1 Introduction

On behalf of the Revitalizing Auto Communities Environmental Response (RACER) Trust, Arcadis of Michigan, LLC (Arcadis) prepared this 2020 Annual Groundwater Monitoring Report (Annual Report) to support the Resource Conservation and Recovery Act (RCRA) corrective action process for RACER Trust Lansing Industrial Land, located in Lansing, Michigan (Site). The Site consists of former Plants 2, 3 and 6. This Annual Report summarizes groundwater monitoring completed between January and December 2020, consistent with the requirements of the Revised Interim Groundwater Monitoring Work Plan (IGMP; Arcadis 2019a), which was approved by the Michigan Department of Environment, Great Lakes and Energy (EGLE) on July 25, 2019.

The following sampling events were completed in accordance with the IGMP (Arcadis 2017a) or 2019 Revised IGMP (Arcadis 2019a):

- *First quarter 2020*. A quarterly event completed in March 2020.
- *Second quarter 2020*. An annual event completed in June 2020.
- *Third quarter 2020*. A quarterly event completed in August 2020.
- *Fourth quarter 2020*. A semi-annual event completed in December 2020.

As outlined in the revised IGMP (Arcadis 2019a), this Annual Report includes quarterly data (e.g., tabulated data, figures, analytical narrative) and includes the following:

- Objective and scope of the sampling events
- Summary of groundwater elevations and light nonaqueous phase liquid (LNAPL) gauging data, including contour maps and trend plots
- Summary of LNAPL recovery completed in accordance with the 2015 LNAPL Removal Work Plan (Arcadis 2015b)
- Figures, tables, and a brief narrative summarizing the groundwater sampling results
- Groundwater elevation contour maps for various water bearing zones
- Updated groundwater plume stability evaluation
- Summary of Lansing Township water supply well sampling
- Conclusions and recommendations for revisions to the IGMP as appropriate.

2 Sampling Methods

This section discusses the sampling methodology used at the Site. The Field Sampling Plan (FSP; Arcadis 2011a) for the Site provides detailed methodology regarding the collection of groundwater samples and includes appropriate Arcadis standard operating procedures (SOPs).

2.1 Groundwater Monitoring Methods

During the second quarter 2020 annual sampling event, and before sample collection, site-wide gauging was completed using electronic water level meters. LNAPL wells were gauged using an oil/water interface probe. During the first, third, and fourth quarter 2020 sampling events, gauging was limited to those wells selected for sampling and LNAPL monitoring. All gauging was completed within 24 hours with few exceptions due to access or other issues. Groundwater samples were collected in a manner consistent with the low-flow sampling techniques outlined in the FSP and the SOP for low-flow sample collection (Arcadis 2011a), and generally consistent with EGLE's Remediation and Redevelopment Division (RRD) Op Memo 2, Attachment 5 (EGLE 2004). An emphasis was placed on collecting low-turbidity samples (less than 10 nephelometric turbidity units [NTUs]) for metals analysis.

The most current sampling matrix provided as part of the 2019 Revised IGMP (Arcadis 2019a) is included as **Table 1**. In general, groundwater samples were submitted for analysis for one or more of the following:

- 1,4-Dioxane by United States Environmental Protection Agency (USEPA) Method 8260B SIM
- 1,4-Dioxane by USEPA Drinking Water Method 522, which provides a reporting limit (RL) of 0.20 microgram per liter (µg/L). (i.e., Lansing Township municipal wells, and select bedrock monitoring wells)
- Volatile organic compounds (VOCs) by USEPA Method 8260B
- Selected metals (arsenic, total chromium, copper, lead, nickel, and vanadium) by USEPA Method 6020, and, at discrete locations, metals associated with known impacts (e.g., hexavalent chromium in Area 14 at Plant 3).
- Per- and polyfluoroalkyl substances (PFAS) using USEPA Method 537 modified with isotope dilution (DoD QSM 5.1).

2.1.1 Quality Control/Quality Assurance

Quality control (QC) samples were collected during the sampling event and included the following:

- One duplicate per every ten samples
- One matrix spike and matrix spike duplicate (MS/MSD) per every 20 samples
- One field blank per sampler per sampling event
- One equipment blank per pump per sampling event, as well as additional equipment blanks from the water level meters used for PFAS sampling

Additionally, trip blanks were included with each cooler containing samples for VOC analysis. One sample delivery group per plant from each quarter underwent complete Tier I validation as defined in USEPA *Innovative Approaches to Data Validation*, USEPA Region III (USEPA 1995). Validation reports are included in **Appendix A** along with laboratory analytical reports.

2.1.2 Light Nonaqueous Phase Liquid Monitoring

LNAPL monitoring wells were gauged during the second, and fourth quarter events with an oil/water interface probe. Gauging methods were consistent with the 2019 Revised Interim Groundwater Monitoring Work Plan (Arcadis 2019a)

2.2 Groundwater Elevation Monitoring

Monitoring wells were gauged during sampling using an electronic water level meter generally within a 24-hour period. To evaluate seasonality, site-wide gauging is rotated annually between the second quarter and fourth quarter events. In 2020, site-wide gauging was completed during the fourth quarter annual sampling event. During the first, second and third quarter sampling events, gauging was limited to those wells selected for sampling. Gauging methods were consistent with the FSP (Arcadis 2011a) and IGMP (Arcadis 2019a).

3 Results

This section summarizes the sampling activities completed between January and December 2020. **Table 2** presents groundwater analytical data collected during the reporting period. As a frame of reference, figures showing exceedances of Part 201 residential drinking water criteria (DW criteria) are provided as **Figures 2** through **9**. **Appendices B** and **C** provide the validated laboratory analytical reports and low-flow groundwater sampling field logs, respectively.

