VOC	volatile organic compound
WWTP	wastewater treatment plant

1. Introduction

GHD, on behalf of the Revitalizing Auto Communities Environmental Response (RACER) Trust, has prepared this 2025 Groundwater Monitoring Report (Report) for the RACER Trust facility located at 2915 Dr. Martin Luther King Junior (MLK) Boulevard in Anderson, Indiana (Site).

1.1 Purpose of this Report

This Report has been prepared to summarize the results of groundwater and surface water monitoring conducted at and near the Site in 2025. This Report is submitted to the Indiana Department of Environmental Management (IDEM) in support of ongoing Resource Conservation and Recovery Act (RCRA) Corrective Action at the Site. The monitoring was conducted pursuant to the Site Groundwater Monitoring Plan (GHD, March 15, 2022).

The Site-wide groundwater monitoring program is intended to be implemented as part of the final corrective measures (CM) at the Site. As such, the primary objective of the Site-wide groundwater monitoring is to:

– Monitor the stability of the two volatile organic compound (VOC) groundwater plumes

As the final corrective measures includes long-term monitoring of groundwater quality, this Report has been prepared to summarize the 2025 groundwater monitoring activities and review of the 2025 analytical data. As appropriate, this Report supplements findings of the Final RCRA Facility Investigation (RFI) Report (CRA, June 2014) and previous groundwater monitoring reports. It is noted that the historical information in this Report is largely cited from the 2011 Annual Groundwater Monitoring Report (AECOM, 2012), prepared by others.

2. Background

2.1 Site Description

The Site is located in the northwest quarter of Section 23, T19N, R7E, on the southwest side of Anderson, Madison County, Indiana. Formerly the Site was comprised of approximately 3,000,000 square feet of manufacturing operations situated on 234 acres. A Site location map is provided on **Figure 1**.

MLK Boulevard divides the Site in a north-south direction. The former east manufacturing areas (Plants 6 and 9) and the Wastewater Treatment Plant (WWTP) are bounded by active railroad tracks to the south, by 29th Street to the north, and Madison Avenue to the east. The former manufacturing facilities west of MLK Boulevard, referred to as the Main Plant, are bounded to the west and south by active railroad tracks, and to the north by 25th Street. Facility parking areas were located west of the westernmost railroad, and north of 25th street. A small public-access park is located in the northernmost portion of the Site. A Site plan is provided on **Figure 2**.

Land use surrounding the Site varies from residential and commercial to the north and east, residential and recreational (Meadowbrook Golf Course) to the south, and residential and agricultural to the west.

2.2 Site History

Operations began at the MLK Boulevard facility in 1929. Primary manufacturing operations at the Site included injection molding, stamping, assembly and wastewater treatment. Manufacturing plants were expanded several times, generally proceeding from the north end of the Main Plant southward and eastward through 1989.

The former Plant 6 and 9 properties and a lot east of Madison Avenue were sold soon after related manufacturing operations ceased in 1997. All manufacturing operations at the Site ceased in 2006. Facilities west of MLK Boulevard were demolished during the period of late 2007 to early 2009. The demolition included the removal of all concrete building slabs and many areas of pavement around the immediate Main Plant building area. Following demolition, the area was regraded and covered with varying thickness of crushed concrete. A soil and vegetative cover were applied during the summer of 2009.

General Motors Corporation (GMC) declared bankruptcy in June 2009. The RACER Trust was created in March 2011 by the U.S. Bankruptcy Court to clean up and position for redevelopment certain properties and other facilities owned by former GMC before the 2009 bankruptcy, including this Site.

RACER Trust sold the northern portion of the former Main Plant building (Tract B North) on April 1, 2015. Tract B (North) was redeveloped as a plastic injection molding plant later in 2015. RACER Trust donated Tracts C and F and Crawford Field, north of the former main plant building, to the City of Anderson on September 14, 2015. Lot 1, east of MLK Boulevard, was sold on July 6, 2016. RACER Trust sold the central portion of the former Main Plant building (Tract B Central) on September 14, 2019 for expansion to the plastic injection molding plant. RACER Trust sold the south portion of the former Main Plant building (Tract B South) on, or about December 15, 2023. The buyer intends to construct a building and storage yard to better serve the plastic injection molding plant and other businesses. The remaining portions of the Site that were held by GMC until its bankruptcy in June 2009 are currently owned by RACER Trust. The Site boundary and historical operational areas are shown on **Figure 3**.

2.3 Hydrologic Setting

2.3.1 Physiography

The Site is situated in the New Castle Till Plains and Drainage ways Section of the Central Till Plain Region as described by Gray (2000). This area was affected by multiple continental glaciations that deposited a thick blanket of glacial sediments over the bedrock. The New Castle Till Plains and Drainage ways Section is primarily underlain by complexly stratified glacial diamict deposits, glaciofluvial sand and gravel deposits and glaciolacustrial silt and clay deposits. The area is characterized by broad plains of low relief crossed by relict glacial meltwater valleys (2011 Annual Groundwater Monitoring Report, AECOM, January 31, 2012).

2.3.2 Stormwater/Surface Water Drainage

The Site area is nearly level with elevations ranging from 860 to 880 feet North American Vertical Datum (NAVD) 88. East of MLK Boulevard the elevation is lowest, and the surface elevation descends into a relict glacial meltwater valley. Former Plant 9, Plant 6, and the Meadowbrook Golf Course are all located in the relict meltwater valley, the western border of which roughly follows the alignment of MLK Boulevard. This valley trends south-southwest from Anderson, Indiana several miles towards Pendleton, Indiana (Brown and others, 2003). A small channelized stream, Stanley Ditch, occupies the north end of the relict meltwater valley and drains westward along the south boundary of the Meadowbrook Golf Course. Stanley Ditch originally flowed to the north between former Plant 6 and Plant 9 but was diverted southward in 1963 to provide stormwater relief for the City of Anderson combined sewer system. As a result, Stanley Ditch is now tributary to Prairie Creek and flows to the south down the trend of the valley to Pendleton, Indiana where it joins Fall Creek, a tributary to the West Fork White River.

Stormwater run-off from paved areas of the property either infiltrates the ground surface or is directed to the combined sewer system that discharges north to the City of Anderson Publicly Owned Treatment Works on the West Fork White River. The combined sewer system flows northward across the Meadowbrook Golf Course property and beneath former Plant 9 up the trend of the relict meltwater channel. Stormwater on the northern portion of the Meadowbrook Golf course property is directed through piping, and discharges to ponds. Stormwater in the southern portion of the Meadowbrook property drains southward toward Stanley Ditch that flows along the southern and eastern property boundaries of the golf course.

A drainage divide between Stanley Ditch and Prairie Creek, draining to the south, and the combined sewer system, draining north to West Fork White River, appears to occur near the south side of former Plant 9, perhaps near and along the South Anderson Cutoff railroad embankment. Areas to the south of the railroad embankment, including most of the Meadowbrook Golf Course, are floodway and floodway fringe areas subject to flooding (Federal Emergency Management Agency [FEMA], February 18, 1994). (2011 Annual Groundwater Monitoring Report, AECOM, January 31, 2012).

