbazole (2.97/1.1 mg/kg), fluoranthene (14.6/5.5 mg/kg), naphthalene (0.908 - 1.87/0.73mg/kg), phenanthrene (2.46-11.9/2.1 mg/kg), arsenic (7.3-16/4.6 mg/kg), chromium 11-53/2 mg/kg), cobalt (7.4/2mg/kg), copper (160-2200/124 mg/kg), cyanide (21/0.1 mg/kg), manganese (490-1100/95.3 mg/kg), mercury 0.135/0.05 mg/kg, and silver (7.3/0.1 mg/kg).

3.2.3 GSI Evaluation

As discussed in further detail in **Appendix BB**, GSI exceedances in the Site storm sewers are being evaluated by the ongoing NPDES Plus Monitoring Program (NPMP). At AOI 83/84-4 the storm sewer represents an intermittent pathway as groundwater levels in this portion of the Site are generally deeper than the invert elevation of the storm sewer; however, levels do fluctuate and are occasionally above the invert. The monthly NPMP samples collected from the Outfall 003 storm sewer (which services this portion of the Site) as part of the NPMP have not exhibited concentrations of VOCs, SVOCs, or beryllium above GSI criteria at the downgradient monitoring point. However, in the last 36 sampling events there have been two exceedances of GSI criteria for silver and one exceedance for arsenic and copper. Note that arsenic and copper were also detected in storm sewer samples collected at the Site's upgradient property boundary.

Data evaluations completed to date suggest that the majority of the metals impacts in the Outfall 003 storm sewer can be addressed a mixing zone based remedy; however, additional data collection and evaluation is needed.

3.2.4 Soil PCB Analytical Data

A review of the analytical data at AOI 83/84-4 indicates that PCBs were detected in one of the 19 soil samples collected at a concentration of 0.59 mg/kg.

3.2.5 Vapor Intrusion Evaluation

Due to the presence of shallow groundwater and LNAPL (approximately 7 feet below ground surface) at the AOI 83/84-4 LNAPL Area, groundwater data were also compared to the applicable Non-Residential Screening Values for the Vapor Intrusion Pathway presented in the *Michigan Department of Environmental Quality (MDEQ) Guidance Document for the Vapor Intrusion Pathway* (further discussed in Section 3.4 of the Report). Groundwater concentrations do not exceed applicable screening levels.

As there are no structures at the Site the MDEQ Part 201 criteria are appropriate for comparison of soil data. Soil data did not exceed applicable screening levels.

3.3 LNAPL Characteristics

- *LNAPL Analytical Data:* LNAPL present at AOI 83/84-4 consists primarily of cutting oil. Additional analysis indicated that:
  - The LNAPL has a viscosity ranging from 42.5 to 62.4 centipoise (cp), interfacial tension ranging from 14 to 19 dynes/centimeter, and a specific gravity of 0.88. This data is used to evaluate LNAPL recoverability and as part of the LNAPL transmissivity analysis.
  - Concentrations of arsenic exceed toxicity characteristic leaching procedure (TCLP) criteria; however, TCLP analysis has not been conducted.

  For reference, the viscosity (at 100 degrees Fahrenheit) of olive oil is 43.2 cp and honey is 73.6 cp (Ingersoll-Rand, 1981). Applicable LNAPL analytical data are presented in **Appendix X**.

- *LIF Data:* Four LIF borings were completed in the AOI 83/84-4 LNAPL Area. The LIF waveform signatures observed in this area are consistent with the known LNAPL type, cutting oil. The vertical range of LIF impact (greater than 5%RE) at the AOI 83/84-4 LNAPL Area is typically 6 to 12 feet bgs. **Figure I1-2** presents the results of the LIF investigation associated with the AOI 83/84-4 LNAPL area.

- *Transmissivity:* An LNAPL transmissivity study was completed at the AOI 83/84-4 Area in April 2013. Based on LNAPL baildown test results, LNAPL transmissivity quantified at monitoring well RFI-83/84-07 was 0.03 square feet per day (ft^2/day), which is less than both the Interstate Technology Regulatory Council (ITRC) and MDEQ threshold values for practical hydraulic recovery.

- *Natural Source Zone Depletion:* NSZD testing was not attempted at AOI 83/84-4 due to the presence of a concrete slab. The testing completed at the Southend of the Site indicated that NSZD is occurring; however, the currently available testing technologies cannot

reliably quantify LNAPL depletion beneath a concrete slab. In addition, when nearby monitoring well MW-83/84-7 was installed during the AOI 83/84-5 LNAPL Area investigation, methane was detected indicating that NSZD may be occurring in this portion of the Site. This methane detection is further discussed in the AOI 83/84-5 memo presented in **Appendix K**.

3.4 Extent of LNAPL

During the RCES preparation, the AOI 83/84-4 LNAPL Area was calculated based on available Site data. The footprint of the LNAPL area containing approximately 0.5 ft. or greater of LNAPL as measured in monitoring wells was estimated to be approximately 3,300 square feet. Based on the LIF and soil boring log data, approximate depth impacts are approximately 3 to 13 ft. bgs. The recently completed field work does not indicate a need to change the extent (as discussed in Section 2.1.3 of the main report) of the measurable LNAPL area.

LNAPL Remedial Decision Tree

Attachment 2 LNAPL Remedial Decision Tree Priority #10 – AOI 83/84-4 Cutting Oil Area

NOTES

(#) NOTES: See Page I2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priority #10 - AOI 83/84-4 Cutting Oil Area

Background: The AOI 83/84-4 Cutting Oil light non-aqueous phase liquid (LNAPL) Area (AOI 83/84-4 LNAPL Area) is located at Building 66C in the former Factory 83/84 area in the southwestern portion of the Northend of the Site. Historic operations in former Factory 83/84 area involved "wet" machining operations including various metal chip conveyors trenches, process fluid recirculation and/or recovery sumps and pits, product supply sumps and storage areas, and metal chip processing. The AOI 83/84-4 area also includes an inactive rail loading area and associated sumps. The floor of the loading area was saturated with oil and the sumps contained oil. The occurrence of LNAPL in the AOI 83/84-4 LNAPL Area is presumably due to historical releases associated with operations in this area. There are currently no buildings within the AOI 83/84-4 LNAPL Area. The entire AOI 83/84-4 LNAPL Area is beneath the concrete footprint of former Factory 83/84.
Geology and Hydrogeology: The soils at AOI 83/84-4 consists of primarily fine to medium sand to silty sands interbedded with silts to a depth of approximately 13 feet bgs that are underlain by silt with some clay. Depth to groundwater in this area varies greatly and has been measured as shallow as 3.72 feet bgs, as deep as 12.92 feet bgs, and averages around 10 feet bgs. Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the south-southeast.

LNAPL Characteristics: Boring logs in the AOI 83/84-4 LNAPL Area show evidence of impacts from as shallow as 3 feet bgs and as deep as 13 feet bgs, across the area. Thicknesses of product greater than 0.5 feet have been measured at two monitoring wells (RFI-83/84-07 and RFI-83/84-45). At both RFI-83/84-07 and RFI-83/84-45, historical thicknesses of up to 2.05 feet of product were measured; however, during recent years, thicknesses have been measured at less than two feet. The LNAPL has a viscosity ranging from 42.5 centipoise (RFI-83/84-07) to 62.4 centipoise (RFI-83/84-45), interfacial tension ranging from 14 to 19 dynes/centimeter (RFI-83/84-07), and a specific gravity of 0.88 (at both locations). The LNAPL also contains arsenic and/or lead at concentrations that exceed the RCRA toxicity characteristic at two locations (RFI-83/84-07 and RFI-83/84-45); however, toxicity characteristic leaching procedure (TCLP) analysis has not been conducted.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*

   YES – The following potential risk/exposure concerns are associated with the AOI 83/84-4 LNAPL Area:

   - Groundwater surface water interface (GSI): Concentrations of select volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and metals in groundwater and soil samples collected from the AOI 83/84-4 area exceed GSI or GSI protection (GSIP) criteria. Based upon a comparison of nearby groundwater and storm sewer lateral elevations, the groundwater table is rarely in connection with the storm sewer lateral.

     In addition, VOC and SVOC concentrations in the monthly samples collected from the Outfall 003 storm sewer (which services this portion of the Site) as part of the NPDES Plus Monitoring program (NPMP) do not exceed GSI criteria; however, select metals have been detected above criteria, intermittently.

   - Potential Volatilization to Indoor Air Concerns for Future Structures: Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*

   YES – Targeted in-situ soil mixing/land farming to address the petroleum constituents may be technically feasible. However, other options evaluated were not feasible as discussed below:

   - Enhanced dissolution and recovery via surfactant or hot water flushing may enhance LNAPL recovery; however, it is not a viable option based on the presence of nearby City sewers. The use of surfactant would increase mobility and therefore, likely increase the potential for LNAPL infiltration into the Outfall 003 storm sewer main. The Outfall 003 storm sewer main is located approximately 100 feet upgradient of the AOI 83/84-4 LNAPL Area and is larger and deeper than the downgradient Outfall 003 lateral discussed in **Attachment 1**. As shown on **Figure 7 of the main Report** there are numerous utilities at AOI 83/84-4 which could provide pathways for the LNAPL if the mobility were increased.

   - Cutting oils have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.

   - In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the proximity of City storm sewers. The storm sewer main in this portion of the Site is an old clay-tile sewer. The heat generated by this technology could compromise the sewer potentially causing a collapse of the pipe. There are also older water lines, sanitary sewers, etc. (since this area was a manufacturing facility for over 100 years) that may be damaged by high temperatures. Also, increasing the water temperature in the storm sewer could have a negative on the Flint River ecosystem.

Attachment 2 Notes

Priority #10 - AOI 83/84-4 Cutting Oil Area

3) Can institutional/engineering controls provide effective risk mitigation

YES – Based on the current understanding of risk conditions, the potential GSI/GSIP and volatilization to indoor air risk can be effectively mitigated through institutional controls.

4) Is there a potential benefit to partial treatment/removal that outweighs costs?

NO – Based on the current understanding of risk conditions, the potential GSI/GSIP, and the volatilization to indoor air risk can be effectively mitigated through institutional controls.

5) Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?

NO – The AOI 83/84-4 LNAPL Area appears to be stable. This finding is supported by the following lines of evidence:

- Well Gauging Data: Sentinel wells located around the periphery of the AOI 83/84-4 LNAPL Area have remained free of LNAPL since monitoring began approximately 10 years ago.
- Age of LNAPL Release: The AOI 83/84-4 LNAPL Area was identified in 2002. Operations began in this portion of the Site in the 1909 and ceased in this portion of the Site in mid-2000s with the building being demolished in 2011. LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).

6) *Is LNAPL mobile within the stable LNAPL perimeter?*

YES – LNAPL is present at two monitoring wells in the AOI 83/84-4 area indicating that the LNAPL is mobile within the stable perimeter.

7) Is LNAPL readily recoverable?

NO – Historic LNAPL bailing activities recovered minimal quantities of LNAPL. In addition, transmissivity testing completed within the AOI 83/84-4 LNAPL Area at monitoring well RFI-83/84-07 was quantified at 0.03 square feet per day (ft^2/day), which is less than both the Interstate Technology Regulatory Council (ITRC) and Michigan Department of Environmental Quality (MDEQ) draft standard threshold values indicating that LNAPL recovery is not practicable.

8) Are controls required?

YES – The Site-wide institutional controls are proposed, for the AOI 83/84-4 LNAPL Area to limit future exposure.

Attachment 3

Remedy Recommendations

Priority #10 - AOI 83/84-4 Cutting Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – Recommended Remedy

This attachment presents the recommended remedies for the Area of Interest (AOI) 83/84-4 Cutting Oil light non-aqueous phase liquid (LNAPL) area (AOI 83/84-4 LNAPL Area).

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in **Attachment 2** identified groundwater surface water interface (GSI) and volatilization to indoor air as potential compositional concerns for AOI 83/84-4 and mobility as a saturation concern. The potential GSI concern is based on the detection of select volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals in groundwater and soil samples at concentrations that exceed the GSI or GSI protection (GSIP) criteria. The potential volatilization to indoor air concern is due to the biodegradation of LNAPL generating methane that could potentially result in indoor air concerns for future structures.

2. Remedy Recommendation Rationale

The remedy recommended to address the compositional and saturation concerns associated with the AOI 83/84-4 LNAPL Area is institutional controls, which is discussed in detail in Section 3.The rationale for this selection is detailed below:

- Volatile organic compounds, semi-volatile organic compounds, and select metals have been detected above GSI criteria and/or GSIP criteria; however:
    - While there is a lateral for the Outfall 003 storm sewer located downgradient of both the AOI 83/84-4 LNAPL area and RFI-83/84-51, a review of Site data indicate that the groundwater table is rarely in connection with the storm sewer lateral. In addition GSI exceedances in the Site storm sewers are discussed in further detail in **Appendix BB**.
    - Downgradient Outfall 003 and 005 storm sewers in the Factory 83/84 Area have been bulkheaded and do not represent a GSI pathway.

- The monthly NPDES Plus Monitoring Program (NPMP) sample collected from Outfall 003 has not exhibited concentrations of VOCs, SVOCs, and beryllium above GSI criteria at the monitoring point; and
- As discussed in **Appendix BB**, the majority of metals exceedances identified in the Outfall 003 storm sewer will likely be addressed by a mixing zone remedy; however, additional data collection and evaluation is needed.

- Based on the current understanding of risk conditions, the potential volatilization to indoor air risk for future structures can be effectively mitigated through the Site-wide institutional controls.
- Although the LNAPL at AOI 83/84-4 is mobile within the stable perimeter, transmissivity testing indicates that recovery is not practical. The LNAPL transmissivity quantified at monitoring well RFI-83/84-07 was 0.03 square feet per day (ft^2/day), which is less than both the ITRC and MDEQ threshold values for practical hydraulic recovery.
- From 2003 to 2005, nine quarterly LNAPL recovery events removed a total of only 2.49 gallons of LNAPL from AOI 83/84-4 wells.

3. AOI 83/84-4 Remedies

3.1 Completed Interim Measures

During the Site-wide LNAPL monitoring program conducted from 2003 through 2004, a total of approximately 2.49 gallons of LNAPL was recovered during quarterly bailing events in the AOI 83/84-4 LNAPL Area. The partial removal of LNAPL has been completed in this area and is considered a component of the remedy.

3.2 Additional Remedy Recommendations

The remedy recommended to address the volatilization and mobility concerns associated with AOI 83/84-4 area is historic interim measures and to establish institutional controls. This remedy will prevent future worker exposure to LNAPL impacts in the long term.

3.2.1 Institutional Controls

Site-wide Institutional Controls discussed in the main report will be implemented to limit potential for future exposure.

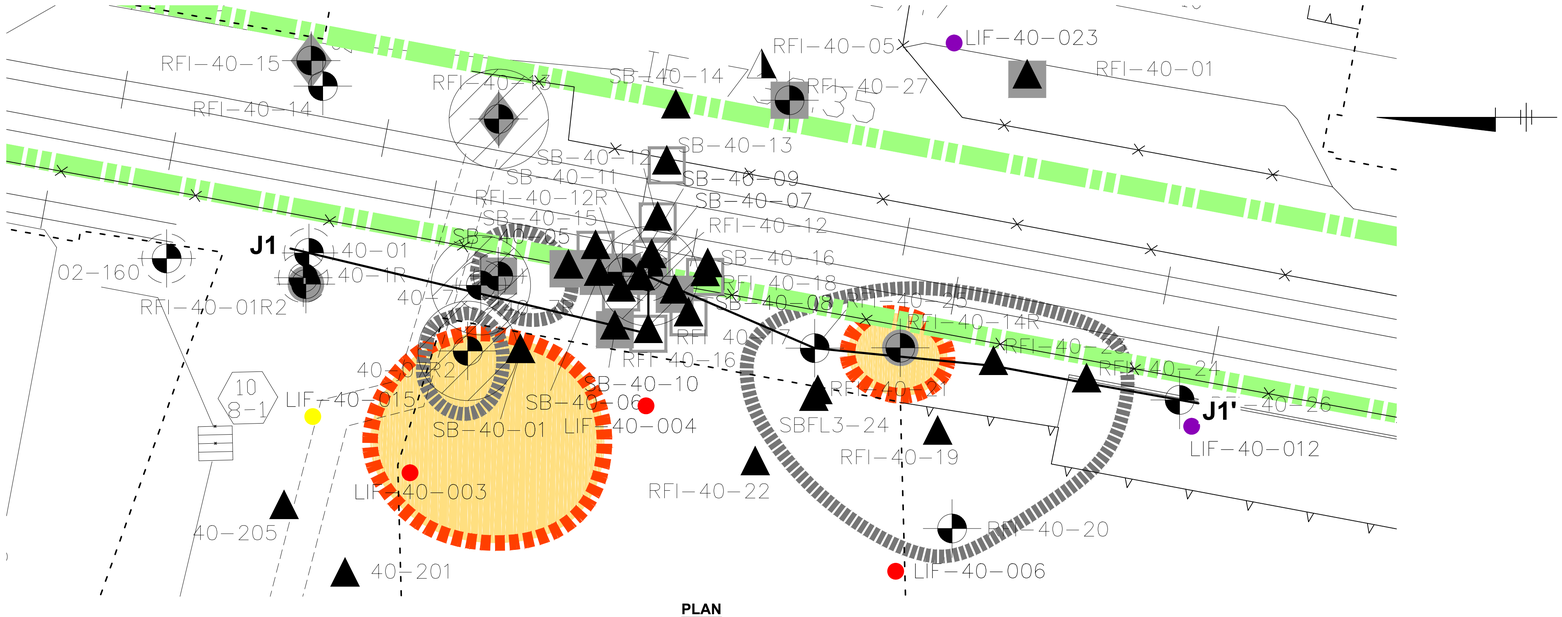
Subject:
Priority #11 - AOI 40-A, -B, & 16-C Fuel Oil LNAPL Areas
Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

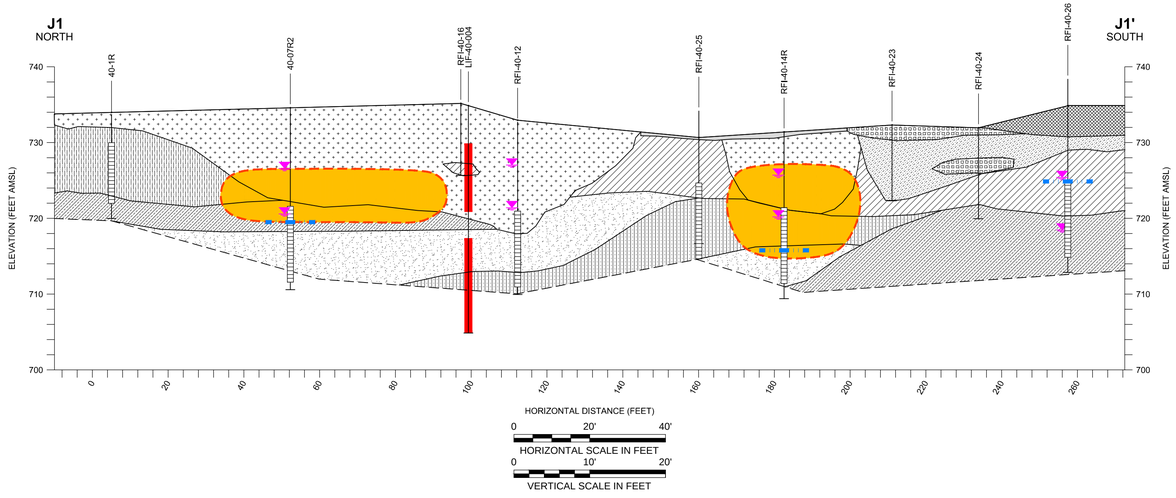


As part of the light non-aqueous phase liquid (LNAPL) remedy evaluation process the Site's 17 LNAPL areas were prioritized based on risk. The Area of Interest (AOI) 40-A, -B, and 16-C Fuel Oil LNAPL Areas (AOI 40-A, -B & 16-C LNAPL Areas) are ranked as Priority #11 with a total potential risk score of 4 (**Table 5 of the main report**). A conceptual site model cross-section is attached (**Figure J-1**) that provides an overview of the AOI 40-A, -B, & 16-C LNAPL Area impacts and interim measures (IMs).

The compositional and saturation concerns identified for the AOI 40-A, -B, and 16-C LNAPL Areas were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:

- Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane generated from the biodegradation of methane, for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.
- Surficial soil direct contact exceedances will be addressed separately in **Appendix P**.
- Exceedances of groundwater surface water interface (GSI) and GSI protection (GSIP) criteria for select volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals were identified at the AOI 40-A,-B, & 16-C LNAPL Areas.

- The potential direct groundwater discharge pathway from AOI 40-A, -B, &16-C to the Flint River will be addressed in Appendix BB. Bulkheading activities will be completed at Outfall 009 and 010 to eliminate the GSI storm sewer pathway.
- Based on the current understanding of risk conditions, the potential groundwater volatilization to indoor air (on and off Site) can be effectively mitigated through the institutional controls.
- Bench-scale testing of five technologies was conducted on samples collected from the AOI 40-A, -B, & 16-C area. The results of the testing indicated that: enhanced dissolution and recovery via surfactant resulted in a 62.4% reduction in LNAPL saturation and hot water flushing resulted in a 10.7% reduction in LNAPL saturation; however, these results were limited to the former tunnel within the AOI where sandy backfill was placed. In addition, in-situ thermal remediation may be technically feasible for the area.
- The LNAPL is not migrating and is not infiltrating the Outfall 009 or 010 storm sewers.
- LNAPL transmissivity quantified at monitoring well 40-7R2 ranged from 1.3 to 1.9 square feet per day (ft^2/day), which exceed the Interstate Technology Regulatory Council (ITRC) and Michigan Department of Environmental Quality (MDEQ) draft standard threshold values, which indicates LNAPL recovery may be practicable at this well. However, LNAPL recovery at 40-7R2 would not decrease risk at AOI 40-A, -B, and 16-C.
- Due to poor recovery transmissivity testing was inconclusive at RFI-40-02R and tests were not conducted at RFI-16-08 and LIF-04-004 because there was insufficient LNAPL accumulation.
- Historical IMs completed at the AOI 40-A, -B, & 16-C LNAPL Areas include an LNAPL bailing program.



Based on the current understanding of conceptual site model risks associated with the GSI storm sewer pathway and volatilization concerns can be effectively mitigated through engineering and institutional controls.

Attachment 1

LNAPL Conceptual Site Model

ARCADIS

Priority #11 - AOI 40-A, -B, and 16-C Fuel Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model for the area of interest (AOI) 40-A, -B, and 16-C Fuel Oil light non-aqueous phase liquid (LNAPL) Areas (AOI 40-A, -B, & 16-C LNAPL Areas), which are located at the Buick City Site (Site) located in Flint, Michigan (**Figure J1-1**).

1. Background

The AOI 40-A, -B, & 16-C LNAPL Areas are located at the Southend of the Site between former Buildings 16 and 40, and north/northeast of former Building 40. The LNAPL areas are presumably associated with releases from underground storage tanks (USTs) located between former Buildings 16 and 40 (10,000-gallon transmission oil UST, two 10,000-gallon gear oil USTs, a 2,500-gallon diesel UST and a 2,500-gallon LS900 UST) and former Buildings 02 and 40 (10,000-gallon transmission oil UST, and 10,000-, 12,000-, and 16,000-gallon hazardous USTs). Additional information regarding these tank farms is presented in the *Current Conditions Report – South of Leith Street* included in **Appendix Y**. The AOI 40-A and AOI 40-B areas are those located north/northeast of former Building 40. The LNAPL area located between the former Buildings 16 and 40 is the AOI 16-C LNAPL area. LNAPL associated with the AOI 40-A, -B, & 16-C LNAPL Areas have accumulated to measurable thicknesses in five monitoring wells (**Figure J1-2**).

The AOI 40-A, -B, & 16-C LNAPL Areas investigation data including, but not limited to soil boring logs, monitoring well logs, laser induced fluorescence (LIF) logs, and analytical data previously presented in Site reports are not re-presented in this memo. However, pertinent AOI 40-A, -B & 16-C investigation data that has not previously been presented in a Site report is attached.

2. Former Interim Measures - LNAPL Monitoring and Bailing Program

During the Site-wide LNAPL monitoring program conducted from 2003 through 2005, a total of approximately 3.4 gallons of LNAPL was recovered during quarterly monitoring and bailing events completed at 18 monitoring wells in the former Building 40 and 16 area.

3. AOI 40-A, -B, & 16-C LNAPL Area Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and LNAPL characteristics and extent of impacts for the AOI 40-A, -B, & 16-C LNAPL Areas. **Figure J1-2** presents the locations of the existing and abandoned monitoring wells and soil borings in the AOI 40-A, -B, &16-C LNAPL Areas.

3.1 Geology and Hydrogeology

- *Geology*: Soil boring and monitoring well logs in the vicinity of the AOI 40-A, -B, & 16-C LNAPL Areas indicate that the soils are primarily Silts and Clays down to approximately 22 feet below ground surface (bgs). The boring logs also indicated visual evidence of impact from 7 to 15 feet bgs.

- *Groundwater/LNAPL Levels:* Twenty-five monitoring wells at the AOI 40-A, -B, & 16-C areas are gauged to monitor the extent of the LNAPL. A summary of the groundwater and LNAPL data for each area is provided below.

    - The AOI 40-A LNAPL Area has been monitored by 11 monitoring wells (40-01R2, 40-06R, 40-07R2, 40-7, RFI-40-12R, RFI-40-13, RFI-40-14R, RFI-40-20, RFI-40-25, RFI-40-26, and RFI-40-27). Depth to groundwater (or LNAPL, where present) at AOI 40-A is approximately 6 to 7 feet bgs. LNAPL has been consistently measured at 40-07R2, RFI-40-12R, and RFI-40-14R and intermittently at RFI-40-25 and RFI-40-26.
    - The AOI 40-B LNAPL Area has been monitored by three monitoring wells (RFI-40-02, RFI-40-03, and RFI-40-10R). Depth to groundwater (or LNAPL, where present) is approximately 6 to 7 feet bgs. LNAPL has been consistently measured at RFI-40-02 and intermittently at RFI-40-03 and RFI-40-10R.
    - The AOI 16-C LNAPL Area has been monitored by eleven monitoring wells (40-302, 40-303R, 40-304, 40-305, RFI-16-04R, RFI-16-07, RFI-16-08, RFI-16-09, RFI-16-10, RFI-16-20, and RFI-16-24. Depth to groundwater (or LNAPL, where present) ranges from 8 to 10 feet bgs. LNAPL has been consistently measured at RFI-16-08 and RFI-16-10 and intermittently at 40-303R, 40-304, 40-305, RFI-16-04R, RFI-16-09, RFI-16-20, and RFI-16-24.

Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the east and southeast. A summary of groundwater level data collected at AOI 40-A, -B and 16-C is presented in **Appendix X**. Logs for recently complete soil borings and monitoring wells are attached.

3.2 Groundwater and Soil Analytical Data

Analytical data were compared to applicable Michigan Part 201 non-residential criteria.

3.2.1 Groundwater Analytical Data

Groundwater samples collected from fifteen wells located in the AOI 40-A, -B, & 16-C LNAPL Areas exhibited concentrations of several volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals exceeding groundwater/surface water interface (GSI) criteria. The VOCs detected above criteria were benzene (210-5,500/200 ug/L), ethylbenzene (61-800/18 ug/L), isopropylbenzene (36-74/28 ug/L) and xylenes (84-230/41 ug/L). The SVOCs detected above criteria were 2-methylnaphthalene (53.2/19 ug/L) and naphthalene (89.4/11 ug/L). The metals detected above criteria were arsenic (11-200/10 ug/L), beryllium (44-190/32 ug/L), copper (26-100/22 ug/L), cyanide (6.8-440/5.2 ug/L), mercury (0.119-0.121/0.0013 ug/L), selenium (11-180/5 ug/L) and silver (0.29-2.0/0.06 ug/L). The dissolved phase plumes continue offsite to the adjacent CSX property (which bisects the Site) as shown on **Figure J1-3.** Groundwater analytical data is presented in **Appendix X.**

3.2.2 Soil VOC, SVOC, and Metals Analytical Data

Soil samples collected from twenty-one locations in the AOI 40-A, -B, & 16-C LNAPL Area detected several VOCs, SVOCs and metals at concentrations that exceed groundwater/surface water interface protection (GSIP) criteria. The VOCs detected above criteria were 1,2,4-trimethylbenzene (0.65/0.57 mg/kg), ethylbenzene (0.7-3.9/0.36 mg/kg) and xylenes (0.86-1.3/0.82 mg/kg). The SVOCs detected above criteria were carbazole (1.68-10.7/1.1 mg/kg), dibenzofuran (4.93/1.7 mg/kg), fluoranthene (15.2-105/5.5 mg/kg), fluorene (7.1/5.3 mg/kg), naphthalene (0.75-3.54/0.73 mg/kg) and phenanthrene (10.3-77.1/2.1 mg/kg). The metals that were detected above criteria include arsenic (5.9-14/4.6 mg/kg), cobalt (7.1-13/2 mg/kg), cyanide (0.5-2.6/0.1 mg/kg), manganese (500-1,300/98 mg/kg), mercury (0.14/0.05 mg/kg), selenium (0.43-0.54/0.4 mg/kg), silver (1.5-2.3/0.1 mg/kg) and zinc (760/280 mg/kg).

In addition, benzo(a)pyrene was detected above non-residential direct contact (8.71-35.8/8 mg/kg) criteria. The benzo(a)pyrene exceedances occur in surface soils and are not related to the LNAPL impacts in the AOI 40-A, -B, and 16-C LNAPL Areas. These exceedances are addressed separately in **Appendix P**.

3.2.3 GSI Evaluation

As discussed in further detail in **Appendix BB**, GSI exceedances in the Site storm sewers are being evaluated by the ongoing NPDES Plus Monitoring Program (NPMP). The AOI 40-A, -B, and 16-C LNAPL Areas are serviced by the Outfall 009 and 010 storm sewers. In order to eliminate the GSI storm sewer pathway at AOI 40-A, -B, and 16-C, the Outfall 009 and 010 storm sewers will be bulkheaded at the property boundary. The potential direct groundwater discharge pathway from AOI 40-A, -B, &16-C to the Flint River will be addressed in **Appendix BB**.

3.2.4 Soil PCB Analytical Data

Seventy-nine soil samples were analyzed for polychlorinated biphenyls (PCBs) and two samples exhibited PCB concentrations greater than 1 part per million (ppm) (RFI-16-04,4 to 6 ft. bgs [1.13 mg/kg];RFI-40-12,0 to 2 ft. bgs [1.12 mg/kg]).

Because the detection of PCBs at RFI-40-12 is co-located with the surface soil benzo(a)pyrene impacts discussed above, this PCB impact will be addressed in the AOI 40-A soil memo presented in **Appendix P**.

3.2.5 Vapor Intrusion Evaluation

Due to the presence of shallow groundwater and LNAPL (approximately 6 to 8 feet below ground surface) at AOI 40-A, -B & 16-C, groundwater data were also compared to the applicable Non-Residential Screening Values For the Vapor Intrusion Pathway presented in the *Michigan Department of Environmental Quality (MDEQ) Guidance Document for the Vapor Intrusion Pathway* (further discussed in Section 3.4 of the Report). Groundwater data at four locations (RFI-40-03, RFI-40-09, RFI-40-10R, and RFI-40-15) exceed applicable volatilization to indoor air screening levels.

As there are no structures at the Site the MDEQ Part 201 criteria are appropriate for comparison of soil data. Soil concentrations did not exceed applicable screening levels.

3.3 LNAPL Characteristics

- *LNAPL Analytical Data:* LNAPL present at AOI 40-A, -B, & 16-C LNAPL Areas consists primarily of fuel oil. Additional analysis indicate that:
    - Concentrations of benzene exceed TCLP criteria at RFI-40-14R; however, TCLP analysis has not been conducted.
    - Concentrations of arsenic and lead exceed TCLP criteria at RFI-16-10; however, TCLP analysis has not been conducted.

  - The LNAPL sample collected from RFI-40-02R has a viscosity of 60.56 centipoise and a specific gravity of 0.896, while the LNAPL at RFI-16-10 has an interfacial tension of 18 dynes/centimeter, a viscosity of 2.7 centipoise, and a specific gravity of 0.86.
  - PCBs have not been detected in the LNAPL samples collected from the AOI 40-A, -B, &16-C areas.

- *LIF Data:* Fifty-three laser-induced fluorescence (LIF) borings were completed in the AOI 40-A, -B, &16-C LNAPL Areas. The LIF response in these areas is consistent with the known LNAPL type, fuel oil. The vertical range of LIF impact (greater than 5%) at the AOI 40-A and 40-B Areas is 5 to 30 feet bgs at the north end of the areas and 5 to 18 feet bgs at the south end of the areas. The vertical range of impacts at the AOI 16-C area is 8.5 to 11.5 feet bgs in the northern portion of the area and 5 to 24 feet bgs in the southern portion of the area. **Figure J1-2** presents the results of the LIF investigation and the extent of impacts associated with the AOI 40-A, -B, & 16-C LNAPL Areas.

- *Transmissivity:* An LNAPL transmissivity study was completed at the AOI 40-A, -B, & 16-C LNAPL Areas, which consisted of completing four quarters of baildown testing at four monitoring wells (RFI-40-7R2, RFI-16-08, RFI-40-02R and LIF-04-004). Based on LNAPL baildown test results, LNAPL transmissivities quantified at monitoring well RFI-40-7R2 ranged from 1.3 to 1.9 square feet per day (ft^2/day), which is above minimum range suggested by ITRC and the MDEQ standard threshold value, indicating that LNAPL recovery may be practicable at this well. Due to poor recovery during the baildown tests, transmissivity results were inconclusive at RFI-40-02R. Transmissivity tests were not conducted at RFI-16-08 and LIF-04-004 because there was insufficient LNAPL accumulation in the monitoring wells during the course of the study.

- *Natural Source Zone Depletion (NSZD):* An NSZD study was conducted at five locations (LIF-16-006, LIF-16-017, LIF-40-004, LIF-40-01, LIF-40-022) that are located in the AOI 40-A, -B, and 16-C LNAPL Areas. The testing completed indicated that NSZD is occurring; however, the currently available testing technologies cannot reliably quantify the depletion beneath a concrete slab.

3.4 Extent of LNAPL

During the Remedial Cost Estimate Summary (RCES) preparation, the AOI 40-A, -B, & 16-C LNAPL Areas was calculated based on historical data. The footprint of the LNAPL area containing approximately 0.5 ft or greater of LNAPL was estimated to be approximately 8,200 square feet. Based on recent field work, the footprint of these LNAPL Areas has been updated (as discussed in Section 2.1.3 of the main report) and is now approximately 16,000 square feet. The boring and LIF logs indicated the depth of impacts to at the AOI 40-A Area is 5 to 30 feet bgs and 5 to 18 feet at the AOI 40-B area. The vertical range of impacts at the AOI 16-C area is 8.5 to 11.5 in the northern portion of the area and 5 to 24 feet bgs in the southern portion of the area.

LNAPL Remedial Decision Tree

Attachment 2 LNAPL Remedial Decision Tree
Priority #11 – AOI 40-A, -B, & 16-C (Fuel Oil Area)

NOTES

(#) NOTES: See Page J2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priority #11 - AOI 40-A, -B, & 16-C Fuel Oil LNAPL Areas

Background: The area of interest (AOI) 40-A, -B, & 16-C light non-aqueous phase liquid (LNAPL) Areas are located at the Southend of the Site between former Buildings 16 and 40, and north/northeast of former Building 40. The AOI 40-A, -B &16-C LNAPL Areas are located adjacent to CSX property that bisects this portion of the Site. The LNAPL plumes are presumably associated with releases from underground storage tanks located between former Buildings 16 and 40 and former Buildings 02 and 40. The AOI 40-A and AOI 40-B areas are those located north/northeast of former Building 40. The LNAPL area located between the former Buildings 16 and 40 is the AOI 16-C area. There are currently no buildings within the AOI 40-A, -B, & 16-C LNAPL Areas.

Geology and Hydrogeology: The soils at AOI 40-A, -B, and 16-C consist of primarily Silts and Clays to a depth of approximately 22 feet bgs. Depth to groundwater at the AOI 40-A and 40-B areas is approximately 6 to 7 feet bgs and at the AOI 16-C area the depth to groundwater ranges from 8 to 10 feet bgs. Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the east and southeast.