3.1 Groundwater Monitoring Results

Groundwater analytical results are summarized on Table 2 with exceedances of DW criteria highlighted in gray and summarized on **Figures 2** through **9**. Results of the 2020 groundwater monitoring events are summarized below.

- **1,4-Dioxane:** 1,4-Dioxane results (**Figure 2** and **3**) are generally consistent with the results summarized in the 2019 Annual Groundwater Monitoring Report (Arcadis 2020a) and 2020 Semi Annual Groundwater Monitoring Report (Arcadis 2020b). Note that for the lower 1,4-dioxane plume, a biosparge remedy has been implemented per the Interim Measures Work Plan: Lower 1,4-Dioxane Biosparge work plan (Arcadis 2018). The Plant 3 biosparge system began operating in May of 2019, and the Plant 2 biosparge system began operating on August of 2020. A summary of the biosparge system performance monitoring results through December 2020, is included in the Lower 1,4-Dioxane Biosparge Update Report (Arcadis 2021a), submitted to EGLE on March 18, 2021. Performance monitoring demonstrates treatment of the lower 1,4-dioxane plume within the radius of influence of the biosparge wells on Plants 2 and 3, as well as downgradient treatment on Plant 3. Currently the Plant 2 biosparge system has not been in operation long enough to show evidence of treatment in downgradient wells. Performance reporting will continue on a quarterly basis.
    - In 2018, detections of 1,4-dioxane in monitoring wells MW-16-74, MW-16-75, and MW-16-77, at the toe of the lower 1,4-dioxane plume suggested additional migration of the plume to the east-southeast (Arcadis 2019b). During 2019 and 2020, 1,4-dioxane concentrations in MW-16-74 and MW-16-75 fluctuated between non-detect and 3 micrograms per liter (µg/L) and were not detected in MW-16-77 suggesting no additional migration. Future migration to the southeast is not expected due to the operation of the biosparge system and geologic conditions described as part of the Lower 1,4-Dioxane Conceptual Site Model (Arcadis 2021b).
    - Lower 1,4-dioxane performance monitoring wells located within the area of influence of the biosparge system (e.g., MW-20-128, MW-14-61, MW-19-121, MW-19-123, MW-13-43, TW-14-06) have shown decreasing concentrations since system startup.

- Increasing concentrations were observed within the northeast lobe of the lower 1,4-dioxane plume on Plant 2 during 2019. The following observations of northeast lobe 1,4-dioxane concentrations were made during 2020 monitoring:
  - MW-17-86: 1,4-Dioxane concentrations have increased from 44 to 90 µg/L from 2018 to 2019 and increased from 99 to 106 µg/L during 2020 monitoring. These concentrations are expected to decrease with continued operation of the biosparge system.
  - Other weathered bedrock monitoring wells located near the northeast lobe including MW-14-61, MW-16-84, and MW-16-85, contain 1,4-dioxane concentrations generally consistent with previous results.
- Monitoring wells located near the western Plant 2 property boundary including MW-14-58 in the perched zone, and MW-14-56, MW-15-73, and MW-16-80 in weathered bedrock, show concentrations of 1,4-dioxane exceeding the DW criterion of 7.2 µg/L in 2020. The detected concentrations are generally consistent with previous results observed at these locations. As previously reported, detections of 1,4-dioxane at these locations could be associated, wholly or in part, with the former Adams Plating Company Site (APC Site). Possible commingling of impacts from the APC site confounds further delineation to the west.

- **VOCs:** VOCs exceeding DW Criteria in at least one monitoring well during 2020 include vinyl chloride, as well as sporadic exceedances of benzene, ethylbenzene, isopropyl benzene, n-propylbenzene, naphthalene, xylenes, 1,1-dichloroethane, and 1,2,4-trimethylbenzene. VOC exceedances are shown on **Figure 4**. This is consistent with previous groundwater investigation and monitoring results.
  - Multiple VOC exceedances at MW-14-54 near the former waste storage area on Plant 2, delineated to the west by MW-14-55 and MW-12-18.
  - Sporadic detections in the central part of Plants 2 and 6 in perched groundwater (MW-14-59, MW-14-60, MW-02-06(6)).
  - Plant 6 entrance off of Stanley and Osborn Streets - Details regarding the detection of vinyl chloride in shallow groundwater in this area was provided to EGLE as part of the *Plant 2, 3 and Plant 6 Vapor Intrusion Summary* (Arcadis 2021c). Vinyl chloride has been detected at on-site at monitoring well MW-20-131 and off-site at MW-20-132 at concentrations above the Site-Specific Vapor Intrusion to Indoor Air Criteria. These wells will continue to be monitored through 2021 along with an off-site soil vapor monitoring point (SVMP-20-01).
  - VOCs are primarily limited to the perched zone; however, detections of VOCs have been observed in weathered bedrock at Plant 2 at concentrations below DW Criteria:
    - *MW-14-61:* contained chloroethane at a concentration of 17 µg/L during June 2020. Chloroethane was not detected during the December 2020 sampling event.
    - *MW-17-86:* contained chloroethane at a concentration of 19 µg/L during June 2020 and 12 µg/L during December 2020, less than the DW criterion of 430 µg/L.

  VOCs will continue to be monitored in the weathered bedrock zone, including additional sampling and analysis of VOCs, as appropriate. Suggested changes to the IGMP are included in Section 5.1.

