1. Overview of Corrective Measures Implemented

This 2011 Corrective Measures Implementation (CMI) Annual Report was prepared by ARCADIS on behalf of Revitalizing Auto Communities Environmental Response (RACER) Trust for the Buick City Site (formerly known as General Motors Corporation [GMC] North American Operations) (the Site), located in Flint, Michigan. On April 1, 2011 the environmental remediation of the property was transitioned from Motors Liquidation Company (MLC) to RACER Trust.

The CMI *Work Plan - Southend of the Former General Motors Corporation North American Operations Facility (Otherwise Known as Buick City)* (CMI Work Plan) was submitted to the United States Environmental Protection Agency (USEPA) on August 13, 2010. The CMI Work Plan was prepared to comply with requirements of the Solid Waste Disposal Act as amended by the Resource Conservation and Recovery Act of 1976 (RCRA) and the Hazardous and Solid Waste Amendments of 1984 (HSWA), 42 U.S.C. § 6901 et seq., and USEPA regulations at 40 C.F.R. Parts 260-271 and Part 124. This annual report was prepared to document and summarize corrective measures completed and implemented during the 2011 calendar year as well as investigations, testing and other activities completed in support of corrective measures design and implementation. The corrective measures are being implemented in accordance with the *Final Decision and Response to Comments* (Final Decision) for the Southend of the Site issued by the USEPA on May 13, 2010.

1.1 Introduction

The Site is located at 902 East Leith Street in Flint, Michigan, in Genesee County and encompasses approximately 452 acres of land. It is generally bounded to the north by Stewart Avenue and Pierson Road, to the south by Harriet Street, to the east by James P. Cole Boulevard and CSX Corporation (CSX) CSX Railroad, and to the west by Industrial Avenue and North Street. The portion of the Site located north of Leith Street (hereafter referred to as the Northend) was in part occupied by GMC for manufacturing operations until December 6, 2010. The factories located in the Northend of the Site are either undergoing decommissioning/demolition or are slated for demolition. Factory demolition has been completed in the portion of the property located south of Leith Street, which is referred to as the Southend. A Site Location map is included as **Figure 1**.

1.2 Summary of 2011 Corrective Measures

The following Corrective Measures were implemented in 2011 and are discussed further in their respective sections of the report.

- A Laser Induced Fluorescence (LIF) investigation was performed at the Site from October 10 through October 28, 2011. The purpose of the LIF investigation was to further define the vertical and horizontal extent of Light Non Aqueous Phase Liquid (LNAPL) impacts at the Site from historic Site operations.

- The annual groundwater monitoring event was conducted from October 18 through October 28, 2011. The purpose of the annual groundwater monitoring event is to monitor groundwater quality and flow patterns, and LNAPL plumes at the Site.

- The "NPDES Plus" monitoring program (NPMP) was continued at the Site to evaluate compliance with Michigan Part 201 Groundwater Surface Water Interface (GSI) criteria for the long-term protection of the Flint River. The NPMP consists of collecting monthly samples from up to 11 Site storm sewers during dry weather flow to assess the impact of groundwater infiltrating into the Site storm sewers.

- Quarterly inspections of surface cover in select areas were completed in order to protect future Site users from near surface soils that exceed direct contact criteria. The engineering controls include maintaining the surface cover consistent with existing conditions at five Areas of Interest (AOIs) located in the Southend of the Site.

- Additional soil sampling activities were completed in the AOI 09-B South area in September 2011 to further refine the current understanding of the horizontal and vertical extent of lead impacted soil in the vicinity of monitoring well/soil sampling location RFI-09-56 and to more accurately define the area requiring engineering controls (i.e. surface cover) to provide protection from potential direct contact exposure.

In addition to the above corrective measures this report also includes a brief summary of the following significant activities completed at the Site in 2011:

- The Outfall 003/004 Storm Water Diversion and Treatment System (Outfall 003/004 System) installation was completed in January 2011. The Outfall 003/004 System continues to operate and is maintained by an operations and maintenance

technician. Maintenance procedures and events occur based on field observations and levels.

- Outfall containment areas continue to be inspected for oil/debris accumulation, absorbent boom saturation, and that the containment booms are in good condition and functioning properly.

- Closure activities for the Factory 36 Waste Management Unit (WMU) #1 were completed and closure status was received from the Michigan Department of Environmental Quality (MDEQ) on September 20, 2011. The Northend WMU closure work plan received MDEQ approval on August 4, 2011. Closure activities for Northend WMUs #4 and #5 were completed on October 10, 2011. Closure sampling activities for WMU #4, #5, and #6 (also located in the Northend) were completed on December 15, 2011.

2. LNAPL Characterization

LNAPL characterization activities were conducted at the Site consistent with the LIF Work Plan dated June 23, 2011 and the CMI Work Plan, prepared by ARCADIS. The LNAPL characterization through LIF investigations was organized into three phases. The first phase of the LIF investigation was conducted at the Southend of the Site in 2010 and reported in the April 2010 Corrective Measures Implementation Report (2010 CMI Report). The second phase of the LIF investigation was conducted in 2011 and was designed to address data gaps in the Southend and target areas of the Northend not affected by demolition activities. The results of the 2011 investigation are reported in Section 2.1, below. The third phase of the investigation is planned to be conducted in 2012 and will target areas that could not be accessed due to demolition as well as data gaps from the first two phases of investigation.

2.1 **LIF Investigation**

The 2011 LIF investigation was performed to further delineate the vertical and lateral extent of the LNAPL areas located in the Northend of the Site and to further define the extent of LNAPL impacts at the Southend of the Site in conjunction with the LIF Investigation completed in August 2010. The known LNAPL areas included in this investigation in the Northend are located at AOI 03-1, AOI 10-4, AOIs 36-1 (2 plumes), 36-2, and 36-5, AOI 81-2, AOIs 83/84-2 and 83/84-4, and AOI 86-1 (**Figure 2a**). The known LNAPL areas in the Southend are located at AOI 02-B, AOI 12-A, -B, and -C, AOI 16-C, and AOIs 40 –A and –B (**Figure 2b**).

2.1.1 Summary of Field Activities

ARCADIS and Matrix Environmental, LLC of Osseo, Minnesota (Matrix) conducted the LIF investigation from October 10 through October 31, 2011. The purpose of the LIF investigation was to further define the vertical and horizontal extent of LNAPL impacts from historic Site activities. Matrix provided the LIF equipment and advanced LIF soil probes under the direct supervision of ARCADIS personnel.

During the 2011 investigation a total of 130 borings were advanced at the Site. At the Northend of the Site 107 LIF borings were completed and 23 LIF borings were completed in the Southend, The borings were completed to an average depth of approximately 30 feet below ground surface (bgs). The LIF borings were completed at five AOIs in the Northend and four AOIs in the Southend known to be impacted by LNAPL, as indicated below.

Northend – 2011						
Area of Interest	**AOI 03-1**	**AOI 10-4**	**AOIs 36-1, 36-2, and 36-5**	**AOI 81-2**	**AOIs 83/84-2 and 83/84-4**	**AOI 86-1**
Number of Borings	3	16	52	11	20	5
Southend – 2011						
Area of Interest	**AOI 02-B**	**AOI 12-A, -B, and -C**	**AOI 16-C**	**AOI 40-A and -B**		
Number of Borings	6	4	9	4		

LIF boring locations were focused in the areas where LNAPL has been observed in monitoring wells in order to further delineate the extent of LNAPL in the soil. Additional "step out" borings were completed to delineate impacts. **Figure 2a** (Northend) and **Figure 2b** (Southend) present the locations of the LIF borings and step out locations. **Figure 2b** also presents the 2010 data for the AOIs delineated in 2011.

There were extensive demolition activities in the Northend during the LIF investigation; limiting access to multiple areas of the site. The third phase of the LIF investigation will target these data gaps.

2.1.2 Description of LIF Technology

LIF investigations are conducted by advancing an ultraviolet optical sensing tool (UVOST®) probe in areas of known or suspected LNAPL impact. The UVOST® probe emits an ultraviolet excitation light and captures returning fluorescence. Polycyclic aromatic hydrocarbon (PAH) compounds, which are a component of common petroleum fuels, readily fluoresce when exposed to ultraviolet light. The magnitude of fluorescence is proportional to the LNAPL saturation within the soil. The fluorescence observed is quantified by comparison to the response of a standard reference solution, known as the reference emitter; the results are expressed as a percentage of reference emitter (%RE) response. Instrument response is expected in areas with no LNAPL impacts due to the fluorescent properties of native soil materials. However, background fluorescence is typically weak as compared to LNAPL fluorescence and does not greatly diminish instrument sensitivity.

The UVOST® probe detects four distinct fluorescent light wavelengths; the relative returns of each wavelength at a given depth are collectively referred to as a waveform. Differences in waveform patterns may indicate differences in the subsurface environment or in LNAPL composition. Waveform changes are indicated by color shifts

in the LIF boring log; snapshots of waveforms at selected depths are presented as callouts on each log.

The return (fluorescent) light signal is analyzed in real time by onsite equipment. As the probe is advanced downward, the fluorescence data form a vertical profile of LNAPL impact present at the soil boring location. Results were reviewed after completing each LIF boring and considered when selecting subsequent locations.

An electrical conductivity (EC) point is advanced along with the UVOST® probe at each boring location. EC is the measure of the soils ability to conduct an electrical current measured on the UVOST® probe. Each boring log includes the vertical profile of the EC data recorded in milliseimens per meter (mS/m) in addition to the fluorescence data. The soil type can be determined by the EC data since soil is in the pathway of the electrical current flow. The grain size can thus be determined by comparing the EC log to a soil boring. Conductivity data in the 100s mS/m indicate smaller grain material such as clay, and data in the 10s of mS/m indicate larger grain material such as sand and gravel. The EC data has not been correlated to Site specific soil types, however, the data is used to assist in the evaluation of LNAPL distribution.

2.1.3 LIF Investigation Methodology

The following methods/practices were employed during implementation of the investigation event.

- The UVOST® probe was advanced using a track-mounted direct-push rig.
- The first five feet of all borings were advanced using a hand auger or air-knife; therefore, LIF responses from 0 to 5 ft bgs were not included in the analysis.
- Based on a correlation of the observed fluorescence with field data indicative of LNAPL it was determined that LIF readings of less than 5 %RE were attributable to background fluorescence and/or insignificant.
- Boreholes were abandoned with bentonite chips after completion and sealed with cement.

2.1.4 Summary of Results

The LIF logs were analyzed to determine the lateral and vertical extent of LNAPL in the subsurface and LNAPL speciation. Visual observations and interpretations of the 130

LIF logs established a site-specific "background" fluorescence response. If a response was less than 5%RE or the max %RE was at a depth less than 5 feet bgs (the area that was hand cleared in the boring), these responses were considered attributable to "background". LIF responses greater than this "background" level were considered indicative of LNAPL impact. The table below displays the number of borings performed and the number of borings observed above background. Borings that exhibit LIF responses below background are areas not affected with LNAPL and assist in delineating the horizontal extent of LNAPL.

Refusal was encountered in a number of borings before reaching the target depth, as shown in the table below. If refusal was encountered and LIF responses greater than background were observed, the boring was included in the analysis on a limited basis. These borings were used as an indicator that the area is affected by LNAPL; however, nothing is concluded about vertical delineation.

Northend – 2011						
Location	**AOI 03-1**	**AOIs 10-4**	**AOIs 36-1, 36-2, and 36-5**	**AOI 81-2**	**AOIs 83/84-2 and 83/84-4**	**AOI 86-1**
Total # of Borings	3	16	52	11	20	5
# of Borings Exhibiting LIF Response Above Background	3	6	40	7	16	1
# of Borings Where Refusal was Encountered	0	1	3	1	3	1

Southend - 2011				
Location	**AOI 02-B**	**AOI 12-A, -B, and -C**	**AOI 16-C**	**AOI 40-A and -B**
Total # of Borings	6	4	9	4
# of Borings Exhibiting LIF Response Above Background	3	1	2	3
# of Borings Where Refusal was Encountered	2	0	5	0

LIF borings were identified as LIF, followed by the AOI number in which the boring was located, followed by the boring number (the order that the borings were drilled in that AOI) as LIF-XX-YYY. As an example, the 17th LIF boring drilled in AOI 40 would be identified as LIF-40-017.

Figures 2a and 2b show the areal distribution of LIF response as color coded dots based on the maximum fluorescence at each LIF boring in the Northend and Southend, respectively. **Figure 2b** also presents the 2010 data for the AOIs delineated in 2011. **Table 1** summarizes the results of the 2011 LIF investigation. LIF boring logs that graphically present the output generated by the LIF equipment are included as a Direct Sensing Report by Matrix presented in **Appendix A**.

2.1.4.1 Areal Distribution of Impacts in Northend

The distribution of LIF responses was evaluated to determine the areal distribution of LNAPL impacts. All areas targeted for investigation in the Northend had some degree of LIF response; however due to access imitations due to demolition activities, full delineation was not possible. Additional delineation is planned during 2012 activities. **Figures 2a** shows the areal distribution of LIF response as color coded dots based on the maximum fluorescence at each LIF boring in the Northend.

AOI 03-1

AOI 03-1 is located south of Stewart Avenue, east of Division Street (vacated) and west of on-site decommissioned railroad tracks. The LIF investigation was planned in this vicinity to evaluate historical LNAPL observations at monitoring well 03-03R. Only three borings were pushed in this area, and the highest LIF response was observed at LIF-03-002 at 319%. The other two borings had significantly lower responses indicating the LNAPL in this AOI is limited in extent. Additional delineation is required to the north and south.

AOI 10-4

AOI 10-4 is located south of Stewart Avenue, east of Division Street (vacated) and west of on-site decommissioned railroad tracks. The LIF investigation was planned in this area to delineate the extent of the AOI 10-4 LNAPL plume. The highest LIF response was observed on the eastern edge of the plume at LIF-10-002 (276%); however, borings placed further east show significant decreases in the LIF response. A number of LIF borings located along the AOI 10-4 plume edge (as interpreted by

LNAPL detect/non-detect in monitoring wells) were non-detect for LNAPL. Based on these non-detections only a few more borings are necessary to complete delineation.

AOIs36-1, 36-2, and 36-5

AOIs 36-1 and 36-2 are located north of Stewart Avenue, West of the CSX Railroad tracks and East of Andrew Street in the area of former Factory 36. AOI 36-5 is located south of Stewart Avenue, West of the CSX Railroad tracks and East of Andrew Street in the area of former Tank farm 37. There are four observed LNAPL plumes at AOI 361, 36-2, and 36-5. The AOI 36-1 Mineral Seal/Hydraulic Oil (MS/HO) plume LNAPL plume is located in the center of the Former Factory 36 slab. The AOI 36-1 Gasoline plume is the smallest of the four plumes and is located on the south central portion of the Factory 36 Slab near well RFI-36-07. The AOI 36-2 MS/HO plume is located from the southeast edge of the Factory 36 slab to the fence along the CSX railroad tracks. The AOI 36-5 plume is located just south of Stewart Street at AOI-36-5. The highest LIF responses were detected within and to the northwest of the AOI 36-1 MS/HO plume, with 14 responses all above 225% RE. Two boring locations near the AOI 36-2 MS/HO plume also exhibited elevated responses of 257% and 236% RE (LIF-36-BD and LIF-36-BA, respectively). The LIF borings indicate that AOI 36-1 MS/HO, AOI 36-1 gasoline, and AOI 36-2 MS/HO plumes are not separate and distinct, but actually co-mingled. Additional delineation, especially to the north and west, is required in this area. AOI 36-5 across Stewart Street is a separate plume and is delineated, except for a small area to the southeast.

AOI 81-2

AOI 81-2 is located west of the CSX railroad tracks, east of former Factory 81 and north of Leith Street. LIF boring, LIF-81-002, had a response of 208% and three other borings had elevated responses above 100% RE, LIF-81-003 (136%), LIF-81-004 (192%), and LIF-81-009 (112%). Additional delineation is required to the west and east.

AOIs 83/84-2 and 83/84-4

AOIs 83/84-2 and 83/84-4 are located on the former Factory 83/43 slab, north of Leith Street, east of Industrial Avenue and east of Division Street (vacant). Elevated responses were identified in the vicinity of LIF 83-003, LIF-83-006, LIF-83-015 and LIF-83-016. Additional delineation is necessary to determine the extent of the three plumes.

AOI 86-1

AOI 86-1 is located north of Leith Street and west of the CSX railroad tracks. Five borings were installed during this investigation. Only one boring, LIF-86-004, had a response greater than background (400.3 % RE). Additional delineation is necessary to determine the extent of the plume.

2.1.4.2 Areal Distribution of Impacts in Southend

A limited number of LIF borings were advanced to address data gaps in the Southend. **Figure 2b** shows the areal distribution of LIF response as color coded dot based on the maximum fluorescence at each LIF boring in the Southend.

AOIs 12-A, -B, and -C

AOIs 12-A, -B, and -C are located south of Leith Street, north of Hamilton Avenue, east of Division Street (vacated) and west of Industrial Avenue. There were four additional LIF borings advanced to delineate the plume to the south. The highest response of the four borings was 27% RE at LIF-12-044. The other three borings were all below background levels and completed the delineation of the LNAPL plume at AOI 12-A to the south. Additional borings are necessary across Leith Street to delineate the plume to the north.

AOI 02-B, AOI 40-A, and -B, and AOI 16-C

AOI 02-B is located between Division Street (vacated) and the CSX railroad tracks. AOI 40-A and –B are located south of AOI 02-B between Division Street (vacated) and the CSX railroad property and AOI 16-C is southwest of AOI 40-B along Division Avenue (vacated). The extent of LNAPL impacts at AOI 02-B, AOI 40-A and -B, and AOI 16-C (Figure 2) appear to create one comingled area of impact. This area extends approximately 1400 feet northwest to southeast, from the CSX railroad, west to Division Street (vacated). Thirteen boring locations were selected to further delineate the horizontal extent of the impacts. Borings were advanced to the north, south, east and west of the area of impact and only one boring had an elevated response. LIF-16-023 is the farthest southeastern boring in the area, which had an LIF response of 222%. The remaining 12 LIF borings completed in this area where considered to be non-detect for LNAPL. Additional delineation is recommended on the east side of the railroad tracks in the vicinity of AOI 02-B and on the west side of AOI 16-C.

2.1.4.3 Vertical Distribution of Impacts in the Northend

The distribution of LIF responses was evaluated to determine the vertical distribution of LNAPL impacts. LIF boring logs that graphically present the output generated by the LIF equipment are included as a Direct Sensing Report by Matrix in **Appendix A**.

AOI 03-1

The vertical distribution of LIF impacts at AOI 03-1 typically ranges from 6 to 21 feet bgs. In the two borings that reached the target bottom depth (25 feet bgs), the LIF responses returned to background levels.

AOI 10-4

The vertical distribution of LIF impacts at AOI 10-4 typically ranges from 5 to 16 feet bgs. There is also a deeper, minor response (both in vertical thickness and LIF intensity) in a number of borings with the deepest impacts to 27 feet bgs. Most borings were extended to 30 feet bgs and returned to background levels indicating the LNAPL is vertically defined.