LNAPL Characteristics: The boring and LIF logs indicated the depth of impacts to at the AOI 40-A area is 5 to 30 feet bgs and 5 to 18 feet at the AOI 40-B area. The vertical range of impacts at the AOI 16-C area is 8.5 to 11.5 feet bgs in the northern portion of the LNAPL area and 5 to 24 feet bgs in the southern portion of the LNAPL area.

- The AOI 40-A LNAPL Area has been monitored by 11 monitoring wells (40-01R2, 40-06R, 40-07R2, 40-7, RFI-40-12R, RFI-40-13, RFI-40-14R, RFI-40-20, RFI-40-25, RFI-40-26, and RFI-40-27). Depth to groundwater (or LNAPL, where present) at the AOI 40-A is approximately 6 to 7 feet bgs. LNAPL has been consistently measured at 40-07R2, RFI-40-12R, and RFI-40-14R and intermittently at RFI-40-25 and RFI-40-26. The LNAPL sample collected from the AOI 40-A area detected benzene at a concentration that exceeds the RCRA toxicity characteristic at one location (RFI-40-14R); however, TCLP analysis has not been conducted. The LNAPL sample collected from RFI-40-02R has a viscosity of 60.56 centipoise and a specific gravity of 0.896,
- The AOI 40-B LNAPL Area has been monitored by three monitoring wells (RFI-40-02, RFI-40-03, and RFI-40-10R). Depth to groundwater (or LNAPL, where present) is approximately 6 to 7 feet bgs. LNAPL has been consistently measured at RFI-40-02 and intermittently at RFI-40-03 and RFI-40-10R.
- The AOI 16-C LNAPL Area has been monitored by eleven monitoring wells (40-302, 40-303R, 40-304, 40-305, RFI-16-04R, RFI-16-07, RFI-16-08, RFI-16-09, RFI-16-10, RFI-16-20, and RFI-16-24. Depth to groundwater (or LNAPL, where present) ranges from 8 to 10 feet bgs. LNAPL has been consistently measured at RFI-16-08 and RFI-16-10 and intermittently at 40-303R, 40-304, 40-305, RFI-16-04R, RFI-16-09, RFI-16-20, and RFI-16-24. At AOI 16-C the LNAPL contains arsenic and lead at concentrations that exceed the RCRA toxicity characteristic at two locations (RFI-16-04 and RFI-16-10); however, TCLP analysis has not been conducted. The LNAPL collected from RFI-16-10 has a viscosity of 2.7 cp, interfacial tension of 18 dynes/cm, and a specific gravity of 0.86.
- PCBs have not been detected in the LNAPL samples collected from the AOI 40-A, -B, &16-C areas.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*

YES – The following potential risk/exposure concerns are associated with the AOI 40-A, -B, & 16-C a:

- Groundwater/surface water interface (GSI): Exceedances of GSI and GSI Protection (GSIP) criteria for select volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals were identified at the AOI 40-A, -B, & 16-C LNAPL Areas. The GSI storm sewer pathway is addressed herein; however, the potential direct groundwater discharge pathway from AOI 40-A, -B, &16-C to the Flint River will be addressed in **Appendix BB**.
- Direct Contact – Seven soil samples collected from the AOI 40-A, -B, &16-C areas exceeded non-residential direct contact criteria for benzo(a)pyrene in surface soils; however these exceedances are in surficial soils and not related to LNAPL, and will be addressed separately in **Appendix P**.
- Potential Groundwater Volatilization to Indoor Air Concern at the Property Boundary: Groundwater data from four locations (RFI-40-03, RFI-40-09, RFI-40-10R, and RFI-40-15) exceed applicable vapor intrusion screening levels. On Site concerns will be addressed by institutional controls. Additional evaluation will be completed for off Site receptors in accordance with the MDEQ's *Guidance Document for the Vapor Intrusion Pathway.* However, as two of the locations (RFI-40-03 and RFI-40-10R) are more than 100 feet from the property boundary and the adjacent CSX property consists of rail road tracks, which are highly unlikely to be replaced by an occupiable structure in the foreseeable future, it is likely that institutional controls will also be recommended as the off Site remedy.
- Potential Volatilization to Indoor Air Concerns for Future Structures: Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*

YES – The following is a general discussion regarding the feasibility of various compositional change remediation strategies for the AOI 40-A, -B & 16-C LNAPL Areas:

- Bench-scale testing of five technologies was conducted on samples collected from the AOI 40-A, -B, & 16-C LNAPL Areas. The results of the testing were presented in the *LNAPL Remediation Technology Bench-Scale Testing Report (*ARCADIS, 2012b*).* Based on the results of the bench-scale testing the following observations are made:
  - At one location (LIF-40-004) the enhanced dissolution and recovery via surfactant resulted in a 62.4% reduction in LNAPL saturation and hot water flushing resulted in a 10.7% reduction in LNAPL saturation; however this testing was conducted in an area of uniform sand backfill that is not consistent with the rest of the AOI 40-A, -B, & 16-C LNAPL Areas.
  - AOI 40-A, -B, & 16-C LNAPL (primarily fuel oil)has a low fraction of volatile constituents rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.
  - Based on the results of simulated distillation testing, a significant portion of the LNAPL has a boiling point above 400°C and would be considered SVOCs. Steam or electric resistive heating (ERH) are not recommended for SVOCs because a higher temperature is required to recover these compounds.
  - In situ thermal remediation may be technically feasible for the area; however, it does not represent an economically feasible remedial alternative given the relatively large area that would need to be addressed.

3) *Can institutional/engineering controls provide effective risk mitigation?*

YES – The risks associated with these areas are GSI and volatilization to Indoor Air concerns.

- GSI – The storm sewer GSI pathway will be addressed by bulkheading the Outfall 009 and 010 storm sewers and eliminating this GSI pathway.
- Potential Groundwater Volatilization to Indoor Air Concern at the Property Boundary: Based on the current understanding of risk conditions, it is likely that institutional controls will also be recommended as the on and off Site remedy.
- Potential Volatilization to Indoor Air Concerns for Future Structures: - Based on the current understanding of risk conditions, the volatilization to indoor air risk can be effectively mitigated through institutional controls.

4) *Is there potential benefit to partial treatment/removal that outweighs costs?*

NO – GSI and Potential Volatilization to Indoor Air concerns can be addressed by engineering and institutional controls.

5) *Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?*

NO – These LNAPL areas appear to be stable. This finding is supported by the following lines of evidence:

- Well Gauging Data: Sentinel wells located around the periphery of the AOI 40-A, -B, & 16-C LNAPL areas have remained free of LNAPL since monitoring began approximately 10 years ago.
- Age of LNAPL Release: The AOI 40-A, -B, & 16-C LNAPL Areas were identified between 1984 and 2001. Operations began in this portion of the Site in the 1910's and ceased in this portion of the Site in 1999 (no active LNAPL sources for at least 10 years). LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).

6) *Is LNAPL mobile within the stable LNAPL perimeter?*

YES – LNAPL has been detected in several monitoring wells indicating that it is mobile within the stable perimeter.

7) *Is LNAPL readily recoverable?*

YES– The results of historic interim measures, bench-scale testing and transmissivity testing indicate that the AOI 40-A, -B, and 16–C LNAPL Areas may be readily recoverable in the northern portion of the AOI 40-A LNAPL Area. These activities are summarized below:

- During the Site-wide LNAPL monitoring program conducted from 2003 through 2005, a total of approximately 3.4 gallons of LNAPL was recovered in 10 quarterly bailing events in the AOI 40-A, -B, & 16-C LNAPL Areas.
- In 2011, as part of bench scale testing activities, hydraulic LNAPL recovery through residual saturation analysis was evaluated. LNAPL saturation was assessed on soil cores collected from AOI 40-A, -B, & 16-C through the petrophysical laboratory analysis Residual Saturation by Water Drive (RSWD). A total of six RSWD tests were performed on samples collected where LNAPL is located in the subsurface. The testing showed that the sample collected from LIF-40-004 showed a 62.4% decrease in LNAPL saturation following the surfactant enhanced water drive and a 10.7% decrease in saturation during the hot water drive.
- A transmissivity study was completed at the AOI 40-A, -B, &, 16-C LNAPL Areas, which consisted of completing four quarters of baildown testing at four monitoring wells (40-7R2, RFI-16-08, RFI-40-02R and LIF-04-004). Based on LNAPL baildown test results, LNAPL transmissivities quantified at monitoring well 40-7R2 ranged from 1.3 to

1.9 square feet per day (ft^2/day), which exceed the ITRC and MDEQ draft standard threshold values that indicates LNAPL recovery may be practicable at this well. Due to poor recovery, transmissivity testing was inconclusive at RFI-40-02R. Transmissivity tests were not conducted at RFI-16-08 and LIF-04-004 because there was insufficient LNAPL accumulation in the monitoring wells during the course of the study.

8) Will potential benefit of LNAPL recovery outweigh the costs?

NO – Compositional and saturation concerns can be addressed through engineering and institutional controls. Although LNAPL may be recoverable at RFI-40-7R2, the value of recovery does not outweigh the recovery costs.

9) Are controls required?

YES – The following AOI-specific institutional and engineering controls, in addition to the Site-wide institutional controls, are proposed for the AOI 40-A, -B, & 16-C LNAPL Areas to limit future exposure:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads as noted on **Figure 6 of the main report**, and
- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present to prevent direct contact with contaminated material (as noted in **Appendix P**) except with using appropriate health and safety measures during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the NREPA.

Attachment 3

Remedy Recommendations

Priority #11 – AOI 40-A, -B, & 16-C Fuel Oil LNAPL Areas Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – Recommended Remedy

This attachment presents the recommended remedies for the area of interest (AOI) 40-A, -B, & 16-C Fuel Oil light non-aqueous phase liquid (LNAPL) Areas (AOI 40-A, -B, & 16-C LNAPL Areas).

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in **Attachment 2** identified potential volatilization to indoor air and groundwater surface water interface (GSI) as compositional concerns and mobility as a saturation concern for the AOI 40-A, -B, & 16-C LNAPL Areas. The surficial soil direct contact exceedances will be addressed separately in Appendix P and the potential direct groundwater discharge pathway from AOI 40-A, -B, &16-C to the Flint River will be addressed in **Appendix BB**.

2. Remedy Recommendation Rationale

The remedies recommended to address the compositional concerns associated with the AOI 40-A, -B, & 16-C LNAPL Areas are engineering and institutional controls, which are discussed in detail in Section 3. The rationale for this selection is detailed below:

- Based on the current understanding of risk conditions, the potential volatilization to indoor air risk for future structures due to the biodegradation of LNAPL generating methane can be effectively mitigated through the Site-wide institutional controls.
- Based on the current understanding of risk conditions, the potential groundwater volatilization to indoor air (on and off Site) can be effectively mitigated through the institutional controls.
- The storm sewer GSI pathway will be addressed by bulkheading the Outfall 009 and 010 storm sewers and eliminating this pathway.
- Although the LNAPL at AOI 40-A, -B, & 16-C is mobile within the stable perimeter, transmissivity testing indicates that recovery may be practical at only one monitoring well (RFI-40-7R2). However, LNAPL recovery at RFI-40-7R2 would not decrease risk at the AOI 40-A, -B, & 16-C LNAPL Areas.
- Due to poor recovery, transmissivity testing was inconclusive at RFI-40-02R indicating hydraulic recovery in this area would not be feasible.

- Transmissivity tests were not conducted at RFI-16-08 and LIF-04-004 because there was insufficient LNAPL accumulation in the monitoring wells during the course of the study.
- An NSZD study was conducted at five locations (located in the AOI 40-A, -B, and 16-C LNAPL Areas. The testing completed indicated that NSZD is occurring; however, the currently available testing technologies cannot reliably quantify the depletion beneath a concrete slab.

3. AOI 40-A, -B, and 16-C Remedies

3.1 Completed Interim Measures

During the Site-wide LNAPL monitoring program conducted from 2003 through 2005, a total of approximately 3.4 gallons of LNAPL was recovered during quarterly monitoring and bailing events completed at 18 monitoring wells at AOI 40-A, -B and 16-C the former Building 40 and 16 area. The partial removal of product has been completed in this area and is considered a component of the remedy.

3.2 Additional Remedy Recommendations

The remedies recommended to address the compositional concerns associated with AOI 40-A, -B, & 16-C are bulkhead installation and institutional controls. These combined remedies will eliminate the GSI pathway and reduce exposure risks associated with the vapor phase, and be protective of future workers in the long term.

3.2.1 Outfall 009 and 010 Bulkhead Installation

In order to address the risks associated with the GSI impacts the Outfall 009 and Outfall 010 storm sewers will be bulkheaded at the last on-Site manhole in order to eliminate the potential pathway for groundwater GSI impacts to reach the Flint River. The locations of the bulkheads are presented on **Figure 6 of the main report**.

3.2.2 Institutional Controls

The following AOI-specific institutional and engineering controls, in addition to the Site-wide institutional controls, are proposed for the AOI 40-A, -B, & 16-C LNAPL Areas to limit future exposure:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads as noted on **Figure 6 of the main report**, and

- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present to prevent direct contact with contaminated material (as noted in **Appendix P**) except with using appropriate health and safety measures during short-term

construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable timeframe. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the NREPA.

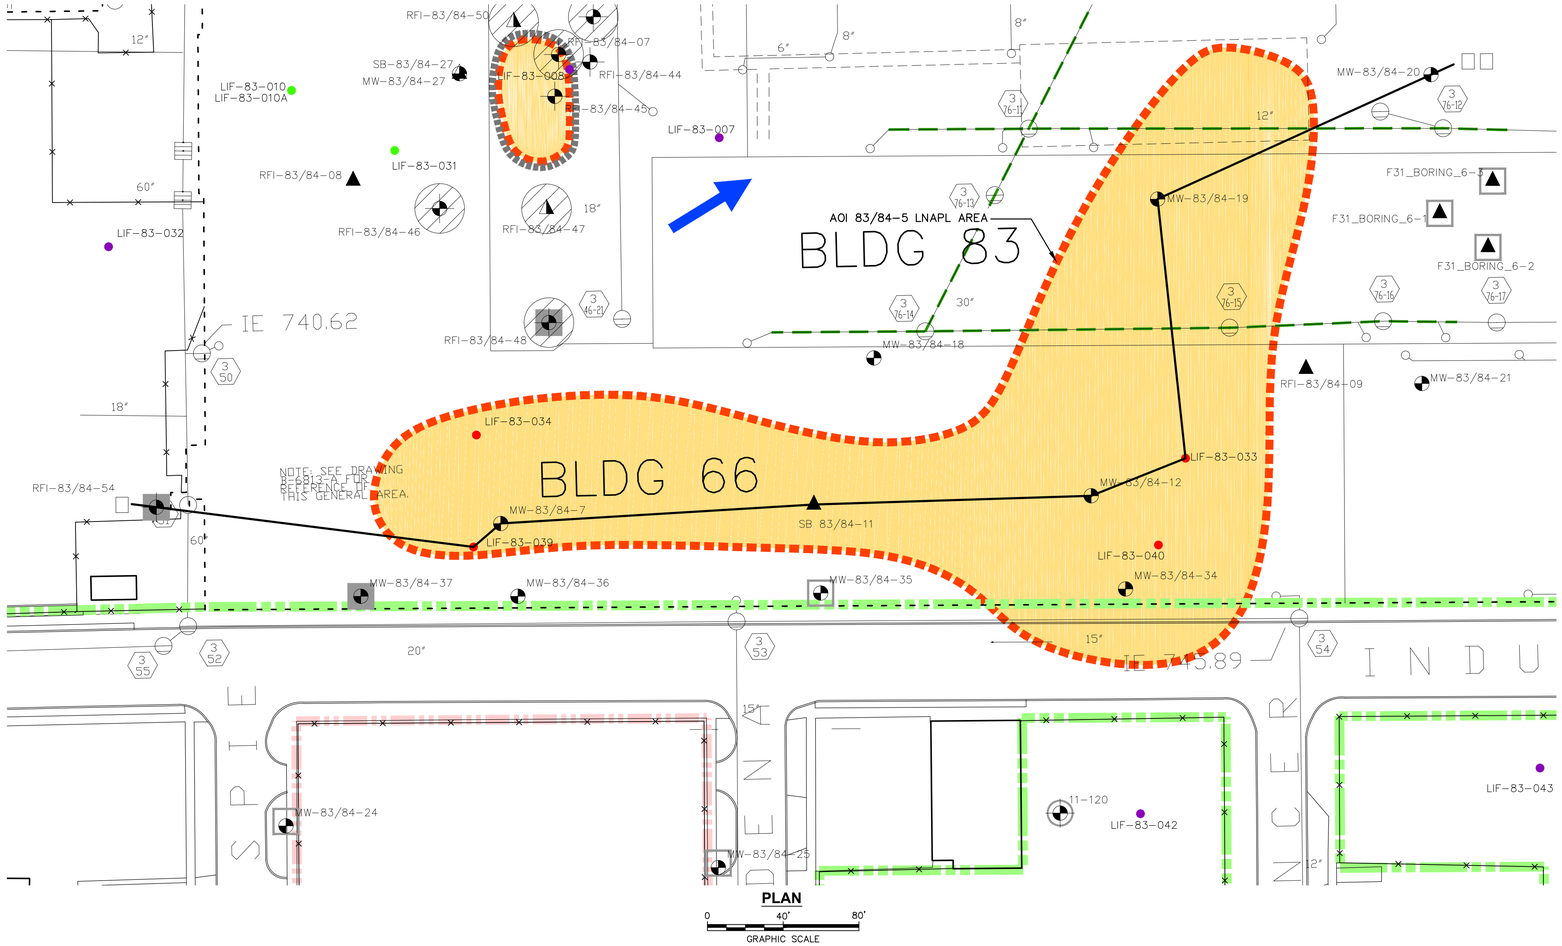
Subject:
Priority #12 - AOI 83/84-5 Cutting Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

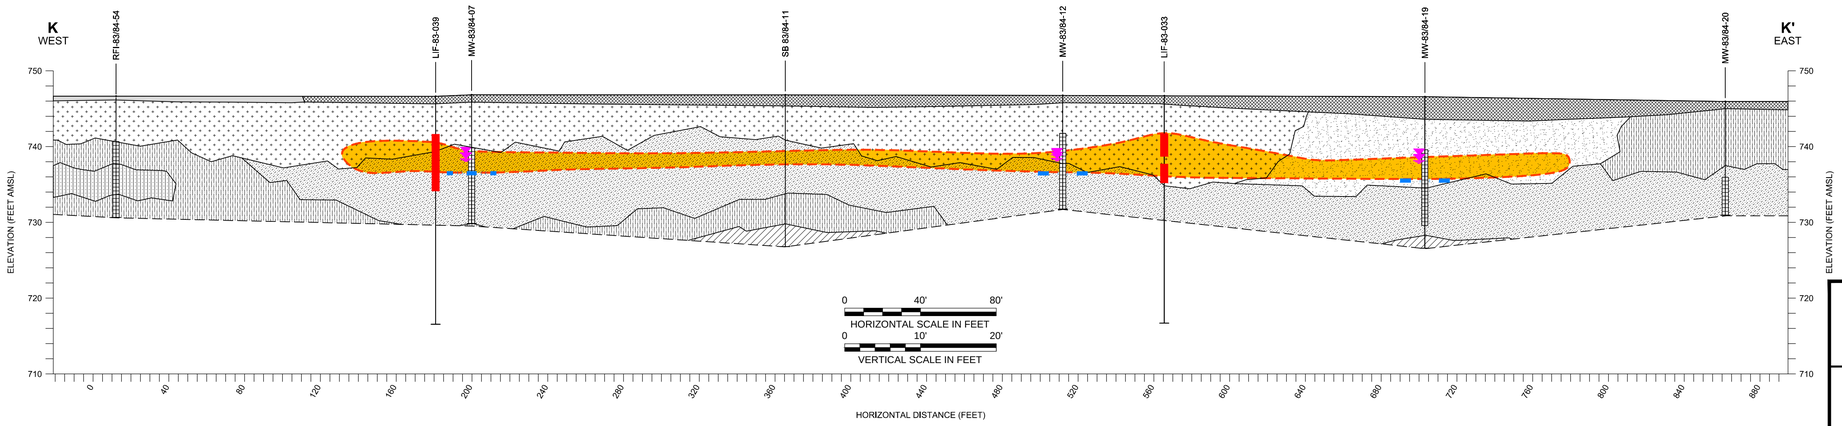


As part of the light non-aqueous phase liquid (LNAPL) remedy evaluation process the Site's 17 LNAPL areas were prioritized based on risk. The Area of Interest (AOI) 83/84-5 Cutting Oil LNAPL Area (AOI 83/84-5 LNAPL Area) is ranked as Priority #12 with a total potential risk score of 3 (**Table 5 of the main report**). A conceptual site model cross-section is attached (**Figure K-1)** that provides an overview of the AOI 83/84-5 LNAPL Area impacts.

The compositional and saturation concerns identified for the AOI 83/84-5 LNAPL Area were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:

- Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane, generated through the biodegradation of LNAPL, for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.
- No feasible options exist to mitigate unacceptable risk through compositional change.
- The LNAPL may be readily recoverable in a portion of the AOI 83/84-5 LNAPL area.
- The AOI 83/84-5 LNAPL area has been recently identified; therefore, additional sampling and investigation will be completed to further delineate the extent of LNAPL to the west and south and to better define the risks associated with the LNAPL Area.

- As the AOI 83/84-5 LNAPL Area is adjacent to the property boundary, and may extend off-Site, and that the LNAPL in the vicinity of MW-83/84-7 is likely readily recoverable, LNAPL recovery is recommended at this LNAPL area.
- The Outfall 003 storm sewer lateral servicing this portion of the Site has been bulkheaded eliminating the lateral as a possible migration pathway.



Based on the current understanding of the conceptual site model, the vapor phase and mobility concerns associated with the AOI 83/84-5 LNAPL Area can effectively be mitigated through institutional controls. However, based on the proximity of the AOI 83/84-5 LNAPL Area to the property boundary, LNAPL recovery is also recommended.

Attachment 1

LNAPL Conceptual Site Model

Priority #12 - AOI 83/84-5 Cutting Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model for the Area of Interest (AOI) 83/84-5 Cutting Oil light non-aqueous phase liquid (LNAPL) Area (AOI 83/84-5 LNAPL Area). AOI 83/84-5 is located at the Buick City Site (Site) located in Flint, Michigan (**Figure K1-1**).

1. Background

AOI 83/84-5 is located in the Building 66 portion of the former Factory 83/84 Area in the southwestern portion of the Northend of the Site (**Figure K1-2**). Historically, the former Factory 83/84 Area was primarily used as a gray iron foundry prior to 1981. From 1981 to 2010, the area was used for welding, machining, and assembly of torque converters. The former Factory 83/84 Area included various process trenches and pits and a former heat treating tunnel. The AOI 83/84-5 LNAPL Area is presumably due to historical releases associated with operations in this area.

Investigation data previously presented in Site reports are not re-presented in this memo. However, pertinent AOI 83/84-5 investigation data that has not previously been presented in a Site report is attached to this memo.

2. AOI 83/84-5 Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and LNAPL characteristics and extent of impacts for the AOI 83/84-5 LNAPL Area.

Figure 2 presents the locations of the existing and abandoned monitoring wells and soil borings in the AOI 83/84-5 LNAPL Area.

2.1. AOI 83/84-5 Geology and Hydrogeology

- *Geology:* The soils at AOI 83/84-5 consist of primarily fine to medium sand interbedded with silts and clays to a depth of approximately 17 feet below ground surface (bgs) that are underlain by

clay. The laser induced fluorescence (LIF) logs also indicated evidence of LNAPL impacts from as shallow as 5 feet bgs and as deep as 12 feet bgs, across the area.

- *Groundwater/LNAPL Levels:* Fourteen monitoring wells (11-120, MW-83/84-07, MW-83/84-12, MW-83/84-18, MW-83/84-19, MW-83/84-20, MW-83/84-24, MW-83/84-25,MW-83/84-34, MW-83/84-35, MW-83/84-36, MW-83/83-37, RFI-83/84-48, and RFI-83/84-54) located in the AOI 83/84-5 LNAPL Area are gauged to monitor the extent of the LNAPL. Depth to groundwater (or LNAPL where present) in this area is generally 9 feet bgs. LNAPL has accumulated at four monitoring wells that define the LNAPL Area (MW-83/84-07, MW-83/84-12, MW-83/84-19, and MW-83/84-34). All four monitoring wells were installed in 2013-2014. During June 2013, thicknesses ranged from 1.45 to 2.17 feet. The greatest thickness of LNAPL measured at MW-83/84-34 was 4.4 feet in March 2014.

  Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the east-southeast. The groundwater level data are presented in **Appendix X.**

2.2. Groundwater and Soil Analytical Data

Analytical data were compared to applicable Michigan Part 201 nonresidential criteria.

2.2.1 Groundwater Analytical Data

The only groundwater sample collected in the vicinity of AOI 83/84-5 was collected from monitoring well 11-120, which is located upgradient of AOI 83/84-5. The groundwater sample did not exceed applicable nonresidential criteria.

2.2.2 Soil Volatile Organic Compound (VOC), Semi-volatile Organic Compound (SVOC), and Metals Analytical Data

Soil samples collected from two boring locations in the AOI 83/84-5 LNAPL area exceed groundwater surface water interface protection (GSIP) criteria for select metals. MW-83/84-37 exceeds GSIP criteria for selenium (0.54-0.56/0.4 mg/kg), and RFI-83/84-48 exceeds GSIP criteria for arsenic (16/4.6 mg/kg) and manganese (490-690/98 mg/kg).

Additionally, mercury was detected above the GSIP criterion at RFI-83/84-54. However, this impact is located approximately 175 feet upgradient of the AOI 83/84-5 LNAPL area in a soil sample collected from 0.6 to 2.6 feet bgs and does not appear to be related to the AOI 83/84-5 LNAPL Area.

2.2.3 GSI Evaluation

As discussed in further detail in **Appendix BB**, groundwater surface water interface (GSI) exceedances in the Site storm sewers are being evaluated by the ongoing NPDES Plus Monitoring Program (NPMP). There does not appear to be a GSI pathway for the AOI 83/84-5 LNAPL Area. This area is located in the Outfall 003 drainage area and the laterals that serve this area have either been bulkheaded or are located above the groundwater table. The Outfall 003 South main is located upgradient of the AOI 83/84-5 LNAPL Area.

The monthly NPMP samples collected from the Outfall 003 storm sewer (which services this portion of the Site) as part of the NPMP have not exhibited concentrations of manganese or selenium above GSI criteria at the downgradient monitoring point. However, in the last 36 sampling events there has been one exceedance for arsenic. Note that arsenic was also detected in storm sewer samples collected at the Site's upgradient property boundary.

Data evaluations completed to date suggest that the majority of the metals impacts in the Outfall 003 storm sewer can be addressed a mixing zone based remedy; however, additional data collection and evaluation is needed.

2.2.4 Soil PCB Analytical Data

Polychlorinated biphenyls (PCBs) were not detected in the soil samples collected from the AOI 83/84-5 LNAPL Area.

2.2.4 Vapor Intrusion Evaluation

Due to the presence of shallow groundwater and LNAPL (approximately 9 feet below ground surface) at AOI 83/84-5, groundwater data were also compared to the applicable Non-Residential Screening Values for the Vapor Intrusion Pathway presented in the *Michigan Department of Environmental Quality (MDEQ) Guidance Document for the Vapor Intrusion Pathway* (further discussed in Section 3.4 of the Report). Groundwater concentrations do not exceed applicable screening levels. However, as the AOI 83/84-5 LNAPL Area has been recently identified and due to its proximity to the property boundary, additional sampling will be completed to further evaluate vapor intrusion.

As there are no structures at the Site the MDEQ Part 201 criteria are appropriate for comparison of soil data. Soil data did not exceed applicable screening levels.

2.3. LNAPL Characteristics

- *LNAPL Analytical Data:* LNAPL present at AOI 83/84-5 consists primarily of cutting oil. Additional analysis indicated that:

    - The LNAPL has a viscosity of 87.49 centipoise and a specific gravity of 0.906. This data is used to evaluate LNAPL recoverability and as part of the LNAPL transmissivity analysis.
    - Concentrations of arsenic exceed TCLP criteria; however, TCLP analysis has not been conducted.
    - PCBs were not detected in the LNAPL.

  For reference, the viscosity (at 100 degrees Fahrenheit) of honey is 73.6 cp (Ingersoll-Rand, 1981). The applicable LNAPL analytical data are presented in **Appendix X**.

- *LIF Data:* Four LIF borings were completed in the AOI 83/84-5 LNAPL Area. The vertical range of LIF impact (greater than 5%RE) at AOI 83/84-5 is typically 5 to 12 feet bgs. **Figure K1-2** presents the results of the LIF investigation associated with the AOI 83/84-5 LNAPL Area.

- *Transmissivity:* An LNAPL transmissivity study was completed in the AOI 83/84-5 LNAPL Area in August 2013. LNAPL baildown tests were conducted at two monitoring wells, MW-83/84-7 and MW-83/84-19. The LNAPL transmissivity quantified at MW-83/84-7 was 1.6 square feet per day (ft^2/day), which is greater than both the Interstate Technology Regulatory Council (ITRC) and MDEQ threshold values for recovery indicating that LNAPL may be readily recoverable at this well. However, the LNAPL transmissivity quantified at monitoring well MW-83/84-19 was 0.08 ft^2/day, which is less than both the ITRC and MDEQ threshold values for recovery, indicating that LNAPL recovery is not practicable at this well. Additional transmissivity testing will be completed in the central portion of the plume, if possible.

- *Natural Source Zone Depletion (NSZD):* NSZD testing was not attempted at AOI 83/84-5 due to the presence of a concrete slab. The testing completed at the Southend of the Site in similar soils indicated that NSZD is occurring; however, the currently available testing technologies cannot reliably quantify the depletion beneath a concrete slab. In addition when monitoring well MW-83/84-7 was installed, high levels of methane were detected, indicating that NSZD is occurring in this area.

2.4. Extent of LNAPL

Based on recently completed Site investigation, the footprint of LNAPL area containing approximately 0.1 ft or greater of LNAPL was estimated to be 85,500 square feet (as discussed in Section 2.1.3 of the main report). However, as the AOI 83/84-5 LNAPL Area has been recently identified and due to its proximity to the property boundary additional delineation activities are planned to further define LNAPL extents to the west and south. Based on the LIF and soil boring log data, depth to LNAPL impacts are approximately 5 to 12 ft. bgs.

LNAPL Remedial Decision Tree

Attachment 2 LNAPL Remedial Decision Tree Priority #12 – AOI 83/84-5 Cutting Oil Area

NOTES

(#) NOTES: See Page K2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priority #12 - AOI 83/84-5 Cutting Oil LNAPL Area

Background The Area of Interest (AOI) 83/84-5 Cutting Oil light non-aqueous phase liquid (LNAPL) Area (AOI 83/84-5 LNAPL Area) is located at Building 66 in the former Factory 83/84 Area in the southwestern portion of the Northend of the Site. Historically, the former Factory 83/84 Area, including former Building 66, was primarily used as a gray iron foundry prior to 1981. From 1981 to 2010, the area was historically used for welding, machining, and assembly of torque converters. Former Factory 83/84 Area included various process trenches and pits and a former heat treating tunnel. The presence of AOI 83/84-5 LNAPL Area is presumably due to historical releases associated with operations in this area. There are currently no buildings within the AOI 83/84-5 LNAPL Area. The AOI 83/84-5 LNAPL Area is located beneath the former Factory 83/84 concrete slab.

Geology and Hydrogeology: The soils at AOI 83/84-5 consists of primarily fine to medium sand interbedded with silts and clays to a depth of approximately 17 feet below ground surface (bgs) that are underlain by clay. Depth to groundwater in this area varies and has been measured as shallow as 7.10 feet bgs, as deep as 10.34 feet bgs, and averages around 9 feet bgs. Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the east-southeast.

LNAPL Characteristics: Boring logs in the AOI 83/84-5 LNAPL Area show evidence of LNAPL impacts as shallow as 5 feet bgs and as deep as 12 feet bgs. Thicknesses of product greater than 0.1 feet have been measured at four monitoring wells (MW-83/84-7, MW-83/84-12, MW-83/84-19, and MW-83/84-34). LNAPL has a viscosity of 87.49 centipoise (cp) and a specific gravity of 0.0.906. The LNAPL does not contain polychlorinated biphenyls (PCBs). The LNAPL also contains arsenic at concentrations that exceed the RCRA toxicity characteristic at two locations (MW-83/84-07 and MW-83/84-12); however, TCLP analysis has not been conducted. The AOI 83/84-5 LNAPL Area has been recently identified and due to its proximity to the property boundary, additional sampling will be completed to further delineate the extent of LNAPL to the west and south.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*
   YES – The following potential risk/exposure concerns are associated with the AOI 83/84-5 area:

   - Groundwater surface water interface (GSI): Concentrations of select metals in soil samples collected from AOI 83/84-5 exceed groundwater surface water interface protection (GSIP) criteria. However, based on an evaluation of available Site data there does not appear to be a GSI pathway for the AOI 83/84-5 LNAPL Area. The Outfall 003 laterals located in the vicinity of AOI 83/84-5 have either been bulkheaded or are above the groundwater table.
   - Potential Volatilization to Indoor Air Concerns for Future Structures*:* Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane generated from biodegradation of the LNAPL for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*

   NO – The following is a general discussion regarding the feasibility of various compositional change remediation strategies for the AOI 83/84-5 LNAPL Area:

   - Enhanced dissolution and recovery via surfactant or hot water flushing may enhance LNAPL recovery; however, it is not a viable option based on the presence of nearby City sewers. The use of surfactant would increase mobility and therefore, likely increase the potential for LNAPL infiltration into the Outfall 003 storm sewer.
   - AOI 83/84-5 LNAPL constituents have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.
   - In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the proximity of City sewers.

3) *Is there a potential benefit to partial treatment/removal that outweighs costs?*

   NO –Based on the current understanding of risk conditions, the volatilization to indoor air risk can be effectively mitigated through institutional controls.

4) *Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?*

   NO – The AOI 83/84-5 LNAPL Area appears to be stable. This finding is supported by the following lines of evidence:

Attachment 2 Notes

Priority #12 - AOI 83/84-5 Cutting Oil LNAPL Area

- Well Gauging Data: Although the AOI 83/84-5 LNAPL Area has only recently been identified and delineated, monitoring wells located in the vicinity of the LNAPL area have been gauged as part of Site activities and have remained free of LNAPL since monitoring began approximately 10 years ago.
- Age of LNAPL Release: Operations began in this portion of the Site in the 1909 and ceased in this portion of the Site in mid-2000s with the building being demolished in 2011. LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).

5) *Is LNAPL mobile within the stable LNAPL perimeter?*

YES – LNAPL is present at four monitoring wells in the AOI 83/84-5 area indicating that the LNAPL is mobile within the stable perimeter.

6) Is LNAPL readily recoverable?

YES – Transmissivity testing completed at MW-83/84-7 was quantified at 1.6 square feet per day (ft^2/day), which exceeds both the ITRC and MDEQ threshold values for recovery. This indicates that LNAPL in the vicinity of MW-84/84-7 may be readily recoverable. However, transmissivity quantified at MW-83/84-19 was 0.08 ft^2/day, which is less than both the ITRC and MDEQ indicating that LNAPL recovery in not practical in this portion of the LNAPL Area. Additional transmissivity testing will be completed in the AOI 83/84-5 area prior to LNAPL removal activities to determine if LNAPL may be readily recoverable in other areas.

7) Will the potential benefit of LNAPL recovery outweigh costs?

YES – While the compositional concerns can be addressed through institutional controls, LNAPL has been identified at the property boundary and may extend off Site. Therefore, LNAPL recovery is recommended to minimize off Site impact.

8) Are controls required?

YES – The following AOI-specific institutional controls, in addition to the Site-wide controls noted in the Report, will be necessary to limit potential for future exposure:

• Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 5 of the main report** in **Attachment 3**.

Attachment 3

Remedy Recommendations

Priority #12 - AOI 83/84-5 Cutting Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – Recommended Remedy

This attachment presents the recommended remedies for the Area of Interest (AOI) 83/84-5 Cutting Oil light non-aqueous phase liquid (LNAPL) Area (AOI 83/84-5 LNAPL Area).

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in **Attachment 2** identified potential volatilization to indoor air as a potential future compositional concern for the AOI 83/84-5 LNAPL Area and mobility as a saturation concern. The potential volatilization to indoor air concern is due to the biodegradation of LNAPL generating methane that could potentially result in indoor air quality concerns for future structures.

