1. Introduction

This *Remedial Action Plan* (RAP) has been prepared on behalf of the General Motors Corporation (GM), the Remediation and Liability Management Company, Inc. (REALM), and Waste Management, Inc. (WMI). The property addressed by this RAP includes the GM Saginaw Malleable Iron (SMI) Plant Property and the adjacent REALM Green Point Landfill and Drum Remediation Area (DRA) property, all located in Saginaw, Michigan (the Site) (Figure 1-1). This RAP describes current Site conditions, summarizes previously implemented remedial actions, provides a summary of Site-specific cleanup criteria established for the Site, and discusses proposed remedies. The RAP was developed pursuant to Part 201 of the Natural Resources and Environmental Protection Act (NREPA), 1994 PA 451, as amended, and reflects the current and projected future use of the Site. This RAP is being completed pursuant to a Consent Judgment executed between the Michigan Department of Environmental Quality (MDEQ), the Michigan Attorney General's (MAG's) Office, GM, and WMI, and entered by the State of Michigan Circuit Court for Saginaw County on March 16, 1998, Case No. 98-22686-CE-2(Consent Judgment).

The information that forms the basis of this RAP is presented in the *Remedial Investigation Report* (RI Report) (Blasland, Bouck & Lee, Inc. [BBL], July 2001) and the Feasibility Study Report (FS Report) (BBL, July 2003). Additional Site data collected since the RI Report was prepared has also been considered in preparation of this RAP. Appendix A includes comprehensive data summary tables. The FS Report includes the *Human Health Evaluation Report* (HHE), prepared by BBL, and the *Ecological Risk Assessment Report* (ERA), prepared by Exponent. To provide consideration of the new Site data and revised generic MDEQ cleanup criteria, a HHE Addendum is provided as Appendix B of this RAP.

Sep 17, 2009 18:39

The RAP has been prepared consistent with the following MDEQ guidance documents:

- *Training Manual for Part 201 Cleanup Criteria*, dated January 2004.
- *Suggested Contents of Part 201 Remedial Action Plans and Plans for Interim Response Activities Designed to Meet Criteria* (draft), dated January 2004.

The purpose of this RAP is to present the technical elements of the selected remedies proposed for the Site.

1.1 Facility Location and Physical Setting

The Site encompasses approximately 273 acres. The SMI Plant Property consists of the northern portion of the Site and includes the SMI Plant and surrounding ancillary areas, two closed Type III Landfills, two stormwater ponds, and a buffer basin (part of a former Water Recycle System). The southern portion of the Site (now owned by REALM) includes the closed Green Point Landfill and the DRA, where drums were previously discovered, excavated, and removed. See Appendix G for the legal description of the Site.

The Site is located approximately 2,000 feet north of the confluence of the Tittabawassee and Shiawassee Rivers and is located on the western half of Section 35, T12N, R4E, in the city of Saginaw, Saginaw County, Michigan. The Site is bounded to the west by the Delphi Automotive Systems Corporation (Delphi) former Saginaw Steering Systems Plant 2 (Plant 2), a junkyard, and another property, which contains miscellaneous debris; to the east by the Saginaw River, a strip of property east of the Green Point Landfill that was previously owned by the Consumers Energy Company (purchased by REALM in 2008), and by property previously used for

agricultural purposes that now contains a mitigation wetland (this agricultural property was once owned by Ruben Schultz and the State of Michigan, and is now owned by REALM); to the north by commercial, residential, and industrial properties; and to the south by farm fields (Figures 1-1 and 1-2).

Figure 1-2 is a Site plan illustrating the locations of the primary Site features: the SMI Plant; the former Water Recirculation System (WRS), which included the former Primary Settling Pond previously encompassing approximately 2 acres (the pond is dry and has been graded over to form a stormwater drainage swale), the two filled recirculation channels, the former Secondary Settling Pond encompassing approximately 16 acres (now exclusively used as a stormwater management pond), the Stormwater Pond, encompassing approximately 1 acre; the closed eastern 8-acre licensed Type III Landfill; the closed central 8-acre licensed Type III Landfill; the 30-acre Green Point Landfill; and the DRA encompassing approximately 13 acres. The Previously Proposed Type III Landfill is also shown on Figure 1-2. This area was the Site of GM's proposed Type III Landfill; however, the landfill was never fully developed (a constructed base of inert foundry sand still remains).

The topography of the Site is generally flat, with the exception of the closed Type III landfills and the Green Point Landfill, which are mounded above the surrounding land. The Secondary Settling Pond and the Stormwater Pond also result in minor topographic variability in the northern part of the Site. In the south and southwest portions of the Site, wetlands and a series of agricultural ditches which provide for drainage are present. The 100-year floodplain elevation is 594 feet above mean sea level (amsl) (RMT, 1980). Many areas of the Site are below this elevation.

For more details regarding the facility setting, including regional geology and hydrogeology, refer to the RI Report, FS Report, and other documents previously submitted to the MDEQ.

1.2 Overview of Property Ownership, Past and Current Use of Properties, and Materials Used at the Site

1.2.1 Property Ownership

The SMI Plant Property (which occupies the northern portion of the Site) is currently owned by GM. The Green Point Landfill and DRA (which occupy the southern portion of the Site) are currently owned by REALM. For more information pertaining to historical ownership of the Site and select adjacent properties refer to the RI Report (BBL, 2001) and FS Report (BBL, 2003).

1.2.2 Past and Current Use of Properties and Materials used at the Site

A description of the past and current use of the Site is provided below for each Site area.

SMI Plant and Production Areas

The SMI Plant building occupies an area of approximately 1 million square feet. Active manufacturing at the plant ended in 2007 and current plans are to demolish existing site structures. Prior to plant closure, manufacturing operations consisted of activities associated with casting and heat-treating iron. Scrap metal was melted and transferred through a series of furnaces before it was placed, as molten metal, into the molds to form the castings. Molds, which form the outer shape of the casting, were formed by putting mold sand (a mixture of lake sand, sea coal, bentonite, and water) under pressure around a die. Cores, which form the internal cavities of

Richard Kowalski
LFR
Sep 17, 2009 18:39

a casting, are made by mixing lake sand with a two-part resin and then injecting a catalyst into the core box to set up the resin. Once the mold and core were completed, molten metal was placed into the mold to form the casting. After cooling, the mold was broken to remove the casting. The resulting castings were then heat-treated and quenched with oil to develop malleability. Several areas discussed below are located within or in the immediate vicinity of the SMI Plant building.

Former Harden, Quench, and Draw Area

The former Harden, Quench, and Draw (HQD) Area is located within the southwestern portion of the SMI Plant building (Figure 1-2). Each of the former HQD units included a quench oil bath used to uniformly cool metal castings. A total of ten HQD units were installed in 1968. Units No. 1 through No. 9 were taken out of service between 1973 and 1991. The remaining unit (No. 10) was used to test alternative quench oil formulas.

Light Nonaqueous Phase Liquid (LNAPL) Assessment and Remediation Area

The LNAPL Assessment and Remediation Area is located within the Unpaved Area southwest of the SMI Plant building, between SMI and the adjacent Delphi property (Figure 1-2). Three 20,000-gallon aboveground storage tanks (ASTs) that contained quench oil are located along the fenced western edge of the Unpaved Area within a concrete secondary containment structure. The Unpaved Area was also used to store roll-off boxes of municipal waste, and miscellaneous other plant materials.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Quench Pit Area

The Quench Pit Area is located in the former Annealing Department inside the central portion of the SMI Plant building (Figure 1-2). The area contains three quench pits, commonly referred to as direct quench pits #1, #2, and #3. Quench pit #1 was installed in 1966. Quench pits #2 and #3 were installed in 1970. The pits are constructed of stainless steel panels welded together to form a double box or shell. Each quench pit typically held approximately 25,000 gallons of quench oils. The quench pits were used during a heat treatment process. In January 1998, GM completed construction activities that incorporated secondary containment features into the quench pits.

Former Underground Storage Tanks

Eleven USTs have been identified and removed from the SMI Plant Property. The tanks had been installed from 1957 through 1978 and were used to store gasoline (Tanks 1, 3, 4, 5, and 7), diesel fuel (Tanks 2, 6, 9, and 10), and waste oil (Tanks 8 and 11). Tank removal activities, which occurred between 1982 and 1991, were completed in accordance with applicable regulatory guidance at the various times of removal.

I27.7 Area

The I27.7 Area is located in the former Foundry Department inside the northern portion of the SMI Plant building (Figure 1-2). Polychlorinated biphenyl- (PCB-) containing oil was spilled from a transformer onto exposed soil in the I27.7 Area in 1971. The exposed soil was covered with concrete in 1972.

Melting Department Area

The Melting Department Area is located in the northeastern portion of the SMI Plant building (Figure 1-2). The Melting Department started operation in approximately 1970 to 1975, supplying molten iron for the production

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

of castings. Iron was melted by electric induction melting furnaces powered by five separate, numbered power supplies (Power Supply 1, 2, 3, 4, and 5). Although the features associated with each power supply varied, typical features included a control room, transformer room, generator room, hydraulic room, pit, and BUSS tunnel.

Previous Metal Feedstock Area

The Previous Metal Feedstock Area is located east of the SMI Plant building (Figure 1-2), and is partially covered by pavement and partially by lawn. This area was previously used for the storage of metal feedstock.

Former CTC Parking Lot East of Plant

The former Casting Technology Center (CTC) Parking Lot is located east of the plant and immediately north of the Previous Metal Feedstock Area. Historical aerial photographs show that this area was a parking lot as early as 1955. The pavement has been removed from this area, clean fill has been added, and a grass cover is in place.

Parking Lot North of Buffer Basin

The Parking Lot North of the Buffer Basin is located between the Buffer Basin and the Previous Metal Feedstock Area. The parking lot is paved and several borings completed through the pavement in 2007 show a one foot thick layer of paving and concrete above sand fill.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Former Railyard Area

The Former Railyard Area is located north of the SMI Plant building (Figure 1-2). The railroad tracks that provided direct access to this operations area have been removed, grass was planted, and the area is not generally used for plant operations.

Queen Street Dump Area

The Queen Street Dump Area is located in the north-northeast portion of the Site (Figure 1-2). GM purchased the northern margin of the SMI Plant Property (including a portion of the City of Saginaw Queen Street Dump Area) in the early 1970s, when the Center Street Bridge was completed over the Saginaw River, and Queen Street was truncated at its intersection with Center Street. Prior to GM's purchase of the property, local residents dumped municipal waste in this area, thus creating the Queen Street dump, which extends beyond the GM property to the north. There is no evidence to suggest that the waste found in the Queen Street Dump came from any GM facility. Therefore, the waste materials found in this area are not the responsibility of GM. An Affidavit to Support Unremediated Release in a Remedial Action Plan is provided in Attachment 2 for this area.

Former Water Recirculation System (WRS)

The SMI property contains a former WRS, which was taken off line in January 1997 (when the new Water Recycle System went on line). The former WRS received and recirculated non-contact process water, stormwater drainage, and air-scrubber effluents as part of the plant processes. Storm drainage from the southern part of the property was also periodically pumped to the Secondary Settling Pond through an aboveground pipe system to provide makeup water to the plant (the piping system was disassembled during construction of the subgrade of the Green Point Landfill).

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

The former system consisted of three settling ponds (primary, secondary, and stormwater) and associated drainage channels, which connected the ponds and returned flow to the plant. The former Primary Settling Pond was approximately two acres in size, but dried up when the plant ceased to use the system. The area was regraded to remove the pond. Highly turbid water had been discharged into the former Primary Settling Pond, where most of the solids settled out. The former Primary Settling Pond then gravity drained to the Secondary Settling Pond, which previously occupied approximately 16 acres, and has reduced in size due to reduced inflows. The Secondary Settling Pond then drained via a weir located on its northeastern side. This water traveled north along the north-south oriented drainage channel to the east-west channel. This water was then directed back into the SMI Plant (Figure 1-2). GM has filled in the drainage channels, and established a stormwater swale and a small wetland area within the former footprint of the channels. The Stormwater Pond, located north of the Secondary Settling Pond, received, and continues to receive, stormwater from roof drains and parking lots, and is discharged via a pump system to the Secondary Settling Pond. In the past, the Stormwater Pond has received incidental quantities of quench oils due to leaks from the cooling towers and associated lines located on the roof of the SMI Plant, in addition to non-contact process water and scrubber effluents.

Regularly dredged materials from the former Primary Settling Pond were previously stockpiled adjacent to the former Primary Settling Pond, and dredged materials from the Stormwater Pond were stockpiled adjacent to the Stormwater Pond. These materials consisted of sand and silt-/clay-size solids, which were continuously removed from the pond to maintain the pond's capacity. In the past, these dredged materials were used for daily cover at the Green Point Landfill during its operation, as fill materials throughout the plant property, and as fill material at GM's Saginaw Metals Casting Operations (SMCO) Landfill also located in Saginaw, Michigan. The sediments from the former Primary Settling Pond, which was dredged regularly, were tested to maintain the SMI Plant's Inert Status with MDEQ (MDEQ Designation for Inertness 92-I-012). The sediments dredged from the Stormwater Pond were disposed of at GM's landfill at SMCO. Routine dredging of both ponds was discontinued following the startup of the Water Recycle System in January 1997, and the Stormwater Pond has been cleaned out and lined. Sediment that accumulated in the Water Recycle System was removed (as it was generated) and shipped off-Site for disposal during the period of system operation.

LFR
Sep 17, 2009 18:39

Saginaw River Boundary

For purposes of this RAP, the Saginaw River boundary is defined as a narrow (approximately 60 feet wide) strip of land separating the Secondary Settling Pond from the Saginaw River and a portion of the Site located east of the eastern Type III Landfill and adjacent to the Saginaw River (Figure 1-2).

Green Point Landfill

The Green Point Landfill is located in the southern portion of the Site (Figure 1-2). The Green Point Landfill was owned by Ruben Schultz and was operated by various commercial enterprises between the 1950s and 1978. The landfill was reportedly used for the disposal of municipal waste, foundry sand, and unspecified quantities and types of waste from a variety of industrial facilities (RMT, 1979). In 1978, the Green Point Landfill stopped receiving waste and was closed in accordance with Michigan regulations at the time of closure. GM purchased the property containing the landfill in 1982. The landfill was capped, consistent with Part 115 of Michigan Act 451, and the Green Point Landfill Cover System Certification Report was submitted to the MDEQ in January 2000.

Richard Kowalski
LFR
Sep 17, 2009 18:39

Type III Landfills

The Site contains two closed, Type III industrial solid waste landfills (referred to as the Eastern and Central Type III landfills, as identified by their relative location on the property). These two landfills received spent foundry sands, scrubber residues, slag, and other materials approved for Type III disposal (e.g., refractory brick and core butts). The Eastern Type III landfill started receiving waste in 1979 and was closed in 1984. The Central Type III landfill received wastes from 1984 (after the closure of the Eastern landfill) until approximately 1990, when it was closed. Waste characterization was conducted as part of landfill permit operating requirements, and closure certifications for these two landfills were filed with the MDEQ. Solid wastes generated by the SMI Plant have been disposed of off Site since 1990.

Former Hillock Area of the DRA

The Former Hillock Area of the DRA is located in the southwest portion of the Site (Figure 1-2). Prior to GM's purchase of this property in 1982, the Former Hillock Area of the DRA was used for disposal purposes (several drums, drum fragments, and wastes associated with drums were identified in this area). There is no evidence to suggest that the drums found in the Former Hillock Area of the DRA, or in the vicinity of the Former Hillock Area of the DRA, came from any GM facility. However, GM removed the impacted Former Hillock Area of the DRA materials and backfilled the excavated areas with clean fill (for a summary of remedial activities implemented in the DRA see Section 2.3.1 below).