2.3.3 Hydrogeology

Figure 4 presents a generalized, schematic east-west hydrogeologic cross-section of the unconsolidated materials at the Site showing monitoring well completion intervals. The unconsolidated deposits range from less than 20 feet to over 160 feet in thickness and overlie an irregular bedrock surface. Bedrock beneath the Site consists of carbonate rocks of Silurian age. The bedrock topography beneath the Site slopes to the northwest into a pre-glacial bedrock valley. The bedrock is high (above 840 foot elevation) in the southern portion of the former Plant 9 area and at the Meadowbrook Golf Course. Bedrock is generally only about 20 feet below ground surface (bgs) in this area as a result of both the high bedrock elevation and low ground surface elevation in the relict meltwater valley area east of MLK Boulevard. To the northwest, the bedrock elevation descends to below 730 foot elevation at former groundwater production well 11 and the bedrock in this area is in excess of 158 feet bgs.

Detailed hydrogeologic cross-sections are presented in both the Stage II RCRA Facility Investigation (RFI) Data Report (Earth Tech, March 30, 2005) and the RFI Final Report (Earth Tech and ENVIRON International Corporation [ENVIRON], September 28, 2007). Five distinct geologic units are recognized in the unconsolidated surficial soil materials. These units are identified from top to bottom as Units 1 to 5.

Unit 1 is a heterogeneous fill material consisting of silty clay loam, silty clay, sandy clay, sandy clay loam, and loam texture soil intermixed, in places, with debris consisting of wood, brick, glass, brick, concrete, coal fragments, and cinders. The unit consists of fill material placed at various times during the developmental history of the property and is generally no more than a few feet in thickness. In places, the lower portion of the Unit 1 fill is saturated and a localized perched groundwater zone occurs. The clayey diamicts in the underlying Unit 2 confining unit cause this perched groundwater condition. Saturated conditions have been observed in the basal portion of Unit 1 in several shallow Area of Concern (AOC) 1 – South Court Area soil borings.

Unit 2 is a glacial diamict of silty clay loam, silty clay, and loam texture with occasional thin, interbedded sand and gravel deposits. Sand and gravel lithologies make up a small percentage of the unit. Unit 2 is thin in southern and eastern parts of the Site, but thickens to the north and west.

Unit 3 consists of stratified sand and gravel and forms the uppermost aquifer beneath the Site. In places, a diamict occurs within Unit 3 and is identified as the Unit 3 Confining Bed. At some locations the confining bed is represented by a distinctive silty texture and laminated structure. The confining bed is hydrologically significant because it separates the Unit 3 aquifer into an upper portion (Unit 3S) and lower portion (Unit 3D). Unit 3 is generally only 10 to 20 feet thick in the eastern part of the Site beneath the meltwater valley. The unit thickens appreciably in the western part of the area where it forms the major portion of the unconsolidated deposits.

Unit 3 is almost entirely within the phreatic zone and is the uppermost aquifer unit at the Site. Groundwater may exist in the unit under both confined and unconfined conditions. Where the base of Unit 2 is relatively high in elevation, the upper few feet of Unit 3 are unsaturated, and unconfined conditions occur. At locations where the base of Unit 2 is relatively low in elevation the top of Unit 3 is saturated, and confined conditions occur.

Conceptually, Unit 3 may be divided into an upper (Unit 3S) and lower (Unit 3D) part. In those places where there is no physical separation between the upper and lower parts of the unit provided by the Unit 3 Confining Bed, the designations 3S and 3D merely provide a convenient way to refer to the upper and lower portions of the Unit 3 aquifer, and the monitoring wells completed therein. Where a physical separation occurs due to the presence of the Unit 3 Confining Bed, Unit 3S refers to that portion of the aquifer above the confining layer and Unit 3D refers to that portion below the confining layer. Locally, the Unit 3 Confining Bed induces a downward vertical gradient within the Unit 3 aquifer. Where the confining bed is absent, water levels in Units 3S and 3D are comparable.

The lateral groundwater gradient in Unit 3S is directed to the east in AOC 1 - South Court Area. Locally there are significant variations in the magnitude and direction of the gradient related, in part, to the presence or absence of the Unit 3 Confining Bed. An east-southeast oriented potentiometric trough in Unit 3S persistently occurs in the vicinity of MW 40 and MW 42 where the confining bed is absent. In this area groundwater flow in Unit 3S appears to be directed easterly into the relict meltwater valley.

The hydraulic gradient for Unit 3D is more consistent and the potentiometric surface for this unit suggests an eastward gradient in the South Court Area and along MLK Boulevard and a predominantly western gradient across the east portion of the Site into the meltwater valley.

Unit 4 consists of hard diamict of loam or clay loam texture. The unit forms a confining bed between Unit 3 and Silurian carbonate bedrock. The unit is absent from the eastern part of the area at Plant 9 and portions of the adjacent Meadowbrook Golf Course.

Two deep bedrock borings at the north end of the Site (MW 62 and MW 71) encountered a bed of cobbles above the bedrock surface. This zone is referred to as Unit 5. The unit was encountered at no other locations. (2011 Annual Groundwater Monitoring Report, AECOM, January 31, 2012).

2.4 Previous Groundwater Investigations

The following sections summarize groundwater investigations that have been conducted at the Site. Monitoring wells on and adjacent to the Site have been installed at various times. The earliest Site wells (MW 1 to MW 17) were installed in 1992 and 1993 for the purposes of evaluating a suspected waste oil leak at Area 1 – Former Waste Oil Tank [Solid Waste Management Unit (SWMU) 16]. The longest monitoring history exists for these wells. Most of the 1992 / 1993 wells were installed in Unit 3S. No evidence of a significant waste oil leak was found at SWMU 16, but elevated concentrations of VOCs, primarily trichloroethene (TCE), cis 1,2 dichloroethene (cis-1,2-DCE) and vinyl chloride were detected in several wells in this area. These wells are now known to be located in and around a source area for the Area 1 – South Court VOC plume.

Work associated with RFI Stage I in 2000 to 2001 included installation of 20 new monitoring wells (MW 18 to MW 37) and collection of 85 groundwater samples from new and existing wells. The new wells were completed in Units 1, 3S, and 3D. The Stage I investigations partially delineated a groundwater VOC plume extending north and east from AOC 1 - South Court. This plume was found to lie underneath several previously-defined Areas of Interest (AOIs) and was referred to as Area 1. The Stage I RFI investigations identified concentrations of TCE, cis 1,2 DCE, and vinyl chloride above screening criteria based on state and federal Maximum Contaminant Levels (MCLs). A Stage I RFI report was completed in 2001, and this report included a work plan for additional groundwater delineation work in both on and off-Site areas (Earth Tech and ENVIRON, July 31, 2001).

In 2001 a Phase II Environmental Site Assessment was conducted in the north parking area and three monitoring wells (MW1 01 to MW3 01) were installed. Groundwater concentrations, where detected, were detected below IDEM's criteria. TCE, cis-1,2-DCE and vinyl chloride were not detected in groundwater samples collected.