2. Remedy Recommendation Rationale

The remedy recommended to address the compositional and saturation concerns associated with the AOI 83/84-5 LNAPL area is institutional controls, which are discussed in detail in Section 3. The rationale for this selection is detailed below:

- Based on an evaluation of available Site data, there does not appear to be a groundwater surface water interface (GSI) pathway for the AOI 83/84-5 LNAPL Area. The Outfall 003 laterals located in the vicinity of AOI 83/84-5 have either been bulkheaded or are above the groundwater table.
- Based on the current understanding of risk conditions, the potential volatilization to indoor air risk for future structures can be effectively mitigated through the Site-wide institutional controls.
- Although the LNAPL at AOI 83/84-5 is mobile within the stable perimeter, transmissivity testing indicates that recovery is not practical in the area of MW-83/84-19. The LNAPL transmissivity quantified at MW-83/84-19 was 0.08 ft^2/day, which is less than the ITRC and MDEQ threshold values for recovery.
- The LNAPL transmissivity at MW-83/84-07 is 1.6 ft^2/day, which is above the ITRC and MDEQ threshold values for recovery, indicating that LNAPL is likely readily recoverable in this portion of the area. Due to the fact that the AOI 83/84-5 area is adjacent to the property boundary, and may

extend off-Site, and that the LNAPL in the vicinity of MW-83/84-7 is likely readily recoverable, LNAPL recovery is recommended in this portion of the area.

- The AOI 83/84-5 LNAPL area has been recently identified and due to its proximity to the property boundary additional sampling and investigation will be completed to further delineate the extent of LNAPL to the west and south and to better define the risks associated with the LNAPL Area.

3. AOI 83/84-5 Remedies

3.1 Completed Interim Measures

As part of a recently completed interim measure (IM) a bulkhead was installed at the Outfall 003 storm sewer later to eliminate the LNAPL infiltration from AOI 83/84-2, as well as any potential infiltration from the AOI 83/84-5 LNAPL Area. Bulkheading activities were completed in this portion of the Site in Spring 2013.

3.2 Additional Remedy Recommendations

The remedy recommended to address the compositional and saturation concerns associated with AOI 83/84-5 LNAPL Area is Institutional Controls. This remedy will reduce exposure risks associated with the AOI 83/84-5 area and be protective of future workers in the long term. However, due to the proximity of the AOI 83/84-5 LNAPL Area to the property boundary LNAPL removal is also recommended.

3.2.1 Institutional Controls

The following AOI-specific institutional controls, in addition to the Site-wide controls noted in the Report, will be necessary to limit potential for future exposure:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 5 of the main report**.

3.2.2 LNAPL Removal

Due to the proximity of the AOI 83/84-5 LNAPL Area to the property boundary LNAPL removal is recommended. Transmissivity data from the north end of AOI 83/84-5 in the vicinity of MW-83/84-7 indicate that LNAPL is likely readily recoverable in this portion of the LNAPL area. Additional delineation, investigation and transmissivity testing will be completed to better delineate the extent of LNAPL to the west and south; to better define the risks; and to aid in determining the portion of the area that may be recoverable. Additional details regarding the specific type of LNAPL recovery will be provided in the basis of design documentation.

Appendix K - AOI 83/84-5 Cutting Oil Area - Addendum No.1
Summary of Additional Investigations
RACER Buick City Site, Flint, Michigan

Introduction

This Addendum No. 1 to Remedy Recommendation Report Appendix K presents a summary of investigation data collected at the AOI 83/84-5 Cutting Oil Area located north of Leith Street and east of Industrial Avenue, from March 19, 2014 through December 31, 2015 at the Buick City Site (Site) located in Flint, Michigan.

Summary of Investigation Activities

Additional investigation activities were completed at AOI 83/84-5 to delineate the extent of LNAPL impacts along the property boundary, to evaluate transmissivity, and to evaluate VOC and methane concentrations along the property boundary (**Figure K-A1-1**).

LNAPL and Soil Impact Delineation

Investigation activities included completing four monitoring wells (MW-83/84-38 through MW-83/84-41) and one soil boring (SB-83/84-42) to delineate the extents of LNAPL (**Figure K-A1-1**). Monitoring wells MW-83/84-38 through MW-83/84-41 were installed to delineate LNAPL on Site.

Six soil borings were attempted in Industrial Avenue to investigate off Site LNAPL impacts; however, due to shallow subsurface obstructions only SB-83/84-42 could be completed. A soil sample was collected from SB-83/84-42 from the 2-foot interval above the groundwater table and submitted for laboratory analysis of total petroleum hydrocarbons (TPH) - oil range organics (ORO), diesel range organics (DRO), and gasoline range organics (GRO).

Transmissivity Evaluation

Additional investigation activities conducted at AOI 83/84-5 also consisted of conducting baildown testing and transmissivity evaluations. In June 2015 baildown testing was completed at monitoring wells MW-83/84-12, MW-83/84-19, MW-83/84-34, MW-83/84-36, and MW-83/84-38 to more thoroughly quantify transmissivity at the AOI 83/84-5 LNAPL Area (**Figure K-A1-1**).

Soil Gas Evaluation

Two soil gas sampling probes with shallow and deep screens (SGP-01S/D and SGP-02S/D) were installed on the west side of Industrial Avenue (**Figure K-A1-1**) to evaluate VOC and methane concentrations. During probe installation activities impacted soils were noted at SGP-01S/D; therefore, one soil sample was collected from 5 to 6 feet below ground surface (ft bgs) from each probe location to characterize soils. Two rounds of soil gas samples were collected from each probe and submitted to the laboratory for VOC and methane analysis. Due to the presences of water within the screened interval, a sample could not be collected from SGP-01D during the second sampling event.

Summary of Data Evaluation

LNAPL and Soil Impact Delineation

Monitoring wells MW-83/84-38 and MW-83/84-39 were gauged several times in 2014 and 2015. LNAPL was measured at MW-83/84-38 at a maximum thickness of 3.93 feet, MW-83/84-39 at a maximum thickness of 0.42 feet, and MW-83/84-40 at a maximum thickness of 0.06 feet. LNAPL was not observed at MW-83/84-41.

There was no evidence of impacts at soil boring SB-83/84-42 and TPH-ORO, DRO, and GRO were not detected (**Table K-A1-1**). In addition, the soil samples collected from SGP-01S/D and SGP-02S/D did not detect analytes at concentrations greater than State Default Background Levels and Part 201 criteria.

Transmissivity Evaluation

LNAPL Baildown test results were analyzed using the American Petroleum Institute (API) LNAPL Transmissivity Workbook (API Tool, API 2012) to calculate LNAPL transmissivity within the depth interval at which LNAPL is observed:

- B&R: Bouwer and Rice (1976)/Bouwer (1989), and
- C&J: Cooper and Jacob (1946)/Jacob and Lohman (1952).

Each of these solutions involves different assumptions regarding the response of fluid levels within the well to the removal of LNAPL. The B&R method was developed utilizing the assumption of steady, radial flow of LNAPL to the test well after test initiation, making it ideally suited for tests involving longer LNAPL purging times. The C&J method is better suited for tests involving more rapid LNAPL removal periods, or tests that do not exhibit steady state flow conditions because they incorporate transient storage effects. Additionally, the B&R method requires that there is a consistent relationship between changes in LNAPL drawdown and LNAPL thickness (the j-ratio) (API 2012 and ASTM International 2013). If there is significant variability in the j-ratio over the course of a test, analysis with the B&R method may be not be judged as appropriate, and only the C&J solution may be applied for analysis.

LNAPL transmissivity quantified for each monitoring well, by each method, is presented on **Table K-A1-3**. The results were then compared to the Michigan Department of Environmental Quality (MDEQ) published technical resource materials (MDEQ, 2014) that establish an LNAPL transmissivity 0.5 square feet per day (ft^2/day) as a lower-bound threshold where LNAPL recovery using hydraulic methods (e.g., LNAPL pumping, dual-phase extraction, and LNAPL skimming) is not typically practicable. The transmissivity results at MW-83/84-34 and MW-83/84-36 exceeded the MDEQ threshold, while the transmissivity at MW-83/84-12, MW-83/84-19, and MW-83/84-38 were quantified below the MDEQ threshold.

Soil Gas Evaluation

Soil gas concentrations in samples collected from SGP-01S/D and SGP-02S/D in February and November 2015 (**Table K-A1-2**) did not exceed the Michigan Department of Environmental Quality (MDEQ) vapor intrusion screening levels.

Remedy Recommendation Report Appendix K – AOI 83/84-5 Cutting Oil Area - Addendum No. 1
RACER Buick City Site, Flint, Michigan

Location ID: Sample Depth(ft): Date Collected:	Units	CSAT	GSIP	NDC	NPSIC	NSVIA	NVSICI	SB-83/84-42 6 - 8 11/20/14	SGP-01S/D 5 - 6 02/23/15	SGP-02S/D 5 - 6 02/23/15
Miscellaneous										
Total solids	mg/kg	- -	- -	- -	- -	- -	- -	790,000	760,000	880,000

Notes:
mg/kg - milligram per kilogram
ft - feet
CSAT - Soil Saturation Concentration Screening Level
GSIP - Groundwater Surface Water Interface Protection Criteria
NDC - Nonresidential Direct Contact Criteria
NPSIC - Nonresidential Particulate Soil Inhalation Criteria
NSVIA - Nonresidential Soil Volatilization to Indoor Air Inhalation Criteria
NVSICI - Nonresidential Infinite Source Volatile Soil Inhalation Criteria
U – not detected above the reporting limit□
Y - Elevated reporting limit due to high target concentration

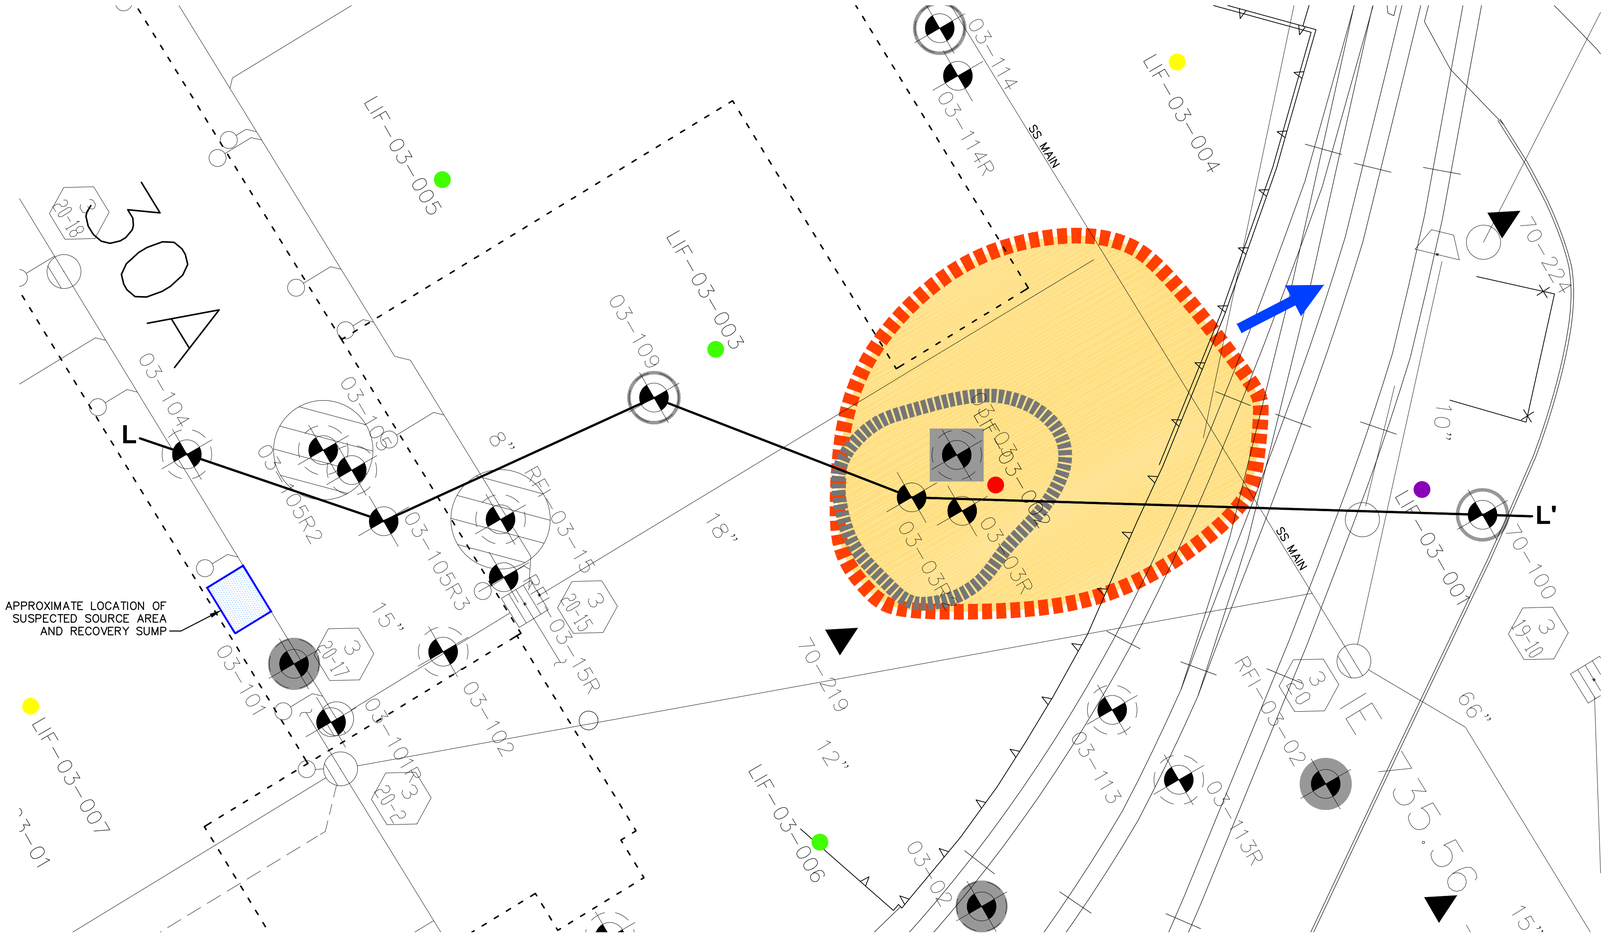
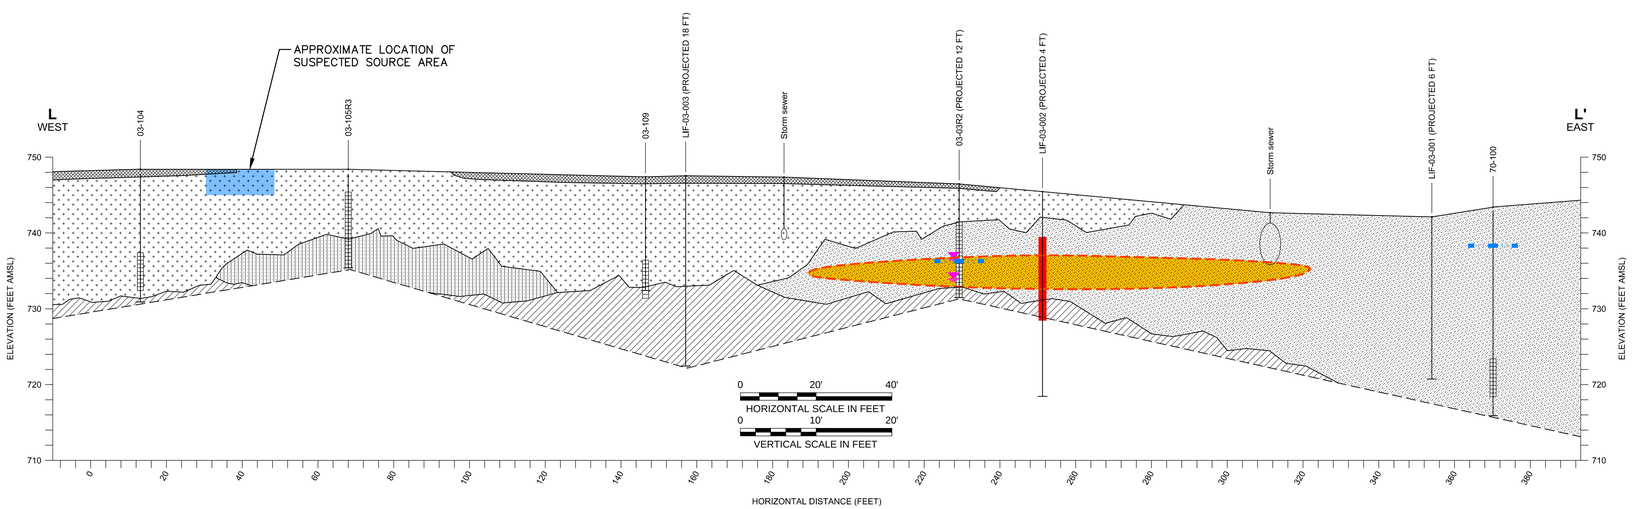
Subject:
Priority #13 - AOI 03-1 Quench Oil Area
Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

As part of the light non-aqueous phase liquid (LNAPL) remedy evaluation process, the Site's 17 LNAPL areas were prioritized based on risk. The area of interest (AOI) 03-1 Quench Oil LNAPL Area (AOI 03-1 LNAPL Area) is ranked as Priority #13 with a total potential risk score of 3 (**Table 5 of the main report**). A conceptual site model cross-section is attached (**Figure L-1)** that provides an overview of the AOI 03-1 LNAPL Area impacts and interim measures (IMs).

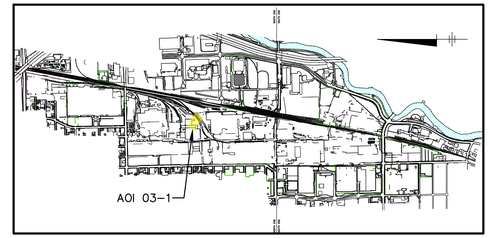
Historical IMs completed at the AOI 03-1 LNAPL Area include a recovery sump and an LNAPL bailing program. The partial and effective removal of product completed in this area is considered a component of the remedy.



The compositional and saturation concerns identified for the AOI 03-1 LNAPL Area were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:



- There are potentially unacceptable groundwater/surface water interface (GSI) and vapor phase concerns associated with the AOI 03-1 LNAPL Area.
- Groundwater levels at the AOI 03-1 LNAPL Area are generally deeper than the invert elevation of the storm sewer; however, groundwater levels do fluctuate and are occasionally above the invert.



Therefore, the storm sewers in this area may be an intermittent groundwater/surface water (GSI) pathway.

- Although select groundwater and soil samples collected from the AOI 03-1 area have exceeded GSI criteria for select volatile organic compounds (VOCs) or metals (arsenic, beryllium, copper, cyanide, selenium, silver), the monthly NPDES Plus Monitoring Program (NPMP) samples collected from Outfall 003 have not detected VOCs, beryllium, or selenium above GSI criteria.
- Based on the current delineation of the AOI 03-1 LNAPL Area, it appears that the footprint may intersect the Outfall 003 storm sewer main and laterals. As such, a visual inspection of the storm sewer was completed and no evidence of LNAPL infiltration was identified in this portion of the sewer.
- A historic IM addressed the suspected source area for the AOI 03-1 LNAPL Area in the southern portion of Building 30A; therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate.
- Polychlorinated biphenyls (PCBs) were detected in an LNAPL sample collected from the AOI 03-1 LNAPL plume at a concentration of 6 parts per million (ppm). Due to the nature and extent of PCB impacts, it is requested that the LNAPL impacts at AOI 03-1 be allowed to remain in place and the area be designated as low occupancy [per 761.61(a)(4)(i)(B)].

Based on the current understanding of conceptual site model, the potential risks associated with GSI, PCBs, and vapor phase can be effectively mitigated through institutional controls.

Attachment 1

LNAPL Conceptual Site Model

Priority #13 - AOI 03-1 Quench Oil Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model (CSM) for the Area of Interest (AOI) 03-1 Quench Oil LNAPL Area (AOI 03-1 LNAPL Area), which is located at the Buick City Site (Site) located in Flint, Michigan (**Figure L1-1**).

1. Background

The AOI 03-1 LNAPL Area is located at the Northend of the Site south of former Factory 03 and is likely associated with a historic release in the southern portion of Building 30A. Light non-aqueous phase liquid (LNAPL) believed to be related to this release was identified at downgradient monitoring well 03-03 (and replacement wells 03-03R and 03-03R2). Historically, LNAPL associated with the AOI 03-1 area was also identified in monitoring wells 03-01, 03-105R, (and its replacement well 03-105R2), and RFI-03-15R; however, LNAPL has not been detected in these wells since 2003-2004. In recent years, the AOI 03-1 LNAPL Area has only accumulated to measurable thicknesses (0.22 feet) in one monitoring well (03-03R2), which is presented on **Figure L1-2**.

Investigation data previously presented in Site reports are not re-presented in this memo. However, pertinent AOI 03-1 investigation data that has not previously been presented in a Site report is attached.

2. Former Interim Measures

2.1 Recovery Wells

In 1991, a roof drain/storm sewer sump located in the southern portion of Building 30A was identified to accumulate free product, determined to be S-7 quench oil. As a result, the sump was converted into a collection sump with a belt skimmer to recover this oil. This recovery system was successful in recovering free-phase LNAPL proximate to the recovery sump; hence, operation of the system was discontinued. The amount of LNAPL removed by this system is unknown.

2.2 LNAPL Monitoring and Bailing Program

From 2003 to 2005, eleven AOI 03-1 monitoring wells were monitored and manually bailed as part of the Site-wide LNAPL monitoring program. During this three year program, a total of one gallon of product was removed, primarily from monitoring well 03-03R.

3. AOI 03-1 Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and LNAPL characteristics and extent of impacts for the AOI 03-1 LNAPL Area.

Figure L1-2 presents the locations of the existing and abandoned monitoring wells and soil borings in the AOI 03-1 area.

3.1 AOI 03-1 Geology and Hydrogeology

- *Geology:* The AOI 03-1 boring logs indicate that the soils are primarily Silt and Sand from 0 to 16 feet below ground surface (bgs) with a Sand layer from 10 to 12 feet bgs as shown on the CSM (**Figure L-1)**. The logs for monitoring wells 03-03, 03-105, and RFI-03-15 show visual evidence of impacts and/or positive oil shake tests ranging from 4.5 to 16 feet bgs.

- *Groundwater/LNAPL Levels:* Nine monitoring wells (03-03R2, 03-101R, 03-105R3, 03-110, 03-115R2, RFI-03-02, RFI-03-03, RFI-03-15R, and 70-100) in the vicinity of the AOI 03-1 area have been gauged to monitor the extent of the LNAPL. Depth to groundwater (or LNAPL, where present) in this area ranges from 8 to 10 feet bgs. Historically, LNAPL was detected intermittently at monitoring wells 03-01R and 03-105R; however, since the completion of the Quarterly LNAPL Monitoring Program in 2005 LNAPL has only been detected at monitoring well location 03-03R2. The greatest thickness of LNAPL was detected in 2008 with 2.94 feet measured. During the 2010 annual groundwater event, no LNAPL was detected at 03-03R; and the well was subsequently damaged/buried during demolition activities. Replacement well 03-03R2 was installed in October 2013 and 0.22 feet of LNAPL was measured on November 2013. The boring log for 03-03R2 is attached to this memo.

  Groundwater flow in this portion of the Site is generally to the south. All pertinent groundwater data is presented in **Appendix X**.

3.2 Groundwater and Soil Analytical Data

Analytical data were compared to applicable Michigan Part 201 non-residential criteria. Pertinent analytical data are presented in **Appendix X**.

3.2.1 Groundwater Analytical Data

A review of groundwater data in the AOI 03-1 LNAPL area indicated that three monitoring wells detect select metals at concentrations that exceed groundwater/surface water interface (GSI) criteria. The groundwater sample collected from well RFI-03-02 exceeds criteria for arsenic (11/10 µg/L), beryllium (43/32 µg/L), cyanide (7.1-7.4/5.2 µg/L), selenium (190/5 µg/L) and silver (2.1/0.2 µg/L). In addition, silver was detected above GSI criteria at monitoring well 03-02 (1.7/0.2 µg/L) and arsenic was detected above GSI criteria at 03-101 (29/10 µg/L). However, there has been insufficient LNAPL present at 03-03R2 to perform metals analysis so it is unknown whether the LNAPL is the source of the metal impacts.

3.2.2 Soil VOC, SVOC and Metals Analytical Data

During recent investigation activities, three soil samples were collected during installation of the 03-03R2 replacement well and submitted for laboratory analysis. Select volatile organic compounds (VOCs) and metals were detected at concentrations that exceed the groundwater/surface water protection (GSIP) criteria. The VOCs detected above criteria include 1,2,4-trimethylbenzene (94.8/0.57 mg/kg), 1,2-dichlorobenzene (0.4/0.28 mg/kg), ethylbenzene (0.5/0.36 mg/kg) and naphthalene (4.01/0.73 mg/kg). The metals detected above criteria include arsenic (7.24/4.6 mg/kg), copper (173/130 mg/kg), mercury (0.19/0.05 mg/kg) and selenium (0.93/0.4 mg/kg). All pertinent soil data is presented in **Appendix X**.

3.2.3 GSI Evaluation

As discussed in further detail in **Appendix BB**, GSI exceedances in the Site storm sewers are being evaluated by the ongoing NPDES Plus Monitoring Program (NPMP). At AOI 03-1, the storm sewer represents an intermittent pathway as groundwater levels in this portion of the Site are generally deeper than the invert elevation of the storm sewer; however, levels do fluctuate and are occasionally above the invert. The monthly NPMP samples collected from the Outfall 003 storm sewer (which services this portion of the Site) have not exhibited concentrations of beryllium, copper, selenium or VOCs above GSI criteria at the downgradient monitoring point.

Data evaluations completed to date suggest that the majority of the metals impacts in the Outfall 003 storm sewer can be addressed a mixing zone based remedy; however, additional data collection and evaluation is needed.

3.2.4 Soil PCB Analytical Data

A review of the analytical data in the AOI 03-1 area indicates that PCBs were not detected in the soil samples collected from 03-03R2.

3.2.5 Vapor Intrusion Evaluation

Based on the fact that, no structures are present at the AOI 03-1 LNAPL Area and the depth to LNAPL/groundwater is greater than 10 feet bgs, the MDEQ Part 201 inhalation criteria are appropriate for comparison. Soil and groundwater concentrations did not exceed applicable screening levels.

3.3 LNAPL Characteristics

- *LNAPL Analytical Data:* LNAPL present at the AOI 03-1 LNAPL Area consists primarily of quench oil. Additional analysis indicate that:

  - The LNAPL has a viscosity of 26 centipoise (cp), an interfacial tension of 2.8 dynes/centimeter, and a specific gravity ranging from 0.90.

  - An LNAPL sample collected from 03-03R2 detected PCBs at a concentration of 6 ppm.

  For reference, the viscosity (at 100 degrees Fahrenheit) of olive oil is 43.2 cp and honey is 73.6 cp (Ingersoll-Rand, 1981). All pertinent LNAPL data is presented in **Appendix X**.

- *LIF Data:* Ten laser-induced fluorescence (LIF) borings were completed in the vicinity of the AOI 03-1 LNAPL area. The LIF response in this area is consistent with the known LNAPL type, quench oil. One boring (LIF-03-002) located within the AOI 03-1 LNAPL footprint exhibited LIF responses above background from 7 to 15 feet. **Figure L1-2** presents the results of the LIF investigation.

- *Transmissivity:* Transmissivity testing has not been completed at the AOI 03-1 LNAPL Area because there is insufficient LNAPL present to conduct transmissivity testing at this time.

- *Natural Source Zone Depletion (NSZD):* In June 2013, NSZD sampling was completed at one location, adjacent to monitoring well 03-03R, to establish ongoing natural attenuation rates of LNAPL at the AOI 03-1 LNAPL Area. The laboratory analytical results indicate that LNAPL is being depleted at a rate of approximately 400 gallons per acre per year. The NSZD data are presented in **Table 3B of the main report**.

3.4 Extent of LNAPL

During the RCES preparation, the AOI 03-1 LNAPL Area was calculated based on available Site data. The footprint of the area containing approximately 0.5 ft or greater of LNAPL as measured in monitoring wells was estimated to be approximately 1,700 square feet. As shown on **Figure L1-2**, the AOI 03-1 LNAPL Area has been re-drawn (as discussed in Section 2.1.3 of the main report) and the current extent of LNAPL is approximately 8,800 square feet. LIF boring LIF-03-002, which was completed within the footprint of the AOI 03-1 LNAPL area, detected impacts from 7 to 15 feet bgs. The soil borings completed in this area indicated visual evidence of impacts and/or positive oil shake tests from 4.5 to 16 feet bgs.

LNAPL Remedial Decision Tree

Attachment 2 LNAPL Remedial Decision Tree Priority #13 – AOI 03-1 Quench Oil Area

NOTES

(#) NOTES: See Page L2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priority #13 - AOI 03-1 Quench Oil Area

Background: The AOI 03-1 Quench Oil LNAPL area is located at the Northend of the Site just south of former Factory 03 and is likely associated with a historic release in the southern portion of Building 30A (Release No.C-0921-91). There are currently no buildings within the AOI 03-1 Quench Oil LNAPL Area footprint.

Geology and Hydrogeology: The soils at AOI 03-1 are primarily Silt and Sand from 0 to 16 feet below ground surface (bgs), with a Sand layer from 10 to 12 feet bgs. Depth to groundwater in this area is generally 8 to 10 feet bgs. Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the south.

LNAPL Characteristics: The soil boring logs indicate evidence of impacts from 4.5 to 16 feet bgs, while LIF logs indicated the depth of impacts to be 7 to 15 feet bgs at the AOI 03-1 LNAPL area. The greatest thickness of LNAPL measured at AOI 03-1 was 2.94 feet measured at monitoring well 03-03R in 2010. At the AOI 03-1 Quench Oil Area, the LNAPL has a viscosity of 26 centipoise (cp), interfacial tension of 2.8 dynes/centimeter (cm), a specific gravity of 0.90 and detected PCBs at a concentration of 6 ppm.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*

   YES – The following potential risk/exposure concerns are associated with the AOI 03-1 Quench Oil Area:

   - Groundwater/surface water interface (GSI): Groundwater and soil samples collected from the AOI 03-1 area exhibited concentrations of select VOCs and metals (arsenic, beryllium, copper, cyanide, selenium) that exceed GSI or GSIP criteria. However, there has been insufficient LNAPL present at 03-03R2 to perform metals analysis, so it is unknown whether the LNAPL is the source of the metal impacts. In addition, the monthly samples collected from the Outfall 003 storm sewer (which services this portion of the Site) as part of the NPDES Plus Monitoring (NPMP) program have not detected VOCs, copper, beryllium, or selenium above GSI criteria.

     In addition, groundwater levels in this portion of the Site are generally deeper than the invert elevation of the storm sewer; however, groundwater levels do fluctuate and are occasionally above the invert. Therefore, the storm sewers in this area may be an intermittent GSI pathway.

   - Potential Volatilization to Indoor Air Concerns for Future Structures: Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*

   NO – The following is a general discussion regarding the feasibility of various compositional change remediation strategies for the AOI 03-1 LNAPL Area:

   - Enhanced dissolution and recovery via surfactant or hot water flushing may enhance LNAPL recovery; however, it is not a viable option based on the presence of nearby City sewers. The use of surfactant would increase mobility and therefore, likely increase the potential for PCB-impacted LNAPL infiltration into the storm sewer.

   - The AOI 03-1 LNAPL Area constituents have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.

   - In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of PCBs in the LNAPL and the proximity of City sewers. In addition, it does not represent an economically feasible remedial alternative given the relatively large area that would need to be addressed in order to avoid the generation of dioxins.

   - Targeted in-situ soil mixing/land farming would use biological additives to address the petroleum constituents; however, the PCBs would remain and could become mobilized. In addition, due to the proximity of the AOI 03-1 LNAPL Area to the Site storm sewers, there is a potential for the additives to enter the sewer and be discharged to the Flint River.

3) *Is there a potential benefit to partial treatment/removal that outweighs costs?*

   NO – A historic IM addressed the suspected source area for this LNAPL Area in the southern portion of Building 30A; therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate.

Attachment 2 Notes

Priority #13 - AOI 03-1 Quench Oil Area

4) *Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?*

NO – The LNAPL area appears to be stable. This finding is supported by the following lines of evidence:

- Well Gauging Data: Sentinel wells located downgradient of the AOI 03-1 LNAPL Area have remained free of LNAPL since monitoring began approximately 10 years ago.
- Age of LNAPL Release: The source of the AOI 03-1 was likely a release from former Factory 03 release identified in 1991 and use of Factory 03 was discontinued in 1998 (no active LNAPL sources for at least 15 years). LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).

5) *Is LNAPL mobile within the stable LNAPL perimeter?*

YES – LNAPL has been consistently detected at monitoring well 03-03 (and its replacements 03-03R and 03-03R2) since 2001.

6) *Is LNAPL readily recoverable?*

NO – An historic IM was completed at the suspected source area of the LNAPL area (located in southern portion of Building 30A) in 1991 and the subsequent bailing program completed at AOI 03-1 from 2003 to 2005 only recovered one gallon of LNAPL. During the bailing program, 11 monitoring wells AOI 03-1 were monitored and manually bailed during 10 events and a total of 1 gallon of product was removed. It is unlikely that future LNAPL recovery is practical at AOI 03-1.

7) *Are controls required?*

YES – The following AOI-specific institutional controls are proposed, in addition to the Site-wide institutional controls, for the AOI 03-1 Quench Oil area to limit future exposure:

- Notify future owners of the presence of PCBs, and
- Restrict the area containing PCB-impacted LNAPL to low occupancy (as shown on **Figure L3-1**).

Attachment 3

761.61(c) Risk Based Cleanup and Disposal Request

Priority #13 – AOI 03-1 Quench Oil Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – 761.61(c) Risk Based Cleanup and Disposal Request

---

This attachment presents the information required to support a 761.71(c) determination for the Area of Interest (AOI) 03-1 light non-aqueous phase liquid (LNAPL) Area.

1. Area Background and History

The AOI 03-1 LNAPL Area is located at the Northend of the Site just south of former Factory 03 and is likely associated with a historic release in the southern portion of Building 30A. LNAPL believed to be related to this release was identified at downgradient monitoring well 03-03 (and replacement wells 03-03R and 03-03R2). Historically, LNAPL associated with the AOI 03-1 LNAPL Area was also identified in monitoring wells 03-01, 03-105R, (and its replacement well 03-105R2), and RFI-03-15R; however, LNAPL has not been detected in these wells since 2003/2004. In recent years, LNAPL has only accumulated to a measurable thickness in one monitoring well (03-03R2) in the AOI 03-1 LNAPL Area.

2. Summary of SOPs and Investigation Results

AOI 03-1 has been previously investigated as part of the Site's RCRA Facility Investigation activities. The RFI Work Plan presents the standard operating procedures, field sampling procedures, quality assurance/quality control procedures, etc. used during the investigation. The results of the investigations (including laboratory analytical reports) were presented in the RFI Phase I and RFI Phase II reports.

3. Nature of Contamination

At AOI 03-1 samples of LNAPL, soil, and groundwater have been analyzed for polychlorinated biphenyls (PCBs). Below is a brief summary of results.

- An LNAPL sample collected from 03-03R2 detected PCBs at concentration of 6 parts per million (ppm).
- Fourteen soil samples collected from the AOI 03-1 area were analyzed for PCBs. Ten of the samples did not detect PCBs, and four samples detected PCBs at levels less than 1 ppm.

- Ten groundwater samples collected from wells in the AOI 03-1 area were analyzed for PCBs. No PCBs were detected in the groundwater samples.