During a test pit investigation program conducted in the Former Hillock Area of the DRA in August 2000 to investigate the source of VOCs in the groundwater, a concrete tile drain pipe was uncovered. The concrete tile drain pipe extends from the neighboring junkyard property into the northern portion of the former Hillock Area of the DRA (Figure 1-2). Sampling of materials in the pipe indicated that the pipe discharges volatile organic compounds-(VOC) impacted water from an off-Site source. The Former Hillock Area of the DRA impacted with off-Site VOCs is limited in size and the media affected is shallow groundwater underlain by clay. An Affidavit to Support Unremediated Release in a Remedial Action Plan is provided in Attachment 2 for this area.

Sep 17, 2009 18:39

1.3 Evidence Property is a "Facility"

A "Facility" is defined in Part 201 324.20101(o) as

> *"any area, place, or property where a hazardous substance in excess of the concentrations which satisfy the requirements of Section 20120a(1)(a) or (17) or the cleanup criteria for unrestricted residential use under part 213 has been released, deposited, disposed of, or otherwise comes to be located. (..)."*

Table 1-1 presents a summary of Site-specific conditions (including relevant exposure pathways and exposure point concentrations) and applicable cleanup criteria that trigger remedial action proposed in this RAP for the Site. Table 1-1 has been developed based on the information presented in the RI and FS Reports (including the HHE and ERA), and recent data. The GM/REALM Site, shown on Figure 1-2, meets the definition of a facility.

1.4 Cleanup Criteria

The MDEQ Remediation and Redevelopment Division (RRD) *Operational Memorandum No. 1, Part 201 Generic Cleanup Criteria Part 213 Risk-Based Screening Levels,* dated December 10, 2004 (Op Memo 1) provides the general process for determining final cleanup criterion for a given chemical constituent of concern (COC) in soil and groundwater. As a first step, the Site data were compared to all of the Generic MDEQ Criteria, regardless of the exposure pathways that are appropriate for the Site. The second step in this process was selecting the appropriate land use criteria. The Site is located in an industrial area of Saginaw and is used for industrial purposes. In accordance with MDEQ guidelines, this Site falls within the Industrial Land Use Category. As such, Industrial and Commercial II, III, &IV Generic Cleanup Criteria are applicable to the Site. Given the potential for groundwater to migrate off Site, MDEQ residential criteria were applied to groundwater at the non-river downgradient property boundary. Groundwater Surface Water Interface (GSI) Criteria were applied to the groundwater associated with the Saginaw River Boundary Area.

Following these screening steps, any chemical constituents present at concentrations in excess of the applicable MDEQ *Generic Cleanup Criteria* were carried through for a more thorough analysis. Merely exceeding these generic cleanup values did not imply that the concentrations found at the GM SMI Plant represent a health risk, only that additional analysis was required.

Chemical constituents whose concentrations exceeded applicable *Generic Cleanup Criteria* were then compared to *Facility-Specific Generic Cleanup Criteria* (FSGCC). FSGCC are based on Site-specific physical characteristics that are not expected to change, such as groundwater characteristics (MDEQ, December 2004).

In accordance with MDEQ guidance (Op Memo 1), *Site-Specific Cleanup Criteria* (SSCC) were developed for those chemical constituents exceeding the FSGCC. The purpose of this subsequent analysis is to provide risk-based concentrations that are more reflective of current and reasonably anticipated future conditions at this facility. The development of the SSCC requires certain modifications to the exposure assumptions and default variables used to derive the MDEQ *Generic Cleanup Criteria*. A summary of the SSCC applicable to each Site area subject to this RAP is presented in Table 1-1.

1.5 Identification of Contiguous Facilities

The entire 276-acre Site including the SMI Plant; former WRS; two closed licensed Type III Landfills; Green Point Landfill; and the DRA constitute the facility for the purposes of this RAP. Contiguous facilities include the Delphi former Plant 2 property, and the REALM Peninsula Area property.

1.6 Compliance with Part 201, Rule 536

The nature and extent of environmental impacts at the Site have been evaluated through multiple investigations. This information was presented in the RI Report (BBL, 2001), and the FS Report (BBL, 2003). Supplemental data collected since the FS Report was submitted have been presented within monthly reports. These documents provide a detailed description of the geology, hydrogeology, vertical and horizontal extent of groundwater and soil impacts, and local conditions which govern the fate of the released constituents of concern. Section 2.1 (below) provides a discussion of previous investigations conducted for the specific Site areas addressed in this RAP and their results.

1.7 Other Releases

All known releases associated with the Site have been, or will be addressed by the measures described in this RAP. The Queen Street Dump Area and the Former Hillock Area of the DRA both contain impacts that are not the responsibility of GM, as described in 1.2.2. In addition, impacts to groundwater from the adjacent Delphi property are present northwest of the Green Point Landfill, and dioxin contamination within the flood plain of the Saginaw River, which includes most of the Site, is well documented. For each of these areas Affidavits to Support Unremediated Release(s) in a Remedial Action Plan are included in Attachment 2.

1.8 Report Organization

This RAP is organized into the following sections:

Section	Purpose
1 – Introduction	Presents the purpose and objective of the RAP. Provides a description of the Site background including the location and physical setting, and an overview of the Site history. In addition, this section provides evidence that the Site is a "Facility" as defined in Part 201 of Michigan State Statues, Chapter 324, Act 451 of 1994, as amended (Part 201).
2 – Facility Characterization, Analysis, and Remedial Actions	Presents a description of the nature and extent of environmental impacts at the Site.
3 – Implementation Details and Documentation	Provides documentation that cleanup criteria presented in the RAP are appropriate for the Site and presents a plan to address the environmental impacts at the Site.
4 – References	Presents citations for reports, guidance documents, and other literature referenced throughout the RAP.

2. Facility Characterization, Analysis, and Remedial Actions

This section presents a description of the nature and extent of environmental impacts at the Site, a summary of past investigations, an evaluation of existing Site conditions and exposure pathways, and completed, ongoing, and proposed remedial actions.

2.1 Facility Characterization: Description of Nature and Extent of Contamination

The nature and extent of environmental impacts at the Site have been evaluated through multiple investigations. This information was summarized in the RI Report (BBL, 2001), and was used as the basis of the HHE and ERA, included as appendices to the FS Report (BBL, 2003). Additional data collected since the RI and FS were prepared have been presented in monthly reports and were evaluated in the HHE Addendum (Appendix B). Summaries of the Site soil and groundwater data that exceed generic MDEQ criteria are shown in Tables 2-1, 2-2, and 2-3.

For a detailed description of the geology, hydrogeology, vertical and horizontal extent of groundwater and soil impacts, and local conditions which govern the fate of the COCs, refer to the above-referenced documents. Presented below is a brief discussion of Site groundwater conditions, followed by a summary of conditions at each of the specific Site areas identified in the FS as requiring additional actions consisting of area-specific restrictive covenants, ongoing remediation, implementation of new remedial actions, and/or monitoring.

Summary of Site Geology and Hydrogeology

The overburden deposits at the Site have been characterized through the completion of more than 200 soil borings and more than 30 test pits. The overburden deposits at the Site are comprised of the following primary units (in descending order): fill materials consisting primarily of foundry sand, glaciolacustrine silts and clay ("upper silty clay unit"), a sand unit that grades coarser with depth (and bifurcates toward the Saginaw River into two separate units, separated by a silty clay unit ["middle silty clay unit"]), glaciolacustrine silty clay ("lower silty clay unit"), and glacial till. The subsurface distribution of the overburden units varies across the Site. The sand unit pinches out beneath the plant building and also toward the western and northern Site boundaries. In addition, the sand unit separates into upper and lower units separated by glaciolacustrine silt and clay in the vicinity of the Saginaw River. Bedrock was encountered at a depth of 86 feet below the ground surface at an upgradient boring location that was advanced through the overlying silty clay and till.

The results of in-situ hydraulic conductivity (K) testing completed at Site wells were grouped according to the screened lithologic unit to determine the following geometric mean values in centimeters per second (cm/sec) for each unit: fill (1.54E-03), silt (1.05E-03), upper sand (1.41E-03), lower sand (3.86E-03), upper silty clay (1.07E-06), and lower silty clay (2.83E-06). These data show that the silty clay units are confining relative to the sand deposits, and that they provide physical barriers to downward groundwater flow.

Water table maps and potentiometric surface elevation maps for the lower sand unit were constructed based on the collected groundwater elevation data, and are presented in the RI Report (BBL, July 2001). The general direction of groundwater flow at the water table is toward the southeast in the northern portion of the Site and to the south southeast in the southern part of the Site, with some variations as a result of mounding from the Site

Confidential under FOIA

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

landfills and the former WRS surface water bodies. The lower sand unit potentiometric surface shows flow generally to the east with some north-south divergence of flow in the center of the Site and a component of flow to the south to southwest in the vicinity of the DRA. On one of the dates that water level measurements were collected, a potentiometric gradient from the Saginaw River to groundwater was observed, the apparent result of temporal bank storage due to high water levels in the river. Actual groundwater flow in response to gradient reversals is expected to be minimal both in duration and travel distance.

Vertical hydraulic gradients were evaluated by comparing the water level and potentiometric surface measurements made at each monitoring well cluster location. This evaluation indicated downward vertical gradients throughout the overburden, with the exception of upward vertical gradients noted between the upper and lower sand units in the vicinity of the Saginaw River.

Groundwater quality in this region of Michigan, including the Site, has been highly affected by natural brine. The shallow groundwater encountered in the overburden deposits is in an unconfined or "water table" condition. The overburden deposits at the Site consist of layers of clay to sand-size sediments. Groundwater yield at the Site is poor in these overlying deposits. The depth to groundwater varies from 2 to 10 feet below the land surface and depends on the proximity of recharge areas and seasonal influences. Bedrock groundwater quality is poor due to presence of heavy mineralization and would generally be unfit for use as a potable water source due to high concentrations of chlorides, iron, total and dissolved solids, and other minerals (*United States Geological Survey* [USGS, 1980]). The chloride and sodium levels detected in the groundwater at the Site consistently exceed MDEQ generic drinking water criteria. However, the elevated levels of chloride and sodium appear to be the result of interaction with natural brine in the region, and not related to historic or current Site operations. An evaluation of regional groundwater quality compared with Site conditions was presented in *Background Groundwater Quality Assessment Report* (BBL, 1998). Appendix H also includes an evaluation of impacts from bedrock groundwater to deep overburden groundwater near the Saginaw River.

Sep 17, 2009 18:39

LNAPL Assessment and Remediation Area

LNAPL was observed on the water table south of the main plant building during the RI. In order to assess the horizontal and vertical extent of LNAPL in this area, a series of soil borings and monitoring wells were installed in the area. A detailed discussion of the field investigations is presented in the *LNAPL Assessment and Recovery Remedial Investigation Interim Report* (BBL, 1995). Tables 2-4 and 2-5 present the soil data collected in this area of the Site, and soil data for those parameters that exceed the relevant generic MDEQ criteria are shown on Figure 2-1.

Quench Pit Area

LNAPL was detected in the Quench Pit Area. Subsequently, the Quench Pit Area investigation was conducted to assess groundwater quality in the area surrounding the three quench pits. The Quench Pit Area investigation results are presented in the *Quench Pit Investigation Report* (BBL, 1998). The monitoring wells that have contained LNAPL in the Quench Pit Area are identified on Figure 2-1.

Former UST #7 Area

Following removal of former UST #7, several monitoring wells and soil borings were installed to characterize subsurface conditions in the Former UST #7 Area. The investigation results indicated the presence of lead and benzene, toluene, ethylbenzene and xylene (BTEX) in subsurface soil and groundwater in the immediate vicinity of former UST #7. For more details pertaining to the UST #7 subsurface investigation and results refer to the

Former UST #7 Area, Supplemental Investigation Report (BBL, 1997). Table 2-6 presents the soil data collected in this area of the Site, and soil data for those parameters that exceed the relevant generic MDEQ criteria are shown on Figure 2-1.

I27.7 Area

PCBs were detected sporadically in sediments of various sewers in the I27.7 Area. A subsurface soil investigation was conducted in 1998 in the I27.7 Area to identify the horizontal and vertical extent of PCB-impacted soil, believed to be related to the dropping of a transformer. The investigation results indicated that PCBs were present in some soil samples collected beneath the plant floor in the I27.7 Area at concentrations exceeding MDEQ generic criteria. The impacted soils are not accessible to plant workers since the soils are located beneath the plant floor. Groundwater was not encountered during the investigation. Table 2-7 presents the soil data collected in this area of the Site, and soil data for those parameters that exceed the relevant generic MDEQ criteria are shown on Figure 2-1. For more details regarding the I27.7 Area subsurface soil investigation refer to *Feasibility Analysis* (CRA, 1998).

Melting Department Area

An investigation was conducted in 1996 to evaluate the presence and extent of PCB contamination in concrete floors of rooms associated with the Melting Department power supplies. PCBs were detected in concrete floor samples and select soil samples collected beneath the plant floor in the Melting Department Area. Based on the results of the investigation, limited soil excavation beneath the floor of the Melting Department was completed in 1996 (CRA, 1997). Table 2-8 presents the soil data collected in this area of the Site, and soil data for those parameters that exceed the relevant generic MDEQ criteria are shown on Figure 2-1. For more details regarding the Melting Department Area investigation and results refer to *Feasibility Analysis* (CRA, 1998).

Sep 17, 2009 18:39

Previous Metal Feedstock Area

Surface and subsurface soil investigation activities conducted within the Previous Metal Feedstock Area as part of the RI indicated the presence of select metals (aluminum, cobalt, iron, and manganese) at concentrations above the MDEQ generic criteria. Tables 2-9 and 2-10 present the soil data collected in this area of the Site, and soil data for those parameters that exceed the relevant generic MDEQ criteria are shown on Figure 2-2. For more details regarding Previous Metal Feedstock Area soil investigation and results refer to the RI Report.

Former CTC Parking Lot East of Plant

Elevated concentrations of manganese have been detected in surface soil in this area of the Site. In 2001, approximately 8-inches of clean fill were placed and the area was seeded with grass. Tables 2-11 and 2-12 present the soil data collected in this area of the Site, and soil data for those parameters that exceed the relevant generic MDEQ criteria are shown on Figure 2-2.

Parking Lot North of Buffer Basin

Elevated concentrations of manganese have been detected in fill material below the paving that covers this area of the Site. In 2007, two soil borings were completed to a depth of four feet during an investigation to identify a suitable source of soil for possible site drainage improvements. Tables 2-13 and 2-14 present the soil data collected in this area of the Site, and soil data for manganese that exceed the relevant generic MDEQ criteria are shown on Figure 2-2.

Sep 17, 2009 18:39

Former Railyard Area

Investigation activities conducted in the Former Railyard Area as part of the RI indicated the presence of PCBs in surface soil at concentrations above the MDEQ generic values. To address the presence of PCBs, a surface soil excavation program was implemented in this area (see Section 2.3). Post-excavation confirmatory soil sampling results indicated that PCBs were not present in the soil samples at concentration above MDEQ generic criteria. However, manganese and total chromium were detected at concentrations above MDEQ generic industrial criteria for particulate inhalation, although the 95% Upper Confidence Limit (UCL) was below the residential particulate inhalation criteria for manganese. In May 2007, the MDEQ collected 12 surface soil samples from off-site areas located northwest of the Former Railyard Area to evaluate potential impacts to residential areas from windblown dust. The MDEQ laboratory analytical results showed no off-site impacts from plant operations. The sample location documentation and laboratory data are included in Attachment 1. As indicated in the HHE (Appendix A of the FS Report [BBL, 2003]), manganese was detected at concentrations below the calculated SSCC for soil and therefore is not considered to present an exposure risk. To investigate the detection of total chromium at concentrations above the generic particulate inhalation criteria for hexavalent chromium, samples were collected at the locations exceeding the inhalation criteria to determine the relative percentages of hexavalent and trivalent chromium. The results indicated that the total chromium concentration consisted of trivalent chromium only, and the generic particulate inhalation criteria for trivalent chromium were not exceeded. Tables 2-13 and 2-14 present the soil data collected in this area of the Site, and soil data for those parameters that exceed the relevant generic MDEQ criteria are shown on Figure 2-3.