- **Metals:** Metals exceeding DW Criteria in at least one monitoring well during 2020 include arsenic, nickel, hexavalent chromium, and vanadium (**Figure 5**). The metals results are consistent with previous sampling events.
  - *MW-13-32:* Total nickel was detected in this shallow monitoring well, located in the southeastern corner of Plant 3 within Area 16, at a concentration of 0.185 milligrams per liter (mg/L; DW criterion: 0.10 mg/L) during the second quarter of 2020. Groundwater elevation in this area has indicated that perched groundwater flow is westerly, onto the Site. A summary of the nickel occurrence at Plant 3 was provided to EGLE for both soil and groundwater (Arcadis 2014b, 2015c, 2015d).
  - *MW-13-36R:* Vanadium was detected in this shallow well located near the eastern boundary of Plant 6, at a concentration of 0.005 mg/L, exceeding the DW criteria of 0.0045 mg/L. This result is consistent with previous analytical results for MW-13-36R. An evaluation of metals stability in groundwater (Arcadis 2014) and subsequent monitoring indicates that metals at the Site are stable and are spatially limited.
  - *MWBP-10-UST5-6:* Arsenic was detected in the perched zone located near the southern boundary of Plant 6, at a concentration of 0.012 mg/L, exceeding the DW criteria of 0.005 mg/L. MWBP-10-UST5-6 is screened in a confined sand unit at approximately 30 feet bgs, which is also screened by several other monitoring wells nearby including MW-12-16 off-site. Groundwater elevations for these wells consistently suggest a northerly flow, onto the Site, since 2014. Based on the hydraulic isolation of this well and the apparent northerly groundwater flow direction, EGLE has agreed that arsenic at this location is related to regional background conditions and not associated with Site impacts.
  - *MWBP-11-UST1-4 & MWBP-12-UST1-4:* Similarly, arsenic was detected in the perched zone located near the southern boundary of Plant 6, at a concentration of 0.012 and 0.010 mg/L at these wells, slightly above DW Criteria. These detections are consistent with background concentrations and/or may be associated with residual reducing conditions associated with the former UST located in this area.
- Perfluorooctanesulfonic Acid (PFOS): concentrations exceeded the DW Criteria of 16 ng/L at 13 perched monitoring well locations (CH-14-RO, MW-12-12, MW-13-36R, MW-14-62, MW-18-88, MW-18-89, MW-18-90, MW-18-91, MW-18-95, MW-18-98, MW-18-99, P6-SB-07, UNK-15) in 2020 (**Figure 6**). The PFOS results are generally consistent with previous results (Arcadis 2018a, 2018b, 2019d, 2019e, 2020b).
  - *MW-18-88 and MW-18-95:* Perched monitoring wells located along the eastern boundary of Plant 3, contained PFOS concentrations higher than the DW Criteria. PFOS did not exceed the DW Criteria at the six perched monitoring wells installed as sentinels in the City of Lansing's Dunnebacke and Westside Parks.
  - *MW-12-12 and MW-13-36R:* Located along the eastern boundary of Plant 6, contained concentrations of PFOS that exceed the DW criteria. PFOS did not exceed DW Criteria at the vertical aquifer profiling (VAP) samples completed to delineate PFAS impacts east of Plant 6. A summary of the off-site VAP investigation is included as part of the Plant 6 PFAS Investigation Summary – Phase 2 (Arcadis 2019c).
  - In addition to DW Criteria exceedances, PFOS exceeds the GSI Criteria of 12 ng/L at 14 perched monitoring wells during the 2020 groundwater monitoring events (**Figure 6**). Monitoring well MW-18-105, located east of Plant 3, contained 12.4 ng/L of PFOS during March 2021; however, concentrations of PFOS detected during June, August, and December 2021 were below the GSI criterion of 12 ng/L. These results are consistent with concentrations detected during 2019 monitoring. Off-site PFOS exceedances will continue to be monitored to evaluate concentration trends and plume stability.

- **PFOA:** concentrations exceeded the DW Criteria of 8 ng/L at 17 perched monitoring well locations (CH-14-RO, MW-04-05(6), MW-12-12, MW-13-36R, MW-14-59, MW-14-60, MW-14-62, MW-14-67, MW-14-70, MW-18-88, MW-18-89, MW-18-90, MW-18-91, MW-18-98, MW-18-99, P6-SB-07, UNK-15) in 2020 (**Figure 7**). The PFOA results are generally consistent with previous results (Arcadis 2018a, 2018b, 2019d, 2019e, 2020b).
  - *MW-18-88:* A perched monitoring well located along the eastern boundary of Plant 3, contained a PFOS concentration of 8.8 ng/L in a sample collected during the third quarter 2020 sampling event, exceeding the DW Criterion of 8 ng/L. PFOA was detected at concentrations below the DW criterion during the first, second, and fourth quarter 2020 sampling events. Additionally, PFOA has not exceeded the DW Criteria at any of the six perched monitoring wells installed as sentinels in the City of Lansing's Dunnebacke and Westside Parks.
  - *MW-04-05(6), MW-12-12, MW-13-36R, and MW-14-67:* Perched monitoring wells located along the eastern boundary of Plant 6, contained concentrations of PFOA that exceed the DW criteria of 8.0 ng/L. Additional monitoring wells were installed along the eastern and southern Plant 6 boundaries during first quarter 2021 to further evaluate perimeter exceedances. These wells will be incorporated into the IGMP and 2021 sampling (Section 5.1). A report summarizing installation and initial sampling results is being prepared and will be submitted to EGLE in 2021. Further, additional work will be completed in summer 2021 off-site to the east of Plant 6 to confirm the extent of PFOA in perched groundwater.
- **Other PFAS:** In general, other PFAS concentrations appear to correlate to PFOS and PFOA concentrations and decrease with distance from PFOS and PFOA source areas. Two other PFAS compounds, perfluorononanoic acid (PFNA) and perfluorohexanesulfonic acid (PFHxS), exceed DW criteria at one or more locations. Specific results for other PFAS are summarized on **Table 2**.
  - PFNA concentrations exceeding the DW criterion of 6 ng/L were detected in 4 perched monitoring wells (**Figure 8**) (MW-12-12, MW-13-36R, MW-14-62, and P6-SB-07).
  - PFHxS concentrations exceeding the DW criterion of 51 ng/L were detected in perched monitoring well CH-14-RO (located in the Plant 3 PFAS source area) and in MW-18-103, a perched monitoring well located along the northern boundary of Dunneback Park east of Plant 3. In MW-18-103 PFHxS was detected at concentrations ranging from 16.8 ng/L to 38 ng/L during the first three quarters of 2020, below the DW criterion of 51 ng/L. A PFHxS concentration of 61.8 ng/L detected in December 2020 exceeded the DW criterion. The PFHxS detected at MW-18-103 appears to be isolated and may be related to an off-site source area.