Stage II RFI investigations began in late 2003. Work associated with the Stage II RFI in 2003 to 2005 included installation of 47 monitoring wells (MW 38 to MW 84) and collection of 182 groundwater samples from both new and existing wells. Area 1 was expanded to include Plant 9 as well as off-Site areas including Meadowbrook Golf Course. Seven wells (MW-1 to MW-7) were installed on the golf course by others in 2003. Sampling of MW-4 in October 2003 indicated that high concentrations of cis 1,2 DCE and vinyl chloride were present. Additional wells (MW 56, MW 57, MW 58, MW 77, and MW 85) were installed by GMC on the golf course in 2004 and 2007 to delineate the VOC plume southeast of MW-4. These and other RFI Stage II monitoring wells delineated the concentrations of TCE, cis 1,2 DCE, and vinyl chloride above MCLs both on and off-Site (Earth Tech and ENVIRON, September 28, 2007).

Three additional monitoring wells (MW 86, MW 87, and MW 88) were installed on the Plant 9 property in October 2010 to provide additional downgradient plume delineation. One well was installed downgradient of MW49 (MW89-11) in 2011 to provide additional downgradient plume delineation in proximity to nearby residential land use. In 2012 and 2013, three monitoring wells (MW90-12, MW91-12, and MW92-13) were installed near a recently identified AOI

referred to as former Bay M26/M27 to assess groundwater quality in the vicinity of the AOI, not previously investigated. In 2013, four monitoring wells (MW 93-13 to MW 96-13) were installed to delineate the lateral extent of groundwater impacts at the perceived source area for the former WWTP Area plume.

In 2014, one monitoring well (MW97-14) was installed to delineate groundwater impacts beneath the Meadowbrook Golf Course. However, MW 97-14 was decommissioned and replaced in May 2016 (MW 97R-16) at a nearby location to facilitate easier lawn maintenance at the request of the property owner.

Seventeen monitoring wells (MW1-01, MW2-01, MW3-01, MW 11, MW 24, MW 25, MW 34, MW35, MW 52, MW 53, MW 54, MW 55, MW 69, MW 70, MW 71, MW 72, and MW 73) north and west of the former main manufacturing areas, upgradient of the VOC plumes, and not a part of the IDEM approved groundwater monitoring plan were abandoned in March and April 2014 following approval from IDEM (VFC # 69789483).

In October 2018, two monitoring wells (MW98-18 and MW99-18) were advanced and installed to further delineate bedrock groundwater impacts on-Site, east of MLK Boulevard.

During construction activities at the Tract B Central property in October and November 2019, monitoring wells MW 50 and MW 51 were decommissioned as they were in the area of a proposed building.

From October 2005 until October 2007 GMC conducted quarterly monitoring of a selected group of monitoring wells according to an interim Site-wide groundwater monitoring plan (Conestoga-Rovers & Associates [CRA], September 20, 2005). This work was conducted for nine consecutive quarters ending in October 2007. Summary results from this monitoring were provided in the 2006 and 2007 Annual Groundwater Monitoring Reports (Earth Tech and ENVIRON, January 31, 2007, January 31, 2008) and an additional round of groundwater monitoring was conducted in February 2008.

The interim monitoring program was replaced by a Site-wide Groundwater Monitoring Plan associated with the draft Corrective Measures Proposal for the Facility. This program consisted of semiannual sampling at a modified well list with sampling of two surface water monitoring points on the Meadowbrook Golf Course conducted three times per year. The sampling plan for this program (AECOM, October 28, 2010) was approved by the IDEM on November 24, 2010. Sampling under this program was conducted from June 2008 to April 2019. On June 10, 2019, IDEM provided comments on the 2018 Annual Groundwater Monitoring Report recommending that groundwater monitoring shift from semi-annual to sampling every 18 months.

The updated Groundwater Monitoring Plan (GHD, March 15, 2022) was prepared as part of the final corrective measures and replaced the previous Site-wide Groundwater Monitoring Plan. Site groundwater monitoring currently occurs every 18 months.

2.5 Area 1 – South Court and Related Areas

The groundwater contaminant plumes at the Site are associated with Area 1 – South Court and Related Areas. Previous isoconcentration maps for Unit 3 suggest there are two separate VOC plumes. One plume is associated with Area 1 – South Court. The AOC 1 – South Court plume extends in a northeast direction from the South Court beneath several SWMUs in the former Main Plant building area. The predominant VOC contaminants detected in this area are TCE, cis-1,2-DCE, and vinyl chloride. The highest reported concentrations of TCE in this plume are found in the South Court at MW 3 (Unit 3S), MW 15 (Unit 3S), and MW 16 (Unit 3S). Perched groundwater in Unit 1 appears to serve as a source area for VOC contaminants in Unit 3. These VOC contaminants are present in both the 3S and 3D portions of Unit 3, but concentrations are generally higher in the upper portion of the unit.

A separate plume is located along and east of MLK Boulevard. Historically the primary evidence for separation of this plume from the AOC 1 – South Court plume comes from four Unit 3S wells located between the plumes where VOCs have not been detected or detected at only very low levels (MW 29, MW 46, MW 59 and MW 84). The VOC plume east of MLK Boulevard extends from an apparent source near MW 68 and the former WWTP along MLK Boulevard eastward toward former Plant 9 and the Meadowbrook Golf Course. The plume has migrated to the south to at least MW 57 and MW 85 on the golf course and to the north to MW 88. This plume is referred to as the former WWTP Area

plume. The predominant VOC constituents detected in this area are cis-1,2-DCE and vinyl chloride. TCE is only a minor plume component.

3. 2025 Groundwater Monitoring Activities

3.1 Groundwater and Surface Water Monitoring

Groundwater and surface water monitoring activities were conducted between April 16 and 30, 2025 in general accordance with the Site-wide Groundwater Monitoring Plan. The Site-wide groundwater monitoring program includes 41 monitoring wells sampled every 18 months. The surface water monitoring program includes sampling the Meadowbrook Golf Course Irrigation Pond. The next Site-wide groundwater and surface water monitoring event will be conducted in October 2026. A summary of the Site-wide groundwater monitoring program is provided in **Table 1**. Monitoring well construction details are provided in **Table 2**.

3.1.1 Hydraulic Monitoring

Water level measurements were collected from all accessible monitoring wells included in the Site-wide groundwater monitoring program during the April 2025 monitoring event. Some monitoring wells were not gauged during 2025 as they could not be located or were not accessible. The static groundwater elevations measured in April 2025 are summarized in **Table 3**, along with previous groundwater elevations collected in October 2023 for comparative reference.

3.1.2 Groundwater Quality Monitoring

Site-wide groundwater monitoring was conducted by GHD between April 21 and 30, 2025. A sample key summarizing the groundwater samples collected in April 2025 is provided in **Table 4**.

Prior to groundwater sample collection, the monitoring wells were purged using a bladder pump and low flow purge techniques to remove suspended solids, reduce turbidity, and allow visual observation of sample color. Field parameters including conductivity, dissolved oxygen (DO), oxidation reduction potential (ORP), pH, temperature, and turbidity were recorded. No color consistent with electroplating operations was observed during purging activities. Groundwater samples were collected using a bladder pump and low flow sampling techniques. Groundwater samples, including field duplicate and matrix spike/matrix spike duplicate samples, were submitted to TestAmerica for chemical analysis of target compound list (TCL) VOCs using analytical method 8260B. Well stabilization parameters recorded by GHD are provided in **Table 5**.