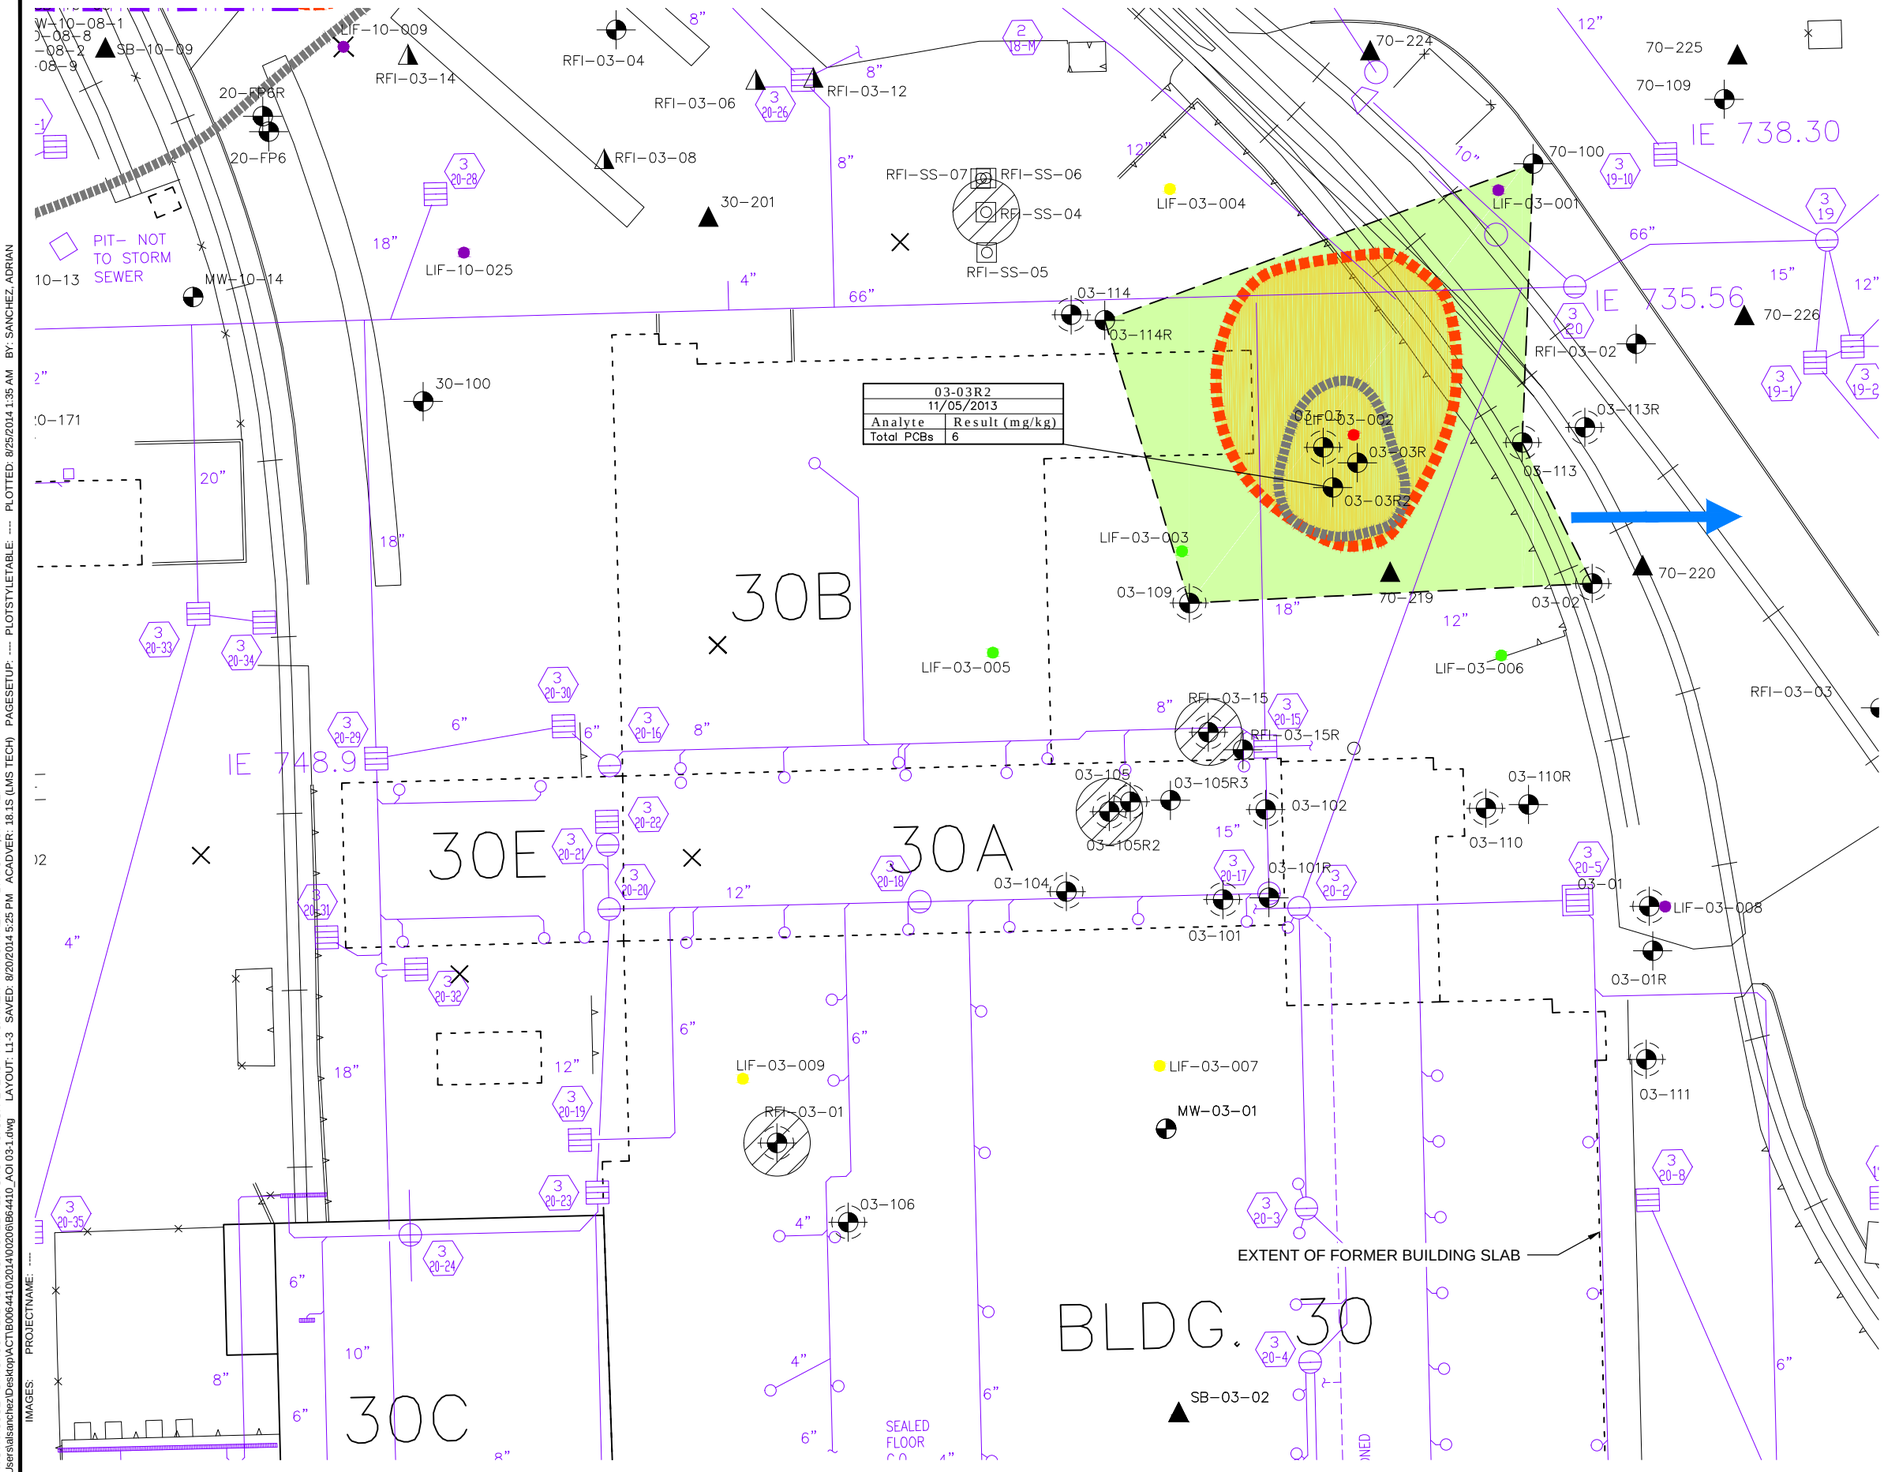
4. Extent of Impacts

At AOI 03-1 PCB impacts are associated with the LNAPL. **Figure L3-1** shows the approximate extent of LNAPL and PCB detection. As discussed above, in recent years LNAPL has only been detected at 03-03R2 and is currently approximately 11 feet bgs. Also, based on LIF borings, the depth of impacts are primarily 7 to 15 feet bgs.

5. Risk-Based Procedure

Due to the nature and extent of PCB impacts, it is requested that the LNAPL impacts at AOI 03-1 be allowed to remain in place. Furthermore, the area will be designated as low occupancy [per 761.61 (a)(4)(i)(B)]. AOI-specific deed restrictions, in addition to the Site-wide institutional controls as noted on **Table 10 of the main report**, placed on AOI 03-1 will include:

- Notification to future owners of the presence of PCBs, and
- Restrict the area shown on **Figure L3-1** to low occupancy based on the presence of PCBs.



6. Evaluation of Alternatives

The following technologies were evaluated to address LNAPL at AOI 03-1:

- Targeted in-situ soil mixing/land farming uses biological additives to address the petroleum constituents; however, the PCBs would remain and could become mobilized. Due to the proximity of the AOI 03-1 LNAPL area to the Site storm sewers, there is a potential for the additives or mobilized PCBs to enter the sewer and be discharged to the Flint River.
- Enhanced dissolution and recovery via surfactant or hot water flushing may enhance LNAPL recovery. However, due to the proximity of the AOI 03-1 LNAPL area to the Site storm sewers, there is a potential for surfactant and mobilized PCB-containing LNAPL to enter the sewer and be discharged to the Flint River.
- In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the presence of PCBs in the LNAPL and the proximity of City sewers. In addition, it does not represent an economically feasible remedial alternative given the relatively large area that would need to be addressed in order to avoid the generation of dioxins.
- Constituents of LNAPL from AOI 03-1 (quench oil) have low volatility rendering remedial technologies which rely on vapor-phase partitioning infeasible on a technical basis.

Remedy Recommendation

Priority #13 – AOI 03-1 Quench Oil Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 4 – Recommended Remedy

This attachment presents the recommended remedies for the Area of Interest (AOI) 03-1 Quench Oil light non-aqueous phase liquid (LNAPL) Area (AOI 03-1 LNAPL Area).

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in **Attachment 2** identified groundwater/surface water interface (GSI) and potential volatilization to indoor air as compositional concerns and mobility as a saturation concern for the AOI 03-1 area. The GSI concern is based on the detection of select volatile organic compounds (VOCs) and metals in groundwater and soil samples at concentrations that exceed the GSI or GSI protection (GSIP) criteria. The volatilization to indoor air concern is due to the potential biodegradation of LNAPL generating methane which theoretically could result in indoor air quality concerns for future structures.

2. Remedy Recommendation Rationale

The remedy recommended to address the compositional and saturation concerns associated with the AOI 03-1 LNAPL Area is institutional controls, which is discussed in detail in Section 3. The rationale for this selection is detailed below:

- Groundwater levels at AOI 03-1 are generally deeper than the invert elevation of the storm sewer; however, levels do fluctuate and are occasionally above the invert. Therefore, the storm sewers in this area may be an intermittent GSI pathway.
- Although select groundwater and soil samples collected from the AOI 03-1 Area have exhibited concentrations that exceeded GSI or GSIP criteria for select VOCs or metals (arsenic, beryllium, copper, cyanide, selenium, and silver); the monthly NPDES Plus Monitoring Plan (NPMP) samples collected from Outfall 003 have not detected VOCs, beryllium, copper, or selenium at concentrations above GSI criteria.

- As discussed in **Appendix BB**, the majority of metals exceedances identified in the Outfall 003 storm sewer will likely be addressed by a mixing zone remedy; however, additional data collection and evaluation is necessary.
- Based on the current understanding of risk conditions, the potential volatilization to indoor air risk for future structures can be effectively mitigated through the Site-wide institutional controls.
- Based on the current delineation of the AOI 03-1 LNAPL Area, it appears that the footprint may intersect the Outfall 003 storm sewer main and laterals. As such a visual inspection of the storm sewer was completed and no evidence of LNAPL infiltration was identified in this portion of the sewer.
- PCBs were detected at a concentration of 6 parts per million at monitoring well 03-03R2. LNAPL has only been detected at 03-03R2 in recent years and is currently approximately 11 feet bgs. Also, based on LIF borings, the depth of impacts are primarily 7 to 15 feet bgs. Due to the nature and extent of PCB impacts, it is requested that the LNAPL impacts at AOI 03-1 be allowed to remain in place. Furthermore, the area will be designated as low occupancy [per 761.61 (a)(4)(i)(B)].
- A historic IM addressed the suspected source area for the LNAPL in the southern portion of Building 30A; therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate.
- The NSZD testing indicates that LNAPL is being depleted at a rate of approximately 400 gallons per acre per year at AOI 03-1.

3. AOI 03-1 Remedies

3.1 Completed Interim Measures

In 1991, a roof drain/storm sewer sump located in the southern portion of Building 30A was converted into a collection sump with a belt skimmer to recover accumulated quench oil. This recovery system was successful in recovering LNAPL proximate to the recovery sump; hence, operation of the system was discontinued. The amount of LNAPL removed by this system is unknown.

In addition, from 2003 to 2005, eleven AOI 03-1 monitoring wells were monitored and manually bailed as part of the Site-wide LNAPL monitoring program. During this three year program a total of 1-gallon of product was removed, primarily from monitoring well 03-03R.

3.2 Additional Remedy Recommendations

The remedy recommended to address the compositional and saturation concerns associated with AOI 03-1 LNAPL Area is Institutional Controls. This remedy will reduce exposure risks associated with the AOI 03-1 area and be protective of future workers in the long term.

3.2.1 Institutional Controls

The following AOI-specific institutional controls, in addition to the Site-wide controls noted in the Report, will be necessary to limit potential for future exposure:

- Notify future owners of the presence of PCBs, and
- Restrict the area shown on **Figure L3-1** in **Attachment 3** to low occupancy based on the presence of PCBs.

Remedy Recommendation Report
Appendix L - AOI 03-1 Quench Oil Area - Addendum No.1
Summary of Additional Investigations
RACER Buick City Site, Flint, Michigan

Introduction

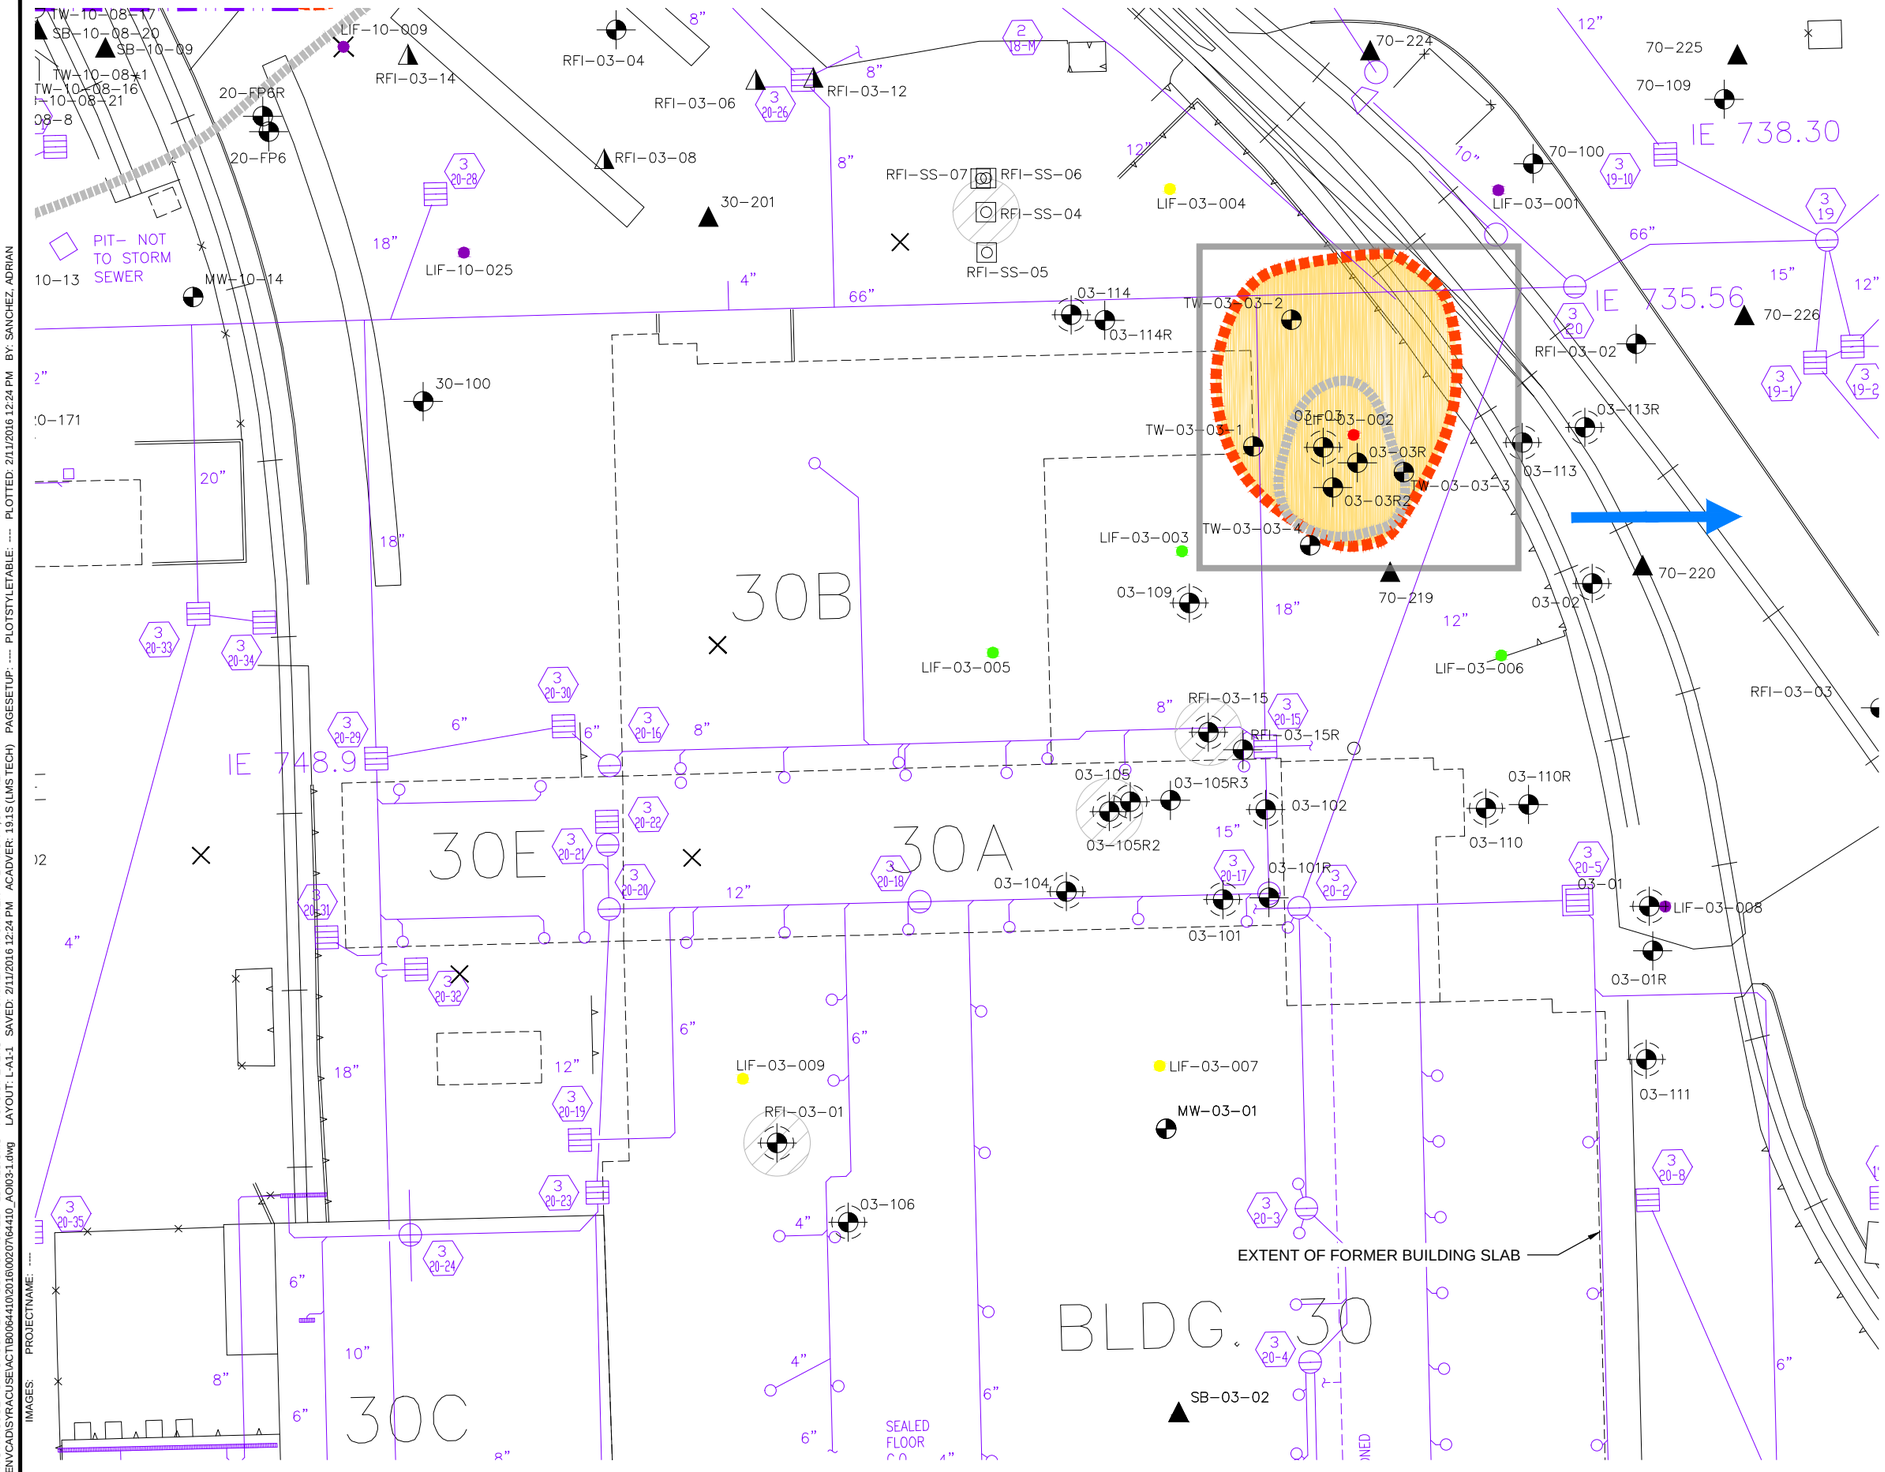
This Addendum No. 1 to Remedy Recommendation Report Appendix L presents a summary of investigation data collected at the AOI 03-1 Quench Oil Area from March 19, 2014 through December 31, 2015 at the Buick City Site (Site) located in Flint, Michigan.

Summary of Investigation Activities

Four temporary wells (TW-03-03-1 through TW-03-03-4) were installed to a depth of approximately 15 feet below ground surface (ft bgs) to delineate LNAPL impacts and refine the extent of polychlorinated biphenyls (PCBs). **Figure L-A1-1** presents the locations of the temporary wells. Soil samples were collected from the 2 foot interval above the groundwater table at each temporary well location and submitted to the laboratory for analysis of PCBs.

Summary of Data Evaluation

Indications of impact were identified at all four temporary well locations. At TW-03-03-1 a moderate odor and elevated PID readings were noted. At TW-03-03-2 through TW-03-03-4 strong odors, staining, elevated PID readings, and sheens were identified.



PCBS were not detected in any of the soil samples collected from TW-03-03-1, TW-03-03-2, and TW-03-03-4. However, the soil sample collected from 8 to 10 ft bgs at TW-03-03-3 detected PCBs at a concentration of 1.8 milligrams per kilogram.

The newly installed monitoring wells were gauged four times in December 2014, January 2015, and August 2015. LNAPL was gauged at a thickness of 0.02 feet in temporary well TW-03-03-4 in August 2015, but was not observed in the remaining wells during any of the gauging events.

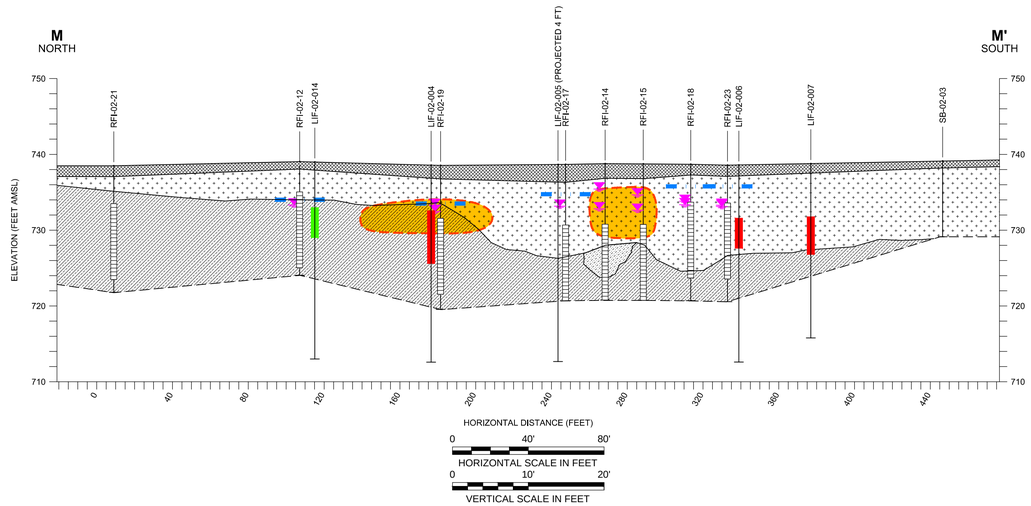
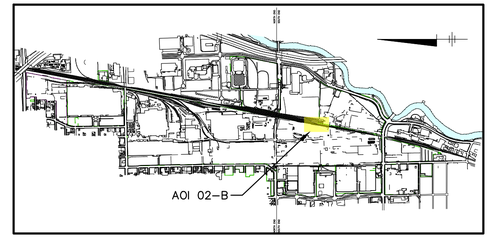
Subject:
Priority #16 - AOI 02-B Hydraulic Oil Area
Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan



As part of the remedy evaluation process each of the Site's 17 light non-aqueous phase liquid (LNAPL) areas were prioritized based on risk. The area of interest (AOI) 02-B Hydraulic Oil Area (AOI 02-B LNAPL Area) is ranked as Priority #16 with a total potential risk score of 1 (**Table 5 of the main report**). A conceptual site model cross-section is attached (**Figure M-1)** that provides an overview of the AOI 02-B LNAPL Area impacts.



The compositional and saturation concerns identified for the AOI 02-B LNAPL Area were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:

- Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane generated from the biodegradation of methane, for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.
- No feasible options exist to mitigate unacceptable risk through compositional change.
- Based on the understanding of site conditions, risk can be effectively mitigated through institutional controls.
- The LNAPL is not migrating and the Outfall 006 storm sewer that services AOI 02-B has been bulkheaded.
- The LNAPL is not readily recoverable.

Based on the current understanding of conceptual site model, the potential future volatilization concern associated with the AOI 02-B LNAPL Area can be effectively mitigated through the Site-wide institutional controls.

SITE MAP

0 2000' 4000'

SCALE IN FEET

AOI 02-B HYDRAULIC OIL AREA

KEY LNAPL COMPOSITION AND SATURATION CONCERNS

1) POTENTIAL VOLATILIZATION TO INDOOR AIR CONCERN FOR FUTURE STRUCTURES
2) THE LNAPL IS NOT MIGRATING AND IS MOBILE WITHIN ITS STABLE PERIMETER . HOWEVER THE VISCOSITY OF THE LNAPL IN THIS PLUME IS 362 cP, LIMITING ITS MOBILITY
3) TRANSMISSIVITY WAS UNABLE TO BE CALCULATED DUE TO THICKNESS OF THE LNAPL. LNAPL IS NOT READILY RECOVERABLE

COMPLETED INTERIM MEASURES AND RECOMMENDED REMEDIES

R-1) INSTITUTIONAL CONTROLS

Attachment 1

LNAPL Conceptual Site Model

ARCADIS

Priority #16 - AOI 02-B Hydraulic Oil Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model for the area of interest (AOI) 02-B Hydraulic Oil light non-aqueous phase liquid (LNAPL) Area (AOI 02-B LNAPL Area), which is located at the Buick City Site (Site) located in Flint, Michigan (**Figure M1-1**).

1. Background

The AOI 02-B LNAPL Area is located at the Southend of the Site in the eastern portion of the former Building 02 footprint. Historically, Building 02 housed the GM Machine Tool Division/Plastics Area and the occurrence of AOI 02-B LNAPL Area is presumably due to historic releases associated with the plant operations. The AOI 02-B LNAPL Area is located along the CSX property boundary (**Figure M1-2**) and LNAPL has accumulated to measurable thicknesses in seven monitoring wells.

Investigation data previously presented in Site reports are not re-presented in this memo. However, relevant AOI 02-B LNAPL Area investigation data that has not previously been presented in a Site report are attached or are presented in **Appendix X**.

2. AOI 02-B LNAPL Area Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, LNAPL characteristics and extent of impacts for the AOI 02-B LNAPL Area. **Figure M1-2** presents the locations of the existing and abandoned monitoring wells and soil borings in the AOI 02-B LNAPL Area.

2.1 AOI 02-B LNAPL Area Geology and Hydrogeology

- *Geology*: Soil boring and monitoring well logs in the vicinity of the AOI 02-B LNAPL Area indicate that the soils are primarily sands to silty sands and fill materials from 0 to 6 feet below ground surface (bgs) in the northern portion of the AOI 02-B LNAPL Area and 0 to 12 feet bgs in the southern portion of the AOI 02-B LNAPL Area. The sands and fill material are underlain by clays to approximately 18 feet bgs. The boring logs also indicated visual evidence of impact from 6 to 15 feet bgs.

- *Groundwater/LNAPL Levels:* Depth to groundwater in this area ranges from 5 to 6 feet bgs and the greatest thickness of LNAPL measured at RFI-02-15 was 8.2 feet in 2012. During the most

recent monitoring event (June 2013) LNAPL was only detected in three of the AOI 02-B LNAPL Area wells (RFI-02-14, RFI-02-15, and RFI-02-19).

During the RFI at the Site, the storm sewers located in the AOI 02-B LNAPL Area were bulkheaded; therefore, the groundwater surface water interface (GSI) pathway is no longer applicable in this part of the Site. Based on fluid level gauging data, groundwater flow in this portion of the Site is generally to the east and southeast. A summary of groundwater level data collected at the AOI 02-B area is presented in **Appendix X**.

2.2 Groundwater and Soil Analytical Data

Analytical data were compared to applicable Michigan Part 201 non-residential criteria.

2.2.1 Groundwater Analytical Data

The groundwater data in the AOI 02-B LNAPL Area do not exceed applicable criteria.

2.2.2 Soil VOC, SVOC and Metals Analytical Data

Soil samples collected from the AOI 02-B LNAPL Area do not exceed applicable criteria.

2.2.3 Soil PCB Analytical Data

Polychlorinated biphenyls (PCBs) were not detected in the 15 soil samples collected in the AOI 02-B LNAPL Area.

2.2.4 Vapor Intrusion Evaluation

Due to the presence of shallow groundwater and LNAPL (approximately 4 feet bgs) at the AOI 02-B LNAPL Area, groundwater data were also compared to the applicable Non-Residential Screening Values for the Vapor Intrusion Pathway presented in the *Michigan Department of Environmental Quality (MDEQ) Guidance Document for the Vapor Intrusion Pathway* (further discussed in Section 3.4 of the Report). Groundwater concentrations do not exceed applicable screening levels.

As there are no structures at the Site the MDEQ Part 201 criteria are appropriate for comparison of soil data. Soil concentrations did not exceed applicable screening levels.

2.3 LNAPL Characteristics

- *LNAPL Analytical Data:* LNAPL present at AOI 02-B LNAPL Area consists primarily of hydraulic oil and PCBs have not been detected in the LNAPL. Additional analysis indicated that:

- At AOI 02-B, the LNAPL has a viscosity of 362 centipoise (cp),a density of 0.9063 grams per cubic centimeter, interfacial tension of 32.4 dynes/centimeter, and a specific gravity of 0.91.

· *LIF Data:* Thirty laser-induced fluorescence (LIF) borings were completed in the AOI 02-B LNAPL Area. The LIF response at the AOI 02-B LNAPL Area is consistent with the known LNAPL type, hydraulic oil. The vertical range of LIF impact (greater than 5%) is typically 6 to 12 feet bgs. **Figure M1-2** presents the results of the LIF investigation and the extent of impacts associated with the AOI 02-B LNAPL Area.

· *Transmissivity:* An LNAPL transmissivity study was completed at the Southend of the Site, which consisted of completing four quarters of baildown testing. Three monitoring wells from AOI 02-B (RFI-02-14, RFI-02-15, and RFI-02-19) were initially included in the study; however the wells were removed from the study after two quarters because the LNAPL was too viscous to accurately measure.

· *Natural Source Zone Depletion (NSZD):* An NSZD study was conducted at two locations (LIF-02-007 and LIF-02-008) that are located in the AOI 02-B LNAPL Area. The testing completed indicated that NSZD is occurring; however, the currently available testing technologies cannot reliably quantify the depletion beneath a concrete slab.

· *Respirometry Testing:* Respirometry testing was completed to determine the feasibility of enhancing biological degradation of total petroleum hydrocarbons (TPH) in soil by augmenting samples with the addition of nutrients under aerobic conditions. Soil samples were collected adjacent to monitoring well RFI-02-19 and submitted to the laboratory for respirometry testing. Three sample intervals (5 to 10, 10 to 15 and 5 to 15 ft. bgs) were collected and submitted for testing. Due to the high clay content in the soils the laboratory indicated that the results of the testing were inconclusive; however, observations can be made based on the results. The testing results indicated that the TPH in the control samples (which did not have nutrients added) degraded at a similar rate to the samples with nutrient added. This indicates that there are enough nutrients already present in the soil. This also indicates that oxygen is rate limiting and that multiphase extraction, soil-vapor extraction, air sparging, land farming or passive venting may be viable options at the Buick City Site. However, due to the geology at AOI 02-B only land farming or passive venting would potentially be applicable. In summary, the two additives did not show a significant improvement in degradation indicating that the naturally occurring microbes present have acclimated to Buick City's contaminated soil and oxygen is the rate limiting in the AOI 02-B LNAPL Area.

2.4 Extent of LNAPL

During the Remediation Cost Estimate Summary (RCES) preparation, the AOI 02-B LNAPL area was calculated based on historical data. The footprint of the AOI 02-B LNAPL Area containing approximately 0.5 ft or greater of LNAPL was estimated to be approximately 4,300 square feet. The current footprint of the LNAPL area is estimated (as discussed in Section 2.1.3 of the main report) to be approximately 10,800 square feet. Based on the soil boring logs, impacts were detected from 6 to 15 feet bgs; however, the soil samples did not exceed applicable cleanup criteria. The LIF logs indicated the depth of impacts to be 6 to 12 feet bgs.

Attachment 2

LNAPL Remedial Decision Tree

Attachment 2 LNAPL Remedial Decision Tree Priority #16 – AOI 02-B Hydraulic Oil Area

NOTES

(#) NOTES: See Page M2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priority #16 - AOI 02-B Hydraulic Oil Area

Background: The area of interest (AOI) 02-B Hydraulic Oil Area (AOI 02-B light non-aqueous phase liquid [LNAPL] Area) is located at the Southend of the Site in the eastern portion of the former Building 02 footprint. Historically, the Building 02 housed the GM Machine Tool Division/Plastics Area and the AOI 02-B LNAPL Area is presumably due to historic releases associated with the plant operations. There are currently no buildings within the AOI 02-B LNAPL Area.

Geology and Hydrogeology: The soils at AOI 02-B LNAPL Area consist of primarily sands and fill materials from 0 to 6 feet bgs in the northern portion of the AOI 02-B LNAPL Area and 0 to 12 feet bgs in the southern portion of the AOI 02-B LNAPL Area. The sands and fill material are underlain by clays to approximately 18 feet bgs. Depth to groundwater in this area averages around 4 to 6 feet bgs. Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the east and southeast.