3.1.1 Municipal Well and Bedrock Monitoring Well Sampling Results

The results of the Lansing Township well sampling indicate 1,4-dioxane concentrations of 0.22 µg/L in Lansing Township well TWP-90-04, and 0.41 µg/L TWP-90-05 (**Appendix A**). These concentrations are consistent with those detected in December 2019 (0.23 ng/L and 0.41 ng/L). The locations of the municipal wells and the bedrock 1,4-dioxane results are summarized on **Figure 9**. TWP-90-03 was out of service during December 2020 and could not be sampled.

Analytical results for the municipal wells are included in **Table 2**. Widespread 1,4-dioxane detections are potentially related to a 1,4-dioxane "background condition" in and around Lansing, as demonstrated by the low-level 1,4-dioxane sampling completed at the Site in 2017. Sporadic detections of 1,4-dioxane in the bedrock

monitoring wells installed along the core of the plume ranged from 0.16 µg/L to 0.98 µg/L and did not exceed DW Criteria in 2020. Annual sampling of Lansing Township wells will continue to monitor for 1,4-dioxane.

3.2 Light Nonaqueous Phase Liquid Monitoring

LNAPL is present in the central portion of Plant 2 (Area 5-2) and in the north-central portion of Plant 3 (Area 17). LNAPL monitoring well locations and approximate extent of LNAPL are presented on figures provided in **Appendix D**. Trend plots indicate that, in general, LNAPL (when present) thickness gradually increases until it reaches equilibrium within the well and then stabilizes. For the deeper LNAPL, the wells take longer to equilibrate with the confined LNAPL conditions relative to the static water level within the formation. The comprehensive *Plant 2 LNAPL Conceptual Site Model* was provided to EGLE for review on February 20, 2020 (Arcadis 2020c). Based on the monitoring results, there is no indication of LNAPL migration. **Table 3** summarizes measured LNAPL thickness, and **Appendix D** includes LNAPL trend plots.

3.3 Groundwater Elevation Monitoring

In 2020, a site-wide groundwater elevation survey was completed during the annual event (June 2020). Additional groundwater elevation measurements were collected at sampled wells during the semi-annual and quarterly events. **Table 4** summarizes groundwater elevation measurements collected at the Site. Groundwater elevation trend graphs for key wells at each plant are provided in **Appendix E**. Trends within each water-bearing zone are discussed below.

3.3.1 Perched Zone

Due to the predominance of clay-rich sediment, the perched zone is interbedded and has an overall low permeability and is characterized by isolated sand zones within layers of silt and clay. The potentiometric surface measured within the perched zones is presented on **Figure 10** (Plants 2 and 6) and **Figure 11** (Plant 3). Both figures include potentiometric surface contours for all wells less than 25 feet deep. The lower conductivity clay and silt that dominate this zone result in high horizontal and vertical gradients. Sand zones are discontinuous and often do not correlate from well to well, and minor variations in well screen elevation have a significant impact on the potentiometric surface. Therefore, although the contour maps represent the overall shallow potentiometric surface, they are of limited use to determine groundwater flow direction.

The trend graphs included in **Appendix E** indicate that potentiometric surface elevations in the perched zone have been stable to increasing during the period of monitoring beginning in 2012. Storm sewer modifications were completed at Plant 3 during November 2018 and at Plant 2 in 2019 and 2020. Comparison of potentiometric surface elevations observed on Plant 3 prior to storm sewer modifications and post-modification potentiometric surface elevations generally show minor fluctuations (both increasing and decreasing) that are within the range of seasonal variation. Perched potentiometric surface elevations on Plant 2 generally show a slight increase in groundwater elevation following the 2019 modifications, however perched groundwater elevations on Plant 2 have generally shown a gradual increasing trend since 2012. It is unclear whether the small changes in groundwater elevation on Plant 2 are influences by storm sewer modifications, or part of longer-term trends related to decommissioning of the plants. Evaluation of perched groundwater elevations will continue during 2021 to evaluate the effect of storm sewer bulkheading.

3.3.2 Deep Overburden

Saturated deep overburden is present only at Plant 3. Groundwater present within the deep overburden is hydraulically connected to the weathered bedrock and bedrock zones. **Figure 12** presents potentiometric surface elevation contours for deep overburden wells located on Plant 3. In the northern portion of Plant 3, the apparent groundwater gradient is northwesterly. In the southwestern portion of Plant 3, a groundwater high is apparent beneath the former coliseum area with groundwater flow to the southeast, consistent with the lower 1,4-dioxane distribution.