AOIs 36-1, 36-2, and 36-5

AOIs 36-1, 36-2, and 36-5 had impacts that ranged vertically from 5 to 25 feet bgs with the greatest impacts observed between 12 and 15 feet bgs. The deepest impact was observed at 32 feet bgs at LIF-36-044 and decreased to background before the boring was terminated. Most borings were extended to 30 feet bgs and returned to background levels indicating the LNAPL is vertically defined.

AOI 81-2

The observed vertical distribution of impact at AOI 81-2 was primarily between 5 and 11 feet bgs. One boring, LIF-81-004, had minor LIF responses above background at 20 feet bgs, with an observed fluorescence of 6.8% RE. The LIF response returned to background before the boring was terminated, indicating the vertical distribution has been defined.

AOIs 83/84-2 and 83/84-4

The range of vertical impacts was observed between 5 and 29 feet bgs at AOIs 83/84-2 and 83/84-4. The deepest impact was observed at 16.8 feet bgs at LIF-83-006

(417.6% RE). All borings that reached their target depth returned to background conditions.

AOI 86-1

There was only one boring at AOI 86-1 with fluorescence observed above background. LIF-86-004 had vertical impact from 14 to 20 feet bgs (219.4% RE) and again from 29 to 32 (400.3 % RE) feet bgs. This boring was located just north of Leith Street to the west of the CSX railroad tracks.

2.1.4.4 Vertical Distribution of Impacts in the Southend

The few LIF borings responses greater than background advanced in the Southend were consistent with observations from 2010. LIF boring logs that graphically present the output generated by the LIF equipment are included as a Direct Sensing Report by Matrix Environmental in **Appendix A**.

2.1.4.5 LNAPL Speciation

The LIF waveform signatures observed at the site are consistent with the known LNAPLs at the AOIs. AOI 02-B, AOI 10-4, and AOIs 12-A, -B, and -C, have responses consistent with hydraulic oil. The LIF responses in AOI 03-1 are consistent with quench oil. LIF responses in AOI 81-2 and AOIs 83/84-2 and 83/84-4 are consistent with cutting oil responses and AOI 86-1, AOI 16-C and AOI 40-A and -B are consistent with a fuel oil response. The LIF response at the co-mingled LNAPL plumes in AOIs 36-1 and 36-2 is consistent with the known LNAPL types, weathered gasoline and MS/HO. The gasoline responses appear to be characteristic of weathered product and are limited in the area. The LIF responses from AOI-36-5 are consistent with fuel oil responses.

2.1.4.6 Correlation of LIF Data to Monitoring Well Data

Where appropriate, LIF data was compared to fluid-level data in nearby monitoring wells to determine the degree that the LNAPL smear zone observed in the LIF borings correlates to observations of LNAPL accumulation in monitoring wells. The comparison indicates that LIF responses greater than background generally have co-located wells with some degree of LNAPL observations; however, LNAPL observations in monitoring wells do not clearly correlate to the degree of impact observed in LIF borings. The comparison of elevated LIF responses to observation of LNAPL accumulation in monitoring wells was evaluated in the 2010 CMI and demonstrated that:

- LIF borings with elevated responses do show some degree of LNAPL in neighboring monitoring wells.

- The magnitude of LNAPL accumulation in site monitoring wells is not an accurate measure of the degree of LNAPL impact near those wells.

- LIF investigations provide additional delineation of the vertical and horizontal extent of LNAPL in the subsurface.

2.1.5 Conclusions and Future Activities

The LIF investigation event yielded valuable data on the areal and vertical extent of LNAPL impacts. Delineation of LNAPL impacts were complete if the LIF response at a boring are at background levels for areal extent or returns to background levels for vertical extent. Additionally, areal delineation is inferred using multiple lines of evidence including reduction of LIF response intensity and vertical response over distance, and changes in LIF response type. The following conclusions were made based on review and analysis of the investigation and historical site data:

AOI 03-1

- Areal LNAPL delineation is not complete at AOI 03-1. The three borings advanced indicate the LNAPL plume is minor and a few additional borings to the north and south are necessary to complete the delineation.

- Vertical LNAPL delineation at AOI 03-1 is complete, with the bottom of the LIF impacted zone identified in the boring logs.

- Quench oil is thought to be the predominant product type.

AOI 10-4

- Areal LNAPL delineation is not complete at AOI 10-4. Active demolition on-site prevented access to the north and west of AOI 10-4. However, areal LNAPL delineation is complete along the east side near the railroad tracks.

- Vertical LNAPL delineation at AOI 10 is complete, with the bottom of the LIF impacted zone identified in the boring logs.

- During the LIF investigation, Factory 10 was undergoing demolition. Upon demolition of Factory 10, delineation to the north and west at AOI 10-4 will be possible.

- Due to the active demolition on-site, LIF borings were unable to be advanced near monitoring wells with accumulated LNAPL. Future borings should be advanced in these areas to determine whether the magnitude of LNAPL accumulation in site monitoring wells is an indicator of the degree of LNAPL impact near those wells.

- Hydraulic oil is thought to be the predominant product type.

AOIs 36-1, 36-2, and 36-5

- Areal LNAPL delineation is not complete at AOIs 36-1, 36-2, and 36-5. The north and west portions of the Factory 36 slab need to be further delineated to determine the extent of the impacts.

- Vertical LNAPL delineation at AOIs 36-1, 36-2, and 36-5 is complete, with the bottom of the LIF impacted zone identified in the boring logs.

- There are several LNAPL plumes present at AOIs 36-1, 36-2, and 36-5, which are composed of different types of production product types. These include hydraulic oil, cutting oil, mineral oil, fuel oil, and gasoline.

AOI 81-2

- Areal LNAPL delineation is not complete at AOI 81-2. Active demolition in the area of AOI 81-2 prevented complete delineation.

- Vertical LNAPL delineation at each AOI 81-2 is complete, with the bottom of the LIF impacted zone identified in the boring logs.

- Factory 81 in currently being demolished and upon completion will provide an additional area to delineate AOI 81-2.

- Cutting oil is thought to be the predominant product type.

AOIs 83/84-2 and 83/84-4

- Areal LNAPL delineation is not complete at AOIs 83/84-2 and 83/84-4.

- Vertical LNAPL delineation at AOIs 83/84-2 and 83/84-4 appears complete in borings that reached the targeted total depth; however, additional borings are necessary to confirm.

- Cutting oil is thought to be the predominant product type.

AOI 86-1

- Areal LNAPL delineation is not complete at AOI 86-1.

- Vertical LNAPL delineation at AOI 86-1 appears complete in the one boring with LIF responses above background; however, additional borings are necessary to determine the vertical delineation in other areas of the plume.

- During the LIF drilling activities, Building 86 was still present in the north portion of AOI 86-1 and this area could not be accessed. This building has since been demolished; therefore delineation will be completed in this area during the next investigation event.

- Fuel oil is thought to be the predominant product type.

AOI 12-A, -B, and -C

- Areal LNAPL delineation of the AOI 12-A, -B and-C LNAPL plumes is now complete.

- Vertical LNAPL delineation at AOIs 12-A, -B, and -C is complete, with the bottom of the LIF impacted zone identified in the boring logs.

- Hydraulic oil is thought to be the predominant product type.

AOI 02-B, AOI 40-A, B, and AOI 16-C

- Areal LNAPL delineation on the north and east sides of AOI 02-B and AOI 40-A and –B is now complete.

- Additional delineation is necessary to the west and south of AOI 16-C.

- Vertical LNAPL delineation is complete, with the bottom of the LIF impacted zone identified in the boring logs.

- Hydraulic and fuel oil are thought to be the predominant product type in this co-mingled plume.

Due to active demolition of buildings at the site, several AOIs had restricted access, reducing the investigation area. Additional assessment in the Northend is recommended to further understand the LNAPL distribution, potential sources, and associated risks at the Site. A limited number of borings are recommended in the Southend to complete the assessment. Determining the extent of horizontal impact will help determine whether off Site migration is occurring.

2.2 **Bench Scale Results**

In 2011 ARCADIS conducted bench-scale treatability studies to evaluate the potential to recover LNAPL characterized as hydraulic oil and fuel oil from four AOIs at the Southend of the Site. The bench-scale study did not include AOI 09-B as pilot testing had already been completed at this AOI. The results of the testing were presented in the *LNAPL Remediation Technology Bench-Scale Testing Report* (ARCADIS, 2011a) submitted to the EPA on March 9, 2012. A brief summary of the testing and results is present below.

The purpose of the testing was to assess LNAPL remediation technology performance on the LNAPL types present at the site using the following remedial technologies:

- Physical (Hydraulic) LNAPL Recovery
- Surfactant-Enhanced LNAPL Recovery
- Thermally-Enhanced LNAPL Recovery via
    - hot water flooding
    - high temperature application (thermal conductive heating)
- In-Situ Chemical Oxidation (ISCO)
- Surfactant-Enhanced ISCO

The results of the bench scale treatability study are outlined below.

- The physical (hydraulic) recovery results showed that all in-situ LNAPL saturations were at residual saturation indicating physical recovery methods may not recover significant LNAPL from the subsurface.

- The surfactant-enhanced LNAPL recovery demonstrated that at the five soil cores representative of subsurface conditions surfactant flooding did not increase the recoverable fraction of LNAPL

- Results of the thermally-enhanced LNAPL recovery by hot water flood at the five soil cores representative of subsurface conditions showed that hot water flooding did not increase the recoverable fraction of LNAPL

- The thermally-enhanced LNAPL recovery by high temperature application via thermal conductive heating was effective at reducing concentrations of TPH in soil from 60% to greater than 99%. This technology is effective; however, implementation of this technology at the scale of Buick City is cost prohibitive.

- Results of the ISCO testing demonstrated that there was no significant reduction in TPH concentration observed for any of the treatments: persulfate, Fenton's, or surfactant-enhanced, on either LNAPL type, which is consistent with the understanding that ISCO is designed to remediate dissolved-phase petroleum impacts.

In summary, the bench scale treatability study found that LNAPL recovery in the Southend appears limited or cost prohibitive even with enhanced remediation methods regardless of the LNAPL type.

2.3 **AOI 09-B System Design and Installation**

2.3.1 System Design Activities

In 2011 the AOI 09-B Multiphase Extraction (MPE) system design was completed and system construction and installation activities began. The AOI 09-B MPE system will serve to remediate LNAPL, gasoline impacted groundwater, and soil vapor. The general concept of the system is that LNAPL, groundwater, and soil vapor will be pumped from the 28 system extraction wells via High Density Polyethylene (HDPE) pipe to a treatment system building. The mixture will be directed through knock out tanks which will route the vapors to a thermal oxidizer for thermal combustion and

liquids to an oil / water separator, which will remove floating and emulsified oil. Separated oil will be pumped to an onsite tank for storage and disposal, while the water will be pumped through an air stripper and then be treated with bag filters and activated carbon prior to discharge to the City of Flint sanitary sewer. Air removed from the air stripper will be combined with the soil vapors prior to thermal combustion. This process is detailed in the process flow diagram, which is presented in **Figure 3**, and the layout is presented in the proposed site plan shown on **Figure 4**.

The MPE treatment system construction subcontract has been awarded; construction of the treatment system has begun; and the system is anticipated to be available for delivery to the site April 2011.

2.3.2 Installation and Permitting Activities

The 28 4-inch MPE extractions wells have been installed. Following well installation, samples were collected from select wells and analyzed in support of the Sanitary Sewer Use Permit Application. The Sanitary Sewer Use permit is required for discharge to the City of Flint sanitary sewer. The permit application was submitted to the city on November 30, 2011 and is pending approval.

Additionally an air permit application was completed and submitted to the Michigan Department of Environmental Quality (MDEQ) for approval on October 20, 2011.

Installation of the system is anticipated to begin April of 2012 with startup and operation of the system is anticipated to begin in May of 2012.

2.4 **Natural Source Zone Depletion (NSZD) Study**

In 2011 the Natural Source Zone Depletion (NSZD) study began in the Southend of the Site. The objective of the NSZD study is to establish ongoing natural attenuation rates of LNAPL at the Site as a baseline for comparison to active LNAPL recovery technologies. In accordance with the *Southend: Natural Source Zone Depletion and LNAPL Transmissivity Measurement Work Plan* (ARCADIS, 2011b), seven nested soil gas wells were installed at the Site in areas where the depth to groundwater exceeded five feet. The nested soil gas well locations are presented on **Figure 5**. Permanent soil gas sampling points were installed according to the soil gas monitoring point installation protocol specified in *Standard Operating Procedure (SOP) Subsurface Soil Gas Sampling Using Single or Nested Ports*, (ARCADIS 2011c). Nested soil gas well and sampling point installation began in December 2011 and was completed in January 2012.

Also in January 2012, carbon dioxide traps were installed at locations where the depth to groundwater was less than five feet to collect data for NSZD rate assessment. The traps were installed according to instruction provided by Colorado State University. Nested soil gas points and carbon traps were installed at four common locations to allow comparative evaluation of NSZD rates obtained. Soil gas sampling and carbon dioxide sequestrant placement activities were coordinated to provide temporally consistent data sets.

The first quarter of sample collection was performed in February 2012. Carbon sequestrant material was placed in the traps in early February 2012 and recovered approximately two weeks after placement, and sent to Colorado State University for carbon dioxide extraction and mass analysis. The soil gas samples were collected from the nested probes and submitted for laboratory analysis.

At the time of publication of this report data obtained from the February 2012 sampling event was under review.

2.5 LNAPL Transmissivity Study

The objective of the LNAPL transmissivity study is to quantify relative LNAPL recoverability at the Site. LNAPL transmissivity will also be used to focus LNAPL recovery efforts in areas where LNAPL is more recoverable and/or be used as a test to establish the practicable limits of LNAPL recovery.

LNAPL transmissivity is measured by conducting baildown testing on Site monitoring wells exhibiting greater than 0.5 foot of in-well LNAPL accumulation. Baildown testing consists of LNAPL removal from test wells and monitoring of LNAPL recovery in the test well over time immediately following extraction. The rate of LNAPL flow into the well during the recovery period of a baildown test is a function of LNAPL saturation, permeability of the surrounding formation to LNAPL, LNAPL physical properties, and the magnitude of the initial hydraulic gradient toward the well developed during LNAPL removal.

The first quarterly baildown test was performed in December 2011 in accordance with the *Southend: Natural Source Zone Depletion and LNAPL Transmissivity Measurement Work Plan* (ARCADIS, 2011b). Fourteen monitoring/bench scale wells located in the Southend were found to contain greater than 0.5 feet of LNAPL during fluid-level gauging events conducted in 2010/2011. These 14 wells were gauged as part of the initial event and baildown testing was conducted in wells that 1) exhibited 0.5 feet or greater of LNAPL accumulation and 2) the LNAPL/air and

LNAPL/groundwater interfaces were within the screened interval of the well. In addition, the integrity of each well was assessed prior to beginning testing activities. The locations of the test wells are presented on **Figure 6**.

LNAPL baildown testing was conducted in accordance with the *Standard Operation Procedure LNAPL Baildown Testing* (ARCADIS 2011d). Baildown tests were repeated at each test well during the first test event, to ensure repeatability of results, and to resolve true aquifer response versus sand pack drainage. Baildown test data was analyzed using AQTESOLVTM software for Windows Pro 4.5 using modified solutions developed for traditional groundwater slug test analysis. Prior to importing data into the software, each dataset was carefully examined to determine the appropriate method for analysis.

At the time of publication of this report baildown test data was in the review process. Pending data analysis future quarterly baildown events may include all wells or a subset of the wells based on the initial testing results.

3. Groundwater Monitoring

3.1 Modifications to the Site Monitoring Plan

Modifications to the Site Monitoring Plan were submitted to the USEPA in the *RCRA Revised Corrective Measures Plan (CMP) Addendum No. 2-1* (ARCADIS, 2011e) (CMP Addendum 2-1). The 2011 Annual Groundwater Monitoring Event (2011 Monitoring Event) was completed in accordance with plan presented in CMP Addendum 2-1. The groundwater level and LNAPL presence monitoring locations included in the 2011 program are presented on **Tables 2 and 3** for the Northend and Southend of the Site, respectively. The groundwater quality monitoring locations included in the 2011 monitoring event are presented in **Table 4.**

The monitoring wells included in the sampling program were selected based on analytical data generated as part of the *RFI Phase I Report* (Blasland, Bouck, and Lee (BBL), 2002), the RCRA Facility Investigation (*RFI) Phase II Report* BBL, 2006), the *CA 750 groundwater monitoring program*, the *Revised (CMP) Addendum No.2 - Northend Corrective Measures and Sitewide Groundwater Monitoring* (ARCADIS, 2010), EPA Comments on CMP Addendum No. 2, and the 2010 Annual Groundwater Monitoring event.

3.2 Annual Groundwater Sampling Event

The 2011 Monitoring Event was conducted from October 18 to 28, 2011. The 2011 monitoring event included collecting groundwater level and LNAPL presence measurements and collecting samples as part of the groundwater quality monitoring program as discussed in Sections 3.2.1 and 3.2.2 below.

3.2.1 Groundwater Level and LNAPL Presence Measurements

As part of the 2011 Monitoring Event, ARCADIS completed a site-wide round of groundwater level and LNAPL presence and thickness measurements, which included attempting to collect measurements from 151 locations listed in **Table 2** (Northend) and 138 locations listed in **Table 3** (Southend). Additionally, depth to water measurements were collected from 12 wells (refer to **Table 5**) within the Factory 36 area that previously were not accessible due to demolition activities.

The monitoring well locations for the Northend and Southend are shown on **Figures 7** and **8**, respectively. Due to the ongoing decommissioning and demolition activities at the Site; limited access to off-Site property wells; expired access agreements for CSX

and DuPont properties, damaged or inaccessible wells; and wells that could not be located, 219 of the 289 wells originally planned monitoring wells were gauged for groundwater elevation and LNAPL thickness. Prior to the 2012 Monitoring Event alternate locations will be selected (where possible) to replace wells that were damaged, inaccessible, or could not be found.

3.2.1.1 Groundwater Level Evaluation

Groundwater level measurements were used to generate site-wide groundwater elevation contour maps (**Figures 7** and **8**) and are summarized in **Table 5.** The groundwater flow directions are consistent with historical observations. As shown on **Figures 7** and **8**, groundwater flow is locally influenced by the presence of storm sewers that traverse the Site. This is particularly apparent at the south end of Factory 81 (**Figure 7**), where Leith Street passes beneath the railroad tracks **(Figures 7 and 8**), and at AOI 40-A (**Figure 8).** Additionally, the Factory 86, Building 40 tunnel (AOI 40-D, **Figure 8**) appears to distort the groundwater contours, and the Factory 10 basement is acting as a sump (**Figure 7)** , with local groundwater flow into the basement. Factory 10 has since been demolished and the basement has been punctured and filled in. Therefore the basement should no longer be acting as a sump in the basement influencing groundwater flow

Note on **Figure 8** that the following monitoring wells located south of Industrial Avenue, 04-120, 04-140, BD01-01, and ACSP-B2AR were not included in development of the groundwater elevation contour maps. Based on the locations of the remaining wells at the Site, the aforementioned wells do not provide relevant data for development of the groundwater elevation contours; therefore, monitoring wells 04-120, 04-140, BD01-01, and ACSP-B2AR will be submitted to the USEPA to review for removal from the Monitoring Plan and will be properly abandoned in the future upon receipt of USEPA approval.

