GENERIC NOTES

GENERAL MOTORS CORPORATION
SAGINAW MALLEABLE IRON PLANT
SAGINAW, MICHIGAN

General Notes:

All concentrations in micrograms per liter (ug/L) or milligrams per kilogram (mg/kg), unless otherwise noted.
Concentrations above criteria are shaded.
NA = Sample was not analyzed for the listed constituent.
Generic MDEQ Criteria Values, updated January 2006:
- IIA = Industrial & Commercial II, III, & IV Groundwater Volatilization to Indoor Air Inhalation Criteria.
- GCC = Groundwater Contact Criteria.
- GAI = Acute Inhalation Screening Levels.
- ISVIA = Soil Volatilization to Indoor Air Inhalation Criteria.
- VSIC = Infinite Source Volatile Soil Inhalation Criteria.
- IPSIC = Particulate Soil Inhalation Criteria.
- IDC = Industrial and Commercial II Direct Contact Criteria.
- WS = Water Solubility

Location ID:
- MW = Permanent monitoring wells
- TW = Temporary monitoring wells
- WT = Water table monitoring wells.

Sample Type:
- FS = Primary field sample.
- DUP = Duplicate field sample.

* Total criteria was used for cis-1-3-Dichloropropene and trans-1-3-Dichloropropene and for m&p xylene and o-xylene.

Data Qualifiers:

B = (Organic) The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect. (Inorganic) The analyte has been positively identified. The concentration is between the instrument detection limit and the required reporting limit.
D = Concentration is based on a diluted sample analysis.
E = The compound was quantitated above the calibration range.
J = The compound/constituent was positively identified; however, the associated numerical value is an estimated concentration only.
M = Matrix interference.
ND = Not detected.
U = The compound/constituent was analyzed for but not detected. The associated value is the compound/constituent quantitation limit.
UJ = The compound/constituent was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
R = The sample results are rejected due to deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.
< = The compound/constituent was not detected at or above the associated value.

MDEQ Criteria Qualifiers:

{A} Criterion is the state of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399, MCL 325.1005.
{B} Background, as defined in R 299.5701(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.
{C} Value presented is a screening level based on the chemical-specific generic soil saturation concentration (C_{sat}) since the calculated risk-based criterion is greater than Csat. Concentrations greater than Csat are acceptable cleanup criteria for this pathway where a site-specific demonstration indicates that free-phase material containing a hazardous substance is not present.
{D} Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).
{E} Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA). A notice of aesthetic impact may be employed as an institutional control mechanism if groundwater concentrations exceed the aesthetic drinking water criterion, but do not exceed the applicable health-based drinking water value provided in the following table:

Hazardous Substance	CAS #	Residential Health-Based DWC	Industrial-Commercial Health-Based DWC
Aluminum	7429905	300	4,100
tertiary Amyl methyl ether	994058	910	2,600
Copper	7440508	1,400	4,000
Diethyl ether	60297	3,700	10,000
Ethylbenzene	100414	700	700
Iron	7439896	2,000	5,600
Manganese	7439965	860	2,500
Methyl-tert-butyl ether (MTBE)	1634044	240	690
Toluene	108883	1,000	1,000
1,2,4-Trimethylbenzene	95636	1,000	2,900
1,3,5-Trimethylbenzene	108678	1,000	2,900
Xylenes	1330207	10,000	10,000

{F} Criterion is based on adverse impacts to plant life and phytotoxicity.
{G} Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg CaCO3/L, use 400 mg CaCO3/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb. The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote.

GENERIC NOTES

GENERAL MOTORS CORPORATION
SAGINAW MALLEABLE IRON PLANT
SAGINAW, MICHIGAN

MDEQ Criteria Qualifiers (Cont'd.):

Hazardous Substance	FCV Formula ug/L	FCV Conversion Factor (CF)	WV ug/L	HNDV ug/L
Acetate	EXP(0.2732*(pH) + 7.0362)	NA	NA	1.30E+06
Barium [X]	EXP(1.0629*(LnH)+1.1869)	NA	NA	1.60E+05
Beryllium	EXP(2.5279*(LnH)-10.7689)	NA	NA	1,200
Cadmium [X]	(EXP(0.7852*(LnH)-2.715))*CF	1.101672-((LnH)*(0.041838))	NA	130
Chromium (III) [X]	(EXP(0.819*(LnH)+0.6848))*CF	0.86	NA	9,400
Copper	(EXP(0.8545*(LnH)-1.702)) *CF	0.96	NA	64,000
Lead [X]	(EXP(1.273*(LnH)-3.296))*CF	1.46203-((LnH)*(0.14571))	NA	190
Manganese	EXP(0.8784*(LnH)+3.5199)	NA	NA	59,000
Nickel	(EXP(0.846*(LnH)+0.0584))*CF	0.997	NA	2.10E+05
Pentachlorophenol	EXP(1.005*(pH)-5.134)	NA	NA	2.8
Zinc	(EXP(0.8473*(LnH)+0.884))*CF	0.986	NA	22,000

Where,

EXP(x) = The base of the natural logarithm raised to power x (e^x).
LnH = The natural logarithm of water hardness in mg $CaCO_3$/L.
* = The multiplication symbol.
[X] = The GSI criterion developed here may not be protective for surface water that is used as a drinking water source. Refer to footnote (X) for further guidance.

A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environmental Quality (DEQ) internet web site.

{H} Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

{I} Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the DEQ, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of $45, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the DEQ, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

{J} Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

{K} Hazardous substance may be flammable or explosive, or both.

{L} Criteria for lead are derived using a biologically based model, as allowed for under Section 20120a(10) of the NREPA, and are not calculated using the algorithms and assumptions specified in pathway-specific rules. The generic residential drinking water criterion of 4 ug/L is linked to the generic residential soil direct contact criterion of 400 mg/kg. A higher concentration in the drinking water, up to the state action level of 15 ug/L, may be allowed as a site-specific remedy and still allow for drinking water use, under Section 20120a(2) of the NREPA if soil concentrations are appropriately lower than 400 mg/kg. If a site-specific criterion is approved based on this subdivision, a notice shall be filed on the deed for all property where the groundwater concentrations will exceed 4 ug/L to provide notice of the potential for unacceptable risk if soil or groundwater concentrations increase. Acceptable combinations of site-specific soil and drinking water concentrations are presented in the following table:

Drinking Water Concentration (ug/L)	Soil Concentration (mg/kg)
5	386-395
6	376-385
7	376-385
8	366-375
9	356-365
10	346-355
11	336-345
12	336-345
13	326-335
14	316-325
15	306-315

{M} Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

{N} The concentrations of all potential sources of nitrate-nitrogen (e.g., ammonia-N, nitrite-N, nitrate-N) in groundwater that is used as a source of drinking water shall not, when added together, exceed the nitrate drinking water criterion of 10,000 ug/L. Where leaching to groundwater is a relevant pathway, soil concentrations of all potential sources of nitrate-nitrogen shall not, when added together, exceed the nitrate drinking water protection criterion of 2.0E+5 ug/kg.

{O} The concentration of all polychlorinated and polybrominated dibenzodioxin and dibenzofuran isomers present at a facility, expressed as an equivalent concentration of 2,3,7,8-tetrachlorodibenzo-p-dioxin based upon their relative potency, shall be added together and compared to the criteria for 2,3,7,8-tetrachlorodibenzo-p-dioxin. The generic cleanup criteria for 2,3,7,8-tetrachlorodibenzo-p-dioxin are not calculated according to the algorithms presented in R 299.5714 to R 299.5726. The generic cleanup criteria are being held at the values that the DEQ has used since August 1998, in recognition of the fact that national efforts to reassess risks posed by dioxin are not yet complete. Until these studies are complete, it is premature to select a revised slope factor and/or reference dose for calculation of generic cleanup criteria.

{P} Amenable cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with all groundwater criteria. Total cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with soil criteria. Industrial-commercial direct contact criteria may not be protective of the potential for release of hydrogen cyanide gas. Additional land or resource use restrictions may be necessary to protect for the acute inhalation concerns associated with hydrogen cyanide gas.

{Q} Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

{R} Hazardous substance may exhibit the characteristic of reactivity as defined in 40 C.F.R. §261.23 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the DEQ, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of $45, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the DEQ, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost.

{S} Criterion defaults to the hazardous substance-specific water solubility limit.

{T} Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the DEQ, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of $55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the DEQ, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the following table if TSCA standards are not applicable.

GENERIC NOTES

GENERAL MOTORS CORPORATION
SAGINAW MALLEABLE IRON PLANT
SAGINAW, MICHIGAN

MDEQ Criteria Qualifiers (Cont'd.):

Land Use Category	TSCA, Subpart D Cleanup Standards	Part 201 Soil Direct Contact Cleanup Criteria
Residential & Commercial I	1,000 ppb, or 10,000 ppb if capped	4,000 ppb
Industrial & Commercial II	1,000 ppb, or 10,000 ppb if capped	16,000 ppb
Commercial III	1,000 ppb, or 10,000 ppb if capped	33,000 ppb
Commercial IV	1,000 ppb, or 10,000 ppb if capped	22,000 ppb

{U} Hazardous substance may exhibit the characteristic of corrosivity as defined in 40 C.F.R. §261.22 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the DEQ, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of $45, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the DEQ, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost.

{V} Criterion is the aesthetic drinking water value as required by Section 20120(a)(5) of the NREPA. Concentrations up to 200 ug/L may be acceptable, and still allow for drinking water use, as part of a site-specific cleanup under Section 20120a(2) of the NREPA.

{W} Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan drinking water standard of 80 ug/L. Concentrations of trihalomethanes in soil shall be added together to determine compliance with the drinking water protection criterion of 1,600 ug/kg.

{X} The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. For a groundwater discharge to the Great Lakes and their connecting waters or discharge in close proximity to a water supply intake in inland surface waters, the generic GSI criterion shall be the surface water human drinking water value (HDV) listed in the table in this footnote, except for those HDV indicated with an asterisk. For HDV with an asterisk, the generic GSI criterion shall be the lowest of the HDV, the WV, and the calculated FCV. See formulas in footnote (G). Soil protection criteria based on the HDV shall be as listed in the table in this footnote, except for those values with an asterisk. Soil GSI protection criteria based on the HDV shall be as listed in the table in this footnote, except for those values with an asterisk. Soil GSI protection criteria for compounds with an asterisk shall be the greater of 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote.

Hazardous Substance	Chemical Abstract Service Number	Surface Water Human Drinking Water Values (HDV) (ug/L)	Soil GSI Protection Criteria for HDV (ug/kg)

2 acre	0.77
5 acre	0.66
10 acre	0.6
32 acre	0.5
100 acre	0.43

{Z} Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

{AA} Comparison to these criteria may take into account an evaluation of whether the hazardous substances are adsorbed to particulates rather than dissolved in water and whether filtered groundwater samples were used to evaluate groundwater.

{BB} The state drinking water standard for asbestos is in units of fibers per milliliter of water (f/mL) longer than 10 millimicrons. Soil concentrations of asbestos are determined by polarized light microscopy.

{CC} Groundwater: The generic GSI criteria are based on the toxicity of unionized ammonia (NH3); the criteria are 29 ug/L and 53 ug/L for cold water and warm water surface water, respectively. As a result, the GSI criterion shall be compared to the percent of the total ammonia concentration in the groundwater that will become NH3 in the surface water. This percent NH3 is a function of the pH and temperature of the receiving surface water and can be estimated using the following table, taken from Emerson, et al., (Journal of the Fisheries Research Board of Canada, Volume 32(12):2382, 1975).

Percent NH_3 in Aqueous Ammonia Solutions for 0-30 ^oC and pH 6-10

The generic approach for estimating NH3 assumes a default pH of 8 and default temperatures of 68 F and 85 F for cold water and warm water surface water, respectively. The resulting percent NH3 is 3.8 percent and 7.2 percent for cold water and warm water, respectively. This default percentage shall be multiplied by the total ammonia-nitrogen (NH3-N) concentration in the groundwater and the resulting NH3 concentration compared to the applicable GSI criterion. As an alternative, the maximum pH and temperature data from the specific receiving surface water can be used to estimate, from the table in this footnote, a lower percent unionized ammonia concentration for comparison to the generic GSI.

MDEQ Criteria Qualifiers (Cont'd.):

Soil: The generic soil GSI protection criteria for unionized ammonia are 580 ug/kg and 1,100 ug/kg for cold water and warm water surface water, respectively.

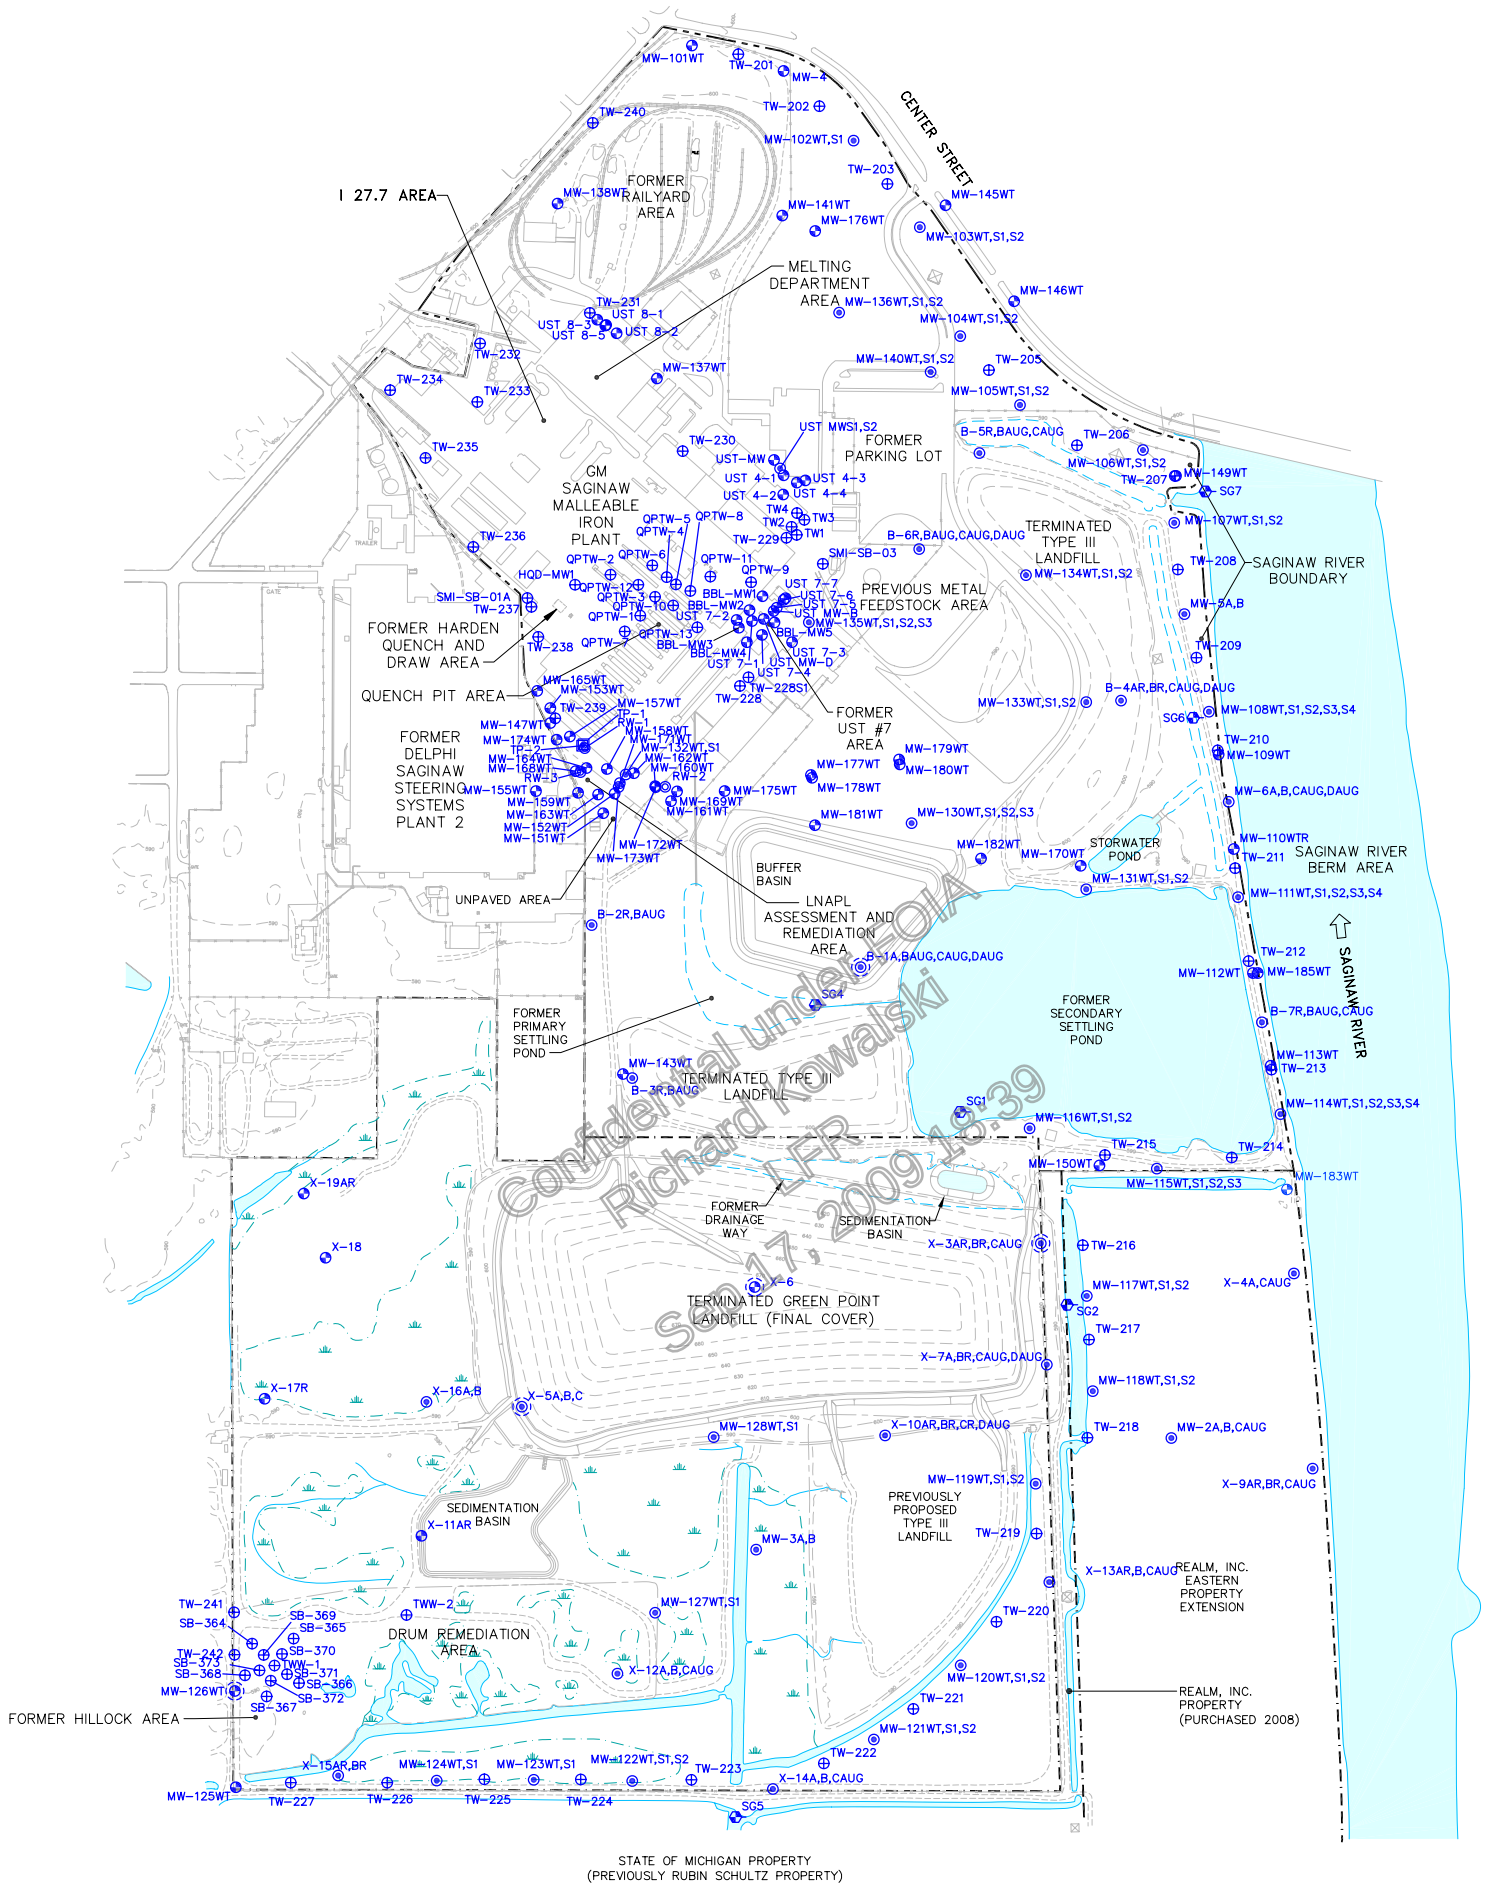
{DD} Hazardous substance causes developmental effects. Residential and commercial I direct contact criteria are protective of both prenatal and postnatal exposure. Industrial and commercial II, III and IV direct contact criteria are protective for a pregnant adult receptor.

{EE} The following are applicable generic GSI criteria as required by Section 20120a(15) of the NREPA.

Hazardous Substance	GSI (ug/L)	Notes
Phosphorus	1,000	Criteria applicable unless receiving water is a surface water that has a phosphorus waste load allocation or is an inland lake. In those cases, contact the department for applicable values.
Total dissolved solids (TDS)	5.00E+05	If TDS data are not available, the TDS criterion may be used a screening level for the sum of the concentrations of the following substances: Calcium, Chlorides, Iron, Magnesium, Potassium, Sodium, Sulfate.
Dissolved Oxygen (DO): Cold receiving waters Warm receiving waters	 ≥ 7,000 ≥ 5,000	Since a low level of DO can be harmful to aquatic life, the criterion represents a minimum level that on-site samples must exceed. This is in contrast to other criteria which represent "not to exceed" concentrations. DO criteria are not applicable if groundwater Carbonaceous Biochemical Oxygen Demand (CBOD) is less than 10,000 ug/L and groundwater ammonia concentration is less than 2,000 ug/L.

{FF} The chloride GSI criterion shall be 125 mg/l when the discharge is to surface waters of the state designated as public water supply sources or 50 mg/l when the discharge is to the Great Lakes or connecting waters. Chloride GSI criteria shall not apply for surface waters of the state that are not designated as a public water supply source, however, the total dissolved solids criterion is applicable.

{GG} Risk-based criteria are not available for methane due to insufficient toxicity data. An acceptable soil gas concentration (presented for both residential and commercial/industrial land uses) was derived utilizing 25 percent of the lower explosive level for methane. This equates to 1.25 percent or 8.4E+6 ug/m3.



ID = Insufficient data to develop criterion.
NA = A criterion or value is not available or, in the case of background and CAS numbers, not applicable.
NLL = Hazardous substance is not likely to leach under most soil conditions.
NLV = Hazardous substance is not likely to volatilize under most conditions.

1. Introduction

This *Human Health Evaluation Report Addendum* (HHE Addendum) has been prepared on behalf of the General Motors Corporation (GM), its subsidiary, the Remediation and Liability Management Company, Inc. (REALM, Inc.), and Waste Management, Inc. (WMI) for the GM Saginaw Malleable Iron (SMI) Plant Property, and REALM Green Point Landfill and Drum Remediation Area Property, located in Saginaw, Michigan. This HHE addendum supplements the *Human Health Evaluation Report* (BBL, 2003) that was presented as Appendix A of the *Feasibility Study Report* (BBL, 2003). The Feasibility Study (FS) was approved by the Michigan Department of Environmental Quality (MDEQ) in a letter dated November 18, 2003 (Brouillet, B., 2003).

The purpose of this HHE addendum is to incorporate consideration of new Site data, updated cleanup criteria and additional information requested by the MDEQ. Additional data has been collected in the Railyard Area, the Previous Metal Feedstock Area and the Saginaw River Berm Area. In addition, new data is available for areas that were not previously evaluated, including the area between the Previous Metal Feedstock Storage Area and the Buffer Basin (BH-9 and BH-10), the Primary Settling Pond (BH-7 and BH-8) and the Eastern Property Extension (BH-1 through BH-6).

The HHE presented in this addendum was conducted consistent with Michigan law, administrative rules and state and federal guidance:

- MDEQ Part 201 of the Natural Resources and Environmental Protection Act (NREPA), 1994 PA 451, as amended, and associated Administrative Rules (Part 201 Rules);
- MDEQ Remediation and Redevelopment Division (RRD) Operational Memorandum no. 1 (Op Memo 1): Part 201 Generic Cleanup Criteria and Screening Levels: Part 213 Risk-Based Screening Levels (MDEQ, 2004);
- Risk Assessment Guidance for Superfund (RAGS), Volume I Human Health Evaluation Manual, Part A (USEPA, 1989); and
- Exposure Factors Handbook (USEPA, 1997).

The methodology adopted for this HHE addendum is consistent with the procedures outlined in MDEQ Op Memo 1 and the approach adapted in the original HHE (BBL, 2003). In practice, the methodology is a tiered approach, which starts with a relatively simple analysis and moves to more sophisticated analyses as dictated by initial results.

The chemical constituent concentrations detected at the site were compared to relevant MDEQ generic cleanup criteria. MDEQ generic cleanup criteria are based upon the current or proposed land use. The MDEQ remedial action types appropriate for this HHE are: *Generic Remedial Actions, Facility-Specific Generic Remedial Actions*, and *Site-specific Remedial Actions*. The first category of cleanup criteria utilized in the MDEQ process is the *Generic Cleanup Criteria*. These criteria are based on generic exposure assumptions that are representative of or exceed the expected exposures for potential receptors. The second category of MDEQ cleanup criteria is the *Facility-Specific Generic Cleanup Criteria* where the generic criteria have been modified based upon facility specific characteristics of the property that are not expected to change. This second category is actually a refined subset of the *Generic Cleanup Criteria*. The third category of MDEQ cleanup criteria is the

Richard Kowalski
LFR
Sep 17, 2009 18:39

Site-Specific Cleanup Criteria. *Site-Specific Cleanup Criteria* are based on alternative exposure assumptions unique to the facility that is the focus of the evaluation.

MDEQ cleanup criteria are based on an excess lifetime cancer risk of 1×10^{-5} (1 in 100,000) or a hazard quotient (HQ) of 1. *MDEQ Generic Cleanup Criteria* were developed by rearranging a typical forward risk assessment equation to determine the chemical concentration that would result in this risk value. This method is presented in the following equations.

Risk = *Chemical Concentration x Exposure x Toxicity*

By rearranging the above risk equation, the following equation is used to determine the chemical concentration that would result from applying the desired MDEQ risk value of 1×10^{-5} or HQ of 1.

Chemical Concentration = Risk ÷ (*Exposure x Toxicity)*

Development of *Facility-Specific Generic Cleanup Criteria* and *Site-Specific Cleanup Criteria* follow this same procedure. The only difference is that *Facility-Specific Generic Cleanup Criteria* (FSGCC) are modified based upon site-specific physical characteristics that are not expected to change, and *Site-Specific Cleanup Criteria* are modified based on site-specific exposure assumptions (MDEQ, 2004).

Sep 17, 2009 18:39

This HHE Addendum follows the same approach presented in Figure 2 of the HHE (BBL, 2003). As a first step, in this HHE Addendum, a preliminary site exposure conceptual model (ECSM) was developed for the site. All the chemical constituents detected at the GM SMI Plant were then compared to the most recent MDEQ *Generic Cleanup Criteria*. This comparison is meant to eliminate from further consideration all chemicals which, because of either low concentrations, low frequency of detection, or low exposure potential, are not expected to represent significant human health risks. Comparison of the chemical constituents to MDEQ *Generic Cleanup Criteria* was discussed originally in Section 4 of the HHE and presented in Tables 4-2 through 4-6 of that report (BBL 2003). The updated comparisons, including new data collected since the original HHE was prepared are briefly discussed in Section 2 of this Addendum and presented in Attachment I, Tables I-1 through I-3 of this Addendum. Following this step, any chemical constituents found to have concentrations in excess of the MDEQ Generic Cleanup Criteria or that were lacking criteria were carried through for a more thorough analysis. A summary of the constituents exceeding the generic MDEQ criteria is shown in Table I-4 of in Attachment I of this Addendum. Site data were organized by area, shown on Figure 1-2 of the Remedial Action Plan (RAP) and the 95% upper confidence limit (UCL) of the arithmetic mean was calculated where appropriate (detailed discussion of the 95% UCL calculation is included in Attachment II of this HHE Addendum). The 95% UCL is considered to be a conservative estimate of the true arithmetic mean and an acceptable value to use to evaluate chemical exposures (MDEQ, 2004). Merely exceeding these generic cleanup values does not imply that the concentrations found at the GM SMI Plant represent a significant health risk, only that additional analysis was required.

Complying with MDEQ guidance (Op Memo 1), chemical constituents remaining after comparison to *Generic Cleanup Criteria* were compared to *Facility-Specific Generic Cleanup Criteria* (FSGCC). FSGCC are based on site-specific physical characteristics that are not expected to change, such as groundwater characteristics (MDEQ, 2004). A detailed discussion of this step is included in Section 5 of the original HHE (BBL, 2003) and chemical constituents that exceed the FSGCC are provided in Tables 5-1 and 5-2 of that report. Comparisons to the FSGCC are provided in Tables I-5 through I-7 in Attachment I of this Addendum.

In accordance with MDEQ guidance (Op Memo 1), *Site-Specific Cleanup Criteria* (SSCC) were developed for those chemical constituents remaining after comparison to the FSGCC. The purpose of this subsequent analysis

Confidential under FOIA
Richard Kowalski

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

was to provide risk-based criteria that are more reflective of current and reasonably anticipated future conditions at this facility. The development of the SSCC requires certain modifications to the exposure assumptions and default variables used to derive the MDEQ *Generic Cleanup Criteria*. The specific modifications and the scientific justification for these alternative values are described in Section 6 of the original HHE (BBL, 2003).

The product of the revised algorithms provides the basis of the SSCC comparison. During the SSCC evaluation, the preliminary site ECSM was revised to specifically address site conditions. The revised ECSM was developed to identify potential or suspected sources of chemicals and affected media, potentially exposed populations, and potential exposure pathways. The SSCC are only developed for those constituents that have concentrations exceeding MDEQ Generic Cleanup Criteria and FSGCC. The development of the SSCC is presented in Section 6 of the original HHE document (BBL, 2003). Once the SSCC are developed for those constituents exceeding the MDEQ *Generic Cleanup Criteria* or *Facility-Specific Generic Cleanup Criteria*, the site data are compared to these site-specific criteria. Constituents exceeding SSCCs in this Addendum are being addressed by placing restrictive covenants on specific areas of the property. The results of the SSCC evaluation are presented in Section 4.

2. Comparison to Generic Cleanup Criteria and Screening Levels

The first step in this process is selecting the appropriate land use criteria. The GM SMI Plant facility has been used for industrial purposes for decades. Consistent with the HHE, since GM/REALM intends to restrict use of the property for industrial use in the future, the "generic and limited Industrial and Commercial II category was deemed appropriate for the HHE and this HHE Addendum. In order to allow for a wider range of potential future uses of the site (in the event of a zoning change), analytical data was also compared to the Commercial III and Commercial IV Direct Contact Criteria.

2.1 Summary of Analytical Data

The analytical data used for this HHE Addendum were collected during sampling events conducted throughout the remedial investigation (RI) (BBL, 2001) and interim measurement activities from 1995 to present. Additional data have been collected since the HHE was submitted in 2003. All data are summarized in Appendix A of the RAP, Tables A-1 through A-4. Data were compared to the current *Generic Cleanup Criteria* in Attachment I Tables I-1 through I-3 of this HHE Addendum. Attachment I Table I-4 lists the constituents that exceeded *Generic Cleanup Criteria* as constituents of potential concern (COPCs). Any exceedances were reviewed and it was determined if the area had been adequately characterized and addressed in the original HHE. The data that were determined not to be adequately addressed in the HHE are addressed in this Addendum. The site ECSM used in the HHE was determined to be appropriate for use in this addendum. Due to remedial activities conducted in various areas of the facility, subsequent confirmatory sampling may have been conducted. Samples from areas where soil has been removed were eliminated from the data set used to evaluate site conditions. Removed samples are listed in Table I-8 of Attachment I. These subsequent results were generally lower than the original results, and were used for comparison to the generic criteria, given the fact that they are reflective of current site conditions.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

The 95% UCL of the arithmetic mean was calculated and used where appropriate to represent levels in the soil (exposure point concentrations). In accordance with MDEQ guidance, the 95% UCL of the arithmetic mean can be used to determine compliance with the generic criteria for select pathways provided the 95% UCL reasonably represents the areas over which exposures are expected to occur. The 95% UCL was calculated for each chemical detected within each area of concern (AOC) provided the data sets were sufficiently robust to adopt this statistical approach. AOCs are depicted on Figure 1-2 of the RAP. Data sets used to evaluate these areas are provided in Attachment II.

The 95% UCLs were compared to the MDEQ criteria except in data sets where the 95% UCL exceeded the maximum concentration. Where this occurred, the maximum detected concentration was used as a conservative exposure point concentration (USEPA, 1992). A detailed explanation of the derivation of the 95% UCL values is provided in Attachment II.

2.2 Exposure Pathway Analysis

The evaluation of the potentially relevant and complete exposure pathways is presented in detail in the original HHE (BBL 2003).

- Section 4 provides the rationale for the selection of generic criteria used in the initial screening of the data.
- Section 5 provides the rationale for the FSGCC and constituents identified for site-specific analysis.
- Section 6 provides the rationale for the SSCC.

This analysis has remained the same. However the comparisons to criteria have been updated. The updated comparisons are provided in the following sections.

2.3 Comparison to MDEQ *Generic Cleanup Criteria*

The laboratory analytical results for the GM SMI Plant facility were compared to MDEQ *Generic Cleanup Criteria,* which are summarized in the RRD Op Memo 1, dated December 10, 2004 (MDEQ, 2004). Summary tables of the Site soil and groundwater data that were found to exceed the *Generic Cleanup Criteria* are included in the RAP (see Appendix A Tables A-1 through A-4).

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

The GM SMI Plant facility is placed in the Industrial Land Use Category. Therefore, chemical constituents detected at the site were compared to MDEQ Industrial *Generic Cleanup Criteria*, with the exception of groundwater. Groundwater at and down gradient of the Site is not currently used and is highly unlikely to be used as a drinking water source in the future (see discussion in Section 2 of the RAP). Based on the proposed recording of restrictions on the property deed preventing groundwater use for drinking water purposes, the groundwater will not be used onsite as a source of drinking water in the future, and there are no residential properties hydraulically down gradient of the Site. Accordingly, ingestion of groundwater, as residential or industrial drinking water, is not considered a potentially complete exposure pathway, and therefore is not considered in this Addendum.

Exceedances of the Groundwater Surface Water Interface (GSI) criteria at the Saginaw River boundary are addressed separately, through the implementation of monitoring activities, and submittal of a Mixing Zone Application (Appendix I).

The purpose of this comparison to generic cleanup criteria is to identify chemicals of potential concern (COPCs) that do not pose a significant health risk and can be eliminated from further evaluation; and to identify which COPCs need to be evaluated further.

2.3.1 Relevant and Applicable MDEQ Generic Criteria

The following generic criteria were identified as potentially relevant and applicable to site conditions. These were used in the screening assessment to identify COPCs.

MDEQ Generic Cleanup Criteria for Groundwater

Although there is no actual routine exposure to groundwater at the site, groundwater samples collected from temporary and permanent monitoring wells were compared to the following applicable MDEQ *Generic Cleanup Criteria*:

- Groundwater Contact Criteria (GCC), to assess dermal exposure;
- Acute Inhalation Screening Level (AISL); to assess inhalation exposure;
- Residential and Industrial Groundwater Volatilization to Indoor Air Criteria (RGVIIC and IGVIIC; respectively), to assess indoor air hazards;
- Flammability and Explosivity Screening Level (FESL) values; and
- Water Solubility Screening Level (WSSL) values.

Depth to groundwater ranges from 2 to 10 feet below ground surface. Intrusive workers may contact groundwater during excavation activities.

MDEQ Generic Cleanup Criteria for Soil

Currently at the site, there is potential for exposure to soils; therefore, soil data were compared to the following MDEQ *Generic Cleanup Criteria*:

- Soil Criteria Protective of Groundwater Contact (GCCP);
- Industrial and Commercial II Direct Contact (IDC), to assess ingestion and dermal exposure;
- Industrial and Commercial II, III, and IV Soil Volatilization to Indoor Air Inhalation Criteria (ISVIIC), to assess indoor air hazards;
- Industrial and Commercial II, III, and IV Infinite Source Volatile Soil Inhalation Criteria (IVSIC), to assess ambient air inhalation hazards; and
- Industrial and Commercial II, III, and IV Particulate Soil Inhalation Criteria (IPSIC), to assess ambient air inhalation hazards.

In order to allow for a wider range of future uses at the site (in the event of a zoning change), the soil data were also compared to the Commercial III and Commercial IV Direct Contact Criteria.

2.3.2 COPCs

COPCs identified based on this comparison are identified in Tables 5-1 and 5-2 of the original HHE (BBL 2003) and are listed below.

Soil
l

- Surface
    - Chromium;
    - Lead; and
    - Manganese.
- Subsurface
    - Benzene;
    - Polychlorinated biphenyls (PCBs);
    - Lead; and
    - Manganese.

Groundwater

- Vinyl chloride;
- Bis(2-ethylhexyl)phthalate; and
- Dioxins/furans.

2.3.3 Additional Evaluation

There were a few exceedances of the generic cleanup criteria that were not addressed in the original HHE. These exceedances are summarized and discussed in the following Sections.

In addition, the MDEQ *Generic Cleanup Criteria* for vinyl chloride increased since the original HHE was completed in 2003. The current IGVIIC for vinyl chloride is 13,000 ug/L and the current GCC is 1,000 ug/L. The maximum detected concentration of vinyl chloride in groundwater was 2,300 ug/L. This value still exceeds the GCC; however it does not exceed the IGVIIC. The exceedance of the GCC was adequately addressed in the original HHE by developing SSCC, and therefore will not be addressed further in this HHE Addendum.

The soil analytical data was originally compared only to the Industrial and Commercial II Direct Contact Criteria. In order to allow for a wider range of potential future uses of the site (in the event of a zoning change), the soil data was also compared to the Commercial III and Commercial IV Direct Contact Criteria. In general, the Industrial and Commercial II Direct Contact Criteria are more restrictive than the Commercial III and Commercial IV Direct Contact Criteria for the constituents that were analyzed on-site, with the exception of lead. There are two areas of the site (The Former Railyard Area and the LNAPL Assessment and Remediation Area) with soil samples exceeding the generic Commercial III or Commercial IV Direct Contact Criteria (both 400 mg/kg). A summary of the soil samples with lead concentrations exceeding any of the Industrial or Commercial Direct Contact Criteria are listed in Table 2-1.

TABLE 2-1
SUMMARY OF LEAD RESULTS EXCEEDING GENERIC INDUSTRIAL AND COMMERCIAL (II, III, OR IV) DIRECT CONTACT CRITERIA IN SOIL

Soil Sample	Area	Result (mg/kg)
RS-2 (0-1')	Former Railyard	530[1]
RS-2-4 (0-1')	Former Railyard	456[1]
RS-2-5 (0-1')	Former Railyard	769[1]
RS-2-6 (0-1')	Former Railyard	1,370
SB-362 (0-2')	LNAPL Assessment	1,020
SB-363 (0-2')	LNAPL Assessment	1,320
SB-363 (4-6')	LNAPL Assessment	1,780

Note:
[1] = Concentration exceeds Commercial III and Commercial IV Direct Contact Criteria but not Industrial and Commercial II Direct Contact Criteria.

Lead concentrations in these areas also exceed the generic Industrial and Commercial II Direct Contact Criteria, and therefore SSCC were developed for a Production Worker, a Maintenance Worker, an Intrusive/Construction Worker, and a Site Visitor using the Adult Lead Model (Appendix D of the original HHE). The exposure scenarios for these four populations are expected to be protective of potential future uses of the site. The SSCC for the Intrusive/Construction Worker was calculated to be 1,982 mg/kg and the lowest calculated SSCC for the production worker, maintenance worker and site visitor was calculated to be 1,610 mg/kg. Therefore, the analyses completed in the original HHE are deemed appropriate and adequate for the direct contact exceedances for lead in these two areas of the site. Accordingly, the lead exceedances will not be addressed further in this HHE Addendum.