The trend graphs included in **Appendix E** show that steady increases in water levels were observed in deep overburden water levels beginning in 2016 likely related to increased precipitation, as well as long-term changes in municipal pumping.

3.3.3 Weathered Bedrock and Bedrock

The long-term trends for bedrock monitoring wells show an increasing potentiometric surface in bedrock and weathered bedrock beginning primarily in 2016. Potentiometric surface trend graphs for select bedrock and weathered bedrock wells are included in **Appendix E**. The increase in potentiometric surface of the bedrock wells was accompanied by a general decrease in the vertical gradient within the Saginaw formation (from 0.44 foot per foot (ft/ft) downward in 2016 to 0.13 ft/ft downward in 2018, 0.28 ft/ft downward in 2019, and 0.33 ft/ft downward in 2020). The effect, as documented in the December 5, 2019 Update Meeting Presentation provided to EGLE, is an overall flatter, more variable bedrock horizontal gradient with a west to east flow component observed in the central part of Plant 2. The rise in potentiometric surface, and overall increasing trend observed since 2016, is likely attributed to changes in municipal pumping patterns, both long-term and seasonally.

Similar to the perched zone, the depth of a monitoring well within the weathered bedrock or bedrock zones plays a large role in the potentiometric surface observed at that location. Large vertical gradients occur in formations with vertical anisotropy and indicate a lack of vertical groundwater communication. Traditional groundwater elevation contour maps were not prepared for the weathered bedrock wells or bedrock wells because they would be of limited use for interpreting groundwater flow direction and transport.

For the bedrock (and by extension, the weathered bedrock), the effective head or “corrected” potentiometric surface elevation can be calculated based on the observed vertical gradients. As indicated in **Table 5**, the vertical gradient tends to be limited near the coliseum and increases to the south to 0.36 ft/ft downward at wells MW-15-72/MW-12-05R (located in central Plant 2) before stabilizing to 0.37 ft/ft downward at wells MW-13-52/MW-13-50 (located on western Plant 6). This variation in vertical gradient appears to coincide with the transition between bedrock formations. Near the coliseum, where the bedrock encountered consists of the more uniform and permeable Grand River Formation, the vertical gradient is negligible. To the south, within the interbedded sandstone and shale of the Saginaw Formation, there is a significant vertical gradient due to the vertical anisotropy created by the interbedded shale and sandstone of the Saginaw Formation. Review of the bedrock wells and other deep boring logs suggests an approximate geologic contact between the Grand River and Saginaw Formations oriented roughly southwest to northeast. **Figure 13** includes the interpreted location of the geologic contact.

To calculate the effective head for the bedrock (**Figure 13**), an average downward gradient 0.33 ft/ft was applied to bedrock monitoring wells installed within the Saginaw Formation as follows:

GWeff = GW – (dh/dl* ΔElev)

Where:

GWeff = effective groundwater elevation

GW = measured groundwater elevation

dh/dl = vertical gradient

ΔElev = change in elevation between deepest well and measured well

As shown on **Figure 11**, the corrected bedrock groundwater contours are a good match for the distribution of the lower 1,4-dioxane plume located within the weathered bedrock zone. The corrected potentiometric surface shows an easterly component of flow within the bedrock/weathered bedrock beneath the Plant 2 LNAPL area, an observation supported by the easterly migration of the lower 1,4-dioxane plume.

4 Groundwater Plume Stability

A preliminary geochemical and plume stability assessment for groundwater at the Site was completed in April 2014 (Arcadis 2014b). The primary objective of this assessment was to provide an initial evaluation of plume stability and determine the suitability of monitored plume stability as a remedial alternative. The preliminary plume stability assessment used data collected between October 2011 and first quarter 2014 as well as geochemical data collected during the August and September 2013 events.

The plume stability assessment has been updated annually and incorporated into the annual reports. Stability assessments have been generally consistent and demonstrate that increasing trends are primarily limited to 1,4-dioxane in weathered bedrock wells and non-site-related metals in perched wells mobilized by changes in groundwater geochemistry associated with the Site. The plume stability assessment presented in this section represents an updated analysis of time-series concentration trends using data collected through fourth quarter 2020.

The updated statistical analysis of dissolved-phase COC concentrations with time was completed using the Mann-Kendall slope trend test, consistent with the methodology used in previous evaluations. The updated analysis for 2020 includes all wells that that meet the following criteria:

- At least four sampling events have been completed.
- At least 65 percent of the sampling results were greater than detection limits (minimum of three sampling results greater than detection limits).
- At least one detection in the dataset exceeded the lowest relevant criteria.

The plume stability assessment was completed in accordance with USEPA guidance (USEPA 2009). Correlations were accepted as significant for p-values less than or equal to the alpha value, 0.10 (with a confidence level of 90

percent). Additional information regarding the Mann-Kendall analysis and methods is provided in the 2014 Preliminary Groundwater Geochemical and Plume Stability Assessment (Arcadis 2014b) and in **Appendix F**.

The Mann-Kendall trend test is a non-parametric test to evaluate if a statistically significant unidirectional (consistently increasing or decreasing) trend was observed during the monitoring period. Guidance for conducting the Mann-Kendall test have been provided in Section 17.3.2 of the US EPA guidance document (USEPA 2009). **Table 6** presents a comprehensive summary Mann-Kendall trend analysis results. The overall trend results are shown on **Figures 14** and **15** for perched and weathered bedrock zones, respectively. **Appendix F** presents plots of concentrations through time for all well/COC pairs that met criteria for statistical trend analysis.