The 2011 groundwater level measurements were also compared to historic groundwater level data collected from July 2005 through October 2011. The evaluation did not reveal any obvious trends with the exception of two wells in the Factory 84 area (RFI-84-09S and RFI-84-09D) which showed a decrease in water levels of 6.04 feet and 4.54 feet, respectively. The groundwater levels in the vicinity of former Factory 36 have not been evaluated since the 2009, due to demolition activities in the area. Groundwater levels were collected from four wells in the former Factory 36 area during both the 2009 and 2011 events. An evaluation of the groundwater levels from these well identified a decrease in levels ranging from 0.39 to 1.29 feet.

3.2.1.2 LNAPL Presence Evaluation

The LNAPL presence and thickness measurements were compared to historical measurements generated as part of the *RFI Phase I Report and RFI Phase II Report* (BBL, 2006), the CA 750 groundwater monitoring program, the *Revised CMP Addendum No.2 – Northend Corrective Measures and Site-wide Groundwater Monitoring* (ARCADIS, 2010) (CMP Addendum No. 2 - Northend).

Figures 7 and 8 present the results of the 2011 LNAPL presence evaluation. The figures show the historical locations where LNAPL has been detected in monitoring wells in a light orange color. The locations where LNAPL was detected at a thickness of 0.01 feet or greater during the 2011 Monitoring Event are indicated in a dark orange color.

The observation of ephemeral LNAPL in monitoring wells is a common problem at sites with seasonally fluctuating water tables. An evaluation of measured LNAPL thicknesses indicates that there is generally an inverse relationship between groundwater elevation and apparent LNAPL thickness in wells (that is, lower groundwater elevations lead to increased LNAPL thicknesses and vice versa). As groundwater elevations fall LNAPL is observed in monitoring wells. When an increase in groundwater elevation occurs, LNAPL is suppressed by the elevated groundwater levels.

LNAPL presence and thickness measurements at the Site were generally consistent with historical data, except as noted below.

North of Leith Street

AOI 03-1 (**Figure 7**)

During the 2011 Monitoring Event monitoring well 03-03R could not be gauged due to a blockage in the well. LNAPL was not detected at monitoring well 03-03R in 2010. Historically, LNAPL had been detected at 03-03R from 2004 through 2008 at thicknesses ranging from 0.05 to 2.94 feet. Historically, the AOI 03-1 LNAPL plume has only been detected at 03-03R and the well that it replaced, 03-03. LNAPL was not detected in nearby monitoring wells 03-105R3 or RFI-03-02. Monitoring well 03-03R will continue to be monitored as part of the annual monitoring events and the blockage in the well assessed prior to the 2012 annual monitoring event.

AOI 10-1 (**Figure 7**)

During the 2011 Monitoring Event monitoring well 20-168 could not be accessed and gauged due to demolition activities. LNAPL was not detected at monitoring well 20-168 in 2010. Historically, LNAPL had been detected at 20-168 from 2003 through 2008 at thicknesses ranging from 0.01 to 2.26 feet. Historically, the AOI 10-1 LNAPL plume has only been detected at monitoring wells 20-167 and 20-168. Site demolition activities are expected to be completed prior to the 2012 Monitoring Event; therefore, 20-168 will be gauged during the next annual event.

AOI 83/84-2 (**Figure 7**)

During the 2011 Monitoring Event LNAPL was detected in monitoring wells RFI-83/84-27 and RFI-83/84-53 for the first time. The measured thickness of LNAPL was 2.08 feet at RFI-83/84-27 and 0.58 feet at RFI-83/84-53. RFI-83/84-27 and RFI-83/84-53 were last evaluated for the presence of LNAPL in September 2004. Historically, the AOI 83/84-2 LNAPL plume has only been detected at monitoring wells RFI-83/84-04, RFI-83/84-06, and RFI-83/84-49. These wells will continue to be monitored as part of the annual monitoring events along with downgradient well RFI-83/84-29.

AOI 36-1 (**Figure 7**)

During the 2011 Monitoring Event LNAPL was detected in monitoring well RFI-36-29R at a measured thickness of 8.08 feet. This is an increase of 4.96 feet from the last time the well was evaluated for the presence of LNAPL in 2008. Historically, LNAPL had been detected at RFI-36-29R from 2005 through 2008 at thicknesses ranging from 0.06 to 3.12 feet. The AOI 36-1 MS/HO LNAPL plume could not be accessed and gauged in 2010 due to demolition activities. The AOI 36-1 MS/HO LNAPL plume has been detected at several monitoring wells including RFI-36-06, and RFI-37-27. These wells will continue to be monitored as part of the annual monitoring events.

AOI 86-1 (**Figure 7**)

During the 2011 Monitoring Event LNAPL was detected in monitoring well RFI-86-08R for the first time. The measured thickness of LNAPL was 0.01 foot. RFI-86-08R was last evaluated for the presence of LNAPL in 2008. In addition, LNAPL re-appeared at RFI-86-02 (0.67 feet) and RFI-86-03 (0.03 feet). LNAPL was previously detected at RFI-86-02 and RFI-86-03 from 2004 through 2005.

Historic LNAPL thicknesses ranged from 0.01 to 2.39 feet at RFI-86-02 and 0.01 to 0.54 foot at RFI-86-03. Historically, the AOI 86-1 LNAPL plume has only been detected at monitoring wells RFI-86-02 and RFI-86-03. These wells will continue to be monitored as part of the annual monitoring events, along with downgradient wells RFI-86-01R, RFI-86-02, RFI-86-06S, and RFI-86-06D.

South of Leith Street

AOI 02-B (**Figure 8**)

During the 2011 Monitoring Event LNAPL was detected in RFI-02-14, RFI-02-15, RFI-02-16, RFI-02-19 and RFI-02-23. In 2010 LNAPL was also detected in RFI-02-12, RFI-02-17, and RFI-02-18 with a thickness of 0.01 foot; however, LNAPL was not detected in these monitoring wells in 2011. These wells will continue to be monitored as part of the annual monitoring program, along with downgradient wells RFI-02-22, RFI-02-24, RFI-40-13, RFI-40-14R, and RFI-40-15 to monitor plume stability.

AOI 09-B (Figure 8)

During the 2011 Monitoring Event LNAPL was detected in monitoring well 31-8 for the first time. The measured thickness of LNAPL at this well was 0.01 foot. This well was last evaluated for the presence of LNAPL in 2010. Historically, the AOI 09-B LNAPL plume has only been detected at monitoring wells 31-7, RFI-09-40R, and RFI-09-47. These wells will continue to be monitored as part of the annual monitoring program, along with downgradient wells RFI-09-11, RFI-09-45R, and RFI-09-52 to monitor plume stability.

AOI 12-A (**Figure 8**)

During the 2011 Monitoring Event LNAPL was not detected at RFI-12-01R, RFI-12-07R2, RFI-02-15, RFI-12-18, RFI-12-26 and RFI-12-27, although LNAPL had been measured at thicknesses of 0.01 to 0.02 feet in 2010. These wells will continue to be monitored as part of the annual monitoring events.

AOI 12-B and C (**Figure 8**)

Although measured in 2010 with a thickness of 0.01 foot, LNAPL was not detected in monitoring wells RFI-12-11S and RFI-12-14R during the 2011 Monitoring Event. LNAPL was measured at RFI-12-38 with a thickness of 0.05

feet. LNAPL was previously detected from 2004 through 2008 at thicknesses ranging from 0.3 to 0.74 feet. These wells will continue to be monitored as part of the annual monitoring events.

AOI 16-C and AOI 40-D (**Figure 8**)

During the 2011 Monitoring Event LNAPL was detected again in RFI-16-04R, RFI-16-24, and 40-304 with a thickness of 0.01 foot. However, approximately one week after the initial measurement of LNAPL, monitoring well 40-304 was evaluated again and LNAPL was not present in the well; therefore, a groundwater sample was collected from monitoring well 40-304 per CMP Addendum 2-1. Although measured in 2010 at a thickness of 0.01 foot, LNAPL was not detected in monitoring wells RFI-16-01, RFI-16-09, RFI-16-12, RFI-16-20, 40-303R, and 40-305 during the 2011 Monitoring Event. These monitoring wells will continue to be monitored as part of the annual monitoring events.

AOI-40-B (**Figure 8**)

During the 2011 Monitoring Event LNAPL was measured again in RFI-40-26 at a thickness of 0.01 foot. Although measured in 2010 at a thickness of 0.01 foot, LNAPL was not detected in monitoring wells RFI-40-10R and RFI-40-20 during the 2011 Monitoring Event. The thickness of LNAPL in monitoring well RFI-40-12R increased by approximately 2.85 feet, since this well was last evaluated for the presence of LNAPL in 2008. These monitoring wells will continue to be monitored as part of the annual monitoring events.

AOI-84-D (**Figure 8**)

During the 2011 Monitoring Event LNAPL was detected in monitoring well RFI-84-04D for the first time. The measured thickness of LNAPL was 0.01 foot. .This well was last evaluated for the presence of LNAPL in 2010. Historically, LNAPL has not been detected within AOI 84-D. The depth to groundwater at RFI-84-04D this well is 9.52 ft bgs; however, the well is screened from 42.5 to 47.5 ft bgs. .

Please note that at the time of the writing of this report RFI-84-04D was inspected and gauged to confirm the findings during the annual event. On March 13, 2012 RFI -84-04D appeared to be in good condition and LNAPL was not detected in the well. This monitoring well will continue to be monitored as part of the annual monitoring events.

These monitoring wells will remain in the annual monitoring program. Additional wells may be installed for monitoring LNAPL at the existing LNAPL plumes, depending on the results of the LIF investigations (see Section 2) and the subsequent remedial actions taken in those areas. These wells will be installed, as necessary, following USEPA approval of the remedial design of each of the LNAPL plumes.

3.2.2 Monitoring Network Inspection and Maintenance

Based on monitoring well inspection observations compiled during the 2010 Annual Groundwater Monitoring event, several repairs and/or maintenance were performed in 2011 on wells within the monitoring well network. These activities included: abandonment of monitoring wells RFI-36-55 (well observed to be destroyed in 2010) and RFI-02-05 (blockage in well required replacement monitoring well); installation of two replacement monitoring wells RFI-36-55R and RFI-02-05R; installation of one new well (RFI-12-42) near the southwest corner of the former Building 12 footprint; and redevelopment of RFI-36-56 (well was observed to be silted in/dry in 2010). In addition, several well covers were replaced.

During the 2011 Monitoring Event an inspection was performed on each monitoring well. The inspection included an assessment of the physical condition of the monitoring well protective casing, j-plug and lock, and confirmation of the total depth of the monitoring well. Monitoring well inspection observations were compiled on field logs sheets, and noted repairs will be addressed as needed/warranted. A number of wells could not be located; therefore, a Global Positioning System (GPS) unit was used to locate missing wells. The GPS unit assisted with locating several wells; however, some wells were not able to be located. These wells include the following: 11-6-2, 04-120, 04-140, 36FP8, 36-121, 43-141, RFI-07-03, RFI-12-21, RFI-12-36, RFI-16-07, RFI-36-27, RFI-40-01R2, RFI-40-25, and RFI-83/84-03.

Also, as documented below groundwater level measurements (and LNAPL measurements, if applicable) could not be collected from the following wells:

- Damaged or Blocked Wells: 03-03R, 20-145, RFI-10-28, RFI-36-20, RFI-36-25R, RFI-55-12, RFI-86-14;
- Not Accessible (in Demolition Area):20-160, 20-162, 20-168, RFI-81-02, RFI-81-35, and RFI-85-02;
- Not Accessible (Buried under gravel or debris): 36FP3, 36FP6, 43-242, RFI-02-07, RFI-03-02, RFI-05-13, RFI-05-14, RFI-10-15, RFI-10-36, and RFI-38-05;

- Not Accessible (CSX Property- Access Agreement Not Finalized): 70-163, 70-164, RFI-36-37, RFI-36-47, RFI-40-11, RFI-40-13, and RFI-40-15;
- Not Accessible (DuPont Property – Access Agreement Not Finalized): MW-16, MW-17, MW-18, MW-19, MW-23, MW-25, MW-26, RFI-09-14, and RFI-09-58;
- Not Accessible (UPF Property – Access Denied): RFI-02-13 and RFI-02-24; and
- Not Accessible (Locked, key not available): GM-1, GM-2.

The Site monitoring wells will be evaluated to determine which wells will be needed for future monitoring or which wells should be abandoned. Prior to the 2012 Monitoring Event alternate locations will be selected (where possible) to replace wells that were damaged, inaccessible, or could not be found. Monitoring wells selected for further monitoring will be repaired as needed. Monitoring wells not selected for further monitoring will be submitted to USEPA for review and the wells will be properly abandoned upon receipt of USEPA approval.

3.2.3 Groundwater Quality Monitoring Program

A total of 50 monitoring wells were sampled during the 2011 Monitoring Event for the purpose of water quality analysis. **Table 4** presents the monitoring well locations included in the groundwater quality monitoring program; the specific analyses to be completed for each sampled location; and the rationale for the inclusion of each monitoring well in the sampling program.

3.2.3.1 Sample Collection and Laboratory Analysis

Groundwater samples were collected, analyzed and validated using methods and procedures consistent with those employed previously at the site, as described in the Site's Field Sampling Plan (FSP) and Quality Assurance Project Plan (QAPP) (Appendix C of the RFI Work Plan [BBL, 2001]).

The following monitoring wells were redeveloped prior to collecting groundwater analytical samples because the monitoring wells have not been sampled in over 2 years or were newly installed wells: 36-FP1, RFI-36-03, RFI-36-04, RFI-36-14, RFI-36-55R, RFI-02-05R, and RFI-12-42.

Monitoring wells were sampled using low-flow purge and sampling methods to reduce turbidity in the samples in accordance with the FSP (BBL, 2001). The static

groundwater level in each well was measured to the nearest 0.01 foot using an oil/water interface probe prior to sampling. Each well was purged until measured field parameters (i.e., temperature, specific electrical conductivity, dissolved oxygen, oxidation/reduction potential, pH and turbidity) stabilized. These field-measured data are summarized in **Table 6**. Groundwater samples were then collected; submitted to Merit Analytical Laboratories of East Lansing, Michigan, as specified in the FSP (BBL 2001); and analyzed using the procedures specified in the QAPP (BBL 2001).

To support the groundwater analyses, one sample delivery group (SDG) was reported by the laboratory at Level 3 and the remainder at Level 2. One SDG was verified/validated as described in the FSP/QAPP based on the USEPA's (1995) approach for data review on one SDG at a Tier II and the remainder of the data was verified/validated at Tier I.

3.2.3.2 Summary of Field Activities

Of the 50 monitoring wells included in the groundwater monitoring program, nine monitoring wells were not sampled. Two wells had been damaged or covered by debris (RFI-10-28 [and its alternate well RFI-10-15] and RFI-10-36), one well had a blockage (RFI-36-20), and six monitoring wells (RFI-36-37, RFI-36-47, and 70-164, MW-23, MW-26, and RFI-09-14) were not accessible due to non-finalized access agreements. The remaining 41 monitoring wells were sampled from October 20 to 27, 2011. The well cap and j-plug were missing from monitoring well RFI-94-11 upon inspection; therefore RFI-94-10 was selected as an alternate well. Additionally, due to the presence of LNAPL in monitoring well 36-FP2, monitoring well 36-FP1 was selected as an alternate well and sampled

3.2.3.3 Summary of Results and Response Plan

The laboratory analytical data for the 2011 Monitoring Event, as well as historical data for these locations, are summarized in **Table 7**. The data was compared to the following MDEQ Part 201 criteria:

- Residential Drinking Water (RDW);
- Non-Residential Drinking (NDW);
- Groundwater/Surface Water Interface (GSI) – only compared to samples collected within 500 feet of the Flint River;

- Groundwater Contact Criteria (GCC);
- Groundwater Acute Inhalation Screening Level (GAI);
- Residential Groundwater Volatilization to Indoor Air Inhalation (RGVIA);
- Non-Residential Groundwater Volatilization to Indoor Air Inhalation (NGVIA); and
- Flammability and Explosivity Screening Level (FE).

Figures 9 and **10** present current and historical data for select parameters at each of the locations sampled during the 2011 Monitoring Event. Results of the 2011 Monitoring Event are generally consistent with the results of prior monitoring events, except as noted below.

20-FP10R, AOI 10-4 (**Figure 9**)

During the 2011 Monitoring Event, benzene was detected at a concentration of 0.018 milligrams per liter (mg/L) in the sample collected from 20-FP10R. This represents an increase in the benzene concentration from 2010 (0.006 mg/L). Concentrations in 2010 and 2011 exceeded the MDEQ Part 201 Non-residential Drinking Water Criteria (NDW) of 0.005 mg/L.

A review of the data collected from 20-FP10/20-FP10R from 2002 through 2012 show values fluctuating from non detect to 0.018 mg/L, with an increasing trend over the last four years. A new monitoring well will be installed to assess conditions downgradient of 20-FP10/20FP10R.

RFI-10-26, AOI 10-4 (**Figure 9**)

During the 2011 Monitoring Event the RFI-10-26 groundwater sample was submitted for analysis of VOCs and the additional analysis of arsenic, lead, and manganese (as requested by the USEPA). The analytical results indicated that VOCs and arsenic were not detected and that manganese was detected below criteria. However, lead was detected at a concentration of 0.008 mg/L, which is above the MDEQ Part 201 NDW criterion of 0.004 mg/L.

Lead and VOCs will continue to be monitored at RFI-10-26 in 2012. Based on the 2012 analytical results, recommendations for additional monitoring will be included in the 2012 annual monitoring report, if necessary.

RFI-36-04, AOI 36-1 (**Figure 9**)

During the 2011 Monitoring Event the RFI-36-04 groundwater sample was submitted for analysis of VOCs and the additional analysis of arsenic (as requested by the USEPA). The analytical results indicated that select VOCs were detected at concentrations below criteria and that arsenic was detected at a concentration of 0.257 mg/L, which is above the MDEQ Part 201 NDW criterion of 0.01 mg/L. Arsenic was previously detected above the MDEQ Part 201 NDW and GSI criteria in 2002 (0.08 mg/L) and 2003 (0.087 mg/L).

To assess downgradient conditions, VOCs and arsenic will be monitored in monitoring well RFI-36-02 in 2012. Based on the 2012 analytical results, recommendations for additional monitoring will be included in the 2012 annual monitoring report, if necessary.