Queen Street Dump Area

During the course of monitoring well installation as part of the RI activities, oil sheens were observed in soil samples collected from wells located adjacent to Center Street in the Queen Street Dump Area. Subsequently, a subsurface investigation was conducted to evaluate the extent and potential source of the oil sheens along Center Street. The investigation results indicated that the oil sheen area in the vicinity of Center Street correlates with the waste associated with the Former Queen Street Dump, and not with any known GM source. The oil sheen area extends to the northeast past the Site perimeter. The results of the investigation are presented in *Center Street Supplemental Investigation Report* (BBL, 1997).

Saginaw River Boundary

Several monitoring wells and soil borings were installed in the Saginaw River Boundary area to characterize surface and subsurface conditions in this area. The investigation results indicated that surface soil in the Saginaw River Berm Area (a narrow strip of land east of the Secondary Settling Pond) contained manganese at concentrations that exceeded the generic industrial particulate inhalation criteria and SSCC value, and that select inorganics and PCBs were sporadically detected in groundwater at concentrations above the MDEQ Generic GSI criteria. A limited soil excavation program was completed to remove soil from the berm that contained manganese at concentrations above the SSCC. Table 2-15 presents the soil data collected in this area of the Site, and soil data for those parameters that exceed the relevant generic MDEQ criteria are shown on Figure 2-4.

Note that, as discussed in the RI Report (BBL, 2001) and FS Report (BBL, 2003), historical PCB detections in groundwater at river boundary wells are believed to be the result of the entrainment of soil particles in the samples that were artificially mobilized by sampling activities, and that PCB transport in groundwater is not occurring. Groundwater sampling completed most recently following an ultra-low-flow sampling methodology has shown the presence of PCBs in one well, and contingency actions are being implemented, as defined in the Operation, Maintenance, and Monitoring Plan (Appendix C). It is still believed that this very low detection is the

Confidential under FOIA

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

result of soil particle entrainment. A few inorganics have been detected inconsistently above GSI criteria at river boundary wells. Arsenic, manganese, thallium, phosphorus, and ammonia have been sporadically detected above the GSI criteria at individual monitoring wells. For more details regarding Saginaw River Boundary investigations and results refer to the FS Report (BBL, 2003), other documents previously submitted to the MDEQ, and Appendix H.

Green Point Landfill

Several environmental investigations have been conducted at the Green Point Landfill, dating back to 1976. Leachate samples collected from the Green Point Landfill contained select COCs as summarized in the HHE Report. However, the exposure pathways associated with the leachate were determined to be incomplete and were eliminated from further consideration. A summary of these investigations is provided in the *Remedial Investigation/ Feasibility Study Work Plan* (BBL, 1997) and in the RI Report (BBL, 2001).

Type III Landfills

As part of the RI activities, groundwater samples were collected from select monitoring wells located at the closed Type III Landfills. Select VOCs, SVOCs, PCBs, and inorganics were detected in groundwater samples at concentrations exceeding drinking water criteria (which is not an exposure pathway for this Site). However, as presented in HHE, none of the constituents were detected at concentrations exceeding the SSCC. For more details refer to the RI Report (BBL, 2001) and the FS Report (BBL, 2003), which includes the HHE as Appendix A).

Former Hillock Area of the DRA

Various investigations have been completed to delineate the presence, nature, and extent of impacted materials in the Former Hillock Area of the DRA. The historical and pre-RI efforts are described in detail in the RI Report (BBL, 2001). A geophysical investigation, followed by a test pit investigation, was conducted as part of the RI in the Former Hillock Area of the DRA to characterize the presence of "target materials". Geophysical data was presented in the *Geophysical Investigation Report for the Drum Remediation Area* (BBL, 1994). The results of the test pit investigation were presented in the *Test Pit Investigation Report* (BBL, 1995). Additional activities associated with the Former Hillock Area of the DRA conducted during the RI consisted of soil sampling, a wetland mitigation area evaluation, supplemental groundwater investigations, and a supplemental test pit program.

Following completion of remedial activities to address "target materials" at the Former Hillock Area of the DRA (see Section 2.3), a few VOCs were detected in groundwater samples collected from a temporary monitoring well located in the Former Hillock Area of the DRA. A test pit program was subsequently implemented to determine the source of the VOCs. During the test pit program, a concrete tile drain pipe was found to be discharging VOC contaminated water into the Former Hillock Area of the DRA from the neighboring junkyard property. Water in the drain pipe was sampled where the pipe entered the REALM property from the adjacent parcel. The same VOC constituents previously detected at the on-Site temporary monitoring well were detected in the water samples collected from the pipe. This indicated migration of VOCs to the Site from an off-Site source. Tables 2-16 and 2-17 present the groundwater data collected in this area of the Site.

Sewers

At the request of the City of Saginaw and the MDEQ, a program involving water sampling and analysis for total PCBs at the GM SMI Plant sewer discharge to the City of Saginaw POTW and in several on-Site sewer locations was implemented in 1995 and 1996. A detailed program of sewer mapping and sampling at the SMI Plant Property was implemented by GM. The results of these activities are presented in the *Feasibility Analysis* (CRA, 1998) for the sewers, and in monthly reports submitted to the MDEQ.

2.2 Facility Analysis/Conditions Evaluation

This section presents Site information to provide evidence that control of hazardous substances and soil and groundwater risks have been evaluated. In addition, this section identifies reasonable and relevant exposure pathways.

A detailed description of Site conditions has been presented in various documents previously submitted to the MDEQ, including, but not limited to, the RI Report (BBL, 2001) and the FS Report (BBL, 2003), which includes the HHE. As discussed in Section 2.1 above, this RAP includes discussion of the specific Site areas that, in addition to imposing the Site-wide restrictive covenant, were identified in the FS Report (BBL, 2003) as requiring further action (e.g., ongoing remediation/monitoring, intrusive remedial action, and/or area-specific restrictive covenants). The Site areas that do not require further action (as identified in the FS Report [BBL, 2003] and presented above) are not discussed herein.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

The paragraphs below provide a brief discussion of whether the exposure pathways for COCs that are present at the Site at concentrations above the SSCC values are reasonable and relevant. If the exposure pathway is considered reasonable and relevant, a reference to other sections of this RAP that provides a description of the response activity to address the risk of exposure is provided.

2.2.1 Control of Hazardous Substances Sources

The only potential on-Site sources of COCs are the Site media impacted by COCs as a result of past releases. Many of the original source areas have been addressed as interim remedial response measures. For a description of remedial measures implemented/to be implemented to address the on-Site sources refer to Sections 2.3.2 and 2.3.3 of this RAP.

The off-Site source of VOC-impacted water that discharges into the Former Hillock Area of the DRA will not be addressed as part of the remedial action proposed in this RAP.

2.2.2 Groundwater Contamination Risks to Drinking Water

Groundwater flow at the Site is controlled by the Saginaw River, which acts as a discharge point for groundwater within the overburden. The majority of groundwater beneath the Site discharges directly to the River along the eastern property boundary. Exceptions include limited areas along the northern and southern property boundaries where groundwater flows off-Site before discharging to the River, Green Point Landfill where groundwater flows beneath a property owned by REALM before entering the Saginaw River. Figure 1-1

Richard Kowalski
LFR
Sep 17, 2009 18:39

shows the locations of the adjoining properties. There are no residences located within the groundwater flow path downgradient of the Site.

Groundwater yield from the shallow overburden deposits at the Site is poor. The depth to groundwater varies from 2 to 10 feet below the land surface, depending on the proximity of recharge areas and seasonal influences. Bedrock groundwater quality is poor due to presence of heavy mineralization and would generally be unfit for use as a potable water source due to high concentrations of chlorides, iron, total and dissolved solids, and other minerals (*United States Geological Survey* [USGS, 1980]). The chloride and sodium levels detected in the groundwater at the Site consistently exceed MDEQ generic drinking water criteria. However, the elevated levels of chloride and sodium appear to be the result of interaction with natural brine in the region, and not related to historic or current Site operations. An evaluation of regional groundwater quality compared with Site conditions was presented in *Background Groundwater Quality Assessment Report* (BBL, 1998).

The GM SMI Plant and areas to the north of the Site are located within the limits of the City of Saginaw. John Premo with Saginaw City Hall confirmed there are no private wells located within the portion of a one mile radius of the Site that lies within the City limits. Upon connection to the Saginaw City water supply (obtained from Lake Huron), all residences are required to disconnect their private wells from the household potable water supply as required by Michigan Public Act 399, and the wells are capped in accordance with wellhead protection under the authority of the Saginaw County Health Department (John Premo, Saginaw City Hall). There is a component of groundwater flow to the south along the southern edge of the property. In this area, groundwater flow is toward the south due to the local influence of the Green Point Landfill, and groundwater enters the agricultural farm field south of the Site before migrating to the Saginaw River. There are no residential properties in the flow path.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Due to the discharge of Site groundwater to the Saginaw River, and the poor natural quality and low yield of groundwater in the vicinity of the Site, groundwater use off-Site as a drinking water source is not of concern. Restrictive covenants on the deed will prevent the future use of groundwater for potable purposes on this Site.

2.2.3 Groundwater Contamination Risks Due to Dermal Exposure

The groundwater contamination risk due to dermal exposure has been evaluated as part of the Site-specific human health evaluation activities. The generic MDEQ Groundwater Contact Criteria (GCC) for dioxin/furan was exceeded at one monitoring well in the LNAPL Assessment and Remediation Area. The evaluation results indicated that the Site-Specific GCC for dioxin/furan was not exceeded. For more details refer to the FS Report (BBL, 2003), which includes the HHE, and the HHE Addendum (Appendix B of this RAP). The GCC for vinyl chloride was exceeded in the Former Hillock Area of the DRA as the result of impacts from an off-site source.

2.2.4 Groundwater Contamination Risks to Indoor Air

The groundwater contamination risk to indoor air hazard has been evaluated as part of the Site-specific human health evaluation activities. The evaluation results previously indicated that one COC (vinyl chloride) was present in the groundwater at the Former Hillock Area of the DRA at a concentration exceeding generic MDEQ Industrial Groundwater Volatilization to Indoor Air Inhalation Criteria (IGVIIC). However, due to an increase in the IGVIIC, the detected concentration does not exceed the current criteria. For a summary of Site-specific conditions (including COC concentrations and relevant exposure pathways) that trigger remedial action proposed in this RAP and applicable SSCC see Table 1-1. Please note that GM and REALM are not responsible

Sep 17, 2009 18:39

for the historical disposal activities in the Former Hillock Area of the DRA. Vinyl chloride in this area is associated with discharge of VOC-impacted water from an off-Site source via an underground concrete tile pipe that enters the Former Hillock Area of the DRA at the western property limit.

A detailed discussion of the indoor air inhalation risk evaluation methods and results is presented in the FS Report (BBL, 2003), which includes the HHE as Appendix A.

2.2.5 Groundwater Contamination Risk to Surface Water Resources

Previous groundwater investigation activities in the Saginaw River Boundary Area have indicated that select inorganics and PCBs have been sporadically detected in samples collected from groundwater monitoring wells in this area. GM does not believe that the PCBs detected in these wells are actually mobile in groundwater but rather are related to entrained particles in the water sample related to berm soil. A summary of the groundwater monitoring activities and results is presented in the FS Report (BBL, 2003) and in Appendix H. A description of the proposed monitoring activities for this area is included in Section 2.3.3. A Mixing Zone Application to address several constituents detected near the Saginaw River is included as Appendix I.

2.2.6 Soil Contamination Risks Due to Direct Contact

The soil contamination risk from direct contact exposure has been evaluated as part of the Site-specific human health evaluation activities. The evaluation results indicated that two COCs are present in three Site areas at concentrations above the generic MDEQ Industrial and Commercial II, III and IV Direct Contact (IDC) Criteria. The Site areas and the COCs that exceeded their applicable IDC criteria are listed below.

- LNAPL Assessment and Remediation Area – contains lead at concentration above the generic MDEQ IDC criteria, but below the Site-Specific IDC criteria.

- I27.7 Area – contains PCBs at concentrations above the generic and Site-Specific IDC criteria (under a concrete barrier).

- Melting Department Area – contains PCBs at concentrations above the generic and Site-Specific IDC criteria (under a concrete barrier).

- Former Railyard Area – contains lead above the generic MDEQ IDC Criteria, but below the Site-Specific IDC criteria.

For a summary of COC concentrations and applicable IDC values for the above-listed areas see Table 1-1. A detailed description of the direct contact exposure risk evaluation is presented in the FS Report (BBL, 2003), which includes the HHE as Appendix A. A brief discussion of exposure pathways for each of the three above-listed areas is presented below.

LNAPL Assessment and Remediation Area: Soil containing lead at concentrations exceeding the generic MDEQ IDC value was identified at the ground surface (below paving and subgrade materials) and at a depth of 4 to 6 feet below ground surface. Potential direct contact of a production or maintenance worker, or of an intrusive worker could occur in this area. To mitigate potential risk for future direct contact exposure to soil containing

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

lead at concentration above the generic IDC value, remedial measures described in Section 2.3.3 will be implemented at the LNAPL Assessment and Remediation Area.

I27.7 Area and Melting Department Areas: Soils containing total PCBs at concentrations above the generic and Site-Specific IDC value remain in the Manhole I27.7 Area and Melting Department Area. However, these soils are located beneath the concrete floor slabs. The concrete slabs act as an impermeable barrier, eliminating direct contact as an exposure pathway. The only potential for direct contact with these constituents would be in the event of removal of the concrete slab. To mitigate potential risk for future direct contact exposure to soil containing PCBs at concentrations above the Site-Specific IDC value, remedial measures described in Section 2.3.3 will be implemented in the I27.7 Area and Melting Department Area.

2.2.7 Soil Contamination Risks Due to Ambient Air Inhalation

The soil contamination risk from ambient air inhalation exposure has been evaluated as part of the Site-specific human health evaluation activities. The evaluation results indicated that a COC (manganese) is present in soil located in five Site areas at concentrations exceeding the generic Industrial Particulate Soil Inhalation Criteria (IPSIC) (see Table 1-1). To mitigate potential risk for future exposure to manganese at concentration above the generic IPSIC value via inhalation of ambient air, remedial measures described in Section 2.3.3 will be implemented at the Previous Metal Feedstock Area, Former Railyard, Former CTC Parking Lot East of the Plant, Parking Lot North of the Buffer Basin, and the Saginaw River Boundary.

For more details refer to the HHE FS Report (BBL, 2003), which includes the HHE as Appendix A, and the HHE Addendum included as Appendix B of this RAP.

LFR
Sep 17, 2009 18:39

2.2.8 Soil Contamination Risks Due to Inhalation of Indoor Air

The soil contamination risk from indoor air inhalation exposure has been evaluated as part of the Site-specific human health evaluation activities. The evaluation results indicated that one COC (benzene) is present in a soil sample collected in 1996 at the Former UST #7 Area (approximately 120 feet from the employee tunnel) at concentrations exceeding Site-Specific Industrial Soil Volatilization to Indoor Air Inhalation Criteria (ISVIIC). The results of air sampling performed within the employee tunnel indicated that benzene in the Former UST #7 Area soil does not pose a risk of exposure via indoor air inhalation in the employee tunnel. However, future land use in the Former UST #7 Area (e.g., building construction) could potentially present an exposure risk. To mitigate this potential risk, remedial measures described in Section 2.3.3 will be implemented in the Former UST #7 Area.

No risk of indoor air inhalation exposure to soil contaminants at concentrations above the Site-Specific ISVIIC value has been identified in any of the remaining Site areas.

A detailed description of the exposure risk evaluation methods and results is presented in the FS Report (BBL, 2003), which includes the HHE as Appendix A.