4.1 Perched Zone

4.1.1 1,4-Dioxane

The 1,4-dioxane plume generally appears to be stable to decreasing within the perched zone as demonstrated with 2014 plume stability evaluation and each successive annual report (Arcadis 2014b, 2015d, 2016a, 2017b, 2018c, 2019b, 2020b). Plant 2 perched monitoring well MW-14-58 shows a statistically increasing trend, however, 1,4-dioxane concentrations in MW-14-58 have fluctuated significantly within the range of 12 µg/L to 78 µg/L since 2014 and have been decreasing since 2019.

4.1.2 Volatile Organic Compounds

Concentrations of VOCs in the perched zone are sporadic, and a large plume footprint has not been observed; rather, VOC concentrations in groundwater greater than DW criteria are limited to discrete source areas (e.g., Area 2, Area 9) and areas immediately surrounding observed LNAPL at Plants 2 and 3. Review of VOC data indicates increasing trends at 3 locations:

- *MW-14-54:* A monitoring well located in Area 2 of Plant 2 exhibits increasing trends for ethylbenzene, isopropyl benzene, and total xylenes. Perched monitoring wells MW-12-18 and MW-14-55 located between MW-14-54 and the western property boundary have not had detectable VOCs, suggesting that the extent of groundwater impacts in Area 2 is spatially limited.
- *MW-14-60:* A monitoring well located near the Plant 2 LNAPL demonstrates an increasing trend for vinyl chloride, however concentrations decreased from 12 µg/L during June 2019, to 5 µg/L during 2020.
- *MWBP-12-UST1-4:* An increasing benzene trend was identified in MWBP-12-UST1-4, located near the southern property boundary of Plant 6. Benzene concentrations in MWBP-12-UST1-4, installed at a depth of 15-25 feet, steadily increased from 2013 to June 2015, with a maximum concentration of 157 µg/L. Benzene concentrations were sporadic from 2016 through 2018 and had decreased to 6 µg/L in December 2018 followed by a concentration increase to 284 µg/L during June 2019. During 2020 benzene was not detected in MWBP-12-UST1-4. Monitoring well MWBP-12A-UST1-4 located between MWBP-12-UST1-4 and the property boundary at a depth of 28-38 feet, has also been non-detect for benzene during recent sampling events. Monitoring of MWBP-12-UST1-4 and MWBP-12A-UST1-4 will continue semi-annually.

4.1.3 Metals

During previous plume stability assessments, most statistical analyses for concentrations of metals in perched zone monitoring wells were determined to be decreasing or exhibit no trend, suggesting overall stability in metals impacts greater than criteria. The trend evaluation for metals focused on monitoring wells near the Site boundary to evaluate the potential for off-site metal impacts. The following increasing trends were observed, with remaining monitoring wells at the Site boundary exhibiting stable to decreasing concentrations of metals:

- Arsenic in MWBP-10-UST5-6, located along the southern Plant 6 boundary, was detected at a concentration of 0.012 mg/L in both June 2019 and June 2020. Arsenic concentrations at this location are within the range of state-wide background concentrations (Cummings 1989), and water levels measured at wells within the same sand unit at Area 9 show a consistent gradient to the north (flow onto the Site), suggesting that arsenic detected in MW-12-16 is not site-related. As agreed with EGLE, additional evaluation beyond continued monitoring is not required for the area.

4.1.4 PFOS, PFOA, PFNA, and PFHxS

Twenty-four monitoring wells met the criteria for Mann-Kendall analysis for PFOS, PFOA, PFNA, or PFHxS during 2020. Statistical trend analysis indicates that, apart from one well (MW-13-36R), all wells with PFAS concentrations exceeding criteria demonstrate stable to decreasing trends. The increasing trend observed at MW13-36R for PFOA is located near the eastern boundary of Plant 6. Additional delineation of PFOA east of Plant 6 will be completed during the summer of 2021.

4.2 Deep Overburden and Weathered Bedrock

4.2.1 1,4-Dioxane

Since the initial plume stability assessment in 2014, concentrations within the lower 1,4-dioxane plume have generally shifted toward decreasing to stable trends in the northern portion of the plume on Plant 3, and stable to increasing trends towards the toe of the plume and the Plant 2 LNAPL area. Nine weathered bedrock and deep overburden wells exhibited increasing trends for 1,4-dioxane on Plants 2 and 3 (MW-13-34, MW-13-45, MW-14-56, MW-14-61, MW-15-73, MW-16-81, MW-16-84, MW-16-85, and MW-17-86). Notable trends within the lower 1,4-dioxane plume include the following:

- *MW-13-34 and MW-13-48:* Nested at the Plant 3 southern property boundary and installed within the weathered bedrock and deep overburden, respectively. MW-13-34 exhibits an increasing trend for 1,4-dioxane and has been observed to be increasing since initial sampling in 2013 (from approximately 20 µg/L to 100 µg/L). MW-13-48 previously exhibited an increasing trend (Arcadis 2019b); however, concentrations in MW-13-48 have been decreasing since 2015 (from a max of approximately 380 µg/L to 150 µg/L) and no longer shows an increasing trend.
- *MW-15-73 and MW-13-45:* Located within the weathered bedrock at the west and east extents of the lower 1,4-dioxane plume in the central part of Plant 2. Together with monitoring well MW-13-43 (plume axis), they comprise a transect across the plume. MW-15-73 has shown consistent detections of 1,4-dioxane, with only the three most recent samples (December 2018, June 2019, and June 2020) exceeding the DW criterion of 7.2 µg/L. This increasing trend could be attributed to contributions from the APC Site. Work completed during

the installation of MW-15-73 and installation of the Biosparge system (Arcadis 2021b) has shown a clean zone between the lower 1,4-dioxane plume and MW-15-73. Concentrations in MW-13-45 initially increased between 2013 and 2015 but appear to be stable since 2016 ranging from approximately 40 to 60 µg/L.