3.1.3 Surface Water Sampling

Surface water samples were collected by GHD on April 16, 2025 from the central irrigation pond located southeast of MW-85 on the Meadowbrook Golf Course. Samples were collected near the irrigation water intake (Pond Intake) and also from a location closest to MW-85 (Pond North). Surface water samples were submitted to TestAmerica for chemical analysis of TCL VOCs using analytical method 8260B.

3.1.4 Sampling Protocol

Monitoring well and surface water samples collected were assigned a unique sample identification (ID) number. Sample ID numbers were recorded with corresponding sample locations.

All monitoring well samples were collected using low-flow bladder pumps and dedicated polyethylene tubing. All non-consumable equipment that contacted groundwater was decontaminated in accordance with the Field Method

Guidelines contained in the Site-wide Groundwater Monitoring Plan. Consumable equipment (tubing) and personal protective equipment were appropriately disposed of off-Site.

Investigative derived waste (IDW) generated from purge and decontamination activities was containerized in on-Site drums for subsequent characterization and appropriate off-Site disposal.

3.1.5 Deviations from the Site-wide Groundwater Monitoring Plan

All monitoring wells included in the Site-wide Groundwater Monitoring Plan were sampled.

4. Potentiometric Surface Mapping

The groundwater elevations measured in April 2025 are summarized in **Table 3**, along with previous groundwater elevations measured in October 2023. Water levels measured during the 2025 monitoring event were generally consistent with the previous years' water levels.

Based on the April 2025 groundwater elevations, GHD developed potentiometric groundwater contours for Unit 3S, Unit 3D, and the bedrock units as shown on **Figures 5** to **7**, respectively.

The groundwater contours representative of the April 2025 Unit 3S data are provided on **Figure 5**. The April 2025 potentiometric groundwater elevation contour map indicates that there is a general northeasterly gradient beneath the central and northern portions of the former Main Plant building. Beneath the southern portion of the former Main Plant, groundwater flow is variable. Data from the April monitoring event again indicates the presence of a groundwater mound, or ridge in Unit 3S that extends in a north-south arc from the MW 46 area on the south to about MW 29 on the north. As discussed in previous annual reports, this groundwater elevation, sometimes extending to MW 59 on the north, appeared to separate the AOC-1 South Court and WWTP Area plumes historically. The AOC-1 South Court plume extends beneath the former Main Plant building and affects several monitoring wells including, from south to north, MW 8, MW 3, MW 14, MW 79, and MW 76R-17. In contrast, historically the Unit 3S monitoring wells along the arc including MW 46, MW 84, MW 59, and MW 29 have not shown any significant VOC contamination.

The groundwater contours representative of the April 2025 Unit 3D data are provided on **Figure 6**. The April 2025 potentiometric groundwater elevation contour map indicates that there is a general easterly gradient across the west portion of the Site and a predominantly western gradient across the east portion of the Site into the meltwater valley.

The groundwater contours representative of the April 2025 bedrock unit data are provided on **Figure 7**. The April 2025 potentiometric groundwater elevation contour map indicates that there is a general easterly gradient across the west portion of the Site and a predominantly western gradient across the east portion of the Site into the meltwater valley.

5. Analytical Results

The sample key (**Table 4**) summarizes the groundwater and surface water monitoring conducted in 2025. The laboratory certificates of analysis are provided in **Appendix A**. The 2025 VOC laboratory analytical data generated from groundwater and surface water sampling are summarized in **Table 6** and **Table 7**, respectively. Analytical data from all groundwater sampling events between 2019 and 2025 are presented on **Figure 8** (on-Site) and **Figure 9** (off-Site). The VOC parameter list shown on **Figure 8** and **Figure 9** includes any VOC concentrations that have exceeded conservative screening criteria at any well or surface water location during any sampling event.

TCE, cis-1,2-DCE and vinyl chloride remain the primary constituents associated with the AOC 1 – South Court and WWTP Area VOC plumes. Isoconcentration maps for TCE, cis-1,2-DCE and vinyl chloride are presented on **Figures 10** through **12**, respectively.

Data verification and validation reports for the analytical data collected during the 2025 Site-wide Groundwater Monitoring Plan activities were completed by GHD and are provided in **Appendix B**. Based on the verification and validation reports, the 2025 data are acceptable for use with the qualifications noted.

5.1 Risk-Based Screening

A conservative risk-based screening was performed on the groundwater and surface water data collected during the Site-wide groundwater monitoring program in 2025. The data were compared to IDEM's Risk Based Closure Guide Screening Levels (R2) and conservative risk-based screening criteria based on potential exposure scenarios that were evaluated in CRA's Refined Human Health Risk Assessment and Derivation of Site-Specific Risk-based Screening Levels Report (October 2013) (RHHRA).

The groundwater monitoring data collected from areas where current and reasonably expected future land use is commercial/industrial were screened against the following: 1) Site-specific Commercial/Industrial Tap Water Use Criteria. Derivation of the Site-specific screening criteria is presented in RHHRA. Monitoring wells screened against these criteria are shown on **Figure 8**.

Groundwater data collected from areas where current and reasonably expected future land use is not commercial/industrial were screened against the following: 1) IDEM R2 - Residential Tap Water Criteria; 2) Site-specific Recreator (Resident Swimming Pool) Criteria; and 3) Site-specific Commercial/Industrial Tap Water Use Criteria. Sampling points screened against these criteria are shown on **Figure 9**.

5.2 AOC 1 – South Court Plume

The AOC 1 – South Court plume contains elevated concentrations of TCE, cis-1,2-DCE, and vinyl chloride with the greatest TCE concentrations in monitoring wells near the AOC 1 - South Court source area (i.e., MW 3, MW 15, and MW 16).

In 2025, the extent of the AOC 1 – South Court plume remained defined on the east side with non-detect or low estimated results for all VOC constituents at monitoring wells MW 37, MW 46, and MW 84. Cis-1,2-DCE and TCE were detected at east boundary monitoring well MW 16. At the north perimeter boundary of the AOC 1 – South Court plume, cis- and trans-1,2-DCE were detected at monitoring well MW 76R-17. In 2025, MW 49 located south of the AOC 1 – South Court area had a detection of TCE above the screening level. Downgradient of MW49 (east-southeast), a minor estimated TCE concentration below the screening level was detected in the sample collected from MW 89-11. At the south perimeter of the AOC 1 – South Court plume, Unit 3S monitoring well MW 21 has no detected VOC concentrations.

Historical and recent trends for the AOC-1 – South Court plume are discussed in Section 6.

5.3 Former WWTP Area Plume

Monitoring wells in the former WWTP Area plume area contain elevated concentrations of primarily cis-1,2-DCE and vinyl chloride.

Historically increasing trends in cis-1,2-DCE and vinyl chloride concentrations have been identified in monitoring wells in the former WWTP Area plume. However, an increasing trend in TCE concentrations has historically been observed downgradient of the perceived source area, at monitoring well MW-4. Cis-1,2-DCE concentrations are increasing at perimeter monitoring wells MW 28, MW 66, and bedrock monitoring well MW 81. Vinyl chloride concentrations are increasing at perimeter monitoring wells MW 80 and MW 88, and at bedrock monitoring wells MW 81 and MW 83.

In 2025, perimeter monitoring wells MW-2 and MW 97R-16 did not have any detected VOC concentrations, and a very minor estimated concentration of cis-1,2-DCE was detected in MW 56, at the southern extent of the WWTP plume.