LNAPL Characteristics: Soil boring logs and LIF logs indicate that LNAPL in the AOI 02-B Area show evidence of LNAPL impacts from as shallow as 6 feet bgs and as deep as 15 feet bgs. The AOI 02-B LNAPL Area includes three monitoring wells (RFI-02-14, RFI-02-15, and RFI-02-19) where LNAPL thicknesses greater than 0.5 feet have been measured. Historically, monitoring wells RFI-02-12, RFI-02-16, RFI-02-18, and RFI-02-23 have only had sheens and minimal thicknesses (0.01 feet) of LNAPL measured intermittently. At AOI 02-B, the LNAPL has a viscosity of 362 centipoise (cp), a density of 0.91 grams per cubic centimeter, interfacial tension of 32.4 dynes/centimeter, and a specific gravity of 0.91.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*

   YES – The following potential risk/exposure concerns are associated with the AOI 02-B LNAPL Area:
   - Potential Volatilization to Indoor Air Concerns for Future Structures: Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*

   YES – Targeted in-situ soil mixing/land farming to address the petroleum constituents may be technically feasible. However, other options evaluated were not feasible as discussed below:
   - Bench-scale testing of five technologies was conducted on samples collected from the Southend of the Site. Two of the technologies (enhanced dissolution and recovery via surfactant or hot water flushing) were tested on samples collected from AOI 02-B and the remaining three technologies were tested on samples from adjacent AOI 12-A, -B, & -C area, which had a similar geology and LNAPL type. The results of the testing were presented in the *LNAPL Remediation Technology Bench-Scale Testing Report (*ARCADIS, 2012b*)* and are summarized on **Tables 4A and 4B of the main report**. Based on the results of the bench-scale testing, the following observations are made from the AOI 02-B and AOI 12-A, -B & 16-C LNAPL testing:
     - Enhanced dissolution and recovery via surfactant or hot water flushing did not result in any additional LNAPL recovery.
     - The LNAPL constituents at AOI 02-B have low volatility rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.
     - Remedial technologies relying on direct chemical destruction of COCs (in-situ chemical oxidation [ISCO]) are also technically infeasible, given that the desired chemical reactions occur within the aqueous phase only, and thus are rate-limited by dissolution of contaminants from the non-aqueous to aqueous phase.
     - Based on the results of simulated distillation testing, a significant portion of the LNAPL has a boiling point above 400°C and would be considered semi-volatile organic compounds (SVOCs). Steam or electric resistive heating (ERH) are not recommended for SVOCs because a higher temperature is required to volatilize these compounds.
     - In situ thermal remediation may be technically feasible for the area; however, it is not a viable option based on the proximity to CSX property and the rail lines.

3) *Can institutional/engineering controls provide effective risk mitigation?*

   YES – Based on the current understanding of risk conditions, the potential volatilization to indoor air risk can be effectively mitigated through the Site-wide institutional controls.

4) *Is there a potential benefit to partial treatment/removal that outweighs costs?*

   NO – The risk associated with this area is possible volatilization to indoor air of a future building due to methane generated by biodegradation of the LNAPL. Based on the current understanding of risk conditions, the volatilization to indoor air risk can be effectively mitigated through institutional controls.

5) *Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?*

NO – The LNAPL area appears to be stable. This finding is supported by the following lines of evidence:

- Well Gauging Data: Sentinel wells located around the periphery of the AOI 02-B LNAPL Area have remained free of LNAPL since monitoring began approximately 10 years ago. Additionally, there are two LIF borings to the east on CSX property that only show responses of a maximum of 10% RE, indicating no LNAPL impact.
- Age of LNAPL Release: Operations began in this portion of the Site in the 1910's and ceased in this portion of the Site ceased in late 1990's - early 2000's (no active LNAPL sources for at least 10 years). LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).

In addition, the outfall in this portion of the Site was bulkheaded during RFI activities and therefore does not provide a potential future migration pathway.

6) *Is LNAPL mobile within the stable LNAPL perimeter?*

YES – The LNAPL is mobile within the stable perimeter, as it is gauged in three monitoring wells. However, the viscosity of the LNAPL is 362 cp (similar to that of molasses), limiting its mobility and recoverability. Transmissivity results are presented in **Table 2 of the main report**.

7) *Is LNAPL readily recoverable?*

NO – Transmissivity testing was attempted at three monitoring wells (RFI-02-14, RFI-02-15, and RFI-02-19) at AOI 02-B; however, the wells were removed from the study because the LNAPL was too viscous to accurately measure. As mentioned above, the viscosity of the LNAPL at AOI 02-B is 362 cp, limiting its mobility and recoverability.

8) Are controls required?

YES – Site-wide Institutional Controls discussed in the main report will be necessary to limit potential for future exposure.

Attachment 3

Remedy Recommendations

Priority #16 - AOI 02-B Hydraulic Oil Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – Recommended Remedy

This attachment presents the recommended remedies for the Area of Interest (AOI) 02-B Hydraulic Oil Area (AOI 02-B light non-aqueous phase liquid [LNAPL] Area).

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in **Attachment 2** identified potential volatilization to indoor air as a compositional concern for the AOI 02-B LNAPL Area. Theoretically, there is a potential unacceptable vapor phase exposure risk associated with future redevelopment scenarios due to the biodegradation of LNAPL that results in the generation of methane.

2. Remedy Recommendation Rationale

The remedy recommended to address the compositional and saturation concerns associated with the AOI 02-B LNAPL Area is institutional controls, which are discussed in detail in Section 3. The rationale for this selection is detailed below:

- Based on the current understanding of risk conditions, the potential volatilization to indoor air risk for future structures can be effectively mitigated through the Site-wide institutional controls.
- Bench-scale testing indicated that enhanced dissolution and recovery via surfactant or hot water flushing did not result in any additional LNAPL recovery in the AOI 02-B LNAPL Area.
- Transmissivity testing was attempted at three monitoring wells (RFI-02-14, RFI-02-15, and RFI-02-19) at AOI 02-B; however, the wells were removed from the study because the LNAPL was too viscous to accurately measure. The viscosity of the LNAPL at AOI 02-B is 362 centipoise, limiting its mobility and recoverability. This indicates hydraulic LNAPL recovery is likely not practicable at this location.
- Respirometry testing indicated that naturally-occurring microbes are present at AOI 02-B. The microbes are depleting the LNAPL mass; however, LNAPL degradation rates are oxygen limited. Due to the geology at AOI 02-B, only land farming or passive venting would potentially be

applicable. Implementation of these technologies would not reduce risk at the AOI 02-B LNAPL Area in a significantly shorter timeframe than NSZD alone.

- An natural source zone depletion (NSZD) study was conducted at two locations located in the AOI 02-B LNAPL Area. The testing completed indicated that NSZD is occurring; however, the currently available testing technologies cannot reliably quantify the depletion beneath a concrete slab.
- The LNAPL is not migrating and the storm sewers in AOI 02-B have been bulkheaded.
- There are no soil or groundwater exceedances of applicable criteria.

3. AOI 02-B Remedy

The remedy recommended to address the compositional and saturation concerns associated with AOI 02-B LNAPL Area is to establish institutional controls. This remedy will prevent future worker exposure to LNAPL impacts in the long term.

3.1 Institutional Controls

Site-wide Institutional Controls discussed in the main report will be implemented to limit potential for future exposure.

Remedy Recommendation Report
Appendix M - AOI 02-B Hydraulic Oil Area - Addendum No.1
Summary of Additional Investigations
RACER Buick City Site, Flint, Michigan

Introduction

This Addendum No. 1 to Remedy Recommendation Report Appendix M presents a summary of investigation data collected at the AOI 02-B Hydraulic Oil Area from March 19, 2014 through December 31, 2015 at the Buick City Site (Site) located in Flint, Michigan.

Summary of Investigation Activities

Additional subsurface investigation activities were completed at the AOI 02-B to investigate a laser-induced fluorescence (LIF) response near LIF-02-019 and to characterize methane concentrations in soil gas at the property boundary (**Figure M-A1-1**).

LIF-02-019 Investigation

A soil boring (SB-02-04) was completed at AOI 02-B to investigate the high fluorescence response identified at LIF boring LIF-02-019 and to determine whether LNAPL impacts were present at this location (**Figure M-A1-1**). SB-02-04 was completed to a depth of approximately 15 feet below ground surface (ft bgs) to

investigate the LIF impacts identified at LIF-02-019 from 7.5 to 14.5 ft bgs. No indications of LNAPL impact (elevated PID, staining, odors, sheens, etc.) were observed at soil boring SB-02-04.

Soil Gas Evaluation

Two soil gas sampling probes (SGP-02-B-01 and SGP-02-B-02) were installed to evaluate methane along the property boundary adjacent to the AOI 02-B LNAPL Areas. Two rounds of soil gas samples were collected from each probe in June and November 2015 and submitted to the laboratory for methane analysis. In addition the second round of samples were also analyzed for volatile organic compounds (VOCs) (**Table M-A1-1**). Neither methane nor any VOCs were detected in the four soil gas samples.

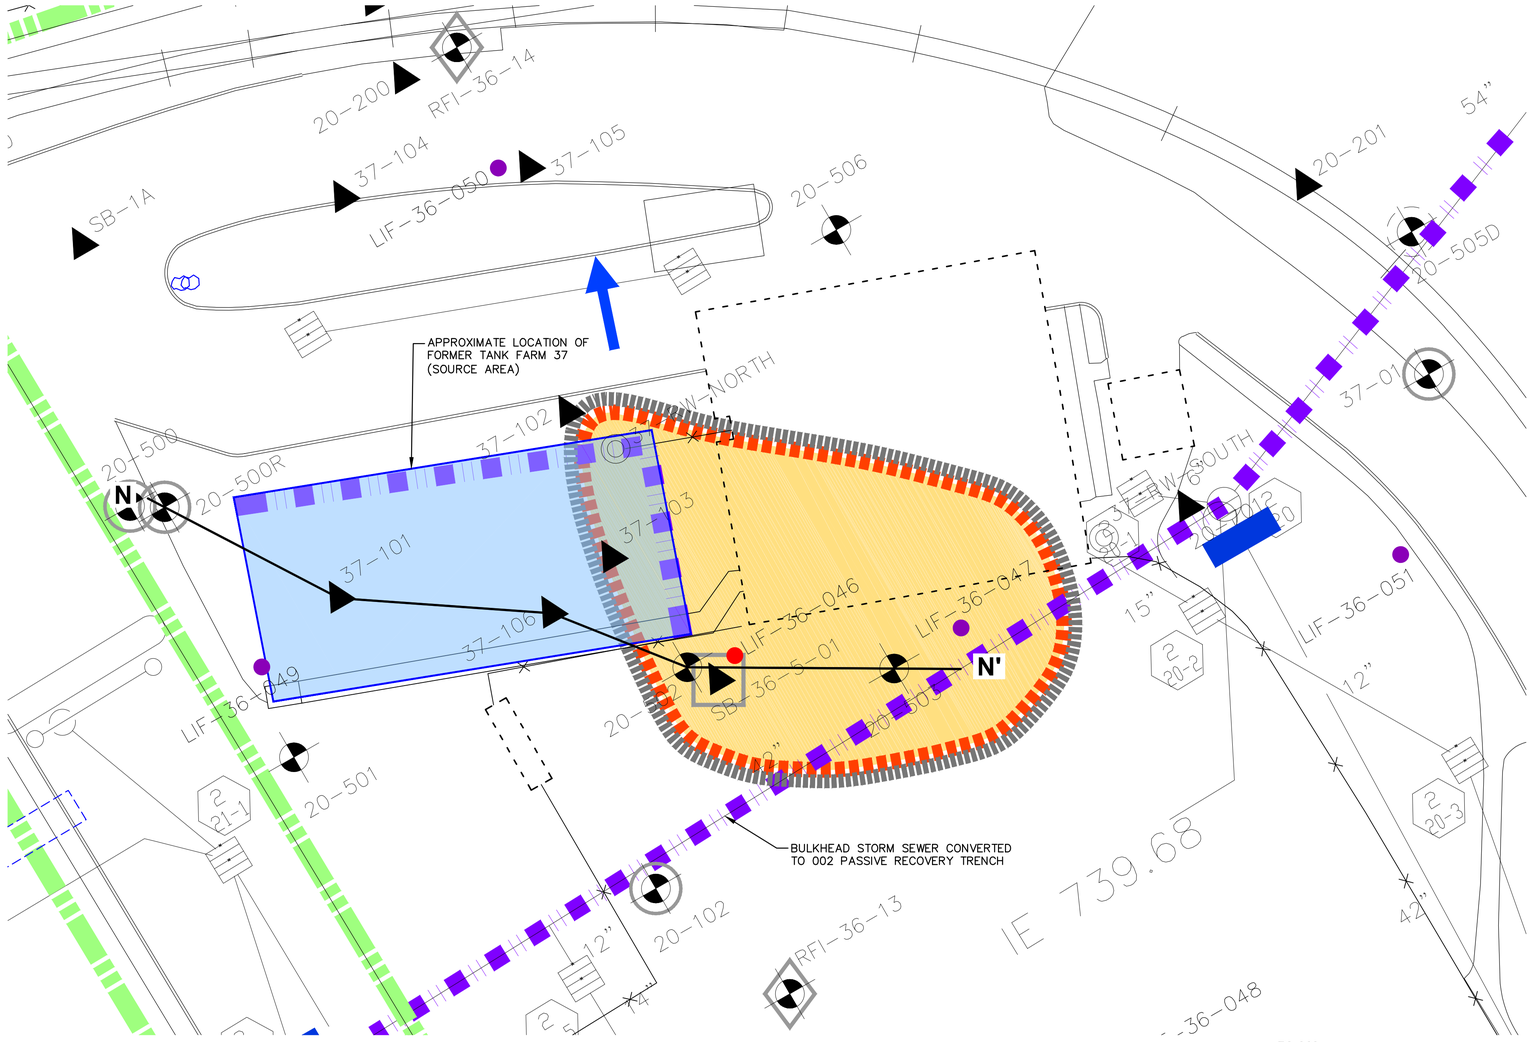
Priority #17 - AOI 36-5 Fuel Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

As part of the light non-aqueous phase liquid (LNAPL) remedy evaluation process, the Site's 17 LNAPL Areas were prioritized based on risk. The area of interest (AOI) 36-5 Fuel Oil LNAPL Area (AOI 36-5 LNAPL Area) is ranked as Priority #17 with a total potential risk score of 0 (**Table 5 of the main report**). A conceptual site model cross-section is attached (**Figure N-1**) that provide an overview of the AOI 36-5 LNAPL Area impacts and interim measures (IMs).

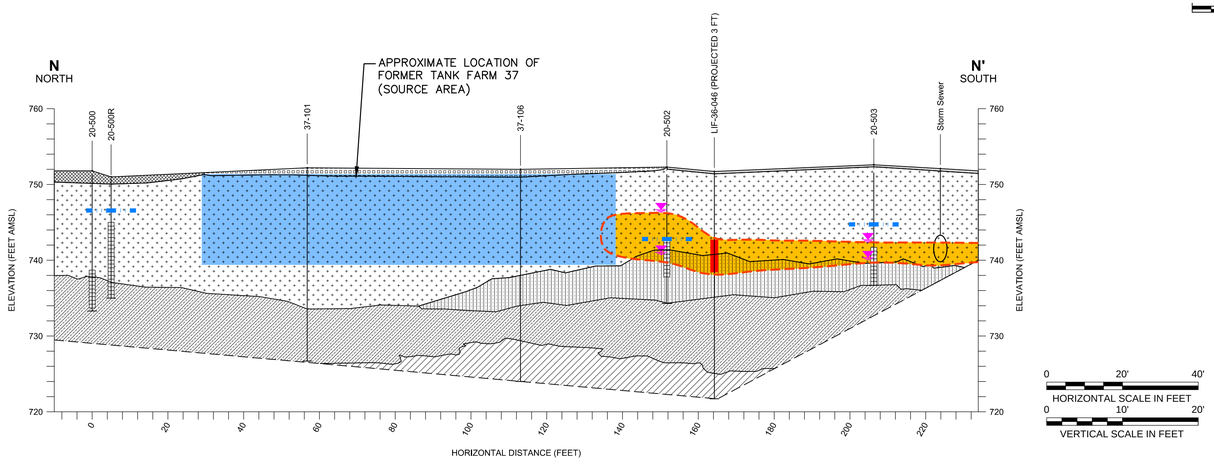


Historical IMs completed at the AOI 36-5 LNAPL Area include excavation, operation of recovery trenches and sumps, and an LNAPL bailing program. The partial and effective removal of LNAPL has been completed in this area is considered a component of the remedy.

The compositional and saturation concerns identified for the AOI 36-5 LNAPL Area were evaluated in the LNAPL decision tree (**Attachment 2**) and are summarized below:

- Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future structures; however, this will be addressed by the proposed institutional controls.
- The Outfall 002 and 003 storm sewers have been bulkheaded in this portion of the Site, so the GSI pathway is not applicable.

- Although remedy options such as surfactant-enhanced recovery or soil mixing may be feasible at the AOI 36-5 LNAPL Area, an LNAPL recovery system has operated at this plume for approximately 20 years; therefore, partial and effective LNAPL recovery has already been completed and a transition to institutional controls is now appropriate.



Based on the current understanding of the conceptual site model, the potential vapor phase risk associated with the AOI 36-5 LNAPL Area can be effectively mitigated through institutional controls.

Attachment 1

LNAPL Conceptual Site Model

Priority #17 - AOI 36-5 Fuel Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 1 - Conceptual Site Model

This attachment presents a conceptual site model (CSM) for the Area of Interest (AOI) 36-5 Fuel Oil light non-aqueous phase liquid (LNAPL) Area (AOI 36-5 LNAPL Area), which is located at the Buick City Site (Site) located in Flint, Michigan (**Figure N1-1**).

1. Background

A release (C-0282-90) was reported from former Tank Farm 37 and is the source of the AOI 36-5 LNAPL Area. Tank Farm 37 consisted of 17 underground storage tanks (USTs) (16 12,000-gallon USTs and 1 6,000-gallon UST) containing various thinners, gasoline and oils. Integrity testing of the tanks was conducted in 1989 after analysis of samples completed at the Tank Farm 37 area suggested that a release had occurred. Integrity testing indicated that the release was likely from two of the USTs, which were then removed from service. As part of initial abatement measures in February 1990, groundwater and free-product recovery trenches were installed along the east and south sides of the excavation. In August 1990, a new AST farm was constructed immediately south of this area and the remaining 15 tanks were removed from service. The groundwater and free-product recovery trenches were in operation until 2011.

Investigation data previously presented in Site reports are not re-presented in this memo. However, pertinent AOI 36-5 investigation data that has not previously been presented in a Site report is included in this memo.

2. Former Interim Measures

2.1 Tank Farm 37 Excavation

In 1989, following the identification of a release from Tank Farm 37 the leaking tanks were taken out of service. In 1991, all 17 USTs associated with the tank farm were excavated along with approximately 3,300 cubic yards of impacted soils.

In 1992, six additional soil borings (37-101 through 37-106) were completed in the former Tank Farm 37 area. Staining, elevated photoionization detector readings and/or odors were noted at borings 37-101, 37-102, 37-103, and 37-106.

Additional information regarding the tank farm excavation and installation of the LNAPL recovery trenches and sumps is available in the *Description of Current Conditions Report – North of Leith Street*, presented in **Appendix Y**.

2.2 LNAPL Recovery Trenches and Sumps

As part of initial abatement measures in February 1990, groundwater and free-product recovery trenches were installed along the east and south sides of the excavation area. These trenches are 3 feet wide and filled with gravel from approximately 2 feet bgs to approximately 14 feet bgs and are sloped toward a 26-inch-diameter recovery well/sump located along the south side of the excavation area. This recovery well/sump (37-RW-North) is installed to a depth of 17 feet bgs and screened from 6 to 13 feet bgs. In addition, a second 26-inch diameter sump (37-RW-South) was installed south of the newly constructed tank farm to a depth of 14 feet bgs. Collected fluids were routed to the Site's industrial wastewater treatment facility.

This system is no longer active as the wastewater treatment facility was decommissioned in 2011. It is unknown how much LNAPL was recovered over the duration of the systems operation. The approximate location of these trenches is shown on the CSM, **Figure N-1.**

2.3 LNAPL Monitoring and Bailing Program 2001 - 2002

The two recovery sumps (37-RW-North and 37-RW-South), as well as nearby monitoring wells 20-502, 20-503, and RFI-36-13, were monitored and manually bailed as part of the Site-wide LNAPL monitoring program. From July 2001 to March 2002, the LNAPL thickness ranged from about 0.1 to 2.5 feet in the monitoring wells, and a total of approximately 11 gallons of LNAPL was recovered as part of this monitoring program.

2.4 LNAPL Monitoring and Bailing Program 2003 – 2005

During the 2003 to 2005 Site-wide LNAPL monitoring and bailing program LNAPL was recovered from two monitoring wells (20-502 and 20-503) in the AOI 36-5 LNAPL Area. A total of approximately 6.5 gallons of LNAPL were removed as part of this monitoring program.

3. AOI 36-5 LNAPL Area Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and LNAPL characteristics and extent of impacts for AOI 36-5 LNAPL Area. **Figure N1-2** presents the locations of the existing and abandoned monitoring wells and soil borings in the AOI 36-5 LNAPL Area.

3.1 AOI 36-5 LNAPL Area Geology and Hydrogeology

- *Geology*: Soil boring and monitoring well logs in the vicinity of the AOI 36-5 LNAPL Area indicates that the soils consist primarily of sand and silty sand down to 13 feet bgs.

- *Groundwater/LNAPL Levels:* Six monitoring wells (20-500R, 20-502, 20-503, 20-506, RFI-36-13, and RFI-36-14) and two recovery wells (37-RW-North and 37-RW-South) at the AOI 36-5 LNAPL Area are gauged to monitor the extent of the LNAPL. Depth to groundwater (or LNAPL, where present) in this area ranges from 8 to 11 feet bgs. Historically, LNAPL has been gauged in the two recovery wells, as well as monitoring wells RFI-36-13, 20-502, and 20-503; however, in recent years LNAPL has not been detected at RFI-36-13 and during the most recent gauging events LNAPL was only detected in monitoring well 20-502 and recovery well 37-RW-North at thicknesses of 3.77 feet and 0.05 feet, respectively

  Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the east and southeast. All pertinent groundwater data is presented in **Appendix X**.

3.2 Groundwater and Soil Analytical Data

Analytical data were compared to applicable Michigan Part 201 non-residential criteria. Pertinent analytical data is presented in **Appendix X**.

3.2.1 Groundwater Analytical Data

Groundwater concentrations in the AOI 36-5 LNAPL Area do not exceed applicable non-residential criteria.

3.2.2 Soil Volatile Organic Compound (VOC), Semi-Volatile Organic Compound (SVOC), and Metals Analytical Data

During recent investigation activities a soil boring was attempted at AOI 36-5. Due to subsurface obstruction only one soil sample was able to be collected from a depth of 0.5 to 2 feet bgs. The sample concentrations did not exceed applicable non-residential criteria.

3.2.3 Groundwater Surface Water Interface (GSI) Evaluation

As discussed in further detail in **Appendix BB**, GSI exceedances in the Site storm sewers are being

evaluated by the ongoing NPDES Plus Monitoring Program (NPMP). AOI 36-5 was primarily serviced by the Outfall 002 storm sewer; however, there is also a lateral for the Outfall 003 storm sewer located downgradient of the AOI 36-5 LNAPL Area. In 2013 the Outfall 002 storm sewer was bulkheaded at the property boundary to eliminate LNAPL infiltration and the Outfall 003 lateral was bulkheaded as part of the remedy for the AOI 10-1/10-4 LNAPL Area. Therefore, the GSI pathway is not applicable at AOI 36-5.

3.2.4 Soil PCB Analytical Data

Polychlorinated biphenyls (PCBs) were not detected in the soil samples collected from the AOI 36-5 LNAPL Area.

3.2.5 Vapor Intrusion Evaluation

Due to the presence of shallow groundwater and LNAPL (approximately 5 feet below ground surface) at the AOI 36-5 LNAPL Area, groundwater data were also compared to the applicable Non-Residential Screening Values For the Vapor Intrusion Pathway presented in the *Michigan Department of Environmental Quality (MDEQ) Guidance Document for the Vapor Intrusion Pathway* (further discussed in Section 3.4 of the Report). Groundwater concentrations do not exceed applicable screening levels.

As there are no structures at the Site the MDEQ Part 201 criteria are appropriate for comparison of soil data. Soil data did not exceed applicable screening levels.

3.3 LNAPL Characteristics

- *LNAPL Analytical Data:* LNAPL present at AOI 36-5 consists primarily of fuel oil. Additional analysis indicate that:
  - The LNAPL has a viscosity of 5.5 centipoise (cp), an interfacial tension of 18 dynes/centimeter, and a specific gravity of 0.89. This data is used to evaluate LNAPL recoverability and as part of the LNAPL transmissivity analysis.
  - The concentration of trichloroethene (1.5 mg/kg) exceeds toxicity characteristic leaching procedure (TCLP) criteria; however, TCLP analysis has not been conducted.
  - No PCBs have been detected in the LNAPL samples collected from the AOI 36-5 area.
  - The Human Health Risk Assessment (HHRA) completed during the Phase II RFI Report did not identify any risks associated with the AOI 36-5 LNAPL plume.

  For reference, the viscosity (at 100 degrees Fahrenheit) of olive oil is 43.2 cp and honey is 73.6 cp (Ingersoll-Rand, 1981).

- *LIF Data:* Seven laser-induced fluorescence (LIF) borings were completed in the AOI 36-5 LNAPL Area. The LIF response at AOI 36-5 area is consistent with the known LNAPL type, fuel oil. Only one of the borings (LIF-36-46) completed exhibited an LIF

impact greater than 5%. The vertical range of impact at this location is 11.5 to 16 feet bgs. **Figure N1-2** presents the results of the LIF investigation.

- *Transmissivity:* Transmissivity testing has not been completed at the AOI 36-5 LNAPL Area because there is insufficient accumulation of LNAPL in monitoring wells or the well did not meet the study criteria (as discussed in the main report).
- Natural Source Zone Depletion (NSZD): NSZD testing was not attempted at the AOI 36-5 LNAPL Area due to the presence of a concrete slab. The testing completed at the Southend of the Site at areas with similar oil types and in similar soils indicated that NSZD is occurring; however, the currently available testing technologies cannot reliably quantify the depletion beneath a concrete slab.

3.4 Extent of LNAPL

During the RCES preparation, the AOI 36-5 LNAPL Area was calculated based on available Site data. The footprint of the area containing approximately 0.5 ft. or greater of LNAPL was estimated to be approximately 9,300 square feet. The LIF logs indicated the depth of impacts to be 11 to 16 feet bgs at the AOI 36-5 area. Although during the most recent LNAPL gauging event LNAPL was not observed at 20-503, additional monitoring is necessary prior to revising the extent of the area (as discussed in Section 2.1.3 of the main report).

LNAPL Remedial Decision Tree

Attachment 2 LNAPL Remedial Decision Tree Priority #17 – AOI 36-5 Fuel Oil Area

NOTES

(#) NOTES: See Page N2-2

Please see Appendix W for the LNAPL Remedial Decision Tree Template that lists additional sources of pertinent information used in the evaluation of the decision points (i.e. tables).

Attachment 2 Notes

Priority #17 - AOI 36-5 Fuel Oil LNAPL Area

Background: The AOI 36-5 Fuel Oil LNAPL Area (AOI 36-5 LNAPL Area) is located in the Northend of the Site at former Tank Farm 37, located just south of Stewart Street. Former Tank Farm 37 consisted of 17 underground storage tanks (USTs) containing various thinners, gasoline and oils. Integrity testing conducted in 1989 identified two leaking tanks that were then removed from service. In August 1990, the remaining tanks were removed. A release (C-0282-90) was reported from former Tank Farm 37 and is the source of AOI 36-5 LNAPL Area. There are currently no buildings within the AOI 36-5 LNAPL Area footprint.

Geology and Hydrogeology: The soils at the AOI 36-5 LNAPL Area consist primarily of fill sand and silty sand down to approximately 13 feet below ground surface (bgs). Depth to groundwater in this area is generally 8 to 10 feet bgs. Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the east and southeast.

LNAPL Characteristics: The LIF logs indicated the depth of impacts to be 11 to 16 feet bgs at the AOI 36-5 LNAPL Area. Based on the most recent gauging data, LNAPL is currently detected at monitoring well 20-502 and recovery well 37-RW-North. The greatest thickness of LNAPL measured at AOI 36-5 was 3.77 feet gauged at 20-502 in 2013. No LNAPL was observed at 20-503 in 2013. At the AOI 36-5 LNAPL Area, the LNAPL has a viscosity of 5.5 centipoise (cp), interfacial tension of 18 dynes/centimeter (cm), and a specific gravity of 0.89. Trichloroethene was detected at a concentration that exceeds the RCRA toxicity characteristic criteria at one location (20-503); however, TCLP analysis has not been conducted.

1) *Are unacceptable dissolved phase, vapor phase, or direct contact exposures associated with the LNAPL under any use scenarios?*

   YES – The following potential risk/exposure concerns are associated with the AOI 36-5 Fuel Oil LNAPL Area:
   - Potential Volatilization to Indoor Air Concerns for Future Structures: Theoretically, there is a potential unacceptable vapor phase exposure risk associated with methane for future redevelopment scenarios; however, this will be addressed by the proposed institutional controls.

2) *Do feasible options exist to mitigate unacceptable risk through compositional change?*

   YES – The following is a general discussion regarding the feasibility of various compositional change remediation strategies for the AOI 36-5 LNAPL Area:
   - Based on the results of bench-scale testing completed at the AOI 40-A, -B, and 16-C Fuel Oil LNAPL Areas, which have a similar LNAPL type and geology, enhanced dissolution and recovery via surfactant or hot water flushing may enhance LNAPL recovery.
   - AOI 36-5 LNAPL Area constituents have low volatility, rendering remedial technologies that rely on vapor-phase partitioning infeasible on a technical basis.
   - In situ thermal remediation may be technically feasible for the area.
   - Targeted in-situ soil mixing/land farming using biological additives to address the petroleum constituents may be technically feasible.

3) *Can institutional/engineering controls provide effective risk mitigation?*

   YES – Based on the understanding of site conditions the potential volatilization to indoor air risk can be effectively mitigated through institutional controls.

4) *Is there a potential benefit to partial treatment/removal that outweighs costs?*

   NO – Following removal of the source for this LNAPL Area (Tank Farm 37) an LNAPL recovery system consisting of two recovery trenches and sumps was installed and operated for approximately 20 years; therefore, partial and effective LNAPL removal has already been completed. The potential volatilization risk can be addressed by institutional controls. A transition to institutional controls is now appropriate at the AOI 36-5 LNAPL Area.

5) *Is LNAPL migrating or potentially migrating (i.e. mobile along the perimeter)?*

   NO – The LNAPL area appears to be stable. This finding is supported by the following lines of evidence:
   - Well Gauging Data: Sentinel wells located downgradient of the AOI 36-5 LNAPL Area have remained free of LNAPL since monitoring began approximately 10 years ago.
   - Age of LNAPL Release: The source of the AOI 36-5 LNAPL Area is a former tank farm, which was removed in 1990 (no active LNAPL sources for at least 20 years). LNAPL bodies typically stabilize within 2 to 5 years after a release has been stopped (ITRC, 2012).

6) *Is LNAPL mobile within the stable LNAPL perimeter?*

   YES – LNAPL is present in one monitoring well and one recovery well/sump in the AOI 36-5 LNAPL Area indicating that LNAPL is mobile within the stable perimeter. In addition, historically LNAPL from AOI 36-5 was infiltrating the

Outfall 002 storm sewer; however, bulkheads and plugs have been installed to eliminate the Site's contribution to the storm sewer.

7) Is LNAPL readily recoverable?

YES – The results of historic interim measures (IM) indicate that in the past LNAPL has been recovered using recovery trenches and wells, and by bailing (summarized below). However it is uncertain whether future LNAPL recovery is practical.

- As part of initial abatement measures in February 1990, groundwater and free-product recovery trenches were installed along the east and south sides of the UST excavation area. These trenches are 3 feet wide and filled with gravel from approximately 2 feet bgs to approximately 14 feet bgs and are sloped toward a 26-inch-diameter recovery well/sump located along the south side of the excavation area. This recovery well/sump is installed to a depth of 17 feet bgs with screen placement at 6 to 13 feet bgs. In addition, a second sump was installed south of the newly constructed tank farm and is approximately a 26-inch-diameter sump constructed to 14 feet bgs. Collected fluids were routed to the Site's industrial wastewater treatment facility. This system is no longer active as the wastewater treatment facility was decommissioned in 2011. It is unknown how much LNAPL was recovered.
- From 2001 to 2005, three monitoring wells (20-502, 20-503, and RFI-36-13) located at AOI 36-5 were monitored as part of a Site-wide Quarterly LNAPL Monitoring Program. During the program, a total of 17.5 gallons of LNAPL was removed primarily from monitoring wells 20-502 and 20-503.

8) Will potential benefit of LNAPL recovery outweigh costs?

NO – Compositional and mobility concerns can be addressed through engineering and institutional controls. Additionally, The LNAPL source area (Tank Farm 37) has been removed and an LNAPL recovery system has operated at the AOI 36-5 LNAPL Area for approximately 20 years. Therefore, partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate. The marginal value of additional recovery does not justify the cost.

9) Are controls required?

YES – The following AOI-specific institutional controls are proposed, in addition to the Site-wide institutional controls, for the AOI 36-5 LNAPL Area to limit future exposure.

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads as shown on **Figure 5 of the main report**.

Attachment 3

Remedy Recommendations

Priority #17 – AOI 36-5 Fuel Oil LNAPL Area Evaluation and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

Attachment 3 – Recommended Remedy

This attachment presents the recommended remedies for the AOI 36-5 Fuel Oil light non-aqueous phase liquid (LNAPL) Area (AOI 36-5 LNAPL Area).

1. Compositional and Saturation Concerns

The LNAPL Decision Tree Analysis presented in **Attachment 2** identified potential volatilization to indoor air for future structures as a compositional concern and mobility as a saturation concern for the AOI 36-5 LNAPL Area. The potential volatilization to indoor air concern is due to the potential biodegradation of LNAPL generating methane that could potentially result in indoor air concerns for future structures. Historically, there was a mobility concern was due to the infiltration of LNAPL to the Outfall 002 storm sewer. However, Outfall 002 was bulkheaded at the RACER property boundary in 2013 as an interim measure (IM) and infiltration is no longer a concern.

2. Remedy Recommendation Rationale

The remedies recommended to address the compositional and saturation concerns associated with the AOI 36-5 LNAPL Area are institutional controls, which are discussed in detail in Section 3. The rationale for this selection is detailed below:

- The Outfall 002 storm sewer was bulkheaded in this portion of the Site to eliminate LNAPL infiltration.
- A lateral for the Outfall 003 storm sewer was located down gradient of the AOI 36-5 LNAPL Area; however, this lateral was bulkheaded as part of the remedy for the AOI 10-1/10-4 LNAPL Area. Therefore, the groundwater/surface water (GSI) pathway is not applicable at AOI 36-5.
- The original extent of the AOI 36-5 LNAPL Area included three monitoring wells (20-502, 20-503, and RFI-36-13) and two recovery wells (37-RW-North and 37-RW-South). However, in recent years LNAPL has not been observed at RFI-36-13 and during the most recent gauging events LNAPL was only detected in monitoring well 20-502 and recovery well 37-RW-North.

- Although remedy options such as surfactant enhanced recovery, in-situ thermal, or soil mixing may be feasible at the AOI 36-5 LNAPL Area, an LNAPL recovery system has already operated at this area for approximately 20 years. Partial and effective LNAPL removal has already been completed and a transition to institutional controls is now appropriate. Additional LNAPL removal will not materially change the risks associated with this area so there is no cost benefit to pursuing additional LNAPL removal.
- Based on the current understanding of risk conditions, the potential volatilization to indoor air risk for future structures can be effectively mitigated through the Site-wide institutional controls.

3. AOI 36-5 Remedies

3.1. Completed Interim Measures

3.1.1 Source Excavation and Recovery System Operation

In 1989, following the identification of a release from Tank Farm 37, the two leaking tanks were taken out of service. As part of initial abatement measures in February 1990, groundwater and free-product recovery trenches were installed along the east and south sides of the excavation area. In August 1990, a new AST farm was constructed immediately south of this area and the 15 remaining tanks were removed from service. In 1991, all 17 USTs associated with the tank farm were excavated along with approximately 3,300 cubic yards of impacted soils.