2.3.3.1 Former CTC Parking Lot East of the Main Plant

In August 2001, four soil samples were collected from below the asphalt at the former CTC Parking Lot East of the Main Plant in preparation for excavation and removal of the asphalt. The samples from the former parking lot were found to contain manganese at concentrations above the IPSIC (Table 2-2). Following removal of the asphalt, approximately 8 inches of clean fill was added and grass seed was planted (Coffey, 2005). This area was not discussed in the original HHE; therefore, the data evaluation is presented in this document.

TABLE 2-2
FORMER CTC PARKING LOT EAST OF THE MAIN PLANT
GENERIC IPSIC EXCEEDED IN SOIL

Chemical Constituent	Exposure Point Concentration [1] (mg/kg)	MDEQ IPSIC Value (mg/kg)
Manganese	11,600 [1]	1,500

Technical Assessment of Exceedances

Manganese detected in the former CTC Parking Lot East of the Main Plant soil will be assessed in the Facility-Specific Generic Cleanup Remedial Action Evaluation, and if required, the Site-Specific Remedial Action Evaluation.

2.3.3.2 Former Railyard Area

The former Railyard Area is an unpaved area located north of the SMI Plant and is used for the temporary storage of process materials and equipment. Surface soil samples were collected from the former Railyard Area during the RI and in 2007 by CRA.

Total chromium was detected (at 3 locations) at concentrations exceeding the IPSIC for hexavalent chromium, and was not addressed in the original HHE. Please note that these sample analyses were conservatively compared to the hexavalent chromium criteria. Chromium, where speciated onsite, has been determined to be in a trivalent state and those criteria were not exceeded.

Additional manganese sampling of surface soil was completed in August 2005 by ARCADIS (10 samples) and in 2007 by CRA (2 samples) and these data are included in the derivation of the 95% UCL, used here as the exposure point concentration. The chemical constituents detected in surface soil that exceed MDEQ generic industrial criteria are listed in Table 2-3 below.

Richard Kowalski
LFR
Sep 17, 2009 18:39

TABLE 2-3
FORMER RAILYARD AREA
GENERIC IPSIC EXCEEDED IN SOIL

Chemical Constituent	Exposure Point Concentration [1] (mg/kg)	MDEQ RPSIC Value (mg/kg)	MDEQ IPSIC Value (mg/kg)
Chromium (total)	1,110 [1]	260 [3]	240 [3]
Manganese	3,540 [2]	3,300	1,500

Notes:
[1] = Maximum detected concentration.
[2] = 95% UCL concentration.
[3] = As hexavalent chromium.

Technical Assessment of Exceedances

Per MDEQ guidance (Op Memo 1), total chromium data were originally compared to the more conservative hexavalent chromium criteria. To determine the breakdown between hexavalent and trivalent chromium at the two locations (pre-2007) where total chromium was detected, the sampling points were re-located in the field by a surveying contractor, and samples were collected for analysis of total and hexavalent chromium. Hexavalent chromium was not detected in either sample and total chromium concentrations do not exceed the generic MDEQ IPSIC for trivalent chromium (15,000 mg/kg). As a result, chromium is not considered further in this assessment.

Manganese, with the additional sampling results, has a 95% UCL above the residential and industrial particulate inhalation criteria. Manganese detected in the former Railyard Area soil will be assessed in the Facility-Specific Generic Cleanup Remedial Action Evaluation and, if required, in the Site-Specific Remedial Action Evaluation.

2.3.3.3 Saginaw River Berm Area

Surface and subsurface soil samples were collected from the berm of the Saginaw River in July 2000 and analyzed for TCL PCBs and TAL inorganics. Manganese and total chromium were detected in the berm area above the IPSIC values. In September 2004, surface soils at three soil boring locations (SB-378, SB-380, and SB-381) were removed. Conestoga-Rovers & Associates (CRA) completed the removal and verification sampling. These results are included in a report titled *Summary of Interim Response Activities Associated with East/West Ditch Filling and Removal of Manganese Impacted Soil in Saginaw River Berm, GMPT SMI* (CRA, 2005). The resulting concentrations were evaluated and any concentrations exceeding the MDEQ generic criteria in soil are listed below in Table 2-4. The post-remediation exposure point concentration for chromium was added to identify the maximum detected concentration of chromium from the soils remaining in-place following excavation activities. The post-remediation exposure point concentrations for manganese changed because samples were inadvertently excluded from the original dataset used for statistical analyses.

TABLE 2-4
SAGINAW RIVER BERM AREA
EXCEEDED IN SOIL

Chemical Constituent Criteria Exceeded	Exposure Point Concentration Pre-Remediation (mg/kg)	Exposure Point Concentration Post-Remediation (mg/kg)	MDEQ RPSIC Value (mg/kg)	MDEQ IPSIC Value (mg/kg)
Chromium	324 [1]	65.7[1]	260 [3]	240 [3]
Manganese (surface)	32,600 [1]	2,330 [2]	3,300	1,500
Manganese (subsurface)	476 [1]	5,800 [2]	3,300	1,500

Richard Kowalski
LFR
Sep 17, 2009 18:39

Notes:
[1] = Maximum detected concentration.
[2] = 95% UCL concentration.
[3] = As hexavalent chromium.

Technical Assessment of Exceedances

As per MDEQ guidance (Op Memo 1) total chromium data were compared to conservative hexavalent chromium standard. This standard was exceeded in only 2 of the 28 samples collected. Total chromium exceeded the standard once at SB-381, and was essentially equal to the generic standard at SB-378. Both of the areas were excavated in September 2004, as a result total chromium is not considered further in this assessment. Manganese concentrations in surface samples were below residential standards following excavation. Manganese detected in the berm area soil will be assessed in the Facility-Specific Generic Cleanup Remedial Action Evaluation and, if required, in the Site-Specific Remedial Action Evaluation.

2.3.3.4 Previous Metal Feedstock Area

The Previous Metal Feedstock Area is located east of the SMI Plant. This area was previously used for the storage of metal feedstock. The generic IPSIC for manganese was exceeded at one surface soil sample location and three subsurface soil samples locations. Because the surface soil dataset contained an outlier, the maximum concentration was used as the exposure point concentration for surface soil. The 95% UCL was used as the exposure point concentrations for subsurface soil. The chemical constituents exceeding MDEQ generic criteria in soils are presented in Table 2-5.

TABLE 2-5
PREVIOUS METAL FEEDSTOCK AREA
GENERIC IDWP AND IPSIC CRITERIA EXCEEDED IN SURFACE AND SUBSURFACE SOIL

Chemical Constituent	Exposure Point Concentration [1] (mg/kg)	MDEQ RPSIC Value (mg/kg)	MDEQ IPSIC Value (mg/kg)
Manganese (soil column)	7,410[2]	3,300	1,500
Manganese (surface)	6,140[1]	3,300	1,500

Technical Assessment of Exceedances

Manganese detected in surface and subsurface soil will be assessed in the Facility-Specific Generic Cleanup Remedial Action Evaluation and, if required, in the Site-Specific Remedial Action Evaluation.

2.3.3.5 Parking Lot North of Buffer Basin

In 2007, CRA collected four soil samples at two locations (BH-9 and BH-10) from beneath the concrete Parking Lot North of Buffer Basin. Samples were collected at 1 to 2 feet bgs and at 2 to 4 feet bgs. Both subsurface soil samples collected at BH-10 exceeded the generic IPSIC for manganese. Due to the limited number of samples in this area, the maximum concentration was used as the exposure point concentration.

TABLE 2-6
PARKING LOT NORTH OF BUFFER BASIN
GENERIC IDWP AND IPSIC CRITERIA EXCEEDED IN SURFACE AND SUBSURFACE SOIL

Chemical Constituent	Exposure Point Concentration [1] (mg/kg)	MDEQ RPSIC Value (mg/kg)	MDEQ IPSIC Value (mg/kg)

3. Facility-Specific Generic Cleanup Remedial Action Evaluation

FSGCC, as discussed in detail in the original HHE and FS, are generic criteria that have been modified based upon the characteristics of the property that are not expected to change. The drinking water pathway was eliminated from the assessment in this step for both off- and on-site receptors. This evaluation is presented in detail in Section 5 of the original HHE (BBL 2003). The additional work presented in this addendum does not change the approach or results of the facility-specific evaluation. Soil exceedances identified are not expected to be affected by any of these physical characteristics of the property. A summary of the data compared to the FSGCC is presented in Attachment I, Tables I-5 through I-7.

4. Site-Specific Remedial Action Evaluation

The following Section provides additional analyses completed for the site-specific evaluation and include information requested by, and discussed with, MDEQ. This includes issues specifically addressed in a March 24th, 2006 letter from GM REALM to Mr. Allan Brouillet of the Remediation and Redevelopment Division of MDEQ.

4.1 Development of Site-Specific Cleanup Criteria

For this HHE Addendum, SSCC were developed in accordance with MDEQ guidelines. The process of developing these SSCC is consistent with what is outlined in Op Memo 1 (MDEQ, 2004). These criteria are based on alternative exposure assumptions unique to the GM SMI Plant facility. SSCC are derived from essentially the same equations used to calculate MDEQ Generic Cleanup Criteria, except that site-specific parameters are used in the calculations.

A revised site ECSM, including an exposure assessment is developed as part of the SSCC comparison. The revised site ECSM and exposure pathway analysis is described in detail in Section 4 of the original HHE (BBL, 2003). It is briefly summarized below.

Additionally, any modifications to the MDEQ *Generic Cleanup Criteria* algorithms and the development of the SSCC are described in original HHE.

The potential inhalation of manganese impacted particulate is the only pathway evaluated in the following section of the Addendum.

The following Section provides a description of how the potential exposure to particulate was evaluated and provides a comparison of point of exposure concentrations and includes detail requested by MDEQ. Calculations are provided as Attachment C.

- PSIC protective of on-site receptors: value calculated using Michigan default exposure parameters for maintenance workers and site-specific exposure parameters for intrusive workers.

- PSIC for off-site receptors: generic Michigan default exposure parameters used, and PEF modified for source-area size.

4.1.1 Source Areas

There are two potentially relevant on-site sources of manganese, the Former Railyard Area and the Previous Metal Feedstock Area. The Former Railyard Area is approximately 9.5 acres and the Previous Metal Feedstock Area is approximately 8.6 acres. Other source areas are present on site (e.g., Saginaw River Berm); however, they are located in areas of the site that are not routinely used, are not located on the Site property, or are located beneath covered parking lots that will remain covered.

For the protection of off-site residents, only the Former Railyard Area was identified as a potential source area due to the location and proximity to off-site residential areas.

4.1.2 Potentially Exposed Populations and Complete Pathways

SSCC were developed for off-site residents, on-site outdoor maintenance workers, and on-site construction workers. The rationale for choosing these receptors and exposure assumptions is provided below.

A summary of the exposure parameters used to calculate site-specific PSIC are presented in Table 4-1 below.

4.1.2.1 Off-Site Resident

The potential for manganese impacted dust to impact off-site residents was evaluated. The default exposure parameters were used for the off-site residents.

A summary of the exposure parameters used to calculate site-specific PSIC are presented in Table 4-1 below.

4.1.2.2 Maintenance Worker

This receptor was selected to specifically evaluate outdoor exposures. This individual spends most of the workday conducting maintenance activities outdoors. These activities include, but are not limited to mowing grass and inspecting the landfills. Occasionally this individual may be involved in emergency type activities (i.e. utility line repair) that would require him to be engaged in intrusive type work which may result in exposure to surface and subsurface soils, and non-potable groundwater. This receptor is the only one that will consistently contact soil in the non-production area. Because this individual represents the most heavily, chronically exposed individual for the non-production area, the risk-based values developed for this receptor will be conservative and protective of other receptors potentially exposed in this area.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

It was assumed that the maintenance worker would only be exposed to surface soils except for occasional emergency-type activities (i.e., utility line repair) that would require the worker to be engaged in intrusive-type work (assumed up to 5 events per year) which may result in exposure to surface and subsurface soils, and non-potable groundwater.

A summary of the exposure parameters used to calculate site-specific PSIC are presented in Table 4-1.

4.1.2.3 Construction Worker (or more correctly an intrusive worker)

This receptor was selected to specifically evaluate potential high-contact, non-routine, activity to subsurface soil and non-potable groundwater. This individual is involved in certain land intrusive activities at the facility, which may result in exposure to surface soils, subsurface soils, and non-potable groundwater associated with the non-production area. However, exposure for these individuals will be relatively short in duration, and this person is unlikely to be a site employee. As a highly conservative assumption, this worker is assumed to never be indoors.

The intrusive worker is assumed to be exposed to both surface and subsurface soils.

This receptor is assumed to be a short-term contractor and not a GM employee. This receptor was assumed to be exposed at a high intensity for a short period of time. This was accomplished by using exposure parameters (consistent with the USEPA (2001) construction worker scenario) that reflect this type of activity (e.g., soil

Sep 17, 2009 18:39

ingestion rate of 330 milligrams per day [mg/day], a surface area of 3,300 cubic centimeters [cm^2], and a skin to soil adherence factor of 0.3 milligrams per cubic centimeter per event [mg/cm^2-event]).

The exposure frequency of 30 days per year for the intrusive worker was based on professional judgment, assuming intrusive activities last 6 weeks, 5 days per week. This value was presented in a memo to Chris Flaga from John Schell dated March 27, 2003 (sent via email).

A summary of the exposure parameters used to calculate site-specific PSIC are presented in Table 4-1 below.

4.1.3 Calculations

4.1.3.1 Particulate Emission Factor

The particulate emission factor (PEF) was adjusted for an 18-acre source area for both the residential and industrial exposure scenarios. A PEF was calculated using both the default assumption for vehicular traffic and, in agreement with the proposed deed restrictions of the RAP, no vehicular traffic.

The site conditions assumed in the derivation of the default PEF (e.g. 50 vehicles traveling 2.25 kilometers per day in the area) are likely to overestimate dust generation at the site. Currently, there is no routine truck traffic in the Former Railyard, and deed restrictions will prevent traffic generation of dust in the areas in question in the future. (More realistically, there will not be any vehicular traffic in the future in the areas in question.) The areas are currently vegetated, and this cover will be maintained as 50% or greater.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Quote from the RAP:

> *V. Former Railyard Area*
> *In order to protect against the inhalation of hazardous substances present in surface soil, the vegetative cover will be maintained (minimum of 50 % coverage of soil surface), and roadways may not be installed unless properly constructed (at least 6 inches of gravel or pavement cover) or other changes approved by MDEQ occur in the former Railyard Area. Activities in this area of the Site are restricted to those consistent with current facility operations, including access by a maintenance worker who spends no more than 160 days, per any such worker per year, and an intrusive/construction worker who spends no more than 30 days, per any such worker per year, in the area. To implement activities in this area that are inconsistent with current facility operations, a Health and Safety Plan must be developed and followed or the activity must be approved by the MDEQ prior to implementation.*

4.1.3.2 Site-Specific PSIC

The parameters used to derive the PSIC values are presented below. The PEF values used are MDEQ default values as presented in the technical support document dated August 31, 1998 (Part 201 Generic Soil Inhalation Criteria for Ambient Air).

Richard Kowalski
LFR
Sep 17, 2009 18:39

$$SSCC - PSIC(mg/kg) = \left[\frac{TH \times AT \times AIR}{EF \times ED \times \left(\frac{1}{RfC}\right) \times \left(\frac{1}{PEF/2}\right)} \right] \times AF$$

Where:

TH = Target Hazard Quotient (unitless);
AT = Averaging Time (days; = ED x 365 days per year);
AIR = Adjusted Inhalation Rate (unitless);
EF = Exposure Frequency (days);
ED = Exposure Duration (years);
RfC = Reference Concentration (milligrams per cubic meter [mg/m^3]);
PEF = Particulate Emission Factor (cubic meters per kilogram [m^3/kg]); and
AF = Adjustment factor for source size (unitless).

The PEF is divided by 2 as discussed in the guidance to account for short-term peak particulate levels for all chemicals which are associated with quarterly, 24-hour, 8-hour, or 2-hour averaging times under the Air Toxics Rule. However, application of the safety factor of 2 is unnecessary given the data used to derive the manganese reference concentrations. In a letter sent to Chris Flaga from John Schell (March 20, 2002), Dr. Schell outlines several technical issues that support the modification of the generic manganese IPSIC. One of the issues outlined in the letter was the unnecessary inclusion of the application of the 2-fold safety factor to protect against acute risks. Manganese is not acutely toxic and therefore this additional safety factor results in an overly conservative IPSIC.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

The input parameters for each of the calculated site-Specific PSIC are presented in Table 4-1 below.

TABLE 4-1
SUMMARY OF INPUT PARAMETERS FOR THE PSIC SSCC

Parameter	Default Industrial	Default Residential	Site-Specific Residential	Site-Specific Maintenance	Site-Specific Intrusive
TH	1	1	1	1	1
AT	7665	10950	10950	7665	365
AIR	NA	NA	NA	2	2
EF	245	350	350	160	30
ED	21	30	30	21	1
RfC	5.0E-05	5.0E-05	5.0E-05	5.0E-05	5.0E-05
PEF (traffic)	3.95E+07	1.28E+08	1.28E+08	3.95E+07	3.95E+07
PEF (no traffic)	NA	NA	2.99E+08	2.99E+08	NA
AF (9 or 18-acre)	NA	NA	0.6 (9-acre)	0.5 (18-acre)	0.5 (18-acre)
PSIC (traffic)	1.5E+03	3.3E+03	2.0E+03	2.3E+03	1.2E+04
PSIC (no Traffic)	NA	NA	4.7E+03	1.7E+04	NA

The source sizes were revised, in response to MDEQ's comments, to 9.5 acres for the Former Railyard Area and 18 acres for the combined Former Railyard Area and the Previous Metal Feedstock Area. The PSIC values have been revised accordingly.

Therefore, the maintenance worker SSCC (surface soil SSCC) can be re-calculated using a PEF for no vehicular traffic. The resulting SSCC is 17,000 mg/kg.

The calculation sheets for these site-specific PSIC are included in Attachment III.

4.2 Estimated Exposure

The maximum detected concentration was used as the exposure point concentration in the screening assessment. A statistical approach was used to estimate exposure in the site-specific assessment. Data in a given exposure area was grouped and an 95% UCL on the mean was calculated. The lower of the maximum detected concentration and the 95% UCL was used as the point of exposure concentration.

4.2.1 Sampling and Statistics for Areas of Interest

The following areas of interest were identified based on the screening assessment:

- Former Railyard Area;
- Former CTC Parking Lot;
- Previous Metal Feedstock Area;
- Saginaw River Berm Area; and
- Parking Lot North of Buffer Basin.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Based on the identified areas of interest, the appropriate datasets were developed for surface soil and for the total soil column. The number of samples and soil borings for each area are summarized in Table 4-2 below. The analytical data are summarized in the Tables in Attachment II. In addition, Table 4-2 summarizes the

TABLE 4-2

This table includes samples that were inadvertently excluded from the statistical analysis completed for the original HHE (BBL 2003) and all additional samples collected in the areas of interest since the original HHE was completed.

Table II-1 of Attachment II summarizes the number of samples; frequency of detection; minimum, mean and maximum concentrations; 95% UCL on the mean; distribution; exposure point concentration; and statistical program used for each area of interest. The datasets for each area of interest area included in Attachment II as Tables II-2 through II-10.

4.3 Comparison of Site Data to the *Site-Specific Cleanup Criteria*

Using the modified equations, *Site-Specific Cleanup Criteria* (SSCC) were developed for the receptors in the production area (i.e., intrusive/construction worker, and production worker) and for the receptors in the non-production area (i.e., maintenance worker, intrusive/construction worker, and site visitor). The products of these calculations, the SSCCs for the production area and the SSCCs for the non-production area, are provided for each chemical constituent that exceeded MDEQ *Generic Cleanup Criteria*. The calculated SSCC for each receptor engaged in activities in the production and/or non-production areas are presented in Tables 4-3 and 4-4. The minimum SSCC is also identified, as is the criterion used in the comparison to site concentrations.

The following areas of interest area considered to be part of the production area:

- Former Railyard Area;
- Former CTC Parking Lot Area;

- Previous Metal Feedstock Area; and
- Parking Lot North of Buffer Basin.

The following area is considered to be part of the non-production area:

- Saginaw River Berm Area

4.3.1 Production Area

The following table presents the SSCC developed for each receptor assumed to be engaged in activities in the production area of the site. Consistent with the original HHE (BBL, 2003), the production worker is expected to spend most, if not all, of the workday indoors. As a result, the production worker is not expected to be significantly exposed to outdoor particulates.

TABLE 4-3
PRODUCTION AREA
SITE-SPECIFIC CLEANUP CRITERIA FOR
INDUSTRIAL PARTICULATE SOIL INHALATION CRITERIA (IPSIC)
(mg/kg)

Chemical Constituent	Maintenance Worker (surface)	Intrusive/Construction Worker (soil column)	Production Worker (surface)
Manganese	2,300*	12,000	--

Notes:

4.3.2 Non-Production Area

The following tables present the SSCCs developed for each receptor assumed to be engaged in activities in the non-production area of the site.

TABLE 4-4
NON-PRODUCTION AREA
SITE-SPECIFIC CLEANUP CRITERIA FOR
INDUSTRIAL PARTICULATE SOIL INHALATION CRITERIA (IPSIC)

Chemical Constituent	Maintenance Worker (surface)	Intrusive/Construction Worker (soil column)	Site Visitor (surface)
Manganese	2,300*	12,000	360,288

Note:
* = Minimum SSCC calculated.

4.4 Results of the *Site-Specific Cleanup Criteria* Evaluation

The following tables (4-5 and 4-6) summarize the *Site-Specific Cleanup Criteria* (SSCC) that were developed for those chemical constituents that exceeded MDEQ *Generic Cleanup Criteria*. These tables provide the

Notes:
[1] = Maximum concentration.
[2] = 95% UCL concentration.
* = PSIC SSCC with vehicular traffic. The PSIC SSCC without vehicular traffic is 17,000 mg/kg.

For a conservative comparison, although not considered in the original HHE (BBL, 2003), the manganese concentrations in the former CTC Parking Lot East of the Main Plant and in the former Railyard Area were compared to the SSCC values for the maintenance worker (2,300 mg/kg for manganese). Given that these areas have been modified since the original assessment (e.g., the asphalt has been removed in the former parking area and the Railyard is no longer active), it is possible the maintenance worker would be present performing routine maintenance activities. The surface soil concentrations in the Previous Metal Feedstock Area were also compared to the maintenance worker SSCC value as a conservative measure. The surface soil exposure point concentrations present in all three areas exceeded the SSCC for the maintenance worker. To ensure protection of human health, the deed restriction proposed in the draft RAP, which places restrictions on intrusive activities in this area, has been modified to also prevent the construction of roadways without cover over them (6 inches of gravel or paving will be required). The resulting SSCC without vehicle traffic is 17,000 mg/kg, which is well above the exposure point concentrations in these areas.

The soil column exposure point concentrations did not exceed the SSCC PSIC criteria in any of the production areas of interest.

TABLE 4-7
NONPRODUCTION AREA
SOIL

Area of Concern And Chemical Constituent	Exposure Point Concentration [1] (mg/kg)	Site-Specific Cleanup Criteria - IPSIC (mg/kg)
Saginaw River Berm		
Manganese (surface)	2,330 [1]	2,300*
Manganese (subsurface)	5,800 [1]	12,000

Notes:
[1] = 95% UCL concentration.
* = PSIC SSCC with vehicular traffic. The PSIC SSCC without vehicular traffic is 17,000 mg/kg.

The manganese surface soil exposure point concentration in the Saginaw River Berm Area is slightly above the SSCCs for maintenance workers. The soil column exposure point concentration is below the intrusive work PSIC SSCC. To ensure protection of human health, the deed restriction proposed in the draft RAP, which places restrictions on intrusive activities in this area, has been modified to also prevent the construction of roadways without a cover (6 inches of gravel or paving will be required). The resulting SSCC without vehicle traffic is 17,000 mg/kg, which is well above the exposure point concentrations in these areas.

4.5 Summary of the *Site-Specific Cleanup Criteria* Evaluation

The exposure point concentrations for surface soils in the Former Railyard Area, the Former CTC Parking Lot, and the Previous Metal Feedstock Area exceed the SSCC for maintenance workers with the generic assumptions for vehicle traffic. To ensure protection of human health, the deed restriction proposed in the draft RAP, which places restrictions on intrusive activities in this area, was modified to also prevent the construction of roadways without a cover (6 inches of gravel or paving will be required). The resulting SSCC without vehicle traffic is 17,000 mg/kg, which is well above the exposure point concentrations for surface soils in these areas.

In addition, in the Former CTC Parking Lot Area, subsequent to removal of the asphalt, 8 inches of clean fill were added to the area, and as a result the surficial soil concentrations are likely overestimated. The presence of the 8-inch clean soil barrier and the grass cover limit the exposure by the maintenance worker. Maintenance of these conditions is addressed in the RAP.

The subsurface soils in the Parking Lot North of the Buffer Basin exceeded the maintenance worker SSCC for PSIC. Therefore, the cover over this area must be maintained to prevent maintenance workers from exposure to this soil. Maintenance of the cover is addressed in the RAP and in the proposed restrictive covenants.

The exposure point concentrations for the soil column in the areas of interest do not exceed the SSCC for intrusive workers. Therefore, no additional deed restrictions need to be added to those proposed in the RAP.

4.6 PCBs

Additional samples have been collected and analyzed for PCBs since the original HHE was completed (BBBL , 2003). PCBs were not detected at levels greater than the 16 ppm MDEQ Industrial Direct Contact criteria or the site-specific Direct Contact Criterion of 60 ppm. This is addressed in the 2006 letter to MDEQ and the data are presented in the RAP. No additional evaluation was completed in this Addendum.

SAGINAW, MICHIGAN

Sampling Area Location ID Sample Depth (ft bgs): Date Collected:	Units	Soil Saturation Concentration Screening Levels CSAT	Groundwater Contact Protection GCCP	Groundwater Surface Water Interface Protection GSIP	Industrial Direct Contact IDC	Industrial Drinking Water Protection IDWP	Industrial Particulate Soil Inhalation Criteria IPSIC	Industrial Soil Volatilization to Indoor Air Inhalation ISVIA	Finite VSIC for 2 Meter Source Thickness IVSIC2	Finite VSIC for 5 Meter Source Thickness IVSIC5	Infinite Source Volatile Soil Inhalation Criteria IVSICI	Residential Drinking Water Protection RDWP
Semivolatile Organics												
3-Methylcholanthrene	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
3-Methylphenol	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
3-Nitroaniline	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
4,4'-Methylene-bis(2-chloroaniline)	mg/kg				32		110000					
4,6-Dinitro-2-methylphenol	mg/kg		190		260	0.83						0.83
4-Aminobiphenyl	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
4-Bromophenyl-phenylether	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
4-Chloro-3-Methylphenol	mg/kg		3000	0.28	15000	16						5.8
4-Chloroaniline	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
4-Chlorobenzilate	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
4-Chlorophenyl-phenylether	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
4-Methylphenol	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
4-Nitroaniline	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
4-Nitrophenol	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
4-Nitroquinoline-1-oxide	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
4-Phenylenediamine	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
5-Nitro-o-toluidine	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
7,12-Dimethylbenz(a)anthracene	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
a,a'-Dimethylphenethylamine	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
Acenaphthene	mg/kg		970	4.4	130000	880	6200000	350000	97000	97000	97000	300
Acenaphthylene	mg/kg		440		5200	17	1000000	3000	2700	2700	2700	5.9
Acetophenone	mg/kg	1100	1100		1100	88	14000000	1100	52000	52000	52000	30
Aniline	mg/kg	4500	2800	0.33	1500	4.4	29000					1.1
Anthracene	mg/kg		41		730000	41	29000000	1000000	1600000	1600000	1600000	41
Aramite	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
Atrazine	mg/kg		110	0.15	330	0.06						0.06
Benzaldehyde	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
Benzidine	mg/kg		1		1	1	59					1
Benzo(a)anthracene	mg/kg				80							
Benzo(a)pyrene	mg/kg				8		1900					
Benzo(b)fluoranthene	mg/kg				80							
Benzo(g,h,i)perylene	mg/kg				7000		350000					
Benzo(k)fluoranthene	mg/kg				800							
Benzoic Acid	mg/kg		70000		1000000	1800						640
Benzyl Alcohol	mg/kg	5800	5800		5800	580	150000000					200
Biphenyl	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
bis(2-Chloroethoxy)methane	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -
bis(2-Chloroethyl)ether	mg/kg	2200	110	0.3	58	0.17	12000	44	13	13	13	0.1
bis(2-Chloroisopropyl)ether	mg/kg	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -	- -

TABLE I-9
NOTES FOR TABLES I-1 THROUGH I-8

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

Notes:
Unless noted otherwise, all values are in milligrams per kilogram (mg/kg).
Shaded - Concentration exceeds screening level.
Duplicate results are shown in brackets.

Criteria:
CSAT - Soil Saturation Concentration Screening Levels.
GCCP - Groundwater Contact Protection Criteria and Risk-Based Screening Levels (RBSLs).
GSIP - Groundwater Surface Water Interface Protection Criteria and RBSLs.
IDC - Industrial and Commercial II Direct Contact Criteria and RBSLs.
IDWP - Industrial Drinking Water Protection Criteria and RBSLs.
IPSIC - Industrial Particulate Soil Inhalation Criteria and RBSLs.
ISVIA - Industrial Soil Volatilization ton Indoor Air Inhalation Criteria and RBSLs.
IVSIC2 - Finite Volatile Soil Inhalation Criteria (VSIC) and RBSLs for 2 Meter Source Thickness.
IVSIC5 - Finite Source SVIC for 5 Meter Source Thickness.
IVSICI - Infinite Source SVIC and RBSLs.
RDWP - Residential Drinking Water Protection Criteria and RBSLs.
SDBL - Statewide Default Background Levels.

Data Qualifiers:

*	Duplicate analysis is not within control limits.
B	The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
BN	Reported value is less than the CRDL but greater than or equal to the IDL and the spiked sample recovery not within control limits.
D	Concentration is based on a diluted sample analysis.
E	The compound was quantitated above the calibration range.
EN	The reported value is estimated because of the presence of the interference and the spiked sample recovery not within control limits.
G	Elevated reporting limit. The reporting limit is elevated due to matrix interference.
J	The compound was positively identified; however, the associated numerical value is an estimated concentration only.
L	Analyte present. Reported value may be biased low. Actual value is expected to be higher.
MBB	This analyte is present at reportable levels in the associated trip blank, but is less than 5% of the sample amount.
MBD	This analyte is present in the associated method blank at an amount that is less than two times the reporting limit.
N	Tentative identification. Consider present. Specific methods may be needed to confirm its presences or absence in future sampling efforts.
R	The sample results are rejected.
W	Post-digestion spike for Furnace-AA Analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
Wa	Post digestion spike recovery fell between 40-85% due to matrix interference.
Wb	Post digestion spike recovery fell between 115-150% due to matrix interference.

TABLE III-1
ON-SITE WITH VEHICLE TRAFFIC
MDEQ-RRD PSIC CALCULATION

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

GM-SMI Estimated Source Areas:

Metal feedstock	8.6	acres
Railyard	9.5	acres
Total area (all sources)	**18.1**	**acres**
Modifier for 18.1 acres (total source area):	**0.50**	
Modifier for 9.5 acres (Former railyard):	**0.60**	

A. Part 201 Generic PSIC **=(THQ*ED*365)/(EF*ED*(1/RfC)*(1/(PEF/2)** **Assumptions/Comments**

residential =(1*30*365)/(350*30*(1/0.00005)*(1/(**128000000/2**)))
3,338 mg/kg ***approx 3,300*** **for a 0.5 acre PEF =** 1.28E+08

industrial ***generic calculation***
=(1*21*365)/(245*21*(1/0.00005)*(1/(**39500000/2**)))
1,471 mg/kg **approx 1,500** **for a 0.5 acre PEF =** 3.95E+07

B. Site-specific calculation (for Saginaw Malleable):
SMI site-specific PSIC **=(THQ*ED*365)/(EF*ED*(1/RfC)*(1/(PEF)**

Corrected residential PSIC: =((1*30*365)/(350*30*(1/0.00005)*(**1/(128000000/2)**)))*0.6 **assuming railyard size is 10 acres**
2,002

Non-production area PSIC =(1*21*365***2**)/(160*21*(1/0.00005)*(1/(**39500000/2**))) **for 0.5 acre; using MDEQ factors except EF is 160 days**
(6/3/03 HHE) **4,505**
Corrected non-production PSIC **1,126** **for a 18 acre source area and without use of AIR**
2,253 maintenance worker **for a 18 acre source area and with use of AIR**

Production area PSIC =(1*1*365***2**)/(30*1*(1/0.00005)*(1/(**39500000/2**))) **for 0.5 acre; Construction worker EF=30 days and ED=one year**
(6/3/03 HHE) **24,029** **used an adjusted intake rate of 2 in the numerator**
Corrected production PSIC **6,007** **for a 18 acre source area and without use of AIR**
construction worker **12,015** intrusive worker **for a 18 acre source area and with use of AIR**

Part 201 Particulate Emission Factor (PEF) Calculation and Assumptions

=(Q/C)*(1/((Ew*(1-V))+Ev)
=82.33*1/((0.00000055*(1-0.5))+0.00000181) --based on Michigan sites; 50% vegetation cover; 0.5 acre source size
1.28E+08 **for residential**
3.95E+07 **for industrial** 1.97E+07

where:

Dispersion factor (Q/C) =	**82.33**	g/m^2-s per kg/m^3	--based on Michigan sites; 0.5 acre source size
Emission due to wind (Ew) =	5.50E-07	g/m^2-s	--default vegetation cover is 50%; based on a 0.5 acre source size
Emission due to vehicle traffic (res) (Ev) =	3.68E-07	g/m^2-s	
Emission due to vehicle traffic (ind) (Ev) =	1.81E-06	g/m^2-s	
Vegetation cover (V) =	50%

1. Introduction

1.1 Purpose of Document

The purpose of this document is to provide a summary of the proposed operation, maintenance, and monitoring (OM&M) activities associated with Remedial Action Plan (RAP) implementation at the General Motors Corporation (GM) Saginaw Malleable Iron (SMI) Plant, and Remediation and Liability Management Company, Inc. (REALM, Inc.) Green Point Landfill and Drum Remediation Area (DRA) (the Site), located in Saginaw, Michigan. Some activities are currently ongoing under separate OM&M plans previously approved by the Michigan Department of Environmental Quality (MDEQ).

1.2 Background

This section presents a summary description of the Site, and also the history of each of the Site areas addressed by this plan.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

1.2.1 Site Location and Physical Setting

The Site encompasses approximately 273 acres. The SMI Plant Property consists of the northern portion of the Site and includes the inactive SMI Plant and surrounding ancillary areas, two closed Type III Landfills, two stormwater ponds, and an inactive Water Recycle System that includes a buffer basin. The southern portion of the Site (now owned by REALM, Inc.) includes the closed Green Point Landfill and the DRA, where drums were previously discovered, excavated, and removed.

The Site is located approximately 2,000 feet north of the confluence of the Tittabawassee and Shiawassee Rivers and is located on the western half of Section 35, T12N, R4E, in the city of Saginaw, Saginaw County, Michigan. The Site is bounded to the west by the Delphi Automotive Systems Corporation (Delphi) former Saginaw Steering Systems Plant 2 (Plant 2), a junkyard, and another property used for storage of miscellaneous debris; to the east by the Saginaw River, a strip of property east of the Green Point Landfill previously owned by Consumers Power Company and currently owned by REALM, Inc, and property previously used for agricultural purposes that now contains a mitigation wetland (this agricultural property was once owned by Ruben Schultz and the State of Michigan, and is now owned by REALM, Inc.); to the north by commercial, residential, and industrial properties; and to the south by farm fields (Figure C-1).

1.2.2 History of Site Areas Addressed by This Plan

Light Nonaqueous Phase Liquid (LNAPL) Assessment and Remediation Area

The LNAPL Assessment and Remediation Area is located within the Unpaved Area southwest of the SMI Plant building, between SMI and the adjacent Delphi property (Figure C-2). Three 20,000-gallon aboveground storage tanks (ASTs) that previously contained quench oil are located along the fenced western edge of the Unpaved Area within a concrete secondary containment structure. The Unpaved Area was also used to store roll-off boxes of municipal waste and miscellaneous other plant materials.

LNAPL was observed on the water table within the Unpaved Area. In order to assess the horizontal and vertical extent of LNAPL in this area, a series of soil borings and monitoring wells were installed. A detailed discussion of the field investigations is presented in the *LNAPL Assessment and Recovery Remedial Investigation Interim Report* (BBL, November 1995).

In 1997, an automated LNAPL recovery system was installed. The system originally consisted of a four-well groundwater and LNAPL recovery system; however, in October 2001, the fourth recovery well, which was located on the adjacent Delphi property, was disconnected from the system, as it was no longer collecting LNAPL. A description of OM&M of the LNAPL recovery system was presented in the *LNAPL Recovery System Operation and Maintenance Plan* (BBL, October 2000). A summary of key elements of the O&M for this system is included in Sections 2 and 3 of this plan.

As of October 2007, when the automated system was shut down temporarily pending building demolition, the automated LNAPL recovery system had recovered approximately 3,700 gallons of LNAPL. Minor quantities of LNAPL are currently being bailed on a monthly basis from monitoring wells in the area. Prior to installation of the automated system, approximately 9,000 gallons of LNAPL and LNAPL mixed with groundwater were removed by hand bailing and vacuum truck operations. The volume of LNAPL observed in the subsurface has decreased significantly since operation of the recovery system was initiated. The rate of LNAPL recovery has also decreased. This was anticipated as the recovery process removes the easily recoverable LNAPL from the subsurface. Re-evaluation of the effectiveness of continuing operation of the recovery system will occur on a regular basis. Any proposed changes will be discussed with MDEQ prior to implementation.

Sep 17, 2009 18:39

Quench Pit Area

The Quench Pit Area is located in the former Annealing Department inside the central portion of the SMI Plant building (Figure C-2). The area contains three quench pits, referred to as direct quench pits #1, #2, and #3. Quench pit #1 was installed in 1966. Quench pits #2 and #3 were installed in 1970. The pits are constructed of stainless steel panels welded together to form a double box or shell. Each quench pit typically held approximately 25,000 gallons of quench oils. The quench pits were used during a heat treatment process.

A subsurface investigation completed in the Quench Pit Area identified LNAPL in the subsurface. The Quench Pit Area investigation results are presented in the *Quench Pit Investigation Report* (BBL, April 1998).

A hand bailing program was initially implemented to recover LNAPL, and approximately 6,500 gallons of LNAPL were removed from 1997 through 2002. An automated LNAPL recovery skimmer pump was installed at the Quench Pit Area in February 2002. The ongoing operation and performance of this pump has been reported in the monthly reports to the MDEQ. As reported to MDEQ, as of September 2007, this system had removed approximately 2,400 gallons of LNAPL. The monitoring wells are currently temporarily being manually bailed pending the hook up of a power supply to the automated system.

Green Point Landfill

The Green Point Landfill is located in the southern portion of the Site (Figure C-2). The Green Point Landfill was owned (during its operating life) by Ruben Schultz and was operated by various commercial enterprises between the 1950s and 1978. The landfill was reportedly used for the disposal of municipal waste, foundry sand, and unspecified quantities and types of waste from a variety of industrial facilities (RMT, 1979). In 1978, the Green Point Landfill stopped receiving waste and was closed in 1978. GM purchased the property containing the landfill in 1982.

Sep 17, 2009 18:39

Several environmental investigations have been conducted at the Green Point Landfill, dating back to 1976. Leachate samples collected from the Green Point Landfill contained select constituents of concern (COCs) as summarized in the Human Health Evaluation (HHE) Report. However, the exposure pathways associated with the leachate were determined to be incomplete and were eliminated from further consideration. A summary of these investigations is provided in the *Remedial Investigation/ Feasibility Study Work Plan* (BBL, October 1997a) and in the RI Report (BBL, July 2001).

In accordance with the Consent Judgment, GM and WMI proposed the design and installation of a cap for the landfill consistent with current closure requirements for solid waste municipal landfills. This design was approved by the MDEQ in a letter dated March 7, 1996. Construction of the landfill cap (consistent with Part 115 of Michigan Act 451) was completed and the *Green Point Landfill Cover System Certification Report* (BBL, January 2000) was submitted to the MDEQ. MDEQ has approved the Green Point Landfill remedial activities as an Interim Response Action (IRA) (Brouillet, B., July 2000).