Along the northern extent of the WWTP plume, monitoring well MW 88 had a detection of vinyl chloride above the Site-specific Commercial/Industrial Tap Water Use Criteria. Other north perimeter monitoring wells, MW 61 and MW 86, had no detected or very low detected concentrations of VOCs.

5.4 Extent of Groundwater Contamination

Figure 10 to **Figure 12** show the isoconcentrations of the principal VOC constituents TCE, cis-1,2-DCE and vinyl chloride, respectively, in groundwater for hydrogeologic Unit 3. These isoconcentration maps are based on 2025 data and update those contained in the 2023 Groundwater Monitoring Report (GHD, March 27, 2024). The 2025 data for each well are shown on the maps with non-detect results presented as half of the reporting limit.

Since the Unit 3S confining unit is absent in the area of former Plant 9 and portions of the Meadowbrook Golf Course, and Unit 3 is relatively thin in these areas, the VOC data from wells in these areas may be shown on the Unit 3S isoconcentration maps. Combining data in this manner provides a useful portrayal of the former WWTP Area plume from its apparent source in the upper part of Unit 3 near MW 68 to its tail area occurrences at former Plant 9 and Meadowbrook Golf Course.

The isoconcentration maps continue to suggest that there are two separate VOC plumes. One plume is associated with AOC 1 – South Court and the second plume is derived from an apparent source area near MW 68. Historically, the plumes have been separated by a series of Unit 3S wells where VOCs have not been detected or have been detected only at very low levels (MW 29, MW 37, MW 46, MW 59, and MW 84). A groundwater ridge in Unit 3S has historically occurred along this line of wells, and this mound appears to have served as a hydraulic barrier separating the two plume areas. Consistent with recent sampling events, in 2025 cis-1,2-DCE and TCE were detected at the AOC 1 – South Court east boundary monitoring well MW 16. VOC detections at MW 16 (between MW 46 and MW 84) and alterations in the predominance and extent of this ridge suggests that changes to the historical hydraulic barrier may be occurring. The analytical results and the hydraulic monitoring data in the area of the two plumes will continue to be evaluated during future monitoring events.

The AOC 1 – South Court plume in Unit 3S extends in a northeast direction from AOC 1 – South Court. The eastern extent of the plume appears to be limited by the groundwater mound noted in the preceding paragraph. The plume is bounded to the north by MW 76/MW76R-17 with only a marginal detection of cis-1,2-DCE.

In 2015, GHD completed a plume stability analysis (GHD, August 12, 2015) that indicated that the AOC 1- South Court plume has changed little in planar plume area, average concentration, and plume mass, despite the presence of degradation products, which is consistent with recent groundwater monitoring.

The former WWTP Area plume extends eastward from the apparent source area near MW 68 towards former Plant 9 and has migrated to the east to the vicinity of MW 64 and MW 66, to the northeast in the vicinity of MW 88, and to the southeast to Meadowbrook Golf Course irrigation pond in the vicinity of MW 57, MW 58, and MW 85. This VOC plume is composed primarily of cis-1,2-DCE and the highest reported concentrations occur in a series of monitoring wells from the source area (MW 68) southeast to the Meadowbrook Golf Course irrigation pond (MW 40, MW-4, and MW 85).

The historical cis-1,2 DCE results are consistent with the findings in the plume stability analysis completed as part of the Supplemental Analysis in Support of the Corrective Measures Proposal (CMP) (GHD, August 12, 2015). The plume stability analysis concluded that TCE equivalent is decreasing in concentration and mass, while increasing in plume area advancing downgradient along the predominant flow direction.

Vinyl chloride and TCE are subordinate components of the former WWTP Area plume. TCE is a relatively minor component even in the source area of this plume. The highest reported concentration for vinyl chloride occurred downgradient of the source area, at MW 57. The east edge of the former WWTP Area plume is marked by persistent occurrences of vinyl chloride in Unit 3D wells MW 58, MW 64, and MW 66. However, a westerly groundwater flow direction east of these wells prevents further vinyl chloride migration to the east. Along the northern extent of the WWTP plume, monitoring well MW 88 had a detection of vinyl chloride above the Site-specific Commercial/Industrial

Tap Water Use Criteria in 2025, although there are no water wells on-Site. Vinyl chloride concentrations at MW 88 will continue to be evaluated during future monitoirng events.

The WWTP Area plume extends vertically to bedrock monitoring wells MW 81 and MW 83. Between September and December 2018, GHD completed a bedrock groundwater investigation to delineate vertical and horizontal bedrock groundwater impacts. The results of the investigation indicate that shallow bedrock VOC impacts at MW 81 have not migrated deeper in the bedrock unit. The results also indicate that shallow bedrock VOC impacts have been delineated to the east at MW 99-18 and that there appears to be a western gradient across the east portion of the Site that would not allow for shallow bedrock groundwater impacts to migrate off-Site towards Madison Avenue.

5.5 Surface Water

Cis-1,2-DCE, trans-1,2-dichloroethene (trans-1,2-DCE), 1,1-dichloroethane (1,1-DCA), and vinyl chloride were detected at surface water monitoring locations Pond North and Pond Intake during the April 2025 surface water sampling event. The detected concentrations of vinyl chloride at the Pond North and Pond Intake sampling locations exceed the relevant screening criteria (i.e., recreator). No other parameters were detected above relevant screening criteria at surface water monitors Pond North or Pond Intake.

6. Statistical Analysis

The required statistical data evaluation is presented in Section 4 of the Site-Wide Groundwater Monitoring Plan (Monitoring Plan, GHD, 2022) and includes the following required elements:

– The statistical evaluation is to be conducted to determine whether the contaminant plumes are stable (i.e., not increasing over time).
– The principal VOC compounds to be considered in the evaluation are TCE, cis-1,2-DCE and vinyl chloride.
– The evaluation of stability is to be carried out using the Mann-Kendall trend test following IDEM Risk Integrated System of Closure guidance (IDEM, February 15, 2001). Notably:
    - A minimum of 4 samples is required to perform the trend test.
    - A minimum detection frequency of 75 percent is required to perform the trend test.
    - Non-detects should be assigned a value below the lowest detected value in the data set.
    - Any field duplicate results should be averaged prior to carrying out statistical testing.
– Trend testing is to be carried out using a significance level of (α) 0.10 (i.e., 90 percent confidence).
– A one-tailed trend test is to be performed (i.e., testing for increases only), using the following statistical hypotheses:
    - Null (no effect) hypothesis (H0) = there is no trend or a decreasing trend in chemical concentrations over time.
    - Alternative hypothesis (HA) = there is an increasing trend over time in chemical concentrations.

The following subsections describe the specific approaches used in carrying out the statistical data evaluation. The data considered in the trend tests are presented in concentration vs. time graphs and tabular format in **Appendix C**.

6.1 Mann-Kendall Test

Methods for statistical trend testing of groundwater quality data are discussed in Section 4.3 of U.S. EPA (2006), Chapter 12 of Helsel & Hirsch (USGS, 2020) and other relevant guidance and reference texts. The evaluation of trends in environmental data is often complicated by factors such as seasonality in data, outlying (grossly atypical) data points, the presence of censored (non-detect) data, small data sets (due to the relatively high costs associated

with sample collection and analysis, particularly for trace concentration analyses) and non-linearity in any patterns present through time. Different tests exist, which balance the statistical power of detecting trends against susceptibility to outliers, deviations from model assumptions (e.g., linearity) and the ability to incorporate non-detect data into the analyses.