- *MW-14-56:* A weathered bedrock well located along the western property boundary of Plant 2, shows an increasing trend (6 to 14 µg/L) for 1,4-dioxane and may also be related to the APC Site located upgradient of the well location.
- *MW-16-81:* Located immediately south of the Plant 2 LNAPL area,1,4-dioxane has been steadily increasing from initial sampling in 2016 to June 2020. The increasing trend suggests leakage from the perched zone. 1,4- Dioxane concentrations in MW-16-81 decreased from 3,100 µg/L during June 2020 to 590 µg/L during September 2020 before rebounding to 1,930 µg/L during December 2020. The recent fluctuations in concentration may be related to the startup of the biosparge system in August 2020, as well as natural variability.
- *MW-16-85 and MW-17-86:* Additional weathered bedrock sentinel wells installed in 2016 and 2017 to monitor the northeast lobe of the lower 1,4-dioxane plume. Well MW-17-86 has shown increasing concentrations since installation in 2017 (from approximately 8 µg/L in 2017 to 110 µg/L in 2020). Well MW-16-85 exceeded DW Criteria for the first time in 2019 (16-17 µg/L); however, 1,4-dioxane concentrations have since decreased to 8 µg/L in June and December 2020. These wells are expected to decrease in concentration with continued operation of the biosparge system.

5 Conclusions

This Annual Report summarizes the groundwater monitoring activities completed between January and December 2020, consistent with the 2019 Revised IGMP (Arcadis 2019a). Based on the results of the sampling and review of the plume stability evaluation, the following conclusions are offered:

- *VOC and Metals:* Groundwater sample results indicate that concentrations of several VOCs and metals exceed residential drinking water criteria during at least one sampling event at the Site. Elevated concentrations of metals are, in most cases, a result of natural geochemical conditions and/or slight shifts in geochemistry associated with the presence of VOCs. The exception is nickel on the eastern boundary of Plant 3, which is attributed to off-site conditions.
- *1,4-Dioxane:* Installation of the biosparge system for the lower 1,4-dioxane plume has been completed per the Interim Measures Work Plan: Lower 1,4-Dioxane Biosparge work plan (Arcadis 2018d). The Plant 3 biosparge system began operating in May of 2019, and the Plant 2 biosparge system began operating on August of 2020. Monitoring wells installed within the radius of influence of the biosparge system have shown decreasing concentrations. Performance monitoring and system construction details for the biosparge system will be submitted under separate cover.
    - 1,4-Dioxane concentrations in the perched zone and weathered bedrock along the western Plant 2 property boundary exceed Part 201 criteria at several locations similar to previous years and are likely wholly associated or commingled with impacts associated with the former APC Site.
    - Wells in the northern portion of the lower 1,4-dioxane plume demonstrate stable to decreasing concentrations. Concentrations in the southern portion of the lower 1,4-dioxane plume are stable to increasing trends, particularly to the east of the Plant 2 LNAPL Area within the northeast lobe. Increasing

weathered bedrock concentrations of 1,4-dioxane in wells near the property boundary (MW-15-73 and MW-14-56) may be due to contributions from the former APC Site.

- *1,4-Dioxane in Bedrock:* Sporadic detections of 1,4-dioxane in deeper bedrock monitoring wells installed along the core of the plume ranged from 0.16 µg/L to 0.98 µg/L and did not exceed drinking water criteria in 2020.
  - Lansing Township wells TWP-90-04 and TWP-90-05 were sampled in December 2020 and analyzed for 1,4-dioxane using USEPA Method 522 for drinking water. Concentrations of 0.23 and 0.41 µg/L, respectively, were reported and are consistent with previous sampling results. The low-level detections of 1,4-dioxane in the region may result from several regional and/or numerous nonpoint sources. Annual sampling of Lansing Township wells will continue in 2021.
- *PFAS Compounds:* PFOS, PFOA, PFNA, and PFHxS concentrations exceeded DW Criteria and PFOS exceeded the GSI criterion in perched monitoring wells during 2020 groundwater monitoring events. Concentrations PFAS in perched groundwater at Plants 2, 3, and 6, are stable or show no significant trend with the exception of one well at the perimeter of Plant 6. Additional work will be completed in 2021 to delineate PFAS off-site to the east of Plant 6.
- *Groundwater potentiometric surface maps:* Contour maps for the three saturated zones at the Site show a complex hydrogeologic system. The potentiometric surface in the perched zone has been stable to increasing in elevation since monitoring began in 2011. Potentiometric levels within the lower zones (deep overburden, weathered bedrock, and bedrock) have been increasing since 2016, potentially related to climate variables but more likely related to changes in municipal pumping.
- *Plants 2 and 3 perched groundwater elevations:* Comparison of pre-bulkheading groundwater elevations to groundwater elevations observed during 2020 shows minor fluctuations that are within the range of seasonal variation. Perched groundwater on Plant 3 appears to exhibit radial flow away from the former press pits in Area 14.
- *Light nonaqueous phase liquid (LNAPL):* Consistent with previous annual reports, there is no indication of LNAPL migration.