36-FP1 and RFI-36-03, AOI 36-1 (Figure 9)

During the 2011 Monitoring Event the 36-FP1 and RFI-36-03 groundwater samples were submitted for analysis of inorganics (as requested by the USEPA) to assess inorganic concentrations at the property boundary. As noted above 36-FP1 was sampled as a replacement well for 36-FP2 due to the presence of LNAPL at 36-FP2. The analytical results at 36-FP1 indicated arsenic and lead were detected at concentrations that exceed the MDEQ Part 201 NDW criteria. The analytical results at RFI-36-03 indicate that lead was detected at a concentration of 0.008 mg/L, which exceeds the MDEQ Part 201 NDW criterion of 0.004 mg/L.

Lead will continue to be monitored in monitoring well RFI-36-03 and at downgradient location RFI-36-44 in 2012 and, based on the 2012 analytical results, recommendations for additional monitoring will be included in the 2012 annual monitoring report, if needed.

RFI-81-51, AOI 81-3 (**Figure 9**)

During the 2011 Monitoring Event monitoring well RFI-81-51 replaced monitoring well RFI-81-08 per CMP Addendum 2-1. The analytical results detected tetrachloroethene at a concentration of 0.007 mg/L, which is above the MDEQ Part 201 NDW criterion of 0.005 mg/L. In addition, trichloroethene was detected at a concentration of 0.067 mg/L, which is above the MDEQ Part 201 NDW criterion of 0.005 mg/L.

Tetrachloroethene and trichloroethene will continue to be monitored in monitoring well RFI-81-51 in 2012. Based on the 2012 analytical results, recommendations for additional monitoring will be included in the 2012 annual monitoring report, if necessary.

RFI-09-53, AOI 09-A (**Figure 10**)

During the 2011 Monitoring Event the sample collected from RFI-09-53 detected trichloroethene and vinyl chloride at concentrations that exceeded criteria. Trichloroethene was detected at a concentration of 0.075 mg/L which exceeds the MDEQ Part 201 NDW criteria of 0.005 mg/L. Vinyl chloride was detected at a concentration of 0.032 mg/L, which exceeds MDEQ Part 201 NDW criteria of 0.002 mg/L

Off-Site monitoring well MW-26 was not sampled during 2011 due to accessibility issues. This well will be sampled for VOCs in 2012. Based on the 2012 analytical results, recommendations for additional monitoring will be included in the 2012 annual monitoring report, if necessary.

RFI-12-42, AOI 12-A (**Figure 10**)

Monitoring well RFI-12-42 was installed at the request of the USEPA to be used as a downgradient monitoring point for the AOI 12-A, -B, and -C area. During the 2011 Monitoring Event the RFI-12-42 groundwater sample was submitted for analysis of VOCs. The analytical results indicated that VOCs were either not detected or detected at concentrations below criteria. RFI-12-42 will continue to be monitored in 2012. Based on the 2012 analytical results, recommendations for additional monitoring will be included in the 2012 annual monitoring report.

RFI-17-02D, AOI 84-D (**Figure 10**)

During the 2011 Monitoring Event benzene was not detected at RFI-17-02D. The 2008 and 2009 samples collected from this location had exceeded the NDW criterion for benzene of 0.005 mg/L. Additionally, vinyl chloride was not detected. The 2008 and 2009 samples collected from this location had vinyl chloride concentrations between 0.001 and 0.002 mg/L. RFI-17-02D will continue to be monitored in 2012 to confirm that concentrations continue to remain below criteria. Based on the 2012 analytical results, recommendations for additional monitoring will be included in the 2012 annual monitoring report.

3.3 NPDES Plus Monitoring Program

The National Pollutant Discharge Elimination System (NPDES) Plus Monitoring Program (NPMP) has continued to be implemented at the Site to monitor compliance with Michigan Part 201 GSI criteria for the long-term protection of the Flint River. The USEPA and MDEQ have previously agreed to the approach of sampling of the Site storm sewers as a means to address potential GSI impacts. As discussed in further detail below, the NPMP consists of collecting monthly samples from up to 11 Site storm sewers during dry weather flow to evaluate the impact of the groundwater infiltrating into the Site storm sewers.

3.3.1 NPMP Sampling

Storm sewers associated with the following NPDES outfalls are included in the NPMP: Outfalls 001, 002, 003, 005, 006, 007, 009, 010, 011, and 013 (see **Figure 11**). The NPMP primary Monitoring Points (MP) are co-located with the monitoring points which have been identified in the current and previous Site NPDES permits.

Please note that Outfalls 004, 008, and 012 are not currently included in the NPMP. The dry weather flow from Outfall 004 has been diverted through Outfall 003/004 Storm Sewer Diversion and Treatment System (Outfall 003/004 System) and now discharges through Outfall 003. Since the Outfall 003/004 System went on Line in January 2011, the sample collected from MP003 has been a combined Outfall 003 and Outfall 004 sample. The Outfall 008 storm sewer has been permanently bulkheaded immediately downstream of MP008. The bulkhead was installed because of a no flow condition due to the collapsed storm sewer line. Outfall 008 no longer receives drainage from the Site; therefore, it is not included in the NPMP. During a previous dry weather sampling activity an attempt was made to collect a sample from MP012, located on the Outfall 012 storm sewer. However, there was only a small puddle (no flow) of water in the storm sewer at the time of sampling indicating that significant groundwater infiltration to Outfall 012 is unlikely; therefore, Outfall 012 was not included in the NPMP (ARCADIS, 2010).

3.3.1.1 Dissolved Phase Sampling

In addition to the routine monthly sampling, additional samples were collected during the February 2011 sampling event and submitted for laboratory analysis of dissolved metals and total suspended solids (TSS) in order to evaluate whether the detected metals concentrations were associated with solid phase of the samples. These results

were previously discussed in the 2010 CMI Report, and are discussed here as well to provide a better overall picture of conditions at each outfall.

3.3.1.2 Upgradient Sampling

In addition to the routine monthly sampling events an upgradient sampling event was completed in August 2011 to assess contributions from offsite upgradient sources. The five upgradient Site storm sewer locations sampled in August 2011 included: MH 1-7, MH 3-31, MH 3-51, MH 4-21, and MH 13-14. Two additional sampling locations (MH 3-28 and MH 3-25-3) were also identified to be sampled, but were observed to be dry, or were inaccessible at the time of sampling. The upgradient sampling event was coordinated with the monthly NPMP sampling. Two sampling teams coordinated efforts in order to sample the upgradient location and NPMP location at approximately the same time to help make sure the samples were representative.

3.3.1.3 Summary of Field Activities

The routine NPMP sampling activities were continued at the Site on a monthly basis. All NPMP samples were collected as grab samples during dry weather flow using a peristaltic pump fitted with tubing. However, the PCB samples were collected using an automated sampler to collect 24-hour composite samples as indicated on **Table 8**. The samples were collected and analyzed using the procedures described in the Site FSP and QAPP (Appendix C of the RFI Work Plan). The routine storm sewer samples were submitted for laboratory analysis of Select VOCs, SVOCs, PCBs, cyanide, Total Suspended Solids (TSS), and/or select metals as summarized in **Table 8**. The upgradient storm sewer samples collected in August 2011 were submitted for laboratory analysis of cyanide and select metals.

To support the NPMP, the laboratory was required to report Level 2 data packages. As discussed in the CMI Work Plan, Level 2 data consists of modified reporting including some supporting documentation, but not full “Contract Laboratory Program”-type (CLP-type). These data were not subjected to verification/validation.

3.3.2 Summary of Results

The results of the 2011 NPMP sampling events are summarized below and presented in **Table 9**. In addition, data summary graphs were prepared using the VOC and metals NPMP data collected to date in order to evaluate trends and to aid in making recommendations for future monthly sampling. Graphs were not prepared for PCBs or SVOC analytical data. The NPMP samples have not detected PCBs and only one

sample detected SVOCs. The detected SVOCs do not have MDEQ Part 201 GSI criteria for comparison. The data summary graphs are presented in **Appendix B** along with a table of all the NPMP data collected to date at the Site**.**

A review of the NPMP analytical data collected since March 2011 indicates that VOCs, SVOCs and PCBs have not been detected above GSI criteria; however, select metals have been detected at concentrations exceeding GSI criteria at Outfalls 001, 002, 003, 005, 006, 007, 009, 010, and 013.

3.3.2.1 Outfall 001

Outfall 001 is sampled from MP001, which is located at manhole MH 1-3. Due to the demolition activities occurring at nearby Factory 38, Outfall 001 was not able to be sampled during January 2011 and due to the manhole being covered with significant water, Outfall 001 was not able to be sampled during the April 2011 sampling event. Therefore, samples were collected during ten of the 12 sampling events with the following samples exceeding the GSI criteria:

- February
  - Total and Dissolved Chromium; Total Copper; Total Cyanide; Total Mercury
- March, May, June, August, November, December
  - Total Mercury
- July
  - Total Chromium; Total Copper; Total Lead; Total Mercury; Total Selenium
- October
  - Total Lead; Total Mercury

TSS was also detected during the sampling events at concentrations ranging from 1,000 µg/L to 123,000 µg/L.

Outfall 001 Data Evaluation

Impacts at Outfall 001 are primarily associated with mercury; however, other select metals have been detected above GSI criteria. The analytical data are presented on Table 9.

The February 2011 analytical data detected TSS at a concentration of 64,000 µg/L. A comparison of the total and dissolved metals data indicates that the exceedances of GSI criteria for copper and mercury may be associated with solids in the sample. There was an exceedance of GSI criteria in the totals data for cyanide; however, cyanide was not included in the analyte list for the dissolved sample. The dissolved phase data are presented on **Table 9**.

The upgradient sampling data collected in August 2011 are presented in **Table 10** with the corresponding downgradient sample results. The Outfall 001 upgradient sample was collected at manhole MH 1-7, which is located at the upgradient property boundary and is representative of the contribution from upgradient offsite sources. The analytical data show that the concentrations of all metals detected in the upgradient sample are higher than those detected at the downgradient sample. In the upgradient sample at MH1-7 mercury was detected at a concentration of 3.6 nanograms per liter (ng/L) which exceeds MDEQ Part 201 GSI criteria. The corresponding downgradient sample collected at MP001 detected mercury at a concentration of 1.4 ng/L, Both samples exceed MDEQ Part 201 criteria for mercury of 1.3 ng/L; however, the on-Site sample concentration is much lower than the upgradient sample collected from the offsite contribution. Additionally, groundwater samples collected during the RFI investigation from on Site monitoring wells located in the drainage area for Outfall 001 did not detect mercury in groundwater.

3.3.2.2 Outfall 002

Outfall 002 is sampled from MP002, which is located at manhole MH 2-19. Samples were collected at MP002 during all 12 of the sampling events with the following samples exceeding the GSI criteria:

- January
  - Total Arsenic
- February
  - Total and Dissolved Selenium
- March, April, May, June, September
  - Total Mercury
- July
  - Total Mercury; Total Silver

- August, December
  - Total Cyanide; Total Mercury
- October
  - Total Arsenic; Total Chromium; Total Mercury
- November
  - Total Arsenic; Total Copper; Total Cyanide; Total Mercury
- December
  - Total Cyanide

TSS was also detected during the sampling events at concentrations ranging from 7,000 µg/L to 914,000 µg/L.

Outfall 002 Data Evaluation

Impacts at Outfall 002 are primarily associated with arsenic, mercury and cyanide; however, other select metals have been detected above GSI criteria. The analytical data are presented on Table 9.

The February 2011 analytical data detected TSS at a concentration of 7,000 µg/L. A comparison of the total and dissolved metals data indicates that the exceedance of GSI criteria for selenium does not appear to be associated with solids in the sample. The results of the dissolved phase sample are comparable to the concentrations detected in the total sample, indicating that the metals were primarily in the dissolved phase. The dissolved phase data are also presented on **Table 9**.

The Outfall 002 storm sewer system begins onsite; therefore, there is no upgradient contribution to the storm sewer.

3.3.2.3 Outfalls 003 and 004

Outfall 003 is sampled from MP003, which is located at manhole MH 3-3. As previously mentioned following the installation of the Outfall 003/004 System in January 2011 the discharge at MP003 is a combined flow from the Outfall 003 and 004 systems. This section presents that January data from samples collected from Outfall 003 and Outfall 004 and the samples of the combined flow beginning in February. Samples were

collected during all 12 of the sampling events with the following samples exceeding the GSI criteria:

- Outfall 003 January Results
  - No Exceedances
- Outfall 004 January Results
  - Total Chromium; Total Copper; Total Lead; Total Mercury; Total Zinc
- February, November, December
  - Total Cyanide; Total Mercury
- March, April, May, June, August, October
  - Total Mercury
- July
  - Total Silver
- September
  - Total Lead; Total Mercury

TSS was also detected during the sampling events at concentrations ranging from 3,000 µg/L to 39,000 µg/L.

Outfall 003 Data Evaluation

Impacts at Outfall 003 are primarily associated with cyanide, lead, and mercury; however, other select metals have been detected above GSI criteria. Beginning in February the sample collected from MP003 is from the combined flow of Outfall 003 and 004.

The February 2011 analytical data detected TSS at a concentration of 15,000 µg/L. A comparison of the total and dissolved metals data indicates that the exceedance of GSI criteria for mercury may be associated with solids in the sample. There was an exceedance of GSI criteria in the totals data for cyanide; however, cyanide was not included in the analyte list for the dissolved sample. The dissolved phase data are presented on **Table 9**.

The upgradient sampling data collected in August 2011 are presented in Table 10 with the corresponding downgradient sample results. Three upgradient samples were

collected at MH 3-31, MH3-51, and MH4-21 which are located at the upgradient property boundary and are representative of the contribution from upgradient offsite sources. The MH 3-31 sample exceeded the GSI criteria for total chromium, total copper, total cyanide, total lead, and total mercury. The MH 3-51 sample exceeded the GSI total mercury criteria. The MH 4-21 sample exceeded the GSI criteria for total arsenic, total copper, total lead, and total mercury.

The corresponding data collected in August from MP003 detected mercury above GSI criteria at a concentration of 3.3 ng/L. The upgradient samples collected from MH 3-31, MH 3-51 and MH 4-21 detected mercury at concentrations of 11 ng/L, 1.5 ng/L, and 42 ng/L, respectively. The data indicate that upgradient offsite sources are likely contributing to the mercury impacts that are being detected at MP003.

3.3.2.4 Outfall 005

Outfall 005 is sampled from MP005, which is located at manhole MH 5-6. Samples were collected at MP005 during all 12 of the sampling events with the following samples exceeding the GSI criteria:

- January, October
  - Arsenic
- March, May, June, August
  - Total Mercury
- April
  - Total Mercury, Total Silver
- July, November
  - Total Arsenic; Total Mercury
- September
  - Total Arsenic; Total Copper; Total Lead; Total Zinc
- December
  - Total Arsenic; Total Lead; Total Mercury

TSS was also detected during the sampling events at concentrations ranging from 1,000 µg/L to 59,000 µg/L.

Outfall 005 Data Evaluation

Impacts at Outfall 005 are primarily associated with mercury; however, other select metals have been detected above GSI criteria. The analytical data are presented on Table 9.

The February 2011 analytical results detected TSS at a concentration of 6,000 µg/L. The analytical results did not detect any analytes above GSI criteria in either the totals or dissolved samples; however, the results of the dissolved phase samples are comparable to the concentrations detected in the total sample, indicating that the metals were primarily in the dissolved phase. The dissolved phase data are also presented on **Table 9**.

3.3.2.5 Outfall 006

Outfall 006 is sampled from MP006, which is located at manhole MH 6-2. Samples were collected at MP006 during all 12 of the sampling events with the following samples exceeding the GSI criteria:

- February, March, April, May, June, July, August, December
  - Total Mercury

TSS was also detected during the sampling events at concentrations ranging from 1,000 µg/L to 71,000 µg/L.

Outfall 006 Data Evaluation

Impacts at Outfall 006 are associated with mercury. The analytical data are presented on Table 9.

The February 2011 analytical results detected TSS at a concentration of 1,000 µg/L. The analytical data for total and dissolved metals indicates that the exceedance of GSI criteria for mercury may be partially attributed to solids in the sample. The dissolved phase data are also presented on **Table 9**.

3.3.2.6 Outfall 007

Due to access issues, the primary sampling location (MH 7-1) was changed after the September 2010 sampling event to where Outfall 007 discharges into the Flint River. However, this secondary location could not be sampled during three sampling events

(January, March, and September 2011) due to the river level being up to the outfall discharge point and safety concerns resulting from ice and snow, making an accurate grab sample not possible. Therefore, samples were collected during nine of the 12 sampling events with the following samples exceeding the GSI criteria:

- February 2011
  - Total and Dissolved Mercury

- April, May, July, August, October, November, December
  - Total Mercury

TSS was also detected during the sampling events at concentrations ranging from 6,000 µg/L to 330,000 µg/L.

Outfall 007 Data Evaluation

Impacts at Outfall 007 are associated with mercury. The analytical data are presented on Table 9.

The February 2011 analytical results did not detect TSS at a reporting limit of 1,000 µg/L. The analytical data detected mercury above GSI criteria in both the total mercury sample (3.1 ng/L) and the dissolved mercury sample (1.4 ng/L) indicating that the exceedance of GSI criteria for mercury may be partially associated with solids in the sample. The dissolved phase data are also presented on **Table 9**.

3.3.2.7 Outfall 009

Outfall 009 is sampled from MP009, which is located at manhole MH 11-7. Due to the manhole area being covered with significant water, Outfall 009 was not able to be sampled during the April and May 2011 sampling events. Therefore, samples were collected during eight of the ten sampling events with the following samples exceeding the GSI criteria:

- January and December
  - Total Arsenic; Total Cadmium; Total Chromium; Total Copper; Total Lead; Total Mercury; Total Vanadium; Total Zinc

- March, June, August, September, October
  - Total Mercury

- July
  - Total Arsenic; Total Chromium; Total Manganese; Total Mercury

- November
  - Total Cyanide; Total Mercury

TSS was also detected during the sampling events at concentrations ranging from 7,000 µg/L to 115,000 µg/L.

Outfall 009 Data Evaluation

Impacts at Outfall 009 are primarily associated with mercury; however, other select metals have been detected above GSI criteria. The analytical data are presented on Table 9.

The February 2011 analytical results detected TSS at a concentration of 23,000 µg/L. The analytical results did not detect any analytes above GSI criteria in either the totals or dissolved samples; however, the results of the dissolved phase samples are comparable to the concentrations detected in the total sample, indicating that the metals were primarily in the dissolved phase. The dissolved phase data are presented on **Table 9**.