The Mann-Kendall trend test is suitable for general application across a variety of environmental data applications. This test is non-parametric (rank-based) and, therefore, robust with respect to outlying observations. The Mann-Kendall test neither assumes a particular data distribution (e.g., normal) nor data pattern tested (e.g., linear trend), but rather tests for a monotonic (single-direction) trend in the data over time. Although the test is not as powerful as parametric tests are under optimal conditions, its wide range of applicability makes it a good candidate for use when testing numerous data sets where the effort required for detailed characterization and selection of specific trend tests on a case-by-case basis is not appropriate.

As specified in the Groundwater Monitoring Plan, the Mann-Kendall trend test was used to evaluate the principal VOC monitoring data for the presence of temporal trends. Computational details for the test may be found in Section 4.3.4.1 of U.S. EPA (2006). The test was applied for data sets containing up to 25 percent non-detects using a one-tailed formulation and a significance level of 0.1, as described above.

Trend tests were carried out separately for each principal VOC at each monitoring well with sufficient temporal data to perform the Mann-Kendall test.

One assumption of the Mann Kendall trend test is that subsequent samples are reasonably equally spaced through time. The monitoring plan specifies a sampling frequency of every 18 months for all wells and the two surface water locations. Due to this change, data sampled more frequently during the earlier period were removed and trend tests were performed using data sampled every 18 months. In addition, well MW 15 had a large temporal gap in the monitoring record, therefore, additional testing was performed using group comparison tests (another method presented in Chapter 12 of USGS, 2020) to evaluate whether the presence of this gap could be obscuring the detection of significant trends. A parametric Student's *t*-test was carried out comparing recent (2014 – 2025) to historic (2005 – 2008) data.

It was noted in some cases that non-detects were present at somewhat-elevated detection limits above the majority of the detected values. In such cases, the comparison of non-detect and detected values is ambiguous (i.e., it cannot be assigned with certainty that the non-detect results are above or below the detected values). In these cases, trend testing was performed excluding the non-detect results, as noted in the table of results in **Table 8**. Current statistical guidance (e.g., U.S. EPA, 2022) would recommend that any detected values lower than the maximum detection limit for a non-detect be "censored" to that detection limit (i.e., all lower values be considered as non-detects). However, doing so would have reduced the detection frequency to much less than the 75 percent required in the Groundwater Monitoring Plan, and therefore carrying out the trend tests using detected values only permits an appropriate assessment with minimal information loss (i.e., removing a few ambiguous non-detects vs. censoring the majority of the data). In other cases, detection frequencies were close to 75 percent, and non-detects were observed in an earlier period. In order to provide a test result, non-detects were excluded from the evaluation, as noted in the table of results in **Table 8**. These cases are listed below:

– TCE at MW-4, MW 12, MW 40, and MW 49
– cis-1,2-DCE at MW 28, MW 64, and MW 81
– Vinyl chloride at MW 3, MW 51, MW 57, MW 61, MW 65, MW 66, MW 83, MW 88, and Pond Intake

According to the Groundwater Monitoring Plan (GHD, 2022), trend tests were carried out considering two time periods:

– Overall period (including all data collected to date)
– Recent period (including the last 10 results)

6.2 Outlier Testing

Prior to carrying out trend tests, each data set was screened for the presence of statistical outliers. An outlier is an observation that differs substantially (atypically) from the rest of the population.

Outliers may be identified by graphical or statistical methods. U.S. EPA (2006, 2009) recommends The Extreme Value Test (Dixon's Test) for testing for outliers in data sets containing up to 25 points (the upper limit of this procedure), or Rosner's Test for data sets containing more than 25 points. Both outlier tests consider both extreme low values and extreme high values. An important element of assessing outliers is identifying the underlying data distribution of a particular data set prior to performing the test. The data may follow a normal (Gaussian) distribution, in which case the original (untransformed) data are subjected to the outlier test. However, if a data set follows another statistical distribution, (i.e., gamma or lognormal) the data must be transformed prior to using Dixon's or Rosner's tests. In testing data distributions for the principal VOC data sets considered, the Shapiro Wilk W Test (U.S. EPA, 2006, 2009) was applied using original, cube root-transformed [approximating the gamma distribution (USGS, 2002)], and log transformed data sets.

Consistent with the requirements of the Groundwater Monitoring Plan for trend testing, outlier tests were performed only for datasets having 75 percent or more detected values. Outlier tests were performed for the overall period, but not the recent period, due to limited number of samples. Outlier testing was performed using a significance level (α) of 0.05 (i.e., 95 percent confidence).

The results of the data distribution and outlier tests are presented in Appendix C Table C.1. Statistical outliers were identified for TCE at MW 15 and MW 49; cis-1,2 DCE at MW 8 and MW 51; and for vinyl chloride at MW-4, MW 8, MW 65, and MW 68, as indicated in the Table C.1.

Where statistically significant outliers were identified, trend testing was carried out twice; first considering all data and second using outlier excluded data sets. In most cases, the results of the trend tests (i.e., increasing or no trend identified) were consistent both with and without the outliers. The exception was for cis-1,2-DCE at well MW 51, where the 3 out of the last 4 results were outliers. However, this well has not been sampled since April 2019. Therefore, the presence of statistical outliers in the principal VOC data sets has not impaired the ability of the present statistical evaluation to identify significant temporal trends, where present in the monitoring data.

6.3 Results

The results from the Mann-Kendall trend test considering the overall period are shown in **Table 8**. The data used in the trend tests are shown in Table C.1 and a summary of descriptive statistics are shown in Table C.2 of **Appendix C**, along with the data distribution and outlier testing results. Trend Plots are shown in **Appendix C**.

Of 126 data sets originally considered (three primary VOCs at each of 40 monitoring wells and 2 surface water locations) and evaluated, 69 did not require trend analysis due to high frequencies of non-detects (i.e., less than 75 percent detects). The remaining 57 data sets were subjected to the Mann-Kendall trend test. Of these, 41 had no statistically significant trend (i.e., groundwater VOC concentrations are stable or decreasing over time), and 16 data sets had significant increasing trends (at a 90 percent confidence level).

Comparing the results to those from the previous (2023) evaluation, 13 changes were observed in the results during the current monitoring period (2025):

- Vinyl chloride at MW 15 (was stable and is currently less than 75 percent detects over time)
- TCE at MW 31R (was stable and is currently less than 75 percent detects over time)
- Cis-1,2-DCE at MW 31R (was increasing over time and is currently stable or decreasing)
- Cis-1,2-DCE at MW 49 (was increasing over time and is currently stable or decreasing)
- Vinyl chloride at MW 58 (was increasing over time and is currently stable or decreasing)
- Cis-1,2-DCE at MW 64 (was increasing over time and is currently stable or decreasing)
- Vinyl chloride at MW 66 (was increasing over time and is currently stable or decreasing)

– Vinyl chloride at MW 79 (was stable or decreasing over time and is currently increasing)
– Vinyl chloride at MW 80 (was increasing over time and is currently stable or decreasing)
– Cis-1,2-DCE at MW 81 (was increasing over time and is currently stable or decreasing)
– Cis-1,2-DCE at MW 85 (was increasing over time and is currently stable or decreasing)
– Vinyl chloride at Pond Intake (was stable or decreasing over time and is currently increasing)
– Vinyl chloride at Pond North (was increasing over time and is currently stable or decreasing)

Considering that data sets were processed due to changes in sampling frequency, a number of changes are to be expected. Of the 126 data sets, only 13 had changed.