O&M activities at the Green Point Landfill are implemented in accordance with provisions contained in the *Final Engineering Design Report for the Green Point Landfill* (BBL, January 1998) and *Post-Closure Environmental Monitoring Plan* included as Appendix K to the Engineering Design Report, with modifications approved by the MDEQ. This OM&M Plan is based on conducting these activities for a period of up to 30 years from the date of the landfill cover system certification (i.e., January 2000). However, these activities or an appropriate subset of these activities may be continued beyond 30 years if, at that time, the monitoring data show that an ongoing risk remains. O&M activities will be reviewed on an annual basis and recommendations for modification, as needed, will be included in the annual monitoring report for MDEQ's approval.

Saginaw River Boundary

For purposes of this RAP, the Saginaw River boundary is defined as a narrow (approximately 20 - 100 feet wide) strip of land separating the Secondary Settling Pond from the Saginaw River and a portion of the Site located east of the eastern Type III Landfill and adjacent to the Saginaw River (Figure C-2).

Several monitoring wells and soil borings were installed in the Saginaw River Boundary area to characterize surface and subsurface conditions in this area. The investigation results indicated that surface soil in the Saginaw River Berm Area contained manganese at concentrations exceeding the site-specific cleanup criteria (SSCC) value and that select inorganics and PCBs were sporadically detected in groundwater at concentrations above the MDEQ Generic GSI criteria. As discussed in the RI Report (BBL, July 2001) and FS Report (BBL, July 2003b), historical PCB detections at river boundary wells are believed to be the result of the entrainment of soil particles from the berm, that contain low levels of PCBs. These soil particles are believed to have been artificially mobilized by sampling activities, and therefore do not indicate PCB transport in groundwater. Groundwater samples collected following an ultra-low-flow sampling methodology have generally been non-detect for PCBs; however sporadic PCB detections at low concentrations have been observed at one or two wells. This pattern of the absence or sporadic detection of low concentrations of PCBs at the river perimeter wells is consistent with the entrainment of soil particles in the samples. PCBs were rarely detected in filtered samples, when collected. A few inorganics have been detected sporadically above GSI criteria at river boundary wells. Arsenic, manganese selenium, and thallium have been detected above the GSI value at one or more monitoring well during several post-RI monitoring events. Due to uncertainty with respect to detections of these inorganic constituents, a continuing monitoring program, using ultra-low-flow sampling methods, is proposed. The groundwater monitoring plan will be reviewed on an annual basis and recommendations for any changes to the monitoring program will be included in the annual monitoring report for MDEQ's approval.

Sep 17, 2009 18:39

DRA/Former Hillock Area

The DRA/Former Hillock Area is located in the southwest portion of the Site (Figure C-2). Prior to GM's purchase of this property in 1982, the DRA/Former Hillock Area was used for disposal purposes (several drums, drum fragments, and wastes associated with drums were identified in this area). There is no evidence to suggest that the drums found in the DRA/Former Hillock Area, or in the vicinity of the DRA/Former Hillock Area, came from any GM facility. GM removed the impacted DRA/Former Hillock Area materials and backfilled the excavated areas with clean fill.

During a test pit investigation program conducted in the DRA/Former Hillock Area in August 2000 to investigate the source of several VOCs in the groundwater within the DRA/Former Hillock Area, a concrete tile drain pipe was uncovered. The concrete tile drain pipe extends from the neighboring upgradient property into the northern portion of the former DRA/Former Hillock Area. Sampling of materials in the pipe indicated that the pipe discharges volatile organic compounds-(VOC) impacted water from an offsite source. The DRA/Former Hillock Area impacted with offsite VOCs is limited in size and the media affected is shallow groundwater.

Former Railyard Area

The Former Railyard Area is located north of the SMI Plant building (Figure C-2). The railroad tracks that provided direct access to this operations area have been removed, and the area is used for the temporary storage of miscellaneous process materials and equipment.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Investigation activities conducted in the Former Railyard Area as part of the RI indicated the presence of PCBs in surface soil at concentrations above the MDEQ generic values. To address the presence of PCBs, a surface soil excavation program was implemented in this area. Post-excavation confirmatory soil sampling results indicated that PCBs were not present in the soil samples at concentration above MDEQ generic criteria. However, select inorganics were detected at concentrations above MDEQ generic criteria for particulate inhalation. As indicated in the HHE (Appendix A of the FS Report [BBL, July 2003a]), these inorganics were detected at concentrations below the calculated SSCC for soil and therefore are not considered to present an exposure risk.

Terminated Type III Landfills

The Site contains two closed, Type III industrial solid waste landfills (referred to as the eastern and central Type III landfills, as identified by their relative location on the property). These two landfills received spent foundry sands, scrubber residues, slag, and other materials approved for Type III disposal (e.g., refractory brick and core butts). The eastern Type III landfill started receiving waste in 1979 and was closed in 1984. The central Type III landfill received wastes from 1984 (after the closure of the eastern landfill) until approximately 1990, when it was closed. Waste characterization was conducted as part of landfill permit operating requirements, and closure certifications for these two landfills have been filed with the MDEQ.

Former CTC Parking Lot

The former CTC Parking Lot is located east of the plant and immediately north of the Previous Metal Feedstock Area. Elevated concentrations of manganese have been detected in surface soil in this area of the Site. In 2001, approximately 8-inches of clean fill were placed over the area and the area was seeded with grass.

I27.7 Area

The I27.7 Area is located in the Foundry Department inside the northern portion of the SMI Plant building (Figure C-2). Polychlorinated biphenyl- (PCB-) containing oil was spilled from a transformer onto exposed soil in the I27.7 Area in 1971. The exposed soil was covered with concrete in 1972.

Melting Department

The Melting Department Area is located in the northeastern portion of the SMI Plant building (Figure C-2). The Melting Department started operation in approximately 1970 to 1975, supplying molten iron for the production of castings. Iron is melted by electric induction melting furnaces powered by five separate, numbered power supplies (Power Supply 1, 2, 3, 4, and 5). Although the features associated with each power supply vary, typical features include a control room, transformer room, generator room, hydraulic room, pit, and BUSS tunnel. PCBs were found in soil below the capacitor rooms, and following an excavation program, residual PCBs remain in a limited area.

Parking Lot North of Buffer Basin

The Parking Lot North of the Buffer Basin is located between the Buffer Basin and the Previous Metal Feedstock Area. The parking lot is paved and several borings completed through the pavement in 2007 show a one foot thick layer of paving and concrete above foundry sand fill. Manganese was detected below the paving at concentrations above the generic MDEQ criteria for particulate inhalation.

1.3 Document Format

The remainder of this document is presented in three sections. Section 2 provides a general description of the existing and proposed Site operation and maintenance (O&M) activities, and Section 3 provides a general description of existing and proposed groundwater monitoring activities for the LNAPL Assessment and Remediation Area, Quench Pit Area, the Green Point Landfill, the Saginaw River Boundary, and the Former UST #7 Area. Section 4 provides a contingency plan for the monitoring activities to be conducted for various areas of the Site.

2. Operation and Maintenance Activities

2.1 General

Routine O&M tasks will be completed to ensure the ongoing effectiveness of various Site controls discussed further in this document. Permanent markers will be installed in each of the Site areas identified in the Restrictive Covenants for the Site, and described in this OM&M Plan. The markers will be inspected on an annual basis, and maintenance of the markers will be completed as needed. Proposed modifications may be presented in the annual progress reports, or in other written communication, and changes will be implemented following MDEQ approval.

2.2 LNAPL Assessment and Remediation Area

The following section describes O&M activities of the LNAPL Assessment and Remediation Area.

2.2.1 General

The LNAPL recovery system within the LNAPL Assessment and Remediation Area (Figure C-2) was constructed in 1997. Note that this automated system is currently not operating due to the interruption of power as a result of planned plant demolition activities. Manual bailing of the monitoring and recovery wells containing a recoverable amount of LNAPL is being conducted on a monthly basis. The amount of LNAPL present in the subsurface in this area has decreased substantially, and only small quantities of LNAPL are recovered each month. As a result, GM plans to re-evaluate the recovery activities implemented in this area, and will submit a proposal to the MDEQ for appropriate modifications. Pending agreement with MDEQ on any system modifications, the wells will continue to be manually bailed until power is restored and then the system will be operated as described below.

On behalf of GM, the O&M Contractor performs O&M activities associated with the recovery system in accordance with a document entitled *LNAPL Recovery System Operation and Maintenance Plan* (O&M Plan; BBL, October 2000). The LNAPL recovery system consists of the following major elements:

- three recovery wells (RW-1 through RW-3; Figure C-2);
- LNAPL recovery and groundwater depression pumps and associated controls for the recovery wells (RW-1 also contains a skimmer pump);
- LNAPL and groundwater transfer piping within containment piping from each recovery well to the treatment system enclosure;
- a 20-foot by 25-foot treatment system enclosure; and

- treatment system equipment, including:

    - one oil/water separator (OWS);
    - one OWS LNAPL transfer pump and associated controls;
    - one OWS water transfer pump and associated controls;
    - two bag filters in parallel and associated controls;
    - two 700-pound granular activated carbon (GAC) units in series;
    - one treatment system enclosure sump pump and associated controls;
    - one in-line mixer (installed in August 1998);
    - one hydrogen peroxide metering pump (installed in August 1998);
    - three LNAPL collection totes (two totes as part of the system and a third as a spare);
    - one rain gauge; and
    - one autodialer.

Record drawings associated with the recovery system are provided in Appendix A of the O&M Plan.

The O&M Contractor is responsible for conducting routine O&M activities at the LNAPL recovery system on behalf of GM. In summary, the O&M activities include managing water, LNAPL, spent carbon, and other waste that could potentially contain VOCs, semi-volatile organic compounds (SVOCs), inorganic compounds, and PCBs. In the event any issues or problems are observed with the operation of the LNAPL recovery system, the O&M Contractor must immediately notify GM verbally and document the issue or problem and the resolution to the issue or problem within 2 weeks. Summaries of performance of the recovery system are currently prepared and submitted to the MDEQ within monthly reports for the RI/FS/RAP activities. Following acceptance of the RAP, an annual report will be prepared and submitted to the MDEQ in place of the monthly reports to present summary information regarding system performance.

2.2.2 LNAPL Recovery Well Inspections

Each recovery well is located within 48-inch-diameter by 48-inch-deep concrete manhole. Access to each manhole is provided by a heavy-duty, 24-inch by 24-inch iron cover. Within each manhole is an 18-inch-diameter well riser pipe that contains an LNAPL recovery pump and a groundwater depression pump. Recovery well RW-1 also contains a skimmer pump. Also within each manhole is a ½-inch-diameter nylon LNAPL transfer hose, 1-inch-diameter rubber groundwater transfer hose, associated valves, and electrical power and control wiring. The LNAPL and groundwater transfer hoses enter a 3-inch-diameter containment pipe at the exit point of each manhole and continue through the 3-inch-diameter containment pipe until entry into the treatment enclosure.

Each recovery well is inspected to determine the structural integrity of the concrete manhole and cover; the well riser pipe/concrete grout seal; and the LNAPL and groundwater pumps, transfer hoses, electrical wires, and valves. The hoses and valves within the manhole are inspected for any sign of leakage, and the containment pipe inspected to determine if either the LNAPL or groundwater transfer hoses are leaking between the manhole and the treatment enclosure.

2.2.3 Treatment Enclosure and Associated Equipment Inspections

The LNAPL recovery system equipment (other than the LNAPL and groundwater well pumps) is located within an insulated, ventilated, and heated 20-foot by 25-foot enclosure. The LNAPL recovery system equipment includes the following major components:

Equipment Description	Equipment Purpose
OWS	Separates LNAPL from groundwater pumped from recovery wells.
OWS LNAPL Transfer Pump	Transfers LNAPL collected in the OWS to LNAPL collection totes.
OWS Water Transfer Pump	Transfers groundwater collected in the OWS to other groundwater treatment equipment.
Hydrogen Peroxide Metering Pump	Introduces a metered amount of hydrogen peroxide to the in-line mixer.
In-Line Mixer	Mixes a metered amount of hydrogen peroxide into groundwater stream.
Bag Filter Units	Removes particulates and emulsified LNAPL from water to minimize fouling of GAC units.
GAC Units	Removes PCBs, other organics, and metals from groundwater prior to discharge to on-Site sanitary sewer.
Treatment Enclosure Sump Pump	Transfers any LNAPL or water collected in the treatment building sump to the OWS.
LNAPL Collection Totes	Provides temporary storage for LNAPL pending sampling, analysis, and disposal.

Other ancillary equipment includes manual and automatic valves; pressure gauges; pressure switches; treated groundwater discharge flow meter; pump on and off switches for the OWS and treatment building sump; and high level alarm switches for the OWS, the treatment building sump, LNAPL collection totes, and HVAC system.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

The following inspections are performed on each component of the LNAPL recovery system, as stated in the O&M Plan:

- OWS - To verify structural integrity and proper operation per manufacturer's literature.
- OWS LNAPL Transfer Pump - To verify proper operation per manufacturer's literature.
- In-Line Mixer - To verify proper operation per manufacturer's literature.
- Hydrogen Peroxide Metering Pump - To verify proper operation per manufacturer's literature.
- OWS Water Transfer Pump - To verify proper operation per manufacturer's literature.
- Bag Filter Units - For accumulation of solids or fouling that could affect filter performance. Pressure drop through the bag filter unit(s) will be determined using the pressure gauges located upstream and downstream of the bag filter unit(s).
- GAC Filter Units - For structural integrity and proper operation per manufacturer's literature. Pressure drop through the GAC filter units will be determined using the pressure gauges located upstream and downstream of the GAC filter units.

Sep 17, 2009 18:39

- LNAPL Collection Totes - For structural integrity and volume of collected LNAPL. Volume of collected LNAPL must be tracked on an Access® database or Excel® spreadsheet for reporting to the state.

- LNAPL Process Piping - For structural integrity. Pressure gauges on the process piping will be checked and pressure differentials along the process piping will be calculated to estimate scaling and fowling of the process piping.

- Treatment Enclosure - For structural integrity and proper operation of floor, roof, siding, doors, and protective bollards.

- Treatment Enclosure, Sump and Sump Pump - For structural integrity and proper operation using manufacturer's literature.

- Treatment Enclosure, HVAC and Lighting Systems - To verify proper operation per manufacturer's literature.

- Check calibration of lower explosive limit (LEL) meter.

- General check for leaks in piping and tanks.

- General housekeeping and cleaning of treatment building.

2.2.4 Maintenance Activities

The O&M Contractor performs various routine maintenance tasks to ensure the ongoing effectiveness of the LNAPL recovery system, and any maintenance needed to correct problems identified during the LNAPL recovery system inspections. All maintenance activities are recorded on an LNAPL Recovery System Maintenance Log. All maintenance is conducted according to applicable equipment warranties and per the O&M manuals provided by equipment vendors for the LNAPL recovery system. Appendix C to the O&M Plan contains the O&M manuals and warranties provided from vendors.

The O&M Contractor is required to perform routine maintenance during the inspection of the LNAPL recovery system. Non-routine maintenance is performed as soon as is feasible when a problem has been identified. Problems that threaten worker health and safety or the environment are dealt with as soon as possible. The O&M Contractor notifies GM of any non-routine required repairs prior to completing the repairs, although notification will not hold up any urgent repairs. All non-routine system repairs are addressed in a timely manner. All alarms are evaluated within 24 to 48 hours of the alarm.

If the LNAPL recovery system is off-line for more than 30 days, MDEQ will be notified in the next progress report submittal, and actions to be taken to get the system re-started will be indentified.

The O&M Contractor cleans debris off of the LNAPL recovery well concrete manholes and hinged cast iron covers so that the hinged covers operate properly. Any cracks or leaks in the concrete manhole, broken hinges, or leaks at conduit and pipe penetration seals are repaired. Recovery wells with covers open or removed are temporarily barricaded at all times to prevent traffic accidents. At a minimum, the O&M Contractor performs the following routine maintenance procedures on the LNAPL recovery well pumps, hoses, valves, hand cranks, steel cables, electrical cables, and connectors and appurtenances.

Equipment Description	Routine Maintenance Procedures
LNAPL Pump/Skimmer Pump	• Check pump discharge flow rate. • Measure thickness of LNAPL layer in well. • Maintain pump per manufacturer's recommendations. • Clean pump and remove any accumulated dirt.
Water Pump	• Check pump discharge flow rate. • Check pump motor current draw and compare to appropriate motor current draw found in pump manufacturer's literature. • Maintain pump per manufacturer's recommendations. • Clean pump and remove any accumulated dirt.
Metering Pump	• Check pump performance against manufacturer's literature. • Maintain pump per manufacturer's recommendations. • Clean pump and remove any accumulated dirt.
Hand Crank and Steel Cable	• Check for proper crank operation and condition of steel cable.
LNAPL and Water Discharge Hoses and Valves	• Check condition of hoses and valves.
Electrical Power and Control Cables	• Check condition of electrical power and control cables.

The O&M Contractor also performs other non-routine maintenance activities necessary to keep the LNAPL recovery pumps in good working condition.

The O&M Contractor performs (at a minimum) the following routine maintenance procedures:

Equipment Description	Routine Maintenance Procedures
Treatment Enclosure	• Maintain heated pre-engineered building per manufacturer's recommendations. • Maintain heated pre-engineered building in a clean, neat, and organized condition.
Treatment Enclosure Sump Pump	• Maintain per manufacturer's recommendations.
OWS	• Clean coalescing screen as needed and maintain unit per manufacturer's recommendations.
OWS LNAPL Transfer Pump	• Maintain per manufacturer's recommendations.
OWS Water Transfer Pump	• Maintain per manufacturer's recommendations.
Hydrogen Peroxide Pump	• Maintain per manufacturer's recommendations.
Bag Filter Units	• Provide replacement filters and replace bag filter elements, as needed, when the differential pressure increases and maintain filter housings per manufacturer's recommendations.
GAC Filter Units	• Replace carbon in primary GAC unit if analytical results of water testing indicate breakthrough of PCBs in the primary unit. During carbon replacement, the primary GAC unit will be replaced with the secondary GAC unit and the newly rebedded carbon unit will be positioned as the secondary GAC unit. • Allow carbon to sit in water for a minimum of 8 to 12 hours after filling to allow air to leave system.
LNAPL Collection Totes	• Clean high level float and switches, as needed, to maintain proper operation. • Drain off any water that accumulates in the collection tote to the enclosure sump using drain valve and hose at bottom of collection tote. • Transfer LNAPL into GM-provided containers, as needed, to maintain sufficient LNAPL storage capacity.
Process Control Panel	• Maintain per manufacturer's recommendations.
Autodialer	• Maintain per manufacturer's recommendations.
Rain Gauge	• Maintain per manufacturer's recommendations.
LEL Meter	• Calibrate per manufacturer's recommendations.

The O&M Contractor performs other non-routine maintenance activities such as cleaning or replacing well pumps, replacing cut or cracked hoses and electrical cables, making repairs to treatment enclosure and floor, or other measures necessary to keep the LNAPL recovery system equipment in good working condition.

The maintenance performed by the O&M Contractor is recorded on the LNAPL Recovery System Maintenance Log.

2.2.5 Transport and Disposal Activities

The O&M Contractor is responsible for the on-Site transport of waste materials generated during operation of the LNAPL recovery system to a designated storage area. The O&M Contractor arranges to change out the spent carbon. All waste containers are labeled in accordance with Department of Transportation (DOT) regulations at 49 CFR 107 and 171-189, as well as applicable Resource Conservation and Recovery Act (RCRA) and Toxic Substances Control Act (TSCA) regulations.

The O&M Contractor is responsible for on-Site handling and coordinating with GM environmental personnel for the off-Site transport and disposal of the recovered LNAPL, spent carbon, and other waste generated during O&M activities. Offsite transport and disposal activities are conducted in accordance with Section 5 of the O&M Plan. Information related to off-Site transport and disposal activities is included in the O&M Contractor's annual report to the GM Site contact.

2.3 Quench Pit Area

The LNAPL recovery system in the Quench Pit Area, which is not currently operating because of upcoming demolition activities, consists of an LNAPL skimmer recovery pump located at well QPTW-3. LNAPL is discharged to a storage tote, and the LNAPL is shipped offsite on an as needed basis for disposal. The system is monitored on a regular basis to track recovery progress and maintain system operation. Manual bailing of the wells containing a recoverable thickness of LNAPL is being completed on a monthly basis, pending re-start of the automated system once electricity can be re-routed to the system.

2.4 Green Point Landfill

The following section describes O&M activities at the Green Point Landfill.

2.4.1 General

O&M activities at the Green Point Landfill are implemented in accordance with provisions contained in the *Final Engineering Design Report for the Green Point Landfill* (BBL, January 1998). This OM&M Plan is based on conducting these activities for a period of up to 30 years from the date of the landfill cover system certification (i.e., January 2000). However, these activities or an appropriate subset of these activities may be continued beyond 30 years if, at that time, the monitoring data show that an ongoing risk remains. O&M activities will be reviewed on an annual basis and recommendations for modification, as needed, will be included in the annual monitoring report for MDEQ's approval.

General activities associated with O&M include maintaining the following:

- integrity and effectiveness of the cover system, including erosion controls;
- maintaining and monitoring the groundwater monitoring system;
- passive gas venting system;
- environmental monitoring system; and
- created mitigation wetlands.

2.4.2 Facility Inspections

Inspections of the Green Point Landfill currently occur on a bi-annual basis. Based on the results of eight years of inspections, it is proposed that future monitoring be conducted on an annual basis. The inspections will be made during completion of the annual groundwater sampling activities described in Section 3. Those items assessed during the inspections include the following:

- cover system;
- surface-water drainage system;
- passive gas venting system;
- groundwater monitoring wells;
- surface-water monitoring points;
- Site access and security system;
- wetlands; and
- overall Site appearance and aesthetics.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

2.4.3 Landfill Cover System

Cover maintenance and repair will be required if an inspection reveals excessive settlement that causes ponding of surface water, erosion of the soil from the cover, slope failure, loss of vegetation, and cracking and/or other disturbance of the landfill cover system.

Excessive settlement that causes ponding on the cover will be repaired by stripping away the soils above the barrier layer, placing and compacting low permeability soil within the low spot, and replacing the excavated soils. Once proper slope is restored, the disturbed area will be reseeded.

Erosion, slope failures, and cracking and/or other disturbances of the cover system will be repaired by regrading or by placing appropriate materials in the affected areas and immediately reseeding to establish vegetative growth.

2.4.4 Surface-Water Drainage System

Maintenance, repair, and replacement (if necessary) of the components of the surface-water drainage system will be performed on an as-needed basis. Cleaning of the drainage structures will be performed as necessary, based on visual evidence of blockage or obstructions due to siltation or other reasons.

Sep 17, 2009 18:39

2.4.5 Passive Gas Venting System

General maintenance activities that may be required periodically include inspection and replacement (if necessary) of piping, connections, or screens. Broken or clogged gas vents will be replaced.

2.5 Terminated Type III Landfills, Former CTC Parking Lot, I27.7 Area, Melting Department, Saginaw River Boundary, Former Railyard, and Parking Lot North of Buffer Basin

Cover materials of the two Terminated Type III Landfills, the Former CTC Parking Lot, the I27.7 Area, the Melting Department and the Parking Lot North of the Buffer Basin will be inspected on an annual basis. The Terminated Type III Landfills and the former CTC Parking Lot are covered with soil and an established grass cover. The I27.7 Area and the Melting Department are located within the SMI Plant, and are covered with the concrete floor. The Parking Lot North of the Buffer Basin is currently paved. A cover, either of soil or paving, will continue to be maintained for both the I27.7 and parking lot areas.

The vegetative cover and any constructed roadways in the Saginaw River Berm Area and the Former Railyard will be inspected on an annual basis to verify that the vegetative cover has been maintained and that any roadway surfaces are in good condition and are either paved or constructed with a minimum thickness of 6-inches of gravel to minimize the creation of dust. Pavement and gravel surfaces will be inspected to ensure that breakthrough to underlying soils is not occurring where traffic is present.

3. Monitoring Activities

3.1 General

The objective of monitoring activities is to collect data to continue to understand conditions at the Site. As conditions change, monitoring activities, including sampling locations, sampling frequency, and the laboratory analyte list, may need to be revised. Proposed modifications may be presented in the annual progress reports, or in other written communication, and changes will be implemented following MDEQ approval. Table C-2 provides a summary of groundwater monitoring activities for each area.

3.2 LNAPL Assessment and Remediation Area

Groundwater and LNAPL Level Monitoring Activities

To monitor the extent of LNAPL present in the LNAPL Assessment and Remediation Area portion at the Site, GM currently collects LNAPL thickness and water-level measurements at select wells on a monthly basis. Due to the consistency and overall reduction in the extent of LNAPL observed in the Site monitoring wells, the frequency of monitoring activities will be reduced to an annual schedule. The LNAPL Assessment and Remediation Area is located south of the GM SMI Plant (Figure C-2). Measurements have been used to track seasonal fluctuations in the groundwater table, investigate groundwater flow conditions, and monitor the LNAPL thickness at various locations. The proposed wells to be initially subject to monitoring activities include: MW-147WT, MW-158WT, MW-160WT, MW-169WT, MW-172WT, MW-178WT, MW-180WT, RW-1, RW-2, RW-3, and TP-2. Due to storage of plant materials in this area of the Site and occasional movement of gravel over the well tops, the identified wells have not always been accessible for monitoring. Groundwater elevation and LNAPL thickness contour maps will be included in the annual monitoring report. Monitoring well locations within the LNAPL Assessment and Remediation Area are shown on Figure C-2.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

LNAPL removed during monitoring activities will be placed into the LNAPL storage totes in the treatment building and disposed of properly once the totes are full.

Sampling and Analysis

In addition to the activities identified above, the O&M Contractor is also responsible for the sampling and analysis of treated groundwater, collected LNAPL, and spent carbon.

System influent and treated groundwater collected after the secondary GAC unit is currently sampled and analyzed monthly for the following constituents:

- VOCs using USEPA Method 8260;
- SVOCs using USEPA Method 8270;
- PCBs using USEPA Method 608;
- inorganics using USEPA 6010 and 7000 Series; and
- flash point USEPA Method 1010.

Richard Kowalski
LFR
Sep 17, 2009 18:39

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Treated groundwater collected after the primary GAC unit is also sampled and analyzed for the following constituents:

- PCBs using USEPA Method 608.

The collected LNAPL and spent carbon are sampled and analyzed, as needed, for disposal characterization as required by the GM National Disposal Contractor.

GM may propose to the City of Saginaw a decreased frequency of sampling and/or a change in the analytical parameter list for system influent and treated groundwater, based on the eleven years of operational data now available.

3.3 Quench Pit Area

LNAPL thickness and water-level measurements will be collected within the Quench Pit Area at select monitoring wells on an annual basis. The Quench Pit Area is located within the central portion of the GM SMI Plant (Figure C-2). Measurements will be used to track seasonal fluctuations in the groundwater table beneath the plant and monitor the LNAPL thickness at various locations. Monitoring activities are anticipated to be performed at the following monitoring wells: QPTW-01, QPTW-02, QPTW-03, QPTW-04, QPTW-05, QPTW-10, and QPTW-13. Monitoring well locations within the Quench Pit Area are shown on Figure C-2.

3.4 Green Point Landfill

In accordance with Appendix K (Environmental Monitoring Plan [EMP]) of the document entitled *90% Engineering Design Report, Green Point Landfill* (BBL, October 1997), as modified with MDEQ approval, GM will continue to monitor groundwater in the vicinity of the Green Point Landfill (Figure C-2). The proposed monitoring plan, summarized below, includes modifications to the original monitoring plan that have been previously approved by the MDEQ, and additional changes that are based on the collection of a substantial amount of additional data during the past year. The proposed groundwater monitoring activities include the following:

- Collection of groundwater elevation measurements at monitoring wells on an annual basis in proximity to the Green Point Landfill to allow construction of a water table contour map;

- Annual sampling of 13 groundwater monitoring wells (MW-117WT, MW-117S1, MW-118WT, MW-118S1, MW-183WT, X-4A, X-4CAUGR, X-4D, X-9AR, X-9BR, X-9CAUG, X-9D, and X-10BR2; Figure C-2 and Table C-2);

- Analysis of the collected samples from all wells for site analyte list dissolved inorganic constituents, dissolved cyanide , total dissolved solids, pH, chloride , sulfate, nitrate (as N), nitrite (as N), and ammonia nitrogen. Analytical methods will be used, as specified in the Site QAPP, as amended.

- Analysis of samples collected from river perimeter monitoring wells for site analyte list total inorganic constituents (MW-183WT, X-4A, X-4CAUGR, X-4D, X-9AR, X-9BR, X-9CAUG, and X-9D) using ultra-low flow sampling methods.

Sep 17, 2009 18:39

The site inorganic constituent analyte list includes the following metals: arsenic, barium, iron, manganese, mercury, selenium, and sodium. This list consists of those analytes detected on more than one date at concentrations above the generic Part 201 criteria at any Green Point Landfill monitoring location from 2004 to 2008.

GM will prepare and submit an EMP Monitoring Report to the MDEQ Environmental Response Division within 90 days of receiving the analytical data from the laboratory. The EMP report will present a review of the analytical data and recommendations for changes to the monitoring plan based on the collected data. GM may propose to the MDEQ deletion of constituents from the monitoring plan based on the existing sampling data. The EMP will continue to be implemented until the data demonstrate that continued monitoring is not necessary.

3.5 Saginaw River Boundary

As referenced in the Feasibility Study Final Report (BBL, July 2003b), PCBs have been sporadically detected along the Saginaw River boundary at low concentrations at six water table monitoring wells and at one deeper monitoring well during previous investigations. Groundwater samples collected along the river were previously analyzed for both unfiltered and dissolved (filtered) PCBs. At the seven permanent monitoring well locations along the river, PCBs were detected in unfiltered samples only, suggesting that PCBs were absorbed to particulates that are larger than the filter size of 0.45 microns.

Initially, annual groundwater monitoring activities for PCBs at select groundwater monitoring well locations is proposed. Specifically, MW-110WTR (replacing MW-110WT), MW-111WT, MW-114WT, MW-185WT, and MW-186WT will be included in the PCB sampling program, provided that the wells contain sufficient groundwater to allow sample collection. For the monitoring program, samples will be collected using "ultra" low-flow sampling methods for laboratory analysis. GM may decide to analyze both filtered and unfiltered samples for PCBs to evaluate particulate impacts on the data.

The GSI groundwater monitoring program includes the following monitoring wells: MW-107WT, MW-107S1, MW-108SWT, MW-108S2, MW-110WTR, MW-111WT, MW-114WT, MW-114S2, MW-149WT, MW-185WT, MW-186WT, and X-4AR. Monitoring well MW-108WT will be sampled for SVOCs to provide data downgradient of the Eastern Terminated Landfill, in response to the historical detection of several SVOCs at the landfill. In addition, unfiltered samples will be collected from select monitoring wells for analysis of inorganic constituents. Specifically, the following samples will be collected at MW-186WT (manganese and thallium analysis), MW-107WT (arsenic, manganese and thallium analysis), MW-108WT (manganese analysis), MW-110WTR (manganese and thallium analysis), MW-111WT (manganese and thallium analysis), MW-114WT (manganese and thallium analysis), MW-149WT (arsenic, manganese, and thallium analysis), MW-185WT (manganese and thallium analysis) and X-4AR (thallium and manganese analysis).

At the request of the MDEQ, the GSI monitoring points (listed above) will also be sampled for those general chemistry parameters that have GSI criteria. Specifically, the following general chemistry constituents will be monitored at one or more of the GSI wells: dissolved oxygen (DO), ammonia, total phosphorus, and manganese. Due to the potential influence of non-Site-related factors, not all of the GSI monitoring points will be analyzed for the full list of general chemistry parameters. Specifically, DO and manganese (due to anoxic conditions) may be impacted by the Queen (Center) Street Dump Area. Therefore, the downgradient monitoring well (MW-149WT) will not be analyzed for those constituents.
Monitoring wells in the upper sand unit: MW-107S1, MW-108S2 and MW-114S2 will be monitored for ammonia nitrogen only.

Sep 17, 2009 18:39

Field data, laboratory analytical results, and conclusions and recommendations of each groundwater sampling event will be presented in groundwater monitoring reports presented to the MDEQ. Contingency actions to be taken in the event of the detection of the monitored constituents at concentrations above the GSI criteria are described in Section 4.

3.6 DRA/Former Hillock Area

Previous investigations performed in the DRA/Former Hillock Area have indicated several VOCs and one SVOC present in groundwater as a result of discharge of impacted water through a drain tile from the adjacent property to the west of the Site. The DRA/Former Hillock Area is located in the southwest portion of the Site (Figure C-2). The monitoring program will consist of the collection of one groundwater sample per year from monitoring well TWW-1, to monitor the progress of VOC attenuation. Monitoring will continue until a downward trend in VOC concentrations is established. When appropriate, a proposal to stop sampling at this location will be made to the MDEQ in the annual report.

3.7 Reporting

The results of the monitoring activities will be provided in an annual monitoring report. The annual monitoring report will include a site wide groundwater elevation contour map, annual groundwater elevation and LNAPL thickness maps of the LNAPL assessment area, data box figures for the Green Point Landfill data, and data summary tables. The report will also include recommendations for future monitoring.

4. Contingency Plan

4.1 General

The majority of the monitoring activities described in this plan are being implemented in areas for which a significant body of historical data are available that show stability of LNAPL and/or the concentrations of dissolved constituents. For example, the LNAPL plume located south of the plant building has been monitored on a monthly basis since 1997, and is documented to be decreasing in size. In addition, the monitored areas, with the exception of the Saginaw River Boundary, are located within the interior of the property. Therefore, since there is no immediate danger of off-Site impacts in the case of a change in the concentration or distribution of the monitored constituents, data will be reported in an annual report, as described in Section 3. In the event that collected monitoring data show a significant change, contingency actions will consist of the submittal to the MDEQ of a Work Plan for proposed response actions within 60 working days of data receipt. The Work Plan will present a schedule for the completion of appropriate response actions, based on the change that is present at the time. Due to the historical variability of the groundwater data collected adjacent to the Saginaw River and the anticipated periodic detection of PCBs, a specific contingency plan is described in the following section. Proposed modifications may be presented in the annual progress reports, or in other written communication, and changes will be implemented following MDEQ approval.

4.2 Saginaw River Boundary

Due to the presence of low concentrations of PCBs, and several inorganics (arsenic, manganese, selenium, and thallium) within the fill material surrounding the well screens of the Saginaw River boundary monitoring wells, it is expected that the GSI criteria may periodically be exceeded at these wells. Sampling activities have been shown to result in the mobilization of particulates and any associated adsorbed compounds, resulting in periodic low detections of the monitored constituents. It is not believed that these periodic detections indicate the migration of the detected constituents to the River via groundwater. However, due to the proximity of the berm fill material to the River, it is necessary to use the monitoring points screened within the fill material to monitor for possible discharges to the River.

To sequentially address the detection of PCBs, arsenic, manganese, and thallium at concentrations above Groundwater/Surface Water Interface (GSI) criteria (and background), the following contingency steps will be implemented:

- Specific monitoring wells where sample analytes are detected at concentrations that exceeded the generic MDEQ GSI criteria, or the mixing zone based criteria where applicable, will be re-sampled for the relevant constituents within 30 working days (six work weeks) of data receipt. In addition, an assessment as to the potential cause of the exceedance will be provided, if known (e.g., anoxic conditions may cause elevated manganese concentrations).

- The analytical data will be provided to the MDEQ within four weeks of sample collection.

- If the original detection of the relevant constituent that was above criteria (and background) is not confirmed by the re-sampling event or is demonstrated to be related to the Queen Street Dump , no further response activities outside of the annual monitoring activities will be necessary.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

- If the detection of the relevant constituent remains at concentrations above criteria (and background) during the re-sampling event and is not related to the Queen Street Dump, response activities will be proposed to the MDEQ within three weeks of receipt of the laboratory analytical data package. Initial response actions could consist of the installation and sampling of a replacement well(s), remediation, additional testing, or other response activity appropriate to the circumstance. Alternate monitoring well or sample collection methods to minimize the introduction of particulates into the sample or to obtain more representative samples will be used. To address concentrations of monitored constituents above GSI criteria other than PCBs, for which a mixing zone has not previously been requested, a mixing zone determination may be requested.

- If the initial response action of new well installation and sampling do not resolve the issue, a work plan to address the issue will be submitted to MDEQ within 60 days of data receipt from the new wells.

Following implementation of response activities, the groundwater monitoring program will be conducted on a semi-annual basis, continuing until two consecutive sampling rounds indicate concentrations of monitored constituents at concentrations not exceeding the relevant criteria, at which time the annual monitoring program will be re-established. A proposal to remove individual analytes from the sampling program will be submitted to the MDEQ following their absence above criteria (and/or background for inorganics) during three consecutive annual sampling events.

SAGINAW, MICHIGAN

No.	Site Area	Operation, Maintenance, and Monitoring Activities	Standard Reporting
1.	LNAPL Assessment and Remediation Area	Routine O&M of LNAPL Recovery System.	Annual report
		- periodic system inspection.	
		- sampling and disposal of LNAPL and spent carbon as needed.	
		Sampling of the influent and discharge from the treatment system as per City requirements.	
		Annual monitoring of groundwater and LNAPL elevations at 12 monitoring wells.	
		Annual inspection of permanent markers.	
2.	Quench Pit Area	Routine O&M of LNAPL Recovery System.	Annual report
		- periodic system inspection.	
		- sampling and disposal of LNAPL as needed.	
		Annual monitoring of groundwater and LNAPL elevations at select monitoring wells.	
		Annual inspection of permanent markers.	
3.	Green Point Landfill	Annual inspection of cover system, surface water drainage system, gas venting system, monitoring wells, site security, and wetlands.	Annual report
		Maintenance and repair actions as needed based on the annual inspections.	
		Annual sampling of 13 monitoring wells.	
		Annual measurement of water levels at monitoring wells in the vicinity of the landfill.	
		Annual inspection of permanent markers.	
4.	Saginaw River Boundary	Annual sampling of 12 wells.	Annual report; with interim deliverables required if GSI criteria are exceeded.
		Annual inspection of vegetative cover and roadways.	
		Annual inspection of permanent markers.	
5.	Drum Remediation/Former Hillock Area	Annual inspection of permanent markers.	Annual report
		Annual sampling of one monitoring well.	
6.	Former Railyard Area	Annual inspection of vegetative cover and roadways.	Annual report
		Annual inspection of permanent markers.	
7.	Terminated Type III Landfills	Annual cover inspection.	Annual report
		Annual inspection of permanent markers.	
8.	Former CTC Parking Lot	Annual cover inspection.	Annual report
		Annual inspection of permanent markers.	
9.	I27.7 Area	Annual cover (soil or paving) inspection.	Annual report
		Annual inspection of permanent markers.	
10.	Melting Department	Annual cover (soil or paving) inspection.	Annual report
		Annual inspection of permanent markers.	
11.	Parking Lot North of Buffer Basin	Annual cover (soil or paving) inspection.	Annual report
		Annual inspection of permanent markers.	

Notes:
1. Reporting for various site areas will be combined, whenever possible.
2. The sampling activities listed are those proposed for initial implementation at the Site. Based on the data, there are provisions to either increase or decrease the scope and frequency of the proposed sampling programs.

DECLARATION OF RESTRICTIVE COVENANT

MDEQ Reference No.: RC-RRD-[Yr]-[number]

This Declaration of Restrictive Covenant ("Restrictive Covenant") has been recorded with the Saginaw County Register of Deeds for the purpose of protecting public health, safety, welfare, and the environment by prohibiting or restricting activities that could result in unacceptable exposure to environmental contamination present at certain property located in the City of Saginaw, County of Saginaw and legally described in Exhibit 1 attached hereto (the "Property"). The Property is associated with General Motors Corporation-Saginaw Malleable Iron Plant, Site I.D. 73000014, for which a remedial action plan is being conducted by General Motors Corporation, a Delaware corporation ("GM"). The remedial action that is being implemented to address environmental contamination is fully described in the Remedial Action Plan, Saginaw Malleable Iron Plant Property and REALM, Inc., Green Point Landfill and Drum Remediation Area, dated July 2008 ("RAP"), and submitted by GM, Remediation And Liability Management, Inc. ("REALM, Inc.") and Waste Management, Inc. to the Michigan Department of Environmental Quality ("MDEQ"). The MDEQ approved the RAP on _____, __ 2009, pursuant to Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended ("NREPA"), MCL 324.20101 et seq.