3.3.2.8 Outfall 010

Outfall 010 is sampled from MP010, which is located at manhole MH 10-5. Samples were collected at MP010 during all 12 of the sampling events with the following samples exceeding the GSI criteria:

- January, October
  - Total Cyanide

- March, May, June,, December
  - Total Mercury

- April
  - Total Cyanide; Total Mercury

- July
  - Total Chromium; Total Copper; Total Lead; Total Mercury; Total Zinc

- August
  - Total Cyanide; Total Mercury

- September
  - Total Lead; Total Mercury

- November
  - Total Arsenic; Total Cadmium; Total Chromium; Total Copper; Total Cyanide; Total Lead; Total Manganese; Total Mercury; Total Zinc

TSS was also detected during the sampling events at concentrations ranging from 1,000 µg/L to 416,000 µg/L.

Outfall 010 Data Evaluation

Impacts at Outfall 010 are primarily associated with cyanide, lead and mercury; however, other select metals have been detected above GSI criteria. The analytical data are presented on Table 9.

The February 2011 analytical results detected TSS at a concentration of 1,000 µg/L. No analytes were detected above GSI criteria in the dissolved samples in the February 2011 samples. There was an exceedance of GSI criteria in the totals data for cyanide; however, cyanide was not included in the analyte list for the dissolved sample. The results of the dissolved phase samples are comparable to the concentrations detected in the total sample, indicating that the metals were primarily in the dissolved phase. The dissolved phase data are also presented on **Table 9**.

3.3.2.9 Outfall 011

Due to access issues, the primary sampling location (MP011) was changed to where Outfall 011 discharges into the Flint River. However, this secondary location could not be sampled during seven of the sampling events (March, April, May, June, August, November, and December 2011) due to the river level being up to the outfall discharge point making an accurate grab sample not possible. Therefore, samples were collected during five of the 12 sampling events, and no sample concentrations exceeded the GSI criteria.

3.3.2.10 Outfall 013

Outfall 013 is sampled from MP013, which is located at manhole MH 13-6. Due to access issues or observed increased flow at the location, MP013 could not be sampled during the February, March, October, and November 2011 sampling events. The observed increased flow refers to flow which was obviously greater than previous events. The increased flow was observed for two consecutive events to confirm that the increase was not due to a wet weather conditions before the flow was considered a revised dry weather flow condition. Sampling at this location then resumed. Samples were collected during eight of the 12 sampling events with the following samples exceeding the GSI criteria:

- April
  - Total Cyanide
- May
  - Total Chromium; Total Copper; Total Lead; Total Mercury
- June
  - Total Copper; Total Lead; Total Mercury
- July
  - Total Chromium; Total Copper; Total Mercury
- August
  - Total Mercury
- September
  - Total Arsenic; Total Copper; Total Mercury

TSS was also detected during the sampling events at concentrations ranging from 1,000 µg/L to 61,000 µg/L.

Outfall 013 Data Evaluation

Impacts at Outfall 013 are primarily associated with copper, lead and mercury; however, other select metals have been detected above GSI criteria. The analytical data are presented on Table 9.

The dissolved sample was collected at Outfall 013 in April 2011, as the outfall was not accessible in February or March. The analytical results detected TSS at a concentration of 2,000 µg/L. Analytical results detected dissolved metals at concentrations below the GSI criteria. There was an exceedance of GSI criteria in the totals data for cyanide; however, cyanide was not included in the analyte list for the dissolved sample. The results of the dissolved phase sample are comparable to the concentrations detected in the total sample, indicating that the metals were primarily in the dissolved phase. The dissolved phase data are also presented on **Table 9**.

The upgradient sampling data collected in August 2011 are presented **in Table 10** with the corresponding downgradient sample results. The Outfall 013 upgradient sample was collected at manhole MH 13-14, which is located at the upgradient property boundary and would be representative of the contribution from upgradient offsite sources. The analytical data show that mercury was detected in the upgradient sample at a concentration of 1.4 ng/L which exceeds MDEQ Part 201 GSI Criteria. The corresponding downgradient sample collected at MP013 detected mercury at a concentration of 1.6 ng/L. Both samples exceed MDEQ Part 201 criterion for mercury of 1.3 ng/L; however, the on-Site sample concentration is only slightly higher that the upgradient sample. This data indicates that the impact is entering the site from an unknown upgradient off-site source.

3.3.3 Response Plan

Nine of the ten outfalls sampled during the NPMP detected select metals at concentrations exceeding GSI criteria. The following recommendations are made to respond to these metals exceedances.

1) Evaluate bulk-heading of impacted outfalls to eliminate potential metals impacts to the Flint River.

2) If bulkheading of a particular section of sewer is not possible for some reason (for example, due to the fact that it is a public sewer), a review of groundwater and surface soil data in the drainage areas for Outfalls 002, 007, 009, and 010 and prepare a plan to move the sampling locations upstream each month to try to determine the source area of the GSI impacts.

3.3.4 Requested Changes to the Monitoring Plan

The requested changes to the NPMP Monitoring Plan are based on a review of the 2011 monthly outfall monitoring data (**Table 9**) and a review of graphs (**Appendix B**) of

the 2010 and 2011 data to evaluate trends in analyte detections/exceedances. The current sampling frequency and analyte list for each Outfall is presented on **Table 8**.

The following rationale was used to determine the proposed 2012 Sampling Plan including determining the sampling frequency and analyte list for each Outfall.

1) If an analyte has not been detected in the past 12 months or has only been detected at concentrations that are less than 25% of the GSI criteria then no additional sampling of that analyte is recommended.

2) If in the past 12 months an analyte was detected in one or more samples at a concentration greater than 25% of GSI criteria then annual sampling is recommended for that analyte.

3) If in the past 12 months one or more samples detected an analyte at a concentration greater than 25% of GSI criteria and the data collected to date show an increasing trend then semi-annual sampling is recommended for that analyte.

4) If in the past 12 months one or more samples detected an analyte at a concentration greater than 75% of GSI criteria then quarterly sampling is recommended for that analyte.

5) If in the past 12 months one or more samples detected an analyte at a concentration exceeding the GSI criteria then continued monthly sampling is recommended.

Using these criteria along the with outfall specific conditions, following 2012 Sampling Plan is proposed:

Outfall 001

Based on NPMP data collected to date, including the upgradient sampling analysis and a review of data trends it is recommended that:.

- **Option A** – Eliminate VOCs and SVOCs analysis (rationale 1). As discussed in Section 3.3.3.1 the Outfall 001 upgradient sample analytical data show that the concentrations of all metals detected in the upgradient sample are higher than those detected at the downgradient sample. The data indicate that the sources of impacts that are being detected at MP001 may be from upgradient offsite sources as mercury has not been detected groundwater samples collected during the RFI investigation from on Site monitoring wells located in the drainage area for Outfall 001. Therefore, it is recommended that on additional

upgradient/downgradient paired sample set be collected and analyzed for metals. If the sampling confirms that the upgradient sample detected metals at higher concentrations than the downgradient sample then no additional sampling will be completed at Outfall 001. If the additional sampling does not confirm that the metals impacts are likely from upgradient offsite sources, then the Option B Sampling Plan will be implemented.

- **Option B** – Eliminate VOCs, SVOCs, antimony, barium, beryllium, cobalt, manganese, nickel, silver, and thallium analysis (rationale 1). Reduce arsenic, cadmium and vanadium to annual analysis (rationale 2). Reduce zinc analysis to quarterly (rationale 4). Maintain chromium, copper, cyanide, lead, mercury, and selenium analysis monthly (rationale 5).

Outfall 002

Based on NPMP data collected to date and a review of data trends it is recommended that:

- Eliminate SVOCs antimony, beryllium, cobalt, nickel, and thallium analysis (rationale 1).
- Reduce VOCs, barium, cadmium, manganese, and zinc to annual analysis (rationale 2).
- Reduce lead and vanadium to quarterly (rationale 4).
- Maintain arsenic, chromium, copper, cyanide, mercury, selenium and silver analysis monthly (rationale 5).

Outfall 003

Based on NPMP data collected to date, including the upgradient sampling analysis and a review of data trends it is recommended that:

- **Option A** – Eliminate VOCs, SVOCs, and PCB analysis (rationale 1). As discussed in Section 3.3.3.3 the Outfall 003 upgradient samples analytical data show that the concentrations of several metals were detected in the upgradient sample at higher than those detected at the downgradient sample. The data indicate that upgradient offsite sources are likely contributing to the mercury impacts that are being detected at MP003. Therefore, it is recommended that on additional upgradient/downgradient paired sample set be collected and analyzed for metals. If the sampling confirms that the upgradient sample

detected metals at higher concentrations than the downgradient sample then no additional sampling will be completed at Outfall 003. If the additional sampling does not confirm that the metals impacts are likely from upgradient offsite sources, then the Option B Sampling Plan will be implemented.

- **Option B** – Eliminate VOCs, SVOCs, PCBs, antimony, barium, beryllium, cadmium, cobalt, nickel, selenium, and thallium analysis (rationale 1). Reduce vanadium and zinc to annual analysis (rationale 2). Reduce arsenic to semi-annual analysis (rationale 3), Reduce chromium, copper, manganese to quarterly (rationale 4). Maintain cyanide, lead, mercury, and silver analysis monthly (rationale 5).

Outfall 005

Based on NPMP data collected to date and a review of data trends it is recommended that:

- Eliminate SVOCs, PCBs, antimony, barium, beryllium, cobalt, cyanide, selenium and thallium (rationale 1).
- Reduce cadmium and vanadium to annual analysis (rationale 2).
- Reduce manganese to semi-annual analysis (rationale 3).
- Reduce chromium and nickel to quarterly (rationale 4).
- Maintain arsenic, copper, lead, mercury, silver, and zinc analysis monthly (rationale 5).

Outfall 006

Based on NPMP data collected to date and a review of data trends it is recommended that:

- Eliminate VOCs, antimony, barium, beryllium, cadmium, cobalt, cyanide, manganese, nickel, selenium, silver, vanadium and zinc (rationale 1).
- Reduce arsenic and lead to semi-annual analysis (rationale 3).
- Reduce chromium and copper to quarterly (rationale 4).

- Maintain mercury analysis monthly (rationale 5).

Outfall 007

Based on NPMP data collected to date and a review of data trends it is recommended that:

- Eliminate VOCs, SVOCs, antimony, barium, beryllium, cadmium, cobalt, copper, cyanide, manganese, nickel, selenium, silver, vanadium and zinc (rationale 1).
- Reduce arsenic to annual analysis (rationale 2).
- Reduce chromium and lead to semi-annual analysis (rationale 3).
- Maintain mercury analysis monthly (rationale 5).

Outfall 009

Based on NPMP data collected to date and a review of data trends it is recommended that:

- Eliminate VOCs, SVOCs, antimony, beryllium, cobalt, nickel, selenium, silver (rationale 1).
- Reduce barium and thallium to annual analysis (rationale 2).
- Maintain arsenic, cadmium, chromium, copper, cyanide, lead, manganese, mercury, vanadium, and zinc analysis monthly (rationale 5).

Outfall 010

Based on NPMP data collected to date and a review of data trends it is recommended that:

- Eliminate VOCs, SVOCs, antimony, beryllium, cobalt, selenium, silver, thallium (rationale 1).
- Reduce nickel and vanadium to semi-annual analysis (rationale 3).

- Reduce barium to quarterly analysis (rationale 3).

- Maintain arsenic, cadmium, chromium, copper, cyanide, lead, manganese, mercury, and zinc analysis monthly (rationale 5).

Outfall 011

Based on NPMP data collected to date and a review of data trends it is recommended that:

- Eliminate VOCs, SVOCs, antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, cyanide, manganese, nickel, selenium, silver, thallium and zinc (rationale 1).

- Reduce vanadium to annual analysis (rationale 2).

- Reduce lead to semi-annual analysis (rationale 3).

- Reduce copper and mercury to quarterly analysis (rationale 4).

Outfall 013

Based on NPMP data collected to date, including the upgradient sampling analysis and a review of data trends it is recommended that:

- Eliminate VOCs, antimony, barium, beryllium, cadmium, cobalt, nickel, selenium, silver, and thallium analysis (rationale 1).

- Reduce manganese and vanadium to annual analysis (rationale 2).

- Reduce zinc to semi-annual analysis (rationale 3),

Maintain arsenic, chromium, copper, cyanide, lead, and mercury analysis monthly (rationale 5).

4. Soil Corrective Measures

4.1 AOI-09B South Lead Soil Impact Delineation Activities

Lead soil sampling activities were performed at the AOI 09-B South area to further refine the current understanding of the horizontal and vertical extent of lead impacted soil in the vicinity of monitoring well/soil sampling location RFI-09-56 and to more accurately define the area requiring engineering controls (i.e. surface cover) to provide protection from potential direct contact exposure. During the RCRA RFI lead was detected at AOI 09-B South above the MDEQ Nonresidential Direct Contact (NDC) Criteria of 900 milligrams per kilogram (mg/kg) in a soil sample that was collected from 2 to 4 feet bgs for sample location RFI-09-56. The analytical data from RFI-09-56 was evaluated in the Site human health risk assessment (HHRA) for AOI Group 09-B. Based on the HHRA evaluation of lead concentrations at RFI-09-56, the *RCRA Revised CMP* (ARCADIS, 2008) indicated that the potential for unacceptable exposure in the future would be mitigated by establishing a deed restriction limiting future excavation and implementing engineering controls (maintaining a surface cover consistent with current conditions).

4.1.1 Summary of Field Activities

A total of eight soil borings were completed at locations approximately 50 feet and 100 feet north, east, south and west of RFI-09-56 in September 2011. Locations are included on **Figure 12**. The depth to groundwater in the vicinity of RFI-09-56 is approximately 5.5 ft bgs; therefore, soil samples were advanced vertically using a hand auger to a depth of approximately 5 feet bgs. Soil samples were collected from 0 to 2 feet bgs and from 3 to 5 feet bgs at each location. The soil samples were submitted to Merit Laboratories located in East Lansing, Michigan for the analysis of lead. Following the completion of soil sample collection activities, the eight soil boring locations were surveyed.

The soil samples were collected and analyzed using methods and procedures that are consistent with those described in the Site's FSP/QAPP (Appendix C of the *RCRA Facility Investigation Work Plan* [BBL, 2001]) (RFI Work Plan) and the *Health and Safety Plan* (HASP) provided as Appendix E of the RFI Work Plan. Laboratory data reporting and data verification/validation was completed in accordance with the methods and procedures described in Section 7.1 of the *CMI Work Plan* (ARCADIS, 2010a).

4.1.2 Summary of Results

A total of 16 soil samples were submitted for laboratory analysis of lead. Lead was detected at concentrations ranging from 1.82 mg/kg to 106 mg/kg. The detected concentrations are below MDEQ Part 201 NDC Criteria. The analytical results are summarized in **Table 11**.

Based on evaluation of the additional soil samples, the current extent of the area requiring restrictions and engineering controls associated with the exceedance at RFI-09-56 (based on the Thiessen polygon) is significantly larger than necessary to be protective of potential direct contact exposure. **Figure 12** presents the revised extent of area requiring restrictions and engineering controls associated with RFI-09-56, which is approximately 5,800 square feet, a reduction in size from 69,000 square feet (as approved by Mr. Chris Black of the USEPA via Email correspondence with ARCADIS on February 7, 2012).

4.2 Maintenance of Select Surface Covers

The five AOIs discussed below contain six areas where surface cover is inspected and maintained. In the areas where a concrete slab or asphalt pavement already exists, these areas will be maintained, as necessary, to ensure that the surface cover remains as a barrier for potential direct contact and/or particulate inhalation exposure. The locations of these areas are located in the Southend of the Site and are depicted on **Figure 13** and include:

- **AOI Group 02-C**: This AOI (one area) is associated with former Factory 86, Building 02, and relates to a former sump in the former Materials Laboratory.

- **AOI Group 12-A**: This AOI (one area) is associated with former Factory 86, Building 12, and relates primarily to several press pits and associated sumps, pits, trenches, and traps.

- **AOI Group 29-A**: This AOI (one area) is associated with the former Building 29, and relates to a pit for a cable-operated elevator and former work slabs with oil staining.

- **AOI Group 09-A**: This AOI (one area) is associated with the former Building 9, and relates to a floor trench and underground storage tank (UST) system.

- **AOI Group 09-B:** This AOI includes two separate areas, one of which is located in the general vicinity of the Former Building 31/Hamilton Avenue Tank Farm, and the other is associated with the former AC Spark Plug property.

4.2.1 Summary of Field Activities

These areas were photographed and visually inspected as a baseline in July 2010 and thereafter inspected and photographed on a quarterly basis. Inspections were performed in March, June, September and December 2011. During each inspection the condition of cover was inspected and documented in an inspection log. Documented items include the type of cover (concrete, stone, vegetation, etc.), the condition of concrete or asphalt cover (good, fair, poor), and whether or not conditions of the cover have changed since the last inspection date. Photos of each inspection area are also included with the inspection log. Inspection logs are included in **Appendix C**.

4.2.2 Summary of Results

Inspections reveal broken concrete and sparsely vegetated spots in several of the AOIs, thus posing a potential risk for direct contact with soils. March, June, September and December 2011inspection logs are included in **Appendix C**.

4.2.3 Plan Modifications

Consideration of long term solutions for providing adequate cover to the areas is in the design phase. ARCADIS is currently evaluating options (soil, stone, concrete, asphalt) to cover these areas as well as cost, maintenance and life of the surface cover. ARCADIS anticipates implementation of cover installation to these areas later in2012.

4.3 **CSX Property Lead Impacted Soil**

RACER and ARCADIS continued to pursue an access agreement with CSX during 2011. The access agreement is required in order to complete excavation of impacted soils on CSX property

5. Non-CMI Activity Summary

5.1 Outfall Maintenance

RACER maintains oil absorbent booms and oil containment booms at Outfalls 002, 003, 004 and 005 in order to contain periodic oil sheens at the Flint River. The booms at each outfall consists of an initial line of oil absorbent booms to contain and absorb during normal outfall flow and an oil containment boom set farther out to contain any discharge during high flow events. A secondary oil containment boom line is set up on an as needed basis to provide an additional level of protection. All booms are installed in such a manner that allows them to adjust to the fluctuating river level. The outfall containment areas are currently inspected for oil/debris accumulation, absorbent boom saturation, and that the containment booms are in good condition and functioning properly on a daily basis. Based on visual observations, the booms are changed on an as-needed basis to ensure proper working order. In addition, accumulated oil and debris in the outfall containment areas are cleaned via vacuum extraction and oil absorbent slabs on an as-needed basis to prevent potential environmental releases.

5.2 Storm Sewer Studies

Absorbent boom studies were conducted in the on Site storm sewers for Outfalls 002 and 004 to identify areas of potential oil infiltration. The installed absorbent booms were monitored weekly for oil saturation. Upon review of the observations additional booms were installed upgradient or downgradient to determine locations of infiltration. The boom studies were complete at Outfalls 002 and 004 in 2011. Additional boom studies will be conducted along Outfall 003 in 2012. Based on the results of the Outfall 002 boom study, evaluation of Site data and design activities for minimizing oil leaving the Site in the line leading to Outfall 002 will be conducted in 2012.