The results from the Mann-Kendall trend test considering the recent period are shown in **Table 9**. The data used in the recent trend tests are shown in Table C.3 and a summary of descriptive statistics are shown in Table C.4 of **Appendix C**.

Data from the recent period indicate that the majority of TCE, cis-1,2-DCE, and vinyl chloride concentrations (76 of the 126 data sets available) were not tested for trends due to high frequencies of non-detects (i.e., less than 75 percent detects). Of the remaining 50 data sets tested, 40 had no statistically significant trends or decreasing trends and only 10 cases of increasing trends were identified.

Comparing trend results from the overall period vs. recent period, of the 16 increasing trends observed during the entire monitoring period, 3 cases had fewer than 75 percent detects, and 5 cases were observed to be stable (no statistically significant trend) during the recent period. Eight increasing trends persisted during the recent period (TCE at MW-4, cis-1,2-DCE at MW 28, MW 51, and MW 66, and vinyl chloride at MW 79, MW 81, MW 83, and MW 88).

A summary of increasing trends comparisons observed during the entire monitoring period vs. the recent period is shown in below:

Analyte	Location	Entire Monitoring Period (2005-2025) Trend Result	Recent Monitoring Period (Last 10 Samples)* Trend Result
Trichloroethene	MW-4	Increasing	Increasing
Trichloroethene	MW 49	Increasing	Over 25% ND
cis-1,2-DCE	MW 28	Increasing	Increasing
cis-1,2-DCE	MW 51	Increasing	Increasing
cis-1,2-DCE	MW 66	Increasing	Increasing
cis-1,2-DCE	MW 79	Increasing	NT or Decreasing
cis-1,2-DCE	MW 81	NT or Decreasing	Increasing
cis-1,2-DCE	Pond Intake	Increasing	NT or Decreasing
Vinyl chloride	MW 28	Increasing	NT or Decreasing
Vinyl chloride	MW 57	Increasing	Over 25% ND
Vinyl chloride	MW 61	Increasing	Over 25% ND
Vinyl chloride	MW 64	Increasing	NT or Decreasing
Vinyl chloride	MW 79	Increasing	Increasing
Vinyl chloride	MW 80	NT or Decreasing	Increasing
Vinyl chloride	MW 81	Increasing	Increasing
Vinyl chloride	MW 83	Increasing	Increasing
Vinyl chloride	MW 88	Increasing	Increasing
Vinyl chloride	Pond Intake	Increasing	NT or Decreasing

A visual inspection of the trend plots shows a few recent high VOC concentrations that were not identified by the trend tests due to low detection frequency (below 75 percent) during the earlier period. Recent detected values were identified for TCE and cis-1,2-DCE at MW 16, and cis-1,2-DCE at MW 57. A gradual increase in VOC concentrations were observed for cis-1,2-DCE at MW 58 and MW 80. Future monitoring events will be determined if these patterns persist.

Group comparison tests were carried out at well MW 15. Data distributions were assessed prior to the test and found that TCE recent and historical concentrations were normally distributed, therefore the Student's *t*-test was used. Both historic and recent cis-1,2-DCE and vinyl chloride data sets were found to be gamma distributed, therefore the *t*-test was performed using gamma-transformed data. The results of the group comparison tests confirm the Mann-Kendall trend test results (NT or Decreasing). Group comparison tests were not carried out at well MW 21 due to elevated percentage of non-detects.

7. Conclusions

Based on the 2025 Annual Groundwater Monitoring activities, including all field and laboratory analytical data generated therefrom, the following conclusions have been developed.

1. The April 2025 Unit 3S potentiometric mapping is consistent with previous mapping. The elevation contour map indicates that there is a general northeasterly gradient in Unit 3S beneath the central and north portions of the former Main Plant building. Beneath the southern portion of the former Main Plant, groundwater flow is variable.
2. The April 2025 Unit 3D potentiometric mapping is consistent with previous mapping. The elevation contour map indicates that there is a general easterly gradient across the west portion of the Site and a general westerly gradient across the east portion of the Site into the meltwater valley.
3. The April 2025 bedrock potentiometric mapping is consistent with previous mapping and indicates that there is a general easterly gradient across the west portion of the Site and a predominantly western gradient across the east portion of the Site into the meltwater valley.
4. In 2025, the extent of the AOC 1 – South Court plume remained defined on the east side with non-detect or low estimated results for all VOC constituents at monitoring wells MW 37, MW 46, and MW 84. Cis-1,2-DCE and TCE were detected at east boundary monitoring well MW 16. At the north perimeter boundary of the AOC 1 – South Court plume, cis- and trans-1,2-DCE were detected at monitoring well MW 76R-17. In 2025, MW 49 located south of the AOC 1 – South Court area had a detection of TCE above the screening level. Downgradient of MW49 (east-southeast), a minor estimated TCE concentration below the screening level was detected in the sample collected from MW 89-11. At the south perimeter of the AOC 1 – South Court plume, Unit 3S monitoring well MW 21 has no detected VOC concentrations.
5. In 2025, perimeter monitoring wells MW-2 and MW 97R-16 did not have any detected VOC concentrations, and a very minor estimated concentration of cis-1,2-DCE was detected in MW 56, at the southern extent of the WWTP plume. Along the northern extent of the WWTP plume, monitoring well MW 88 had a detection of vinyl chloride above the Site specific Commercial/Industrial Tap Water Use Criteria. Other north perimeter monitoring wells, MW 61 and MW 86, had no detected or very low detected concentrations of VOCs.
6. Of 126 data sets originally considered (three primary VOCs at each of 40 monitoring wells and 2 surface water locations) and evaluated considering the overall period, 69 had less than 75 percent detects, therefore were not evaluated. Of the remaining 57 data sets tested for trends, 41 were stable or decreasing over time and 16 had significant increasing trends. Comparing these results to those from the 2023 evaluation, the observed trends for TCE, cis-1,2-DCE and vinyl chloride concentrations in 2025 were somewhat consistent with the assessment conducted in 2023, considering the data processing carried out this year, there were only 13 differences.
7. Comparing trend results from the overall period vs. recent period, of the 16 increasing trends observed during the entire monitoring period, 3 cases had fewer than 75 percent detects, and 5 cases were observed to be stable (no statistically significant trend) during the recent period. Eight increasing trends persisted during the recent period

(TCE at MW-4, cis-1,2-DCE at MW 28, MW 51, and MW 66, and vinyl chloride at MW 79, MW 81, MW 83, and MW 88).