The recovery system is no longer active as the wastewater treatment facility was decommissioned in 2011. It is unknown how much LNAPL was recovered over the duration of the systems operation. In addition, LNAPL was removed as part of the LNAPL monitoring and bailing program from 2001 to 2005. The partial and effective removal of product has been completed in this area and is considered a component of the remedy.

3.1.2 Outfall 002 Storm Sewer Bulkhead

As part of a recently completed interim measure (IM), bulkheads were installed at the Outfall 002 storm sewer to eliminate the LNAPL infiltration from AOI 36-5, as well as AOI 36-1/36-2. Additional bulkheading was completed in the adjacent drainage area for Outfall 003 to address LNAPL infiltration from other sources, and also serves to eliminate the GSI pathway in the AOI 36-5 LNAPL Area. Bulkheading activities were completed in this portion of the Site in Spring 2013.

3.2. Additional Remedy Recommendations

The additional remedy recommended to address the compositional and saturation concerns associated with the AOI 36-5 LNAPL Area is institutional controls. This remedy will reduce exposure risks associated with the vapor phase and be protective of future workers in the long term. In addition, the 002 passive recovery trenches will continue to be monitored for LNAPL accumulation.

3.2.1 002 Passive Recovery Trench Monitoring

The installation of the Outfall 002 bulkheads created two closed sections of pipe, referred to as the 002 passive recovery trenches. These trenches are monitored for LNAPL accumulation and oil absorbent booms are used to remove LNAPL, as necessary.

3.2.2 Institutional Controls

The following AOI-specific institutional controls, in addition to the Site-wide controls noted in the Report, will be necessary to limit potential for future exposure:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 5 of the main report**.

Subject:
AOI 38-1 Investigation Summary and Remedy Recommendation
Buick City Site - Flint, MI

---

1. Overview

This summary and remedy recommendation memo has been prepared on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) by ARCADIS. This memo summarizes investigation activities completed and recommends remedies for area of interest (AOI) 38-1, which is located at the former Building 38 area in the Northend of the Buick City Site (the Site) located in Flint, Michigan (**Figure O-1**).

2. Soil and Groundwater Data Summary

In 2012 and 2013 sampling events were completed at AOI 38-1 (also known as the 'Northern Parcel') to characterize current Site conditions in preparation of a potential sale. Sampling locations were biased towards areas of historic operations including the locations of three former underground storage tanks (USTs) that were removed in 1988. Documentation of UST investigation and removal activities are presented in the *Current Conditions Report – North of Leith Street*, which is included in **Appendix Y**.

The 2012/2013 investigation results are summarized in the *Northern Parcel Sampling Results Memo* dated December 4, 2013, which is attached. The investigation results and recommended remedies are briefly summarized below. **Figure O-2** shows the monitoring well and soil boring locations at AOI 38-1.

2.1 Groundwater Data

The results of the 2012 groundwater sampling identified two monitoring wells that exceeded non-residential drinking water (NDW) criteria and/or groundwater surface water interface (GSI) criteria for trichloroethene, arsenic, and/or manganese.

2.2 Soil Data

The results of the 2012 – 2013 soil sampling indicated the following:

- Exceedances of groundwater/surface water interface protection criteria (GSIP), non-residential drinking water protection criteria (NDWP), and/or non-residential particulate soil inhalation criteria (NPSIC) for select metals in four shallow soil samples, including the three background sampling locations (RFI-38-12, RFI-BG-08-2, RFI-BG-09-2, and RFI-BG-10/RFI-BG-10-2). The manganese exceedances of NPSIC criteria detected at RFI-38-12 and RFI-BG-10/RFI-BG-10-2 were delineated.
- The former hydraulic lift investigation results detected select volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) above GSIP, groundwater contact protection criteria (GCCP), and/or non-residential direct contact criteria (NDC) at two soil boring locations (SB-38-04 and SB-38-06).

3. Remedy Recommendation Rationale

The remedies recommended to address the groundwater and soil exceedances associated with the AOI 38-1 soils are excavation, engineering controls, and institutional controls, which are discussed in more detail in Section 4. The rationales for the remedy selection are detailed below:

- A groundwater restrictive zone is being proposed for the Site as well as the downgradient properties between the Site and the Flint River. In addition, a groundwater use restriction is planned for Site-wide institutional controls. Therefore, the drinking water pathway is not applicable.

- The only GSI pathway in this portion of the Site is the storm sewers, which discharge to the Flint River. Water concentrations in the monthly samples collected from the Site storm sewer in this area have not exceeded GSI criteria for arsenic, VOCs, or SVOCs since the sampling program began in Fall of 2010.
- The soil sample that exceeded GCCP criteria was collected from 7 to 9 feet below ground surface (bgs), which is 8 to 10 feet above the groundwater table. In addition, none of the groundwater samples (historic or recent) have detected an analyte above groundwater contact criteria.
- The shallow soil exceedances of NPSIC in the area around RFI-BG-10 are located beneath an asphalt surface cover and not located near any proposed construction. Therefore, an engineering control requiring maintaining the surface cover is necessary.
- The soil exceedances of NPSIC in the area around RFI-38-12 are located beneath an asphalt and/or concrete surface cover, but located within and are where construction activities are proposed. Therefore, the recommended remedy is targeted excavation to remove the NPSIC impacts.
- The soil exceedances of NDC criteria around the former hydraulic lifts are at depth. Therefore, institutional controls requiring evaluation prior to excavation are appropriate.

4. Remedy Recommendation

The remedies recommended to address the exceedances at AOI 38-1 are engineering controls, excavation, and institutional controls. These remedies will prevent worker exposure to soil impacts.

4.1 Surface Cover

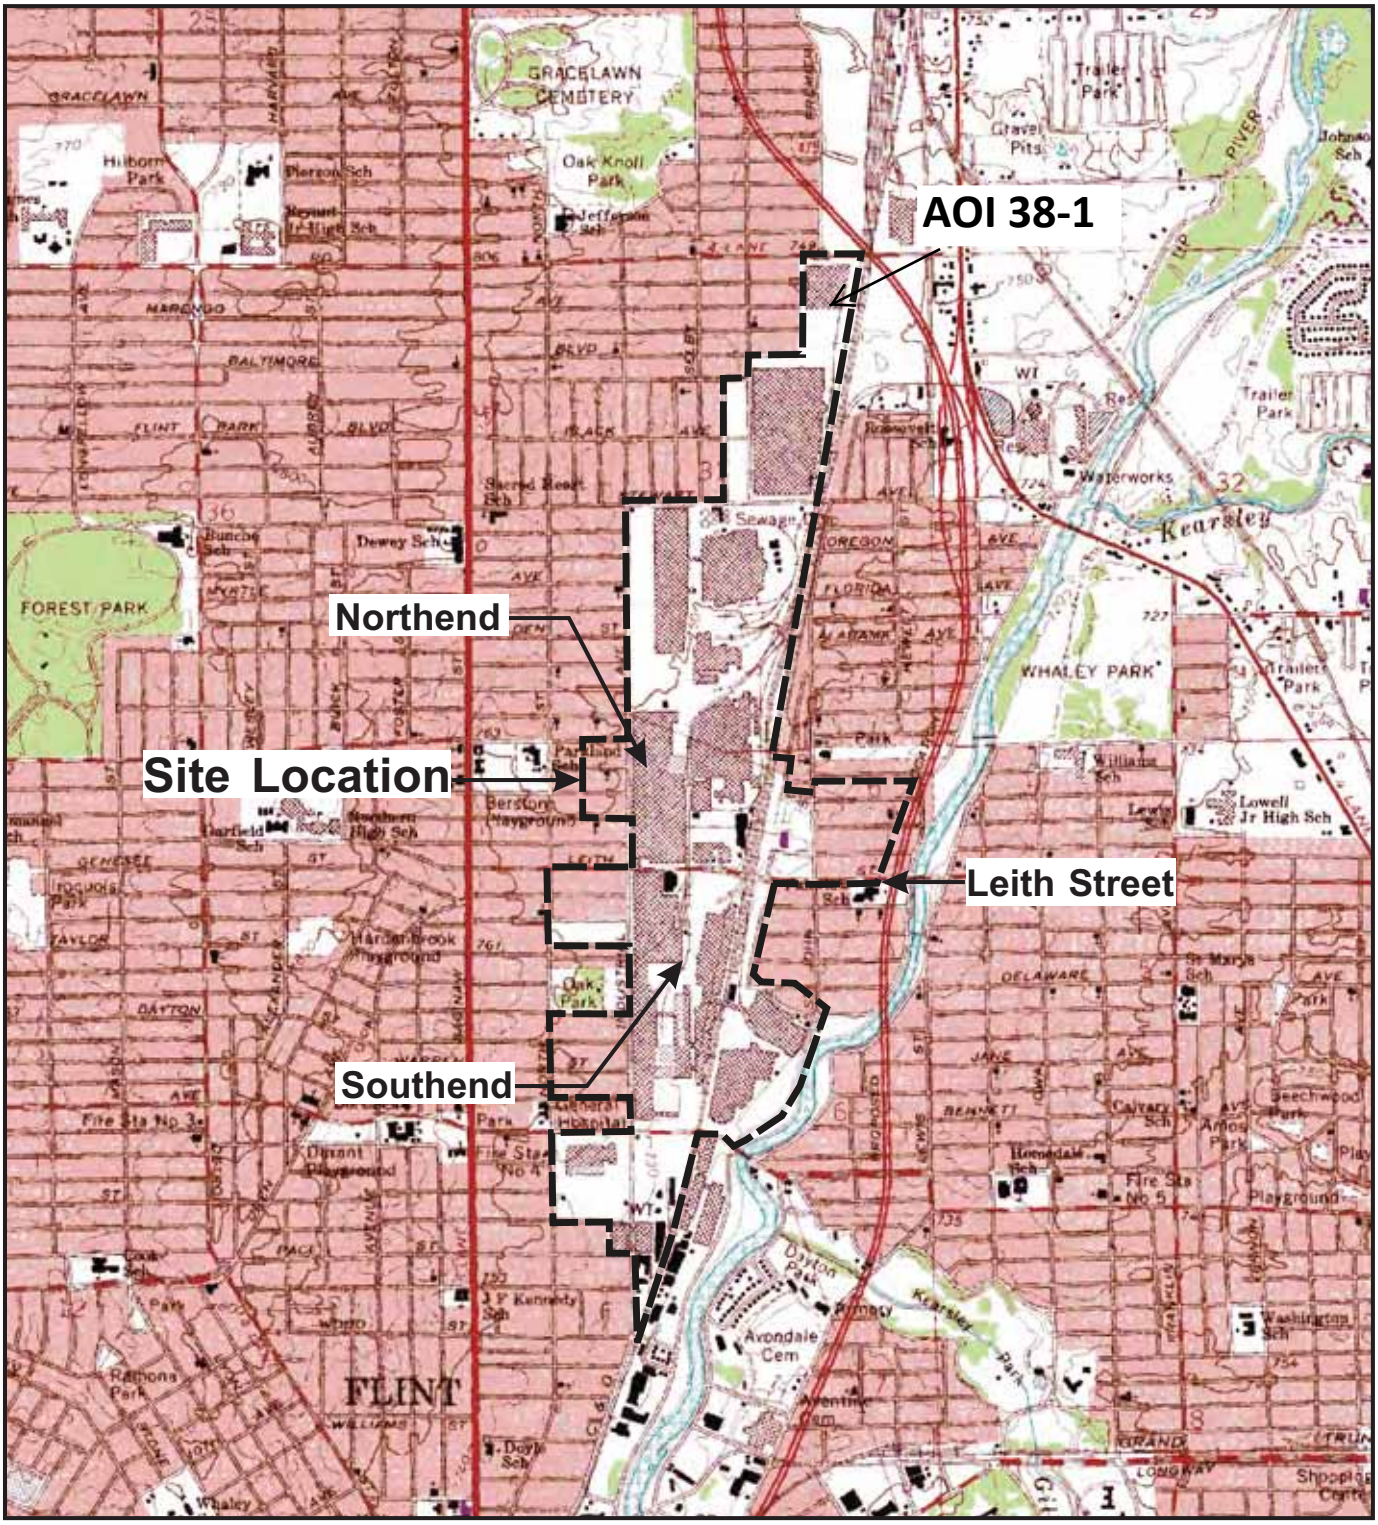
The remedy to address shallow soil impacts at RFI-BG-10 will be to maintain the surface cover over the impacted area. The surface cover will be inspected and maintained to provide protection from future exposure. The area requiring cover is presented on **Figure O-2**.

The remedy to address the NDC impacts at SB-38-06 will be to maintain the surface cover over the former Factory 38 slab, as shown on **Figure O-2.** The surface cover will be inspected and maintained to provide protection from future exposure.

4.2 Targeted Excavation

The remedy recommended to address the manganese exceedances of NPSIC in the RFI-38-12 area is a

targeted removal of the impacted soils. This portion of the site is slated for redevelopment and due to the location and shallow nature of the impacts (0 to 2 ft bgs); the likelihood of the soils being exposed during redevelopment activities; and the pathway of concern (inhalation), it is prudent to remove and dispose of the impacted soils. The anticipated excavation limits are presented on **Figure O-2** and soils in this area will be removed to 3 feet below ground surface. Sidewall and floor confirmation samples will be collected and analyzed for manganese to confirm the remaining material is below the NPSIC criteria.



4.3 Institutional Controls

In addition to the Site-wide Institutional Controls discussed in the main report, the following AOI-specific controls will be necessary to limit potential for future exposure:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure noted on **Figure 5 of the main report** including storm sewer bulkheads.

Subject:
Northern Parcel Sampling Results Memo
Buick City Site - Flint, MI

This memorandum was prepared by ARCADIS on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) for the Buick City Site (Site) located in Flint, Michigan to summarize the field activities and laboratory analytical results of the Northern Parcel Sampling Event. The purpose of this sampling event was to provide a snapshot of the current Site conditions at the Northern Parcel, as much of the Site data is 8 to 10 years old. The initial sampling event was completed in October 2012 and delineation sampling was completed March through June 2013 to define the extents of manganese impacts identified at two sampling locations. An additional sampling event was completed in September 2013 to investigate two former hydraulic lifts located at the north end of the former Building 38 slab. This memo also provides a summary of the historic use of the Northern Parcel and the data collected during the RFI and previous investigations.

The approximate location of the Northern parcel is identified on the Site Location Map presented as **Figure 1**.

History of Northern Parcel

The Northern Parcel historically included a single story structure (Building 38) and a parking lot. Building 38 was constructed in 1964 and was slightly over 200,000 square feet. The building was primarily used as a manufacturing warehouse for vehicle engines, vehicle washing and waxing, vehicle emissions testing

and light vehicle repair. The area immediately surrounding the exterior of the building was predominantly paved with asphalt and was used for new vehicle parking. A portion of Building 38 was formerly used as a "climate-controlled soak room' for vehicle emission testing. The building was demolished in 2010, with the slab and surrounding asphalt parking lots remaining in place.

During the RFI one area of interest (AOI) 38-1 was identified related to the Building 38 Area. This area involved the northern portion of Building 38, which housed several process waste sumps containing oil and/or oily sediment, several car wash trenches containing oily sediment, and several hydraulic car lifts. Additionally, an 8,000-gallon fuel oil UST was located within AOI 38-1 near the northwest corner of Building 38. Although previous investigation reports identified an 8,000 gallon UST located at AOI 38-1, no supporting documentation of the installation or closure of the tank can be found. It is likely that this tank was not installed

Historic documents also indicated the presence of a 500-gallon fuel oil UST formerly located along the north side of Building 38, and two former gasoline USTs identified South of Building 38; however, the closure documentation indicated that no releases occurred related to these tanks.

2012 Groundwater Sampling

A monitoring well inventory was completed at the Northern Parcel prior to sampling to determine which wells were remaining following demolition activities. Monitoring wells RFI-36-02, RFI-38-04, RFI-38-06, 36-101 and 38-120 were located and found to be in good condition. Monitoring wells RFI-38-05 and 36-121 could not be located. Monitoring well locations are presented on **Figure 2**.

The monitoring wells located in the Northern Parcel have not been sampled in over 5 years; therefore, re-development was completed prior to sample collection. Approximately one week following well development groundwater samples were collected and submitted for laboratory analysis of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs) and metals.

Groundwater Sampling Results

The groundwater analytical data were compared to the Nonresidential Michigan Department of Environmental Quality (MDEQ) Part 201 Generic Cleanup Criteria and Screening Levels including Non-residential Drinking Water criteria (NDW); Groundwater-Surface Water Interface criteria (GSI);

Groundwater Contact criteria (GCC); Non-residential Groundwater Volatilization to Indoor Air criteria (NGVIA); Groundwater Acute Inhalation (GAI); Water Solubility criteria (WS); and Flammability and Explosivity criteria (FE). Groundwater data were not compared to residential criteria as the parcel is zoned for non-residential use.

Table 1A presents the groundwater data collected during the 2012 sampling event. Analytes which were detected at concentrations that exceed criteria are further discussed below. Please note that RFI-36-02 was also sampled during the 2012 annual groundwater sampling event. The results from that sampling event are also included in Table 1A and discussed below.

- The groundwater samples collected from monitoring wells 36-101, 38-120, and RFI-38-04 do not exceed any criteria.
- The groundwater samples collected from RFI-36-02 and RFI-38-06 exceed the aesthetic based NDW for manganese; however, neither sample exceeds health-based NDW criteria for manganese.
- The groundwater sample collected during the annual groundwater sampling event from RFI-36-02 exceeded GSI and NDW for arsenic.
- The groundwater sample collected from RFI-38-06 also exceeded NDW for trichloroethene.

Table 1B presents the historic groundwater data from the Northern Parcel. In addition the 2012 data are also presented on Table 1B for reference. Analytes which were detected in the historic samples at concentrations that exceed criteria are further discussed below.

- The historical groundwater samples collected from monitoring well 36-121 and RFI-38-05 did not exceed any criteria.
- One of the historical groundwater samples collected from monitoring well 36-101 exceeded GSI criteria for mercury; however, the 2012 sample did not exceed criteria.
- The one historic groundwater sample collected from 38-120 exceeded GSI criteria for silver; however, the 2012 sample did not exceed criteria.
- One of the historic groundwater samples collected from monitoring well RFI-36-02 exceed GSI and NDW for arsenic (total and dissolved) and nickel (total); however, the 2012 sample did not exceed criteria for nickel (total).
- One of the historic groundwater samples collected from monitoring well RFI-38-04 exceeded NDW criteria for lead (dissolved); however, the 2012 sample did not exceed criteria for lead (total).

- Select historic groundwater samples collected from monitoring well RFI-38-06 exceed GSI and NDW criteria for beryllium (total) and thallium (dissolved and total) and GSI was exceeded for silver. However, the 2012 sample did not exceed criteria for beryllium (total), thallium (total), or silver (total).

2012-2013 Soil Sampling

In October 2012 the initial sampling event was completed. Soil samples were collected from six locations (RFI-38-07 through RFI-38-12) within the Northern Parcel to evaluate the subsurface for possible impacts from historic Site use. The sampling locations were placed in AOI 38-1 (RFI-38-07 through RFI-38-09); at the locations of the former USTs (RFI-38-10 and RFI-10-11); and at the former storage area (RFI-38-12). The soil samples were planned to be collected from 0 to 2 ft bgs and 5 to 7 ft bgs at each boring location; however, due to shallow subsurface refusal, only borings RFI-38-07 and RFI-38-10 were completed to a depth of 7 ft bgs. At the remaining boring locations a 0 to 2 ft bgs sample was collected and a second deeper sample was collected where possible. Soil samples were submitted for laboratory analysis of VOCs, SVOCs, PCBs, and metals.

In addition, soil samples were collected from the three background sampling locations (RFI-BG-08-2, RFI-BG-09-2, and RFI-BG-10-2) along the western property boundary of the Site. These borings were co-located with historic background sampling locations RFI-BG-08, RFI-BG-09, and RFI-BG-10. Soil samples were collected from 0 to 2 feet bgs at these locations and submitted to the laboratory for analysis of VOCs, SVOCs, PCBs, and metals.

In March – June 2013 additional sampling was completed to delineate two exceedances of Non-residential Particulate Soil Inhalation Criteria (NPSIC) identified during the initial sampling event. Nineteen soil borings (RFI-38-12-1, RFI-38-12-2, RFI-38-12-4 through RFI-38-12-17, and RFI-38-12-19 through RFI-38-12-21) were completed to delineate the exceedance identified at RFI-38-12. At RFI-BG-10 five soil borings (RFI-BG-10-3 through RFI-BG-10-7) were completed to delineate NPSIC exceedance. In addition, a boring was co-located with the RFI-BG-10-2 soil boring to vertically delineate the exceedance.

Soil samples were collected from 0 to 2 ft bgs, 3 to 5 ft bgs, and/or 5 to 7 ft bgs and were submitted for laboratory analysis of manganese. One exception is RFI-38-12-19 which only had one sample collected from 0 to 2 ft bgs due to refusal at 2.2 ft bgs. The soil samples collected from the 3 to 5, and 5 to 7 ft bgs interval were placed on hold pending exceedances of NPSIC criteria detected in the shallower intervals. Please note that soil borings were not completed at proposed locations RFI-38-12-3 and RFI-38-12-18.

In September 2013 during a site walk, surface staining was observed at a former hydraulic lift area at the northern portion of the Building 38 slab. Eight soil borings (SB-38-01 through SB-38-08) were completed to investigate two former hydraulic lifts in the area. One soil sample was collected from soil borings SB-38-01 through SB-38-06, with the sample intervals being biased towards staining and/or elevated PID readings. No samples were collected from boring SB-38-07 and SB-38-08 as there was no evidence of impact at these boring locations. The soil samples were submitted to the laboratory for analysis of VOCs, SVOCs, PCBs, total petroleum hydrocarbons (TPH) - Diesel Range Organics (DRO), and TPH- Oil Range Organics (ORO).

Soil Sampling Results

The soil analytical data were compared to the Nonresidential MDEQ Part 201 Generic Cleanup Criteria and Screening Levels including Non-residential Drinking Water Protection criteria (NDWP); Groundwater-Surface Water Interface Protection criteria (GSIP); Nonresidential Direct Contact (NDC); Groundwater Contact Protection criteria (GCCP); Soil Saturation Concentration screening levels (CSAT); Non-residential Particulate Soil Inhalation Criteria (NPSIC); Non-residential Soil Volatilization to Indoor Air Inhalation criteria (NSVIA); Non-residential Infinite Source Volatile Soil inhalation Criteria (NVSICI); Non-residential Finite Volatile Soil inhalation Criteria for 5 meter Source Thickness (NVSIC5); Nonresidential Finite Source Volatile Soil inhalation Criteria for 2 meter Source Thickness (NVSIC2); and State Default Background Levels (SDBL). Soil data were not compared to residential criteria as the parcel is zoned for non-residential use.

Table 2A presents the soil data collected during the sampling events completed from the October 2012 through June 2013. **Table 2B** presents the soil data collected during the former hydraulic lift investigation event. Analytes which were detected at concentrations that exceed state default background levels and one of the criteria listed above are further discussed below.

October 2012 Sampling Results

- The soil samples collected from borings RFI-38-07, RFI-38-08, RFI-38-09, RFI-38-10, and RFI-38-11 do not exceed criteria.
- The soil sample collected from RFI-38-12 (0.7 to 1.4 ft bgs) exceeds GSIP criteria for cobalt, copper, manganese, silver, and zinc. In addition the sample exceeds NDWP for cobalt and manganese and NPSIC criteria for manganese.

- The soil sample collected from RFI-BG-08-2 (0.6 to 2 ft bgs) exceeds GSIP and NDWP criteria for cobalt and manganese.
- The soil sample collected from RFI-BG-09-2 (0.5 to 1 ft bgs) exceeds GSIP and NDWP criteria for cobalt and manganese.
- The soil sample collected from RFI-BG-10-2 (0.6 to 1 ft bgs) exceeds GSIP and NDWP criteria for cobalt.

March – June 2013 Delineation Sampling Results

- RFI-BG-10/RFI-BG-10-2 Area
  - The delineation samples collected from RFI-BG-10-3 (0 to 2 ft bgs), RFI-BG-10-4 (3 to 5 ft bgs), and RFI-BG-10-6 (0 to 2 ft bgs) do not exceed criteria.
  - The delineation soil samples collected from RFI-BG-10-2 exceeded NPSIC, GSIP and NDWP criteria for manganese in the shallow sample (0 to 2 ft bgs) and GSIP and NDWP criteria in the deeps sample (3 to 5 ft bgs).
  - The delineation soil samples collected from RFI-BG-10-3 (3 to 5 ft bgs), RFI-BG-10-4 (0 to 2 ft bgs), RFI-BG-10-5 (0 to 2 and 3 to 5 ft bgs), and RFI-BG-10-6 (3 to 5 ft bgs) exceeded GSIP and NDWP criteria for manganese.

The manganese exceedances of NPSIC criteria are shown on **Figure 8.**

- RFI-38-12 Area
  - The delineation samples collected from RFI-38-12-1 (3 to 5 ft bgs), RFI-38-12-2 (3 to 5 ft bgs), RFI-38-12-5 (3 to 5 ft bgs), RFI-38-12-6 (0 to 2 and 3 to 5 ft bgs), RFI-38-12-7 (0 to 2 and 3 to 5 ft bgs), RFI-38-12-8 (0 to 2 and 3 to 5 ft bgs), RFI-38-12-9 (3 to 5 ft bgs), RFI-38-12-11 (1 to 2 ft bgs), RFI-38-12-13 (0 to 2 ft bgs) RFI-38-12-19 (0 to 2 ft bgs), and RFI-38-12-21 (0 to 2 ft bgs) do not exceed criteria.
  - The delineation soil samples collected from RFI-38-12-1 (0 to 2 ft bgs), RFI-38-12-2 (0 to 2 ft bgs), RFI-38-12-4 (0 to 2 ft bgs), RFI-38-12-5 (0 to 2 ft bgs), and RFI-38-12-12 (0 to 2) exceeded NPSIC, GSIP and NDWP criteria for manganese.
  - The delineation samples collected from RFI-38-12-4 (3 to 5 ft bgs), RFI-38-12-9 (0 to 2 ft bgs), RFI-38-12-10 (0 to 2 ft bgs), RFI-38-12-14 (0 to 2 ft bgs), RFI-38-12-15 (0 to 2 ft bgs), RFI-38-12-16 (1 to 2 ft bgs), RFI-38-12-17 (1 to 2 ft bgs), and RFI-38-12-20 (0 to 2 ft bgs) exceeded GSIP and NDWP criteria for manganese.

The vertical and horizontal extents of the manganese exceedances of NPSIC criteria at RFI-38-12 have been delineated as shown on **Figure 4**.

September 2013 Former Hydraulic Lift Investigation Sampling Results

- The investigation samples collected from SB-38-01 (1 to 2 ft bgs), SB-38-02 (2 to 3 ft bgs), SB-38-03 (6 to 7 ft bgs), and SB-38-05 (3 to 3.5 ft bgs) do not exceed criteria.
- The investigation soil samples collected from SB-38-04 (2 to 3 ft bgs) and SB-38-06 (7 to 9 ft bgs) exceeded GSIP criteria for fluoranthene and phenanthrene.
- The investigation soil sample collected from SB-38-06 (7 to 9 ft bgs) also exceeded GSIP criteria for 2-methylnaphthalene, acenaphthalene, fluorene, and naphthalene.
- The investigation soil samples collected from SB-38-06 (7 to 9 ft bgs) also exceeded NDC criteria for benzo(a)anthracene, benzo(a)pyrene, benzo(a)fluoranthene, and dibenzo(a,h)anthracene.
- The investigation soil samples collected from SB-38-06 (7 to 9 ft bgs) also exceeded GCCP criteria for anthracene.
- It should be noted that while the soil sample collected from SB-38-06 (7 to 9 ft bgs) also exceeded the Vapor Intrusion Soil Screening Level criteria in the MDEQ Guidance Document for the Vapor Intrusion Pathway (May 2013), the criteria in the Guidance document are not applicable for the following reasons:
    - The guidance document in its entirety is located at: http://www.michigan.gov/documents/deq/deq-rrd-VIGuidanceDoc-May2013_422550_7.pdf The specific section that address the applicability of the document is located in Appendix C – Checklists for Evaluating Compliance with Part 201, specifically C.1 Checklist for Determining if Generic Volatilization to Indoor Air Inhalation Criteria Apply. Per the soil discussion at the bottom of page 1 and the following criteria, the MDEQ Part 201 Non-residential soil volatilization to indoor air inhalation criteria applies to the Site data.
        - Sample location SB-38-06 is located beneath the former Building 38 slab, which is constructed of poured concrete.
        - There are no active sumps present in this area.
    - As the soil data does not exceed part 201 criteria Non-residential Soil Volatilization to Indoor Air Inhalation Criteria, Vapor intrusion is not a concern.
    - Concrete cracking becoming a pathway is a valid concern. Appendix B – Supplemental Guidance Information, specifically B.1 - Alternate Approach for Demonstrating

Compliance with the Volatilization to Indoor Air Pathway (Big Building Model); Section 1.0 on page 4 addresses the floor thickness assumed under Part 201 and how cracks are accounted in the selection criteria.

In addition the soil sample collected from SB-38-06 (7 to 9 ft bgs) does not exceed NSVIA criteria.

The soil boring locations are as shown on **Figure 6**.

Historic Sampling Results

Table 2C presents the historic soil data collected from the Northern Parcel. In addition the 2012-2013 data are also included on Table 2C for reference. Analytes which were detected in the historic samples at concentrations that exceed criteria are further discussed below.

- The soil samples collected from RFI-36-02, RFI-38-02, RFI-38-03, RFI-38-04, and RFI-38-06 do not exceed criteria.
- The shallow soil sample collected from RFI-38-01 (0.5 to 2.5 ft bgs) exceeds GSIP and NDWP criteria for arsenic and manganese. The samples collected from RFI-38-01 at depth (8.5 to 10.5 ft bgs and 18.5 to 20.5 ft bgs) did not exceed criteria.
- The shallow soil sample collected from RFI-38-05 (0.6 to 2.6 ft bgs) exceeds GSIP and NDWP criteria for manganese. The samples collected from RFI-38-05 at depth (8.6 to 10.6 ft bgs and 14.6 to 16.6 ft bgs) did not exceed criteria.
- The soil sample collected from RFI-BG-08 (0 to 2 ft bgs) exceeds GSIP and NDWP criteria for arsenic and manganese.
- The soil sample collected from RFI-BG-09 (0 to 2 ft bgs) exceeds GSIP and NDWP criteria for arsenic.
- The soil sample collected from RFI-BG-10 (0 to 2 ft bgs) exceeds GSIP, NDWP and NPSIC criteria for manganese and GSIP criteria for zinc.

Conclusions and Remedy Recommendations

Conclusion

The historic groundwater data detected various metals at concentrations exceeding NDW and/or GSI criteria at several wells. The results of the 2012 groundwater sampling identified two monitoring wells (RFI-36-02 and RFI-38-06) which exceeded NDW criteria for arsenic, manganese, and/or

trichloroethene and RFI 36-02 also exceeded GSI criteria for arsenic. The GSI pathway is only applicable through the Site storm sewers which discharge to the Flint River. The samples collected from the Site storm sewer in this area as part of a monthly sampling event have not exceeded GSI criteria for arsenic since the sampling program began in Fall of 2010.

The historic soil data detected select metals at concentrations exceeding GSIP, NDWP and /or NPSIC criteria at five soil boring locations, including the three background sampling locations. The results of the 2012 -2013 soil sampling indicate the following:

- Exceedances of GSIP, NDWP, and/or NPSIC criteria for select metals in four shallow soil samples, including the three background sampling locations (RFI-38-12, RFI-BG-08-2, RFI-BG-09-2, and RFI-BG-10/RFI-BG-10-2). The manganese exceedances of NPSIC criteria detected at RFI-38-12 and RFI-BG-10/RFI-BG-10-2 were delineated during subsequent sampling events
- The former hydraulic lift investigation results detected select VOCs and SVOCs above GSIP, GCCP, and/or NDC criteria at two soil boring locations (SB-38-04 and SB-38-06).

GSIP and GCCP criteria are not applicable pathways. As discussed above, GSI criteria have not been exceed in samples collected from the Site storm sewer which is the only GSI pathway in this part of the Site. The sample that exceeds GCCP criteria was collected from 7 to 9 feet bgs, which is 8 to 10 feet above the groundwater table. In addition, none of the groundwater samples (historic or recent) have detected an analyte above GCC criteria.

The samples that exceed NDC and/or NPSIC criteria were collected from soils located beneath concrete or asphalt; therefore, the direct contact and soil particulate inhalation pathways are not currently applicable pathways.

In addition, the historic soil and groundwater data collected from the Northern Parcel were evaluated in the Human Health Risk Assessments (HHRAs) completed as part of RCRA Facility Investigation (RFI) Phase II activities. The HHRAs determined that the Northern Parcel did not pose a potential threat to human health and the environment and that no further action was required. The HHRA, dated 2006, was completed with the data available at the time. The additional northern parcel sampling conducted since then was not considered in that HHRA. The remedy recommendations in this Memo will address these potential human health exposures brought to light from recent sampling.

Remedy Recommendations

1) The remedy recommended to address the drinking water pathway is a groundwater use restriction. The restriction planned for the Northern Parcel will prohibit the use of groundwater for any purpose beyond sampling and other related investigatory testing. An example of the language to be included in the *Prohibited Activities to Eliminate Unacceptable Exposure to hazardous Substances* section of the Restrictive Covenant is as follows:

The Owner shall prohibit activities on the Property that may result in exposures to hazardous substances at the Property. These prohibited activities include: The construction and use of wells or other devices on the Property, as described in Exhibit 1, to extract groundwater for consumption, irrigation, or any other purpose, except as provided below:

(a) Wells and other devices constructed as part of a corrective action activity for the purpose of evaluating groundwater quality or to remediate subsurface contamination associated with a release of hazardous substances into the environment are permitted provided the construction of the wells or devices complies with all applicable local, state, and federal laws and regulations and does not cause or result in a new release, exacerbation of existing contamination, or any other violation of local, state, or federal laws or regulations.

(b) Short-term dewatering for construction purposes is permitted provided the dewatering, including management and disposal of the groundwater, is conducted in accordance with all applicable local, state, and federal laws and regulations and does not cause or result in a new release, exacerbation of existing contamination, or any other violation of local, state, and federal environmental laws and regulations.

2) The potential remedy recommendation options to address the NDC exceedance at SB-38-06 are as follows:

Option 1 – Deed Restriction

Implementation of a deed restriction for a substantial portion of the Northern Parcel that will require the evaluation of Site data prior to conducting excavation activities and implementation of a health and safety plan to be protective of workers. An example of the language to be included in the Prohibited Activities to Eliminate Unacceptable Exposure *to hazardous Substances* section of the Restrictive Covenant is as follows:

The Owner shall consider that any excavation or other intrusive activity within the area of the Property identified in the area SB-38-06 and illustrated and described in Exhibit 2, may require such work to be performed in compliance with 40 CFR 1910.120, and shall prohibit any excavation or other intrusive activity within these areas that could result in the exposure to workers not wearing required personal protective equipment (PPE).