In addition oil absorbent booms are maintained in select on Site manholes along the storm sewer lines associated with Outfalls 002 and 005 to capture oil and prevent it from reaching the outfalls. The booms are inspected on a bi-weekly basis. Based on visual inspections the booms are changed on an as-needed basis to ensure proper working order and disposed appropriately.

5.3 Outfall 003/004 Storm Water Diversion and Treatment System

The Outfall 003/004 System serves to remove oils and sediment in the Outfall 003 and 004 storm sewers prior to reaching the Flint River. The general concept of the System was to modify two existing storm water vaults to divert water into a newly constructed treatment system and finally return treated water to the storm sewer network. Major system components include an oil-water separator, BaySeparator™ debris removal

system, HDPE conveyance piping, overflow weirs, and above ground structures (bollards, fencing, etc.). Storm water enters the System via a 12-inch and an 8-inch HDPE pipe inlet diverted from two existing storm water vaults (manholes MH 3-6 and 4-6, respectively). Steel overflow weirs were installed in each vault to aid in the diversion process. Sediment, debris, and oils are then captured in the BaySeparator™ consisting of a dual manhole system. Water then travels through an oil-water separator removing floating and emulsified oils. Finally, treated water is returned to the Outfall 003 storm sewer for discharge into the nearby Flint River.

The Outfall 003/004 System continues to operate and is maintained at least once per week. Water levels and oil levels are actively being monitored in vaults, the BaySeparator™ manholes, and the oil-water separator. Storm water downstream of the System is also being monitored in manholes as well as the Flint River outfalls to check for accumulating oils. Routine maintenance events were scheduled based on field observations and levels; including removal of debris and trash racks from the diversion structures, jetting of HDPE piping to clear blockage, and a cleaning event of the BaySeparator^{TM} system. The BaySeparator^{TM} cleaning event included removal of oil and sediment utilizing a vacuum box and power washing the surfaces to ensure all material was removed.

5.4 RCRA WMU Closures

Ten historic RCRA Waste Management Units (WMUs) are present at the Site. In April 2007, a *RCRA Waste Management Unit Closure Status Report* (Closure Status Report) was submitted to the Michigan Department of Environmental Quality (MDEQ) – Waste and Hazardous Materials Division (WHMD) summarizing 10 WMU areas and the proposed activities / information required for closure (ARCADIS BBL, 2007). The locations of the WMUs are presented on **Figure 14.** The WMUs are identified as:

- Factory 36, Building 36, Engine Plant Northeast Dock (WMU #1)
- Division 25, East of Factory 10, Outside Waste Thinner Tank (WMU #2)
- Factory 10, Building 20, Transmission Plant Tank Area (WMU #3)
- Factory 10, Salvage Yard Tank Storage Area (WMU #4)
- Factory 10, Salvage Yard Container Storage Area (WMU #5)
- Factory 31, Building 32, Axle Plant North Dock (WMU #6)

- Building 41A, Assembly Plant Waste Storage Tank Area (WMU #7)
- Building 02, Container Storage Area (WMU #8)
- Division 29, Building 23, Tool Manufacturing Cyanide Container Storage Area (WMU #9)
- Factory 86, Building 04, Assembly Plant Waste Storage Tanks (WMU #10)

In July 2009, the MDEQ – WHMD issued a response to the Closure Status Report detailing guidance on the activities needed to obtain closure of the 10 WMU areas (MDEQ, 2009). The MDEQ letter also concurred with the clean closure of WMU # 9 and deferred WMU #3 to corrective action and stated that the work proposed for closure would be conducted as part of ongoing Site activities.

The WMUs were addressed in three closure work plans; WMU #1 work plan, the Northend work plan (WMU #2, 4, 5, and 6), and the Southend work plan (WMU #7, 8, and 10).

The closure work plan approval for WMU #1 was approved by the MDEQ in 2010. Closure activities for the Factory 36 WMU, WMU #1 were completed in 2011 and a Certification of Closure was submitted to the MDEQ in June 2011. WMU #1 received Closure status from the MDEQ on September 20, 2011.

The Northend WMU closure work plan received approval from the MDEQ on August 4, 2011. Closure activities including industrial cleaning and sampling of existing tanks and the secondary containment in WMU #4 and 5 was completed on October 10, 2011. Closure sampling activities for WMU #4, 5, and 6 including concrete coring and collection of soil samples were completed on December 15, 2011. A subsurface concrete slab was encountered during closure sampling activities at WMU #2 requiring additional guidance from the MDEQ. This work was concluded in January 2012. ARCADIS is currently evaluating the analytical results and preparing a closure report for the Northend WMUs for submittal to the MDEQ.

The Southend WMU closure work plan received approval from the MDEQ on October 7, 2011. Closure sampling activities for WMU #7, 8, and 10 including concrete coring and collection of soil samples were completed in January 2012. ARCADIS is currently evaluating the analytical results and preparing a closure report for the Southend WMUs for submittal to the MDEQ.

Notes:

1. Groundwater elevation relative to the National Geodetic Vertical Datum (NGVD) of 1929.

2 - The equivalent groundwater (GW) elevation is calculated where LNAPL is present using the LNAPL surface elevation, the thickness of LNAPL and the approximate specific density of the LNAPL. The calculation is as follows:

Equivalent GW elevation = LNAPL surface elevation - ((1-specific density of the LNAPL) x LNAPL thickness)

GPS - Global positioning system

NA = Not available.

-- = Not applicable.

*Depth to water measurements were collected for selected wells within the Factory 36 area that previously were not accessible due to demolition activities.

ft amsl - feet above mean seal level

Notes:
ºC = Celsius.
mg/L = milligrams per liter.
mV = millivolts.
NTUs = Nephelometric Turbidity Units.
SU = Standard Units.
mS/cm = milliSiemens per centimeter.
NS = not sampled.

Table 7. 2011 Annual Groundwater Sampling Event and Historical Groundwater Analytical Data, 2011 CMI Annual Report
RACER Trust, NAO Flint Operations Site, Flint, Michigan

General Notes:
Samples were collected by ARCADIS., and submitted Merit Laboratories, for analysis of MDEQ List volatile organic compounds, select inorganics and PCBs.
Duplicate results are presented in brackets.
Groundwater concentrations are presented in milligrams per liter (mg/L).
Total Xylenes reported as the sum of m&p-Xylene and o-Xylene.
Highlighted cells represent constituent concentrations that exceed at least one of the listed Michigan Part 201 Criteria:

RDW = Residential Drinking Water criteria, updated March 2011.
NDW = Non-Residential Drinking Water criteria, updated March 2011.
GSI = Groundwater/Surface Water Interaction criteria, updated December 2010.
GCC = Groundwater Contact criteria, updated March 2011.
GAI = Groundwater Acute Inhalation Screening Level, updated March 2011.
RGVIA = Residential Groundwater Volatilization to Indoor Air Inhalation criteria, updated March 2011.
NGVIA = Non-Residential Groundwater Volatilization to Indoor Air Inhalation criteria, updated March 2011.
FE = Flammability and Explosivity Screening Level, updated March 2011.

GSI criteria compared to samples located within 500 feet of the Flint River, which includes wells: RFI-94-11, RFI-94-10, RFI-84-11S, RFI-84-09S, RFI-84-09D, RFI-84-12, RFI-17-02D, RFI-17-02, RFI-84-06R, RFI-09-48, RFI-09-46, MW-23, MW-26.

Data Qualifiers:
U = Not detected. The value represents the associated detection limit.
NS = Not analyzed for this constituent.
D = Concentration is based on a diluted sample analysis.
J = The compound/constituent was positively identified; however, the associated numerical value is an estimated concentration only.
E = Measured concentration exceeded the linear range of the instrument. A diluted sample analysis was run; however, the undiluted result was chosen as representative of the sample concentration.
R = Indicates that the previously reported detection limit or sample result has been rejected due to a major deficiency in the data generation procedure. The data shall not be used for any qualitative or quantitative purposes.
Y = Elevated reporting limit due to high target concentration.

MDEQ Criteria Qualifiers:
ID = *Inadequate data* to develop criterion.
NA = Criterion or value is *not available* or, as is the case for Csat, *not applicable*.
{A} = Criterion is the State of Michigan Drinking Water Standard established pursuant to Section 5 of the Safe Drinking Water Act, Act No. 399 of the Public Acts of 1976.
{D} = Calculated criterion exceeds 100%, hence it is reduced to 100% (i.e., 1.0E+9 ppb). Evaluation of free phase contaminant, environmental impacts, adverse aesthetics and acute or local toxicity is required.
{E} = Criterion is the aesthetic drinking water value, as required by Sec. 20120(1)(5). A Notice of Aesthetic Impact may be employed as an institutional control mechanism where groundwater concentrations exceed the aesthetic DWC, but do not exceed the applicable health-based DWC. Health-based DWC are provided in the table below.

Hazardous Substance	CAS #	Residential Health-Based DWC	Non-Residential Health-Based DWC
Aluminum	7429905	300	4,100
Copper	7440508	1,400	4,000
Diethyl ether	60297	3,700	10,000
Ethylbenzene	100414	700	700
Iron	7439896	2,000	5,600
Manganese	7439965	860	2,500
Methyl-tert-butyl ether (MTBE)	1634044	240	690
Toluene	108883	1,000	1,000
1,2,4-Trimethylbenzene	95636	1,000	2,900
1,3,5-Trimethylbenzene	108678	1,000	2,900
Xylenes	1330207	10,000	10,000

{G} = GSI criterion is pH or water hardness dependent. The Final Chronic Value (FCV) for the protection of aquatic life must be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg CaCO3/L, use 400 mg CaCO3/L for the FCV calculation. The FCV formula provides values in units of ug/L (ppb). The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 X GSI and the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote.

Hazardous Substance	FCV Formula (ug/L)	FCV Conversion Factor (CF)	WV (ug/L)	HNDV (ug/L)
Barium[X]	EXP(1.0629*(LnH)+1.1869)	NA	NA	1.6E+5
Beryllium	EXP(2.5279*(LnH)-10.7689)	NA	NA	1,200
Cadmium[X]	(EXP(0.7852*(LnH)-2.715))*CF	1.101672-((LnH)*0.04184)	NA	130
Chromium (III)[X]	(EXP(0.819*(LnH)+0.6848))*CF	0.86	NA	9,400
Copper	(EXP(0.8545*(LnH)-1.702))*CF	0.96	NA	64,000
Lead[X]	(EXP(1.273*(LnH)-3.296))*CF	1.46203-((LnH)*0.14571)	NA	190
Manganese	EXP(0.8784*(LnH)+2.226)	NA	NA	59,000
Nickel	(EXP(0.846*(LnH)+0.0584))*CF	0.997	NA	2.1E+5
Pentachlorophenol[X]	EXP(1.005*(pH)-5.134)	NA	NA	2.8
Zinc	(EXP(0.8473*(LnH)+0.884))*CF	0.986	NA	22,000

Where,
EXP(x) = The base of the natural logarithm raised to power x (e^x).
LnH = The natural logarithm of water hardness in mg $CaCO_3$/L.
SS = Total suspended solids in mg/L.
* = The multiplication symbol.
[X] = The GSI criterion developed here may not be protective for surface water that is used as a drinking water source. Refer to footnote {X} for further guidance.

Table 7. 2011 Annual Groundwater Sampling Event and Historical Groundwater Analytical Data, 2011 CMI Annual Report
RACER Trust, NAO Flint Operations Site, Flint, Michigan

MDEQ Criteria Qualifiers (Cont'd.):

A spreadsheet that may be used to calculate GSI and GSI PC for {G} footnoted hazardous substances is available at http://www.deq.state.mi.us/erd.

{I} = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 CFR 261.21.
{J} = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to criteria.
{M} = Calculated criterion is below the analytical Target Detection Limit (TDL), therefore, the criterion defaults to the TDL.
{R} = Hazardous substance may exhibit the characteristic of reactivity as defined in 40 CFR 261.23.
{S} = Criterion defaults to the chemical-specific water solubility limit.
{W} = Concentrations of trihalomethanes in groundwater must be added together to determine compliance with the State of Michigan Drinking Water Standard of 100 ug/L. Concentrations of trihalomethanes in soil must be added together to det compliance with the DWPC of 2,000 ug/kg.
{X} = The GSI criterion shown is not protective for surface water that is used as a drinking water source. For groundwater discharges to the Great Lakes and their connecting waters or discharges in close proximity to water supply intake(s) in inl surface waters, the generic GSI criterion is the Surface Water Human Drinking Water Value (HDV) listed in the table below except for those HDV indicated with an asterisk. For HDV with an asterisk, the generic GSI criterion is the lesser of HDV, the WV and the calculated FCV (see formulas in footnote {G}). Soil protection criteria based on the HDV are listed below except for those values with an asterisk. Soil GSI protection criteria for compounds with an asterisk are the gre the 20 X GSI and GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote.

Hazardous Substance	Chemical Abstract Service Number	Surface Water Human Drinking Water Values (HDV) (ug/L)	Soil GSI Protection Criteria for HDV (ug/Kg)
Acrylonitrile	107131	2.0 (M); 0.87	100 (M); 17
Alachlor	15972608	3.5	91

Table 8. 2011 NPMP Monitoring Points and Rationale, 2011 CMI Annual Report
RACER Trust, NAO Flint Operations Site, Flint, Michigan

Outfall	Monitoring Point	Current Frequency	Sample Type	Analytes	Sampling Rationale
001	MP001	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs and metals were detected in the sample collected from Outfall 001 in support of the 2010 NPDES Permit (permit); therefore, the NPMP samples collected from Outfall 001 have been analyzed for VOCs (MDNRE list) and metals [1]. Cyanide was not detected in the sample collected from Outfall 001 in support of the permit; however, cyanide was detected above criteria in groundwater samples collected from the Outfall 001 drainage area; therefore, the NPMP samples collected from Outfall 001 have been analyzed for cyanide in order to monitor the storm sewers for possible infiltration of cyanide impacted groundwater. TSS was added in February 2011 to monitor the trend between total suspended solids and metal concentrations.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 001 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 001 drainage area; therefore, a yearly sample has been collected from Outfall 001 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
002	MP002	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs and metals were detected in the sample collected from Outfall 002 in support of the permit; therefore, the NPMP samples collected from Outfall 002 have been analyzed for VOCs (MDNRE list) and metals[1]. Cyanide was not detected in the sample collected from Outfall 002 in support of the permit; however, cyanide was detected above criteria in groundwater samples collected from the Outfall 002 drainage area; therefore, the NPMP samples collected from Outfall 002 have been analyzed for cyanide in order to monitor the storm sewers for possible infiltration of cyanide impacted groundwater. TSS was added in February 2011 to monitor the trend between total suspended solids and metal concentrations.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 002 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 002 drainage area; therefore, a yearly sample has been collected from Outfall 002 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
003	MP003	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select metals were detected in the sample collected from Outfall 003 in support of the permit; therefore, the NPMP samples collected from Outfall 003 have been analyzed for metals[1]. VOCs and cyanide were not detected in the sample from Outfall 003 in support of the permit; however, VOCs and cyanide were detected above criteria in groundwater samples collected from the Outfall 003 drainage area; therefore, the NPMP samples collected from Outfall 003 have been analyzed for VOCs and cyanide in order to monitor the storm sewers for possible infiltration of impacted groundwater. Oil and grease was not detected in the sample collected from Outfall 001 in support of the permit and there is not a GSI criteria for this analyte; therefore, oil and grease will not be analyzed for in the NPMP.
		Monthly	Dry weather - 24-hr Composite	PCBs	PCBs were not detected in the sample collected from Outfall 003 in support of the permit. However due to the presence of PCB-containing LNAPL in the Outfall 003 drainage area and the presence of oil in the storm sewer, the NPMP samples collected from Outfall 003 will be analyzed for PCBs.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 003 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 003 drainage area; therefore, a yearly sample will be collected from Outfall 003 and analyzed for SVOCs(MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.

Table 8. 2011 NPMP Monitoring Points and Rationale, 2011 CMI Annual Report
RACER Trust, NAO Flint Operations Site, Flint, Michigan

Outfall	Monitoring Point	Current Frequency	Sample Type	Analytes	Sampling Rationale
005	MP005	Monthly	Dry weather - Grab	Metals [1] Cyanide	Select metals were detected in the sample collected from Outfall 005 in support of the permit; therefore, the NPMP samples collected from Outfall 005 will be analyzed for metals[1]. Cyanide was not detected in the sample collected from Outfall 005 in support of the permit; however, cyanide was detected above criteria in groundwater samples collected from the Outfall 005 drainage area; therefore, the NPMP samples collected from Outfall 005 will be analyzed for cyanide in order to monitor the storm sewers for possible infiltration of cyanide impacted groundwater. TSS was added in February 2011 to monitor the trend between total suspended solids and metal concentrations.
		Monthly	Dry weather - 24-hr Composite	PCBs	PCBs were not detected in the sample collected from Outfall 005 in support of the permit. However due to the presence of PCB-containing LNAPL in the Outfall 005 drainage area and the presence of oil in the storm sewer, the NPMP samples collected from Outfall 005 have been analyzed for PCBs.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 005 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 005 drainage area; therefore, a yearly sample has been collected from Outfall 005 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
006	MP006	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs and metals were detected in the sample collected from Outfall 006 in support of the 2010 NPDES Permit (permit); therefore, the NPMP samples collected from Outfall 006 have been analyzed for VOCs (MDNRE list) and metals [1]. Cyanide was not detected in the sample collected from Outfall 006 in support of the permit; however, cyanide was detected above criteria in groundwater samples collected from the Outfall 006 drainage area; therefore, the NPMP samples collected from Outfall 006 have been analyzed for cyanide in order to monitor the storm sewers for possible infiltration of cyanide impacted groundwater. TSS was added in February 2011 to monitor the trend between total suspended solids and metal concentrations.
007	MP007	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs and metals were detected in the sample collected from Outfall 007 in support of the permit; therefore, the NPMP samples collected from Outfall 007 have been analyzed for VOCs (MDNRE list) and metals[1]. Cyanide was not detected in the sample collected from Outfall 007 in support of the permit; however, cyanide was detected above criteria in groundwater samples collected from the Outfall 007 drainage area; therefore, the NPMP samples collected from Outfall 007 have been analyzed for cyanide in order to monitor the storm sewers for possible infiltration of cyanide impacted groundwater. TSS was added in February 2011 to monitor the trend between total suspended solids and metal concentrations.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 007 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 007 drainage area; therefore, a yearly sample has been collected from Outfall 007 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.