The RAP requires the recording of this Restrictive Covenant with the Saginaw County Register of Deeds to: 1) restrict unacceptable exposures to hazardous substances located on the Property; 2) assure that the use of the Property is consistent with the exposure assumptions utilized in the development of cleanup criteria pursuant to Section 20120a(1)(g) and (1)(i) of the NREPA and the exposure control measures relied upon in the RAP; and 3) to prevent damage or disturbance of any element of the response activity constructed on the Property. The restrictions contained in this Restrictive Covenant are based upon information available to the MDEQ at the time the RAP was approved by the MDEQ. Failure of the response activities to achieve and maintain the criteria, exposure controls, and requirements specified in the RAP; future changes in the environmental condition of the Property or changes in the cleanup criteria developed under Section 20120a(1)(g) and (1)(i) of the NREPA; the discovery of environmental conditions at the Property that were not accounted for in the RAP; or use of the Property in a manner inconsistent with the restrictions described herein, may result in this Restrictive Covenant not being protective of public health, safety, and welfare, and the environment.

Exhibit 2 provides a survey and location figure of the Property that is subject to the land use or resource use restrictions which apply to the entire Property and are described in Paragraphs 1, 2a, and 2b below, and Exhibits 3-13 provide the legal descriptions and surveys that distinguishes those portions of the Property that are subject to other specific land use or resource use restrictions as specified herein.

Summary of Response Activities

Soil excavation activities have occurred in the Melting Department Area, the Former Railyard Area, the Saginaw River Berm Area, and the Unpaved Area located south of the GM Saginaw Malleable Iron Plant. Erosion control measures to mitigate berm erosion by surface-water runoff will be implemented in the Saginaw River Berm Area. The Saginaw River Berm Area will be graded to fill existing rills and provide a smooth surface. A vegetative cover will then be established.

Definitions

"Intrusive Activities" means any activities that involve physical intrusion into the subsurface.

"MDEQ" means the Michigan Department of Environmental Quality, its successor entities, and those persons or entities acting on its behalf.

"Owner" means at any given time the then current fee title owner of the Property or any portion of the Property. GM is the current Owner.

All other terms used in this document which are defined in Part 3, Definitions, of the NREPA; Part 201 of the NREPA; or the Part 201 Administrative Rules ("Part 201 Rules"), 1990 AACS R 299.5101 et seq., shall have the same meaning in this document as in Parts 3 and 201 of the NREPA and the Part 201 Rules, as of the date of filing of this Restrictive Covenant.

NOW THEREFORE,

Declaration of Land Use and Resource Use Restrictions

Pursuant to the RAP and Consent Judgment #98-22686-CE-2 entered by the Circuit Court of Saginaw County, GM as current Owner of the Property, hereby declares and covenants that the Property shall be subject to the following restrictions and conditions:

1. The Owner shall prohibit all uses of the Former Railyard Area and the LNAPL Assessment and Remediation Area that are not compatible with the limited industrial and limited commercial II categories under Section 20120a(1)(g) and (1)(i) of the NREPA and generally described in the Description of Allowable Uses, attached hereto as Exhibit 14. The Owner shall prohibit all uses of the rest of the Property (excluding the Former Railyard Area and the LNAPL Assessment and Remediation Area) that are not compatible with the limited industrial and limited commercial II, III, and IV categories under Section 20120a(1)(g) and (1)(i) of the NREPA and generally described in the Description of Allowable Uses, attached hereto as Exhibit 14. The Owner may re-evaluate the exceedances and make appropriate changes or additional remediation for the allowable land use, provided that the changes and new land use are reviewed and approved by GM and the MDEQ. Cleanup criteria for land use-based response activities are located in the Government Documents Section of the State of Michigan Library. The following uses allowed under the City of Saginaw M-2 General Industrial zoning code designations are prohibited on the Property:

Hotels and Motels

Penal and correctional institutions and detention facilities subject to the standards in §§ 153.490 *et seq* of the Saginaw Code of Ordinances.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

2. The Owner shall prohibit activities on the Property that may result in exposures above levels established in the RAP. These prohibited activities include:

a. No activities at the Property are allowed that may permanently interfere with the Remedial Action, operation or maintenance, monitoring, or other measures necessary to assure the effectiveness and integrity of the Remedial Action except as approved by the MDEQ and GM; provided, however, that the foregoing shall not be construed to apply to or restrict temporary interruptions such as maintenance, repair and replacement of existing structures and facilities that are consistent with any limitations relating to worker protection contained in this Restrictive Covenant, which is hereby specifically permitted.

b. In order to restrict the use and consumption of groundwater, wells shall not be installed on the Property for extracting groundwater for potable or domestic uses. This provision does not prohibit installation of wells for: environmental study, monitoring, or remediation; dewatering of excavations; non-contact cooling water; ground water heat pumps; or for emergency purposes, provided that the installation and operation of such wells is in compliance with applicable federal,

state and local laws and regulations and the fluids are managed in accordance with the requirements of Section 20107a of NREPA and other applicable local, state and federal laws and regulations.

c. To protect against direct contact with light non-aqueous phase liquid ("LNAPL") and/or hazardous substances present in subsurface soil in the **LNAPL Assessment and Remediation Area (Exhibit 3) and Quench Pit Area (Exhibit 4)**, Intrusive Activities must be completed in accordance with the health and safety requirements set forth under MiOSHA, the OSHA, and all other applicable local, state, and federal laws and regulations. The MDEQ shall be notified whenever these activities are undertaken and records shall be kept of activities that can be reviewed by the MDEQ upon request for five years. Prior to the implementation of any Intrusive Activities, an evaluation of soil and soil vapors must be completed. Proposed Intrusive Activities can be undertaken if the evaluation demonstrates that unacceptable exposures above the then applicable soil volatilization to indoor air inhalation, volatilization to ambient air inhalation, and direct contact criteria would not result. Activities in these areas of the Property are restricted so that a maintenance worker spends no more than 160 days, per any such worker per year, and access by an intrusive/construction worker spends no more than 30 days, per any such worker per year, in the area. All excavated soils and extracted fluids shall be managed in accordance with the requirements of section 20107a of NREPA and all other applicable local, state, and federal laws and regulations.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

d. In order to protect against inhalation of hazardous substances in indoor air that migrate from contaminated soil in the **Former UST #7 Area**, no new enclosed structure suitable for short or long term human habitation shall be constructed on the Property in the area delineated in Exhibit 5 as the former UST #7 Area without the use of an adequate vapor barrier under such new enclosed structure, unless it can be demonstrated to the satisfaction of the MDEQ that the soil or soil vapor in these areas meets applicable MDEQ soil volatilization to indoor air criteria (or equivalent) established at the time of the new construction. All excavated soils and extracted fluids shall be managed in accordance with the requirements of section 20107a of NREPA and all other applicable local, state, and federal laws and regulations.

e. In order to protect against the inhalation of impacted soil particulates containing hazardous substances present in soil, the soil and grass cover must be maintained in the **Former Casting Technology Center (CTC) Parking Lot East of the Plant Area (Exhibit 6),** and a cover must be maintained over the **Parking Lot North of the Buffer Basin Area (Exhibit 7).** In the event the cover is disrupted or temporarily removed by Owner, it shall be restored by Owner at Owner's expense. Activities in the Former CTC Parking Lot East of the Plant Area (Exhibit 6) and Parking Lot North of the Buffer Basin Area (Exhibit 7) are restricted so that access by an intrusive/construction worker spends no more than 30 days, per any such worker per year, in the area. To implement

activities in these areas that are inconsistent with current facility operations, activities must be completed in accordance with the health and safety requirements set forth under MiOSHA, the OSHA, and all other applicable local, state, and federal laws and regulations. All excavated soils and extracted fluids shall be managed in accordance with the requirements of section 20107a of NREPA and all other applicable local, state, and federal laws and regulations.

f. In order to protect against direct contact with hazardous substances potentially present in soil or fill material in the **Type III Landfills Area (Exhibit 8), I27.7 Area (Exhibit 9) and Melting Department Area (Exhibit 10),** cover materials must be maintained. In the event the covers are disrupted or temporarily removed by Owner, they shall be restored by Owner at Owner's expense. Intrusive Activities must be completed in accordance with the health and safety requirements set forth under MiOSHA, the OSHA, and all other applicable local, state, and federal laws and regulations. The MDEQ shall be notified whenever these activities are undertaken and records shall be kept of activities that can be reviewed by the MDEQ upon request for five years. All excavated soils and extracted fluids shall be managed in accordance with the requirements of section 20107a of NREPA and all other applicable local, state, and federal laws and regulations.

g. In order to protect against the inhalation of nonvolatile hazardous substances present in surface soil of the **Former Railyard Area (Exhibit 11) and the Previous Metal Feedstock Area (Exhibit 12)**, the vegetative cover must be maintained (minimum of 50% coverage of soil surface) and roadways may not be installed unless properly constructed (with at least 6-inches of gravel, or pavement). In the event the vegetative cover is disrupted or temporarily removed by Owner, it shall be restored by Owner at Owner's expense. Activities in the Former Railyard Area (Exhibit 11) and the Previous Metal Feedstock Area (Exhibit 12) are restricted so that a maintenance worker spends no more than 160 days, per any such worker per year, and an intrusive/construction worker spends no more than 30 days, per any such worker per year, in the area. To implement activities in these areas that are inconsistent with the above restrictions, health and safety requirements set forth under MiOSHA, the OSHA, and all other applicable local, state, and federal laws and regulations must be followed. All excavated soils and extracted fluids shall be managed in accordance with the requirements of section 20107a of NREPA and all other applicable local, state, and federal laws and regulations.

h. In order to protect against the inhalation of impacted soil particulates containing hazardous substances present in surface and subsurface soil located in the **Saginaw River Boundary area (Exhibit 13)**, the vegetative cover must be maintained (minimum of 50% coverage of soil surface) and new roadways may not be installed unless properly constructed (with at least 6-inches of gravel, or pavement). In the event the vegetative cover is disrupted or temporarily removed by Owner, it shall be restored by Owner at Owner's expense. Activities in the

Saginaw River Boundary Area (Exhibit 13) are restricted so that a maintenance worker spends no more than 160 days, per any such worker per year, and an intrusive/construction worker spends no more than 30 days, per any such worker per year, in the area. To implement activities in this area that are inconsistent with the above requirements, health and safety requirements set forth under MiOSHA, the OSHA, and all other applicable local, state, and federal laws and regulations must be followed. Excavated impacted subsurface soils shall not be brought to and used as surface soil unless they meet the applicable criteria for that area of the Property.

3. The Owner shall prohibit activities on the Property that may interfere with any element of the RAP, including the performance of operation and maintenance activities, monitoring, or other measures necessary to ensure the effectiveness and integrity of the RAP in the RAP; provided, however, that the foregoing shall not be construed to apply to or restrict maintenance, repair and replacement of existing structures and facilities, which is hereby specifically permitted or those activities specifically approved by the MDEQ and GM. Any disruption to the effectiveness and integrity of the RAP shall be temporary and in accordance with any health and safety requirements for that particular area. All excavated soils and extracted fluids shall be managed in accordance with the requirements of section 20107a of NREPA and all other applicable local, state, and federal laws and regulations

4. Permanent Markers. The Owner shall not remove, cover, obscure, or otherwise alter or interfere with the permanent markers placed at the locations noted in Exhibit 2. The Owner shall keep vegetation and other materials clear of the permanent markers to assure that the markers are readily visible.

Sep 17, 2009 18:39

5. Contaminated Soil Management. The Owner shall manage all soils, media and/or debris located on the Property in accordance with the applicable requirements of Section 20120c of the NREPA; Part 111, Hazardous Waste Management, of the NREPA; Subtitle C of the Resource Conservation and Recovery Act, 42 U.S.C. Section 6901 et seq.; the administrative rules promulgated thereunder; and all other relevant state and federal laws.

6. Access. The Owner shall grant to the MDEQ, GM, and REALM, Inc., and their designated representatives, the right to enter the Property at reasonable times for the purpose of determining and monitoring compliance with the RAP, including the right to take samples, inspect the operation of the response activities and, inspect any records relating thereto, and to perform any actions necessary to maintain compliance with Part 201 and the RAP.

7. Notice. The Owner shall provide notice to the MDEQ, and to GM if at the time GM is no longer the Owner, of the Owner's intent to transfer any interest in the Property at least fourteen (14) business days prior to consummating the conveyance. This notice requirement does not obviate the requirement to comply with any other applicable notice requirement. A conveyance of title, easement, or other interest in the Property shall not be consummated by the Owner without adequate and complete provision for compliance with the terms and conditions of this Restrictive Covenant and the applicable provisions of Section 20116 of the NREPA. The notice required to be made to the MDEQ under this Paragraph shall be made to: Director,

MDEQ, P.O. Box 30473, Lansing, Michigan 48909-7973; and shall include a statement that the notice is being made pursuant to the requirements of this Restrictive Covenant, MDEQ Reference Number RC-RRD-[YR]-[number]. The notice required to be made to GM under this Paragraph shall be made to: Cheryl Hiatt, WFG – Engineering Center – West, 30200 Mound Road, Mail code: 480-111-W60, Warren, MI 48090. A copy of this Restrictive Covenant shall be provided to all future owners, heirs, successors, lessees, easement holders, assigns, and transferees by the person transferring the interest.

8. Term and Enforcement of Restrictive Covenant. This Restrictive Covenant shall run with the Property and shall be binding on the Owner; future Owners; and all current and future successors, lessees, easement holders, their assigns, and their authorized agents, employees, or persons acting under their direction and control. This Restrictive Covenant may only be modified or rescinded with the written approval of the MDEQ and GM.

The State of Michigan, through the MDEQ, and GM may enforce the restrictions set forth in this Restrictive Covenant by legal action in a court of competent jurisdiction.

9. Severability. If any provision of this Restrictive Covenant is held to be invalid by any court of competent jurisdiction, the invalidity of such provision shall not affect the validity of any other provisions hereof, and all such other provisions shall continue unimpaired and in full force and effect.

10. Authority to Execute Restrictive Covenant. The undersigned person executing this Restrictive Covenant is the Owner, or has the express written permission of the Owner and all other holders of a legal interest whose interest is materially affected by this Restrictive Covenant, and represents and certifies that he or she is duly authorized and has been empowered to execute and deliver this Restrictive Covenant.

NOTES:

1. THIS PHOTOGRAMMETRIC BASE MAP FOR THE GM SAGINAW MALLEABLE IRON PLANT AND DELPHI SAGINAW STEERING SYSTEMS PLANT 2 PROPERTIES WAS PREPARED BY LOCKWOOD MAPPING, INC. OF ROCHESTER, NEW YORK. AERIAL PHOTOGRAPHY WAS CONDUCTED ON 11/11/94. ORIGINAL LOCKWOOD MAP WAS AT A SCALE OF 1"=100' AND WAS INTERPRETED FOR TWO-FOOT CONTOURS.
2. BASE MAP HAS BEEN MODIFIED TO INCORPORATE BUFFER BASIN, SEDIMENTATION BASINS, WETLANDS MITIGATION AREA, AND GREEN POINT LANDFILL (GPL) FINAL COVER FROM THE FINAL ENGINEERING DESIGN REPORT PREPARED BY BBL FOR THE GPL, DATED JANUARY 1998.
3. VERTICAL DATUM REFERENCED TO NGVD OF 1929, HORIZONTAL DATUM REFERENCED TO MICHIGAN SPC-NAD 1983.
4. PROPERTY BOUNDARY FOR REALM, INC, DIGITIZED FROM SPICER GROUP DRAWING NO. A-21854-1, DATED 3/27/98.
5. BASE MAP INFORMATION SOUTH OF MAIN REALM, INC. PROPERTY LINE FROM AIR-LAND SURVEYS, INC. PHOTO DATE 11/90, MAPPING DATE 10/91.

EXHIBIT 14

DESCRIPTION OF ALLOWABLE USES

Examples of permitted industrial activities on the Property include manufacturing, utilities (including electrical and gas lines and associated facilities), and industrial research and development. Examples of permitted commercial activities on the Property include large scale commercial warehouse operations, wholesale lumber yards, and building supply warehouses. Examples of additional types of permitted commercial activities on the Property (except for the Former Railyard Area and the LNAPL Assessment and Remediation Area) include retail gas stations, auto service stations, auto dealerships, retail, retail warehouses selling the majority of their merchandise indoors but including some limited storage or stockpiling of materials in an outdoor yard, repair and service establishments, small warehouse operations, professional offices, banks, credit unions, savings and loan institutions, publicly owned office buildings, and personal service establishments which perform services indoors.

Examples of activities which would not be permitted on the Property include, but are not limited to, day cares (except day-cares that are limited to indoor activities), schools, churches, convalescent or nursing homes, and hospitals.

DECLARATION OF RESTRICTIVE COVENANT

MDEQ Reference No.: RC-RRD-[Yr]-[number]

This Declaration of Restrictive Covenant ("Restrictive Covenant") has been recorded with the Saginaw County Register of Deeds for the purpose of protecting public health, safety, welfare, and the environment by prohibiting or restricting activities that could result in unacceptable exposure to environmental contamination present at the property located in the City of Saginaw, County of Saginaw and legally described in Exhibit 1attached hereto ("Property"). The Property is associated with General Motors Corporation-Saginaw Malleable Iron Plant, Site I.D. 73000014 for which a remedial action plan is being conducted. The remedial action that is being implemented to address environmental contamination is fully described in the Remedial Action Plan, Saginaw Malleable Iron Plant Property and REALM, Inc., Green Point Landfill and Drum Remediation Area, dated July, 2008 ("RAP"), and submitted by General Motors Corporation ("GM"), Remediation and Liability Management Company, Inc. ("REALM, Inc.") and Waste Management, Inc. The Michigan Department of Environmental Quality ("MDEQ") approved the RAP on _____, __ 2009, pursuant to Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended ("NREPA"), MCL 324.20101 et seq.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

The RAP requires the recording of this Restrictive Covenant with the Saginaw County Register of Deeds to: 1) restrict unacceptable exposures to hazardous substances located on the Property; 2) assure that the use of the Property is consistent with the exposure assumptions utilized in the development of cleanup criteria pursuant to Sections 20120a(1)(g), 20120a(1)(i) and 20120a(2) of the NREPA and the exposure control measures relied upon in the RAP which consist of a cap that has been installed on Green Point Landfill and 3) to prevent damage or disturbance of any element of the response activity constructed on the Property. The restrictions contained in this Restrictive Covenant are based upon information available to the MDEQ at the time the RAP was approved by the MDEQ. Failure of the response activities to achieve and maintain the criteria, exposure controls, and requirements specified in the RAP; future changes in the environmental condition of the Property or changes in the cleanup criteria developed under Section 20120a(1)(g) , 20120a(1)(i) and 20120a(2) of the NREPA; the discovery of environmental conditions at the Property that were not accounted for in the RAP; or use of the Property in a manner inconsistent with the restrictions described herein, may result in this Restrictive Covenant not being protective of public health, safety, and welfare, and the environment.

Exhibit 2 provides a survey of the Property that is subject to the land use or resource use restrictions which apply to the entire Property and are described in Paragraphs 1, 2a, and 2c

below, and Exhibits 3 and 4 provide the legal descriptions and surveys that distinguishes those portions of the Property that are subject to additional specific land use or resource use restrictions as specified herein.

Exhibit Number	Area	Summary of Primary Restrictions	Location of Complete Description of Restrictions
2	Green Point Landfill Property	• Limiting Property to industrial and limited commercial II, III, and IV use only • Prohibiting installation of wells for potable water supply.	Paragraph 1, 2a, and 2c
3	Former Hillock Area of the Drum Remediation Area	• Worker duration restrictions apply for intrusive/construction workers • Restrictions on intrusive activities	Paragraph 2b and e
4	Terminated Green Point Landfill	• Maintenance of existing cover material required • Restrictions on building construction • Restrictions on intrusive activities	Paragraph 2b, d, f

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Summary of Response Activities

The following response activities have been completed or will be completed as described in the remedial action plan approved by the department:

- Capping of the Green Point Landfill;
- periodic monitoring and maintenance of the Green Point Landfill;
- construction of wetlands mitigated as a result of constructing the Green Point Landfill cap;
- excavation and removal of drums and fill material from the Drum Remediation Area and Former Hillock Area; and
- periodic monitoring of groundwater.

Definitions

"Intrusive Activities" means any activities that involve physical intrusion into the subsurface.

"MDEQ" means the Michigan Department of Environmental Quality, its successor entities, and those persons or entities acting on its behalf.

"Owner" means at any given time the then current title holder of the Property or any portion thereof.

All other terms used in this document which are defined in Part 3, Definitions, of the NREPA; Part 201 of the NREPA; or the Part 201 Administrative Rules ("Part 201 Rules"), 1990 AACS R 299.5101 et seq., shall have the same meaning in this document as in Parts 3 and 201 of the NREPA and the Part 201 Rules, as of the date of filing of this Restrictive Covenant.

NOW THEREFORE,

Declaration of Land Use and Resource Use Restrictions

Pursuant to the RAP and Consent Judgment #98-22686-CE-2 entered by the Circuit Court of Saginaw County, REALM, Inc. as Owner of the Property, hereby declares and covenants that the Property shall be subject to the following restrictions and conditions:

1. The Owner shall prohibit all uses of the entire Property, that are not compatible with the limited industrial, limited commercial II, III, and IV, and site-specific categories under Section 20120a(1)(g) , 20120a(1)(i) and 20120a(2) of the NREPA and generally described in the Description of Allowable Uses, attached hereto as Exhibit 5. The Owner may re-evaluate the exceedances and make appropriate changes or, if needed, provide additional remediation for the allowable land use, provided that the changes and new land use are reviewed and approved by GM, REALM, Inc., and the MDEQ. Cleanup criteria for land use-based response activities are located in the Government Documents Section of the State of Michigan Library. The following uses allowed under the City of Saginaw M-2 General Industrial zoning code designations are prohibited:

LFR
Sep 17 2009 18:39

Hotels and motels

Penal and correctional institutions and detention facilities subject to the standards in §§ 153.490 *et seq* of the Saginaw Code of Ordinances.

2. The Owner shall prohibit activities on the Property that may result in exposures above levels established in the RAP. These prohibited activities include:

a. No activities at the Property are allowed that may interfere with the Remedial Action, operation or maintenance, monitoring, or other measures necessary to assure the effectiveness and integrity of the Remedial Action.

b. In order to protect against direct contact with contaminated subsurface soils, no activities at the Property that may result in exposures to such soils in areas where such media exceed the applicable exposure criteria identified in the RAP (Former Hillock Area of the Drum Remediation Area and the Terminated Green Point Landfill Area, Exhibits 3 and 4) are permitted unless conducted in conformance with the RAP and the health and safety requirements set forth under the Michigan Occupational Safety and Health Act ("MiOSHA"), the federal Occupational Safety and Health Act ("OSHA"), and all other applicable local, state, and federal laws and regulations. The MDEQ shall be notified whenever these activities are undertaken and records shall be kept of activities that can be

reviewed by the MDEQ upon request for five years. All excavated soils and extracted fluids shall be managed in accordance with the requirements of section 20107a of NREPA and all other applicable local, state, and federal laws and regulations.

c. In order to restrict the use and consumption of groundwater, wells shall not be installed on the Property for extracting groundwater for potable or domestic uses. This provision does not prohibit installation of wells for: environmental study, monitoring, or remediation; dewatering of excavations; non-contact cooling water; ground water heat pumps; or for emergency purposes, provided that the installation and operation of such wells is in compliance with applicable federal, state and local laws and regulations and the fluids are managed in accordance with the requirements of Section 20107a of NREPA and other applicable local, state and federal laws and regulations.

d. No subsurface footings, utilities or structures of any type ("Subsurface Structures") may be installed in the Terminated Green Point Landfill Area (Exhibit 4) except as consistent with, and allowed by, the RAP.

e. To protect against direct contact with hazardous substances present in subsurface soil and groundwater in the Former Hillock Area of the Drum Remediation Area (Exhibit 3), Intrusive Activities must be completed in accordance with the health and safety requirements set forth under MiOSHA, the OSHA, and all other applicable local, state, and federal laws and regulations. Activities in the Former Hillock Area of the Drum Remediation Area (Exhibit 3) are restricted so that access by an intrusive/construction worker spends no more than 30 days, per any such worker per year, in the area. The MDEQ shall be notified whenever these activities are undertaken and records shall be kept of activities that can be reviewed by the MDEQ upon request for five years. All excavated soils and extracted fluids shall be managed in accordance with the requirements of section 20107a of NREPA and all other applicable local, state, and federal laws and regulations.

f. In order to protect against direct contact with potential hazardous substances present in soil or fill material in the Terminated Green Point Landfill Area (Exhibit 4), cover materials must be maintained. In the event the cover is disrupted or temporarily removed, it shall be restored by Owner at Owner's expense. Intrusive Activities in the waste materials in the landfill must be completed in accordance with the health and safety requirements set forth under MiOSHA, the OSHA, and all other applicable local, state, and federal laws and regulations. The MDEQ shall be notified whenever these activities are undertaken and records shall be kept of activities that can be reviewed by the MDEQ upon request for five years. All excavated soils and extracted fluids shall be managed in

accordance with the requirements of section 20107a of NREPA and all other applicable local, state, and federal laws and regulations.

3. The Owner shall prohibit activities on the Property that may interfere with any element of the RAP, including the performance of operation and maintenance activities, monitoring, or other measures necessary to ensure the effectiveness and integrity of the RAP.

4. Contaminated Soil Management. The Owner shall manage all soils, media and/or debris located on the Property in accordance with the applicable requirements of the RAP; Section 20120c of the NREPA; Part 111, Hazardous Waste Management, of the NREPA; Subtitle C of the Resource Conservation and Recovery Act, 42 U.S.C. Section 6901 et seq.; the administrative rules promulgated thereunder; and all other relevant state and federal laws.

5. Access. The Owner shall grant to the MDEQ, GM, REALM, Inc. and their designated representatives the right to enter the Property at reasonable times for the purpose of determining and monitoring compliance with the RAP, including the right to take samples, inspect the operation of the response activities and, inspect any records relating thereto, and to perform any actions necessary to maintain compliance with Part 201 and the RAP.

6. Notice. The Owner shall provide notice to the MDEQ, GM and REALM, Inc. of the Owner's intent to transfer any interest in the Property at least fourteen (14) business days prior to consummating the conveyance. This notice requirement does not obviate the requirement to comply with any other applicable notice requirement. A conveyance of title, easement, or other interest in the Property shall not be consummated by the Owner without adequate and complete provision for compliance with the terms and conditions of this Restrictive Covenant and the applicable provisions of Section 20116 of the NREPA. The notice required to be made to the MDEQ under this Paragraph shall be made to: Director, MDEQ, P.O. Box 30473, Lansing, Michigan 48909-7973; and shall include a statement that the notice is being made pursuant to the requirements of this Restrictive Covenant, MDEQ Reference Number RC-RRD-[YR]-[number]. The notice required to be made to GM and under this Paragraph shall be made to: Cheryl Hiatt, WFG – Remediation, Engineering Center – West, 30200 Mound Road, Mail code: 480-111-W60, Warren, MI 48090. The notice required to be made to REALM, Inc. under this Paragraph shall be made to: William McFarland, WFG – Remediation, Engineering Center – West, 30200 Mound Road, Mail code: 480-111-W60, Warren, MI 48090. A copy of this Restrictive Covenant shall be provided to all future owners, heirs, successors, lessees, easement holders, assigns, and transferees by the person transferring the interest.

7. Term and Enforcement of Restrictive Covenant. This Restrictive Covenant shall run with the Property and shall be binding on the Owner; future owners; and all current and future successors, lessees, easement holders, their assigns, and their authorized agents, employees, or persons acting under their direction and control. This Restrictive Covenant may only be modified or rescinded with the written approval of the MDEQ, GM, and REALM, Inc.

The State of Michigan, through the MDEQ, GM and REALM, Inc. may enforce the restrictions set forth in this Restrictive Covenant by legal action in a court of competent jurisdiction.

8. Severability. If any provision of this Restrictive Covenant is held to be invalid by any court of competent jurisdiction, the invalidity of such provision shall not affect the validity of any other provisions hereof, and all such other provisions shall continue unimpaired and in full force and effect.

9. Authority to Execute Restrictive Covenant . The undersigned person executing this Restrictive Covenant is the Owner and represents and certifies that he or she is duly authorized and has been empowered to execute and deliver this Restrictive Covenant.

EXHIBIT 5

DESCRIPTION OF ALLOWABLE USES

Examples of permitted industrial activities include manufacturing, utilities (including, but not limited to, electrical transmission lines), and industrial research and development. Examples of permitted commercial activities includes large scale commercial warehouse operations, wholesale lumber yards, storage, building supply warehouses, retail gas stations, auto service stations, auto dealerships, retail, retail warehouses selling the majority of their merchandise indoors but including some limited storage or stockpiling of materials in an outdoor yard, repair and service establishments, small warehouse operations, professional offices, banks, credit unions, savings and loan institutions, publicly owned office buildings, and personal service establishments which perform services indoors.

Examples of activities which would not be permitted include, but are not limited to, day cares (except day-cares that are limited to indoor activities), schools, churches, convalescent or nursing homes, and hospitals.

DECLARATION OF RESTRICTIVE COVENANT

MDEQ Reference No.: RC-RRD-[Yr]-[number]

This Declaration of Restrictive Covenant ("Restrictive Covenant") has been recorded with the Saginaw County Register of Deeds for the purpose of protecting public health, safety, welfare, and the environment by prohibiting or restricting activities that could result in unacceptable exposure to environmental contamination present at the property located in the City of Saginaw, County of Saginaw and legally described in Exhibit 1 attached hereto ("Property"). The Property is located adjacent to, and immediately to the east and south of the General Motors Corporation-Saginaw Malleable Iron Plant, Site I.D. 73000014 (the "Site") for which a remedial action plan is being conducted. The remedial action that is being implemented to address environmental contamination is fully described in the Remedial Action Plan, Saginaw Malleable Iron Plant Property and REALM, Inc., Green Point Landfill and Drum Remediation Area, dated July, 2008 ("RAP"), and submitted by General Motors Corporation ("GM"), Remediation And Liability Management, Inc. ("REALM, Inc.") and Waste Management, Inc. The Michigan Department of Environmental Quality ("MDEQ") approved the RAP on _____, __ 2009, pursuant to Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended ("NREPA"), MCL 324.20101 et seq.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

The RAP requires the recording of this Restrictive Covenant with the Saginaw County Register of Deeds to: 1) restrict unacceptable exposures to hazardous substances located on the Property that are associated with the Site; and 2) to prevent damage or disturbance of any element of the response activity constructed on the Property. The restrictions contained in this Restrictive Covenant are based upon information available to the MDEQ at the time the RAP was approved by the MDEQ. Failure of the response activities to achieve and maintain the criteria, exposure controls, and requirements specified in the RAP; future changes in the environmental condition of the Property or changes in the cleanup criteria developed under Act No. 399 of the Public Acts of 1976, being section 325.1005 of the Michigan Compiled Laws; the discovery of environmental conditions at the Property that were not accounted for in the RAP; or use of the Property in a manner inconsistent with the restrictions described herein, may result in this Restrictive Covenant not being protective of public health, safety, and welfare, and the environment.

Exhibit 2 provides a survey of the Property that is subject to the land use or resource use restrictions specified herein.

Summary of Response Activities

Response activities have not been performed on the Property; however, the following response activities have been completed or will be completed within the vicinity of the Property as described in the remedial action plan approved by the department:

- Capping of the Green Point Landfill, which lies to the west of the Property.
- periodic monitoring and maintenance of the Green Point Landfill;
- completion of a remedial investigation and feasibility study;
- periodic monitoring of groundwater.

Definitions

"MDEQ" means the Michigan Department of Environmental Quality, its successor entities, and those persons or entities acting on its behalf.

"Owner" means at any given time the then current title holder of the Property or any portion thereof.

All other terms used in this document which are defined in Part 3, Definitions, of the NREPA; Part 201 of the NREPA; or the Part 201 Administrative Rules ("Part 201 Rules"), 1990 AACS R 299.5101 et seq., shall have the same meaning in this document as in Parts 3 and 201 of the NREPA and the Part 201 Rules, as of the date of filing of this Restrictive Covenant.

NOW THEREFORE,

Declaration of Land Use and Resource Use Restrictions

Pursuant to the RAP and Consent Judgment #98-22686-CE-2 entered by the Circuit Court of Saginaw County, REALM, Inc. as Owner of the Property, hereby declares and covenants that the Property shall be subject to the following restrictions and conditions:

1. The Owner shall prohibit activities on the Property that may result in exposures above levels established in the RAP. These prohibited activities include:

a. No activities at the Property are allowed that may interfere with the Remedial Action, operation or maintenance, monitoring, or other measures necessary to assure the effectiveness and integrity of the Remedial Action, except that maintenance, repair and replacement of existing structures may be conducted. All such work shall be completed in accordance with the Michigan Occupational Safety and Health Act ("MiOSHA"), the federal Occupational Safety and Health Act ("OSHA"), and all other applicable local, state, and federal laws and regulations. All excavated soils and extracted fluids shall be managed in accordance with the requirements of Section 20107a of NREPA and other applicable local, state and federal laws and regulations.

Sep 17, 2009 18:39

b. In order to restrict the use and consumption of groundwater, wells shall not be installed on the Property for extracting groundwater for potable or domestic uses. This provision does not prohibit installation of wells for: environmental study, monitoring, or remediation; dewatering of excavations; non-contact cooling water; ground water heat pumps; or for emergency purposes, provided that the installation and operation of such wells is in compliance with applicable federal, state and local laws and regulations and the fluids are managed in accordance with the requirements of Section 20107a of NREPA and other applicable local, state and federal laws and regulations.

2. Permanent Markers. The Owner shall not remove, cover, obscure, or otherwise alter or interfere with the permanent markers placed at the locations noted in Exhibit 2. The Owner shall keep vegetation and other materials clear of the permanent markers to assure that the markers are readily visible.

3. Access. The Owner shall grant to the MDEQ, GM and REALM, Inc. and their designated representatives the right to enter the Property at reasonable times for the purpose of determining and monitoring compliance with the RAP, including the right to take samples, inspect the operation of the response activities and, inspect any records relating thereto, and to perform any actions necessary to maintain compliance with Part 201 and the RAP.

4. Notice. The Owner shall provide notice to the MDEQ, GM and REALM, Inc. of the Owner's intent to transfer any interest in the Property at least fourteen (14) business days prior to consummating the conveyance. A conveyance of title, easement, or other interest in the Property shall not be consummated by the Owner without adequate and complete provision for compliance with the terms and conditions of this Restrictive Covenant and the applicable provisions of Section 20116 of the NREPA. The notice required to be made to the MDEQ under this Paragraph shall be made to: Director, MDEQ, P.O. Box 30473, Lansing, Michigan 48909-7973; and shall include a statement that the notice is being made pursuant to the requirements of this Restrictive Covenant, MDEQ Reference Number RC-RRD-[YR]-[number]. A copy of this Restrictive Covenant shall be provided to all future owners, heirs, successors, lessees, easement holders, assigns, and transferees by the person transferring the interest. The notice required to be made to GM under this Paragraph shall be made to: Cheryl Hiatt, WFG – Remediation, Engineering Center – West, 30200 Mound Road, Mail code: 480-111-W60, Warren, MI 48090 The notice required to be made to REALM, Inc. under this Paragraph shall be made to: William McFarland, WFG – Remediation, Engineering Center – West, 30200 Mound Road, Mail code: 480-111-W60, Warren, MI 48090.

5. Term and Enforcement of Restrictive Covenant. This Restrictive Covenant shall run with the Property and shall be binding on the Owner; future owners; and all current and future successors, lessees, easement holders, their assigns, and their authorized agents, employees, or persons acting under their direction and control. This Restrictive Covenant may only be modified or rescinded with the written approval of the MDEQ, GM and REALM, Inc.

The State of Michigan, through the MDEQ, GM and REALM, Inc. may enforce the restrictions set forth in this Restrictive Covenant by legal action in a court of competent jurisdiction.

6. Severability. If any provision of this Restrictive Covenant is held to be invalid by any court of competent jurisdiction, the invalidity of such provision shall not affect the validity of any other provisions hereof, and all such other provisions shall continue unimpaired and in full force and effect.

7. Authority to Execute Restrictive Covenant . The undersigned person executing this Restrictive Covenant is the Owner, or has the express written permission of the Owner, and represents and certifies that he or she is duly authorized and has been empowered to execute and deliver this Restrictive Covenant.

DRAFT 12-31-08

DECLARATION OF RESTRICTIVE COVENANT

MDEQ Reference No.: RC-RRD-[Yr]-[number]

This Declaration of Restrictive Covenant ("Restrictive Covenant") has been recorded with the Saginaw County Register of Deeds for the purpose of protecting public health, safety, welfare, and the environment by prohibiting or restricting activities that could result in unacceptable exposure to environmental contamination present at the property located in the City of Saginaw, County of Saginaw and legally described in Exhibit 1 attached hereto ("Property"). The Property is located adjacent to, and immediately to the east and south of the General Motors Corporation-Saginaw Malleable Iron Plant, Site I.D. 73000014 (the "Site") for which a remedial action plan is being conducted. The remedial action that is being implemented to address environmental contamination is fully described in the Remedial Action Plan, Saginaw Malleable Iron Plant Property and REALM, Inc., Green Point Landfill and Drum Remediation Area, dated July 2008 ("RAP"), and submitted by General Motors Corporation ("GM"), Remediation And Liability Management, Inc. ("REALM, Inc.") and Waste Management, Inc. The Michigan Department of Environmental Quality ("MDEQ") approved the RAP on _____, __ 2009, pursuant to Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended ("NREPA"), MCL 324.20101 et seq.

Confidential under FOIA
Richard Kowalski
Sep 17, 2009 18:39

The RAP requires the recording of this Restrictive Covenant with the Saginaw County Register of Deeds to: 1) restrict unacceptable exposures to hazardous substances located on the Property that are associated with the Site; and 2) to prevent damage or disturbance of any element of the response activity constructed on the Property. The restrictions contained in this Restrictive Covenant are based upon information available to the MDEQ at the time the RAP was approved by the MDEQ. Failure of the response activities to achieve and maintain the criteria, exposure controls, and requirements specified in the RAP; future changes in the environmental condition of the Property or changes in the cleanup criteria developed under Act No. 399 of the Public Acts of 1976, being section 325.1005 of the Michigan Compiled Laws; the discovery of environmental conditions at the Property that were not accounted for in the RAP; or use of the Property in a manner inconsistent with the restrictions described herein, may result in this Restrictive Covenant not being protective of public health, safety, and welfare, and the environment.

Exhibit 2 provides a survey of the Property that is subject to the land use or resource use restrictions specified herein. The Property is currently occupied with electrical transmission lines and an easement is held by the Michigan Electric Transmission Company, LLC ("METC").

Summary of Response Activities

The following response activities have been completed or will be completed as described in the remedial action plan approved by the department:

- Capping of the Green Point Landfill, which lies to the west of the Property.
- The cap for the Green Point Landfill extends onto the Property;
- periodic monitoring and maintenance of the Green Point Landfill;

Definitions

"MDEQ" means the Michigan Department of Environmental Quality, its successor entities, and those persons or entities acting on its behalf.

"Owner" means at any given time the then current title holder of the Property or any portion thereof.

All other terms used in this document which are defined in Part 3, Definitions, of the NREPA; Part 201 of the NREPA; or the Part 201 Administrative Rules ("Part 201 Rules"), 1990 AACS R 299.5101 et seq., shall have the same meaning in this document as in Parts 3 and 201 of the NREPA and the Part 201 Rules, as of the date of filing of this Restrictive Covenant.

monitoring, or remediation; dewatering of excavations; non-contact cooling water; ground water heat pumps; or for emergency purposes, provided that the installation and operation of such wells is in compliance with applicable federal, state and local laws and regulations and the fluids are managed in accordance with the requirements of Section 20107a of NREPA and other applicable local, state and federal laws and regulations.

c. No subsurface footings, utilities or structures of any type ("Subsurface Structures") may be installed except for maintenance, repair replacement or removal of existing structures, and except as consistent with, and allowed by, the RAP in order to prevent damage to the Green Point Landfill Cap, which extends onto the Property as shown in Exhibit 2. All such work shall be completed in accordance with MiOSHA, OSHA, and all other applicable local, state, and federal laws and regulations. All excavated soils and extracted fluids shall be managed in accordance with the requirements of Section 20107a of NREPA and other applicable local, state and federal laws and regulations.

2. Cap Maintenance and Repair. The Owner shall notify GM and REALM, Inc. in advance, or alternatively as soon as practicable, of any damage or changes caused by the Owner to the cap. GM and/or REALM, Inc. shall repair the cap and properly handle any residual soils in accordance with the applicable requirements of the RAP; Section 20120c of the NREPA; Part 111, Hazardous Waste Management, of the NREPA; Subtitle C of the Resource Conservation and Recovery Act, 42 U.S.C. Section 6901 et seq.; the administrative rules promulgated thereunder; and all other relevant state and federal laws.

3. Permanent Markers. The Owner shall not remove, cover, obscure, or otherwise alter or interfere with the permanent markers placed at the locations noted in Exhibit 2. The Owner shall keep vegetation and other materials clear of the permanent markers to assure that the markers are readily visible.