Based on these conclusions, no immediate action is recommended at this time. Results of the monitoring program do not suggest changes are required for the previously submitted Plant 2 LNAPL CSM (Arcadis 2020c), or the lower 1,4-dioxane CSM (Arcadis 2021b). Further, there are no apparent risks of exposure noted for the surrounding residential neighborhoods. Groundwater monitoring will continue consistent with the 2019 revised IGMP, with several suggested modifications, as outlined below.

6 Proposed IGMP Modifications

As outlined in the *Plant 6 PFAS Investigation Summary report – Phase 2* (Arcadis 2019c), three perched monitoring wells were installed near the eastern property boundary (MW-21-133, MW-21-134, and MW-21-135), and three perched monitoring wells were installed in the southern ROW of Michigan Avenue to the south of Plant 6 (MW-21-136, MW-21-137, and MW-21-138). The new perched monitoring wells were installed and sampled during March 2021 to evaluate potential off-site migration of PFAS. Installation details and initial results for the new monitoring wells will be submitted to EGLE under separate cover, along with a workplan for further off-site investigation of PFAS at Plant 6. The new monitoring wells will be integrated into the IGMP for quarterly PFAS sampling during 2021, with sampling frequency re-evaluated for 2022.

In December 2020, abandonment of eleven perched and one weathered bedrock monitoring well were completed at the Site. Details of the well abandonments are summarized in the 2020 Well Abandonment Documentation Memo (Arcadis 2021d) submitted to EGLE on March 9, 2021. Six of the eleven abandoned monitoring wells were not included in the previous IGMP. The remaining five will be removed from the IGMP matrix (**Table 1**).

Summary of Groundwater Analytical Results
2019 Annual Groundwater Report
RACER Trust Plants 2, 3, and 6 - Lansing, Michigan

Data Flagging:
Bold font represents data where detections were noted above the laboratory method detection limit.
Gray shading represents result exceeding either or both the EGLE Part 201 Generic Cleanup Criteria and Screening Levels (dated January 10, 2018) or the EGLE GSI Criteria (Updated June 25, 20:

Notes:
1. EGLE Part 201 Residential Drinking Water Criteria and Groundwater Surface Water Interface Criteria from the Generic Cleanup Criteria and Screening Levels (dated January 10, 2018) are used for comparison with all VOC and Inorganic data and revised criteria values (dated December 21, 2020) are used for comparison with all PFAS data.
2. 1,4-Dioxane is compared to a drinking water criteria of 7.2 µg/L per the *MDEQ Establishment of Cleanup Criteria for 1,4 -Dioxane: Emergency Rules* dated October 27, 2016.

Abbreviations:
- - = Not listed in the EGLE Criteria Tables.
* = Analyzed for low-level 1,4-Dioxane via EPA Method 522
Deg. C. = degrees Celsius
EGLE = Michigan Department of Environment, Great Lakes, and Energy
mg/L = milligrams per liter
NA = Not Analyzed
NR = Not Recorded
NTU = Nephelometric Turbidity Unit
s.u. = standard unit
ug/L = micrograms per liter
µS/cm = microSiemens per centimeter

Lab and Validation Data Qualifiers:
F1 = Matrix spike and/or matrix spike duplicate recovery is outside acceptance limits.
J = The compound was positively identified, however, the associated numerical value is an estimated concentration only.
Y = Elevated reporting limit due to high target concentration.

Notes:
< = less than the posted reporting limit
% = percent
CV = coefficient of variation; low values indicate stable concentrations. Values near or greater than 1 suggest variability and/or a temporal trend.
mg/L = milligrams per liter
n = number of samples included in analysis (sample size)
NA = not applicable due to elevated proportion of non-detect concentrations
ng/L = nanograms per liter
p = Indication of statistical significance of trend direction. Concentration trends considered statistically significant trend at p-values less than 0.1 (90% confidence level).
PFOA = Perfluorooctanoic acid
PFHxS = Perfluorohexanesulfonic acid
PFNA = Perfluorononanoic acid
PFOS = Perfluorooctane sulfonic acid
S = Mann-Kendall test statistic. Sign indicates trend direction: positive values suggest increasing trend, negative values suggest decreasing trend, values near zero indicate stability or variability.
RACER = Revitalizing Auto Communities Environmental Response
µg/L = micrograms per liter

Narrative

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Racer Lansing

Report Number: 200-56406-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, Burlington attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 12/8/2020 10:30 AM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.4º C.

1,4-DIOXANE

Samples FB-01_120720 (200-56406-1), TWP-90-04_120720 (200-56406-2), TWP-90-05_120720 (200-56406-3) and DUP-08-120720 (200-56406-4) were analyzed for 1,4-Dioxane in accordance with EPA Method 522. The samples were prepared on 12/08/2020 and analyzed on 12/10/2020.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Narrative

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Racer Lansing

Report Number: 240-127078-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, Canton attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The 522 1,4-Dioxane analysis was performed at the Eurofins TestAmerica, Burlington laboratory.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 3/4/2020 9:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.7° C.

Analytical Laboratory Report

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

Narrative

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Racer Lansing

Report Number: 240-131443-1

Revision

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Report revised on 7/6/2020 to correct sample IDs.

Eurofins TestAmerica, Burlington attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 6/5/2020 9:40 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 1.8º C.

Narrative

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Racer Lansing

Report Number: 240-131478-1

Revision

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Report revised on 7/6/2020 to correct sample IDs.

Eurofins TestAmerica, Burlington attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 6/6/2020 9:50 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.4° C.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Full accreditation certificates are available upon request. Starred (*) analytes are not NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