2.2.9 Soil Contamination Risk to Groundwater Used for Drinking Water

As presented in the FS Report (BBL, 2003), *Background Groundwater Quality Assessment Report* (BBL, 1998), and summarized in Sections 2.1 and 2.2.2 above, groundwater in the City of Saginaw (including the Site and surrounding area) is unlikely to be used as drinking water. Groundwater flow at the Site is also toward the Saginaw River, which serves as a groundwater discharge point and interceptor. Regardless, a comparison of Site groundwater data to the generic MDEQ criteria, including the drinking water criteria, is shown in Table 2-3. Within the table, each of the data points that exceed the generic criteria is evaluated. A restrictive covenant will be implemented to prevent the use of groundwater at the Site for drinking water. A similar restriction will be placed on the two REALM properties located east of the Green Point Landfill, as described in Section 2.3.3.

2.2.10 Soil Contamination Risk to Groundwater Due to Dermal Contact

No risk of soil contamination to groundwater due to a dermal contact hazard has been identified at the Site. Furthermore, as presented in Section 2.2.3, no risk of dermal exposure to groundwater above the Site-Specific GCC values was identified at the Site. For more details refer to the FS Report (BBL, 2003), which includes the HHE as Appendix A.

Sep 17, 2009 18:39

2.2.11 Soil Contamination Risk to Surface Water Due to Groundwater Impacts

No soil contamination risks to surface water due to impacts to groundwater (i.e., soil contaminant leaching to groundwater) have been identified at the Site.

2.2.12 Erosion Control Adjacent to Surface Waters

Soil erosion was not identified in the FS Report (BBL, 2003) as an unacceptable risk requiring action to achieve the remedial action objectives (RAOs) specified in the FS Report. However, GM will implement erosion control measures in select areas along the Saginaw River berm. Any areas along the berm with sparse vegetation, including newly graded areas, will be reseeded, and limited re-grading will be completed, as needed. A description of the remedial measures to be implemented at the Saginaw River berm area to mitigate future soil erosion in this area is presented in Section 2.3.3 of this RAP.

2.2.13 Surface Water Sediment Contamination Risk

No surface water sediment contamination risk has been identified at the Site. For more details refer to the RI Report (BBL, 2001 and the FS Report (BBL, 2003).

2.2.14 LNAPL and Abandoned/Discarded Containers

As presented in Section 2.1 above, LNAPL was observed in the following areas:

- LNAPL Assessment and Remediation Area (LNAPL); and
- Quench Pit Area (LNAPL).

In order to address the presence of LNAPL and/or oil sheens in the LNAPL Assessment and Remediation Area and Quench Pit Area, remedial measures described in Section 2.3.2 are being implemented.

GM removed the impacted materials from the Former Hillock Area of the DRA, and backfilled the excavated areas with clean fill (for a summary of remedial activities implemented in the DRA see Section 2.1 above). There are no known remaining areas with abandoned/discarded containers with hazardous substances at the Site.

No acute toxic and physical hazard risks associated with COCs present at the Site have been identified.

2.2.15 Ecological and Aesthetic Impacts

The ERA was conducted to assess potential risks to ecological receptors that may result from exposure to constituents detected in Site environmental media. The ERA risk evaluation indicated that the potential ecological impacts associated with Site constituents are minimal. As there are no significant ecological risk issues, no remedial evaluations were performed. For more details refer to the FS Report (BBL, 2003), which includes the ERA as Appendix B.

There will be short-term aesthetic impacts associated with excavating at the DRA Hillock to block the flow of contaminated water through a drain tile from the adjacent property, and during completion of limited re-grading activities along the Saginaw River Boundary.

There will be no aesthetic impacts associated with implementation of the remedial measures (e.g., restrictive covenants and sampling) in the remaining Site areas.

2.2.16 Other Risks from Hazardous Substance Releases at or Posed by the Facility

In order to protect the integrity of the Green Point Landfill cover and the Type III Landfills (see Sections 1.2.2 and 2.1 above) remedial measures, including restrictive covenants to prevent excavation of the landfills will be implemented, as described in Section 2.3.3.

2.3 Completed, Ongoing, and Proposed Remedial Actions

This section presents a discussion of how areas at the Site not meeting cleanup criteria (either historically or currently) will be addressed to meet the Site-specific cleanup criteria. For Site areas previously addressed via interim response actions (IRAs), evidence that the IRAs were complete and effective is provided in this section.

Multiple IRAs have been completed to address various environmental impacts identified at the Site. In addition to the IRAs completed in the past, several ongoing IRAs are currently being implemented at select Site areas. The past and ongoing IRAs are described in the FS Report (BBL, 2003). A summary of the completed and ongoing remedial actions is presented in Sections 2.3.1 and 2.3.2 below.

In order to meet RAOs established for the Site (for a description of the Site RAOs refer to the FS Report), GM, WMI, and REALM propose to implement remedial actions that consists of the following components:

- Continue implementation of the ongoing IRAs to the extent needed.
- Impose Site-wide and area-specific restrictive covenants to limit future land use options without first re-evaluating and addressing, as appropriate, exceedances of criteria relevant to the proposed land use and therefore mitigating potential impacts to human health and the environment.
- Implement intrusive remedial measures at select Site areas.

A detailed description of the proposed remedial action is presented in Section 2.3.3 below.

2.3.1 Completed Remedial Actions

The following IRAs were previously completed in the Site areas that were identified in the FS Report (BBL, 2003) as requiring further action (IRAs completed in the Site areas that do not require further action [as identified in the FS Report] are not discussed herein).

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

I27.7 Area

Several IRAs were conducted to address the presence of PCBs in this area. The sewer lines in the I27.7 Area were cleaned in December 1997 and a sewer sleeve was installed between two manholes in the vicinity of the area (I23.6 and J25.8) to prevent infiltration of impacted materials into the sewer from the I27.7 Area. In addition, sediment in the 60-inch diameter storm sewer downstream of the I27.7 Area (identified as a potential source of PCBs) was removed and a sewer sleeve was inserted. Also, as part of the IRA activities, a 48-inch diameter storm sewer was cleaned and sediment was removed from the sewer. Following sewer cleaning and sleeve placement activities, the concrete floor was repaired/replaced. For more details refer to *Feasibility Analysis* (CRA, 1998) and FS Report (BBL, 2003). As part of the plant demolition activities, the inputs into the sewer will be blocked.

Melting Department Area

As presented in *Feasibility Analysis* (CRA, 1998), the Melting Department Area was cleaned, capacitors in this area were replaced, and rooms containing PCBs at concentrations above action levels were remediated in 1996 and 1997 as an IRA. The flooring material in the five capacitor rooms and in one hydraulic room was completely removed. Soils containing PCBs at concentrations above the MDEQ Generic IDC Criteria were excavated to the extent practicable, given the access limitations within the plant. Groundwater was not encountered during the removal activities. As part of the IRA conducted in this area, sediment accumulated within a 30-inch sewer line was removed and the sewer line was cleaned. PCB-impacted soil remains in this area below the concrete floor slab, but is not accessible to plant workers and therefore is not a complete exposure pathway.

Sep 17, 2009 18:39

Former Railyard Area

In order to address the presence of PCBs in the Former Railyard Area surface soil, GM implemented a soil excavation IRA. The IRA was completed in 1998. The results of the post-excavation confirmatory soil sampling indicated that the soils containing PCBs at concentrations above MDEQ generic industrial criteria have been removed from the Former Railyard Area. For more details regarding the soil excavation IRA at the Former Railyard Area refer to the RI Report (BBL, 2001).

As discussed in the draft RAP (BBL, 2004), manganese concentrations in surface soil were detected at concentrations above the generic residential criteria for particulate soil inhalation, raising the concern with MDEQ that soil could move off-Site to residential areas. Since the draft RAP was prepared, ten additional surface soil samples were collected for manganese analysis from within the railyard. Although the residential screening criteria (3,300 mg/kg) was exceeded at four of the thirty five individual sampling points, the calculated 95% upper confidence limit for manganese in this area of the Site does not exceed the residential criteria. In addition, the HHE included an evaluation that was completed to demonstrate that Site conditions (e.g., soil manganese concentrations) are protective of off-Site residents. Exposure to particulates at the Site boundary was quantified using equations from USEPA (2001) *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* to calculate a manganese soil concentration that will not pose an unnecessary risk of harm to off-Site receptors. The resulting cleanup criterion for protection of off-Site residents is 23,000 mg/kg. The maximum concentration in the railyard (5,030 mg/kg) is well below this acceptable concentration. To further assess the presence or absence of off-site impacts, the MDEQ collected and analyzed soil samples from off-site areas in 2007 and found no impacts related to the facility (see MDEQ June 19, 2007 email in Attachment 1).

Sep 17, 2009 18:39

Former Hillock Area of the DRA

Although GM was not responsible for placement of the drums and other waste materials in this area, various voluntary response actions have been undertaken to address the DRA. IRAs have included the removal of drums and other "target materials" (e.g., drum fragments, wastes associated with drums, stained soil, soil associated with an organic vapor content of greater than 600 ppm, soil containing NAPL) encountered within the DRA.

In 1987, GM excavated, overpacked, and staged 339 drums/drum fragments (none of which contained hazardous wastes) from the western portion of the area. In July 1989, GM collected and disposed of surface metal debris, collected drums at the ground surface and overpacked the drums as needed, restaged the 339 drums identified above, excavated 23 test pits (removing drums and drum fragments encountered) and characterized the staged materials. In February 1990, GM disposed of 408 tons of staged material (characterized as a hazardous waste due to the presence of copper and lead at concentrations above regulatory criteria). In June 1990, GM disposed of 1,538 tons of non-hazardous waste and eight drums off-Site as non-hazardous waste. In June 1994, an intact drum was discovered during removal of additional surface debris. The drum was characterized and appropriately disposed off-Site. In March and April 1995, two intact drums and drum fragments were removed, overpacked, sampled, and disposed off-Site as non-hazardous waste.

In addition, the soil and fill that constituted the remaining unexcavated part of the Former Hillock Area was excavated to the water table and placed within the fill materials of the Green Point Landfill prior to capping (GM had previously excavated and removed fill from a majority of the DRA). Clean fill was then used to bring the area up to grade.

The historical and pre-RI efforts are described in detail in the RI Report (BBL, 2001). Response actions conducted subsequently in the DRA are described in the FS Report (BBL, 2003) and *Remedial Investigation/Feasibility Study Work Plan* (BBL, 1997).

Sewers

At the request of the MDEQ, a program involving weekly PCB sampling and analysis of the sewer discharge to the POTW was implemented during the RI. Samples were collected and analyzed weekly from GM's POTW discharge point of compliance and the City of Saginaw's water intake line. In addition, at GM's request, grab samples were collected weekly from a manhole located along the 42-inch diameter sanitary sewer line south of the visitor parking area.

GM has since conducted extensive testing, cleanup, and remediation associated with the Site sewer system in coordination with the City of Saginaw. These IRAs included installing a cure-in-place pipe inside the 42-inch diameter pipe from the diversion chamber through an inverted siphon, and installing a 36-inch diameter slip liner in the 42-inch diameter storm sewer line. For more information regarding sewer IRAs refer to the FS Report (BBL, 2003), and other documentation previously submitted to the MDEQ. As part of the plant demolition activities, the inputs into the sewer will be blocked.

Green Point Landfill

In accordance with the Consent Judgment, GM and WMI proposed, and MDEQ reviewed and approved, the design and installation of a cap for the landfill consistent with current closure requirements for solid waste municipal landfills. Construction of the landfill cap (consistent with Part 115 of Michigan Act 451) was completed and the *Green Point Landfill Cover System Certification Report* (BBL, January 2000) was submitted to the MDEQ. MDEQ has approved the Green Point Landfill remedial activities in the Interim Response (Brouillet, B., July 2000).

Former UST #7 Area

An IRA consisting of monitored natural attenuation (MNA) was initiated in the Former UST #7 Area in 1997 in accordance with MDEQ-approved *Interim Response Action Work Plan* (BBL, 1997) and was completed in 2008.

2.3.2 Ongoing Remedial and Monitoring Actions

A summary of the ongoing operation, maintenance and monitoring activities at the Site is presented in the Summary Operation, Maintenance, and Monitoring (OM&M) Plan provided as Appendix C. The following IRAs are currently being implemented in the Site areas listed below:

LNAPL Assessment and Remediation Area

In 1997, an automated LNAPL recovery system was installed at the LNAPL Assessment and Remediation Area. The system was constructed as part of the commitment to the MDEQ to install an LNAPL Recovery System IRA pursuant to Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (Part 201). A description of operation and maintenance (O&M) and monitoring

of the LNAPL recovery system was presented in *LNAPL Recovery System Operation and Maintenance Plan* (BBL, 2000). A summary of key elements of this O&M Plan is included in Appendix C.

As of October 2007, when the automated system was temporarily shut down pending building demolition, the automated LNAPL recovery system had recovered approximately 3,700 gallons of LNAPL (total includes some water). Prior to installation of the automated recovery system, an additional 8,700 gallons of LNAPL mixed with water were recovered manually during storm sewers repair activities in the area. Due to the decrease in the extent and volume of recoverable LNAPL remaining in the subsurface, the system is being re-evaluated to determine if changes to the system are appropriate. Minor quantities of LNAPL are currently being bailed on a monthly basis from monitoring wells in the area until power can be reconnected to this area and the automated system restarted.

Quench Pit Area

An automated LNAPL recovery skimmer pump was installed at the Quench Pit Area in February 2002. The ongoing operation and performance of this pump has been reported in the monthly reports to the MDEQ. As reported to MDEQ, as of September 2007 this system has removed approximately 2,400 gallons of LNAPL. Also, prior to installation of the automated recovery system (between 1997 and 2002), an additional 6,500 gallons of LNAPL mixed with water were recovered manually from the Quench Pit Area. The monitoring wells are currently being manually bailed pending the hook up of a power supply to the automated system.

Sep 17, 2009 18:39

Green Point Landfill

In accordance with the Consent Judgment, GM and WMI proposed the design and installation of a cap for the landfill consistent with current closure requirements for solid waste municipal landfills. Construction of the landfill cap (consistent with Part 115 of Michigan Act 451) was completed and the *Green Point Landfill Cover System Certification Report* (BBL, January 2000) was submitted to the MDEQ. MDEQ has approved the Green Point Landfill remedial activities as an Interim Response (Brouillet, B., July 2000). The operation, maintenance, and monitoring programs at the Green Point Landfill are ongoing in accordance with post-closure operation and maintenance procedures presented in *Final Engineering Design Report for Green Point Landfill* (BBL, 1998) and *Post-Closure Environmental Monitoring Plan* included as Appendix K to the Engineering Design Report, with modifications as approved by the MDEQ. GM will continue to monitor groundwater in the vicinity of the Green Point Landfill. The proposed monitoring plan, detailed in the Summary Operation, Maintenance, and Monitoring Plan (Appendix C), includes modifications to the original monitoring plan that have been previously approved by the MDEQ, and additional changes that are based on the collection of a substantial amount of additional data during the past year. Modifications to the monitoring plan include the removal of TCL VOCs from the sampling program analyte list, development of a site-specific inorganic constituent analyte list based on historical data and substitution of this analyte list for the Target Analyte List (TAL) inorganics analyte list, removal of 8 monitoring wells from the monitoring program (MW-128WT, MW-128S1, X-1A, X-1B, X-1CR2, X-2A, X-16A, and X-16B) that are located northwest, west, and southwest , and addition of 8 monitoring wells to the sampling program (MW-183WT, X-4A, X-4CAUGR, X-4D, X-9AR, X-9BR, X-9CAUG, and X-9D) to monitor groundwater quality along the Saginaw River. Following RAP approval, the monitoring program described in the Operation, Maintenance, and Monitoring Plan (Appendix C), which reflects these changes, will be implemented for the Green Point Landfill.

2.3.3 Proposed Additional Remedial Actions

The proposed additional remedial actions described below are considered appropriate to meet the RAOs established for the Site (refer to the FS Report [BBL, 2003]), and to comply with cleanup criteria of Part 201. The proposed remedial actions are based on the Site data collected and an evaluation of the exposure pathways and risks associated with potential impacts of Site-related constituents on human health and the environment. A description of the components of the proposed remedial actions is presented below.