RACER Trust, NAO Flint Operations Site, Flint, Michigan

Outfall	Monitoring Point	Current Frequency	Sample Type	Analytes	Sampling Rationale
009	MP009	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs and metals were detected in the sample collected from Outfall 009 in support of the 2010 NPDES Permit (permit); therefore, the NPMP samples collected from Outfall 009 have been analyzed for VOCs (MDNRE list) and metals [1]. Cyanide was not detected in the sample collected from Outfall 009 in support of the permit; however, cyanide was detected above criteria in groundwater samples collected from the Outfall 009 drainage area; therefore, the NPMP samples collected from Outfall 009 have been analyzed for cyanide in order to monitor the storm sewers for possible infiltration of cyanide impacted groundwater. TSS was added in February 2011 to monitor the trend between total suspended solids and metal concentrations.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 009 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 009 drainage area; therefore, a yearly sample has been collected from Outfall 009 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
010	MP010	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs, metals, and cyanide were detected in the sample collected from Outfall 010 in support of the 2010 NPDES Permit (permit); therefore, the NPMP samples collected from Outfall 010 have been analyzed for VOCs (MDNRE list), metals [1], and cyanide. TSS was added in February 2011 to monitor the trend between total suspended solids and metal concentrations.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 010 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 010 drainage area; therefore, a yearly sample has been collected from Outfall 010 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
011	DP011	Monthly	Dry weather - Grab	VOCs (MDNRE List) Metals [1] Cyanide	Select VOCs, metals, and cyanide were detected in the sample collected from Outfall 011 in support of the 2010 NPDES Permit (permit); therefore, the NPMP samples collected from Outfall 011 have been analyzed for VOCs (MDNRE list), metals [1], and cyanide. TSS was added in February 2011 to monitor the trend between total suspended solids and metal concentrations.
		Yearly [2]	Dry weather - Grab	SVOCs (MDNRE List)	SVOCs were not detected in the sample collected from Outfall 011 in support of the permit and therefore were not included in the NPMP monthly sampling. However, SVOCs were detected above criteria in groundwater samples collected from the Outfall 011 drainage area; therefore, a yearly sample has been collected from Outfall 011 and analyzed for SVOCs (MDNRE List) in order to monitor the storm sewers for possible infiltration of SVOC impacted groundwater.
013	MP013	Monthly	Dry weather - Grab	Metals [1] Cyanide	Select metals and cyanide were detected in the sample collected from Outfall 013 in support of the permit; therefore, the NPMP samples collected from Outfall 013 has been analyzed for metals[1] and cyanide. TSS was added in February 2011 to monitor the trend between total suspended solids and metal concentrations.

Notes:

1. Metals analysis to include - Ag, As, Ba, Be, Cd, Cr (total), Co, Cu, Hg, Mn, Ni, Pb, Sb, Se,Tl, V, and Zn
2. SVOCs will be collected on a yearly basis for the first three years of the NPMP (ending in 2012).
3. Upgradient sampling locations (MH 1-7, MH 3-31, MH 3-51, MH 4-21, and MH 13-14) collected in August 2011 were analyzed for select metals[1] and cyanide.

NOTES:

1. BASE MAP INFORMATION FROM A SURVEY BY BMJ, INC. DATED SEPTEMBER 2001, AT A SCALE OF 1:100.
2. ALL LOCATIONS ARE APPROXIMATE.

LEGEND:

- MONITORING WELL
- ABANDONED MONITORING WELL
- RECOVERY WELL
- PIEZOMETER LOCATION
- RFI SOIL BORING/GRAB GROUNDWATER SAMPLE LOCATION
- RACER PROPERTY BOUNDARY
- PROPERTY OWNED BY OTHERS
- APPROXIMATE AOI BOUNDARY
- BASEMENT/TUNNEL AREA
- DEMOLISHED BUILDING
- ESTIMATED CURRENT LIMITS OF MEASURABLE LNAPL
- ESTIMATED AREA WHERE VOCs AND/OR SVOCs EXCEED MICHIGAN PART 201 GENERIC INDUSTRIAL SCREENING CRITERIA IN GROUNDWATER
- ESTIMATED AREA WHERE INORGANICS EXCEED MICHIGAN PART 201 GENERIC INDUSTRIAL SCREENING CRITERIA IN GROUNDWATER
- 710.79 GROUNDWATER ELEVATION (IN FEET)
- 726 GROUNDWATER ELEVATION CONTOUR (IN FEET)
- GENERALIZED FLOW DIRECTION
- (710.79) ANOMALOUS GROUNDWATER ELEVATION (IN FEET) NOT USED TO GENERATE GROUNDWATER ELEVATION CONTOURS
- LOCATION WHERE MEASURABLE LNAPL HAS BEEN DETECTED IN 2011

-Direct Sensing Report-

Client:	**ARCADIS**
Project Name:	**Buick City**
Location:	**Flint, MI**
Project Number:	**135-MNDS-11UV**

The analysis and opinions expressed in this report are based upon data obtained from UVOST logs generated (and samples collected for emulations if applicable) at the location specified, and from other information discussed in this report. Exceptions, if any, are discussed in the accompanying discussion if applicable. This report is prepared for the exclusive use of our client for specific application to the project discussed and has been prepared in accordance with generally accepted practices. Reported results shall not be reproduced, except in full, without written approval of the lab. The sample results relate only to the analytes of interest tested. No warranties, expressed or implied are intended or made.

I certify that the data contained in this final report has been generated and reviewed in accordance with approved methods and our Standard Operating Procedure. Release of this final report is authorized by Laboratory management, which is verified by the following signature.

_____ _____

Approval Signature Date

LIF SYSTEM DESCRIPTION & ANALYSIS

UVOST

Fluorescence is a property of some compounds where absorbed UV light stimulates the emission of photons (light) of a longer wavelength relative to the source emission. The release of the photons can be used to detect small amounts of substance (i.e. polycyclic aromatic hydrocarbons or PAHs) in a larger matrix (soil). This method of detection has been used in laboratories for decades. Now, with the availability of lasers and optical fibers, this technology can be applied down hole in the field.

The UVOST system sends light (via 308 nm laser) through a fiber optic cable strung within probe rods. The light, reflected by a parabolic mirror, then exits through a sapphire window in the side of the probe. As the probe is advanced, the soil is exposed to the UV laser light. If PAHs are present (compounds in POLs that fluoresce, i.e. LNAPL) longer wavelength light is emitted by the contaminants. This "signal" light is transmitted through a fiber, back up hole to be analyzed. Responses are indicated in real-time on a graph of signal vs. depth. The UVOST log displays "color mixed" signal logs (contributions from 4 channels) and waveforms ("fingerprint" of multi-wavelength) to aid in identification of the contaminant present.

Prior to every log the UVOST system is checked for optical quality by observing the background signal for sources of signal in the fiber, filter, mirror and sapphire window. Also, the reference emitter (a standard proprietary NAPL mixture called the "RE") is placed on the window to determine the qualitative and semi-quantitative properties of the laser system. This is to assure that the RE response has the correct shape and intensity and that the UVOST system is ready to log. Typically the RE will fall between 10,000 and 12,000 pVs (picovolt-seconds, a measure of waveform area) and the background can vary from 0.1% to 1% (area of about 0-100 pVs). It is important to remember that the relationship between the NAPL in the ground and the RE depends on that particular NAPL. The calibration of the system is not to a concentration, but to a known fluorescence signature.

EC (Electrical Conductivity)

Electrical Conductivity (EC) is a measure of the soils ability to conduct an electrical current between two dipoles on the LIF/EC probe. Conductivity is the reciprocal of electrical resistivity and has the units (in our application) of millisiemens per meter (mS/m). Since soil is in the pathway of the charge flow, the grain size can be determined by comparing the EC log to a soil boring. Conductivity readings in the 100s indicate smaller grain (size such as clay). Larger grain size (sand and gravels) are typically in the 10s of mS/m range. Prior to every log the EC point of the UVOST probe is checked for proper operation by performing a voltage test with a voltage meter and a conductivity test with a test block.

UVOST Log Reference Guide

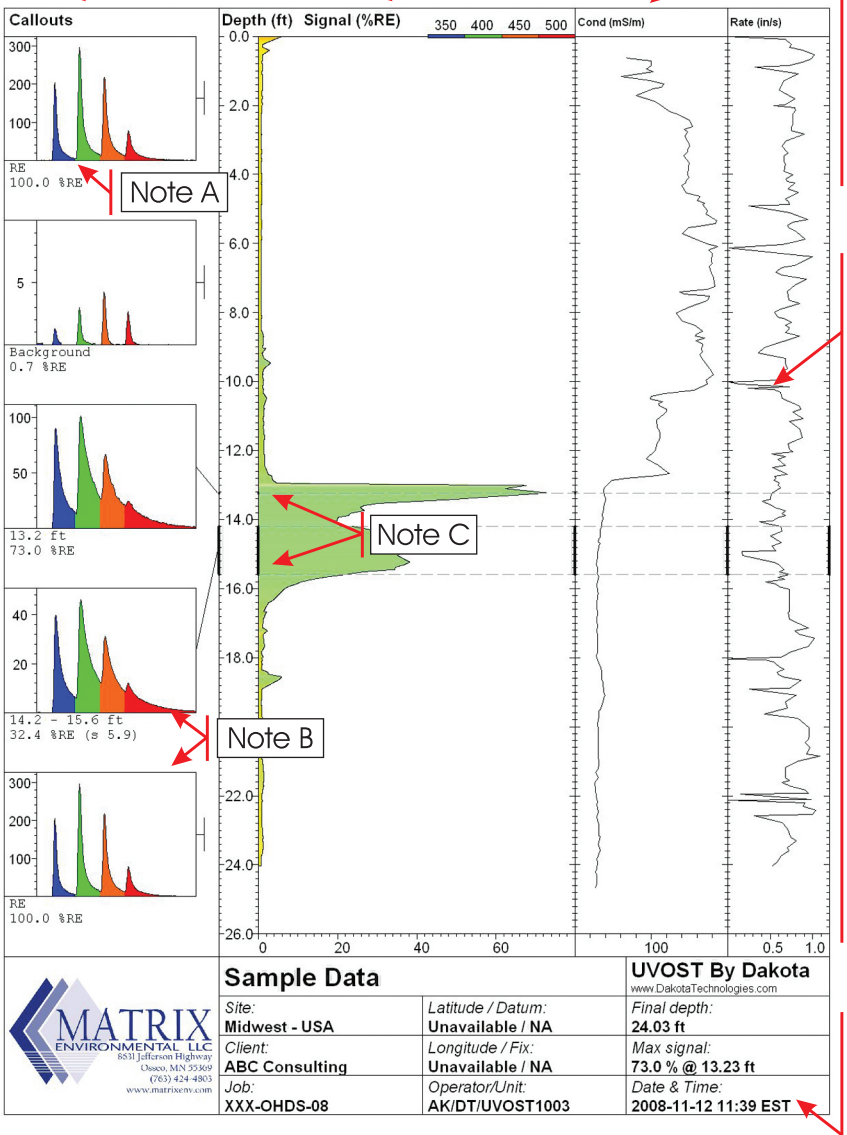

Main Plot :
Signal (total fluorescence) versus depth where signal is relative to the Reference Emitter (RE).The total area of the waveform is divided by the total area of the Reference Emitter yielding the %RE.This %RE scales with the NAPL fluorescence. The fill color is based on relative contribution of each channel's area to the total waveform area (see callout waveform).The channel-to-color relationship and corresponding wavelengths are given in the upper right corner of the main plot.

Callouts :
Waveforms from selected depths or depth ranges showing the multi-wavelength waveform for that depth.

The four peaks are due to fluorescence at four wavelengths and referred to as “channels”. Each channel is assigned a color.

Various NAPLs will have a unique waveform “fingerprint” due to the relative amplitude of the four channels and/or broadening of one or more channels.

Basic waveform statistics and any operator notes are given below the callout.

Conductivity Plot :
The Electrical Conductivity (EC) of the soil can be logged simultaneously with the UVOSTdata. EC often provides insight into the stratigraphy.
Note the drop in EC from 10 - 13 ft, indicating a shift from consolidated to unconsolidated stratigraphy.This correlates with the observed NAPL distribution.

Rate Plot :
The rate of probe advancement. ~ 0.8 in (2cm) per second is preferred.

A noticeable decrease in the rate of advancement may be indicative of difficult probing conditions (gravel, angular sands, etc.).

Notice that this log was terminated arbitrarily, not due to "refusal", which would have been indicated by a sudden rate drop at final depth.

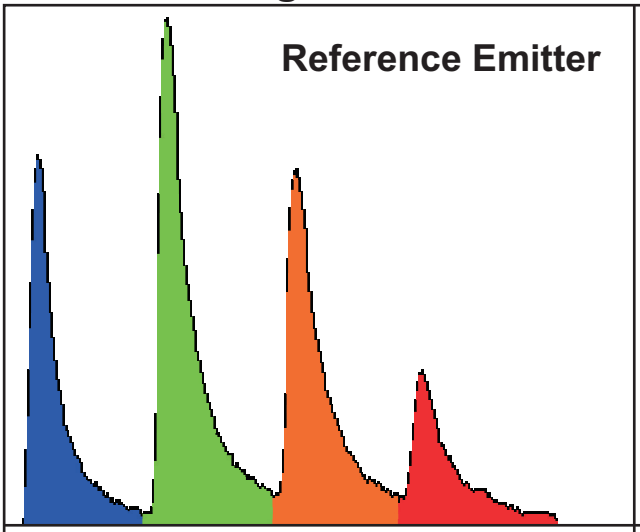

Info Box :
Contains pertinent log info including name and location.

NoteA:
Time is along the x axis. No scale is given, but it is a consistent 320ns wide.
The y axis is in mV and directly corresponds to the amount of light striking the photodetector.

Note B :
These two waveforms are clearly different.The first is weathered diesel from the log itself while the second is the Reference Emitter (a blend of NAPLs) always taken before each log for calibration.

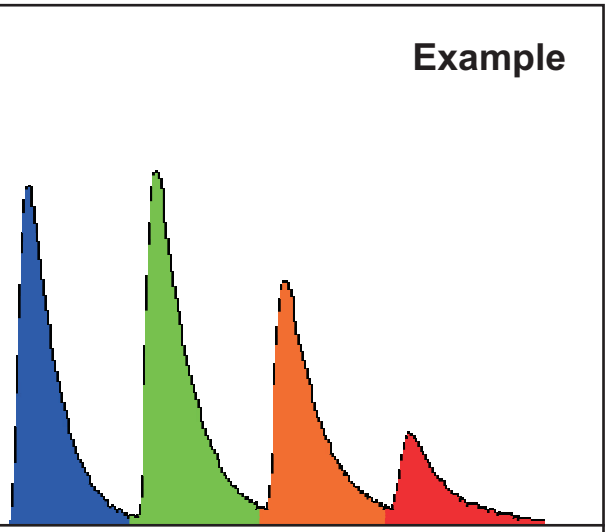

Note C :
Callouts can be a single depth (see 3rd callout) or a range (see 4th callout).The range is noted on the depth axis by a bold line. When the callout is a range, the average and standard deviation in %RE is given below the callout.

Waveform Signal Calculation

CH1		CH2		CH3		CH4		Total
4820	+	8108	+	6249	+	2984	=	**22161**
21.7		36.6		28.2		13.5		**100%**

Channel Area (pVs) Percent RE

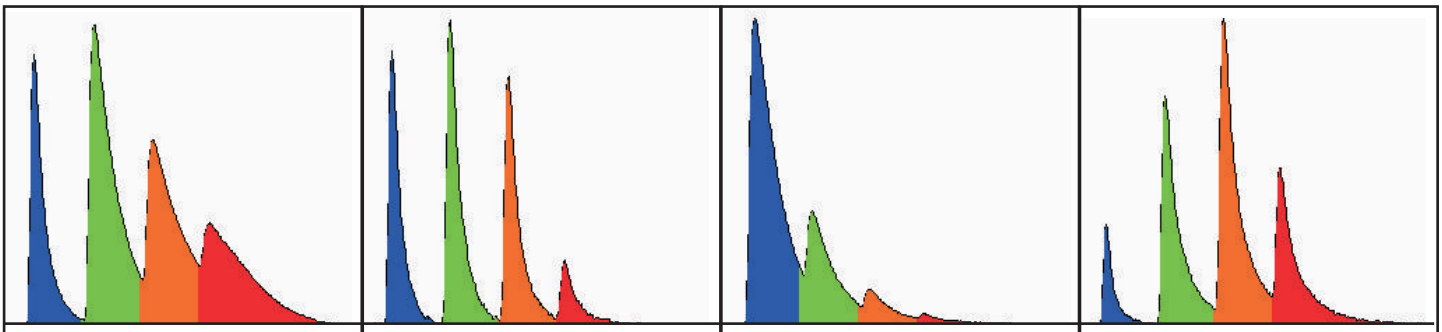

CH1		CH2		CH3		CH4		Total
4923	+	5743	+	4166	+	1735	=	**16587**
22.3		25.9		18.8		7.8		**75%**

Data Files

***.lif.raw.bin**	Raw data file. Header is ASCII format and contains information stored when the file was initially written (e.g. date, total depth, max signal, gps, etc., and any information entered by the operator). All raw waveforms are appended to the bottom of the file in a binary format.
***.lif.plt**	Stores the plot scheme history (e.g. callout depths) for associated Raw file. Transfer along with the Raw file in order to recall previous plots.
***.lif.jpg**	A jpg image of the OST log including the main signal vs. depth plot, callouts, information, etc.
***.lif.dat.txt**	Data export of a single Raw file. ASCII tab delimited format. No string header is provided for the columns (to make importing into other programs easier). Each row is a unique depth reading. The columns are: Depth, Total Signal (%RE), Ch1%, Ch2%, Ch3%, Ch4%, Rate, Conductivity Depth, Conductivity Signal. Summing channels 1 to 4 yields the Total Signal.
***.lif.sum.txt**	A summary file for a number of Raw files. ASCII tab delimited format. The file contains a string header. The summary includes one row for each Raw file and contains information for each file including: the file name, gps coordinates, max depth, max signal, and depth at which the max signal occured.
***.lif.log.txt**	An activity log generated automatically located in the OST application directory in the 'log' subfolder. Each OST unit the computer operates will generate a separate log file per month. A log file contains much of the header information contained within each separate Raw file, including: date, total depth, max signal, etc.

Common Waveforms (highly dependent on soil, weathering, etc.)

Report Summary

Lab Sample ID(s): S48170.01-S48170.12
Project: B0064410.2011.00801
Collected Date: 03/24/2011
Submitted Date/Time: 03/24/2011 14:50
Sampled by: Tony Maffeo
P.O. #: B0064410.2011.0

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Fibertec Project Number: 43806
Project Identification: 48170 /
Submittal Date: 03/24/2011

Ms. Paula Shaw
Merit Laboratories, Inc.
2680 East Lansing Drive
East Lansing, MI 48823

Dear Ms. Shaw,

Thank you for selecting Fibertec Environmental Services as your analytical laboratory. The samples you submitted have been analyzed in accordance with NELAC standards and the results compiled in the attached report. Any exceptions to NELAC compliance are noted in the report. These results apply only to those samples submitted. Please note samples will be disposed of 30 days after reporting date.

If you have any questions regarding these results or if we may be of further assistance to you, please contact me at (517) 699-0345.