4. Access. The Owner shall grant to the MDEQ, GM and REALM, Inc. and their designated representatives the right to enter the Property at reasonable times for the purpose of determining and monitoring compliance with the RAP, including the right to take samples, inspect the operation of the response activities and, inspect any records relating thereto, and to perform any actions necessary to maintain compliance with Part 201 and the RAP.

5. Notice. The Owner shall provide notice to the MDEQ, GM and REALM, Inc. of the Owner's intent to transfer any interest in the Property at least fourteen (14) business days prior to consummating the conveyance. A conveyance of title, easement, or other interest in the Property shall not be consummated by the Owner without adequate and complete provision for compliance with the terms and conditions of this Restrictive Covenant and the applicable provisions of Section 20116 of the NREPA. The notice required to be made to the MDEQ under this Paragraph shall be made to: Director, MDEQ, P.O. Box 30473, Lansing, Michigan 48909-7973; and shall include a statement that the notice is being made pursuant to the requirements of this Restrictive Covenant, MDEQ Reference Number RC-RRD-[YR]-[number]. A copy of this Restrictive Covenant shall be provided to all future owners, heirs, successors,

lessees, easement holders, assigns, and transferees by the person transferring the interest. The notice required to be made to GM under this Paragraph shall be made to: Cheryl Hiatt, WFG – Remediation, Engineering Center – West, 30200 Mound Road, Mail code: 480-111-W60, Warren, MI 48090 The notice required to be made to REALM, Inc. under this Paragraph shall be made to: William McFarland, WFG – Remediation, Engineering Center – West, 30200 Mound Road, Mail code: 480-111-W60, Warren, MI 48090.

6. Term and Enforcement of Restrictive Covenant. This Restrictive Covenant shall run with the Property and shall be binding on the Owner; future owners; and all current and future successors, lessees, easement holders, their assigns, and their authorized agents, employees, or persons acting under their direction and control. This Restrictive Covenant may only be modified or rescinded with the written approval of the MDEQ, GM and REALM, Inc.

The State of Michigan, through the MDEQ, GM and REALM, Inc. may enforce the restrictions set forth in this Restrictive Covenant by legal action in a court of competent jurisdiction.

7. Severability. If any provision of this Restrictive Covenant is held to be invalid by any court of competent jurisdiction, the invalidity of such provision shall not affect the validity of any other provisions hereof, and all such other provisions shall continue unimpaired and in full force and effect.

8. Authority to Execute Restrictive Covenant. The undersigned person executing this Restrictive Covenant is the Owner, or has the express written permission of the Owner, and represents and certifies that he or she is duly authorized and has been empowered to execute and deliver this Restrictive Covenant.

1. Introduction

1.1 General

This document has been prepared to supplement the Remedial Action Plan (RAP) for the General Motors Corporation (GM) Saginaw Malleable Iron Plant, and Remediation and Liability Management Company, Inc. (REALM) Green Point Landfill and Drum Remediation Area (DRA) located in Saginaw, Michigan (the Site). For information pertaining to Site location, ownership, and past and current uses of the property, refer to Section 1 of the RAP. This document presents a Work Plan for implementing remedial action (RA) activities at the following two Site areas:

- Saginaw River Berm Area; and
- DRA/Former Hillock Area.

The RA activities described in this Work Plan were initially outlined in the Feasibility Study Report (FS Report) prepared for the Site, dated July 29, 2003. In general, the RA activities will consist of the following:

- implementation of erosion control measures at the Saginaw River Berm Area; and
- capping of the drainage tile discharging volatile organic compound- (VOC-) impacted water from an offsite source onto the DRA/Former Hillock Area.

For a detailed description of the above-referenced areas and associated environmental concerns refer to the RAP and other Site-related documents previously submitted to the MDEQ (including, but not limited to, the FS Report). Approximate locations of the Saginaw River Berm Area and DRA/Former Hillock Area within the Site are presented on Figure 1-2 of the RAP. A summary of the RA objectives is presented below.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

1.2 RA Objectives

1.2.1 Saginaw River Berm Area

Completion of erosion control measures along portions of the Saginaw River berm is not being completed to satisfy RA objectives established in the FS, but as part of plant maintenance activities to protect against erosion of the berm. The Saginaw River Berm Area erosion control activities are described in Section 2 of this Work Plan.

1.2.2 DRA/Former Hillock Area

A 6-inch-diameter subsurface concrete tile drain pipe extending from the neighboring property (previously Rubin Schultz property) onto the DRA/Former Hillock Area was observed during implementation of a test pit program in October 2000. Further investigation indicated that the pipe discharges VOC-impacted water from an offsite source into the DRA/Former Hillock Area.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

The objective of the RA is to mitigate the future direct discharge of VOC-impacted water from the offsite source onto the REALM, Inc. property. Since the source of water to the drain pipe is located upgradient of the Site, there is a concern that there may continue to be indirect Site impacts due to the migration of impacted water through the soil. However, blocking the drain pipe will mitigate future VOC impacts to soil and groundwater within the DRA/Former Hillock Area. The DRA/Former Hillock Area RA activities are described in Section 2 of this Work Plan.

2. Description of RA Activities

2.1 Saginaw River Berm Area

The RA activities at the Saginaw River Berm Area will include implementation of erosion control measures, and placement of restrictive covenants on the Site, including the berm area.

2.1.1 Erosion Control Measures

Based on a visual review of the Saginaw River Berm Area, sections of the berm will be graded and vegetated to stabilize the berm and to address potential future erosion of the bank. Erosion of the berm was not identified in the Human Health Evaluation Report (HHE Report) (BBL, July 2003) or Ecological Risk Assessment Report (ERA Report) (Exponent, January 2003) as an unacceptable risk or as an area requiring action to achieve a Remedial Action Objective (RAO); however, it will be addressed during the RA activities. As needed, areas of the river berm will be graded to eliminate irregularities in the ground surface caused by precipitation runoff. These areas will then be seeded to establish a vegetative cover.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

2.1.2 Restrictive Covenants

In addition to the above-listed RA activities, restrictive covenants will be placed on the property to minimize the potential for future impacts to human health and the environment. A Site-wide restrictive covenant (which will include the Saginaw River Berm Area) will be imposed limiting future land use to limited industrial and limited commercial II activities and preventing installation of drinking water wells. An additional restriction requires that any new roadways placed between the existing roadway and the river edge be paved or constructed with a minimum of six inches of gravel to limit the creation of dust. Annual inspections of the area will be completed to verify maintenance of any roadways and vegetation.

2.2 DRA/Former Hillock Area

To mitigate future impacts to the groundwater and subsurface soil in the vicinity of the DRA/Former Hillock Area by the offsite source of VOCs, the following RA activities will be implemented:

- capping of the pipe at the Site boundary (southwest portion of the site); and
- establishing restrictive covenants.

2.2.1 Capping of the Pipe

Soil surrounding the pipe at the Site boundary will be excavated to allow access to the 6-inch diameter drain pipe. Upon gaining access to the pipe, the pipe will be capped/sealed or removed at the Site boundary to minimize the potential for the offsite VOC-impacted water from discharging onto the REALM, Inc. property via the pipe. The excavated area will be backfilled, and the fill material will be compacted and graded. The

Confidential under FOIA
Richard Kowalski
LFR

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

excavation and backfilling activities will be conducted using conventional construction equipment (e.g., a backhoe or an excavator).

2.2.2 Restrictive Covenants

In addition to the above-listed RA activities, restrictive covenants will be placed on the property to minimize the potential for future impacts to human health and the environment. A Site-wide restrictive covenant (which will include the DRA/Former Hillock Area) will be imposed limiting future land use to limited industrial and limited commercial II activities and preventing installation of drinking water wells. In addition to the Site-wide restrictive covenant, the DRA/Former Hillock Area will be subject to restrictive covenants that address intrusive activity and building construction.

The restrictive covenants will specify that intrusive activities (e.g., soil excavation, utility location/relocation, groundwater extraction, etc.) would only be permitted following an assessment to ensure that excavation can be safely performed. In addition, prior to any building construction activities in the DRA Hillock area, potential volatilization of VOCs would be evaluated.

1.0 INTRODUCTION

This report presents Conestoga-Rovers & Associates (CRA) summary of the manganese soil removal activities on the berm along Saginaw River and filling of the remaining recirculation channel for the old water recirculation system completed during September 2004 at the General Motors Powertrain Saginaw Malleable Iron (SMI) Plant (Site) in Saginaw, Michigan. Figure 1 presents the Site Location and Figure 2 presents the Site Plan. Interim responses summarized in this report include the removal of higher levels of manganese soil along the Saginaw River berm on the Site and the closure, by filling, of the remaining channel of the SMI Plant's former water recirculation system.

2.0 BACKGROUND

During 2004, activities were completed to address the following outstanding issues:

1. The east/west channel was the last remaining portion of the SMI Plant's former water recirculation loop to be closed.
2. During the Remedial Investigation/Feasibility Study (RI/FS), soil in three areas along the Saginaw River Berm on the SMI Site was identified to exceed the generic residential particulate soil inhalation criteria for manganese (3,300 mg/kg) at soil boring locations SB-378, SB-380, and SB-381. The data for these sample locations are presented in Table 1.
3. A soil stockpile had been created during construction of the Crotty Street Mitigation Wetland in the REALM farm field next to the REALM Green Point Site. Table 2 presents data for the stockpile soil.

These areas are presented on Figures 1 and 2.

3.0 2004 RESPONSE ACTIVITIES

3.1 FILLING OF EAST/WEST DITCH

The manganese-impacted soil excavated from the SB-378, SB-380, and SB-381 areas was placed in the bottom of the east/west ditch as part of the east/west ditch filling along with soil from the Crotty Street Mitigation Wetland soil stockpile. Figure 3 presents the manganese-impacted locations. These soils were placed in the bottom of the channel. Imported clean fill, along with a minimum of a 6 inch topsoil cover was placed over the berm and mitigation soils. The area was then re-seeded. A minimum of 2 feet of clean material covers the entire east/west ditch area.

Figures 4-7 present the design of the filling activities. Final design included a shallow swale to control stormwater runoff in the area and an area on the western edge, which could be turned into a wetland.

3.2 MANGANESE IMPACTED SOILS

Higher levels of manganese-impacted soils (presented on Figure 3) were excavated and placed on the bottom of the east/west former recirculation conveyance channel along with soil previously stockpiled during the construction of the Crotty Street Mitigation Wetland. Verification of remediation samples in the berm along the Saginaw River were collected from the bottom and sides of the three excavation areas. Verification sample locations are presented on Figures 8, 9, and 10. Verification sample results are presented in Tables 3, 4, and 5.

In the vicinity of SB-378, an initial excavation was completed to the dimensions of 130 feet long, 5 feet wide, and 1 foot deep. Verification sampling completed at the locations presented on Figure 8, indicated that samples from the south wall, north/east wall, and the floor of the excavation (3 samples) were reported at concentrations exceeding the Michigan Act 451, Part 201 Generic Residential Particulate Soil Inhalation Criteria (PSIC) for manganese. The excavation was expanded by 1 foot to the north, south, and east directions as well as extended 1 foot deeper (132 feet long by 6 feet wide by 2 feet deep). Verification samples were then collected in the expanded excavation from the south wall and north/east wall. All wall samples were reported at concentrations below residential PSIC, although they exceeded the generic industrial PSIC for manganese. Three floor samples were collected at depths representative of approximately 2 to 3 feet below ground surface (bgs). All of the samples collected from

the excavation floor were reported at concentrations above residential PSIC for manganese. The excavation was subsequently backfilled with two feet of clean fill, eliminating the potential for exposure to the impacted soil on the floor of the excavation. Soil sample results are presented in Table 3, and on Figure 8.

In the vicinity of SB-380, an initial excavation was conducted to the dimensions of 90 feet long, 5 feet wide, and 1 foot deep. Verification sampling completed, at the locations presented on Figure 9, indicated that samples from the south wall, north-west wall, and the floor of the excavation (both samples) were reported at concentrations exceeding the residential PSIC for manganese. The excavation was expanded by 1 foot to the north, south, and west directions as well as extended 1 foot deeper (92 feet long by 6 feet wide by 2 feet deep). Verification samples were then collected in the expanded excavation from the south wall and north-west wall. All wall samples were reported at concentrations below the residential PSIC for manganese. Three floor samples were collected at depths representative of 2 to 3 feet bgs after backfilling. All of the samples collected from the excavation floor were reported at concentrations above the residential PSIC for manganese. The excavation was subsequently backfilled with two feet of clean fill, eliminating the potential for exposure to the impacted soil in the bottom of the excavation. Soil sample results are presented in Table 4, and on Figure 9.

In the vicinity of SB-381, an initial excavation was conducted to the dimensions of 140 feet long, 5 feet wide, and 1 foot deep. Verification sampling completed, at the locations presented on Figure 10, indicated that samples from the north-east wall and the floor of the excavation (1 of 3 samples) were reported at concentrations exceeding the residential PSIC for manganese. The excavation was expanded by 1 foot in the north, south, and east directions as well as extended 1 foot deeper (142 feet long by 6 feet wide by 2 feet deep). Verification samples were then collected in the expanded excavation from the north-east wall and the excavation. All wall samples were reported at concentrations below the residential PSIC for manganese. The floor verification sample at the 2-foot depth exceeded the residential PSIC for manganese. The excavation was subsequently backfilled with two feet of clean fill, eliminating the potential for exposure to the impacted soil in the bottom of the excavation. Soil sample results are presented in Table 5, and on Figure 10.

All final verification sample results from the side walls of the excavation were reported at concentrations below the residential PSIC for manganese. Most of the sample results from the excavation floor were reported at concentrations above the residential PSIC criteria, and subsequently were covered with a minimum of two feet of clean fill, eliminating the exposure by particulate soil inhalation.

3.3 CROTTY STREET MITIGATION STOCKPILE

The stockpile generated during the Crotty Street Mitigation was removed and was used to fill the bottom of the east/west recirculation conveyance channel under the clean imported fill and topsoil.

4.0 SUMMARY

Mangenese impacted soils from an on-Site berm along the Saginaw River as well as soils from the Crotty Street wetland mitigation project were used to fill in the bottom of the remaining channel of the SMI former water recirculation system. These soils were capped by two feet of clean fill and topsoil and re-seeded. The channel was filled to allow a swale to control stormwater and a shallow wetland area to remain.

The Mangenese impacted areas were excavated to meet the MDEQ generic residential PSIC standard. Although the standard was not achieved in the floors of the excavations, 2 to 3 feet of fill was placed over the floors eliminating the pathway of residential particulate air inhalation for those areas.

General Notes:

All concentrations in micrograms per kilogram (µg/kg); equivalent to parts per billion (ppb).

Detections are shown in bold.

Sample Type:

FS = Primary field sample.

DUP = Duplicate field sample.

Data Qualifiers:

B = (Inorganic) The analyte has been positively identified. The concentration is between the instrument detection limit and the required reporting limit.

G = Elevated reporting limit due to matrix interference.

J = The compound/constituent was positively identified; however, the associated numerical value is an estimated concentration only.

U = The compound/constituent was analyzed for but not detected. The associated value is the compound/constituent quantitation limit.

UJ = The compound/constituent was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

ND = Not detected.

1. Legal Description of Site

The Site encompasses approximately 273 acres. The SMI Plant Property consists of the northern portion of the Site and includes the SMI Plant and surrounding ancillary areas, two closed Type III Landfills, two stormwater ponds, and a Water Recycle System that includes a buffer basin. The southern portion of the Site (now owned by REALM, Inc.) includes the closed Green Point Landfill and the DRA, where drums were previously discovered, excavated, and removed.

The Site is located approximately 2,000 feet north of the confluence of the Tittabawassee and Shiawassee Rivers and is located on the western half of Section 35, T12N, R4E, in the city of Saginaw, Saginaw County, Michigan. The attached site survey includes the SMI Plant, the REALM Green Point Landfill and Drum Remediation Area Property, and the Eastern Property Extension. As shown on Figures 1-1 and 1-2 in the RAP, the *Site* includes the SMI Plant Property and the REALM Green Point Landfill and Drum Remediation Area Property only. A legal description of the SMI Plant Property and the REALM Green Point Landfill and Drum Remediation Area Property is provided below.

1.1 SMI Plant Property Legal Description

DESCRIPTION OF A 150.97 ACRE PARCEL OF LAND
(KNOWN AS SAGINAW MALLEABLE IRON PLANT PROPERTY)

Commencing at a found monument at the center-line intersections of Salt Road (66.00 feet wide) and Sylvan Road (60.00 feet wide) being part of Sections 34 & 35, T12N, R4E, City of Saginaw, Saginaw County, Michigan; thence N41°13'20"E 53.66 feet along the center-line of said Salt Road; thence S48°46'40"E 33.00 feet perpendicular to said center-line of said Salt Road for a **PLACE OF BEGINNING**; thence N41°13'20"E 155.86 feet along the Southeasterly Right-of-Way line of said Salt Road; thence S56°24'15"E 100.97 feet; thence S79°30'05"E 162.10 feet; thence N13°24'11"E 160.56 feet; thence along the Southwesterly Right-of-Way line of vacated relocated Florence Street (66.00 feet wide) as recorded thereof in Liber 1269, Page 348 of Saginaw County Records, N76°42'45"W 186.19 feet to the said Southeasterly Right-of-Way line of said Salt Road, said point being S44°49'19"E 33.08 feet from a found monument at the center-line of said Salt Road; thence N41°13'20"E 2.12 feet along the Southeasterly Line of said Salt Road; thence N41°30'33"E 1174.43 feet continuing along said Southeasterly Right-of-Way line of said Salt Road to the Southwesterly Right-of-Way Line of West Center Street (130.00 feet wide) for the following seven (7) courses: [1]S77°59'54"E 348.21 feet; [2]S53°41'09"E 303.68 feet; [3]S35°19'18"E 1142.28 feet; [4]S89°15'47"E 87.93 feet; [5]S46°59'44"E 117.45 feet; [6]S66°53'15"E 55.70 feet; [7]S75°13'36"E 193.96 feet to an intermediate traverse point "A"; said point "A" being N75°13'36"W 81.73 feet from the United States Harbor Line as recorded thereof in Liber 2194 Page 1169 of Saginaw County Records; thence S75°13'36"E 25 feet, plus or minus, to the Westerly Edge of Water of the Saginaw River; thence the following three (3) courses along an intermediate traverse line from aforementioned Intermediate Traverse point "A":[1] S03°21'51"E 548.91 feet, [2]S07°27'01"E 907.34 feet,[3] S10°55'18"E 798.66 feet to an Intermediate Traverse Point "B"; said point "B" being N89°42'41"W 121.04 feet from said United States Harbor Line; thence N89°40’46”W 720.87 feet to the East line of Consumers Power Company Right-of-Way (72.00 feet wide) as recorded thereof in Liber 1106 Pages, 426 & 427; thence N89°34'47"W 72.06 feet along the North line of said Right-of-Way; thence N01°57’47”W 100.28; thence N89°36’59”W 1421.88 feet; thence N00°07'58"E 1033.08 feet; thence N25°14'05"W 365.55 feet; thence N24°37'18"W 89.80 feet; thence N00°17'27"W 80.90 feet; thence N89°46'34"W 8.85 feet; thence N00°13'22"E 159.80 feet; thence N48°10'04"W 158.71 feet; thence N44°27'28"W 229.01 feet; thence N26°08'40"W 69.66 feet; thence N28°53'40"W 207.15 feet; thence N38°36'14"W 183.21 feet to the PLACE OF BEGINNING.

1. Introduction

Supplemental groundwater sampling has been conducted adjacent to the Saginaw River during several monitoring events between November 2007 and June 2008. The program included sampling of the monitoring wells located east of the Green Point Landfill, adjacent to the Saginaw River, and also select monitoring wells located further north, along the river berm on the Saginaw Malleable Iron plant property. Note that several shallow monitoring wells screened within the berm fill material (MW-108WT, MW-110WT, MW-114WT, and X-4AR) that are included in the river perimeter sampling program due to past exceedances of the Generic Michigan Department of Environmental Quality (MDEQ) Groundwater Surface Water Interface (GSI) criteria, were dry and therefore were not sampled. These wells remain on the list of wells to be sampled on an annual basis, as described in the Site Operation, Maintenance, and Monitoring Plan (Appendix C). Nine monitoring wells located along the up-gradient, western site perimeter were also sampled for total dissolved solids (TDS) and ammonia to provide background data for those constituents. This appendix provides a summary of the groundwater analytical data collected adjacent to the Saginaw River, a further discussion of the data relative to background conditions in the case of TDS and ammonia, and a plan to address exceedances of the GSI criteria.

2. Analytical Data

The validated data for groundwater samples collected between November 2007 and June 2008 from monitoring wells located in the Saginaw River berm area, for those constituents detected at concentrations above the Groundwater Surface Water Interface (GSI) criteria at one or more well, are shown in Table H-1. Note that comprehensive analytical data tables are provided in Appendix A. The TDS and ammonia analytical data collected from the nine monitoring wells located along the up-gradient site perimeter are shown in Table H-2. The monitoring well locations are shown on Figure H-1.

The following analytes were detected above GSI criteria during the November 2007 to June 2008 sampling interval: polychlorinated biphenyls (PCBs; 1 well), mercury (1 well), selenium (1 well), TDS (14 wells), and ammonia nitrogen (11 wells).

PCB detections have been noted during the past two sampling rounds at monitoring well B-7R, located east of the Secondary Settling Pond. We believe that these detections were caused by soil entrained in the sample. This well is located within the berm, which does contain low levels of PCBs in the soils. In response to this data, a new monitoring well was installed between B-7R and the Saginaw River during the week of July 14, 2008. Following development and a two-week time interval to allow the well to stabilize, a sample will be collected from the new well for PCB analysis. Depending on the results of sample analysis, the new well will be added to the annual groundwater monitoring program, or re-sampled. Follow-up actions in the case of PCB detection in the new well will follow the Site contingency plan.

Sep 17, 2009 18:39

Mercury was detected in March 2008 at an estimated concentration below the quantitation limit at monitoring well X-9AR (Table H-1). The monitoring well was re-sampled in June 2008 and mercury was not detected. Mercury has not been identified as a constituent of concern associated with the landfill and had not previously been detected at the well. Therefore, the detection is believed to be anomalous and monitoring will continue on an annual basis.

Selenium was detected slightly above GSI criterion at monitoring well X-9AR in March 2008. Re-sampling in June 2008 indicated that selenium was not detected in the well. Monitoring of X-9AR for selenium will continue on an annual basis.

Total dissolved solids (TDS) concentrations exceeded the GSI criterion at two monitoring wells (MW-110WTR and MW-111WT) located east of the Eastern Type III Landfill, and at all of the wells located in the X-4 and X-9 monitoring well clusters located east of the Green Point Landfill (excluding X-4AR, which was dry). Additional sampling was completed to further evaluate background concentrations of TDS.

The background concentrations of TDS were obtained from two sources: the first, from establishing a background screening level (BSL) based on sampling completed at up-gradient shallow monitoring wells; and the second, by looking at regional data for the chemical and physical characteristics of natural groundwater in Michigan and data from the coal deposits and abandoned mines in the Saginaw County.

The background analytical data collected at the up-gradient Site perimeter are shown in Table H-2. To establish a background screening level (BSLs) for groundwater, the conventional approach is to calculate an upper tolerance limit (UTL) from the background data set, and to then compare data from site wells to the UTL on a point-by-point basis. Tolerance limits provide an interval within which, at least a certain proportion of the population lies with a specified probability that the stated interval does indeed “contain” that proportion of the population (USEPA, 2002). Consistent with USEPA guidance for establishing background screening levels

(BSLs) for groundwater (USEPA, 1989; 1992; 1998a; 1998b), the statistical methods used in this report are based on the 95 percent confidence interval for the 95th percentile (95/95UTL). The 95/95UTL is the appropriate statistic for calculating a BSL for groundwater data when the intended use of the BSL is to compare data from unimpacted wells with data from potentially impacted wells. The site-specific BSL, calculated based on the nine shallow groundwater samples collected along the western edge of the Site, is 4,100 mg/L. The data are gamma distributed, and the 95/95 UTL is 5,548 mg/L. Since this concentration exceeds the maximum observed, the maximum concentration of 4,100 mg/L is accepted as the more reliable measure. Since the background data set is small, and contains one data point that is a statistically significant outlier, another way to look at the background concentration is to calculate the 95/95 UTL based on the data excluding the outlier. The resulting data set is normally distributed, and results in a BSL of 2,200 mg/L.

The GSI criterion for ammonia is based on an estimate of the percentage of the total ammonia that is likely present as unionized ammonia given the pH and temperature of the receiving water body. The estimated concentrations of unionized ammonia shown in Table H-1 are calculated based on the MDEQ default value of 7.2 % of total ammonia nitrogen for warm water surface water. The GSI criterion for ammonia was exceeded at 11 river perimeter monitoring wells. The background data collected from the nine monitoring wells located along the up-gradient Site perimeter show low levels of ammonia in the shallow groundwater (Table H-2).

A review of the data adjacent to the Saginaw River east of the Green Point Landfill shows concentrations of TDS, ammonia, and also chloride, sodium, and sulfate that are higher than would be expected in the deepest wells installed in the deep sand unit, given the concentrations observed up-gradient, near the landfill. As discussed in the Remedial Investigation report, vertical flow gradients are upward near the river, indicating flow upward from the underlying bedrock to the overburden deposits. Due to the presence of heavily mineralized groundwater within the bedrock, an abandoned coal mine beneath a portion of the Site (in the vicinity of the Drum Remediation Area), and the former presence of a flowing artesian oil exploration well south of the Site, impacts from the deeper overburden and bedrock units are likely. To further investigate the nature of these impacts, available literature was reviewed.

Saginaw County is underlain by the Pennsylvanian Aquifer (Saginaw Formation) where it is overlain by, and hydraulically connected with the surficial aquifer system (USGS, 1992). The water from the Pennsylvanian aquifer in this area is salty (dissolved-solids concentrations in excess of 1,260 milligrams per liter) and tends to be a sodium chloride type, the same type found in the deep wells located near the river edge.

Figure H-2 shows a comparison of TDS concentrations observed at the deep sand monitoring wells located adjacent to the river (X-4D and X-9D), the deep monitoring wells located closer to the Green Point Landfill (MW-117S2 and MW-118S2), and natural background concentrations obtained from published sources. The illustrated background concentrations were obtained from *Chemical and Physical Characteristics of Natural Groundwater in Michigan* and from *Coal Deposits and Abandoned Mines in the Saginaw County* (Cummings, 1980, 1989, and Handy, 1982). This figure shows an increase in TDS observed in the deep wells located near the river, when compared to data from wells located closer to the landfill, illustrating the impact of flow from deeper groundwater flow zones.

Handy (1982), in a study of the water quality of coal deposits and abandoned mines of Saginaw County found values of up to 9.20 mg/L of ammonia nitrogen, illustrating that the nearby abandoned coal mine may also be contributing ammonia to the deep wells located adjacent to the river.

3. Summary and Conclusions

To address the constituents identified in the river perimeter wells at concentrations above the GSI criteria, the following actions will be taken:

- As described above, to respond to the detection of PCBs at monitoring well B-7R, a new monitoring well will be installed closer to the river and sampled, and additional actions will be undertaken based on the result of that sampling, as described in the Site contingency plan;
- Monitoring will continue for mercury to confirm that the detection at X-9AR was an anomaly; and
- A mixing zone application will be submitted for selenium and ammonia present in the shallow sand zone.

The TDS concentrations found adjacent to the river are representative of background concentrations, based on sampling completed at the up-gradient site edge, and no actions are required. Based on the presence of upward flow gradients from the bedrock to the overburden adjacent to the river, the naturally high levels of ammonia and TDS associated with the bedrock and high ammonia levels associated with coal mines, we do not believe that the elevated levels of these analytes found in deep sand wells X-4D and X-9D are associated with the Green Point Landfill.

TABLE H-1
GROUNDWATER ANALYTICAL RESULTS - RIVER PERIMETER WELLS
CONSTITUENTS DETECTED ABOVE GSI CRITERIA IN ONE OR MORE WELL
NOVEMBER 2007 THROUGH JUNE 2008

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

General Notes:

Samples were collected by ARCADIS, and submitted Test America Laboratories in North Canton, Ohio for analysis.
Duplicate results are presented in brackets.
Groundwater concentrations are presented in milligram per liter (mg/L), except where noted.
Total PCBs reported as the sum of PCB Aroclors.
* Although not detected above GSI criteria during this sampling interval, constituent is included in table due to past exceedences.
The estimated unionized ammonia (NH_3) concentrations calculated for the monitoring wells located adjacent to the Saginaw River are based on the MDEQ default value of 7.2% of total ammonia nitrogen for warm water surface water.
Shaded and bolded cells represent constituent concentrations that exceed at least one of the listed Michigan Part 201 Criteria:
For Groundwater Adjacent to Saginaw River:
GSI = Groundwater/Surface Water Interface criteria, updated January 2006.

Data Qualifiers:

ND = Not detected. The value in parentheses represents the associated detection limit.
NA = Not analyzed for this constituent.
B = Inorganics: the detected analyte is and estimated value between the instrument detection limit and the reporting limit.
B = Organics: the compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
BJ = The detected analyte is an estimated concentration between the IDL and the RL.
U = The constituent was analyzed for but not detected. The associated value is the constituent quantitation limit.
UJ = The constituent was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual result.
D = Concentration is based on a diluted sample analysis.
J = The compound/constituent was positively identified; however, the associated numerical value is an estimated concentration only.
R = Indicates that the previously reported detection limit or sample result has been rejected due to a major deficiency in the data generation procedure. The data shall not be used for any qualitative or quantitative purposes.

MDEQ Criteria Qualifiers:

(B) Background, as defined in R 299.5701(b), may be substituted if higher than the calculated cleanup criterion.
(I) Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001),
(J) Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.
(M) Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.
(T) Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the DEQ, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of $55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the DEQ, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the following table if TSCA standards are not applicable.

Land Use Category	TSCA, Subpart D Cleanup Standards	Part 201 Soil Direct Contact Cleanup Criteria
Residential & Commercial I	1,000 ppb, or 10,000	4,000 ppb
Industrial & Commercial II	1,000 ppb, or 10,000	16,000 ppb
Commercial III	1,000 ppb, or 10,000	33,000 ppb
Commercial IV	1,000 ppb, or 10,000	22,000 ppb

(X) The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. For a groundwater discharge to the Great Lakes and their connecting waters or discharge in close proximity to a water supply intake in inland surface waters, the generic GSI criterion shall be the surface water human drinking water value (HDV) listed in the table in this footnote, except for those HDV indicated with an asterisk. For HDV with an asterisk, the generic GSI criterion shall be the lowest of the HDV, the WV, and the calculated FCV. see formulas in footnote (G). Soil protection criteria based on the HDV shall be as listed in the table in this footnote, except for those values with an asterisk. Soil GSI protection criteria based on the HDV shall be as listed in the table in this footnote, except for those values with an asterisk. Soil GSI protection criteria for compounds with an asterisk shall be the greater of 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote.

TABLE H-1
GROUNDWATER ANALYTICAL RESULTS - RIVER PERIMETER WELLS
CONSTITUENTS DETECTED ABOVE GSI CRITERIA IN ONE OR MORE WELL
NOVEMBER 2007 THROUGH JUNE 2008

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

MDEQ Criteria Qualifiers (Cont'd.):

(Z) Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

(CC) Groundwater: The generic GSI criteria are based on the toxicity of unionized ammonia (NH3); the criteria are 29 ug/L and 53 ug/L for cold water and warm water surface water, respectively. As a result, the GSI criterion shall be compared to the percent of the total ammonia concentration in the groundwater that will become NH3 in the surface water. This percent NH3 is a function of the pH and temperature of the receiving surface water and can be estimated using the following table, taken from Emerson, et al., (Journal of the Fisheries Research Board of Canada, Volume 32(12):2382, 1975).

Percent NH_3 in Aqueous Ammonia Solutions for 0-30 ^oC and pH 6-10

TABLE H-1
GROUNDWATER ANALYTICAL RESULTS - RIVER PERIMETER WELLS
CONSTITUENTS DETECTED ABOVE GSI CRITERIA IN ONE OR MORE WELL
NOVEMBER 2007 THROUGH JUNE 2008

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

MDEQ Criteria Qualifiers (Cont'd.):

The generic approach for estimating NH3 assumes a default pH of 8 and default temperatures of 68 F and 85 F for cold water and warm water surface water, respectively. The resulting percent NH3 is 3.8 percent and 7.2 percent for cold water and warm water, respectively. This default percentage shall be multiplied by the total ammonia-nitrogen (NH3-N) concentration in the groundwater and the resulting NH3 concentration compared to the applicable GSI criterion. As an alternative, the maximum pH and temperature data from the specific receiving surface water can be used to estimate, from the table in this footnote, a lower percent unionized ammonia concentration for comparison to the generic GSI.

(EE) Soil: The generic soil GSI protection criteria for unionized ammonia are 580 ug/kg and 1,100 ug/kg for cold water and warm water surface water, respectively. The following are applicable generic GSI criteria as required by Section 20120a(15) of the NREPA.

Hazardous Substance	GSI (ug/L)	Notes
Phosphorus	1,000	Criteria applicable unless receiving water is a surface water that has a phosphorus waste load allocation or is an inland lake. In those cases, contact the department for applicable values.
Total dissolved solids (TDS)	5.00E+05	If TDS data are not available, the TDS criterion may be used a screening level for the sum of the concentrations of the following substances:
		Calcium, Chlorides, Iron, Magnesium,
		Potassium, Sodium, Sulfate.
Dissolved Oxygen (DO): Cold receiving waters Warm receiving waters	≥ 7,000 ≥ 5,000	Since a low level of DO can be harmful to aquatic life, the criterion represents a minimum level that on-site samples must exceed. This is in contrast to other criteria which represent "not to exceed" concentrations. DO criteria are not applicable if groundwater Carbonaceous Biochemical Oxygen Demand (CBOD) is less than 10,000 ug/L and groundwater ammonia concentration is less than 2,000 ug/L.

1. Introduction

This document provides information to allow review of the request of MDEQ mixing zone based GSI criteria for the GM Saginaw Malleable Iron Plant Property (SMI) and the Green Point Landfill (collectively referred to as the site; Figure 1) located in Saginaw Michigan. The groundwater discharge rate along the eastern boundary of SMI and the Green Point Landfill to the Saginaw River is estimated to support the Mixing Zone Request for the following parameters: un-ionized ammonia (estimated based on ammonia concentrations) arsenic (total), selenium (total), and thallium (total). The groundwater discharge rate was calculated using hydraulic conductivities, hydraulic gradients, areas of flow zone identified during the Remedial Investigation (RI). The RI results, including monitoring well construction longs and soil boring logs, are included in the Remedial Investigation Report (Blasland, Bouck & Lee, Inc. [BBL], 2001).

2. Groundwater Quality

Ammonia, arsenic, selenium and thallium were detected at concentrations that exceeded Part 201 of Michigan's Natural Resources and Environmental Protection Act (NREPA), 1994 Public Act 451 (Part 201) generic groundwater surface-water interface (GSI) criteria in monitoring wells located in the fill units, upper silty clay unit and upper sand unit along the Saginaw River. The minimum and maximum concentrations were established using the maximum detected concentration for each constituent within the mixing zone.

	Un-ionized Ammonia (mg/L)	Total Arsenic (mg/L)	Total Selenium (mg/L)	Total Thallium (mg/L)
Minimum Concentration	0.006	0.002	0.008	0.004
Maximum Concentration	0.425	0.223	0.008	0.008

The area of each mixing zone and the monitoring wells included in the mixing zone are shown on Figure 2. The horizontal extent of the mixing zone for each constituent has been conservatively extended to the nearest monitoring well with concentrations below GSI criteria. At the southern end of the ammonia mixing zone was extended to the outer edge of the projected flow for the Green Point Landfill. The analytical data for each monitoring well within the mixing zone is provided on Figure 2 and in Table 1.

3. Physical Setting

The site is located approximately 2,000 feet north of the confluence of the Tittabawassee, Shiawassee and Saginaw Rivers, and is located on the western half of Section 35, T12N, R4E, in the city of Saginaw, Saginaw County, Michigan. The site is bounded to the west by the Delphi Automotive Systems Corporation (Delphi) Saginaw Steering Systems Plant 2 (Plant 2) and a junkyard; to the east by the Saginaw River and property previously used for agricultural purposes (previously owned by Ruben Schultz and the State of Michigan, now owned by REALM, Inc.); to the north by commercial, residential and industrial properties; and to the south by agricultural property (Figure 1).

The site topography is generally flat, with the exception of several closed Type III Landfills and the Green Point Landfill, which are mounded above the surrounding land. The components of a former water recirculation system (WRS), including settling ponds and associated channels, also result in minor topographic variability in the northern part of the site. Wetlands are present in the southwest portion of the sit, and a series of ditches provide for drainage throughout the southern portion of the site.

3.1 Regional Geology

The site is located within the Central Lowland geomorphic province and overlies bedrock units of the Michigan basin, which is a roughly circular synclinal structure in which the youngest formations subcrop at the center of the basin, and progressively older formations subcrop outward in concentric rings. The site lies over bedrock units in the central part of the basin, the shallowest of which consist of Pennsylvanian-age bedrock of the Grand River and Saginaw Formations. The Grand River Formation consists primarily of sandstones, which are unconformably overlain by the Saginaw Formation, consisting of interbedded sandstone, shale and limestone, with frequent coal seams.

Sep 17, 2009 18:39

Overburden deposits consist of layers of clay to sand-size sediments that were deposited by fluvial and glaciofluvial processes. The overburden varies on a regional scale across the Saginaw area as a result of variations in the depth to bedrock and the proximity to former and existing depositional controls, including rivers and glacial outwash channels.

3.1.1 Site Geology

Geologic cross-sections are provided on Figures 4, 5 and 6, and the location of the cross-sections is shown on Figure 3. The overburden deposits at the site are summarized below.

- **Fill Unit.** The fill unit consists primarily of foundry sand (fine to medium sand), trace slag, glass and gravel. The thickness of the fill unit along the Saginaw River ranges from 4 to 9 feet thick, with a mean thickness of 6.6 feet. The fill unit thins to the south.

- **Upper Silty Clay Unit.** The upper silty clay unit consists of glaciolacustrine silts and clay. The thickness of the silty clay unit along the Saginaw River ranges from 1 to 10 feet thick, with a mean thickness of 5.5 feet. The silty clay unit thins to the south.

- **Upper Sand Unit.** The upper sand unit consists of fine sand with little silt and trace shell fragments; the unit locally grades coarser with depth. The sand unit pinches out beneath the plant building and also

toward the western and northern site boundaries. In addition, the sand unit is separated into upper and lower units by the glaciolacustrine silt and clay layer in the vicinity of the Saginaw River. The thickness of the sand unit along the Saginaw River ranges from 14 to 22 feet thick, with a mean thickness of 18 feet.

The following saturated geologic units below the upper sand unit do not significantly discharge to the Saginaw River; however, they are included as a reference.

- **Middle Silty Clay Unit.** The middle silty clay unit is a lower confining boundary to groundwater flow in the overburden.

- **Lower Sand Unit.** The silty clay unit previously believed to be the underlying confining layer of the overburden at a depth of approximately 25 to 30 feet in the vicinity of the Saginaw River was observed to be less than 10 feet thick, and underlain by additional sand deposits.

  As illustrated most clearly by cross section C-C' (Figure 6), the two sand units observed adjacent to the Saginaw River appear to connect and form the single sand unit observed beneath the majority of the site. Based on a review of potentiometric surface elevation data, the lower sand identified along the Saginaw River is hydraulically connected to the sand unit observed across the majority of the site.

- **Lower Silty Unit.** The lower silty clay unit was observed underlying the other overburden units across the entire site, and is believed to represent a lower confining boundary (aquitard) to both groundwater flow and contaminant transport.

4. Hydrogeology

The thickness of the units addressed by this Mixing Zone Request ranges from 10.5 feet at MW-149WT to 19.5 feet at the X-9 well cluster as shown on Figure 4. The saturated area extends from the water table to the base of the upper sand unit along the Saginaw River.

4.1 Hydraulic Conductivity

The hydraulic conductivity values obtained from the in-situ hydraulic conductivity testing at 182 monitoring well locations were divided into groups based on the lithologic unit in which the well screen was placed. The five groups of screened units for the wells tested include: fill, silt, fill and silt unit, upper sand, upper clay, lower sand, and upper silty clay and lower silty clay. The data were used to measure responsiveness to changes in static water levels and provide estimates of the hydraulic conductivities of the hydrostratigraphic units (Hvorslev, 1951; Bouwer and Rice, 1976; and Bouwer, 1989). Table 3-2 of the RI Report (BBL, 2001) summarizes the testing data for each monitoring well, including: screened lithologic unit(s) and hydraulic conductivity values calculated for each well tested (Attachment 1).