Continue Implementation of the Ongoing IRAs

The ongoing IRAs described in Section 2.3.2 above will continue to be implemented in accordance with their respective implementation plans (referenced in Section 2.3.2 above).

Impose Site-Wide and Area-Specific Restrictive Covenants

A Site-wide restrictive covenant will be instituted to restrict future land use to the limited industrial and limited commercial II, III and IV categories under Section 20120a(1)(g) and (1)(i) of the NREPA. The owner may re-evaluate the exceedances and make appropriate changes to the allowable Site uses, provided that the changes are reviewed and approved by GM and MDEQ. A Site-wide restrictive covenant will also be instituted to restrict future use of groundwater at the Site, and prohibit the installation of wells for potable or domestic uses. A restriction preventing the use of groundwater for drinking water will also be placed on the property east of the Green Point Landfill that is owned by REALM In addition to the Site property as a whole being subject to the restrictive covenant, the following Site areas will also be deed restricted to limit and control future activities.

Sep 17, 2009 18:39

LNAPL Assessment and Remediation Area and Quench Pit Area

To protect against direct contact with light non-aqueous phase liquid (LNAPL) and/or hazardous substances present in subsurface soil, intrusive activities must be completed in accordance with requirements set forth under Michigan and federal OSHA. In the LNAPL Assessment and Remediation Area, activities are restricted to access by a maintenance worker who spends no more than 160 days, per any such worker per year, and an intrusive worker spends no more than 30 days, per any such worker per year, in the area. MDEQ will be notified whenever these activities are undertaken and records will be kept of activities that can be reviewed by MDEQ upon request. All excavated soils and extracted fluids will be managed in accordance with the requirements of Section 20107a of NREPA and other applicable local, state and federal laws and regulations.

Former UST #7 Area

In order to protect against inhalation of hazardous substances in indoor air that migrate from contaminated soil, no new enclosed structure suitable for short or long term human occupation shall be constructed in the area of benzene exceedance without the use of an adequate vapor barrier under such new enclosed structure (or other engineering control such as vapor venting), unless it can be demonstrated that the soil or soil vapor in this area meets applicable MDEQ soil volatilization to indoor air criteria (or equivalent) established at the time of the new construction. All excavated soils and extracted fluids will be managed in accordance with the requirements of Section 20107a of NREPA and other applicable local, state and federal laws and regulations.

Former DRA Hillock Area

The fill materials previously present in this area of the Site were excavated and moved beneath the cap of the Green Point Landfill. In order to protect against hazardous constituents that could potentially be present in the underlying soil (note that sampling was not conducted following removal of the fill) and hazardous constituents present in groundwater, intrusive activities must be completed in accordance with the health and safety requirements set forth under MiOSHA, OSHA, and all other applicable local, state, and federal laws and regulations. Activities in this area of the property are restricted so that an intrusive/construction worker spends no more than 30 days per any such worker per year in the area. The MDEQ shall be notified whenever these activities are undertaken and records shall be kept of activities that can be reviewed by the MDEQ upon request for five years. All excavated soils and extracted fluids shall be managed in accordance with the requirements of section 20107a of NREPA and all other applicable local, state, and federal laws and regulations.

Former CTC Parking Lot East of the Plant, and Parking Lot North of the Buffer Basin

In order to protect against the inhalation of hazardous substances present in soil, cover materials will be maintained in the designated areas. Where a grass cover is present, vegetation must be maintained at a minimum of 50%. Activities in this area of the Site are restricted to access by an intrusive/construction worker who spends no more than 30 days, per any such worker per year, in the area. To implement other activities in this area, work must be conducted in accordance with Health and Safety requirements established by Michigan and Federal OSHA. All excavated soils and extracted fluids will be managed in accordance with the requirements of Section 20107a of NREPA and other applicable local, state and federal laws and regulations.

Sep 17, 2009 18:39

Green Point Landfill, Type III Landfills, I27.7 Area, and Melting Department Area

In order to protect against direct contact with hazardous substances present in soil or fill material, cover materials must be maintained in these Site areas. Intrusive activities in the defined areas of waste must be completed in accordance with Health and Safety requirements established by Michigan and Federal OSHA. MDEQ will be notified whenever these activities are undertaken and records will be kept of activities that can be reviewed by MDEQ upon request. All excavated soils and extracted fluids will be managed in accordance with the requirements of Section 20107a of NREPA and other applicable local, state and federal laws and regulations.

Former Railyard Area, Previous Metal Feedstock Area, and Saginaw River Boundary

In order to protect against the inhalation of hazardous substances present in surface soil, the vegetative cover will be maintained (minimum of 50 % coverage of soil surface) in the designated areas, and roadways may not be installed unless properly constructed (at least 6 inches of gravel or pavement cover). Activities in this area of the Site are restricted to access by a maintenance worker who spends no more than 160 days, per any such worker per year, and an intrusive/construction worker who spends no more than 30 days, per any such worker per year, in the area. To implement other activities in this area, work must be conducted in accordance with Health and Safety requirements established by Michigan and Federal OSHA. MDEQ will be notified whenever these activities are undertaken and records will be kept of activities that can be reviewed by MDEQ upon request. All excavated soils and extracted fluids will be managed in accordance with the requirements of Section 20107a of NREPA and other applicable local, state and federal laws and regulations.

The Site areas subject to the proposed restrictive covenants are shown on Figure 2-5. A copy of the draft restrictive covenants document prepared in accordance with Section 324.20120b of Part 201 is included as Appendix D of this RAP. The draft restrictive covenants document includes a Site description. The restrictive

covenants will be instituted and notices to appropriate authorities will be provided within the time frames specified in Section 324.20120b of Part 201 and Rule 299.51013 of the Part 201 Administrative Rules. The ultimate goal of the restrictive covenants is to eliminate potential complete exposure pathways at the Site in the future.

Parking Lot North of Buffer Basin

The pavement and cement parking lot (or other cover if paving is replaced) will be maintained and work will be completed in accordance with Michigan OSHA and federal OSHA. MDEQ will be notified whenever these activities are undertaken and records will be kept of activities that can be reviewed by MDEQ upon request. All excavated soils and extracted fluids will be managed in accordance with the requirements of Section 20107a of NREPA and other applicable local, state and federal laws and regulations.

Implement Intrusive Remedial Measures at Select Site Areas

Intrusive remedial measures will be implemented at the Saginaw River Boundary Area and at the Former Hillock Area of the DRA and, in general, will consist of the following:

- Implementation of erosion control measures at the Saginaw River Berm Area, as needed.
- Capping of the pipe discharging VOC-impacted water from an off-Site source into the northern part of the Former Hillock Area of the DRA.

A description of the remedial measures to be implemented at the two above-referenced Site areas is presented in Appendix E.

Implement Groundwater Monitoring Program

Groundwater monitoring programs will be implemented, as described in the Operation, Maintenance, and Monitoring Plan (Appendix C) in the following Site areas:

- Saginaw River Boundary Area;
- Green Point Landfill;
- Former DRA Hillock Area;
- LNAPL Assessment and Remediation Area (groundwater and LNAPL elevation measurement only); and
- Quench Pit Area (groundwater and LNAPL elevation measurement only).

3. Implementation Details and Documentation

This section presents the implementation details and documentation associated with the remedial actions implemented to date, as well as the proposed remedial actions. The specific information presented in this section is based on MDEQ's draft Guidance Document for *Suggested Format and Content for Remedial Action Plans* MDEQ, 2004) and addresses the following topics:

- documentation that cleanup criteria are appropriate for the Site;
- identification of indicator chemicals;
- source control analysis;
- statistical analysis;
- implementation schedule;
- identification and rationale for construction/implementation monitoring;
- operation and maintenance plans;
- plans for abandonment of observation/monitoring wells;
- effectiveness monitoring plan;
- contingency plans;
- comparison of Site zoning information to Site-specific criteria;
- land use or resource use restrictions;
- documentation of easement holders;
- monitoring plan;
- specifications for permanent markers;
- proposed financial assurance mechanism; and
- proposed legally enforceable agreement.

3.1 Appropriate Cleanup Criteria

This RAP is based on generic and Site-Specific Criteria (SSCC) developed for relevant Site use, that satisfy the applicable requirements of Part 201, as provided for in Section 324.20120a(2) of Part 201. The SSCC were developed in accordance with MDEQ guidelines. The SSCC are based on alternative exposure assumptions unique to the Site and are considered appropriate to meet goals and objectives of the proposed remedial action. A summary of the SSCC values that triggered remedial action at the Site areas subject to this RAP is presented in Table 1-1. For more details regarding development of the SSCC refer to the FS Report (BBL, 2003), which includes the HHE as Appendix A, and the HHE Addendum (Appendix B of this RAP). The evaluation criteria for the groundwater monitoring program along the Saginaw River are MDEQ's GSI Criteria.

3.2 Rationale for Indicator Chemicals

The indicator chemicals proposed for the groundwater monitoring programs are based on the results of previous testing of groundwater samples collected in this area.

3.3 Statistical Analysis

The 95% upper confidence limit (UCL) of the arithmetic mean was calculated and used where appropriate during the HHE. In accordance with MDEQ guidance, the 95% UCL of the arithmetic mean can be used to determine compliance with the generic criteria for select pathways, provided the 95% UCL reasonably represents the areas over which exposures are expected to occur. The 95% UCL was calculated for each chemical detected within each area of concern (AOC), provided the data sets were sufficiently robust to adopt this statistical approach. The 95% UCLs were compared to the MDEQ criteria except in data sets where the 95% UCL exceeded the maximum concentration. Where this occurred, the maximum detected concentration was used as the exposure point concentration (USEPA, 1992). A detailed explanation of the derivation of the 95% UCL values is provided in the FS Report (BBL, 2003), which includes the original HHE as Appendix A of the FS Report.

3.4 Source Control Analysis

On-Site sources of COCs have previously been addressed or are currently being addressed through IRAs, as described in the FS Report (BBL, 2003). Two of the five ongoing IRAs address environmental media that have been impacted with COCs as a result of past releases and may currently act as a source of COCs (LNAPL Assessment and Remediation Area and Quench Pit Area). A detailed description of these IRAs is presented in the documents referenced in the preceding sections of this RAP and summarized in Sections 2.3.1 and 2.3.2.

Confidential under FOIA
Richard Kowalski

Sep 17, 2009 18:39

The off-Site source of VOC-impacted water that discharges into the Former Hillock Area of the DRA is not related to any GM activities, and will not be addressed by remedial action proposed in this RAP. Remedial measures proposed for the Former Hillock Area of the DRA in Section 2.3.3 is designated to stop future discharge of VOC-impacted water into the Former Hillock Area of the DRA from the concrete tile pipe.,

Impacts to groundwater by VOCs in an area northwest of the Green Point Landfill have also recently been identified during investigations of the adjoining REALM Peninsula Area Property (Figure 1-1). It has been demonstrated that the source of VOCs is located on an adjoining property owned by others. The off-Site source of VOCs is not addressed by remedial actions proposed in this RAP.

No known new sources of COCs are being introduced at the Site as a result of current operations.

3.5 Site Contamination Not Addressed by RAP

The VOC impacts to groundwater and potentially to surface water in the Site area located north west of the Green Point Landfill and west of the SMI facility are not addressed by this RAP. These impacts were recently identified and are currently being investigated by the owner of the adjoining source property.

There is also an area on the northern boundary of the Site known as the Queen Street (Center Street) Dump. Although exceedances of criteria were not encountered here, it is an area with an oil sheen on the groundwater and an observed decreased DO level in the groundwater. This area was not part of GM operations and is not addressed in this RAP.

Sep 17, 2009 18:39

As noted in Section 1.2.2, the VOCs detected in groundwater in the Drum Remediation Area are not associated with GM operations and are not addressed by the RAP.

Recent investigations within the Saginaw River watershed have identified the presence of dioxins and furans in areas subject to flooding. These constituents were released at an upstream source and were distributed with flood water from the Saginaw River and upstream tributaries. The presence of elevated concentrations of these compounds has not been documented at the Site; however, it is possible that elevated concentrations are present. Dioxin/furan issues are not addressed in this RAP. An affidavit to support unremediated releases is provided in Attachment 2

3.6 Implementation Schedule

The ongoing IRAs described in Section 2.3.2 will be implemented as described in the OM&M Plan (Appendix C).

In general, Section 324.20120b(4) requires that the restrictive covenants shall be recorded with the register of deeds for the county in which the property is located within 21 days of the MDEQ's selection or approval of the remedial action plan, or within 21 days of the completion of construction of the containment or barrier, as appropriate to the circumstances.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

The intrusive remedial activities in the Saginaw River Boundary Area (i.e. re-vegetating exposed areas along the berm and regrading as needed) and Former Hillock Area of the DRA (i.e. capping the drain tile) will be initiated within 8 months following MDEQ's approval of the RAP and RADR, respectively, and will be implemented during a typical construction season.

3.7 Construction/Implementation Monitoring

This section provides a description of environmental monitoring to be conducted during implementation of the remedial action. The monitoring will be conducted to document that installation of the remedial action does not pose unacceptable hazards to humans and the environment.

As described in Section 2.3.3 above, the proposed remedial action consists of continuing implementation of the ongoing IRAs, imposing restrictive covenants, groundwater monitoring, and implementing intrusive remedial measures. The ongoing IRAs are being implemented in accordance with previously approved operation and implementation plans (referenced in Section 2.3.2 above). As such, the environmental monitoring for these IRAs has been addressed in these plans and is not discussed herein, except for any proposed modifications. Imposing restrictive covenants and groundwater monitoring do not involve intrusive activities and, as such, do not require any environmental monitoring. The only additional components of the proposed remedy that requires environmental monitoring are intrusive activities proposed for the Saginaw River Boundary Area and Former Hillock Area of the DRA. A summary of the environmental monitoring proposed for these areas is presented below.

Sep 17, 2009 18:39

The environmental monitoring in the Saginaw River Boundary Area and Former Hillock Area of the DRA will include the following:

- Visual observation. A GM/REALM representative will be present on-Site during implementation of the intrusive remedial measures in the Saginaw River Boundary area (i.e., erosion control measures) and Former Hillock Area of the DRA to verify that the remedy is implemented properly. The GM/REALM representative will document that action levels are observed, and that erosion control measures during regrading of the berm are sufficient and adequate.

3.8 Operation and Maintenance

This section provides a summary of operation and maintenance for the ongoing and proposed remedial actions.

Operation, maintenance and monitoring of the ongoing IRAs are being conducted in accordance with previously approved operation and implementation plans (referenced in Section 2.3.2) which include operation, maintenance, and monitoring, as appropriate. Key elements of these O&M plans are presented in Appendix C. For more details refer to the respective operation and implementation plans (referenced in Section 2.3.2).

As required by Section 324.20120b(4) of Part 201, the restrictive covenants will run with the land and be binding on the owner's successors, assigns, and lessees. Such restrictions may be modified in the future only upon approval by the MDEQ, REALM, and GM. No other operation or maintenance is proposed for the restrictive covenants.

Sep 17, 2009 18:39

Groundwater elevation and quality monitoring programs are proposed for the Saginaw River Boundary and Green Point Landfill. Groundwater and LNAPL elevation monitoring programs are proposed for the LNAPL Assessment and Remediation Area and the Quench Pit Area. Integrity and overall condition of monitoring wells included in these sampling plans will be observed during the monitoring events. Repairs will be made as needed.

Operation and maintenance for the Former Railyard Area, Former CTC Parking Lot, Saginaw River Boundary Area will include monitoring the vegetative cover, and re-vegetating where appropriate. If any roads are constructed in the Former Railyard Area or the Saginaw River Boundary Area, the road condition will be monitored and maintained.