Sincerely,

Daryl P. Strandbergh
Laboratory Director

1 Mercury (NN)	U		ng/L	0.51	1.0	03/31/11	PM11C31A	03/31/11	M511C31A

Definitions/ Qualifiers:

A: Spike recovery or precision unusable due to dilution.
B: The analyte was detected in the associated method blank.
E: The analyte was detected at a concentration greater than the calibration range, therefore the result is estimated.
J: The concentration is an estimated value.
M: Modified Method
U: The analyte was not detected at or above the reporting limit.
X: Matrix Interference has resulted in a raised reporting limit or distorted result.
W: Results reported on a wet-weight basis.
***:** Value reported is outside QA limits

Exception Summary:

ACCREDITED IN ACCORDANCE WITH nelac

Accreditation Number:

E-10395

Report Summary

Lab Sample ID(s): S48172.01-S48172.13
Project: B0064410.2011.00801
Collected Date: 03/24/2011
Submitted Date/Time: 03/24/2011 14:50
Sampled by: Tony Maffeo
P.O. #: B0064410.2011.0

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report Summary

Lab Sample ID(s): S48223.01
Project: B0064410.4010.00005
Collected Date: 03/29/2011
Submitted Date/Time: 03/31/2011 14:30
Sampled by: Corri Zilio
P.O. #: OPERATIONAL

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Report Summary

Lab Sample ID(s): S48565.01-S48565.13
Project: B0064410.2011.00801
Collected Date: 04/29/2011
Submitted Date/Time: 04/29/2011 14:10
Sampled by: Corri Zilio
P.O. #: B0064410.2011.0

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Friday, May 06, 2011

Fibertec Project Number: 44304
Project Identification: 48565 /
Submittal Date: 04/29/2011

Ms. Paula Shaw
Merit Laboratories, Inc.
2680 East Lansing Drive
East Lansing, MI 48823

Dear Ms. Shaw,

Thank you for selecting Fibertec Environmental Services as your analytical laboratory. The samples you submitted have been analyzed in accordance with NELAC standards and the results compiled in the attached report. Any exceptions to NELAC compliance are noted in the report. These results apply only to those samples submitted. Please note samples will be disposed of 30 days after reporting date.

Sample 44304-003 (48565.02 Filtered) was filtered upon reciept at laboratory on April 29, 2011.

If you have any questions regarding these results or if we may be of further assistance to you, please contact me at (517) 699-0345.

Sincerely,

Daryl P. Strandbergh
Laboratory Director

1 Mercury (NN)	**3.2**		ng/L	0.51	1.0	05/05/11	PM11E05A	05/05/11	M511E05A

Definitions/ Qualifiers:

A: Spike recovery or precision unusable due to dilution.
B: The analyte was detected in the associated method blank.
E: The analyte was detected at a concentration greater than the calibration range, therefore the result is estimated.
J: The concentration is an estimated value.
M: Modified Method
U: The analyte was not detected at or above the reporting limit.
X: Matrix Interference has resulted in a raised reporting limit or distorted result.
W: Results reported on a wet-weight basis.
***:** Value reported is outside QA limits

Exception Summary:

ACCREDITED IN ACCORDANCE WITH nelac

Accreditation Number:

E-10395

Report Summary

Lab Sample ID(s): S48574.01
Project: B0064410.4010.00005/ Flint NAO
Collected Date: 04/26/2011
Submitted Date/Time: 04/29/2011 14:10
Sampled by: Corri Zilio
P.O. #: MLI0001

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Report Summary

Lab Sample ID(s): S48758.01
Project: B0064410.2011.00801
Collected Date: 05/18/2011
Submitted Date/Time: 05/19/2011 14:30
Sampled by: Tony Maffeo
P.O. #: B0064410.2011.0

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report produced by

Merit Laboratories
2680 East Lansing Drive
East Lansing, MI 48823

Phone: (517) 332-0167 FAX: (517) 332-6333

Report Summary

Lab Sample ID(s): S48854.01-S48854.13
Project: Monitoring
Collected Date: 05/31/2011
Submitted Date/Time: 05/31/2011 15:10
Sampled by: DLN/AM
P.O. #: B0064410.2011.0

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Fibertec Project Number: 44784
Project Identification: 48854 /
Submittal Date: 05/31/2011

Ms. Paula Shaw
Merit Laboratories, Inc.
2680 East Lansing Drive
East Lansing, MI 48823

Dear Ms. Shaw,

Thank you for selecting Fibertec Environmental Services as your analytical laboratory. The samples you submitted have been analyzed in accordance with NELAC standards and the results compiled in the attached report. Any exceptions to NELAC compliance are noted in the report. These results apply only to those samples submitted. Please note samples will be disposed of 30 days after reporting date.

If you have any questions regarding these results or if we may be of further assistance to you, please contact me at (517) 699-0345.

Sincerely,

Daryl P. Strandbergh
Laboratory Director

1 Mercury (NN)	**1.4**		ng/L	0.51	1.0	06/07/11	PM11F07A	06/07/11	M511F07B

Definitions/ Qualifiers:

A: Spike recovery or precision unusable due to dilution.
B: The analyte was detected in the associated method blank.
E: The analyte was detected at a concentration greater than the calibration range, therefore the result is estimated.
J: The concentration is an estimated value.
M: Modified Method
U: The analyte was not detected at or above the reporting limit.
X: Matrix Interference has resulted in a raised reporting limit or distorted result.
W: Results reported on a wet-weight basis.
***:** Value reported is outside QA limits

Exception Summary:

ACCREDITED IN ACCORDANCE WITH nelac

Accreditation Number:

E-10395

Report Summary

Lab Sample ID(s): S48857.01-S48857.14
Project: B0064410.2011.00801
Collected Date: 05/31/2011
Submitted Date/Time: 05/31/2011 15:10
Sampled by: DLN/AM
P.O. #: B0064410.2011.0

* Thallium reported instead of titanium.

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Samples are held by the lab for 30 days from the sample submittal date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report Summary

Lab Sample ID(s): S49112.01
Project: B0064410.4011.00001
Collected Date: 06/21/2011
Submitted Date/Time: 06/22/2011 14:00
Sampled by: DLN
P.O. #: MLI0001

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Fibertec Project Number: 45180
Project Identification: 49154 /
Submittal Date: 06/27/2011

Ms. Paula Shaw
Merit Laboratories, Inc.
2680 East Lansing Drive
East Lansing, MI 48823

Dear Ms. Shaw,

Thank you for selecting Fibertec Environmental Services as your analytical laboratory. The samples you submitted have been analyzed in accordance with NELAC standards and the results compiled in the attached report. Any exceptions to NELAC compliance are noted in the report. These results apply only to those samples submitted. Please note samples will be disposed of 30 days after reporting date.

If you have any questions regarding these results or if we may be of further assistance to you, please contact me at (517) 699-0345.

Sincerely,

Daryl P. Strandbergh
Laboratory Director

DPS/kc

Mercury by CVAFS, Low-Level, Total (EPA 1631E) **Aliquot ID: 45180-015** **Matrix: Ground Water** **Analyst: JLH**

Parameter(s)	Result	Q	Units	Reporting Limit	Dilution	Prep Date	Prep Batch	Analysis Date	Analysis Batch
1 Mercury (NN)	U		ng/L	0.51	1.0	06/29/11	PM11F29D	06/29/11	M511F29B

Definitions/ Qualifiers:

A: Spike recovery or precision unusable due to dilution.
B: The analyte was detected in the associated method blank.
E: The analyte was detected at a concentration greater than the calibration range, therefore the result is estimated.
J: The concentration is an estimated value.
M: Modified Method
U: The analyte was not detected at or above the reporting limit.
X: Matrix Interference has resulted in a raised reporting limit or distorted result.
W: Results reported on a wet-weight basis.
***:** Value reported is outside QA limits

Report Summary

Lab Sample ID(s): S49155.01-S49155.15
Project: B0064410.2011.00801
Collected Date: 06/27/2011
Submitted Date/Time: 06/27/2011 14:40
Sampled by: DLN/AO
P.O. #: B0064410.2011.0

* Thallium reported instead of titanium.

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Samples are held by the lab for 30 days from the sample submittal date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Phone: (517) 332-0167 FAX: (517) 332-6333

Report Summary

Lab Sample ID(s): S49173.01
Project: B0064410.2011.00801
Collected Date: 06/27/2011
Submitted Date/Time: 06/28/2011 14:10
Sampled by: DLN
P.O. #: MLT-1295

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Fibertec
environmental
services

Monday, July 25, 2011

Fibertec Project Number: 45434
Project Identification: 49336 /
Submittal Date: 07/14/2011

Ms. Paula Shaw
Merit Laboratories, Inc.
2680 East Lansing Drive
East Lansing, MI 48823

Dear Ms. Shaw,

Thank you for selecting Fibertec Environmental Services as your analytical laboratory. The samples you submitted have been analyzed in accordance with NELAC standards and the results compiled in the attached report. Any exceptions to NELAC compliance are noted in the report. These results apply only to those samples submitted. Please note samples will be disposed of 30 days after reporting date.

If you have any questions regarding these results or if we may be of further assistance to you, please contact me at (517) 699-0345.

Sincerely,

Daryl P. Strandbergh
Laboratory Director

DPS/kc

Definitions/ Qualifiers:

A: Spike recovery or precision unusable due to dilution.
B: The analyte was detected in the associated method blank.
E: The analyte was detected at a concentration greater than the calibration range, therefore the result is estimated.
J: The concentration is an estimated value.
M: Modified Method
U: The analyte was not detected at or above the reporting limit.
X: Matrix Interference has resulted in a raised reporting limit or distorted result.
W: Results reported on a wet-weight basis.
***:** Value reported is outside QA limits

Report Summary

Lab Sample ID(s): S49337.01-S49337.16
Project: B0064410.2011.00801
Collected Date: 07/14/2011
Submitted Date/Time: 07/14/2011 14:00
Sampled by: DLN/AO
P.O. #: B0064410.2011.0

* Thallium reported instead of titanium.

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Samples are held by the lab for 30 days from the sample submittal date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report Summary

Lab Sample ID(s): S49345.01-S49345.02
Project: B0064410.2011.00801
Collected Date: 07/13/2011
Submitted Date/Time: 07/14/2011 14:00
Sampled by: DLN
P.O. #: MLT-1295

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report Summary

Lab Sample ID(s): S49456.01-S49456.02
Project: B0064410.2011.00801
Collected Date: 07/22/2011
Submitted Date/Time: 07/25/2011 13:30
Sampled by: DLN
P.O. #: MLT-1295

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report Summary

Lab Sample ID(s): S49702.01
Project: B0064410.2011.00801
Collected Date: 08/16/2011
Submitted Date/Time: 08/16/2011 13:30
Sampled by: Dustin Swarthout
P.O. #: MLT1295

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Fibertec
environmental
services

Tuesday, August 23, 2011

Fibertec Project Number: 45867
Project Identification: 49690 /
Submittal Date: 08/15/2011

Ms. Paula Shaw
Merit Laboratories, Inc.
2680 East Lansing Drive
East Lansing, MI 48823

Dear Ms. Shaw,

Thank you for selecting Fibertec Environmental Services as your analytical laboratory. The samples you submitted have been analyzed in accordance with NELAC standards and the results compiled in the attached report. Any exceptions to NELAC compliance are noted in the report. These results apply only to those samples submitted. Please note samples will be disposed of 30 days after reporting date.

Samples were received at 22.5 degrees Celcius.

If you have any questions regarding these results or if we may be of further assistance to you, please contact me at (517) 699-0345.

Sincerely,

Daryl P. Strandbergh
Laboratory Director

DPS/kc

Definitions/ Qualifiers:

A: Spike recovery or precision unusable due to dilution.
B: The analyte was detected in the associated method blank.
E: The analyte was detected at a concentration greater than the calibration range, therefore the result is estimated.
J: The concentration is an estimated value.
M: Modified Method
U: The analyte was not detected at or above the reporting limit.
X: Matrix Interference has resulted in a raised reporting limit or distorted result.
W: Results reported on a wet-weight basis.
***:** Value reported is outside QA limits

Exception Summary:

ACCREDITED IN ACCORDANCE WITH nelac

Report produced by

Merit Laboratories
2680 East Lansing Drive
East Lansing, MI 48823

Phone: (517) 332-0167 FAX: (517) 332-6333

Report Summary

Lab Sample ID(s): S50025.01-S50025.02
Project: B0064410.2011.00801/Buick City/ Flint, MI
Collected Date: 09/13/2011
Submitted Date/Time: 09/13/2011 14:30
Sampled by: D. Newcom
P.O. #: MLT1295

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

services

Wednesday, September 21, 2011

Fibertec Project Number: 46317
Project Identification: 50048 /
Submittal Date: 09/14/2011

Ms. Paula Shaw
Merit Laboratories, Inc.
2680 East Lansing Drive
East Lansing, MI 48823

Dear Ms. Shaw,

Thank you for selecting Fibertec Environmental Services as your analytical laboratory. The samples you submitted have been analyzed in accordance with NELAC standards and the results compiled in the attached report. Any exceptions to NELAC compliance are noted in the report. These results apply only to those samples submitted. Please note samples will be disposed of 30 days after reporting date.

As discussed, the MS/MSD analysis was cancelled.

If you have any questions regarding these results or if we may be of further assistance to you, please contact me at (517) 699-0345.

Sincerely,

Daryl P. Strandbergh
Laboratory Director

Definitions/ Qualifiers:

A: Spike recovery or precision unusable due to dilution.
B: The analyte was detected in the associated method blank.
E: The analyte was detected at a concentration greater than the calibration range, therefore the result is estimated.
J: The concentration is an estimated value.
M: Modified Method
U: The analyte was not detected at or above the reporting limit.
X: Matrix Interference has resulted in a raised reporting limit or distorted result.
W: Results reported on a wet-weight basis.
***:** Value reported is outside QA limits

Report Summary

Lab Sample ID(s): S50051.01-S50051.15
Project: B0064410.2011.00801 / Buick City / Flint MI
Collected Date: 09/14/2011
Submitted Date/Time: 09/14/2011 14:50
Sampled by: D.Newcom, A.O'Neil
P.O. #: B0064410.2011.0

* Thallium reported instead of titanium.

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Samples are held by the lab for 30 days from the sample submittal date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report Summary

Lab Sample ID(s): S50052.01-S50052.02
Project: B0064410.2011.00801 / Buick City / Flint MI
Collected Date: 09/14/2011
Submitted Date/Time: 09/14/2011 14:50
Sampled by: D.Newcom
P.O. #: B0064410.2011.0

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

PARAMETER ANALYSIS & METHOD

KEYS

Preservation Key:
A. H_2SO_4
B. HCL
C. NaOH
D. HNO_3
E. None
F.
G.
H.

Container Information Key:
1. 40 mL VOA
2. 1 L Amber
3. 125 mL Plastic
4. 250 mL Plastic
5. 500 mL Plastic
6. 1 L Plastic
7. 2 oz. Glass
8. 4 oz. Glass
9. 8 oz. Glass
10.

Matrix Key:
SE = Sediment, A = Air, SL = Sludge
SO = Soil, NL = NAPL / Oil, SW = Surface

Report Summary

Lab Sample ID(s): S50339.01-S50339.15
Project: B0064410.2011.00801 / Buick City / Flint MI
Collected Date: 10/12/2011
Submitted Date/Time: 10/12/2011 15:00
Sampled by: D.Newcom, A.O'Neil
P.O. #: MLT1295

* Thallium reported instead of titanium.

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Samples are held by the lab for 30 days from the sample submittal date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

services

Friday, October 28, 2011

Fibertec Project Number: 46802
Project Identification: 50339 /
Submittal Date: 10/12/2011

Ms. Paula Shaw
Merit Laboratories, Inc.
2680 East Lansing Drive
East Lansing, MI 48823

Dear Ms. Shaw,

Thank you for selecting Fibertec Environmental Services as your analytical laboratory. The samples you submitted have been analyzed in accordance with NELAC standards and the results compiled in the attached report. Any exceptions to NELAC compliance are noted in the report. These results apply only to those samples submitted. Please note samples will be disposed of 30 days after reporting date.

Samples were analyzed by Kar Laboratory.

As discussed, the MS and MSD samples were not received.

If you have any questions regarding these results or if we may be of further assistance to you, please contact me at (517) 699-0345.

Sincerely,

Daryl P. Strandbergh
Laboratory Director

Definitions/ Qualifiers:

A: Spike recovery or precision unusable due to dilution.
B: The analyte was detected in the associated method blank.
E: The analyte was detected at a concentration greater than the calibration range, therefore the result is estimated.
J: The concentration is an estimated value.
M: Modified Method
U: The analyte was not detected at or above the reporting limit.
X: Matrix Interference has resulted in a raised reporting limit or distorted result.
W: Results reported on a wet-weight basis.
***:** Value reported is outside QA limits

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Report Summary

Lab Sample ID(s): S50632.01-S50632.02
Project: B0064410.2011.00801 / Buick City / Flint MI
Collected Date: 11/01/2011
Submitted Date/Time: 11/02/2011 15:00
Sampled by: D.Newcom
P.O. #: MLT1295

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Samples are held by the lab for 30 days from the sample submittal date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Report Summary

Lab Sample ID(s): S51024.01-S51024.11
Project: B0064410.2011.00801 / Buick City / Flint MI
Collected Date: 12/13/2011
Submitted Date/Time: 12/13/2011 14:30
Sampled by: DLN, J.Kotwicki
P.O. #: B0064410.2011.0

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Samples are held by the lab for 30 days from the sample submittal date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Report Summary

Lab Sample ID(s): S51038.01-S51038.02
Project: B0064410.2011.00801 / Buick City / Flint MI
Collected Date: 12/13/2011
Submitted Date/Time: 12/14/2011 14:15
Sampled by: D.Newcom
P.O. #: MLT1295

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Samples are held by the lab for 30 days from the sample submittal date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Report Summary

Lab Sample ID(s): S51140.01-S51140.02
Project: B0064410.2011.00801 / Buick City / Flint MI
Collected Date: 12/21/2011
Submitted Date/Time: 12/21/2011 15:15
Sampled by: D.Newcom
P.O. #: MLT1295

Report Notes

Results relate only to items tested as received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
"Not detected" indicates that parameter was not found at a level equal to or greater than the RL.
Samples are held by the lab for 30 days from the sample submittal date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories.

Laboratory Certifications:
Michigan DNRE (#9956), Ohio EPA (#CL0002), NELAC NY (#11814), NELAC FL (#E871045), WBENC (#2005110032)
Some analytes reported may not be certified. Full certification lists are available upon request.

Violetta F. Murshak
Laboratory Director

Facing North (includes east and west sides)

AOI 09B-2

Facing South (taken through perimeter fence on north side)

Facing Southeast (taken through perimeter fence north side)

Facing East (from outside fence, H&S concerns)

This location is separated from the larger area which includes AOI 9A and 9B-1 by a perimeter fence. There is only one route of entry and exit for this area and it must be walked. The access opening which previously held a guard shed is not drivable due to vandalism. There are numerous access holes made in the property fence and generally shows signs of activity. Due to H&S concerns, photos and inspection completed from outside fence. Area is mainly comprised of vegetation and concrete/gravel paths.