LFR
Sep 17, 2009 18:39

Lithologic Unit	Total Wells Tested Within Unit	Geometric Mean K		Minimum K Value		Maximum K Value	
		(ft/min)	(cm/sec)	(ft/min)	(cm/sec)	(ft/min)	(cm/sec)
Fill	56	3.03E-03	1.54E-03	3.79E-06	1.93E-06	1.63E-01	8.28E-02
Upper Silty Clay	42	2.08E-03	1.05E-03	3.33E-06	1.69E-06	8.03E-02	4.08E-02
Upper Sand	52	2.77E-03	1.41E-03	3.79E-06	1.93E-06	1.63E-01	8.28E-02
Lower Sand	74	7.61E-03	3.86E-03	7.86E-06	3.99E-06	1.26E-01	6.40E-02
Middle Silty Clay	7	2.10E-06	1.07E-06	3.29E-07	1.67E-07	6.31E-05	3.21E-05
Lower Silty Clay	4	5.56E-06	2.83E-06	4.67E-07	2.37E-07	1.10E-04	5.59E-05

Notes:
ft/min = Feet per minute.
cm/sec = Centimeters per second.

The data indicate that both the upper and lower clay layers transmit water at rates of approximately two to three orders of magnitude less permeable lower on average than the fill, upper and lower sand units on site. These data indicate that the silty clay units (both upper and lower silty clay units, where applicable) act as confining layers to downward groundwater flow on site.

Based on the similar K values of the fill unit, upper silty clay unit and upper sand unit, these units will be combined into one unit for the discharge calculations. A value of 2.9E-03 feet per minute (geometric mean of the K values for the fill, silt and upper sand units) will be used.

4.2 Horizontal Gradients and Groundwater Flow

The general direction of site wide groundwater flow at the water table is toward the southeast in the northern portion of the site and to the south-southeast in the southern part of the site, with localized variations as a result of mounding from the site landfills and surface-water bodies (Figure 7). Generally, groundwater flow is toward the Saginaw River.

Sep 17, 2009 18:39

The horizontal gradient in the northern section of the site ranges from 0.03 feet per foot to 0.13 feet per foot, and is influenced by the site landfills and surface-water bodies. The horizontal gradient in the southern section of the site is 0.003 feet per foot.

For the ammonia mixing zones, the area was divided into three sections due to the variations in the gradient (Figure 7). For the northern section, a gradient of 0.07 feet per foot was used, for the central section, a gradient of 0.13 feet per foot was used and for the southern section, a gradient of 0.003 feet per foot was used to calculate volumetric flow rates. For the arsenic mixing zone, a gradient of 0.035 feet per foot was used in flow calculations, and in the thallium mixing zone 0.13 feet per foot was used in flow calculations. For the selenium mixing zone, a gradient of 0.003 feet per foot was used in flow calculations.

4.3 Cross-Sectional Areas of Discharge Zones

Cross-sectional areas of each of the mixing zone areas are as follows:

Mixing Zone Area	Un-ionized Ammonia	Total Arsenic	Selenium	Thallium
Cross-Sectional Area (ft squared)	69,882	3,185	14,855	26,425

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Cross-sectional areas were calculated for each mixing zone based on the top of the water table and base of the upper sand unit for each area (Figure 4).

5. Estimate of Potential Discharge Rates Using Darcy's Law

The formula below was used to calculate the volumetric groundwater flow rate to the Saginaw River.

Darcy's Law describes the volumetric flow of water through a porous medium based on the hydraulic conductivity of the medium and the hydraulic gradient. Darcy's Law may be stated as (Freeze and Cherry, 1979):

$$Q = KIA$$

where:

- Q = Volumetric flow of water (cubic feet per day)
- K = Hydraulic conductivity of porous medium (feet per day)
- I = Hydraulic gradient (dimensionless)
- A = Cross sectional area perpendicular to flow (feet squared)

The table below presents a summary of the approximate groundwater flow rate for each mixing zone.

Mixing Zone Area	Cross-Sectional Area (ft^2)	Hydraulic Gradient (ft/ft)	K Value (ft/day)	Approximate Groundwater Flow Rate (gal/day)*
Un-ionized Ammonia (total of all sections)	69,882	--	4.18	113,310
Northern Section- [Un-ionized Ammonia]	26,280	0.07	4.18	54,727
Central Section – [Un-ionized Ammonia]	13,737	0.13	4.18	55,784
Southern Section [Un-ionized Ammonia]	29,864	0.003	4.18	2,799
Arsenic	3,185	0.035	4.18	3,482
Thallium	26,425	0.13	4.18	107,305
Selenium	16,200	0.003	4.18	1,392

Notes:
*Flow rate in gallons per day equals flow rate in cubic feet per day times 7.48.

TABLE 1
GROUNDWATER ANALYTICAL DATA

GENERAL MOTORS CORPORATION
SMI PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

General Notes:

Duplicate results are presented in brackets.
Groundwater concentrations are presented in milligram per liter (mg/L), except where noted.
The estimated unionized ammonia (NH_3) concentrations calculated for the monitoring wells located adjacent to the Saginaw River are based on the MDEQ default value of 7.2% of total ammonia nitrogen for warm water surface water.
Shaded and bolded cells represent constituent concentrations that exceed at least one of the listed Michigan Part 201 Criteria:
For Groundwater:
IDW = Industrial Drinking Water criteria, updated January 2006.
For Groundwater Adjacent to Saginaw River:
GSI = Groundwater/Surface Water Interface criteria, updated January 2006.

Data Qualifiers:

ND = Not detected. The value in parentheses represents the associated detection limit.
NA = Not analyzed for this constituent.
B = Inorganics: the detected analyte is and estimated value between the instrument detection limit and the reporting limit.
BJ = The detected analyte is an estimated concentration between the IDL and the RL.
J = The compound/constituent was positively identified, however, the associated numerical value is an estimated concentration only.

MDEQ Criteria Qualifiers:

NA = Criterion or value is *not available* or, as is the case for Csat, *not applicable*.

(A) Criterion is the state of Michigan drinking water standard established pursuant to Section 5 of 1976 pa 399, mcl 325.1005.
(B) Background, as defined in R 299.5701(b), may be substituted if higher than the calculated cleanup criterion.
(I) Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001),
(X) The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. For a groundwater discharge to the Great Lakes and their connecting waters or discharge in close proximity to a water supply intake in inland surface waters, the generic GSI criterion shall be the surface water human drinking water value (HDV) listed in the table in this footnote, except for those HDV indicated with an asterisk. For HDV with an asterisk, the generic GSI criterion shall be the lowest of the HDV, the WV, and the calculated FCV. see formulas in footnote (G). Soil protection criteria based on the HDV shall be as listed in the table in this footnote, except for those values with an asterisk. Soil GSI protection criteria based on the HDV shall be as listed in the table in this footnote, except for those values with an asterisk. Soil GSI protection criteria for compounds with an asterisk shall be the greater of 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote.

TABLE I-2
MIXING ZONE CALCULATIONS

GENERAL MOTORS CORPORATION
I PLANT PROPERTY, AND REALM GREEN POINT LANDFILL AND DRUM REMEDIATION AREA
SAGINAW, MICHIGAN

Hydraulic Gradient Summary

For the un-ionized ammonia mixing zone mean gradient :

Northern Section (MW-149WT to MW-111WT)	0.07 ft/ft
Central Section (MW-111WT to MW-114WT)	0.130 ft/ft
Southern Section (MW-114WT to X-9)	0.003 ft/ft

For the arsenic mixing zone gradient = 0.035 ft/ft

For the thallium mixing zone mean gradient = 0.130 ft/ft

For the selenium mixing zone gradient = 0.003 ft/ft

Average K for all mixing zones = 2.90E-03 ft/min
4.18 ft/day

Saturated Area Summary

	Saturated Area
Un-ionized Ammonia (total)	69,882 ft^2
Northern Section	26,280 ft^3
Central Section	13,737 ft^4
Southern Section	29,864 ft^5
Arsenic	3,185 ft^2
Thallium	26,425 ft^2
Selenium	16,200 ft^2

- EXCEEDS MICHIGAN PART 201 GENERIC INDUSTRIAL SCREENING CRITERIA:
  - GSI – GROUNDWATER/SURFACE WATER INTERFACE CRITERIA
  - IDW – INDUSTRIAL DRINKING WATER CRITERIA

NOTES:

1. THIS PHOTOGRAMMETRIC BASE MAP FOR THE GM SAGINAW MALLEABLE IRON PLANT AND DELPHI SAGINAW STEERING SYSTEMS PLANT 2 PROPERTIES WAS PREPARED BY LOCKWOOD MAPPING, INC. OF ROCHESTER, NEW YORK. AERIAL PHOTOGRAPHY WAS CONDUCTED ON 11/11/94. ORIGINAL LOCKWOOD MAP WAS AT A SCALE OF 1"=100' AND WAS INTERPRETED FOR TWO–FOOT CONTOURS.
2. BASE MAP HAS BEEN MODIFIED TO INCORPORATE BUFFER BASIN, SEDIMENTATION BASINS, WETLANDS MITIGATION AREA, AND GREEN POINT LANDFILL (GPL) FINAL COVER FROM THE FINAL ENGINEERING DESIGN REPORT PREPARED BY BBL FOR THE GPL, DATED JANUARY 1998.
3. VERTICAL DATUM REFERENCED TO NGVD OF 1929, HORIZONTAL DATUM REFERENCED TO MICHIGAN SPC–NAD 1983.
4. PROPERTY BOUNDARY FOR REALM, INC, DIGITIZED FROM SPICER GROUP DRAWING NO. A–21854–1, DATED 3/27/98.
5. ND (0.039)–CONSTITUENT NOT DETECTED. ASSOCIATED DETECTION LIMIT PRESENTED IN PARENTHESES.
6. B = THE DETECTED ANALYTE IS ESTIMATED VALUE BETWEEN THE INSTRUMENT DETECTION LIMIT (IDL) AND THE REPORTING LIMIT (RL).
7. J = THE COMPOUND WAS POSITIVELY IDENTIFIED; HOWEVER, THE ASSOCIATED NUMERICAL VALUE IS AN ESTIMATED CONCENTRATION ONLY.

REQUEST TO MDEQ FOR MIXING ZONE-BASED GSI CRITERIA

Shaded selections of this form should be completed with appropriate information, documentation or narrative to provide the necessary information for the MDEQ to process the request. Original sources of information, if not supplied, should be appended or clearly referenced.

TO: Susan Kaebler-Matlock, Project Manager
Southeast Michigan District Remediation and Redevelopment Division

FROM: General Motors and Waste Management

SUBJECT: Request for Mixing Zone-Based Criteria
Facility Name: *SMI and Green Point Landfill* Part 201 Facility ID#: *73000014*
Saginaw County Part 213 Site ID#:

We are requesting mixing zone-based criteria for the above referenced facility, located in the SE 1/4 of the NW 1/4 of Section 35, T 12, R 4 in Saginaw

The facility characteristics include:

1. The name of the receiving surface water body and the location of the venting groundwater contaminant plume:

   Saginaw River

   This is a ☐ new ☐ increased or ☑ existing loading.
   Recreational Use: ☑ Yes/☐ No (if no, provide an explanation of conditions that make recreation use not applicable to site conditions).

   (MAP ATTACHED).

2. The location, nature, and chemical characteristics of the source of the groundwater contamination plume:

   See supplemental letter

3. The name, Chemical Abstract Service (CAS) Number, and worst case maximum concentration of contaminants predicted to reach the groundwater/surface water interface (GSI). Generally the highest concentration of the contaminant found in the groundwater would be appropriate to represent the worst case maximum. If source contaminants have not yet reached the groundwater but are expected to do so, source concentrations should be identified and noted as such. Mixing zone-based GSI criteria will not be developed for contaminants that are not identified as having a reasonable potential to exceed water quality criteria.

Chemical or General Chemistry Parameter	CAS #	Predicted Worst Case Maximum GSI Discharge Concentration	Average Surface Water Conc. Upstream If available
Un-ionized Ammonia	7664-41-7	0.425 mg/l	NA
Arsenic	7744-03-82	0.223 mg/l	NA
Selenium	7782-24-92	0.008 mg/l	NA
Thallium	7740-28-0	0.008 mg/l	NA

4. The discharge rate of the venting groundwater contaminant plume in cubic feet per second (cfs).

   See supplemental letter

5. The location of other contaminant plumes entering the receiving surface water body, their constituents and concentrations, if available:

   None known

6. If available:
   The lowest monthly 95 percent exceedance low flow at the discharge location: 580.00 CFS
   The harmonic mean flow at the discharge location: 1,490.00 CFS
   The 90dQ10 flow at the discharge location: 620.00 CFS
   source:
   - ☐ MDEQ Low Flow Data Base
   - ☑ Determined by MDEQ Hydrologic Studies Unit (memo attached)
   - ☐ Other

I certify under the penalty of law that I have personally examined and am familiar with the information submitted in this request and all attachments thereto and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information

If this is a new loading, or increased loading above previously authorized levels, an antidegradation demonstration, which includes the information in 8 and 9 below, or a demonstration of qualification for an exemption under Rule 323.1098 (7) or (8), is required.

7. Please check whether there is
   - ☐ an antidegradation demonstration (Information for 8 and 9 is included.) **or**
   - ☐ a demonstration of qualification for an exemption (Refer to 323.1098 (7) and (8) for elements needed for this demonstration.)

   Please identify below who prepared the antidegradation or exemption demonstration.

8. This is a new or increased loading from venting groundwater. The social or economic development and the benefits to the area in which the waters are located that would be foregone if the new or increased discharge is not allowed include:
   - Employment increases:
   - Production level increases:
   - Employment reductions avoidance:
   - Efficiency increases:
   - Industrial, commercial, or residential growth:
   - Environmental or public health problem corrections:
   - Economic or social benefits to the community:
   - Other relevant factors:

If the new or increased loading includes the following bioaccumulative chemicals of concern (BCCs), Chlordane, 4,4'-Dichlorodiphenyldichloroethane, 4,4'-Dichlorodiphenyldichloroethylene, 4,4'-Dichlorodiphenyltrichloroethane, Dieldrin, Hexachlorbenzene, Hexachlorobutadiene, Hexachlorocyclohexanes, alpha-Hexachlorocyclohexane, beta-Hexachlorcyclohexane, delta-Hexachlorocyclohexane, Lindane, Mercury, Mirex, Octachlorostyrene, Polychlorinated biphenyls, Pentachlorobenzene, Photomirex, 2,3,7,8-Tetrachlorodibenzodioxin, 1,2,3,4-Tetrachlorobenzene, 1,2,4,5-Tetrachlorobenzene, Toxaphene, complete the following:

9. Please check whether
   - ☐ There is no BCC in the discharge **or**
   - ☐ BCCs are included in the discharge (information for 10. and 11. is included.)

10. The alternatives evaluated and the alternatives to be implemented that will comply with minimizing the discharge of the BCC by implementation of any cost-effective pollution prevention alternatives (such as source control) and techniques reasonably available that would eliminate or significantly reduce the discharge of the BCC are:

11. If pollution prevention alternatives would not eliminate the increased discharge of the BCC, the person making the demonstration must evaluate alternative or enhanced groundwater treatment techniques that would eliminate the discharge of the BCC. The techniques that have a cost that are reasonable relative to the cost of treatment necessary to achieve generic GSI criteria must be implemented. The alternatives evaluated and the alternatives to be implemented that will comply with this requirement are:

Mail Code 483-520-190
2000 Centerpoint Parkway
Pontiac, Michigan 48341-3146

Dear Ms. Hiatt:

SUBJECT: Human Health Risk Assessment - Revised Draft Remedial Action Plan
Saginaw Malleable Iron Plant/Green Point Landfill
Consent Judgment No. 98-22686-CE-2

This letter has been prepared as follow-up to issues discussed during our February 22, 2006, meeting at General Motors Corporation (GM) offices in Pontiac related to the revised Remedial Action Plan (Revised RAP) submitted by GM under the provisions of the Consent Judgement No. 98-22686-CE-2. The meeting was productive towards resolving outstanding issues related to the human health risk component of the Revised RAP. The following is understood by the Remediation and Redevelopment Division (RRD) to be the agreed upon actions:

- GM will prepare a letter that contains information sufficient to address Department of Environmental Quality (DEQ) comments and concerns expressed in the January 18, 2006, DEQ memorandum in accordance with discussions and determinations made during the February 22 meeting. GM will submit this letter to the DEQ for review on or before **March 24, 2006**.

- The RRD staff will review information presented in the letter and will provide GM with formal written response as to the acceptability of the information presented in the letter on or before **April 7, 2006**. The RRD staff will immediately contact GM should there be any questions or concerns regarding the information presented in the letter.

- Incorporating the information contained in the GM letter, the DEQ will provide GM with a formal determination regarding the acceptability of the Revised RAP on or before **May 19, 2006**. This date was agreed upon by GM and DEQ representatives during the meeting.

MICHIGAN DEPARTMENT OF ENVIRONMENTAL QUALITY

INTEROFFICE COMMUNICATION

TO: Sue Kaelber-Matlock, Senior Geologist
Remediation and Redevelopment Division (RRD)
Saginaw Bay District Office

FROM: Divinia N. Stemm, Ph.D.
Toxicology Unit, RRD

DATE: January 18, 2006

SUBJECT: Saginaw Malleable Iron (SMI) Plant Property and REALM, Inc.
Greenpoint Landfill and Drum Remediation Area
Human Health Evaluation (HHE) Addendum (9/23/2005)

I have conducted my review of the above document taking into consideration information that you have provided and documents on file with the Toxicology Unit. My comments follow:

Site-specific particulate soil inhalation criteria (PSIC) calculation for manganese (Mn)

1) The following comments and requests for additional information were made/requested by Jeff Crum, formerly of RRD, from Holli Jones of BBL (see communication dated 7/28/2003). The recommendations were not incorporated nor was the additional information provided. Moreover, Allan Brouillet has indicated in an 11/10/2003 communication to Jeff that the feasibility study will be approved with the caveat that General Motors provide the information needed to support their calculations as part of the draft Remedial Action Plan (RAP).

   a) The Michigan-specific defaults should be used to derive the particulate exposure factor (PEF). The use of an EPA-derived PEF (EPA, 2002) in the PSIC calculation for off-site residents is neither site- nor state-specific and should be revised.

   b) The PSIC and PEF calculations must be provided.

   c) Please have the consultants provide documentation for the factors other than the meteorological parameters which cause the site-specific Mn PSIC of 23,000 mg/kg (ppm) for off-site residential receptors and 24,019 ppm for the site production area to be significantly higher than the generic residential and industrial criteria (3,300 ppm and 1,500 ppm, respectively). The exposure variables for the off-site residents are the same as the DEQ assumptions.

2) The proposed site-specific PSIC for Mn have not been approved by the DEQ. The information requested by the RRD on how the site-specific criteria were derived for the off-site residents and the exposed workers has not been provided to the RRD.

3) Site-specific PSIC equation variables.

   a) When a site-specific criterion is calculated for a facility, site-specific assumptions must be used in place of the generic default assumptions and the equations presented in the Part 201 Administrative Rules must be used for the calculation (R 299.5710 to

Sep 17, 2009 18:39

R 299.5726). Therefore, the SMI site-specific calculation must be revised based on the following considerations:

i) The short-term peaks in particulate levels must be considered in the calculation by dividing the PEF by a factor of 2. See explanation on pages 11-12 of the MDEQ Technical Support Document for Generic Soil Inhalation Criteria for Ambient Air (SIC-TSD).

ii) A site-specific PSIC calculation must consider the site-specific source size. The PEF used in the site-specific PSIC calculation was based on a 0.5 acre contaminant source area for Mn. For multiple source areas at a facility, it is assumed that the contaminant emitted from different source areas will commingle in ambient air and produce a concentration that is greater than the emission from a single source (SIC-TSD, pages 19-21, MDEQ Sampling Strategies and Statistics Training Manual (S3TM)). In this case, the final source size is the sum of the individual emission source areas at the facility.

iii) The use of the correctly modified PEF should result in a lower site-specific PSIC since there are 4 Mn sources at the facility.

iv) The adjusted air intake (AIR) used in the site-specific equation is not in the DEQ PSIC algorithm for non-carcinogens (R 299.5726(2)). Likewise, the EPA does not use the AIR in its PSIC calculation for non-carcinogens. The Toxicology Unit previously indicated that the use of the AIR may be appropriate for the worker scenario since the Mn reference concentration is based on continuous exposure while the worker exposures are not continuous (7/2/2003, DEQ memo). Although it is not clear that this parameter is appropriate, the use of AIR will be allowed for the worker scenario at this facility. We do however, caution against its use in the future for site-specific calculations of ambient air criteria for non-carcinogens.

v) The area utilization factor (AUF) in the PSIC equations (Appendix C of the 2003 final FS) should be removed as previously requested in a memo dated 3/5/2003. The AUF is not consistent with the Part 201 PSIC algorithms.

4) Receptor and exposure assumptions for the Mn PSIC.

a) The site-specific scenario for the construction worker is a 30-day single construction event [exposure frequency (EF)] for one year [exposure duration (ED)]. In comparison, the generic EF and ED are 245 days and 21 years, respectively. The main consideration for the construction worker during construction events is the intensive, substantial inhalation exposure to surface and subsurface soil contaminants due to excavation and extensive soil movement, loss of vegetative cover leading to increased emission due to wind erosion, and use of heavier vehicles and increased vehicle traffic producing much higher vehicle traffic particulate emissions. The site-specific PSIC should consider not only the EF but other site-specific factors especially the use of heavy vehicles during construction, current and future vegetative cover, and atmospheric variables in the derivation of the air dispersion factor to account for short-term peaks in air concentrations at the site.

b) Please have the consultant provide supporting documentation for the use of an EF of 30 days for a construction worker. The 30-day EF appears low. The exposure scenarios used for the DEQ generic criteria are based on "maximum reasonable exposures (RME)" in accordance with the EPA guidance. Site-specific exposure scenarios are also expected to represent RMEs.

c) The PEF used in the generic residential PSIC calculation assumes that vehicles at the facility are mainly passenger; therefore, the residential criterion of 3,300 ppm should not be applied to an industrial or construction setting.

d) Maintenance workers should be included as receptors in the source areas that are categorized as production areas (former rail yard and metal feedstock storage areas).

e) Please have the consultant explain why the site-specific PSIC value for surface soil Mn is different from that for subsurface soil Mn in the non-production area (river berm).

5) Sampling and statistics.

a) Please have the consultant clarify the number of samples taken from each contaminated source area and indicate whether samples are surface or subsurface soil. Also have them identify the samples that were included in the 95% upper confidence limit (UCL) for the mean calculated for each source area (Appendix 1 of the HHE addendum). Note that only samples taken from the emission source area should be included in the 95% UCL calculation (SIC-TSD pages 20-21, S3TM).

b) Subsurface soil samples and surface soil samples should not be combined in calculating the 95% UCL for the emission source unless it is shown that there is little variability between these soil layers; i.e., they represent the same sample population.

c) The verification samples collected from the 3 berm areas where soil with high Mn concentrations was removed are considered biased samples and should be compared to the criterion on a point-by-point basis (S3TM Sections 1.3.3 and 2.3). These samples should not be included in the 95% UCL calculation.

d) Please have the consultant clarify or explain how they determined where and when to collect the subsurface samples from a source area. In general, the subsurface soils appear to have higher Mn concentrations than the surface soils. For example, subsequent sampling of the subsurface in the berm area after removal of contaminated surface soils showed high Mn concentrations (95% UCL = 6,964 ppm; maximum = 26,600 ppm).

e) In the HHE Addendum Appendix 1, pages 1 and 2, please have the consultant clarify the information in these tables. The titles do not match the UCL values shown in Tables 4-5 and 4-6.

Polychlorinated biphenyls (PCBs)

PCBs were not addressed in the HHE addendum except for the statement that soils in the river berm and rail yard areas were analyzed for PCBs. Based on information you provided, PCB contamination at the facility was evaluated for Toxic Substances Control Act (TSCA) applicability and is being addressed under Part 201; however, disposal of PCB contaminated soil was done in accordance with TSCA requirements. Please have the consultant indicate that TSCA was addressed where appropriate. The feasibility study as well as the RAP indicates PCB concentrations in soil as high as 650 ppm and 4,900 ppm at the manhole and melting department, respectively. The Part 201 industrial soil direct contact criterion for PCBs is 16 ppb. However, Table 2.1-1 of the RAP indicates a site-specific criterion of 60 mg/kg. This site-specific criterion was also used to evaluate PCBs in Tables 6- 2, 6-9, 6-12, and 6-15 of the feasibility study. The consultant must provide detailed documentation on how this criterion was derived.

Re: Human Health Risk Assessment – Revised Draft Remedial Action Plan
GM Saginaw Malleable Iron Plant Property, and REALM Green Point Landfill
Consent Judgment No. 98-22686-CE-2

Dear Mr. Brouillet:

This letter has been prepared on behalf of the General Motors Corporation (GM) and Waste Management Inc. (WMI) to provide responses to Michigan Department of Environmental Quality (MDEQ) comments on the Human Health Evaluation (HHE) (an attachment to the Feasibility Study [FS]) and the HHE Addendum (an attachment to the Remedial Action Plan [RAP]) presented in a January 18, 2006 memorandum from Ms. Divinia Stemm (MDEQ-RRD) to Ms. Susan Kaelber-Matlock (MDEQ-RRD). A meeting was held on February 22, 2006, between representatives of the MDEQ, GM, and WMI to discuss the comments. GM's understanding of the resolution of each comment, as discussed at the meeting, in addition to supplemental information requested to resolve several of the comments is provided below. Note that a list of relevant project correspondence dealing with the FS and the RAP was distributed at the meeting along with copies of the correspondence, as requested by the MDEQ. The correspondence list is provided in Attachment 1.

MDEQ Comment 1)

1) Site-specific particulate soil inhalation criteria (PSIC) calculation for manganese (Mn)
The following comments and requests for additional information were made/requested by Jeff Crum, formerly of RRD, from Holli Jones of BBL (see communication dated 7/28/2003). The recommendations were not incorporated nor was the additional information provided. Moreover, Allan Brouillet has indicated in an 11/10/2003 communication to Jeff that the feasibility study will be approved with the caveat that General Motors provide the information needed to support their calculations as part of the draft Remedial Action Plan (RAP).

Response

Based on review of the July 28, 2003 email sent from Jeff Crum to Christine Flaga, which was provided to GM at the February 26, 2006 meeting, Jeff Crum's comments primarily dealt with the evaluation of potential impacts to offsite residential receptors due to windblown dust from the Former Railyard. This exposure pathway was addressed in the HHE through the use of an EPA model due to the absence of MDEQ criteria that are applicable to this potential exposure route. As discussed below, an alternative

evaluation has been completed using generic residential exposure parameters and a Particulate Emission Factor (PEF) that is representative of site conditions (specified in a deed restriction). Based on discussions at the February 22, 2006 meeting, GM believes that this approach is acceptable to the MDEQ.

The Former Railyard is considered a potential source for offsite migration of manganese dust. Comparison of the 95% UCL calculated for the Former Railyard (2,638 mg/kg) to the generic residential Particulate Soil Inhalation Criteria (PSIC equal to 2,000 mg/kg assuming a 9.5 acre source area) shows the concentration detected in the source area slightly exceeds the generic PSIC value, which assumes use of dirt roads in the future. However, deed restrictions are being implemented at the site as part of the RAP, which will limit dust generation by preventing the installation of dirt roadways in this area (the RAP specifies construction with 6-inches of gravel or pavement cover). The MDEQ derived generic residential exposure parameters have been used because the exposure parameters (exposure frequency of 350 days per year, exposure duration of 30 years and an averaging time of 10,650 days) are consistent for the adjacent residential population assumed to be exposed to windblown dust if dirt roads were used in this area of the site. If a PEF is calculated assuming 50% vegetation and no routine vehicular traffic on the 9.5 acres (reflecting the provisions of the deed restriction); the resulting site-specific PSIC for the residential population is 4,700 mg/kg. The 95% UCL for the source area (2,638 mg/kg) is less than the site-specific PSIC. As a result, there is no potential risk to offsite residential receptors.

MDEQ Comment 1a)

a) The Michigan-specific defaults should be used to derive the particulate exposure factor (PEF). The use of an EPA-derived PEF (EPA, 2002) in the PSIC calculation for off-site residents is neither site- nor state-specific and should be revised.

Response

The Michigan Particulate Exposure Factor (PEF) was used to calculate the PSIC for offsite residential receptors.

MDEQ Comment 1b)

b) The PSIC and PEF calculations must be provided.

Response

The updated calculations, reflecting a modifier due to the source size, are provided in Attachment 2. Note that the PSIC calculations used in the HHE were provided in Appendix A of the Feasibility Study. The PEF calculations were not included at that time, since MDEQ default values were used.

MDEQ Comment 1c)

c) Please have the consultants provide documentation for the factors other than the meteorological parameters which cause the site-specific Mn PSIC of 23,000 mg/kg (ppm) for off-site residential receptors and 24,019 ppm for the site production area to be significantly higher than the generic residential and industrial criteria (3,300 ppm and 1,500 ppm, respectively). The exposure variables for the off-site residents are the same as the DEQ assumptions.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Response

The parameters used to derive the PSIC values are presented below. The PEF values used are MDEQ default values as presented in the technical support document dated August 31, 1998 (Part 201 Generic Soil Inhalation Criteria for Ambient Air).

$$\text{SSCC – PSIC (mg/kg)} = \frac{\text{TH x AT x 365dy/yr x AIR}}{\text{EF x ED x (1/RfC) x (1/PEF)}}$$

Where:

Site-Specific Industrial	Default - Industrial	
1	1	TH = Target Hazard Quotient (unitless; MDEQ default)
1 (construction worker)	21 (MDEQ default)	AT = Averaging Time
2 (construction worker)	NA	AIR = adjusted Inhalation Rate
30 (construction worker)	245(MDEQ default)	EF = Exposure Frequency
1 (construction worker)	21 (MDEQ default)	ED = Exposure
5E-05	5E-05	RfC (mg/m^3) = Reference Concentrations (USEPA, 2003)
1.97E+07* (MDEQ, 1998 TSD) assumes 18 acre source area	3.95E+07* (MDEQ, 1998 TSD)	PEF (m^3/kg) = Offsite particulate emission factor
12,000	1,500	SSCC (mg/kg) = Site-specific clean-up criteria

*The PEF is divided by 2 as discussed in the guidance to account for short-term peak particulate levels for all chemicals which are associated with quarterly, 24-hour, 8-hour, or 2-hour averaging times under the Air Toxics Rule.

The site conditions assumed in the derivation of the default PEF (e.g. 50 vehicles traveling 2.25 kilometers per day in the area) are likely to overestimate dust generation at the site. Currently, there is no routine truck traffic in the Former Railyard, and deed restrictions will prevent traffic generation of dust in the areas in question in the future. (More realistically, there will not be any vehicular traffic in the future in the areas in question.) The areas are currently vegetated, and this cover will be maintained as 50% or greater.

From the RAP:

> *V. Former Railyard Area*
> *In order to protect against the inhalation of hazardous substances present in surface soil, the vegetative cover will be maintained (minimum of 50 % coverage of soil surface), and roadways may not be installed unless properly constructed (at least 6 inches of gravel or pavement cover) in the former Railyard Area. Activities in this area of the Site are restricted to those consistent with current facility operations, including access by a maintenance worker who spends no more than 160 days, per any such worker per year, and an intrusive/construction worker who spends no more than 30 days, per any such worker per year, in the area. To implement activities in this area that are inconsistent with current facility operations, a Health and Safety Plan must be developed and followed or the activity must be approved by the MDEQ prior to implementation..*

MDEQ Comment 2)

2) *The proposed site-specific PSIC for Mn have not been approved by the DEQ. The information requested by the RRD on how the site-specific criteria were derived for the off-site residents and the exposed workers has not been provided to the RRD.*

Response

Based on MDEQ comments and discussions with MDEQ on February 22, 2006, the USEPA model, which was the basis of the original site-specific criteria for offsite residents, is no longer being used by GM to evaluate potential impacts to offsite residents (refer to the response to Comment 1). The potential offsite hazards are discussed in the response to Comment 1. Additionally, information used to derive the PSIC for the exposed workers is provided in the response to Comment 1c.

MDEQ Comment 3ai)

3) *Site-specific PSIC equation variables.*

a) *When a site-specific criterion is calculated for a facility, site-specific assumptions must be used in place of the generic default assumptions and the equations presented in the Part 201 Administrative Rules must be used for the calculation (R 299.5710 to R 299.5726). Therefore, the SMI site-specific calculation must be revised based on the following considerations:*

i) *The short-term peaks in particulate levels must be considered in the calculation by dividing the PEF by a factor of 2. See explanation on pages 11-12 of the MDEQ Technical Support Document for Generic Soil Inhalation Criteria for Ambient Air (SIC-TSD).*

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Response

For the onsite worker, the default MDEQ PEF for an industrial exposure (3.95E+09 m^3/kg) was used. This value was divided by 2 to account for short-term peak particulate levels for all chemicals which are associated with quarterly, 24-hour, 8-hour, or 1-hour averaging times under the Air Toxics Rule. A factor of 2 was also applied to the PEF for the offsite receptor described in Comment 1.

However, application of the safety factor of 2 is unnecessary given the data used to derive the manganese reference concentrations. In a letter sent to Chris Flaga from John Schell (March 20, 2002), Dr. Schell outlines several technical issues that support the modification of the generic Mn IPSIC. One of the issues outlined in the letter was the unnecessary inclusion of the application of the 2-fold safety factor to protect against acute risks. Manganese is not acutely toxic and therefore this additional safety results in an overly conservative IPSIC.

MDEQ Comment 3aii)

ii) *A site-specific PSIC calculation must consider the site-specific source size. The PEF used in the site-specific PSIC calculation was based on a 0.5 acre contaminant source area for Mn. For multiple source areas at a facility, it is assumed that the contaminant emitted from different source areas will commingle in ambient air and produce a concentration that is greater than the emission from a single source (SIC-TSD, pages 19-21, MDEQ Sampling Strategies and Statistics Training Manual (S3TM)). In this case, the final source size is the sum of the individual emission source areas at the facility.*

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Response

The source sizes have been revised, in response to MDEQ's comments, to 9.5 acres for the Former Railyard Area and 18 acres for the combined Former Railyard Area and the Previous Metal Feedstock Area. The PSIC values have been revised accordingly.

MDEQ Comment 3aiii)

iii) The use of the correctly modified PEF should result in a lower site-specific PSIC since there are 4 Mn sources at the facility.

Response

As per our discussions on February 22, 2006, with MDEQ representatives, it was determined that there are two potentially relevant onsite sources of manganese, the Former Railyard Area and the Previous Metal Feedstock Area. The following table summarizes the revised SSCC if an 18 acre source area (combined Former Railyard Area and Previous Metal Feedstock Area) is considered.

	Site Concentration (mg/kg)	Maintenance Worker PSIC (mg/kg)	Construction (Intrusive) Worker PSIC (mg/kg)
Railyard Area	2,638 (95% UCL)	2,300*	12,000
Previous Metal Feedstock Area	6,140 (maximum)	2,300*	12,000
Former CTC Parking Lot East of the Main Plant	11,600 (maximum)	2,300*	12,000
Saginaw River Berm	1,779 (95% UCL)	2,300*	12,000

*Various deed restrictions prevent dust generation from vehicular traffic. The IPSIC assuming no vehicular traffic = 17,000 mg/kg.

Confidential under FOIA Richard Kowalski LFR Sep 17, 2009 18:39

MDEQ Comment 3aiv)

iv) The adjusted air intake (AIR) used in the site-specific equation is not in the DEQ PSIC algorithm for non-carcinogens (R 299.5726(2)). Likewise, the EPA does not use the AIR in its PSIC calculation for non-carcinogens. The Toxicology Unit previously indicated that the use of the AIR may be appropriate for the worker scenario since the Mn reference concentration is based on continuous exposure while the worker exposures are not continuous (7/2/2003, DEQ memo). Although it is not clear that this parameter is appropriate, the use of AIR will be allowed for the worker scenario at this facility. We do however, caution against its use in the future for site-specific calculations of ambient air criteria for non-carcinogens.

Response

No action required.

MDEQ Comment 3av)

v) The area utilization factor (AUF) in the PSIC equations (Appendix C of the 2003 final FS) should be removed as previously requested in a memo dated 3/5/2003. The AUF is not consistent with the Part 201 PSIC algorithms.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Response

Although the AUF term is still included in the equations in Appendix C of the HHE included in the FS, it is set to one and therefore, does not impact the calculations (it is essentially a placeholder). The different use patterns are incorporated into the exposure frequencies for each receptor in the production and non-production areas. This means that although the AUF terms are included in the tables, the calculation still assumes that each receptor spends 100% of the time exposed in the identified areas.

MDEQ Comment 4a)

4) Receptor and exposure assumptions for the Mn PSIC.

a) The site-specific scenario for the construction worker is a 30-day single construction event [exposure frequency (EF)] for one year [exposure duration (ED)]. In comparison, the generic EF and ED are 245 days and 21 years, respectively. The main consideration for the construction worker during construction events is the intensive, substantial inhalation exposure to surface and subsurface soil contaminants due to excavation and extensive soil movement, loss of vegetative cover leading to increased emission due to wind erosion, and use of heavier vehicles and increased vehicle traffic producing much higher vehicle traffic particulate emissions. The site-specific PSIC should consider not only the EF but other site-specific factors especially the use of heavy vehicles during construction, current and future vegetative cover, and atmospheric variables in the derivation of the air dispersion factor to account for short-term peaks in air concentrations at the site.

Response

The exposure frequency of 30 days per year for the construction worker (or more correctly an intrusive worker) was based on professional judgment. This receptor is assumed to be a short term contractor and not a GM employee. We agree with MDEQ's statement that other factors should be considered for this receptor, an individual exposed at a high intensity for a short period of time. This was accomplished by using exposure parameters (consistent with the USEPA (2001) construction worker scenario), that reflect this type of activity (e.g., soil ingestion rate of 330 mg/day, a surface area of 3300 cm^2, and a skin to soil adherence factor of 0.3 mg/cm^2-event).

MDEQ Comment 4b)

b) Please have the consultant provide supporting documentation for the use of an EF of 30 days for a construction worker. The 30-day EF appears low. The exposure scenarios used for the DEQ generic criteria are based on "maximum reasonable exposures (RME)" in accordance with the EPA guidance. Site-specific exposure scenarios are also expected to represent RMEs.

Response

The exposure frequency of 30 days per year for the construction worker (worker could also be designated as an intrusive worker) was based on professional judgment, assuming intrusive activities last 6 weeks, 5 days per week. This receptor is assumed to be a short term contractor and not a GM employee. This value was presented in a memo to Chris Flaga from John Schell dated March 27, 2003 (sent via email). After discussing this exposure scenario at our February 22, 2006, meeting, we believe that we reached concurrence on this approach.

MDEQ Comment 4c)

c) *The PEF used in the generic residential PSIC calculation assumes that vehicles at the facility are mainly passenger; therefore, the residential criterion of 3,300 ppm should not be applied to an industrial or construction setting.*

Response

The residential criterion of 3,300 ppm was only used when trying to determine if offsite conditions were acceptable. It is understood that the PEF for the residential value assumes vehicles at the facility are mainly passenger, however, the area of the site in question here, the Former Railyard Area, is not expected to have any traffic in the normal course of daily activities. Additionally, 3,300 ppm was only used to conservatively determine the potential risks offsite (where it could be assumed that the dust being generated onsite has dispersed somewhat before reaching the receptors). Additionally, the generic value has been adjusted to reflect the 9.5 acre source area. The resulting value is 2,000 mg/kg.

MDEQ Comment 4d)

d) *Maintenance workers should be included as receptors in the source areas that are categorized as production areas (former rail yard and metal feedstock storage areas).*

Response

This is inconsistent with the original site conceptual model presented for the site. However, as discussed in the HHE addendum in the RAP, changes in some of the site usage (e.g. the Railyard is no longer active) required comparison of site conditions of some of the source areas to the values derived for the maintenance workers (specifically the Former Railyard and the Previous Metal Feedstock Area). The following is language contained in the Human Health Evaluation:

> **Maintenance Worker**: This receptor was selected to specifically evaluate *outdoor* exposures. This individual spends most of the workday conducting maintenance activities outdoors. These activities include, but are not limited to mowing grass and inspecting the landfills. Occasionally this individual may be involved in emergency type activities (i.e. utility line repair) that would require him to be engaged in intrusive type work which may result in exposure to surface and subsurface soils, and non-potable groundwater. This receptor is the only one that will consistently contact soil in the non-production area. Because this individual represents the most heavily, chronically exposed individual for the non-production area, the risk based values developed for this receptor will be conservative and protective of other receptors potentially exposed in this area.
>
> **Construction Worker (or more correctly an intrusive worker)**: This receptor was selected to specifically evaluate potential high contact activity to subsurface soil and non-potable groundwater. This individual is involved in certain land intrusive activities at the facility, which may result in exposure to surface soils, subsurface soils, and non-potable groundwater associated with the non-production area. However, exposure for these individuals will be relatively short in duration, and this person is unlikely to be a site employee. As a highly conservative assumption, this worker is assumed to never be indoors.