3.9 Abandonment of Observation/Monitoring Wells

As presented in the previous sections, ongoing groundwater monitoring programs are currently being implemented in the Green Point Landfill Area, and LNAPL Remediation Area. In addition, groundwater monitoring programs are proposed for the Saginaw River Boundary area and Former Hillock Area of the DRA. Monitoring wells located in the above-listed areas that are or will be included as part of the ongoing or proposed groundwater monitoring programs, respectively, will remain in place. The remaining on-Site wells (that are not and will not be included as part of the ongoing and proposed groundwater monitoring programs) will be abandoned, in accordance with a schedule agreed upon with the MDEQ. Upon the conclusion of all response activities requiring the use of groundwater wells or other subsurface devices detailed in the RAP, including operation, and long-term monitoring, notice will be provided to the MDEQ to obtain approval for abandonment or removal of all remaining wells and other response activity-related devices at the Site. Following MDEQ approval, well abandonment will be completed in accordance with American Society of Testing Materials

(ASTM) Standard D5299-92 *Standard Guide for Decommissioning Groundwater Wells, Vadose Zone Monitoring Devices, Boreholes and Other Devices for Environmental Activities*.

3.10 Effectiveness Monitoring Plan

Groundwater monitoring will be performed at the Green Point Landfill Area, Former DRA Hillock Area and Saginaw River Boundary Area on an annual basis. Each of these monitoring programs will continue as part of remedial activities, and will be modified over time by increasing or decreasing the sampling frequency and number of wells monitored, in response to collected monitoring data. The specifics of the proposed monitoring plan are provided in the Summary OM&M Plan included as Appendix C. These monitoring activities, along with the monitoring of the landfill caps, the vegetated areas, and the maintained roadways (existing or newly constructed) will monitor the effectiveness of the remedy.

3.11 Remedial Action Contingency Plan

The Site monitoring data collected as described in the above section will be evaluated on an ongoing basis to assess the effectiveness of the implemented activities. Contingency actions will be implemented as needed during RAP implementation. The Summary OM&M Plan (Appendix C) describes the specific contingency actions proposed for the groundwater monitoring program.

Sep 17, 2009 18:39

3.12 Evidence of Zoning

The Site is located in an industrial area of Saginaw that is and will continue to be used for industrial purposes for the foreseeable future. A zoning map, presented as Figure 3-1, shows that the Site is zoned for industrial purposes. A Site-wide restrictive covenant to restrict future land use to limited industrial and limited commercial II, III, and IV uses is proposed as part of the remedial action for the Site (for more information see Section 2.3.3 above).

3.13 Land, Groundwater, and Surface Water Use Restriction

As presented in Section 2.3.3 above, a Site-wide restrictive covenant will be instituted to restrict future land use to limited industrial and limited commercial II, III, and IV uses, and to restrict future use of groundwater at the Site to prevent the use of groundwater for drinking water purposes. In addition to the Site property as a whole being subject to restrictive covenants, the following Site areas will also be subject to various restrictive covenants to limit and control future activities in these areas:

- LNAPL Assessment and Remediation Area;
- Quench Pit Area;
- Former DRA Hillock Area;
- Previous Metal Feedstock Area;
- Former UST #7 Area;
- Parking Log North of Buffer Basin;
- Former CTC Parking Lot East of the Plant;

Confidential under FOIA

Sep 17, 2009 18:39

- Green Point Landfill;
- Type III Landfills;
- I27.7 Area;
- Melting Department Area;
- Former Railyard Area; and
- Saginaw River Boundary.

The Site areas subject to the proposed restrictive covenants are shown on Figure 2-5. GM and REALM will file (for their respective properties), for recording with the Saginaw County Register of Deeds, the Restrictive Covenant within twenty-one days of approval by MDEQ, in accordance with the law. Copies of the draft restrictive covenant documents prepared in accordance with Section 20120b of Part 201 are included in Appendix D of this RAP.

3.14 Documentation of Easement Holders

One easement holder has been identified on the Site property. The Consumers Energy Company has an easement at the north-west corner of the property, at the location shown on Figure 1-2. The easement area is located at the upgradient edge of the property, and the area is not known or suspected of containing hazardous substances at concentrations above the generic Industrial Cleanup Criteria. No ongoing monitoring or maintenance, as described in this RAP, will take place in the easement area. Therefore, the deed restrictions will not impact the easement area.

Michigan Electric Transmission Company ("METC") has an easement on the former Consumers Energy Company property located east of the Green Point Landfill (Figure 1-2), which is not part of the Site. Discussions are ongoing with METC to obtain an agreement to the proposed deed restrictions that impact that property.

3.15 Monitoring Plan

This section presents a description of activities to be conducted to demonstrate effectiveness of the proposed remedy.

Groundwater sampling activities will be conducted in the Green Point Landfill Area on an annual basis. Monitoring of LNAPL thickness and groundwater level elevations will be conducted in the LNAPL Remediation Area and the Quench Pit Area on an annual basis. Additional groundwater monitoring programs are proposed for the Saginaw River Boundary area and Former Hillock Area of the DRA, as described in Appendix C. GM may propose modifications to the monitoring plan, including deletion of monitoring wells and/or constituents and changes in the sampling frequency, subject to approval by the MDEQ.

Monitoring will also be conducted as described in the OM&M Plan in areas where vegetation must be maintained and in areas of the Saginaw River Boundary if roadways are constructed. Cap integrity will also be monitored for the GPL and the two Terminated Type III landfills.

3.16 Specifications for Permanent Markers

GM and WMI will install permanent markers on the Site within sixty days of receipt of the recorded restrictive covenant from the Saginaw Register of Deeds. One primary permanent marker will be posted at each deed restricted area at a location that is readily visible. The permanent markers will be constructed of stone, cast metal, concrete, or similar durable material, and will contain the following information legibly presented in or on a durable material (e.g. stone, metal, concrete):

WARNING
This area has been restricted due to the presence of hazardous substances
This is the _[Insert Site Area Name and description of area]
[Graphic depiction of the restricted area relative to the Site]
[List of Restrictions]
See Liber ___and Page ___
Saginaw County Register of Deeds
MDEQ Part 201 site identification number

The location of each primary permanent marker is identified on Figure 2-5. Marker posts constructed of durable material will be installed at three additional locations around the perimeter (or at the corners) at each deed restricted area. All permanent markers will be inspected annually and maintained in legible condition in accordance with the provisions of the MDEQ-approved Operation, Maintenance, and Monitoring Plan (Appendix C).

Sep 17, 2009 18:39

3.17 Proposed Financial Assurance Mechanism

GM will be obtaining a Financial Assurance Mechanism (FAM) acceptable to MDEQ for the Site, according to the schedule set forth in the Consent Judgment. The FAM will be established and maintained in accordance with Section XXIX (Financial Capability) of the Consent Judgment. The FAM will be in an amount sufficient to cover Long-Term RAP Cost at the Site for a thirty year period and will be in a form that allows the MDEQ to immediately contract for the response activities for which financial assurance is required in the event the LPG fails to implement the required tasks.

3.18 Legally Enforceable Agreement

The Consent Judgment for this Site provides for the implementation of the RAP and is the Legally Enforceable Agreement for this Site.

The following elements of the provisions required pursuant to Part 20120b{3) that are missing from the Consent Judgment. These elements are further outlined in this Section and contain the enforceable provisions pertaining to:

(a) – the Abandonment of Observation and Monitoring Wells presented in Section 3.9 of the RAP

(b) – the Land, Groundwater, and Surface Water Use Restrictions presented in Section 3.13 of the RAP

Confidential under FOIA
Richard Kowalski

Richard Kowalski
LFR
Sep 17, 2009 18:39

(c) – the Specifications for Permanent Markers presented in Section 3.16 of the RAP

(d) – the Proposed Financial Assurance Mechanism presented in 3.17 of the RAP

With final approval of the RAP, the RAP will be incorporated as an enforceable component of the Consent Judgment as stipulated in Section XVIII, Paragraph 18.2, of the Consent Judgment. Consequently the Consent Judgment and the provisions of Section 3.18 of the RAP collectively serve as the legally enforceable agreement required pursuant to Section 20120b(3) of the NREPA.

3.18.1 Definitions

"Remedial Action Plan" or "RAP" refers to this document, submitted on behalf of the liable party group (LPG), and all other subsequent MDEQ-approved modifications to the RAP.

"Long-Term RAP Costs" means the costs of Operation and Maintenance, oversight, monitoring, and other costs necessary to assure the effectiveness and integrity of the remedial action set forth in the RAP in perpetuity.

"Operation and Maintenance Phase" means the performance of the activities set forth in the Summary Operation, Maintenance and Monitoring Plan found in Appendix C, beginning the date upon which this RAP is approved by the MDEQ.

"Part 201 Administrative Rules" or "Rules" means the administrative rules promulgated under Part 201.

Unless otherwise defined herein or in the Consent Judgment, all other terms used in this RAP, which are defined in Part 3, Definitions, of the NREPA, MCL 324.301; Part 201 of the NREPA; or the Part 201 Administrative Rules, 1990 AACS R 299.5101, *et seq.*, as amended by changes at 2002 Michigan Register 24 that became effective on December 21, 2002, shall have the same meaning in this document as in Parts 3 and 201 of the NREPA, and the Part 201 Administrative Rules.

3.18.2 Performance Standards

The overall performance standard of the RAP is to assure the protection of the public health, safety and welfare, and the environment. The specific performance standards employed by the RAP are as follows:

(a) Prevent unacceptable exposures to groundwater used for potable or domestic use.

(b) Prevent unacceptable direct contact exposures with soil, groundwater, or LNAPL for the LNAPL Assessment and Remediation Area, I27.7 Area, Melting Department Area, Former Railyard, Quench Pit Area, and Former DRA Hillock Area.

(c) Prevent unacceptable inhalation exposures from contaminated soil in the Former UST #7 Area.

(d) Prevent unacceptable inhalation exposures from contaminated soil in the Former CTC Parking Lot East of the Plant, Previous Metal Feedstock Area, Former Railyard Area, and the Parking Lot North of the Buffer Basin.

Confidential under FOIA

Sep 17, 2009 18:39

(e) Prevent unacceptable direct contact exposure with waste fill material in the former Green Point Landfill, and Type III Landfills.(f) Prevent unacceptable inhalation exposures from contaminated soil along the Saginaw River Boundary and control erosion along the Saginaw River Berm Area.

(g) Prevent unacceptable hazardous substance migration from the former Green Point Landfill in accordance with post-closure operation and maintenance procedures.

(h) Implement groundwater quality monitoring at the Saginaw River Boundary Area, Green Point Landfill, and Former UST 7 Area.

3.18.3 Progress Reports

In addition to the requirements specified in Section XVI of the Consent Judgment (Progress Reports), the annual progress reports will include an assessment and documentation of the integrity of all exposure control mechanisms on which the RAP is dependent (e.g., barriers, permanent markers, etc.), and compliance with land-use restrictions, resource-use restrictions, and institutional controls. If appropriate, the report shall describe any modifications to the RAP that are determined to be necessary to assure the continued effectiveness and integrity of the remedial action.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

3.18.4 Modification

If the MDEQ determines that a modification to the work specified in the approved RAP is necessary to: (a) achieve or maintain the performance standards set forth in Paragraph 3.18.2 of this RAP; (b) assure the effectiveness, integrity, or reliability of the remedial action undertaken pursuant to the RAP; (c) correct a lapse or noncompliance under Paragraph 3.18.5 of this RAP; or (d) otherwise prevent unacceptable exposures to public health, safety, welfare and the environment, the MDEQ may require that such modification be incorporated into the RAP. However, only modifications consistent with the Section VI (Additional Response Activity) of the Consent Judgment may be required. If the necessary modifications are extensive the MDEQ may request submittal of a RAP modification plan proposal for MDEQ review and approval. The RAP may only be modified by written agreement between the Defendants and the MDEQ. Upon MDEQ approval, the Defendants shall perform the response activities in accordance with MDEQ-approved implementation schedules.

3.18.5 Compliance with State and Federal Laws

In addition to the requirements set forth In Section XII (Compliance with Other Laws) of the Consent Judgment, and except as provided under Section 20120a(15) of the NREPA, this RAP does not obviate the Defendants' obligation to obtain and maintain compliance with any permit or authorization required under state or federal laws.

TABLE 1-1
SUMMARY OF SITE-SPECIFIC CONDITIONS AND CLEANUP CRITERIA THAT TRIGGER RESPONSE ACTION*

GENERAL MOTORS CORPORATION
SAGINAW MALLEABLE IRON PLANT PROPERTY,
AND REALM GREEN POINT LANDFILL
AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

Site Area	Constituent(s) Triggering Response Action (*)	Exposure Point Concentration	Potential Exposure and Relevant (**) Exposure Pathway	Generic MDEQ Criteria Exceeded	Applicable Site-Specific Cleanup Criteria
Saginaw River Boundary	Manganese (surface)	2,330 mg/kg (2)	Particulate soil inhalation (maintenance worker)	IPSIC	2,300 mg/kg
	Manganese (soil column)	5,800 mg/kg (2)	Particulate soil inhalation (intrusive/construction worker)	IPSIC	12,000 mg/kg
Green Point Landfill	Integrity of the landfill	---	---	---	---
Type III Landfills	Integrity of the landfill	---	---	---	---
Drum Remediation Area/Former Hillock	Vinyl Chloride (groundwater)	2,300 ug/L (1)	Dermal contact with impacted groundwater (intrusive/ construction worker)	GCC	2,923 ug/L
Former CTC Parking Lot East of Main Plant	Manganese (under soil and grass barrier)	11,600 mg/kg (1)	Particulate soil inhalation (intrusive/construction worker)	IPSIC	12,000 mg/kg
Parking Lot North of Buffer Basin	Manganese (under parking lot)	11,900 mg/kg (1)	Particulate soil inhalation (intrusive/construction worker)	IPSIC	12,000 mg/kg

Notes:
This table has been prepared based on information presented in the *Feasibility Study Report* (BBL, July 2003) (FS Report), *Human Health Evaluation Report* (BBL, July 2003) (HHE Report), *Ecological Risk Assessment Report* (Exponent, January 2003) (ERA Report), Supplemental Site data that has been submitted to the MDEQ in monthly reports, and *Human Health Addendum* (ARCADIS, July 2008).

* = in addition to the site-wide industrial use limitation.

** = Exposure pathway is relevant only if the following four elements exist:

- a source and mechanism of chemical release to the environment;
- a relevant environmental transport medium;
- a relevant point of exposure to the chemical present in the medium; and
- a route of uptake at the exposure point.

1 = maximum concentration.

2 = 95% UCL concentration.

Acronyms/Abbreviations:

IDC – Industrial and Commercial II Direct Contact.
IGVIIC – Industrial Groundwater Volatilization Indoor Air Inhalation Criteria.
ISVIIC – Industrial Soil Volatilization to Indoor Air Inhalation Criteria.
IPSIC – Industrial Particulate Soil Inhalation Criteria.
LNAPL – Light Non-Aqueous Phase Liquid.
mg/kg – milligrams/per kilogram
PCBs – Polychlorinated Biphenyls.
RA – Remedial Action.
SSCC – Site-Specific Cleanup Criteria.
ug/L – micrograms per liter.
UST – Underground Storage Tank.
--- – Not applicable.