8. One surface water sampling event was conducted in April 2025 at the Meadowbrook Golf Course central irrigation pond. 1,1-DCA, cis and trans-1,2-DCE, and vinyl chloride were detected at surface monitoring locations Pond Intake and Pond North.
9. Based on monitoring at adjacent monitoring well MW 85, the golf course irrigation pond appears to be within the former WWTP Area plume.
10. Based on the 2025 groundwater results from residential well MW 89-11, there is no current unacceptable risk to nearby residents due to groundwater volatilization to indoor air.

8. Recommendations

The following recommendation is provided with respect to ongoing monitoring:

1. Based on the 2025 monitoring well survey, it is recommended monitoring wells be repaired or decommissioned, as required. IDEM approval will be required prior to the decommissioning of any monitoring wells.
2. Monitoring wells MW 29 and MW 59 along the Unit 3S ridge have not been sampled since 2019, as such it is recommended that these monitoring wells be added to the 2026 monitoring event.

Notes:
(1) Coordinates are Indiana State Plane Coordinate System, 1301 East, NAD 83, US Survey Feet.
(2) Elevation based on level survey relative to USGS Monument PID LA1429 = 882.61 NAVD88.
(3) Datum for elevation and depth is marked on top of PVC riser pipe.
(4) Survey revised in 2010
(5) Survey revised in 2017
(6) Survey revised in 2023
NA - Not Applicable

Pond North	Surface Water	Surface Water	2005 - 2025	--	NT or Decreasing	NT or Decreasing

Notes:

(1) Tend test was calculated using detected values only, due to elevated detection limits for non-detects or due to detection frequency close to 75 percent.

Due to changes in sampling frequency, earlier sampling events were excluded from the Mann-Kendall trend test to provide a consistent sampling interval corresponding to current program (annual).

-- Trend test not performed due to infrequent detections (i.e., fewer than 75 percent detects).

NT or Decreasing - A statistically-significant (90 percent confidence) increasing trend was not found. Analyte concentrations may be stable or decreasing over time. (Per approved Monitoring Plan, a 1-sided test is performed).

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Definitions/Glossary

Client: GHD Services Inc. Job ID: 240-222643-1
Project/Site: 11209506, MLK - Anderson, IN

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
240-222643-1

Receipt
The samples were received on 4/18/2025 9:10 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.2°C.

GC/MS VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Client: GHD Services Inc.

1	Vinyl acetate	108-05-4	RP231030CTH	98%	5,034.8 µg/mL	+/- 173.9777

* Expanded Uncertainty displayed in same units as Grav. Conc.

Solvent: P&T Methanol
CAS # 67-56-1
Purity 99%

Tech Tips:

Vinyl acetate is a volatile organic ester included in the target lists of several US EPA and other methods. Under acidic conditions, esters react with alcohols to form new esters (transesterification). Methanol-based mixes containing halogenated compounds are slightly acidic, so it is important to minimize exposure of vinyl acetate to mixes of halogenated compounds in methanol. For this reason, we offer vinyl acetate in individual solution, and suggest that it be introduced into the working level calibration solution immediately before use. This will minimize problems and ensure more consistent results.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Definitions/Glossary

Client: GHD Services Inc. Job ID: 240-223045-1
Project/Site: 11209506-2025-001, MLK - Anderson, IN

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
240-223045-1

Receipt
The samples were received on 4/25/2025 9:30 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.7°C.

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) analyzed in batch 240-654325 was outside the method criteria for the following analyte(s): 1,1,1-Trichloroethane, 1,1,2,2-Tetrachloroethane, 2-Hexanone and Carbon tetrachloride. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D: The laboratory control sample (LCS) for analytical batch 240-654301 recovered outside control limits for the following analytes: Trichloroethene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: The continuing calibration verification (CCV) analyzed in batch 240-654301 was outside the method criteria for the following analyte(s): Bromomethane. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D: The continuing calibration verification (CCV) analyzed in batch 240-654458 was outside the method criteria for the following analyte(s): 1,1,1-Trichloroethane, 1,1,2,2-Tetrachloroethane, Carbon tetrachloride and Chloromethane. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D: The laboratory control sample (LCS) for analytical batch 240-654697 recovered outside control limits for the following analytes: Bromomethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: The continuing calibration verification (CCV) analyzed in batch 240-654698 was outside the method criteria for the following analyte(s): 1,1,1-Trichloroethane, 2-Hexanone, Acetone, Carbon tetrachloride and 2-Butanone (MEK). A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

This Detection Summary does not include radiochemical test results.

Detection Summary

Client: GHD Services Inc. Job ID: 240-223045-1
Project/Site: 11209506-2025-001, MLK - Anderson, IN

Client Sample ID: TB-03 Lab Sample ID: 240-223045-28

No Detections.

This Detection Summary does not include radiochemical test results.

Client Sample ID: GW-042125-AH-01 Lab Sample ID: 240-223045-1

Date Collected: 04/21/25 08:40 **Matrix: Water**
Date Received: 04/25/25 09:30

Method: SW846 8260D - Volatile Organic Compounds by GC/MS

ilac-MRA A2LA ACCREDITED ISO 17034 Accredited Reference Material Producer Certificate #3222.01

ilac-MRA A2LA ACCREDITED ISO/IEC 17025 Accredited Testing Laboratory Certificate #3222.02

FOR LABORATORY USE ONLY-READ SDS PRIOR TO USE.

This Reference Material is intended for Laboratory Use Only as a standard for the qualitative and/or quantitative determination of the analyte(s) listed.

Catalog No. : 569724 **Lot No.:** A0200199

Description : 8260 List 1 / Std #6 Vinyl Acetate (2015)

8260 List 1 / Std #6 Vinyl Acetate (2015) 5,000µg/mL, P&T Methanol, 1mL/ampul

Container Size : 2 mL **Pkg Amt:** > 1 mL

Expiration Date : January 31, 2025 **Storage:** -20°C or colder

Handling: This product is photosensitive. **Ship:** On Ice

Purity 99%

Tech Tips:

Vinyl acetate is a volatile organic ester included in the target lists of several US EPA and other methods . Under acidic conditions, esters react with alcohols to form new esters (transesterification). Methanol-based mixes containing halogenated compounds are slightly acidic, so it is important to minimize exposure of vinyl acetate to mixes of halogenated compounds in methanol. For this reason, we offer vinyl acetate in individual solution, and suggest that it be introduced into the working level calibration solution immediately before use. This will minimize problems and ensure more consistent results.

CERTIFIED REFERENCE MATERIAL

Certificate of Analysis

chromatographic plus

ilac-MRA A2LA ACCREDITED ISO 17034 Accredited Reference Material Producer Certificate #3222.01

ilac-MRA A2LA ACCREDITED ISO/IEC 17025 Accredited Testing Laboratory Certificate #3222.02

FOR LABORATORY USE ONLY-READ SDS PRIOR TO USE.

This Reference Material is intended for Laboratory Use Only as a standard for the qualitative and/or quantitative determination of the analyte(s) listed.

Catalog No. : 571992.SEC **Lot No.:** A0195252

Description : 8260 List 1 / Std #1 MegaMix (2017)

8260 List 1 / Std #1 MegaMix (2017) 1,250-62,500µg/mL, P&T Methanol, 1mL/ampul

Container Size : 2 mL **Pkg Amt:** > 1 mL

Expiration Date : August 31, 2025 **Storage:** 0°C or colder

Ship: Ambient