The revised site IPSIC concentrations are compared with the site data in the table presented in the response to Comment 3aiii. Other than described, we still do not believe it is appropriate to use maintenance workers as receptors in the other remaining production areas.

MDEQ Comment 4e)

e) Please have the consultant explain why the site-specific PSIC value for surface soil Mn is different from that for subsurface soil Mn in the non-production area (river berm).

Response

The surface exposure is derived for the maintenance worker, who is assumed to contact only surface soil. Occasionally this individual may be involved in emergency type activities (i.e. utility line repair) that would require him to be engaged in intrusive type work (5 events per year) which may result in exposure to surface and subsurface soils, and non-potable groundwater. The intrusive worker (formerly referred to as a construction worker) is assumed to be exposed to both surface and subsurface soils.

MDEQ Comment 5a)

5) Sampling and statistics.

a) Please have the consultant clarify the number of samples taken from each contaminated source area and indicate whether samples are surface or subsurface soil. Also have them identify the samples that were included in the 95% upper confidence limit (UCL) for the mean calculated for each source area (Appendix I of the HHE addendum). Note that only samples taken from the emission source area should be included in the 95% UCL calculation (SIC-TSD pages 20-21, S3TM).

Response

Site Area	Number of Manganese Soil Samples	Surface or Subsurface	IDs of Samples Used to Determine Exposure Point Concentration	Exposure Point Concentration
Railyard	17	Surface	RS-1 through RS-4, RS-6 through RS-18 (all samples collected from 0-1 foot depths)	2,638 mg/kg[2]
Former CTC Parking Lot	4	Surface (below soil cover)	PL-1 through PL-4 (collected below paving that has been replaced by soil cover)	11,600 mg/kg[1]
Previous Metal Feedstock Area	10	Surface	FS-1 through FS-8, SB-304, and SB-305 (all samples collected from 0-1 foot depths)	6,140 mg/kg[1]
	4	Subsurface	SB-304 and SB-305 (2-4 foot and 6-8 foot sample depths)	9,190 mg/kg[1]
Saginaw River Boundary	26	Surface	SB-378 (4 samples at 0-1 foot depth at excavation walls), SB-379 (0-0.5 and 0.5-1 foot sample depths), SB-380 (3 samples at 0-1 foot depth at excavation walls), SB-381(3 samples at 0-1 foot depth at excavation walls), SB-382 through SB-388 (0-0.5 and 0.5-1 foot sample depths).	1,779 mg/kg[2]
	37	Combined Surface and Subsurface	Surface samples listed above plus MW-183WT (8-9.5 foot depth), SB-374 (9.5 -10.5 foot depth), SB-375 (6.5-7.5 foot depth), SB-377 (2-2.5 and 2.5-3 foot depth), SB-378 (3 samples at 2-3 foot depth at excavation walls and floor), SB-380	6,964 mg/kg[2]

LFR
Sep 17, 2009 18:39

Site Area	Number of Manganese Soil Samples	Surface or Subsurface	IDs of Samples Used to Determine Exposure Point Concentration	Exposure Point Concentration
			(2 samples at 2-3 foot depth from excavation floor), and SB-381 (2 foot depth from excavation floor)	

Notes:
1 = Maximum detected concentration.
2 = 95% UCL concentration.

Note that in preparation of this table it was determined that two surface soil samples (SB-304 and SB-305) had been inadvertently excluded from the 95% UCL calculations presented in the HHE (July 29, 2003). As a result, the correct exposure point concentration is equal to the maximum concentration detected. To ensure protection of human health, the deed restriction proposed in the draft RAP, which places restrictions on intrusive activities in this area, will be modified to also prevent the construction of dirt roadways (6 inches of gravel or paving will be required).

MDEQ Comment 5b)

b) Subsurface soil samples and surface soil samples should not be combined in calculating the 95% UCL for the emission source unless it is shown that there is little variability between these soil layers; i.e., they represent the same sample population.

Response

Regardless of the sample population used to calculate the 95% UCL for the River Berm Area, a deed restriction is included in the RAP, which provides for the maintenance of a vegetative cover (minimum of 50% coverage), prevents the installation of dirt roadways (a minimum of 6-inches of gravel or pavement cover is required), and restricts activities that are not consistent with current facility operations.

MDEQ Comment 5c)

c) The verification samples collected from the 3 berm areas where soil with high Mn concentrations was removed are considered biased samples and should be compared to the criterion on a point-by-point basis (S3TM Sections 1.3.3 and 2.3). These samples should not be included in the 95% UCL calculation.

Response

This concern is being addressed by a deed restriction.

MDEQ Comment 5d)

d) Please have the consultant clarify or explain how they determined where and when to collect the subsurface samples from a source area. In general, the subsurface soils appear to have higher Mn concentrations than the surface soils. For example, subsequent sampling of the subsurface in the berm area after removal of contaminated surface soils showed high Mn concentrations (95% UCL = 6,964 ppm; maximum = 26,600 ppm).

Response

The initial site soil sampling program is described in the RI/FS Work Plan, and all sampling locations have been selected in coordination with the MDEQ. In the river berm area, subsurface samples were collected following completion of a limited soil excavation program to determine if the excavation had successfully removed soils containing elevated manganese concentrations. In response to the detection of elevated manganese concentrations in the subsurface samples, the area is being addressed by a deed restriction.

MDEQ Comment 5e)

e) In the HHE Addendum Appendix 1, pages 1 and 2, please have the consultant clarify the information in these tables. The titles do not match the UCL values shown in Tables 4-5 and 4-6.

Response

The table headings have been revised, and the tables are provided as Attachment 3.

MDEQ Comment regarding PCBs

Polychlorinated biphenyls (PCBs)
PCBs were not addressed in the HHE addendum except for the statement that soils in the river berm and rail yard areas were analyzed for PCBs. Based on information you provided, PCB contamination at the facility was evaluated for Toxic Substances Control Act (TSCA) applicability and is being addressed under Part 201; however, disposal of PCB contaminated soil was done in accordance with TSCA requirements. Please have the consultant indicate that TSCA was addressed where appropriate. The feasibility study as well as the RAP indicates PCB concentrations in soil as high as 650 ppm and 4,900 ppm at the manhole and melting department, respectively. The Part 201 industrial soil direct contact criterion for PCBs is 16 ppb. However, Table 2.1-1 of the RAP indicates a site-specific criterion of 60 mg/kg. This site-specific criterion was also used to evaluate PCBs in Tables 6-2, 6-9, 6-12, and 6-15 of the feasibility study. The consultant must provide detailed documentation on how this criterion was derived.

Response

In general, the applicability of TSCA to a specific activity or issue is assessed according to the circumstances of that activity or issue. For example, offsite disposal of soil containing PCB concentrations greater than 50 mg/kg needs to be managed at a TSCA permitted or approved facility. GM has and will continue to manage any TSCA regulated soils that are to disposed of offsite, in accordance with TSCA.

The I27.7 area (manhole area referenced in the MDEQ comment) is located in the Foundry Department. PCB-containing oil leaked from a dropped transformer in 1971, and collected in a small area of exposed soil around a structural support column. The exposed soil was covered with concrete in 1972. The extent of PCB impacted soil was investigated and addressed under 201, as described in a report titled *Feasibility Analysis* (CRA, May 1998) and is from a release prior to TSCA.

Various areas within the Melting Department at the SMI Plant have been remediated due to the presence of PCBs. The activities completed in this area of the site are discussed in a letter and attached report titled *Melting Department Area Investigation and Remediation Report* (CRA, April 1997). The letter and report were sent from GM to the MDEQ and the Wastes, Pesticides, and Toxics Division of the U.S.

Environmental Protection Agency on April 14, 1997. The Melting Department includes furnaces used to melt scrap metal to be incorporated into new parts, and related system components that include tilt units, furnace pits, dedicated hydraulic systems and control rooms, a dedicated electrical system, standby generator rooms, and a utility tunnel (BUSS tunnel). As described in the April 14, 1997 letter and associated report, the remedial efforts in the Melting Department were completed consistent with the TSCA regulations.

The derivation of the SSCC of 60 ppm (industrial soil direct contact) is contained in the HHE included in the Feasibility Study. The HHE addendum in the RAP just addressed areas where new data had been collected (e.g., railyard area) or site conditions had changed (e.g., former CTC parking lot).

Please feel free to contact Cheryl Hiatt at 248-753-5799 if you have additional concerns or questions regarding these responses.

Sincerely,

BLASLAND, BOUCK & LEE, INC.

Correspondence Regarding FS Report and RAP

GM SMI Plant Property, and REALM Inc. Green Point Landfill and Drum Remediation Area

I. Feasibility Study

January 3, 2002 - DRAFT FS submitted to MDEQ

BBL, January 2002. *Draft Feasibility Study Report*, General Motors Corporation Saginaw Malleable Iron Plant Property and REALM Inc. Green Point Landfill and Drum Remediation Area, January 2002.

March 20, 2002 – Letter to MDEQ presenting a proposal to modify the Industrial Particulate Inhalation Criteria for Mn.

John Schell (BBL), March 20, 2002. Letter to Christine Flaga (MDEQ), Subject: Application for revision of the Industrial Particulate Inhalation Criteria for manganese.

June 19, 2002 – Letter from MDEQ to GM with comments on draft FS; primarily dealing with the HHE.

Brouillet, Brenda J. (MDEQ), June 19, 2002. Letter to Joe Medved (GM), Subject: Draft Feasibility Study, Greenpoint Landfill/General Motors Saginaw Malleable Iron Facility Consent Decree No 98-22686-CE-2.

October 30, 2002 – Meeting between MDEQ, GM, WMI, and BBL to discuss MDEQ's comments on the draft Human Health Evaluation. Agreement was reached on the approach to be taken in response to the majority of the comments. For several comments MDEQ requested written clarification to facilitate their review. A letter dated November 26, 2002 (see below) was sent from BBL to MDEQ documenting the meeting discussions and providing additional information.

November 26, 2002 – Letter from BBL to MDEQ providing documentation of discussions held at the October 30, 2002 meeting, and providing additional requested information.

Schell, John (BBL), November 26, 2002. Letter to Rochelle Inglis (MDEQ), Subject: proposed resolution of MDEQ comments on HHE.

December 12, 2002 – Letter from BBL to MDEQ providing additional information to support the proposed soil ingestion rate of 35 mg/day. The apparently is a follow-up to a December 10 phone conversation between the above parties.

Jones, Holli (BBL), December 12, 2002. Letter to Rochelle Inglis (MDEQ), Subject: Additional information to support soil ingestion rate of 35 mg/day.

Correspondence Regarding FS Report and RAP

GM SMI Plant Property, and REALM Inc. Green Point Landfill and Drum Remediation Area

December 19, 2002 - Email from Rochelle Inglis (MDEQ) to Holli Jones (BBL) rejecting the proposed soil ingestion rate of 35 mg/day for the production worker, and recommending a rate of 100 mg/day, December 19, 2002.

January 29, 2003 – Letter to MDEQ providing formal responses to MDEQ's comments on the draft FS that were contained in a June 19, 2002 letter from MDEQ.

Schell, John (BBL), January 29, 2003. Letter to Brenda Brouillet (MDEQ), Subject: Responses to MDEQ comments on draft FS.

March 5, 2003 – Memo from Rochelle Inglis (MDEQ) to Sue Kaelber-Matlock (MDEQ) providing comments on the "Human Health Evaluation Report, Final (January 2003)" ?

March 26, 2003 - Email from Christine Flaga (MDEQ) to John Schell (BBL) documenting their telephone conversation regarding the worker soil ingestion rate and area utilization factor.

March 27, 2003 - Memo from John Schell and Holli Jones (BBL) to Chris Flaga and Rochelle Inglis (MDEQ) providing the information requested by Chris Flaga in her March 26, 2003 email.

June 3, 3003 – Revised Human Health Evaluation (showing edits in track changes) sent from Lisa Coffey (BBL) to Rochelle Inglis and Christine Flaga (MDEQ) by email.

July 2, 2003 (forwarded via email on July 16, 2003, from Christine Flaga (MDEQ) to Holli Jones (BBL)) - Memo from Rochelle Inglis (MDEQ) to Sue Kaelber-Matlock (MDEQ) that provides comments on the June 3, 2003, Revised Draft Human Health Evaluation.

July 21, 2003 - Memo from Holli Jones (BBL) to Chris Flaga (MDEQ), documenting the development of an exposure scenario to address fugitive dust emissions from the Site (transmitted attached to July 22, 2003 email from Lisa Coffey (BBL). [Also sent to Jeff Crum by Holli Jones as a draft]

July 29, 2003 - Final Feasibility Study (FS) submitted to MDEQ

BBL, July 29, 2003. *Final Feasibility Study Report*, General Motors Corporation Saginaw Malleable Iron Plant Property and REALM Inc. Green Point Landfill and Drum Remediation Area.

November 18, 2003 – Letter from Brenda Brouillet to Cheryl Hiatt conditionally approving the Final Feasibility Study Report.

Correspondence Regarding FS Report and RAP

GM SMI Plant Property, and REALM Inc. Green Point Landfill and Drum Remediation Area

Brouillet, Brenda (MDEQ), November 18, 2003. Letter to Cheryl Hiatt (GM), Subject: Conditional approval of Feasibility Study Report.

December 15, 2003 - Memo Documenting November 10, 2003 telephone conversation between Rochelle Inglis (MDEQ) and Holli Jones (BBL) discussing use of USEPA PEF for particulate Mn for off-site residents.

Jones, Holli (BBL), December 15, 2003. Memo to Rochelle Inglis (MDEQ), Subject: Use of USEPA default PEF for Mn to evaluate potential off-site residential exposure and request for confirmation that remaining HHE concerns have been addressed.

II. Remedial Action Plan

June 17, 2004 - Draft Remedial Action Plan (RAP) submitted to MDEQ

BBL, June 17, 2004. *DRAFT Remedial Action Plan*, General Motors Corporation Saginaw Malleable Iron Plant Property and REALM Inc. Green Point Landfill and Drum Remediation Area.

December 7, 2004 - MDEQ RAP Comment Letter

Brouillet, Brenda J. (MDEQ), December 7, 2004. Letter to GM, Subject: *Comments on Draft RAP; and comments of FS ecological assessment provided in attached October 29, 2004 memo from Hector Galbraith (GES).*

February 10, 2005 - Meeting between MDEQ, GM, WMI, EXPONENT, and BBL to discuss December 7, 2004 MDEQ Comment Letter; All comments discussed and tentatively resolved with exception of Ecological Issues. A second meeting is needed with Hector Galbraith (GES) present to discuss his comments on ecological assessment.

May 19, 2005 - Meeting between MDEQ, GES (MDEQ's Ecological Consultant), GM, WMI, EXPONENT, and BBL to discuss ecological assessment.

September 23, 2005 - Revised Draft RAP submitted to MDEQ

BBL, September 23, 2005. *DRAFT Remedial Action Plan*, General Motors Corporation Saginaw Malleable Iron Plant Property and REALM Inc. Green Point Landfill and Drum Remediation Area.

January 18, 2006 - MDEQ Comments on HHE Addendum (Forwarded by Sue Kaelber-Matlock by email on January 30, 2006)

Stemm, Divinia (MDEQ), January 2006. Memo to Sue Kaelber-Matlock (MDEQ), Subject: Comments on HHE addendum and HHE, January 18, 2006.

MDEQ-RRD PSIC Calculation
GM Saginaw Malleable
February, 2006
By: Dr. Divinia Stemm, modified by H. Jones

GM-SMI estimated source areas:

	square feet	
Metal feedstock	[redacted]	**8.6**
Railyard		**9.5 acres**
Total area (all sources)		**18.1 acres**
Modifier for 18.1 acres (total source area):	**0.50**	
Modifier for 9.5 acres (Former railyard):	**0.60**	

A. Part 201 Generic PSIC =(THQ*ED*365)/(EF*ED*(1/RfC)*(1/(PEF/2) — **Assumptions/Comments**

residential =(1*30*365)/(350*30*(1/0.00005)*(1/(**128000000/2**)))
3,338 mg/kg ***approx 3,300*** — **for a 0.5 acre PEF =** 1.28E+08

industrial ***generic calculation***
=(1*21*365)/(245*21*(1/0.00005)*(1/(**39500000/2**)))
1,471 mg/kg **approx 1,500** — **for a 0.5 acre PEF =** 3.95E+07

B. Site-specific calculation (for Saginaw Malleable):

SMI site-specific PSIC =(THQ*ED*365)/(EF*ED*(1/RfC)*(1/(PEF)

Corrected residential PSIC: =((1*30*365)/(350*30*(1/0.00005)*(1/(**128000000/2**))))*0.6 — **assuming railyard size is 10 acres**
2,002

Non-production area PSIC =(1*21*365*2)/(160*21*(1/0.00005)*(1/(**39500000/2**))) — **for 0.5 acre; using MDEQ factors except EF is 160 days**
(6/3/03 HHE) **4,505**
Corrected non-production PSIC **1,126** — **for a 18 acre source area and without use of AIR**
2,253 maintenance worker — **for a 18 acre source area and with use of AIR**

Production area PSIC =(1*1*365*2)/(30*1*(1/0.00005)*(1/(**39500000/2**))) — **for 0.5 acre; Construction worker EF=30 days and ED=one year**
(6/3/03 HHE) **24,029** — **used an adjusted intake rate of 2 in the numerator**
Corrected production PSIC **6,007** — **for a 18 acre source area and without use of AIR**
construction worker **12,015** intrusive worker — **for a 18 acre source area and with use of AIR**

Part 201 Particulate Emission Factor (PEF) Calculation and Assumptions

=(Q/C)*(1/((Ew*(1-V))+Ev)

Mail Code 483-520-190
2000 Centerpoint Parkway
Pontiac, Michigan 48341-3146

Dear Ms. Hiatt:

SUBJECT: Revised Remedial Action Plan
Saginaw Malleable Iron Plant/Green Point Landfill;
Consent Judgment 98-22686-CE-2

On September 23, 2005, the Michigan Department of Environmental Quality (MDEQ), Remediation and Redevelopment Division (RRD), received at the Saginaw Bay District Office an electronic submission of the Revised Remedial Action Plan (RAP) for the Saginaw Malleable Iron Plant/Greenpoint Landfill site of environmental contamination (Facility). The RAP was submitted by the liable party group (LPG) in compliance with the mutually agreed submittal date established in accordance with the provisions of the Consent Judgment 98-22686-CE-2 (Consent Judgment). The RAP was also submitted in accordance with Part 201, Environmental Remediation (Part 201), of the Natural Resources and Environmental Protection Act (NREPA), 1994 PA 451, and the Part 201 Administrative Rules. The RAP presents a limited industrial/commercial land-use based remedy pursuant to Part 201 and the Part 201 Administrative Rules. In addition to site-wide restrictions, specific restrictions for certain site areas were proposed to ensure adequate protection of the public health and the environment.

The MDEQ has completed its review of the RAP, as well as subsequent correspondence and information submitted by the LPG to answer MDEQ questions and concerns. From this review it is the assessment of RRD staff that the RAP presents a final remedy work plan that is much improved from the Draft RAP that was submitted by the LPG on June 24, 2004, but denied approval by the MDEQ by letter dated December 7, 2004. However, there are certain matters related to the final form of the legally enforceable agreement, the restrictive covenants, and financial assurance that remain to be agreed upon to ensure that these documents are consistent with Part 201 and the Part 201 Administrative Rules. Also, some additional targeted soil sampling and some additional evaluation of long-term monitoring are necessary to assure the protectiveness of the RAP. Three attachments (Attachments) accompany this letter that present RRD staff comments and recommendations for assuring a Part 201 compliant RAP:

- Attachment 1 – Enforceable Agreement, Restrictive Covenants, Permanent Markers.
- Attachment 2 – DEQ Guidance for a Performance Bond Financial Assurance Mechanism
- Attachment 3 – Technical Comments and Recommendations for Monitoring, Long-Term Monitoring & Maintenance.

Sep 17, 2009 18:39

It is important that there be an open interactive working relationship between the RRD and the LPG to adequately address the comments and recommendations presented in the Attachments and most importantly to ensure that the final form of the RAP and RAP legal documents are acceptable to all parties and are compliant with Part 201. Therefore, the RRD has discussed with the LPG the proposal that the MDEQ withhold its final determination regarding the RAP to provide an adequate time period to discuss, develop, and implement all actions necessary to address the comments and recommendations in the Attachments, and then submit a Final RAP to the MDEQ that is compliant with Part 201 and can be approved in accordance with the Consent Judgment. The RRD District staff discussed this proposal by phone with LPG representatives on May 15 and May 16, 2006. By electronic correspondence dated May 18, 2006, the LPG has provided its concurrence with the RRD proposed approach to defer the MDEQ final RAP determination. The LPG and the RRD have also reached agreement that two years is an acceptable time period for working to address the comments and recommendations in the Attachments, and submitting a Final RAP that is compliant with Part 201, the Part 201 Administrative Rules, and is approvable under the terms of the Consent Judgment. With this concurrence between representatives for the LPG and the MDEQ the date of **May 19, 2008**, is the agreed upon submittal date for the approvable Final RAP. This date is understood by all parties to be enforceable under the provisions of the Consent Judgment. The MDEQ will review the Final RAP and will provide its determination in accordance with the schedule established in Paragraph 15.2 of the Consent Judgment.

Thank you for your continuing efforts to work proactively with RRD staff towards ensuring that the final remedy for the Facility is protective of the environment and the public health, and compliant with Part 201 and the Consent Judgment. If you should have further questions or concerns, please contact Sue Kaelber-Matlock, RRD, Saginaw Bay District Office, at 989-686-8025, extension 8303, or Allan Brouillet at 989-686-8025, extension 8305.

Attachment 1

Overview

Section 3.18 of the RAP proposes use of the Consent Judgment as the legally enforceable agreement for implementation of the RAP as required by Section 20120b(3) of the NREPA. This approach is acceptable to the MDEQ provided that supplementary information is added to the RAP to bring the RAP, and therefore the Consent Judgment, into compliance with the provisions of Part 201 of the NREPA and the Part 201 Administrative Rules. To facilitate discussion and resolution of this matter, the MDEQ has prepared a RAP supplementary information proposal. The paragraph numbering reflects the proposed placement of the verbiage into the RAP.

Attachment 1 also includes additional language modifications to the RAP that the RRD believes are necessary to support the proposed changes to Section 3.18 discussed above, as well as to address recommended MDEQ modifications for the placement of permanent markers and the financial assurance mechanism.

Finally, Attachment 1 includes MDEQ modification recommendations specific to the restrictive covenants.

MDEQ Proposed RAP Supplementary Information to bring the Consent Judgment into Compliance with the Provisions of Part 201 and the Part 201 Administrative Rules.

3.18 Legally Enforceable Agreement

Pursuant to Section 20120b(3) of the NREPA, the following provisions of the remedial action are required to be stipulated in a legally enforceable agreement with the MDEQ: (a) land-use or resource-use restrictions; (b) monitoring; (c) operation and maintenance; (d) permanent markers; and (e) financial assurance. To satisfy the requirements of Section 20120b(3) of the NREPA, the legally enforceable agreement for this RAP relies upon the Consent Judgment executed between the Michigan Department of Environmental Quality (MDEQ), the Michigan Attorney General's Office, General Motors Corporation (GM), and Waste Management, Inc. (WMI), and entered by the State of Michigan Circuit Court for Saginaw County on March 16, 1998, Case No. 98-22686-CE-2 (Consent Judgment).

There are elements of the provisions required pursuant to Part 20120b(3) that are missing from the Consent Judgment. These elements are further outlined in this Section 3.18 and contain the enforceable provisions pertaining to:

(a) – the Abandonment of Observation and Monitoring Wells presented in Section 3.9 of the RAP;

(b) – the Land, Groundwater, and Surface Water Use Restrictions presented in Section 3.13 of the RAP;

(c) – the Specifications for Permanent Markers presented in Section 3.16 of the RAP;

(d) – the Proposed Financial Assurance Mechanism presented in Section 3.17 of the RAP.

The provisions set forth in Section 3.18 are necessary for RAP inclusion to satisfy Part 201 and the Part 201 Administrative Rules. With final approval of the RAP, the RAP is incorporated as an enforceable component of the Consent Judgment as stipulated in Section XVIII, Paragraph 18.2, of the Consent Judgment. Consequently the Consent Judgment, as supplemented by the provisions of Section 3.18 of the RAP, collectively serves as the legally enforceable agreement required pursuant to Section 20120b(3) of the NREPA.

3.18.1 Definitions

"Remedial Action Plan" or "RAP" means this Site Specific based criteria remedial action plan entitled, General Motors Corporation Saginaw Malleable Iron Plant Property, and REALM, Inc. Green Point Landfill and Drum Remediation Area, Saginaw, Michigan, dated September 23, 2005, for the Facility, prepared by Blasland, Bouck & Lee, Inc., that was submitted on behalf of the LPG, and all other subsequent MDEQ-approved modifications to the RAP.

"Long-Term RAP Costs" means the costs of Operation and Maintenance, oversight, monitoring, and other costs necessary to assure the effectiveness and integrity of the remedial action set forth in the RAP in perpetuity.

"Operation and Maintenance Phase" means the performance of the activities set forth in the Summary Operation, Maintenance and Monitoring Plan found in Appendix C, beginning the date upon which this RAP is approved by the MDEQ.

"Site" means the property legally described in Appendix G and generally described as the General Motors Corporation Saginaw Malleable Iron facility and surrounding ancillary areas, as well as the closed Green Point Landfill and the Drum Remediation Area. For purposes of this RAP, the term "Site" is synonymous with the term "facility" as that term is defined by Section 20101(o) of the NREPA.

"Part 201 Administrative Rules" or "Rules" means the administrative rules promulgated under Part 201.

Unless otherwise defined herein or in the Consent Judgment, all other terms used in this RAP, which are defined in Part 3, Definitions, of the NREPA, MCL 324.301; Part 201 of the NREPA; or the Part 201 Administrative Rules, 1990 AACS R 299.5101, *et seq.*, as amended by changes at 2002 Michigan Register 24 that became effective on December 21, 2002, shall have the same meaning in this document as in Parts 3 and 201 of the NREPA, and the Part 201 Administrative Rules.

3.18.2 Performance Standards

The overall performance standard of the RAP is to assure the protection of the public health, safety and welfare, and the environment. The specific performance standards employed by the RAP are as follows:

(a) Eliminate unacceptable exposures to groundwater used for potable or domestic use.

(b) Eliminate unacceptable direct contact exposures for the LNAPL Assessment and Remediation Area, Quench Pit Area, Former DRA Hillock Area, and Previous Metal Feedstock Area.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

(c) Eliminate unacceptable inhalation exposures from contaminated soil and groundwater volatilization to indoor air in the Former UST #7 Area and the DRA/Former Hillock Area.

(d) Eliminate unacceptable inhalation exposures from contaminated soil in the Former CTC Parking Lot East of the Plant.

(e) Eliminate unacceptable direct contact exposure with contaminated soil or waste fill material in the former Green Point Landfill, Type III Landfills, 127.7 Area, and Melting Department Area.

(f) Eliminate unacceptable inhalation exposures from contaminated soil in the Former Railyard Area.

(g) Eliminate unacceptable inhalation exposures from contaminated soil along the Saginaw River Boundary and control erosion along the Saginaw River Berm Area.

(h) Prevent unacceptable hazardous substance migration from the former Greenpoint Landfill in accordance with post-closure operation and maintenance procedures.

(i) Implement groundwater monitoring along the Saginaw River Boundary Area and within the DRA/Former Hillock Area.

(j) Eliminate unacceptable exposures to ecological receptors from constituents detected in site environmental media that are associated with industrial and landfilling operations that occurred at the facility.

3.18.3 Progress Reports

In addition to the requirements specified in Section XVI of the Consent Judgment (Progress Reports), the Progress Reports shall also include an assessment and documentation of the integrity of all exposure control mechanisms on which the RAP is dependent (e.g., barriers, permanent markers, etc.), and compliance with land-use restrictions, resource-use restrictions, and institutional controls. If appropriate, the report shall describe any modifications to the RAP that are determined to be necessary to assure the continued effectiveness and integrity of the remedial action.

3.18.4 Modification

If the MDEQ determines that a modification to the work specified in the approved RAP is necessary to: (a) achieve or maintain the performance standards set forth in Paragraph 3.18.2 of this RAP; (b) assure the effectiveness, integrity, or reliability of the remedial action undertaken pursuant to the RAP; (c) correct a lapse or noncompliance under Paragraph 3.18.5 of this RAP; or (d) otherwise prevent unacceptable exposures to public health, safety, welfare and the environment, the MDEQ may require that such modification be incorporated into the RAP. However, only modifications consistent with the Section VI (Additional Response Activity) of the Consent Judgment may be required. If the necessary modifications are extensive the MDEQ may request submittal of a RAP modification plan proposal for MDEQ review and approval. The RAP may only be modified by written agreement between the Defendants and the MDEQ's RRD Chief or his or her authorized representative. Upon MDEQ approval, the Defendants shall perform the response activities in accordance with MDEQ-approved implementation schedules.

3.18.5 Voidance and Nullification

Confidential under FOIA
Richard Kowalski

Sep 17, 2009 18:39

(a) The MDEQ has determined that all of the following provisions are applicable to the remedial action and the RAP. If any of these provisions lapse or are not complied with as provided in this RAP then the MDEQ's approval of the RAP is void from the time of the lapse or noncompliance until the lapse or noncompliance is corrected to the satisfaction of the MDEQ:

(1) Required land and/or resource use restrictions including, but not limited to:
(i) A required land and/or resource use restriction that is determined to be unlawful by a court of competent jurisdiction; or
(ii) A required land and/or resource use restriction that is violated in a manner that results in the RAP not being protective of public health safety, welfare, and the environment.
(2) Monitoring
(3) Operation and Maintenance
(4) Permanent Markers
(5) Financial Assurance

(b) If the Defendants fail to correct the lapse or noncompliance as set forth above within thirty (30) days of written notification by MDEQ of the lapse, or if the Defendants fail at any time to adequately implement the remedial action in accordance with the RAP, the MDEQ may implement those response activities that the Defendants have failed to perform. Costs which the MDEQ lawfully incurs in the performance of response activities shall be reimbursed by the Defendants pursuant to Section XXIII (Reimbursement of Costs) of the Consent Judgment.

(c) The MDEQ's approval of the RAP shall be nullified if any of the following occur, and shall continue until the lapse or violation is corrected to the satisfaction of the MDEQ:

(1) Site conditions unknown at the time of RAP implementation are discovered and these previously unknown conditions result in the RAP no longer being protective of the public health, safety, welfare, or the environment.
(2) Failure to achieve compliance with applicable cleanup criteria or performance standards established in the RAP.
(3) Failure to reliably maintain compliance with applicable cleanup criteria or performance standards established in the RAP, notwithstanding repeated attempts to cure the failure. In these circumstances nullification of MDEQ approval will take effect within ninety (90) days of the initial discovery of the failure by either the Defendants or the MDEQ.

(d) If the MDEQ's approval of the RAP becomes void or nullified, all other terms of the Consent Judgment will remain in full force and effect.

3.18.6 Compliance with State and Federal Laws

In addition to the requirements set forth in Section XII (Compliance with Other Laws) of the Consent Judgment, and except as provided under Section 20120a(15) of the NREPA, this RAP does not obviate the Defendants' obligation to obtain and maintain compliance with any permit or authorization required under state or federal laws.

Additional Language Modifications to the RAP

Table of Contents

- 3.18 – remove the word "Proposed".
- Add an Appendix G that provides the legal description of the Site.

RAP Page 1-1

- At the end of the first paragraph add a comma after 1998 and then add, "... Case No. 98-22686-CE-2 (Consent Judgment)."
- Under 1.1 add the following sentence to the beginning of the first paragraph: "For the purposes of this RAP, the term "Site" is synonymous with the term "facility" as that term is defined by Section 20101(o) of the NREPA."
- After first paragraph under 1.1 add: "See Appendix G for a legal description of the Site."

RAP Page 2-16

- In the second paragraph under *VI. Saginaw River Boundary*, fourth sentence, add "and Rule 299.51013 of the Part 201 Administrative Rules."

RAP Page 3-4, Section 3.9 (Abandonment of Observation/Monitoring Wells)

- At the end of the fourth sentence, add "...in accordance with a schedule agreed upon between the LPG and the MDEQ."
- Add the following paragraph: "Upon the conclusion of all response activities requiring the use of groundwater wells or other subsurface devices detailed in the RAP, including operation, maintenance, and long-term monitoring, the Defendants shall provide notice to and obtain approval from the MDEQ for the proper plugging and abandonment or removal of all remaining wells and other response activity related devices at or related to the Site. Upon receipt of MDEQ's approval, Defendants shall use the proper well abandonment procedures as described in ASTM Standard D 5299-92 (*Standard Guide for Decommissioning Ground Water Wells, Vadose Zone Monitoring Devices, Boreholes, and Other Devices for Environmental Activities*), or other relevant or applicable standards.

RAP Page 3-6, Section 3.16 (Specifications for Permanent Markers)

- Pursuant to Section 20120b(3)(d) of the NREPA, the permanent marker must describe the restricted areas of the site and the nature of any restrictions. This is most commonly accomplished by a properly scaled representation of the property boundary and the restricted area, accompanied by text that briefly describes the restrictions. In addition, the use of wood and the use of iron pipe, as proposed by the LPG in the RAP, are unacceptable for the construction of permanent markers. To address these issues the MDEQ recommends replacing verbiage after the third sentence in Paragraph 3.16 with the following: "The permanent markers will be made of stone, cast metal, or similar durable material. The location of each permanent marker is identified in the survey attached as Exhibit 2 to Appendix D of this RAP. The permanent markers will include text that describe the restricted area, the use restrictions for the restricted area, the

MDEQ Part 201 site identification number, the liber and page numbers of the restrictive covenant, and a graphical depiction of the restricted area(s) relative to the Site boundaries. Perimeter permanent markers will be posted at the corners of each restricted area. All permanent markers will be maintained in legible condition in accordance with the provisions of the MDEQ approved operation and maintenance plan.

RAP Page 3-7, Section 3.17 (Proposed Financial Assurance Mechanism)

- The first sentence of Section 3.17 should be removed. The MDEQ recommends that the following verbiage be added after the remaining sentence: "The FAM will be established and maintained in accordance with Section XXIX (Financial Capability) of the Consent Judgment. The FAM will be in an amount sufficient to cover Long-Term RAP Costs at the Site for a thirty (30) year period and will be in a form that allows the MDEQ to immediately contract for the response activities for which financial assurance is required in the event the LPG fails to implement the required tasks."
- The MDEQ requests that the performance bond be worded in accordance with MDEQ model language accompanying the Notice as Attachment 2. In addition, the MDEQ reminds the LPG that the "Surety" must be an insurer who is authorized to transact the business of surety and fidelity insurance in the state of Michigan, and is an acceptable surety on federal bonds as listed in Circular 570 of the United States Department of Treasury.

Modifications Specific to the Restrictive Covenants

1. The LPG did not provide a survey of restricted areas (Exhibit 2). All restrictive covenant exhibits and support information must be available for review by the MDEQ before any final determination on acceptability of the restrictive covenant(s) can be made. Surveys are required for areas requiring maintenance of protective cover, prevention of intrusion, construction prohibitions, and areas requiring limitations on worker exposure. A survey of the entire site is also required.

2. It is important that the LPG ensure that restrictive covenants and the associated allowable uses for the property accurately conform with City of Saginaw zoning.

3. Over the months prior to the issuance of this Notice the MDEQ and the LPG engaged in detailed discussions regarding human health risk issues at the facility. The MDEQ requests that the LPG review the use restrictions in the restrictive covenants to ensure that they remain accurate and appropriate to the outcome of the human health risk discussions.

4. Because only a portion of the Property will have specific use restrictions, the MDEQ recommends that the third paragraph on Page 1 of the restrictive covenant be changed to read: "The "*Limits of Land or Resource Use Restrictions,"* attached hereto as Exhibit 2, provides the legal description(s) and a survey that distinguishes those portions of the Property that are subject to land use or resource use restrictions as specified herein."

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

5. The LPG should evaluate the "Summary of Response Activities at the Site" to ensure that it accurately describes the response actions that were implemented at the portion of the property subject to the restrictions.

6. Paragraph 2, located on Page 4 of the restrictive covenant for the Quench Pit and Previous Metal Feedstock Area, appears to be mislabeled. The labeling should be 2.a through 2.h. With this change, the MDEQ recommends that an additional sentence be added to 2.c that states: "Prior to the implementation of any intrusive activities an evaluation of soil and soil vapors must be completed. Proposed intrusive activities can be undertaken if the evaluation demonstrates that unacceptable exposures above the then applicable soil indoor air inhalation and direct contact criteria would not result."

7. The LPG should reexamine the restrictive covenants to ensure that all exhibits are properly labeled and referenced within the restrictive covenant.

8. The MDEQ recommends that the term "current facility operation" be defined by the LPG since future owners or operators may be unaware of what these operations were.

9. The requirement for completion and implementation of a Health and Safety Plan is an unenforceable component of the restrictive covenants, cannot be approved by the MDEQ, and should be removed from the restrictive covenants. The MDEQ requests that the LPG propose alternate restrictive language to address the exposure concerns that were intended to be addressed by the Health and Safety Plan proposed verbiage.

10. The MDEQ recommends that the 'Nonexclusivity' paragraph be removed from the restrictive covenants.

11. The MDEQ reference number will be provided when the LPG addresses all modifications and conditions specific to the restrictive covenants in a manner that is acceptable to the MDEQ.

Attachment 2

MICHIGAN DEPARTMENT OF ENVIRONMENTAL QUALITY (DEPARTMENT)
REMEDIATION AND REDEVELOPMENT DIVISION
FINANCIAL ASSURANCE MECHANISMS
PART 201

Date: 1/17/2003
Guidance Document
Financial Assurance Mechanism: Performance Bond (PB)

Purpose: The purpose of this guidance document is to provide information on the use of a PB to fulfill the requirements for financial assurance pursuant to Rules 532(11) and 526(7) of the Part 201 Administrative Rules (Part 201 Rules), R 299.5532(11) and R 299.5526(7), promulgated under Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA).

Background: Section 20120b(3) of the NREPA states that if a remedial action is selected or approved by the Department, based on criteria provided for in Section 20120(1)(f) to (j) or (2), provisions concerning the following, if determined by the Department to be necessary to assure the effectiveness and integrity of the remedial action, shall be stipulated in a legally enforceable agreement with the Department.

(a) Land use or resource use restrictions;
(b) Monitoring;
(c) Operation and maintenance;
(d) Permanent markers to describe areas of the site and the nature of any restrictions; and
(e) Financial assurance, in a form acceptable to the Department to pay for monitoring, operation and maintenance, oversight, and other costs determined by the Department to be necessary to assure the effectiveness and integrity of the remedial action.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Specifically, Rule 532(11)(m) of the Part 201 Rules, R 299.5532(11)(m), states that the costs of activities covered by the financial assurance mechanism (FAM) shall be documented on the basis of an annual estimate of maximum costs for the activity as if they were to be conducted by a person under contract to the state. Costs shall not be based on activities being conducted by employees of the person proposing the remedial action. A FAM shall be provided if the cost of monitoring, operation and maintenance, and other activities necessary to assure the effectiveness and integrity of the remedial action plan (RAP) or the interim response designed to meet criteria (IRDC) are more than an average of $2,500 per year in year 2001 dollars. Any adjustment in the $2,500 threshold to account for inflation shall be determined in a manner that is acceptable to the Department. The FAM shall provide sufficient funds to conduct any task for which a FAM is required under this subrule, but is not required to cover an alternative remedial action in the event of remedy failure. The financial assurance shall be in an amount and form that allows the Department to immediately contract for the response activities for which financial assurance is required in the event the person conducting response activity fails to implement the required tasks. An acceptable financial assurance shall be in one of the following forms:

(i) Letter of Credit,
(ii) Environmental Escrow,
(iii) Trust Fund,
(iv) Certificate of Deposit,

Sep 17, 2009 18:39

(v) Performance Bond, or
(vi) Another form that is acceptable to the Department and satisfies the requirements of this subrule.