Melting Department	S2033	RVSICI, RDC, IDC	9/6/1996	0	0.5	Total PCBs	650	Soils samples containing PCBs were excavated in July 1996; confirmatory sampling indicated soils exceeding generic values were removed. (Melting Department Area Investigation and Remediation Report, CRA 1997).
Melting Department	S2034	IDC, RDC	9/6/1996	0	0.5	Total PCBs	27	Soils samples containing PCBs were excavated in July 1996; confirmatory sampling indicated soils exceeding generic values were removed. (Melting Department Area Investigation and Remediation Report, CRA 1997).
Melting Department	S2036	RDC	9/6/1996	0	0.5	Total PCBs	12.7	Soils samples containing PCBs were excavated in July 1996; confirmatory sampling indicated soils exceeding generic values were removed. (Melting Department Area Investigation and Remediation Report, CRA 1997).
Melting Department	S3043	RDC	11/27/1996	0	0.5	Total PCBs	6.3	Addressed by restrictive covenant. The concrete plant floor serves as a barrier.
Metal Feedstock area	SB-304	IPSIC, RPSIC	2/8/1995	0	1	Manganese	6,140	Addressed by site specific evaluation (HHE Page 6-14); site specific value = 12,000 mg/kg; UCL = 6,140 mg/kg.
Metal Feedstock area	SB-304	IPSIC, RPSIC	2/8/1995	2	4	Manganese	9,190	Addressed by restrictive covenant.
Metal Feedstock area	SB-305	IPSIC, RPSIC	2/8/1995	2	4	Manganese	6,820	Addressed by restrictive covenant.
Metal Feedstock area	SB-305	IPSIC, RPSIC	2/8/1995	6	8	Manganese	3,830	Addressed by restrictive covenant.
North of DRA	SB-388	IPSIC	7/25/2000	0	0.5	Manganese	2,940 J	Addressed by site specific evaluation (HHE Page 6-15); site specific value = 4,504 mg/kg.
Parking lot east of main plant	PL-1	IPSIC, RPSIC, RDC	8/10/2001	0.75	1.21	Manganese	11,600	Addressed by restrictive covenant.
Parking lot east of main plant	PL-2	IPSIC, RPSIC	8/10/2001	0.75	1.25	Manganese	6600	Addressed by restrictive covenant.
Parking lot east of main plant	PL-2	IPSIC, RPSIC	8/10/2001	0.75	1.25	Manganese	7,700	Addressed by restrictive covenant.
Parking lot east of main plant	PL-3	IPSIC, RPSIC	8/10/2001	0.67	1.67	Manganese	10,700	Addressed by restrictive covenant.
Parking lot east of main plant	PL-4	IPSIC	8/10/2001	0.75	1.5	Manganese	1,800	Addressed by restrictive covenant.
Railyard Area	BH11	IPSIC	3/6/2007	0	2	Manganese	2540	Addressed by restrictive covenant.
Railyard Area	BH12	RPSIC, IPSIC	3/6/2007	0	2	Chromium Total	918 [572]	Addressed by restrictive covenant.
Railyard Area	BH12	RPSIC, IPSIC	3/6/2007	0	2	Manganese	7380 [6770]	Addressed by restrictive covenant.
Railyard Area	BH12	RPSIC, IPSIC	3/6/2007	0	2	Manganese	6770	Addressed by restrictive covenant.
Railyard Area	BH12	RDC	3/6/2007	0	2	Total PCBs	11	Addressed by restrictive covenant.
Railyard area	RS-09	IPSIC	8/19/2005	0	1	Manganese	1,560	Addressed by restrictive covenant.
Railyard area	RS-11	IPSIC, RPSIC	8/19/2005	0	1	Manganese	3, 650	Addressed by restrictive covenant.
Railyard area	RS-12	IPSIC	8/22/2005	0	1	Manganese	2,310	Addressed by restrictive covenant.
Railyard area	RS-13	IPSIC	8/23/2005	0	1	Manganese	1,530/2,360	Addressed by restrictive covenant.
Railyard area	RS-14	IPSIC	8/24/2005	0	1	Manganese	2,380	Addressed by restrictive covenant.
Railyard area	RS-17	IPSIC, RPSIC	8/27/2005	0	1	Manganese	5,470	Addressed by restrictive covenant.
Railyard area	RS-2	RDC	6/13/1995	0	1	Arsenic	11.8	Addressed by restrictive covenant.
Railyard area	RS-2	IPSIC	6/13/1995	0	1	Chromium (Total)	1,110	Sample collected in August 2005 from same location for total chromium (Cr) and Cr VI analysis; no Cr VI detected and total concentrations are below Cr III criteria.
Railyard area	RS-2	RDC	6/13/1995	0	1	Lead	530 J	Addressed by restrictive covenant.
Railyard area	RS-2	IPSIC, RPSIC	6/13/1995	0	1	Manganese	3,320 J	Addressed by site specific evaluation (HHE Page 6-15); site specific value = 12,000 mg/kg.
Railyard area	RS-2-4	RDC	6/10/1996	0	1	Lead	456 J	Addressed by restrictive covenant.
Railyard area	RS-2-5	RDC	6/10/1996	0	1	Lead	769 J	Addressed by restrictive covenant.
Railyard area	RS-2-6	IDC, RDC	6/10/1996	0	1	Lead	1,370 J	Addressed by site specific evaluation (HHE Page 6-15); site specific value = 1,602 mg/kg.

TABLE 2-1
SUMMARY OF SITE SOIL DATA THAT EXCEED GENERIC MDEQ CRITERIA1

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

Notes:
RI = Remedial Investigation Report, BBL, July 2001.
HHE = Human Health Evaluation, BBL, July 2003.
IDC = Industrial Direct Contact criteria
ISVIA = Industrial Soil Volatilization to Indoor Air Inhalation criteria.
IPSIC = Industrial Particulate Soil Inhalation criteria.
J = The compound/constituent was positively identified; however, the associated numerical value is an estimated concentration only.
B = (Organic) The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect. (Inorganic) The analyte has been positively identified. The concentration is between the instrument detection limit and the required reporting limit.

[1] The data were compared to the Part 201 Generic MDEQ Residential and Industrial Criteria, dated January 2006 (with the exception of the Drinking Water and Groundwater Surface Water Interface Protection Criteria; a comparison to these criteria is shown in Table 2-2).

TABLE 2-2

SUMMARY OF SITE SOIL DATA THAT EXCEED GENERIC MDEQ DRINKING WATER AND GSI PROTECTION CRITERIA

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

Site Area	Location ID	Generic MDEQ Criteria Exceeded	Samples Collected On:	Depth Start (feet)	Depth End (feet)	Analyte	Detected Concentration (mg/kg)	Comments
Parking Lot Area North of Buffer Basin	SB-355	IDWP, RDWP	6/28/1995	2	4	Iron	37,700	Excavated; samples were collected to characterize soils excavated in conjunction with buffer basin construction.
Parking lot east of main plant	PL-1	IDWP, GSIP, RDWP	8/10/2001	0.75	1.21	Cobalt	61	Interior site area; GSI criteria do not apply. Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-1	IDWP, GSIP, RDWP	8/10/2001	0.75	1.21	Chromium (Total)	190	Interior site area; GSI criteria do not apply. Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-1	IDWP, GSIP, RDWP	8/10/2001	0.75	1.21	Manganese	11,600	Interior site area; GSI criteria do not apply. Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-1	IDWP, RDWP	8/10/2001	0.75	1.21	Aluminum	20,900	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-1	IDWP, RDWP	8/10/2001	0.75	1.21	Iron	85,400	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-1	RDWP	8/10/2001	0.75	1.21	Magnesium	9,100	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-2	GSIP	8/10/2001	0.75	1.25	Cyanide, Total	1.1	Interior site area; GSI criteria do not apply.
Parking lot east of main plant	PL-2	IDWP, GSIP, RDWP	8/10/2001	0.75	1.25	Cobalt	26	Interior site area; GSI criteria do not apply. Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-2	IDWP, GSIP, RDWP	8/10/2001	0.75	1.25	Cobalt	27	Interior site area; GSI criteria do not apply. Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-2	IDWP, GSIP, RDWP	8/10/2001	0.75	1.25	Chromium (Total)	110	Interior site area; GSI criteria do not apply. Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-2	IDWP, GSIP, RDWP	8/10/2001	0.75	1.25	Manganese	6,600	Interior site area; GSI criteria do not apply. Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-2	IDWP, GSIP, RDWP	8/10/2001	0.75	1.25	Manganese	7,700	Interior site area; GSI criteria do not apply. Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-2	IDWP, RDWP	8/10/2001	0.75	1.25	Aluminum	13,600	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-2	IDWP, RDWP	8/10/2001	0.75	1.25	Aluminum	14,900	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-2	IDWP, RDWP	8/10/2001	0.75	1.25	Iron	28,100	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Parking lot east of main plant	PL-2	IDWP, RDWP	8/10/2001	0.75	1.25	Iron	35,200	Restrictive Covenant prevents use of the groundwater as a drinking water source.

TABLE 2-2

SUMMARY OF SITE SOIL DATA THAT EXCEED GENERIC MDEQ DRINKING WATER AND GSI PROTECTION CRITERIA

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

Site Area	Location ID	Generic MDEQ Criteria Exceeded	Samples Collected On:	Depth Start (feet)	Depth End (feet)	Analyte	Detected Concentration (mg/kg)	Comments
River Berm Area	SB-385	IDWP, GSIP, RDWP	7/25/2000	0.5	1	Cobalt	2.2 B	Cobalt was not detected above GSI in groundwater samples collected from permanent monitoring wells in area. Restrictive Covenant prevents use of the groundwater as a drinking water source.
River Berm Area	SB-385	IDWP, GSIP, RDWP	7/25/2000	0.5	1	Manganese	384 J	Groundwater samples collected in this area using ultra-low-flow procedures have not shown Mn above GSI.
River Berm Area	SB-385	IDWP, RDWP	7/25/2000	0.5	1	Aluminum	4,040	Restrictive Covenant prevents use of the groundwater as a drinking water source.
River Berm Area	SB-385	IDWP, RDWP	7/25/2000	0.5	1	Iron	6,980	Restrictive Covenant prevents use of the groundwater as a drinking water source.
River Berm Area	SB-385	RDWP	7/25/2000	0.5	1	Magnesium	10,900	Restrictive Covenant prevents use of the groundwater as a drinking water source.
River Berm Area	SB-386	GSIP	7/25/2000	0	0.5	Mercury	0.16	Mercury was not detected above GSI in groundwater samples collected from permanent monitoring wells in area.
River Berm Area	SB-386	GSIP	7/25/2000	0	0.5	Chromium (Total)	25.1 J	Chromium was not detected above GSI in groundwater samples collected from permanent monitoring wells in area.
River Berm Area	SB-386	IDWP, GSIP, RDWP	7/25/2000	0	0.5	Manganese	1,180 J	Manganese was not detected above GSI in groundwater samples collected from permanent monitoring wells in area. Restrictive covenant prevents use of the groundwater was a drinking water source.
River Berm Area	SB-386	IDWP, GSIP, RDWP	7/25/2000	0	0.5	Cobalt	2.2 B	Cobalt was not detected above GSI in groundwater samples collected from permanent monitoring wells in area. Restrictive Covenant prevents use of the groundwater as a drinking water source.
River Berm Area	SB-386	IDWP, RDWP	7/25/2000	0	0.5	Aluminum	3,710	Restrictive Covenant prevents use of the groundwater as a drinking water source.
River Berm Area	SB-386	IDWP, RDWP	7/25/2000	0	0.5	Iron	10,500	Restrictive Covenant prevents use of the groundwater as a drinking water source.
River Berm Area	SB-386	GSIP	7/25/2000	0.5	1	Chromium (Total)	7.7 J	Chromium was not detected above GSI in groundwater samples collected from permanent monitoring wells in area.
River Berm Area	SB-386	IDWP, GSIP, RDWP	7/25/2000	0.5	1	Manganese	173 J	Manganese was not detected above GSI in groundwater samples collected from permanent monitoring wells in area. Restrictive covenant prevents use of the groundwater was a drinking water source.
River Berm Area	SB-386	IDWP, GSIP, RDWP	7/25/2000	0.5	1	Cobalt	2.2 B	Cobalt was not detected above GSI in groundwater samples collected from permanent monitoring wells in area. Restrictive Covenant prevents use of the groundwater as a drinking water source.
River Berm Area	SB-386	IDWP, RDWP	7/25/2000	0.5	1	Aluminum	3,490	Restrictive Covenant prevents use of the groundwater as a drinking water source.

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

SUMMARY OF SITE SOIL DATA THAT EXCEED GENERIC MDEQ DRINKING WATER AND GSI PROTECTION CRITERIA

Notes:
RI = Remedial Investigation Report, BBL 2001.
HHE = Human Health Evaluation, BBL 2001.
GSIP = Groundwater Surface Water Interface Protection; updated January 2006.
RDWP = Residential Drinking Water Protection criteria, updated January 2006.
IDWP = Industrial Drinking Water Protection criteria, updated January 2006.
B = (Organic) The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
(Inorganic) The analyte has been positively identified. The concentration is between the instrument detection limit and the required reporting limit.
D = Concentration is based on a diluted sample analysis.
J = The compound/constituent was positively identified; however, the associated numerical value is an estimated concentration only.

TABLE 2-3
SUMMARY OF SITE GROUNDWATER DATA THAT EXCEEDS GENERIC MDEQ CRITERIA

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

Site Area	Location ID	Generic MDEQ Criteria Exceeded	Samples Collected On:	Parameter Group	Analyte	Detected Concentration (ug/L)	Comments
Drum Remediation Area	X-15BR	GAI, GCC, GSI, IDW, RDW, WS		Semivolatiles	bis(2-Ethylhexyl)phthalate	500 B D	Detected in 1995, subsequent sampling events (1996 and 2000) showed much lower concentrations not exceeding standard (HHE Section 4-10). Bis(2-Ethylhexyl)phthalate was also detected in 1995 rinse blank (RI p 4-6)
East Landfill	B-4AR	GCC, GSI, IDW, RDW	7/25/1995	PCBs	Total Aroclors	4.4	Only filtered samples were considered for comparison to the GCC value (HHE Section 4-19).
East Landfill	B-4AR	GSI, IDW, RDW	7/25/1995	PCBs-Filtered	Total Aroclors	2.6	Restrictive Covenant prevents use of the groundwater as a drinking water source and monitoring well is not a GSI monitoring point.
East Landfill	B-4AR	GSI	7/25/1995	Semivolatiles	Naphthalene	61	Monitoring well is not located within the groundwater surface water interface.
East Landfill	B-4AR	IDW, RDW	6/12/1996	Inorganics	Iron	26,740	Restrictive Covenant prevents use of the groundwater as a drinking water source.
East Landfill	B-4AR	GSI, IDW, RDW	6/12/1996	PCBs	Total Aroclors	2.2	Restrictive Covenant prevents use of the groundwater as a drinking water source and monitoring well is not a GSI monitoring point.
East Landfill	B-4AR	GSI	6/29/1999	Inorganics	Cyanide, Total	72	Monitoring well is not located within the groundwater surface water interface.
East Landfill	B-4AR	GSI	6/29/1999	Inorganics-Filtered	Antimony	4.2	Monitoring well is not located within the groundwater surface water interface.
East Landfill	B-4AR	IDW, RDW	6/29/1999	Inorganics-Filtered	Aluminum	310 J	Restrictive Covenant prevents use of the groundwater as a drinking water source.
East Landfill	B-4AR	IDW, RDW	6/29/1999	Inorganics-Filtered	Lead	9.3	Restrictive Covenant prevents use of the groundwater as a drinking water source.
East Landfill	B-4AR	GSI	9/2/1999	Inorganics-Filtered	Cyanide, Total	81	Monitoring well is not located within the groundwater surface water interface.
East Landfill	B-4AR	GSI	9/2/1999	Inorganics-Filtered	Silver	0.51 JM	Monitoring well is not located within the groundwater surface water interface.
East Landfill	B-4AR	GSI, IDW, RDW	9/2/1999	Inorganics-Filtered	Antimony	9.4	Restrictive Covenant prevents use of the groundwater as a drinking water source and monitoring well is not a GSI monitoring point.
East Landfill	B-4BR	IDW, RDW	7/25/1995	Inorganics-Filtered	Aluminum	470	Restrictive Covenant prevents use of the groundwater as a drinking water source.
East Landfill	B-4BR	GSI, IDW, RDW	7/25/1995	PCBs	Total Aroclors	2.46	Restrictive Covenant prevents use of the groundwater as a drinking water source and monitoring well is not a GSI monitoring point.
East Landfill	B-4BR	IDW, RDW	6/5/1996	Inorganics	Iron	18,410	Restrictive Covenant prevents use of the groundwater as a drinking water source.
East Landfill	B-4BR	GSI, IDW, RDW	6/5/1996	PCBs	Total Aroclors	1	Restrictive Covenant prevents use of the groundwater as a drinking water source and monitoring well is not a GSI monitoring point.
East Landfill	B-4BR	GSI	6/5/1996	PCBs-Filtered	Total Aroclors	0.3	Monitoring well is not located within the groundwater surface water interface.