Option 2 – Reduce deed restricted area

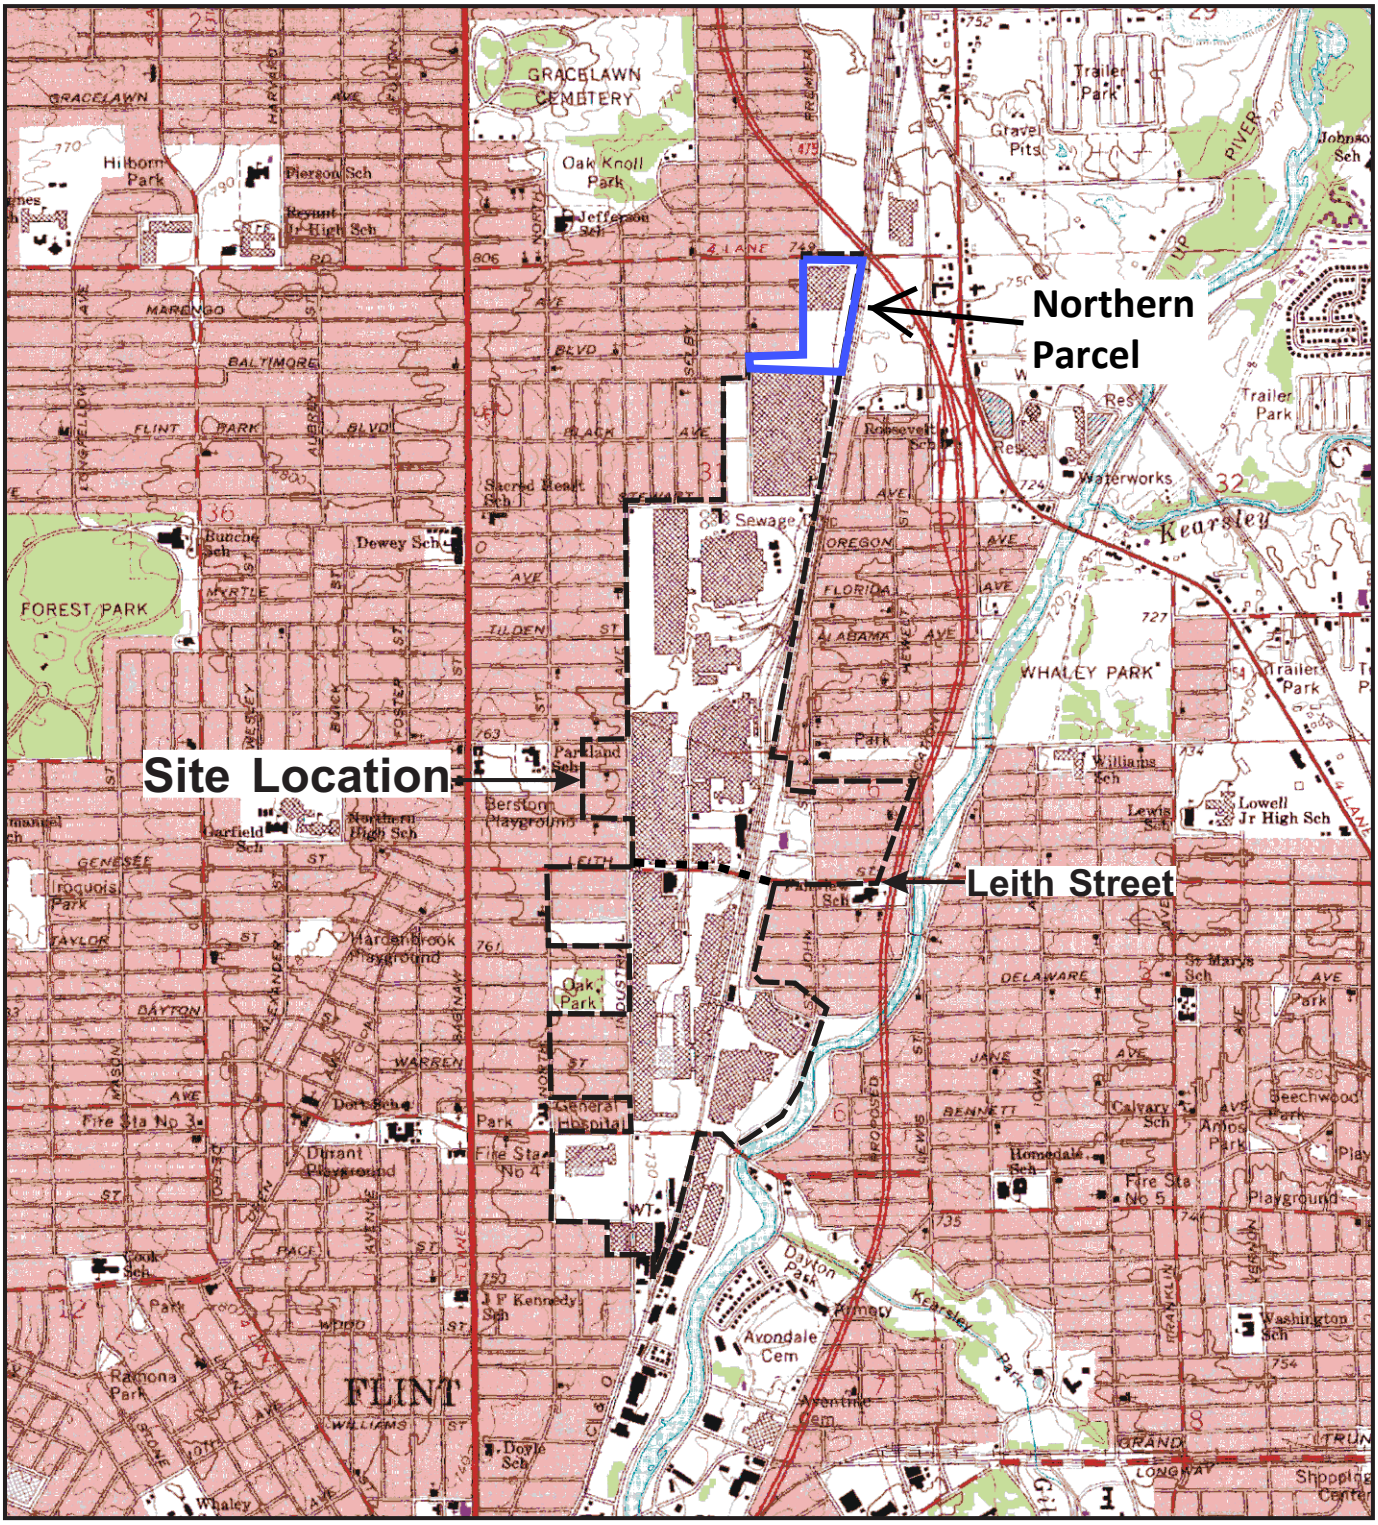
This option would include completing additional soil borings to refine the extent of the NDC impact vertically and horizontally. This option would minimize the area requiring restriction or excavation.

Option 3 – Limited removal of Impact Soils

This option would include that RACER be responsible for incremental costs associated from the transportation and disposal of impacted soils generated during structure foundation installation. All other costs, including but not limited to excavation and removal of soils, would be borne by the potential purchaser

3) The remedies recommended to address the NPSIC exceedance at RFI-BG-10 is an excavation restriction (as described above) and a soil exposure barrier restriction. The soil barrier restriction planned for the Northern Parcel will require that in the event that existing cover (concrete or pavement) are removed at the Property, as defined in Exhibit 1, the barrier must either be replaced or soil above non-residential cleanup standards must be excavated and disposed of. An example of the language to be included in the *Prohibited Activities to Eliminate Unacceptable Exposure to hazardous Substances* section of the Restrictive Covenant is as follows:

In addition, the Owner shall maintain the surface cover of all areas of the Property identified as Area RFI-BG-10 as illustrated and described in Exhibit 2, such that it remains consistent with current cover materials. Any excavation or other intrusive activity that could affect the integrity of the concrete, asphalt or soil is prohibited, except during short-term construction or repair projects or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the concrete, asphalt, or soil that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within 45 days of completion of the work. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the NREPA and 40 C.F.R §761.61(a)(8)(B)(ii).



4) The remedy recommended to address the manganese exceedances of NPSIC in the RFI-38-12 area is a targeted removal of the impacted soils. This portion of the site is slated for redevelopment and due to the location and shallow nature of the impacts (0 to 2 ft bgs); the likelihood of the soils being exposed during redevelopment activities; and the pathway of concern

(inhalation), it is prudent to remove and dispose of the impacted soils. The anticipated excavation limits are present in **Figure 4** and soils in this area will be removed to 3 feet below ground surface. Sidewall and floor confirmation samples will be collected and analyzed for manganese to confirm the remaining material is below the cleanup criteria.

5) In addition the Site use will be restricted to Non-residential.

Note:
During the 2012 sampling event two of the groundwater samples were accidentally mis-named in the field. The sample collected from monitoring well 36-101 was mis-named 38-101 and sample RFI-36-02 was mis-named RFI-38-02. The well names have been corrected on this table.

Note:
During the 2012 sampling event two of the groundwater samples were accidentally mis-named in the field. The sample collected from monitoring well 36-101 was mis-named 38-101 and sample RFI-36-02 was mis-named RFI-38-02. The well names have been corrected on this table.

Note:
During the 2012 sampling event two of the groundwater samples were accidentally mis-named in the field. The sample collected from monitoring well 36-101 was mis-named 38-101 and sample RFI-36-02 was mis-named RFI-38-02. The well names have been corrected on this table.

Note:
During the 2012 sampling event two of the groundwater samples were accidentally mis-named in the field. The sample collected from monitoring well 36-101 was mis-named 38-101 and sample RFI-36-02 was mis-named RFI-38-02. The well names have been corrected on this table.

AOI 40-A Soil Investigation Summary and Remedy Recommendation
Buick City Site - Flint, MI

---

1. Overview

This summary and remedy recommendation memo has been prepared on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) by ARCADIS. This memo summarizes investigation activities completed and recommends remedies for the soil impacts at area of interest (AOI) 40-A that is located north/northeast of former Building 40 in the Southend of the Buick City Site (the Site) located in Flint, Michigan (**Figure P-1**).

Light non-aqueous phase liquid (LNAPL) impacts associated with AOI 40-A,-B & 16-C are discussed separately in **Appendix J**. This memos focuses on the surface soil impacts located east of former Building 40, which are not associated with the LNAPL.

2. Soil Data Summary

Select soil samples collected from borings at AOI 40-A exceed groundwater surface water interface protection criteria (GSIP) for ethylbenzene (1.6/0.36 mg/kg), carbazole (10.7/1.1 mg/kg), dibenzofuran (4.93/1.7 mg/kg), fluoranthene (17.9-105/5.5 mg/kg), fluorene (7.1/5.3 mg/kg), naphthalene (0.794-3.54/0.73 mg/kg), phenanthrene (10.298-77.1/2.1 mg/kg), arsenic (5.9-9.3/4.6 mg/kg), cobalt (11/2 mg/kg),

cyanide (0.5-2.6/0.1 mg/kg), mercury (0.143/0.05 mg/kg), selenium (0.43-0.54/0.4 mg/kg) , and zinc (760/280 mg/kg); and non-residential direct contact criteria (NDC) for benzo(a)pyrene (8.7-35.8/8 mg/kg). Additionally, polychlorinated biphenyls (PCBs) have been detected at concentrations exceeding 1 part per million (ppm) at one location, RFI-40-12, at a depth of 0 to 2 ft below ground surface (bgs).

In 2013 soil sampling activities were completed to delineate the benzo(a)pyrene exceedance of NDC in the surface soil sample collected from RFI-40-12. Samples were collected on Site and on CSX property located to the east. The sample results indicated that the NDC impacts are located on Site.

Soil analytical results from samples collected during the RFI are discussed in more detail in the RFI Phase I and RFI Phase II reports that can be found in **Appendix Y**. However, pertinent AOI 40-A investigation data is in **Appendix X**. The soil boring and monitoring well locations are presented on **Figure P-2**.

3. Remedy Recommendation Rationale

The remedies recommended to address the soil exceedances at AOI 40-A are engineering and institutional controls. The rationale for this selection is detailed below:

- The planned remedy for the AOI 40-A, -B, & 16-C LNAPL areas includes bulkheading storm sewers leading to Outfalls 009 and 010. Therefore, the soil exceedances of GSIP do not require further controls.
- The potential direct groundwater discharge pathway from AOI 40-A, -B, &16-C to the Flint River will be addressed in **Appendix BB**.
- The soil exceedances of NDC criteria are not located beneath a concrete slab. The depth of NDC impacts are from the surface to 2 feet below ground surface and do not extend off-site.

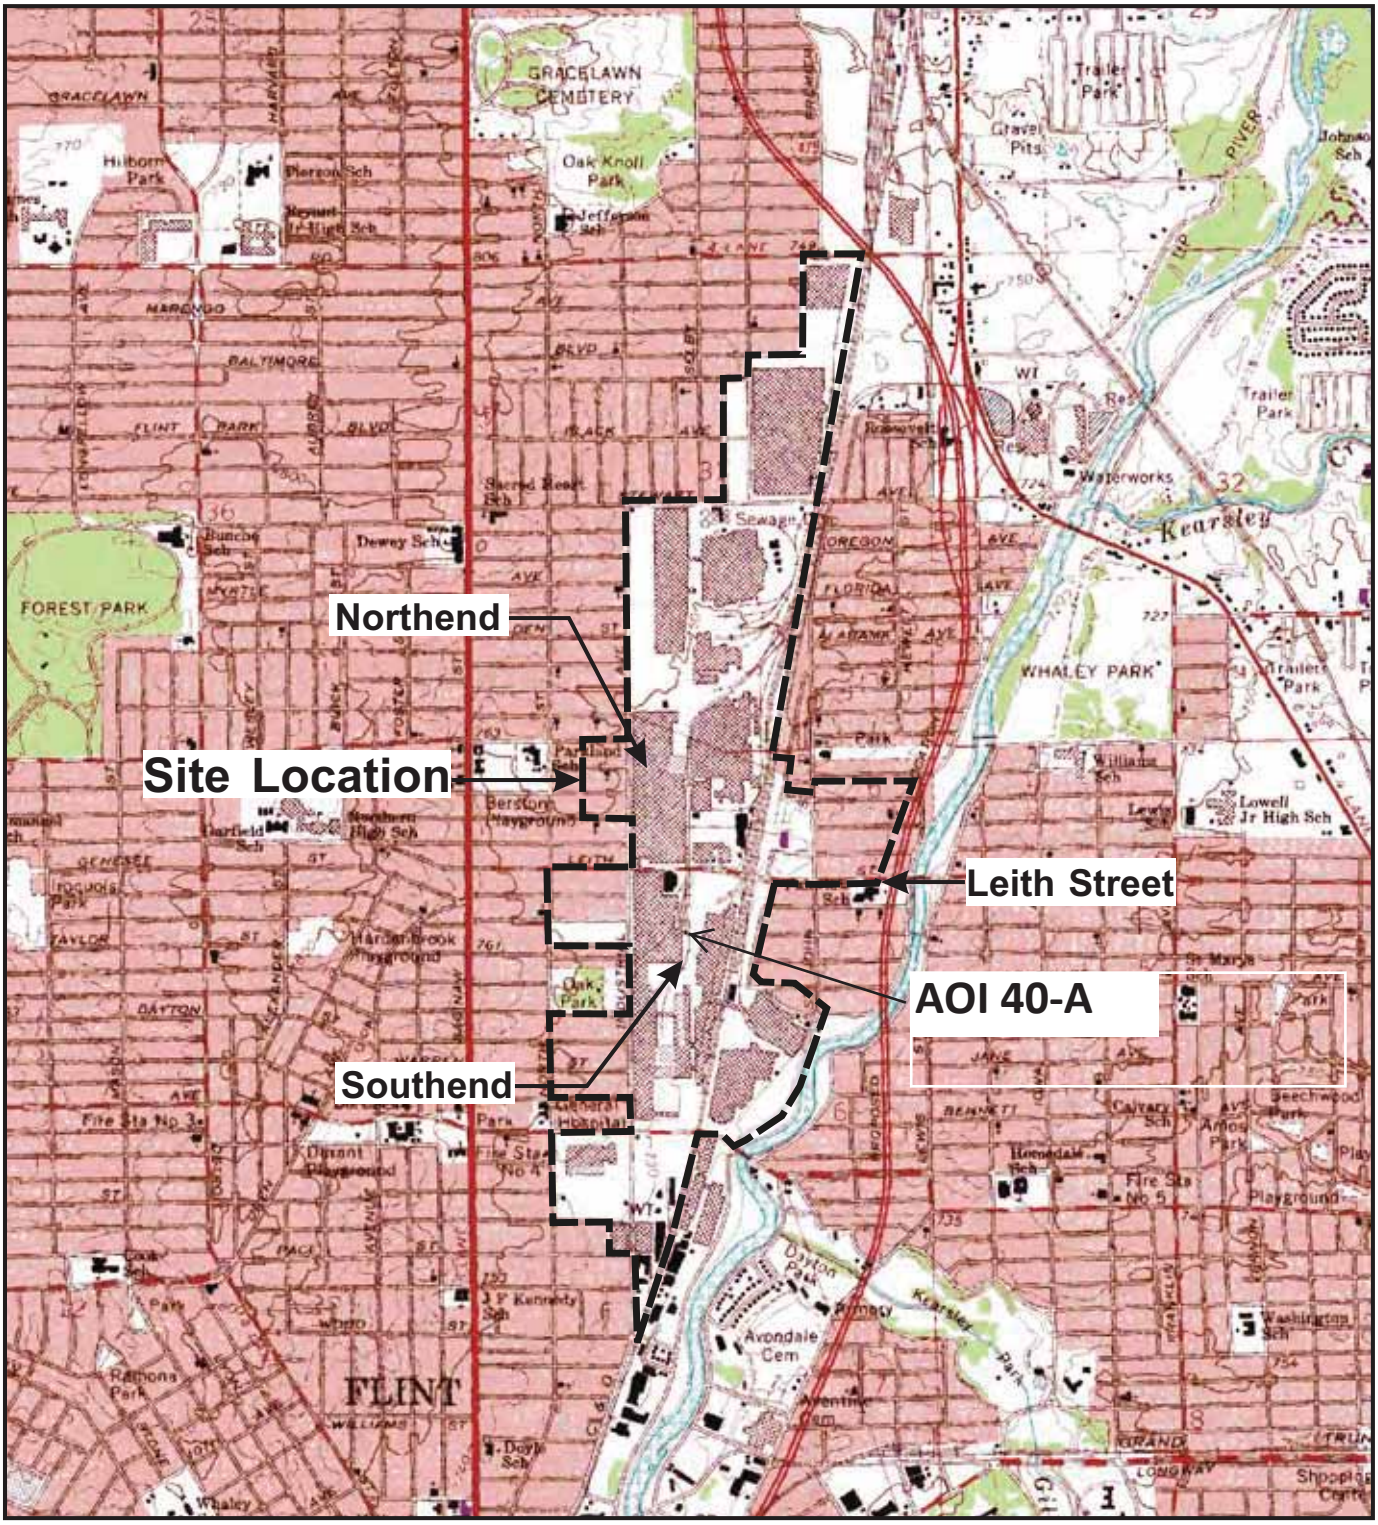
4. Remedy Recommended

The remedies recommended to address the soil impacts at AOI 40-A are engineering and institutional controls. In addition, as noted in **Appendix J**, the Outfall 009 storm sewers will be bulkheaded as part of the remedy in AOI 40-A, -B, & 16-C, which will address the GSIP concerns. These remedies will prevent worker exposure to soil impacts.

4.1 Surface Cover

The remedy recommended to address on-Site shallow soil impacts is to install surface cover over the impacted area. The area requiring surface cover is presented on **Figure P-2**. The surface cover will be inspected and maintained to provide protection from future exposure. Details regarding the monitoring and maintenance activities associated with surface cover will be included in the design documentation. This remedy is consistent with the Final Decision for the Southend of the Site was issued by U.S. EPA in May 2010 (Southend Final Decision).

4.2 Institutional Controls



In addition to the Site-wide Institutional Controls discussed in the main report the following AOI specific controls will be necessary to limit potential for future exposure:

- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present to prevent direct contact with contaminated material (as noted on **Figure P-2**) except with using appropriate health and safety measures during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable time period. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the NREPA.

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure noted on **Figure 6 of the main report** including storm sewer bulkheads.

Subject:
AOI 83/84-3 Lead Soil Impacts Investigation Summary and Remedy Recommendation Memo
Buick City Site - Flint, MI

---

1. Overview

This summary and remedy recommendation memo has been prepared on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) by ARCADIS. This memo summarizes investigation activities completed and recommends remedies for area of interest (AOI) 83/84-3, which is located at the former Factory 83/84 area in the Northend of the Buick City Site (the Site) located in Flint, Michigan (**Figure Q-1**).

The former Factory 83/84 Area primarily manufactured axle assemblies prior to 1981. From 1981 to 2010, the area was used for manufacturing "white metals" components such as water pumps, pistons, and manifolds.

1.1 Background

Lead-impacted soils were identified at AOI 83/84-3 during the Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI). However, the extents of the lead impacted soils could not be delineated at the time due to the presence of process related equipment. Mean lead concentrations in surface and subsurface exceed Michigan Department of Environmental Quality (MDEQ) non-residential

direct contact (NDC) criterion of 900 milligrams per kilogram (mg/kg). In 2012, following the demolition of Factory 83/84, delineation of the lead-impacted soils was from in accordance with the approved AOI 83/84-3 Lead Soil Delineation Work Plan.

2. Subsurface Investigation

A total of 12 soil borings were completed in September and October 2012 to delineate lead impacts at AOI 83/84-3. Six soil borings were collocated with RFI borings to provide vertical delineation (RFI-83/84-16 through -18 and -35 through -37). The remaining six borings (SB-83/84-01 through -06) were completed to provide horizontal delineation of previously identified exceedances.

Three additional soil borings were completed in April 2013 (SB-83/84-13, SB-83/84-14, and MW-83/84-15) to further define subsurface impacts to the east. One of the three soil borings installed in April 2013 (MW-83/84-15) was completed as a monitoring well to investigate the AOI 83/84-1 LNAPL area as detailed in **Appendix H**.

Soil boring and monitoring well locations are shown on **Figure Q-2**. At each boring location the surface concrete was cored and soils were continuously field screened to a depth of approximately 8 feet bgs (or shallower if the boring met refusal). At location SB-83/84-04 a possible subfloor was encountered at 7.5 feet bgs.

2.1 Sample Collection

A total of 28 delineation soil samples were collected in 2012 and 2013. One to three soil samples were collect from each boring depending on soil conditions encountered (i.e. refusals, obstructions). Soil samples were based on previously identified exceedances as well as evidence of impact identified from field observations. Soil boring logs from locations completed in 2012/2013 are attached to this memo, while logs for borings completed during the RFI are presented in the RFI Phase I and RFI Phase II reports that can be found in **Appendix Y**.

Soil samples were submitted to Merit Laboratories Inc. in East Lansing, Michigan for the analysis of lead. Laboratory analytical results are summarized in **Appendix X**.

Upon completion of the event, soil borings were abandoned with hydrated bentonite pellets to within 6 inches of ground surface and completed with a concrete patch. Monitoring well MW-83/84-15 remains on-Site as part of the investigation of the AOI 83/84-1 LNAPL area.

2.2 Soil Analytical Results

Soil analytical results were compared to Michigan Part 201 Generic Nonresidential Cleanup Criteria. Sampling completed during the RFI detected lead at concentrations exceeding NDC criteria at RFI-83/84-05 (42,000/900 milligrams per kilogram [mg/kg]), RFI 83/84-16 (2,500/900 mg/kg), RFI-83/84-17R (1,800/900 mg/kg) RFI-83/84-18 (1,100/900 mg/kg), and RFI-83/84-35 (3,900/900 mg/kg). Soil data from samples collected during 2012/2013 are presented in **Appendix X,** while analytical results from samples collected during the RFI are discussed in more detail in the RFI Phase I and RFI Phase II reports that can be found in **Appendix Y**.

Lead concentrations in the soil samples collected during the 2012-2013 delineation event exceeded NDC criteria at SB-83/84-04 (3,090/900 mg/kg) and RFI-83/84-37 (1,350/900 mg/kg). Please note that a subsurface slab was present at 7.5 feet bgs in SB-83/84-04 preventing the collection of any deeper soil samples.

2.3 Investigation Conclusions

The lead-impacted soil samples are horizontally and vertically delineated within AOI 83/84-3. Please note that the end of the Factory 83/84 building slab provides horizontal delineation of shallow impacts (2.4 to 4.8 feet bgs) at RFI-83/84-37. Based on available elevation data the ground surface south of the slab is approximately 4 feet below the top of the slab and surface cover consists of 1 foot of concrete.

3. Remedy Recommendation Rationale

The remedies recommended to address the soil exceedances at AOI 83/84-3 are engineering and institutional controls. The rationales for this selection are detailed below:

- The human health risk assessment presented in the RFI Phase II Report showed that lead exceeded the mean concentration at AOI 83/84-3.
- The lead soil exceedances of the NDC criterion are located beneath the former Factory 83/84 concrete slab. The depth of impacts range from directly beneath the slab up to 8 feet below ground surface.
- An exceedance from 6 to 8 feet bgs was located at SB-83/84-04, which is horizontally delineated by samples collected from RFI-83/84-18, RFI-83/84-37, SB-83/84-03, SB-83/84-14, and MW-83/84-15 as shown on **Figure Q-2**.

- The exceedance at RFI-83/84-37 from 2.4 to 4.8 feet bgs is delineated by the edge of the factory slab to the South (**Figure Q-2**), where ground surface is approximately 4 feet below the top of the slab and surface cover consists of 1 foot of concrete.

4. Remedy Recommended

The remedies recommended to address the soil exceedances at AOI 83/84-3 are engineering and institutional controls. These remedies will prevent worker exposure to soil impacts.

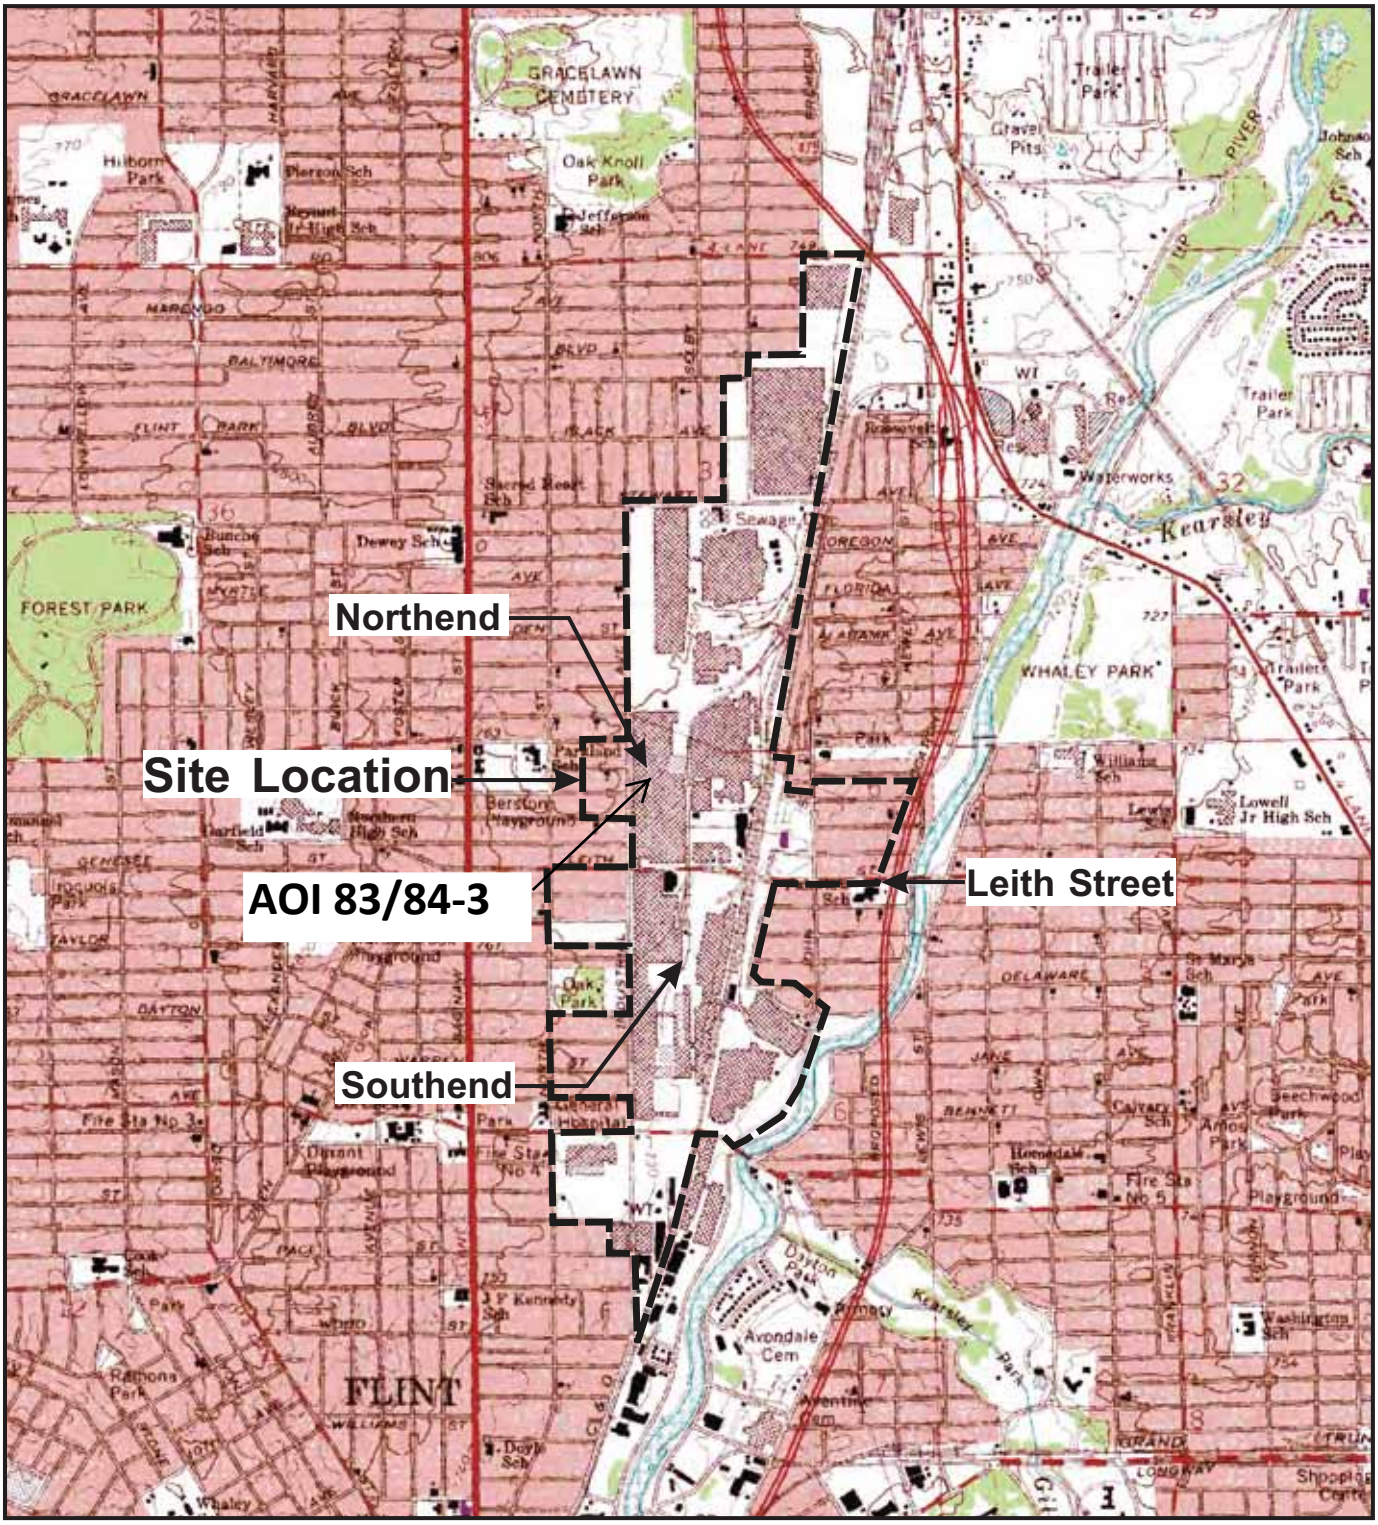
4.1 Surface Cover

The remedy recommended to address shallow soil impacts (from 0 to 8 feet bgs) beneath the existing concrete slab is to maintain the surface cover over the impacted area. The area requiring surface cover is presented on **Figure Q-2**. The surface cover will be inspected and maintained to provide protection from future exposure.

As shown on **Figure Q-2**, the area requiring surface cover at AOI 83/84-3 overlaps the AOI 83/84-1 LNAPL plume. Please note that the remedies recommended for the AOI 83/84-1 LNAPL Area (presented in **Appendix H**) do not require intrusive measures in the vicinity of AOI 83/84-3 and should not interfere with the surface cover. In the event that subsurface work is required in the area requiring surface cover, those activities would be completed in accordance with the institutional controls outlined below.

4.2 Institutional Controls

In addition to the Site-wide Institutional Controls discussed in the main report, the following AOI-specific controls will be necessary to limit potential for future exposure:



- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present to prevent direct contact with contaminated material (as noted on **Figure Q-2**) except with using appropriate health and safety measures during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable amount of time. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that

demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the NREPA.

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure noted on **Figure Q-2** including storm sewer bulkheads.

AOI 86-1 Soil Investigation Summary and Remedy Recommendation
Buick City Site - Flint, MI

---

1. Overview

This summary and remedy recommendation memo has been prepared on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) by ARCADIS. This memo summarizes investigation activities completed and recommends remedies for the soil impacts at area of interest (AOI) 86-1, which is located at the intersection of Leith Street and the CSX railroad tracks along the east side of the Buick City Site (the Site) located in Flint, Michigan (**Figure R-1**).

The light non-aqueous phase liquid (LNAPL) impacts associated with AOI 86-1 are discussed separately in **Appendix A**. This memo focuses on the soil impact located on the south side of Leith Street, which are not associated with the LNAPL.

2. Soil Data Summary

Select soil samples collected from borings at AOI 86-1 in the area located south of Leith Street exceed groundwater surface water interface protection criteria (GSIP) for arsenic (6.2-190/4.6 milligrams per kilogram [mg/kg]), cobalt (12-74/2 mg/kg), manganese (640-3,200/98 mg/kg), mercury (0.145/0.05 mg/kg), selenium (0.89-4.8/0.4 mg/kg), and zinc (540/280 mg/kg); non-residential direct contact criteria (NDC) for

arsenic (56-190/37 mg/kg); and non-residential particulate soil inhalation criteria (NPSIC) for manganese (3,200/1,500 mg/kg). Additionally, polychlorinated biphenyls (PCBs) have been detected at concentrations exceeding 1 part per million (ppm) at one location, RFI-86-07, at a depth of 0.7 to 2.7 feet below ground surface (bgs). The soil boring and monitoring well locations are presented on **Figure R- 2**. The extent of impacts in this area have not been delineated; therefore, additional sampling will be completed to delineate the extent of impacts prior to implementing the selected remedy.

3. 761.61 (c)

As discussed above, PCBs were detected in the soil at RFI-86-07 (0.7 to 2.7 ft bgs) at 3.5 ppm and additional soil sampling is required to delineate the extent of PCB impacts prior to remedy implementation. A delineation sampling plan will be submitted for EPA approval, prior to conducting investigation activities. As shown on **Figure R-2** this portion of the AOI 86-1 area is covered by a 1-foot concrete slab, which serves as a protective cover.