TABLE 2-3
SUMMARY OF SITE GROUNDWATER DATA THAT EXCEEDS GENERIC MDEQ CRITERIA

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

Site Area	Location ID	Generic MDEQ Criteria Exceeded	Samples Collected On:	Parameter Group	Analyte	Detected Concentration (ug/L)	Comments
Green Point Landfill	MW-128S1	GSI, IDW, RDW	6/26/2002	Miscellaneous	Chloride	1,460,000	Monitoring well is not located within the groundwater surface water interface and restrictive covenant prevents the use of groundwater as a drinking water source.
Green Point Landfill	MW-128S1	GSI	6/18/2003	Miscellaneous	Nitrogen, Ammonia	6,900	Monitoring well is not located within the groundwater surface water interface.
Green Point Landfill	MW-128S1	GSI, IDW, RDW	6/18/2003	Miscellaneous	Chloride	1,090,000	Monitoring well is not located within the groundwater surface water interface and restrictive covenant prevents the use of groundwater as a drinking water source.
Green Point Landfill	MW-128S1	GSI	5/25/2004	Miscellaneous	Nitrogen, Ammonia	6,400	Monitoring well is not located within the groundwater surface water interface.
Green Point Landfill	MW-128S1	GSI, IDW, RDW	5/25/2004	Miscellaneous	Chloride	1,220,000	Monitoring well is not located within the groundwater surface water interface and restrictive covenant prevents the use of groundwater as a drinking water source.
Green Point Landfill	MW-128S1	IDW, RDW	6/22/2005	Inorganics-Filtered	Arsenic	14.2	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Green Point Landfill	MW-128S1	IDW, RDW	6/22/2005	Miscellaneous	Chloride	1230000	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Green Point Landfill	MW-128S1	GSI	6/22/2005	Miscellaneous	Estimated Un-ionized Ammonia	403.2 [410.4]	Monitoring well is not located within the groundwater surface water interface.
Green Point Landfill	MW-128S1	GSI, IDW, RDW	6/22/2005	Inorganics-Filtered	Selenium	39.1 [52.3]	Monitoring well is not located within the groundwater surface water interface and restrictive covenant prevents the use of groundwater as a drinking water source.
Green Point Landfill	MW-128S1	IDW, RDW	6/22/2005	Inorganics-Filtered	Sodium	398000	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Green Point Landfill	MW-128S1	GSI, IDW, RDW	6/22/2005	Miscellaneous	TDS	2800000	Monitoring well is not located within the groundwater surface water interface and restrictive covenant prevents the use of groundwater as a drinking water source.
Green Point Landfill	MW-128S1	IDW, RDW	12/12/2006	Miscellaneous	Chloride	1250000	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Green Point Landfill	MW-128S1	GSI	12/12/2006	Miscellaneous	Estimated Un-ionized Ammonia	360	Monitoring well is not located within the groundwater surface water interface.
Green Point Landfill	MW-128S1	IDW, RDW	12/12/2006	Inorganics-Filtered	Sodium	423000	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Green Point Landfill	MW-128S1	GSI, IDW, RDW	12/12/2006	Miscellaneous	TDS	3700000	Monitoring well is not located within the groundwater surface water interface and restrictive covenant prevents the use of groundwater as a drinking water source.
Green Point Landfill	MW-128S1	IDW, RDW	12/5/2007	Inorganics-Filtered	Arsenic	11.1	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Green Point Landfill	MW-128S1	IDW, RDW	12/5/2007	Miscellaneous	Chloride	1300000	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Green Point Landfill	MW-128S1	GSI	12/5/2007	Miscellaneous	Estimated Un-ionized Ammonia	237.6	Monitoring well is not located within the groundwater surface water interface.

Green Point Landfill	X-6B	GSI	9/26/1995	Semivolatiles	Fluoranthene	27	Monitoring well is not located within the groundwater surface water interface.
Green Point Landfill	X-6B	GSI	9/26/1995	Semivolatiles	Naphthalene	54	Monitoring well is not located within the groundwater surface water interface.
Green Point Landfill	X-6B	GSI	9/26/1995	Semivolatiles	Phenanthrene	38	Monitoring well is not located within the groundwater surface water interface.
Green Point Landfill	X-6B	GSI, IDW, RDW, WS	9/26/1995	Semivolatiles	Chrysene	9.4 J	Located at 75 ft, under landfill cap p 4-17; addressed by site specific clean up (HHE Section 6-17).
Green Point Landfill	X-6B	RDW	9/26/1995	Semivolatiles	Benzo(a)anthracene	7.9 J	Restrictive Covenant prevents use of the groundwater as a drinking water source.
Green Point Landfill	X-7A	GSI	6/20/1995	Inorganics	Cyanide, Total	8.7	Monitoring well is not located within the groundwater surface water interface.
Green Point Landfill	X-7A	GSI, IDW, RDW	6/20/1995	Inorganics-Filtered	Antimony	7.9	Monitoring well is not located within the groundwater surface water interface and restrictive covenant prevents the use of groundwater as a drinking water source.
Green Point Landfill	X-7A	IDW, RDW	6/20/1995	Inorganics-Filtered	Iron	29,500	Restrictive Covenant prevents use of the groundwater as a drinking water source and monitoring well is not a GSI monitoring point.
Green Point Landfill	X-7A	GSI, IDW, RDW	6/20/1995	Inorganics-Filtered	Nickel	147	Monitoring well is not located within the groundwater surface water interface and restrictive covenant prevents the use of groundwater as a drinking water source.
Green Point Landfill	X-7A	GSI	6/20/1995	Semivolatiles	Naphthalene	51	Monitoring well is not located within the groundwater surface water interface.
Green Point Landfill	X-7A	GSI	6/20/1995	Semivolatiles	Phenanthrene	4.6J	Monitoring well is not located within the groundwater surface water interface.
Green Point Landfill	X-7A	GSI, IDW, RDW	6/20/1995	Volatiles	Benzene	820	Monitoring well is not located within the groundwater surface water interface and restrictive covenant prevents the use of groundwater as a drinking water source.
Green Point Landfill	X-7A	GSI	6/20/1995	Volatiles	Ethylbenzene	40	Monitoring well is not located within the groundwater surface water interface.
Green Point Landfill	X-7A	GSI	6/20/1995	Volatiles	Xylenes, Total	56J	Monitoring well is not located within the groundwater surface water interface.
Green Point Landfill	X-7A	IDW, RDW	6/12/1996	Inorganics	Iron	73,350	Restrictive Covenant prevents use of the groundwater as a drinking water source and monitoring well is not a GSI monitoring point.

RI = Remedial Investigation Report, BBL 2001.
HHE = Human Health Evaluation, BBL 2001.
RDW = Residential Drinking Water criteria, updated January 2006.
IDW = Industrial Drinking Water criteria, updated January 2006.
GAI = Groundwater Acute Inhalation Screening Level, updated January 2006.
GSI = Groundwater/Surface Water Interaction criteria, updated January 2006.
GCC = Groundwater Contact criteria, updated January 2006.
RGVIA = Residential & Commercial I Groundwater Volatilization to Indoor Air Inhalation criteria, updated January 2006.
IGVIA = Industrial & Commercial II, III, & IV Groundwater Volatilization to Indoor Air Inhalation criteria, updated January 2006
WS = Water Solubility, updated January 2006.
J = The compound/constituent was positively identified; however, the associated numerical value is an estimated concentration only.
B = (Organic) The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
(Inorganic) The analyte has been positively identified. The concentration is between the instrument detection limit and the required reporting limit.
D = Concentration is based on a diluted sample analysis.

TABLE 2-20
GENERIC TABLE NOTES

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

General Notes:

Soil concentrations are presented in milligrams per kilogram (mg/kg).
Duplicate results are presented in brackets.
Total Xylenes reported as the sum of m&p-Xylene and o-Xylene.
Excavated samples results are shaded.

Data Qualifiers:

B = (Organic) The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect. (Inorganic) The analyte has been positively identified. The concentration is between the instrument detection limit and the required reporting limit.
D = Concentration is based on a diluted sample analysis.
E = The compound was quantitated above the calibration range.
J = The compound/constituent was positively identified; however, the associated numerical value is an estimated concentration only.
NA = Not analyzed for this constituent.
R = Result rejected.
U = The compound/constituent was analyzed for but not detected. The associated value is the compound/constituent quantitation limit.
UJ = The compound/constituent was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
* = Duplicate analysis not within control limits.
£ = Serial dilution of a digestive in the analytical batch indicates that physical and chemical interferences are present.
G = Elevated reporting limit. The reporting limit is elevated due to matrix interference.
GWa = Elevated reporting limit; the reporting limit is elevated due to matrix interference. Post digestion spike recovery fell between 40-85% due to matrix interference.
N = Tentative identification. Consider present. Specific methods may be needed to confirm its presences or absence in future sampling efforts.

NOTES:

1. THIS PHOTOGRAMMETRIC BASE MAP FOR THE GM SAGINAW MALLEABLE IRON PLANT AND DELPHI SAGINAW STEERING SYSTEMS PLANT 2 PROPERTIES WAS PREPARED BY LOCKWOOD MAPPING, INC. OF ROCHESTER, NEW YORK. AERIAL PHOTOGRAPHY WAS CONDUCTED ON 11/11/94. ORIGINAL LOCKWOOD MAP WAS AT A SCALE OF 1"=100' AND WAS INTERPRETED FOR TWO-FOOT CONTOURS.
2. BASE MAP HAS BEEN MODIFIED TO INCORPORATE BUFFER BASIN, SEDIMENTATION BASINS, WETLANDS MITIGATION AREA, AND GREEN POINT LANDFILL (GPL) FINAL COVER FROM THE FINAL ENGINEERING DESIGN REPORT PREPARED BY BBL FOR THE GPL, DATED JANUARY 1998.
3. VERTICAL DATUM REFERENCED TO NGVD OF 1929, HORIZONTAL DATUM REFERENCED TO MICHIGAN SPC-NAD 1983.
4. PROPERTY BOUNDARY FOR REALM, INC, DIGITIZED FROM SPICER GROUP DRAWING NO. A-21854-1, DATED 3/27/98.
5. BASE MAP INFORMATION SOUTH OF MAIN REALM, INC. PROPERTY LINE FROM AIR-LAND SURVEYS, INC. PHOTO DATE 11/90, MAPPING DATE 10/91.

- GM SAGINAW MALLEABLE IRON PLANT PROPERTY LINE (APPROX.)
- REALM, INC PROPERTY LINE (APPROX.)
- APPROXIMATE LIMITS OF SITE AREA SUBJECT TO AREA-SPECIFIC REMEDIAL ACTION
- INDUSTRIAL ZONING AREA (GENERAL)
- INDUSTRIAL ZONING AREA (LIGHT)
- **R-1** RESIDENTIAL (1) FAMILY
- **R-2** RESIDENTIAL (2) FAMILY
- **RO-1** RESTRICTED OFFICE
- **R-1A** RESIDENTIAL/AGRICULTURAL

NOTES:

1. THIS PHOTOGRAMMETRIC BASE MAP FOR THE GM SAGINAW MALLEABLE IRON PLANT AND DELPHI SAGINAW STEERING SYSTEMS PLANT 2 PROPERTIES WAS PREPARED BY LOCKWOOD MAPPING, INC. OF ROCHESTER, NEW YORK. AERIAL PHOTOGRAPHY WAS CONDUCTED ON 11/11/94. ORIGINAL LOCKWOOD MAP WAS AT A SCALE OF 1"=100' AND WAS INTERPRETED FOR TWO-FOOT CONTOURS.
2. VERTICAL DATUM REFERENCED TO NGVD OF 1929, HORIZONTAL DATUM REFERENCED TO MICHIGAN SPC-NAD 1983.
3. BASE MAP HAS BEEN MODIFIED TO INCORPORATE BUFFER BASIN, SEDIMENTATION BASINS, AND GREEN POINT LANDFILL (GPL) FINAL COVER FROM THE FINAL ENGINEERING DESIGN REPORT PREPARED BY BBL FOR THE GPL, DATED JANUARY 1998.
4. PROPERTY BOUNDARY FOR REALM, INC, DIGITIZED FROM SPICER GROUP DRAWING NO. A-21854-1, DATED 3/27/98.
5. BASE MAP INFORMATION SOUTH OF MAIN REALM, INC. PROPERTY LINE FROM AIR-LAND SURVEYS, INC. PHOTO DATE 11/90, MAPPING DATE 10/91.
6. ZONING AREAS ARE BASED ON THE 2002 CITY OF SAGINAW, MICHIGAN ZONING MAP OBTAINED FROM THE CITY OF SAGINAW IN AUGUST 2003.

TABLE A-1
SUMMARY OF GROUNDWATER SAMPLE ANALYTICAL RESULTS
ORGANIC COMPOUNDS

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

Sample ID: Sample Depth (feet): Date Collected:	Units	Previously Proposed Type III Landfill Area MW-3B 23 - 28 07/27/95	Previously Proposed Type III Landfill Area MW-119S1 24 - 29 07/17/95	Previously Proposed Type III Landfill Area MW-119S2 36.5 - 41.5 07/17/95	Previously Proposed Type III Landfill Area MW-119WT 2 - 12 07/17/95
Volatile Organics (Cont'd.)					
Chloroethane	ug/L	1.0 U	1.0 UJ	1.0 UJ	1.0 UJ
Chloroform	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
Chloromethane	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
cis-1,2-Dichloroethene	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
cis-1,3-Dichloropropene	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
Cyclohexane	ug/L	NA	NA	NA	NA
Dibromochloromethane	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
Dibromomethane	ug/L	NA	NA	NA	NA
Dichlorodifluoromethane	ug/L	NA	NA	NA	NA
Ethyl Methacrylate	ug/L	NA	NA	NA	NA
Ethylbenzene	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
Hexachlorobutadiene	ug/L	NA	NA	NA	NA
Iodomethane	ug/L	NA	NA	NA	NA
Isobutanol	ug/L	NA	NA	NA	NA
Isopropylbenzene	ug/L	NA	NA	NA	NA
m&p-Xylene	ug/L	NA	NA	NA	NA
Methacrylonitrile	ug/L	NA	NA	NA	NA
Methyl acetate	ug/L	NA	NA	NA	NA
Methyl cyclohexane	ug/L	NA	NA	NA	NA
Methyl Methacrylate	ug/L	NA	NA	NA	NA
Methyl tert-butyl ether	ug/L	NA	NA	NA	NA
Methylene Chloride	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
Naphthalene	ug/L	NA	NA	NA	NA
n-Butylbenzene	ug/L	NA	NA	NA	NA
n-Propylbenzene	ug/L	NA	NA	NA	NA
o-Xylene	ug/L	NA	NA	NA	NA
p-Isopropyltoluene	ug/L	NA	NA	NA	NA
Propionitrile	ug/L	NA	NA	NA	NA
sec-Butylbenzene	ug/L	NA	NA	NA	NA
Styrene	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
tert-Butylbenzene	ug/L	NA	NA	NA	NA
Tetrachloroethene	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
Toluene	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
trans-1,2-Dichloroethene	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
trans-1,3-Dichloropropene	ug/L	1.0 UJ	1.0 U	1.0 U	1.0 U
trans-1,4-Dichloro-2-butene	ug/L	NA	NA	NA	NA
Trichloroethene	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
Trichlorofluoromethane	ug/L	NA	NA	NA	NA
Vinyl Acetate	ug/L	NA	NA	NA	NA
Vinyl Chloride	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
Total 1,3-Dichloropropenes	ug/L	1.0 U	1.0 U	1.0 U	1.0 U
Total Xylenes	ug/L	3.0 U	3.0 U	3.0 U	3.0 U