4. Remedy Recommendation Rationale

The remedies recommended to address the soil exceedances at AOI 86-1 are engineering and institutional controls. The rationale for this selection is detailed below:

- The human health risk assessment presented in the RFI Phase II Report showed that soil exceedances did not exceed the United States Environmental Protection Agency's (USEPA) cumulative cancer risk and hazard index limits.
- Exceedances of GSIP criteria, with the exception of RFI-86-01, are in an area that has been bulkheaded; therefore, the groundwater surface water interface pathway is not complete. The location of the bulkhead is presented on **Figure 6 of the main report**. The soils in this area were not disturbed during bulkheading activities.
- The soil exceedance of NPSIC criteria is located RFI-86-01 at a depth of 8.5 feet bgs. The soil present from the surface to a depth of 8 feet bgs is providing an engineering control by capping the impacted soil.
- The NDC exceedances and PCB detection are located beneath a concrete slab, which provides an engineering control by capping the impacted soil. The existing cover will remain in place at the location shown on **Figure R-2** and an excavation restriction will be placed on this area.
- The soil exceedances at AOI 86-1 have not been fully delineated, so additional borings will need to be completed prior to finalizing the proposed restrictions. In the event that exceedances of

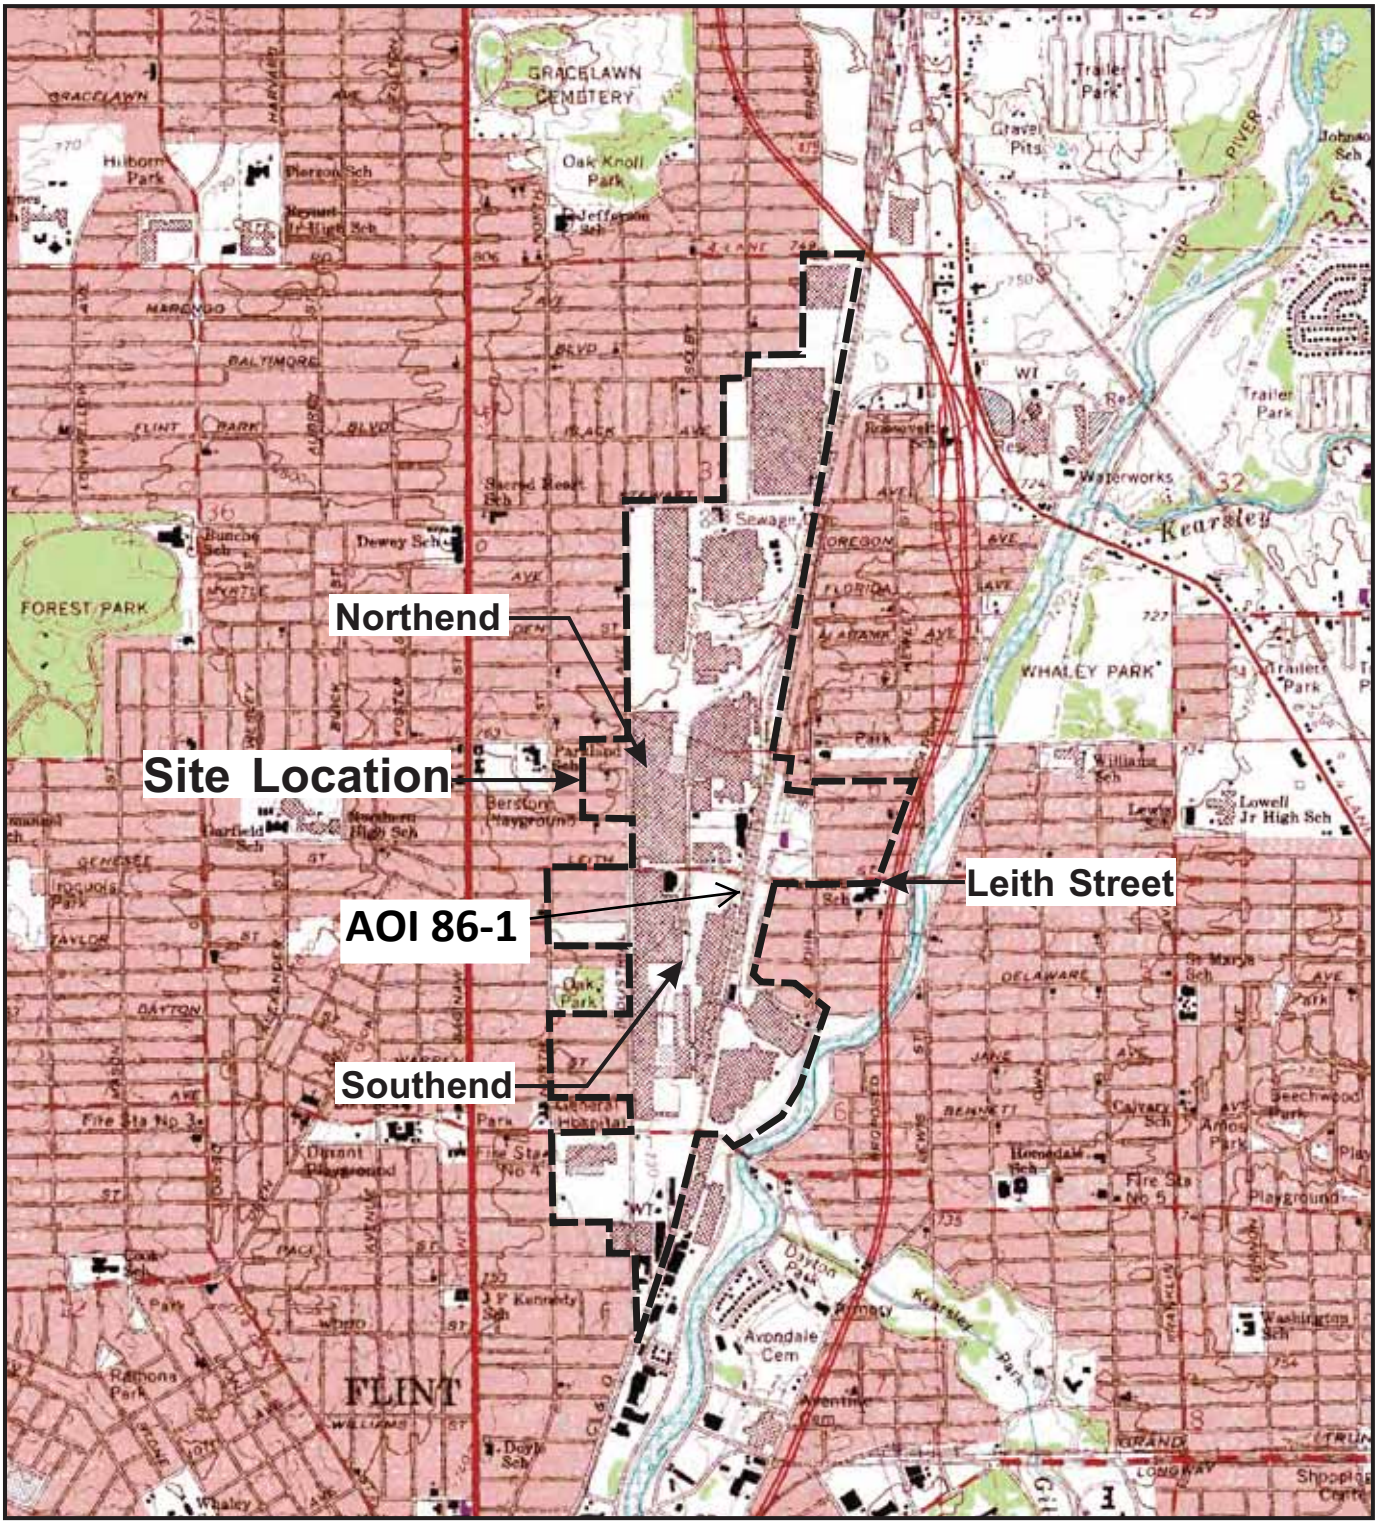
applicable criteria are identified on CSX property the impacts will be addressed in accordance with the Final Decision for the Southend of the Site - Corrective Measures to Address Offsite Soil Contamination.

5. Remedy Recommended

The remedies recommended to address the soil exceedances at AOI 86-1 – South of Leith Street are engineering and institutional controls. These remedies will prevent worker exposure to soil impacts.

5.1 Surface Cover

The remedy recommended to address shallow soil impacts beneath the existing slab is to maintain the surface cover over the impacted area. The surface cover will minimize water infiltration and prevent direct contact with impacted soils. The area requiring surface cover is presented on **Figure R-2**. The surface cover will be inspected and maintained to provide protection from future exposure. Please note that additional sampling will be completed to refine the extents of impacts prior to implementing the restriction.



5.2 Institutional Controls

In addition to the Site-wide Institutional Controls discussed in the main report the following AOI specific controls will be necessary to limit potential for future exposure:

- Prohibit any excavation or other intrusive activity that could affect the integrity of the surface cover that is present to prevent direct contact with contaminated material (as noted on **Figure R-2**) except with using appropriate health and safety measures during short-term construction or repair projects, or for purposes of further treating or remediating the subject contamination. Any excavation or other intrusive activity, including removing, altering, or disturbing the surface cover, that could affect the integrity of the barrier, must be replaced with a cover that provides at least an equivalent degree of protection as the original barrier within a reasonable time period. Repair and/or replacement of the barrier must be completed unless additional sampling is conducted that demonstrates that a barrier in the area is no longer necessary in accordance with the applicable provisions and requirements of Part 201 of the NREPA.
- Notify future owners of the presence of PCBs.

Remedy Recommendation Report
Appendix R AOI 86-1 Soil Impacts - Addendum No.1
Summary of Additional Soil Investigation
RACER Buick City Site, Flint, Michigan

Introduction

This Addendum No. 1 to Remedy Recommendation Report Appendix R presents a summary of the soil investigation data collected at AOI 86-1 *south of Leith Street* from March 19, 2014 through December 31, 2015 at the Buick City Site (Site) located in Flint, Michigan. Please note that additional investigations conducted at the AOI 86-1 Fuel Oil Area *north of Leith Street* are addressed in the addendum to Appendix A - AOI 86-1 Fuel Oil Area.

Summary of Investigation Activities

In December 2014 additional soil investigation activities were completed at AOI 86-1, south of Leith Street, to delineate the extents of arsenic, manganese, and PCB impacted shallow soils (**Figure R-A1-1**).

Three soil borings (SB-86-12, SB-86-13, and SB-86-14) were completed to delineate arsenic exceedances of nonresidential direct contact (NDC) criteria in shallow soil (0.5 to 3 feet below ground surface [ft bgs]) at RFI-86-07, RFI-86-12, and RFI-86-17. The borings were completed to a depth of approximately 5 ft bgs.

Soil samples were collected from the 2 foot interval below concrete and 3 to 5 feet bgs and submitted to the laboratory for arsenic analysis.

At RFI-86-01R two soil borings (SB-86-10 and SB-86-11) were completed to delineate the manganese exceedance of nonresidential particulate soil inhalation criteria (NPSIC). The borings were completed to a depth of 13 ft bgs. Soil samples were collected from 4 to 6, 8.5 to 10.5 and 10.5 to 12.5 ft bgs and submitted to the laboratory for manganese analysis.

At RFI-86-07 two soil borings (SB-86-15 and SB-86-16) were completed to delineate the PCB detection of 3.5 ppm in shallow soil (0.7 to 2.7 ft bgs). The borings were completed to a depth of approximately 5 feet bgs. Soil samples were collected from the 2 foot interval below concrete and 3 to 5 feet bgs and submitted to the laboratory for PCB analysis. In addition, the soil samples collected from the two borings (SB-86-13 and SB-86-14) completed west of RFI-86-07 as part of the arsenic investigation activities were also submitted for PCB analysis.

Summary of Data Evaluation

Arsenic Delineation

Arsenic concentrations in the soil samples collected from SB-86-12, SB-86-13, and SB-86-14 (**Table R-A1-1**) did not exceed NDC criteria. The arsenic exceedances in shallow soils at RFI-86-07, RFI-86-12, and RFI-86-17 have been delineated.

Manganese Delineation

Manganese concentrations in the soil samples collected from SB-86-10 and SB-86-11 (**Table R-A1-1**) did not exceed NPSIC. The manganese exceedance at RFI-86-01R has been delineated.

PCB Delineation

The analytical results of the soil samples collected from SB-86-13, SB-86-14, SB-86-15, and SB-86-16 (**Table R-A1-1**) did not detect PCBs. The PCB detection in shallow soils at RFI-86-07 has been delineated.

Subject:
Waste Management Unit #3 Subsurface Investigation Summary and Remedy Recommendation
Buick City Site - Flint, MI

---

1. Overview

This summary and remedy recommendation memo has been prepared on behalf of Revitalizing Auto Communities Environmental Response Trust (RACER) by ARCADIS. This memo summarizes investigation activities completed and recommends remedies for Resource Conservation and Recovery Act of 1976 (RCRA) Waste Management Unit #3 (WMU #3) located at former Factory 10 in the Northend of the Buick City Site (the Site) located in Flint, Michigan (**Figure S-1**).

1.1 WMU #3 Background

The WMU #3 – Factory 10, Building 20 Transmission Plant Tank Area is located in the northwestern portion of former Factory 10 as shown on the Site Plan (**Figure S-2**). WMU #3 consisted of two above ground storage tanks (ASTs) used to store 1,1,1-trichloroethane (1,1,1-TCA), a 5,000-gallon AST to store 1,1,1-TCA product and a 1,000-gallon regulated waste AST to store spent 1,1,1-TCA. These tanks were removed, cleaned and disposed of 1985. A release was identified at WMU #3 in May 1986 while completing maintenance work at the area. In 1987 and 1988, hydrogeological investigations were completed in the area and revealed 1,1,1-TCA impacts to soil and groundwater.

In April 2007, a *RCRA Waste Management Unit Closure Status Report* (Closure Status Report) was submitted to the Michigan Department of Environmental Quality (MDEQ) – Waste and Hazardous Materials Division (WHMD) summarizing 10 WMU areas (including WMU #3) and the proposed activities / information required for closure (ARCADIS BBL, 2007). In a July 27, 2009, response letter the MDEQ determined that due to the possibility that the release may have been from the former product tank and not the regulated waste tank, as well as the fact that some soil removal was conducted during a waterline repair, it would be appropriate to incorporate this WMU into the Site-wide corrective action being conducted pursuant to the Corrective Action Consent Agreement with the U.S. Environmental Protection Agency (U.S. EPA) and by placing restrictive covenants on groundwater usage and soil relocation. A copy of the July 27, 2009 correspondence can be found in **Appendix Y**.

2. Subsurface Investigation

Investigation activities were completed at WMU #3 on September 20, 2012 and May 23, 2013 in accordance with the approved WMU #3 Subsurface Investigation Work Plan and WMU #3 Additional Investigation Work Plan (work plans).

In September 2012, three soil borings were completed to evaluate subsurface impacts at WMU #3. One boring location was completed at WMU #3 (WMU-3A) and the other two borings were completed to the southeast (WMU-3B) and southwest (WMU-3C) of WMU #3, in the direction of downgradient groundwater flow.

Four additional soil borings were completed in May 2013 to further define subsurface impacts based on a detection of 1,1-Dichloroethene (1,1-DCE) at WMU-3B (further discussed below). Three of the soil borings were located to the north (WMU-SB-04), east (WMU-TW-05), and south (WMU-TW-06) of WMU-3B, and one boring location (WMU-TW-07) was collocated with WMU-3B. Three of the four soil borings installed in May 2013 (WMU-TW-05, WMU-TW-06, and WMU-TW-07) were completed as temporary monitoring wells. WMU-TW-05 and WMU-TW-06 are downgradient from WMU-3B.

Soil boring and temporary monitoring well locations are shown on **Figure S-3**. At each boring location the surface concrete was cored and soils were continuously field screened until the lower clay unit was encountered (approximately 18 to 20 feet below ground surface [bgs]) or until approximately 20 feet bgs (if no clay unit was encountered).

2.1 Sample Collection

Two soil samples were collected from each soil boring location except for WMU-TW-07, which was collocated with WMU-3B and only sampled for groundwater. Soil samples were either 1) biased towards evidence of impact identified from field observations and photo ionization detector (PID) readings or 2) in the event that no evidence of impact was observed, soil samples were collected from the 2-foot interval below the slab and the 2-foot interval above the groundwater table. PID readings in the soil borings ranged from 0.1 to 24.8 parts per million (ppm). Soil samples were collected from the following intervals; WMU-3A (9 to 10 and 19 to 20 ft bgs), WMU-3B (5 to 6 and 19 to 20 ft bgs), WMU-3C (4 to 5 and 10 to 11 ft bgs) WMU-SB-04 (1 to 3 and 8 to 10 ft bgs), WMU-TW-05 (2 to 4 and 8 to 10 ft bgs), WMU-TW-06 (1 to 3 and 8 to 10 ft bgs). The soil sample from WMU-3A (9 to 10 ft bgs) was biased toward the evidence of impact (strong odor) noted on the soil boring log. Soil boring and temporary well logs are attached to this memo.

One groundwater sample was collected from each of the temporary monitoring wells. Water samples include: WMU-TW-05, WMU-TW-06, and WMU-TW-07. The temporary wells were screened across the water table and developed prior to sampling through the use of low flow sampling techniques. Materials used in construction of the temporary monitoring wells were the same standard materials used in construction of permanent monitoring wells; however, the temporary wells will not include bentonite seal, grout, or surface completion as would normally apply to permanent monitoring wells.

Soil and groundwater samples were submitted to Merit Laboratories Inc. in East Lansing, Michigan for the analysis of volatile organic compounds (VOCs) and/or 1,4-Dioxane (a semi-volatile organic compound [SVOC]). Laboratory analytical results for soil and groundwater are summarized in the **Appendix X**.

Upon completion of the event, soil borings were abandoned with hydrated bentonite pellets to within 6 inches of ground surface and completed with a concrete patch. The temporary monitoring wells were left in place after sampling pending review of the analytical results and will be abandoned at a later date.

2.2 Soil and Groundwater Analytical Results

Soil analytical results were compared to Michigan Part 201 Generic Cleanup Criteria - Nonresidential Soils for groundwater surface water interface protection (GSIP) criteria, soil volatilization to indoor air inhalation (NSVIA) criteria, infinite source volatile soil inhalation criteria (NVSICI), particulate soil inhalation (NPSIC) criteria, and direct contact (NDC) criteria.

The soil analytical results detected the following exceedances of criteria:

- The soil samples collected from soil boring WMU-3A (9 to 10 and 19 to 20 ft bgs), WMU-3B (5 to 6 and 19 to 20 ft bgs), and WMU-SB-04 (1 to 3 ft bgs) detected 1,1,1-Trichloroethane (TCA) at concentrations which exceed GSIP criteria (2.34-10.14/1.8 mg/kg).
- The soil sample collected from soil boring WMU-3B (19 to 20 ft bgs) detected at a concentration which exceeds NSVIA criteria for 1,1-DCE (0.36/0.33 mg/kg) and Trichloroethene (3.58/1.9 mg/kg).

Groundwater analytical results were compared to applicable Michigan Part 201 Criteria including groundwater surface water interface (GSI) criteria and Nonresidential Groundwater Volatilization to Indoor Air Inhalation Criteria (NGVIA).

The groundwater analytical results detected the following exceedances of criteria:

- The groundwater sample collected from temporary monitoring well WMU-TW-05 detected 1,1,1-TCA (1,690/89 ug/L); 1,1-Dichloroethane (1,1-DCA) (780/740 ug/L); and 1,1-DCE (310/130 ug/L) at concentrations which exceed GSI criteria.

2.3 Investigation Conclusions

Five of the soil samples analyzed exceed GSIP criteria for 1,1,1-TCA and one groundwater sample collected from WMU-TW-5 exceeded GSI criteria for 1,1,1-TCA, 1,1-DCA, and 1,1-DCE. Based on available groundwater elevation and storm sewer invert elevation data in this area, the groundwater level is approximately at the same elevation as the storm sewer invert. This represents a possible pathway for groundwater at WMU #3 to infiltrate the Outfall 003 storm sewers, which discharges to the Flint River. However, the monthly samples collected from Outfall 003 (as part of the NPDES Plus Monitoring Program) did not detect 1,1,1-TCA, 1,1-DCA, or 1,1-DCE in the 24 sampling events that analyzed for VOCs.

One of the soil samples (WMU-3B [19 to 20 ft bgs]) analyzed exceeds NSVIA criteria for 1,1-DCE and TCE. Analytical concentrations in the shallow soil sample collected from the same boring, WMU-3B (5 to 6 ft bgs), did not exceed NSVIA criteria. The impact of 1,1-DCE and TCE in soil above NSVIA criteria at WMU-3B has been delineated. Concentrations of 1,1-DCE or TCE in soil samples collected to the north (WMU-SB-04), east (WMU-TW-05), south (WMU-TW-06) and west (WMU-3A and WMU-3C) were below

the NSVIA criterion. In addition, all buildings at the Site have been demolished; therefore, indoor air criteria are not applicable to the Site at this time.

3. Remedy Recommendation

The remedy recommended to address the soil volatilization to indoor air exceedance associated with WMU #3 is establishing the Site-wide institutional controls to limit potential for future exposure.

Boring Logs

Date Start: 1/13/2014
Date Finish: 1/13/2014
Drilling Company: Cascade
Driller's Name: John Roberts, Randy O'Hearn
Drilling Method: Sonic
Sampling Method: 4.0" five foot core barrel
Rig Type: Sonic
Water Level Start (ft. bgs.): 7.5' bgs
Water Level Finish (ft. btoc.): NA

Northing: 565983.117

Subject:
WMU #7 - Building 41A, Assembly Plant Waste Storage Tank Area
Investigation Summary and Remedy Recommendation Memo
Buick City Site, Flint, Michigan

---

1. Overview

This Summary and Remedy Recommendation Memo has been prepared on behalf of Revitalizing Auto Communities Environmental Response (RACER) Trust by ARCADIS. This memo summarizes investigation activities completed and recommends remedies for Resource Conservation and Recovery Act of 1976 (RCRA) Waste Management Unit #7 (WMU #7) located at former Building 41A in the Southend of the Buick City Site (the Site) located in Flint, Michigan (**Figure T-1**).

1.1 WMU #7 Background

Historically, the Building 41A, Assembly Plant Waste Storage Tank Area (WMU #7) was located at the Southend of the Site north of former Building 40 as shown on the Site Plan (**Figure T-2**). WMU #7 contained four steel underground storage tanks (USTs) used to contain hazardous waste (Tanks 73 and 74) and other waste (Tanks 71 and 72). Tank 71 was a 10,000-gallon UST that stored transmission oil, Tank 72 was a 16,000-gallon UST that stored waste solvents, Tank 73 was a 10,000-gallon UST that stored hazardous chlorinated solvents (F003 and F005), and Tank 74 was a 12,000-gallon UST that stored hazardous paint sludge (F003 and F005). These tanks were aligned end to end, and had a cement

vault above the walkway that housed the associated piping system. Available documentation indicates that Tank 71 was closed in place and Tanks 72, 73, and 74 were removed in January 1987.

A release (C-0471-97) was identified at WMU #7 when the USTs were removed. It is unknown whether the release was associated with the product storage tank or hazardous waste storage tanks. In addition, there are multiple other releases located in the vicinity of WMU #7 including Release #'s C-0375-01, C-0320-01, C-0470-97, and C-0633-91. The impacts of these releases may be co-mingled.

1.2 WMU Closure Sampling Plan and MDEQ Response

In April 2007, a *RCRA Waste Management Unit Closure Status Report* (Closure Status Report) was submitted to the Michigan Department of Environmental Quality (MDEQ) – Waste and Hazardous Materials Division (WHMD) summarizing 10 WMU areas (including WMU #7) and the proposed activities / information required for closure (ARCADIS BBL, 2007). During subsequent communications with the MDEQ in 2009 and 2010, it was determined that separate work plans would be prepared for WMUs in the Northend and the Southend of the Site. The Southend WMU closure work plan was approved by the MDEQ on October 7, 2011. The report and work plan are presented in **Appendix Y**.

In January 2012, investigation activities were completed at WMU #7 and investigation results were submitted to the MDEQ on April 2, 2012 for the *Southend: Certification of Closure for Closure Response Activities at RCRA Waste Management Units* report. In a January 15, 2013 correspondence, the MDEQ determined that the residual contamination at WMU #7 should be addressed through incorporation into the Site-wide Corrective Action activities being conducted pursuant to the Corrective Action Consent Order (No. R8H-5-00-2) with the U.S. Environmental Protection Agency (U.S. EPA) and by placing restrictive covenants on groundwater usage and soil relocation.

2. Site Setting and Data Summary

This section provides a summary of the geology, hydrogeology, analytical data, and extent of impact for the WMU #7.

Figure T-3 presents the locations of the existing and abandoned monitoring wells and soil borings in the WMU #7 area.

2.1. WMU #7 Geology and Hydrogeology

- *Geology:* The soils at WMU #7 consist of primarily fine to medium sand with trace silts to a maximum depth of approximately 15 feet below ground surface (bgs) overlying silt and clay. The presence of sheen was identified in all three borings ranging from 7 to 13.8 feet bgs. The logs for the three borings completed in WMU #7 are attached to this memo.

- *Groundwater Levels:* Groundwater gauging data collected show that the depth to groundwater in this area averages around six feet bgs. Light non-aqueous phase liquid (LNAPL) was not detected in the temporary well installed at WMU7-SB1 nor has it been detected in downgradient monitoring well 40-06R. Monitoring well 40-06R was gauged as part of the annual groundwater sampling program from 2001 through 2011. The groundwater level data are presented in **Appendix X.**

  Based on historic fluid level gauging data, groundwater flow in this portion of the Site is generally to the east and east-southeast.

2.2. Soil and Groundwater Analytical Data

- *Soil:* Three soil borings (WMU7-SB1, WMU7-SB2, and WMU7-SB3) were completed as part of the closure investigation activities. One soil sample was collected from each boring from the native materials beneath the base of the former USTs (approximately 13 to 15 feet bgs) and submitted for analysis of select F-listed waste constituents. Analytical data were compared to applicable Michigan Part 201 non-residential criteria. Analytic concentrations in soil samples collected from borings in the WMU #7 area do not exceed applicable non-residential criteria (**Appendix X**). Although no soil sample concentrations exceed applicable non-residential criteria, sample intervals were not biased toward areas with evidence of impact. The sampling intervals were selected with the onsite MDEQ representative as part of closure investigation activities. Shallow soils in WMU7 will be sampled to confirm the proposed remedy is appropriate.

- *Groundwater:* Groundwater samples were not collected during WMU closure activities; however, the groundwater data from downgradient monitoring well 40-06R was reviewed. The groundwater exceeded groundwater/surface water interface (GSI) criteria from cyanide in all three samples collected (24-440/5.2 ug/L). However, the Outfall 009 and 010 storm sewers, which service this area, are slated for bulkheading, which will eliminate the GSI pathway. Additionally, it is unknown

whether the cyanide detections are associated WMU #7 or one of the other releases (C-0375-01, C-0320-01, C0470-97, and C-0633-91) in the area. The proposed shallow soil sampling will include cyanide analysis. Applicable analytical data can be found in **Appendix X**.

3. Remedy Recommended

The remedies recommended to address the impacts at WMU #7 are installation of bulkheads and institutional controls. These remedies will eliminate the GSI pathway in the short term and prevent future worker exposure in the long term.

3.1 Bulkhead Installation at Outfall 009 and 010

Bulkheads will be installed at the Outfall 009 and Outfall 010 storm sewers to eliminate this potential GSI pathway. Bulkheading activities are scheduled to be completed in this portion of the Site in Spring 2014. The locations of the bulkheads are presented on **Figure 6 of the main report.**

3.2 *Institutional Controls*

The following area-specific institutional control, in addition to Site-wide institutional controls, will be necessary to limit potential for future exposure:

- Prohibit any activity that could create a preferential pathway for migration, exacerbate existing site conditions, or affect the integrity, effectiveness, and/or operation of any corrective measure including storm sewer bulkheads, as shown on **Figure 6 of the main report.**

Addendum to Remedy Recommendation Report Appendix T – WMU #7 Investigation Results Summary and Remedy Recommendations
RACER Buick City Site, Flint, Michigan

Introduction

This Addendum No. 1 to Remedy Recommendation Report Appendix T presents a summary of investigation data collected at the Waste Management Unit (WMU) #7 Area from March 19, 2014 through December 31, 2015 at the Buick City Site (Site) located in Flint, Michigan.

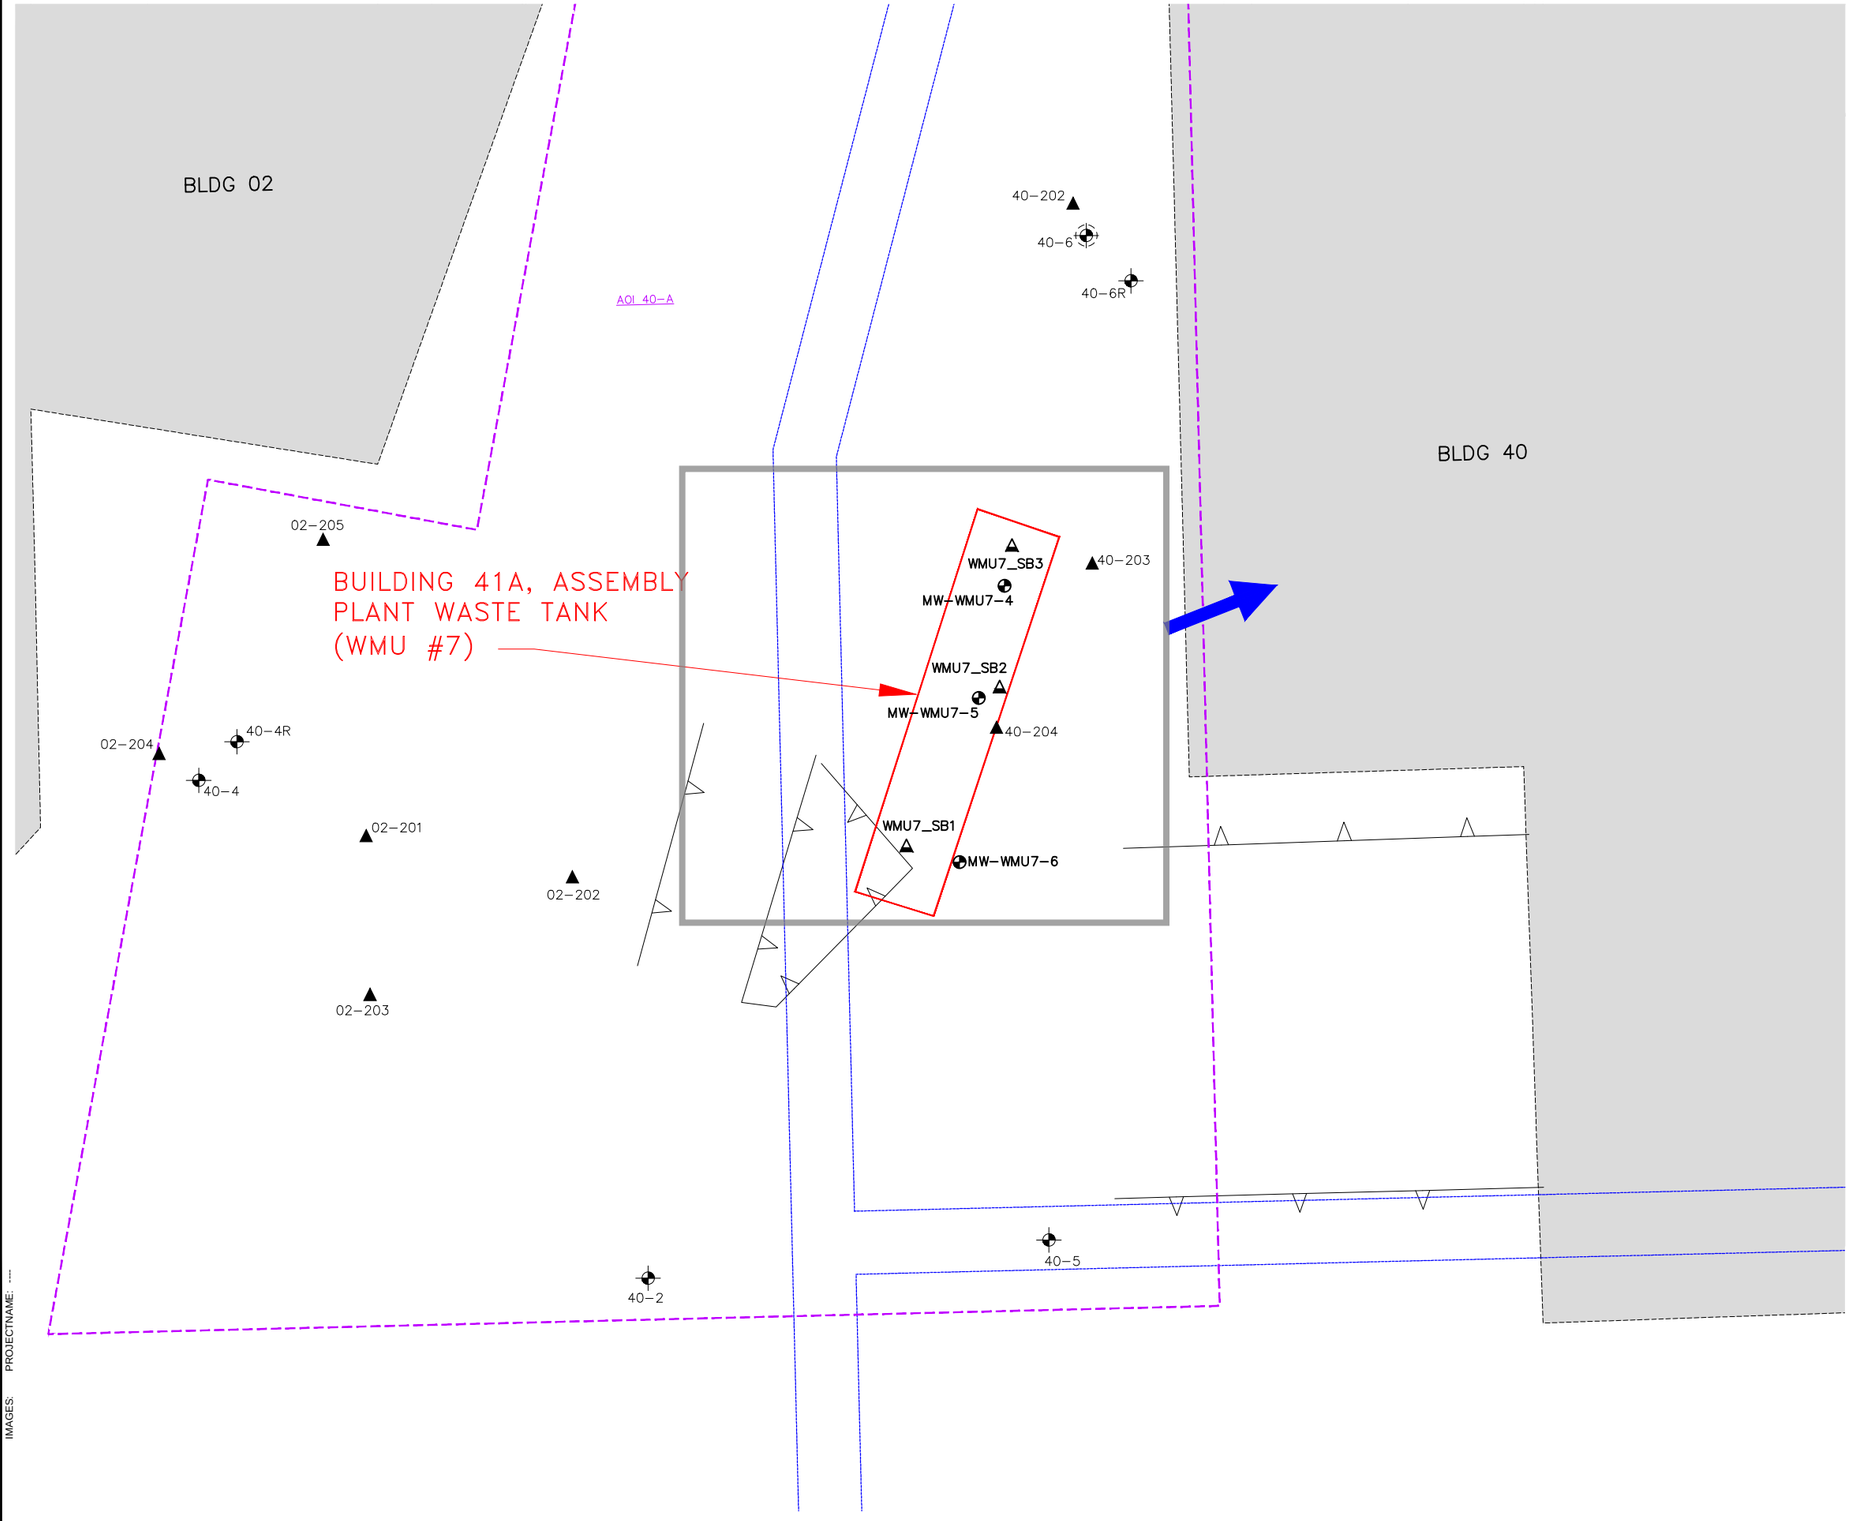
Summary of Investigation Activities

Additional investigation activities included installing three monitoring wells (MW-WMU7-4 through MW-WMU7-6) at WMU #7 to address comments received from the United State Environmental Protection Agency (USEPA) on March 17, 2014. The comments requested additional investigation of impacted soils identified as having odors and sheens in the boring logs for WMU7-SB1 through WMU7-SB3 from 7 to 14 feet below ground surface (ft bgs). As the impacted soils are below the groundwater table the impacts were evaluated by installing and sampling groundwater monitoring wells.

In November 2014 monitoring wells MW-WMU7-4, MW-WMU7-5, and MW-WMU7-6 (**Figure T-A1-1**) were installed at WMU #7 to depths of 14 ft bgs (MW-WMU7-6) and 15 ft bgs (MW-WMU7-4 and MW-WMU7-

5). In March 2015 a groundwater sample was collected from each well and submitted for F-scan analysis by USEPA Methods 8260 and 8270.

Summary of Data Evaluation



No VOCs or SVOC were detected in the groundwater samples collected from MW-WMU7-04, MW-WMU7-05, and MW-WMU7-06 (**Table T-A1-1**).

Table T-A1-1