Rule 526(7) of the Part 201 Rules, R 299.5526(7), states that a person who wishes to establish that an IRDC provided for under Section 20120(1)(f) to (j) or (2) of the act [the NREPA] is complete for one or more environmental media in all or a portion of the Part 201 regulated facility shall maintain documentation including, but not limited to, subrule (c)(ii):

> Documentation of the Department's approval of all of the applicable provisions of Section 20120b(3)(a) to (e) of the act.

Minimum Requirements: The Person Proposing the Plan (PPP) must enter a "Performance Bond" with the Department and the financial institution. The following minimum requirements apply to a PB:

1. The "Surety" must be an insurer who is authorized to transact the business of surety and fidelity insurance in the state of Michigan and is an acceptable surety on federal bonds as listed in Circular 570 of the United States Department of Treasury.

2. The PB must be executed on the letterhead of the Surety, must be in the sole name of the Department, and the Department must be the sole beneficiary.

3. The amount of the PB must at least be equal to or greater than the amount to fund all necessary monitoring, operation and maintenance, oversight, and other costs necessary to assure the effectiveness and integrity of the RAP or IRDC for the time frame(s) specified in the legally enforceable agreement.

4. The PPP must provide to the Department a proposed PB. The PB must be worded in accordance with the model language (see RAP-IRDC PERF BOND.doc), except that the bolded instructions, options, and/or blanks are to be replaced with the appropriate information. Any further changes to this model language may be made only with the concurrence of the division chief charged with implementation of the Part 201 program.

5. The Surety is subject to the approval of the Department and can be replaced at the direction of the Department.

6. The PB can only be terminated at the direction of the Department.

For More Information on FAMs and Legal Agreements: The PB can be located at the following link: RAP-IRDC Performance Bond. Other types of FAMs and enforceable agreements can be obtained from the website at: www.michigan.gov\deq; then click on Land\Land Cleanup\Enforcement & Response Activity\Information – Model Documents; or by calling 517-373-7818.

RECITALS

A. On [*insert the effective date of the Agreement*]**, the Michigan Department of Environmental Quality (hereinafter, "Department") approved a** [remedial action plan (RAP) *OR* interim response activity designed to meet the cleanup criteria (IRDC)] **for a** [*insert category of land use based closure pursuant to Section 20120a*] **at the** [*name and address of Facility*] **("Facility") pursuant to Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended ("NREPA"), MCL 324.20101, *et seq.*, and as provided for in** [*list type of agreement: e.g, legally enforceable agreement OR Administrative Order by Consent OR Consent Decree, etc.*] **("Agreement") for the** [Facility *OR* Property]**. The Agreement includes provisions for the implementation of** [*insert as appropriate:* land use restrictions, monitoring, operation and maintenance, installation of permanent markers, and a financial assurance mechanism] **at the** [Facility *OR* Property]**. Pursuant to Section 20120b(3)(e) of the NREPA,** [*name of person proposing the plan OR ("PPP")*] **(hereinafter, "Principal") is required to provide financial assurance, in a mechanism acceptable to the Department, to pay for "monitoring, operation and maintenance, oversight and other costs determined by the Department to be necessary to assure the effectiveness and integrity of the Long-Term Requirements of the** [RAP *OR* IRDC] **as provided for in the Department-approved** [RAP *OR* IRDC] **for the** [Facility *OR* Property] **(hereinafter, "Long-Term Requirements").**

Sep 17, 2009 18:39

B. The "Current Cost Estimate" to pay for the performance of the Long-Term Requirements is: **$[*insert numeric amount*]**

C. The Principal is providing this Performance Bond ("Bond") to the Department to fulfill its obligations under Part 201 to provide financial assurance for the performance of the Long-Term Requirements. **[*Name of insurer*]** ("Surety") is an insurer who is authorized to transact the business of surety and fidelity insurance in the state of Michigan and is an acceptable surety on federal bonds as listed in Circular 570 of the United States Department of Treasury. The Principal and Surety, and their heirs, executors, administrators, successors, and assigns, jointly and severally, are firmly bound unto the Department to fulfill their obligations as set forth in the Bond.

D. The definition of the terms used in this Bond is the same as those used in the Agreement.

NOW, THEREFORE, the Principal and Surety agree to the following:

1. This Bond as issued is sufficient to cover the Current Cost Estimate for performing the Long-Term Requirements. Adjustments to the amount of the Bond may only be made as follows:

(a) If there is an increase in the cost estimate for performing the Long-Term Requirements, the Principal, within sixty (60) days of becoming aware of the increased costs, shall increase the amount of financial assurance by making arrangements with the Surety for an increase in this Bond to an amount at least equal to the increased cost estimate and submitting evidence of such increase to the Department, by submitting a replacement performance bond, or by establishing an alternative financial assurance mechanism that is acceptable to the Department to assure the performance of the Long-Term Requirements.

The Surety acknowledges that the Principal is obligated to provide increased financial assurance to pay for the performance of the Long-Term Requirements if either of the following occur: (i) the Principal's five (5)-year cost estimate update for performing the Long-Term Requirements, which the Principal is required to conduct pursuant to the Agreement, shows that the Principal will incur costs to perform the Long-Term Requirements, which are in excess of the Current Cost Estimate; or (ii) the Principal is required to implement a modification to the **[RAP *OR* IRDC]**, pursuant to the Agreement and that modification affects the Long-Term Requirements such that the Principal will incur costs which are in excess of the Current Cost Estimate.

(b) If any five (5)-year cost estimate conducted by the Principal is less than the Current Cost Estimate amount provided for by this Bond, the amount of this Bond may be reduced to that lesser amount following the Principal and Surety's receipt of written approval for such reduction by the Department.

2. This Bond shall continue in full force and effect for a period beginning with the effective date of this Bond and ending only when this Bond is terminated or cancelled. This

Bond may only be terminated or cancelled when the Principal has satisfied one of the following conditions (a) through (c) below and the Principal and Surety have received written authorization for such termination or cancellation from the Department.

(a) The performance of the Long-Term Requirements is no longer necessary at the **[Facility *OR* Property]** and the Principal has paid all of the Department's response activity costs in accordance with the Agreement.

(b) The Department has determined that a financial assurance mechanism is no longer necessary for the **[Facility *OR* Property]** and the Principal has paid all of the Department's response activity costs in accordance with the Agreement.

(c) The Principal provides an alternative financial assurance mechanism acceptable to the Department to assure the performance of the Long-Term Requirements.

3. The Surety shall become liable as provided for in this Bond only when the Principal has failed to perform the Long-Term Requirements, has failed to pay the Department's response activity costs as required by the Agreement, or has failed to provide alternative financial assurance acceptable to the Department as provided for in this Bond or the Agreement. If the Principal fails to meet any of these obligations and the Department authorized representative (division chief of the Part 201 implementing program) has issued a written notification to the Principal and Surety regarding the Principal's failure to comply, the Surety shall do the following as directed by the Department within thirty (30) days.

(a) If the Principal has failed to perform the Long-Term Requirements, the Surety shall either perform those requirements in accordance with the **[RAP *OR* IRDC]** or make payment to the Department for the full amount guaranteed by this Bond.

(b) If the Principal has failed to pay the Department's response activity costs, the Surety shall make payment to the Department for the full amount of the Department's response activity costs that the Principal has not paid.

(c) If the Principal has failed to provide an alternative financial assurance mechanism within sixty (60) days of receipt of the Surety's intent to cancel this Bond as specified in Paragraph 6 of this Bond, the Surety shall make payment to the Department for the full amount guaranteed by this Bond.

Sep 17, 2009 18:39

4. The liability of the Surety shall not be discharged by any payment or succession of payments hereunder unless and until such payment or payments amount in the aggregate to the amount of this Bond; however, in no event shall the Surety's obligation hereunder exceed the amount of this Bond.

5. The Surety agrees that any amendments to the **[RAP *OR* IRDC]** or to any applicable laws, statutes, rules, or regulations shall not affect its obligations with respect to this Bond, except that any modifications of the **[RAP *OR* IRDC]** that cause an increase or decrease in the amount of financial assurance required by Part 201 shall be dealt with in accordance with Paragraph 1.

6. The Surety may initiate the process to cancel this Bond by sending written notice of its intent to cancel by certified mail to the Principal and to the Department. Within sixty (60) days of the Department's receipt of the Surety's intent to cancel this Bond, the Principal must either provide an extension of this Bond or provide an alternative financial assurance mechanism to the Department. The Surety shall not cancel this Bond during the one hundred and twenty (120)-day period after the Principal and the Department receive the notice of intent to cancel. However, the Surety may cancel this Bond after the one hundred and twenty (120)-day period or upon its receipt of written authorization for such cancellation from the Department.

Sep 17, 2009 18:39

7. The Principal may terminate this Bond by sending written notice to the Surety and the Department, provided, however, such termination shall only become effective if the Principal has met the requirements of Paragraph 2. The Surety may then terminate this Bond when the Principal and Surety have received written authorization for such termination from the Department.

8. If the Department determines that either the Principal or Surety has not complied with any of the terms or conditions of this Bond, Department shall have recourse to the rights created under this Bond. The Department reserves all its other rights against the Principal under the applicable statutes.

Attachment 3

Technical Comments - May 15, 2006

The Draft Remedial Action Plan (Draft RAP) was submitted on September 26, 2005 by Blasland, Bouck & Lee (BBL) for General Motors (GM). The response regarding the ecological assessment from Exponent was sent to Dr. Hector Galbraith on November 1, 2005, and was found to be acceptable. The Human Health Evaluation Addendum was forwarded to Remediation and Redevelopment Division (RRD) toxicologists, Ms. Chris Flaga and Ms. Divinia Stemm, on October 20, 2005. Their response, dated January 18, 2006, was discussed in a meeting with GM, Waste Management, Inc. (WMI), and BBL staff on February 22, 2006. GM then submitted comments on March 24, 2006, and agreed to a RAP response date of May 19, 2006. The Draft RAP has been reviewed in context with the additional restrictions as proposed in the March 24, 2006 letter. The Draft RAP was discussed at District QRT on April 4, 2006, and at FOQRT on April 5, 2006. The Draft RAP is approvable with the following comments.

1. As was discussed at the February 2006 meeting, the concentration of manganese in the surficial soils of the former railyard area must be defined adjacent to and into the residential area. The source size calculated for the off-site receptors will be dependent on the results of the future sampling effort. GM agreed to define the nature and extent of manganese off-site, but my understanding was that it will not be completed prior to the submittal of the final RAP. Instead, a workplan for the additional investigation will be included in the final RAP. If the nature and extent of the off-site manganese is not defined prior to the approval of the RAP, in order for the MDEQ to approve the RAP as protective and compliant with Part 201, GM must include a proposal for a presumptive remedy for any areas that exceed the residential particulate criterion.

2. Revisions, such as changing timeframes and deleting specific monitoring wells or parameters, cannot be made without the review and approval of the MDEQ. GM can propose revisions or modifications in the annual monitoring report.

3. Analytical results of compounds obtained using filtered samples with "ultra" low flow sampling methods should not be used for comparison with the relevant Part 201 risk criteria. If GSI exceedances of specific metals continue along the Saginaw River boundary, GM must take response actions to address the exceedances and could consider applying for a mixing zone for those compounds.

4. Information regarding the Type III Landfills is missing at the bottom of page 1-4.

5. The following comments are specific to Operation and Maintenance (O&M) and Monitoring Plan.

   A. LNAPL O&M and Monitoring Activities
      - If the LNAPL system is off-line for longer than 30 days, the MDEQ must be notified with a plan of action and schedule to re-start the system.
      - It is acceptable to monitor the wells on the GM side on a quarterly basis for LNAPL and static water levels. The MDEQ is currently in the process of reviewing the LNAPL recovery systems in place at the adjacent Delphi facility. It appears that neither GM nor Delphi are addressing the MW-148/RW-4 area. This area must be addressed.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

- The results of the tracking for seasonal variations in the water table, the groundwater flow conditions, the LNAPL thickness, and draw-down maps (such as J-3 included in the LNAPL Assessment and Recovery Report, January 1998), must be submitted to the MDEQ for review in the annual monitoring report.
- In addition to the monitoring wells proposed, MW-168WT and MW-180WT should be included in the monitoring for this area. MW-168WT had product on the one occasion that it was tested and MW-180WT is the most down-gradient well which has had small amounts of product over the years.
- Currently only the LNAPL is being addressed in this area. The final RAP must include a contingency plan to address the dissolved contaminants in this area, if necessary, once the LNAPL has been removed.

B. Greenpoint Landfill Monitoring
   - For long-term monitoring, GSI wells in the deeper sand will be needed along the Saginaw River. The new wells should be monitored quarterly for one year with analytical samples and static water levels.
   - GM has stated in the RAP that the ammonia nitrogen found in the Greenpoint Landfill area is from past agricultural practices, however there are elevated levels of ammonia nitrogen around the landfill in areas that are not currently or historically farmed. Ammonia nitrogen must be added to the parameter list for all monitoring wells. The potential discharge of ammonia nitrogen into the surrounding wetlands, ditches, and/or the Saginaw River must be evaluated and addressed, as necessary.
   - Well clusters X-4 and X-9 must be added to the long-term monitoring plan, and sampled quarterly for the entire parameter list for one year.
   - Since the deeper wells have not been sampled since before the capping was completed at Greenpoint Landfill, the deeper wells in the well clusters MW-117, MW-118, X10, and X2, must be sampled quarterly for the entire parameter list for at least one year.
   - GM cannot limit long-term monitoring around Green Point Landfill to a maximum of 30 years.

C. Saginaw River Boundary
   - In addition to MW-111WT, groundwater in MW-112WT, MW-185WT, B-7R, and MW-114WT, must also be monitored for manganese since they appear to be within the manganese impacted area, as shown on CRA Figure 2.
   - MW-107WT must be added to the Saginaw River Boundary program.

6. Monitoring wells, not used in the Long-term Monitoring Program, must be properly abandoned within the next six months. The documentation to verify this activity must be submitted to the MDEQ in the first annual monitoring report.

7. The final RAP must include specific details of what will be included in the annual monitoring reports. The annual monitoring report must include the effectiveness of the response actions, the effectiveness of the monitoring, and any modifications needed. The annual monitoring report must include site-wide groundwater contour maps.

8. Appendix F indicates that the soil pathway for Particulate Soil Inhalation Criteria (PSIC) has been eliminated in the Saginaw River berm because only the subsurface soil concentrations of manganese exceed the Part 201 criterion. The PSIC criteria are applicable at all soil depths, consequently, this pathway cannot be eliminated and the soils in this area must be addressed.

Cheryl and Kent, when I spoke with Lisa, I told her that I would respond by e-mail specifically regarding the well installations along the river.
I will respond to the remainder of the comments prior to December 8, 2006.

It was my intent that the wells in the deep sand be installed according to the previously agreed upon protocol, meaning that if there was more than 12' or 14' of saturated sand, wells with 5' screens would be, at a minimum, installed at the top and base of the saturated unit. A single well installed at the base of the unit, as proposed, is not acceptable,
unless there is less than 12' of saturated unit.

The parameter list for the new wells must include PCBs and semi-volatiles as well as those parameters proposed in the workplan.
The parameter list for the existing deep wells that have not been sampled since before the landfill was capped should also include 3
rounds of PCBs and semi-volatiles.

Three quarters of analytical is acceptable to characterize the groundwater in the deeper sand, but some long-term monitoring of the deeper sand downgradient of the Greenpoint Landfill will also be necessary.

If you have questions or want a conference call to discuss this issue,
please call me to set up a time. Thanks, Sue

Subject: GM SMI Semi Annual Groundwater Monitoring Report, Former UST#7 Area, Oct 31, 2006

To Cheryl Hiatt, Kent Bainbridge, Renee Mietz, Dave Lipson, and Lisa Coffey, The DEQ has received this report and concurs with the conclusions. It is acceptable to discontinue groundwater monitoring for the purpose of evaluating the Former UST#7 area at the BBL-MW4, MW135WT, and MW139WT locations. It is expected that the long-term monitoring of the groundwater in the area of Former UST#7 area will be incorporated into the Remedial Action Plan for this facility. In the interim, semi-annual groundwater monitoring should continue, as proposed, at locations BBL-MW1, UST7-2, UST7-3R, UST7-4, and UST7-5. Please let me know if you
have any questions. Sue

Subject: Manganese samples in surficial soils west of the SMI facilityin Saginaw, MI

Attachments: smi mn results.pdf; smi May 21.doc

smi mn results.pdf (105 KB) smi May 21.doc (32 KB)

The field notes and sample results from the 12 surficial soil samples taken on May 21, 2007, are attached. The field notes include the sample locations. The samples were analyzed by the DEQ laboratory. There were 9 samples taken west of the former railyard area at the SMI facility. The total manganese results for the samples located directly adjacent to the chainlink fence surrounding the SMI facility were 380 mg/kg, 220 mg/kg, and 460 mg/kg. The other 6 samples are from locations 1 to 2 city blocks away from the facility. The "background samples" taken from 3 locations south of the site off Washington St were 550 mg/kg, 480 mg/kg, and 290 mg/kg. The state-wide background for manganese is 440 mg/kg.

I will be participating on the conference call scheduled for tomorrow at 10am. Sue

May 21, 2007 Field Notes
Clear, cool, about 60 degrees, arrived on-site 10:30 am.

Took 12 surficial (about 1" deep) soil samples west of the SMI facility in Saginaw, MI. The samples will be analyzed for fine, coarse, and total manganese concentrations. Samples were taken in black topped 8 oz jars, 1 jar per location, and completely filled with soil. The vegetation was scraped away and the top 1" of soil put in the jar. A new packaged plastic scoop was used for each location. The used scoops and packaging were disposed in the trash.

#1 Sample location was west of the GM fenceline, across Salt St from the corner of Salt and Stewart. Soil was gray brown silty material.

#2 Sample location was west of the GM fenceline, across Salt St from the corner of Salt and McGregor. Soil was gray brown silty material.

#3 Sample location was west of the GM fenceline, across Salt St from the corner of Salt and Vermont. Soil was gray brown silty material.

#4 Sample location was on southeast corner of Vermont and King. Soil was black silty fine sandy material.

#5 Sample location was on northeast corner of McGregor and King. Soil was black silty fine sandy material.

#6 Sample location was on northeast corner of Stewart and King. Soil was black silty fine sandy material.

Sep 17, 2009 18:39

#7 Sample location was on northeast corner of Stewart and Niagara. Soil was black silty fine sandy material.

#8 Sample location was on northeast corner of McGregor and Niagara. Soil was black silty fine sandy material.

#9 Sample location was on northeast corner of Vermont and Niagara. Soil was black silty fine sandy material.

#10 Sample location was on the northwest corner of Washington and Elsie in south Saginaw. Sample was gray brown sandy silt.

#11 Sample location was on the southwest corner of Washington and Dayton in south Saginaw. Sample was gray brown sandy silt.

#12 Sample location was on the east side of Washington across from the corner of Washington and Banner in south Saginaw. Sample was gray brown sandy silt.

Left the site about 12:30.

The samples were put into a cooler with ice and transported to the DEQ lab on May 22, 2007, by Sue Kaelber-Matlock.

Qualifier Code	Qualifier Description
1	Result(s) and RL(s) are estimated due to low surrogate recovery.
2	Result is estimated due to high surrogate recovery.
3	Result(s) and RL(s) are estimated due to low matrix spike recovery.
4	Result is estimated due to high matrix spike recovery.
5	Result and RL are estimated due to low continuing calibration standard criteria failure.
6	Result is estimated due to high continuing calibration standard criteria failure.
7	Result(s) and RL(s) are estimated due to poor precision.
8	Result(s) and RL(s) are estimated due to low recovery of batch QC.
9	Result outside QC acceptance criteria.
A	Value reported is the mean of two or more determinations.
C	Value calculated from other independent parameters.
D	Analyte value quantified from a dilution(s); reporting limit (RL) raised.
E	Result is estimated due to high recovery of batch QC.
F	Amenable cyanide was not analyzed due to low level of total cyanide.
G	Result and RL are estimated due to initial calibration standard criteria failure.
H	Recommended laboratory holding time was exceeded.
I	Dilution required due to matrix interference; reporting limit (RL) raised.
J	Analyte was positively identified. Value is an estimate.
JA	Result is estimated due to multiple Aroclors present.
JC	Result is estimated since confirmation analysis did not meet acceptance criteria
JD	Due to severe degradation, specific Aroclor identification is difficult and quantitation is estimated.
K	RL(s) raised due to matrix interferences.
KR	RL(s) raised due to low sample volume submitted.
KS	RL(s) raised due to low total solids.
KW	RL(s) raised due to light sample weight.
LB	Reported library search compounds are tentative identifications with estimated concentrations.
M	The level of the method preparation blank (MPB) is reported in the qualifier column.
N	Non-homogeneous sample made analysis of sample questionable.
O	Result and RL estimated due to analysis from an open vial.
P	Recommended sample collection/preservation technique not used; reported result(s) is an estimate.
Q	Quantity of sample insufficient to perform analyses requested.
R	Result confirmed by re-extraction and analysis.
S	Supernatant analyzed.
T	Reported value is less than the reporting limit (RL). Result is estimated.
V	Value not available due to dilution.
W	Reported value is less than the method detection limit (MDL).
X	Methods 8260 & 624 are used to analyze volatile organics that have boiling points below 200°C. 2-Methylnaphthalene & naphthalene have boiling points above 200°C and are better suited to analysis by methods 8270 or 625 as semivolatile organics.
PI	Possible interference may have affected the accuracy of the laboratory result
Z	Result reported below the RL to meet the TDL in RRD Op Memo 2 (10/22/04) multiplied by applicable dilution factor.

Dear Ms. Brouillet:

The following Work Plan has been developed in response to Michigan Department of Environmental Quality (MDEQ) comments on the revised Site Remedial Action Plan, presented in correspondence dated May 18, 2006. Additional investigation activities have been incorporated with the monitoring activities described in the Summary Operations and Maintenance Plan (O&M Plan) that was submitted to MDEQ as part of the Remedial Action Work Plan dated September 23, 2005. Based on MDEQ comments, additional monitoring wells will be installed along the Saginaw River, and the Greenpoint Landfill and Saginaw River Boundary monitoring programs will be expanded during the next two monitoring events to include additional monitoring wells and monitoring parameters. Table 1 presents a summary of the proposed sampling program. The new sampling components, added in response to MDEQ comments, are shown in bold.

Greenpoint Landfill Monitoring

In attachment 3 of the May 18, 2006 MDEQ Comment Letter, Comment 5B outlines the specific additional activities associated with Greenpoint Landfill Monitoring Activities that MDEQ is requesting. At MDEQ's request, a minimum of two additional monitoring wells (and up to four monitoring wells, depending on the thickness of the lower sand unit) will be installed, and the groundwater-monitoring program will be

expanded for the next two monitoring events to include additional monitoring wells and analytical parameters.

Monitoring Well Installation

The overburden deposits at the SMI Plant and GPLF Site are comprised of the following primary units, in descending order:

- fill materials consisting primarily of foundry sand, glaciolacustrine silts and clay ("upper silty clay unit"),
- a sand unit that grades coarser with depth and divides toward the Saginaw River into two separate units ("upper sand unit" and "lower sand unit"), separated by a silty clay unit ("middle silty clay unit"), glaciolacustrine silty clay ("lower silty clay unit"), and
- glacial till.

Several figures from the Remedial Investigation (RI) Report illustrate subsurface conditions in the vicinity of the Green Point Landfill, and are provided as attachments to this Work Plan. RI Figure 3-1 is a cross-section location map, and Cross-Sections C-C' (RI Figure 3-4) and F-F' (RI Figure 3-7) are constructed from north to south along the river and from west to east south of the Green Point Landfill, respectively. In comment 5B of Attachment 3 of the May 18, 2006 MDEQ response letter, MDEQ requested that monitoring wells be installed in the lower portion of the sand unit along the Saginaw River, east of the Green Point Landfill. Two new monitoring wells will be installed (X-4D and X-9D) at the base of the lower sand unit at existing well cluster locations X-4 and X-9. If greater than 12 feet of saturated sand are present within the lower sand unit, two additional monitoring wells (X-4E and X-9E) will be installed at the top of this unit. Sampling data from the new wells screened in the lower sand unit will supplement data obtained from the existing wells that screen the upper sand unit. The monitoring wells will be installed using rotosonic or large diameter auger drilling methods and soil cores will be recovered continuously as the

borings are advanced. The soil will be described and screened using a photoionization detector (PID). No soil samples will be collected for laboratory analysis.

The monitoring wells will be constructed of 2-inch inside diameter, Schedule 40, machine slotted polyvinyl chloride (PVC). It is anticipated that the screen length will be five-feet. A sand pack will be installed from the base of the well screen to approximately two feet above the top of the well screen. The remaining annular space will be grouted to the ground surface. The monitoring wells will be completed with stick-up protective well casings.

The monitoring wells will be allowed to sit for a minimum of 24 hours to allow the grout to set prior to development to remove sediment. An elevation survey of the new monitoring wells will be completed relative to the National Geodetic Vertical Datum (NGVD) of 1929. The elevation of the ground surface, and top of the inner casing of the wells will be measured to the nearest 0.01 feet.

Greenpoint Landfill Groundwater Sampling

The monitoring wells included in the Green Point Monitoring Program are listed in Table 1 and shown on Figure 1. Groundwater monitoring activities described in the O&M Plan include the following activities:

- collecting groundwater elevation measurements at monitoring wells on an annual basis in proximity to the Green Point Landfill to allow construction of a water table contour map.
- collecting and analyzing groundwater samples annually from each of 13 groundwater monitoring wells (MW-117WT, MW-117S1, MW-118WT, MW-118S1, MW-128WT, MW-128S1, X-1A, X-1B, X-1CR2, X-2A, X-10AR2, X-16A, and X-16B; Figure 1).

Supplemental groundwater monitoring activities were completed in December 2006 to provide additional data in response to MDEQ comments and to guide the

Sep 17, 2009 18:39

development of additional monitoring activities that are described in this Work Plan. These data are discussed in the Environmental Program Annual Report for the Green Point Landfill, dated July 2007. Evaluation of the data shows that the principle analytes that have been detected in the vicinity of the landfill consist of the inorganic parameters. PCBs were detected above the drinking water criterion at the X-1 monitoring well cluster in 1995; however, the criterion was not exceeded during two subsequent monitoring events in 1996 and 2000. PCBs have not been detected at the other groundwater monitoring wells in the vicinity of the GPLF. Benzene and vinyl chloride have been detected above the Industrial Drinking Water (IDW) criterion at individual monitoring wells; however, the data have shown localized, consistent concentrations with no evidence of migration. As a result, analyses for PCBs at all of the monitored locations will be eliminated. TCL VOC and SVOC analyses will also be eliminated at all of the monitored locations with the exception of the new wells to be installed near the river.

Richard Kowalski
LFR
Sep 17, 2009 18:39

In response to MDEQ comment 5B, the following additional sampling activities will be conducted:

- Sampling of the new monitoring wells to be installed along the river (two to four new wells to be installed depending on the thickness of the lower sand unit). These samples will be analyzed for Target Compound List (TCL) volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), total and dissolved Target Analyte List (TAL) metals, and landfill indicator parameters (dissolved cyanide, total dissolved solids [TDS], pH, chloride, sulfate, nitrate [as N], nitrite [as N], and ammonia nitrogen). Two rounds of groundwater sampling will be conducted. Following the first round of sampling, the analytical data will be reviewed and if no VOCs or SVOCs are detected, these parameters will be dropped from the sampling program.

- Sampling of 13 groundwater monitoring wells not included in the annual Green Point Landfill monitoring program (MW-117S2, MW-118S2, X-2B, X-2C, X-2DAUG, X-4A, X-4CAUG [replacement], X-9AR, X-9BR, X-9CAUG, X-10BR, X-

10CR, and X-10DAUG) and analysis of the samples for dissolved TAL inorganics and the landfill indicator parameters during two sampling rounds.

Although MDEQ requested four quarterly sampling events, we believe that the proposed sampling program, in combination with the supplemental sampling completed in December 2006, will allow for adequate characterization of groundwater quality in the lower sand unit. The data collected to date show minimal variation over time. If, based on future data, it appears that more information is needed (e.g. unexpected variability of the results), additional sampling will be proposed.

The depth to water at each of the monitoring wells will be measured to the nearest 0.01 foot using an electronic water level probe. Prior to the collection of groundwater samples, each monitoring well will be purged using ultra-low-flow sampling procedures until the field parameters (pH, dissolved oxygen, conductivity, temperature, turbidity, and oxidation reduction potential) have stabilized. Groundwater samples will be collected in bottleware supplied by the lab and will be analyzed by Severn Trent Laboratories (STL), located in North Canton, Ohio. The analytical methods that will be used for laboratory analysis of the groundwater samples are as follow:

- nitrogen, ammonia (Method 350.3)

Saginaw River Berm Sampling

In attachment 3 of the May 18, 2006 MDEQ Comment Letter, Comment 5C outlines MDEQ requests for additional activities associated with Saginaw River Boundary Monitoring Activities. As outlined in the O&M Plan, the monitoring program was developed to address the sporadic detection of PCBs, arsenic manganese, and thallium at concentrations above Groundwater/Surface Water Interface (GSI) criteria along the Saginaw River at seven monitoring well locations (B-7R, MW-110WTR (replacing MW-110WT), MW-111WT, MW-112WT, MW-114WT, and MW-185WT). At MDEQ's request, monitoring well MW-107WT will also be added to the monitoring program.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Unfiltered groundwater samples will be collected using ultra-low-flow sampling methods for laboratory analysis. Prior to the collection of groundwater samples, the monitoring wells will be purged at a rate of less than 100 milliliters per minute until the field parameters (pH, dissolved oxygen, conductivity, temperature, and oxidation reduction potential) have stabilized and the turbidity is less than 2 nephelometric turbidity units (NTUs). GM may also decide to analyze both filtered and unfiltered samples for PCBs and inorganic constituents to evaluate particulate impacts on the data. Groundwater samples will be collected in bottleware supplied by the lab. The sampling list varies for the individual wells, as shown in Table 1. The following analyses will be completed at one or more of the Saginaw River Berm wells.

- PCBs (total and dissolved) (Method 8082)
- target compound list (TCL) semi-volatile organic compounds (SVOCs) (Method 8270)
- ammonia (Method 350.3)
- phosphorus (Method 365)
- total dissolved solids (TDS) (Method 160.1)

- total arsenic (Methods 6010B)
- total thallium (Methods 6010B)
- total manganese (Methods 6010B)
- dissolved oxygen

Table 1 details the sampling parameters for each monitoring well in the monitoring program and the monitoring well locations are shown on Figure 1.

Railyard Sampling

In comment 1 of Attachment 3 of the May 18, 2006 MDEQ RAP response letter, delineation of manganese in surface soil north-west of the Site, into a residential area was requested. MDEQ sampled surface soil in the area north-west of the Site on May 21, 2007. The results of this sampling showed no exceedances of the Residential Particulate Inhalation Criterion (RPIC) in any of the samples. In addition, the concentrations of manganese found in samples collected adjacent to the Site were lower than the concentrations detected in the majority of the samples collected at greater distances from the Site. Therefore, no additional soil sampling for manganese is proposed.

Groundwater Elevation Monitoring

In attachment 3 of the May 18, 2006 MDEQ Comment Letter, Comment 7, MDEQ requested that site-wide groundwater contour maps be included in the annual monitoring reports. Included in Table 1 is a list of monitoring wells to be included in the groundwater elevation monitoring program. Based on field observations of monitoring well conditions, alternative monitoring wells may be proposed for the monitoring program.

Sep 17, 2009 18:39

Monitoring Well Abandonment

In attachment 3 of the May 18, 2006 MDEQ Comment Letter, Comment 6, MDEQ requested that all monitoring wells not included in monitoring programs be abandoned. Table 2 includes a list of monitoring wells that are candidates for well abandonment. The monitoring well abandonment will not be scheduled until the first groundwater elevation monitoring event has been completed to ensure that the remaining monitoring locations will be adequate. The monitoring wells will be abandoned by over drilling wherever practical, to remove well construction materials and grouted to the ground surface. It is anticipated that the presence of overhead power lines at several monitoring well locations may present a health and safety concern related to the operation of a drill rig. At these locations, the monitoring wells will be tremie-grouted in place, and the surface completions will be removed.

QA/QC Samples

Quality Assurance (QA) and Quality Control (QC) samples will consist of matrix spikes (MS) and matrix spike duplicate (MSD), field duplicates, rinse blanks, and trip blanks. One set of QA/QC samples will be collected for every twenty field samples and one trip blank will be submitted with every cooler containing VOCs samples, in accordance with the Site Quality Assurance Project Plan.

Investigation Derived Waste (IDW)

The investigation derived waste will include soil cuttings from monitoring well installation, development water, purge water, and decontamination water. The soil cuttings will be distributed at the ground surface adjacent to the corresponding well location, unless there is visual evidence of contamination. Any decontamination water that contains solvents will be containerized and transported to the onsite LNAPL recovery and groundwater treatment system located south of the plant building for treatment. The development water and the purge water will be discharged to the ground surface, unless there is visual evidence of contamination (e.g., sheen, high PID reading).

Based on your June 22, 2007, electronic mail approval of the proposed well installation scope of work, we expect to complete the well installation activities this week. Following your approval of this work plan, we will schedule the remaining field activities. The analytical data will be reported to the MDEQ in the monthly reports, following completion of data validation and will be summarized in a letter report following completion of the Work Plan activities. Please contact Cheryl Hiatt at 248-753-5799 with any questions or comments.

Sincerely,

ARCADIS of New York, Inc.

Lisa R. Coffey

STATE OF MICHIGAN
DEPARTMENT OF ENVIRONMENTAL QUALITY
SAGINAW BAY DISTRICT OFFICE

JENNIFER M. GRANHOLM
GOVERNOR

STEVEN E. CHESTER
DIRECTOR

October 16, 2007

CERTIFIED MAIL

Ms. Cheryl Hiatt
Environmental Project Manager
General Motors Corporation
Remediation Services, MC 483-520-190
2000 Centerpoint Parkway
Pontiac, Michigan 48341

Dear Ms. Hiatt:

SUBJECT: Workplan (Revision 1) for Additional Site Investigation –
Remedial Action Plan, July 24, 2007
Environmental Monitoring Program Annual Report, July 25, 2007
Saginaw Malleable Iron Plant/Green Point Landfill
Consent Judgment No. 98-22686-CE-2

The Department of Environmental Quality (DEQ), Remediation and Redevelopment Division (RRD), has received Revision 1 of the Workplan for Additional Site Investigation (Workplan), dated July 24, 2007, and the Environmental Monitoring Program Annual Report (Report), dated July 25, 2007. They were submitted by ARCADIS BBL on behalf of the liable party group (LPG) for the Saginaw Malleable Plant/Greenpoint Landfill (SMI) site located in Saginaw, Michigan.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

The Workplan is approved with modifications in accordance with Section XV of the Consent Judgment No. 98-22686-CE-2 (Consent Judgment).

- The installation of the two new wells, X-4D and X-9D, was approved by electronic mail addressed to you on June 22, 2007. The soil boring/well logs for the two new wells and one replacement well, X-4CAUG, was received in the August 2007 Monthly Report, dated September 12, 2007.

- The parameter list for the analysis of groundwater from the Groundwater-Surface Water Interface (GSI) well locations adjacent to the Saginaw River must include the polychlorinated biphenyl compounds (PCBs), semivolatile organic compounds (SVOCs), and volatile organic compounds (VOCs) from the Target Compound List (TCL), as well as the Target Analyte List (TAL) metals, and the landfill indicator parameters. The Greenpoint Landfill is being proposed for closure without a leachate collection and treatment system, and consequently some long-term GSI monitoring will be required adjacent to the surface water bodies.

- As requested in the May 19, 2006 correspondence to you, four rounds of quarterly groundwater sampling will be needed from the two new wells to determine seasonal variation.

Sep 17, 2009 18:39

- Groundwater from MW183-WT should be sampled for the landfill indicator parameters as it is downgradient from the landfill and those parameters are being found in significant concentrations adjacent to the Saginaw River.

- Surface water elevation measurements of the Saginaw River and Secondary Pond must be included on the shallow groundwater elevation maps that are submitted as part of the Groundwater Elevation Monitoring.

- The Workplan indicates a Table of wells proposed for abandonment. We believe that most of the wells should be left in place until the final RAP has been approved. Please identify any wells that need to be abandoned in order to demolish the building.

- The RRD staff were on-site at Delphi on October 12, 2007, and found the wells installed by General Motors as part of the free product investigation at SMI. These wells must be included on the appropriate maps.

- In addition to these comments, please understand that any Part 201 Remedial Action Plan (RAP) for a former landfill must be equivalent to all relevant and appropriate requirements of Part 115, Solid Waste, of the Natural Resources and Environmental Protection Act. The RAP for the closed landfill must address performance standards, including but not limited to:

    - Design, construct, and maintain a landfill cap that mitigates infiltration and promotes stormwater control.

    - Design, construct, and operate a system that reduces and maintains leachate levels in the waste disposal area and prevents lateral and vertical migration of the leachate.

    - Design, construct, and operate a groundwater collection system as necessary to prevent unacceptable exposures outside the property boundary.

    - Design, construct, and operate a landfill gas venting system that collects and treats all landfill gas migrating from the waste disposal area.

    - Mitigate exposure to any hazardous substance present in concentrations greater than the applicable criteria.

    - Assure long term effectiveness of remediation activities contained in the RAP through implementation of land use and/or resource use restrictions, approvable groundwater and gas monitoring plans, operation and maintenance plans, and the use of permanent markers.

    - Propose an acceptable financial assurance mechanism.

The RAP for this site must address the boundary area between the Delphi and SMI facilities. Part 20120(a) requires that contaminants in soil and groundwater must be at concentrations less than the generic residential criteria unless appropriate land use or resource use restrictions are placed on all impacted properties. In addition, the extent of dissolved contaminants, as well as separate phase materials, must be defined. It may be possible to show a divisibility of harm along the property boundary.

Many of the concentrations of landfill indicator parameters detailed in the Report are significant. In order to provide more information regarding the equivalency requirements to the LPG, Saginaw Bay District staff expects to discuss the SMI site conditions, specifically what is needed to determine compliance of general chemistry and other parameters with GSI, with Lansing staff in the near future. We suggest that a meeting to discuss this and other pertinent issues be scheduled before the RAP submittal date.

Please contact me at 989-686-8025, extension 8303, or by electronic mail at matlocks@michigan.gov should you have any questions or concerns regarding the information presented in this letter.

Sincerely,

Sue Kaelber-Matlock, Senior Geologist

Dear Ms. Kaelber-Matlock:

This letter has been prepared on behalf of the General Motors Corporation (GM) and Waste Management Inc. (WMI) to respond to the October 16, 2007, Michigan Department of Environmental Quality (MDEQ) letter, that provided comments on the July 24, 2007 Work Plan for Additional Site Investigation at the GM Saginaw Malleable Iron (SMI) Plant and the Green Point Landfill property, located in Saginaw, Michigan. The letter provided work plan approval, with modifications, and each of the requested modifications were identified in comments. Each MDEQ comment is reproduced below, followed by a response. As several of the comments were new or different from previous discussions, a meeting was held on November 5, 2007, between you, Mr. Allan Brouillet (MDEQ - ERD), Mr. Edward Peterson (GM), Ms. Cheryl Hiatt (GM), Mr. Kent Bainbridge (WMI), and Ms. Lisa Coffey (ARCADIS BBL) to discuss your letter. The responses given below reflect our understanding of the resolution of each comment, as discussed at the meeting.

MDEQ Comment 1:

The installation of the two new wells, X-4D and X-9D, was approved by electronic mail addressed to you on June 22,2007, The soil boring/well logs for the two new wells and one replacement well, X-4CAUG, was received in the August 2007 Monthly Report, dated September 12, 2007.

GM/WMI Response:

No response is required.

MDEQ Comment 2:

The parameter list for the analysis of groundwater from the Groundwater-Surface Water Interface (GSI) well locations adjacent to the Saginaw River must include the polychlorinated biphenyl compounds (PCBs), semivolatile organic compounds (SVOCs), and volatile organic compounds (VOCs) from the Target Compound List (TCL), as well as the Target Analyte List (TAL) metals, and the landfill indicator parameters. The Greenpoint Landfill is being proposed for closure without a leachate collection and treatment system, and consequently some long-term GSI monitoring will be required adjacent to the surface water bodies.

GM/WMI Response:

We understand from our meeting on November 5th, that the monitoring wells referred to in this comment are the newly installed monitoring wells located adjacent to the Saginaw River. These wells are installed in the deeper sand unit, and although up-gradient data for the landfill do not suggest that some of the listed constituent groups are of concern, GM and WMI agree to sample these wells three times for the requested analytes. Table 1 has been edited to show that X-4D and X-9D will be sampled for PCBs, TCL VOCs, TCL SVOCs, total and dissolved TAL metals, and the landfill indicator parameters (total dissolved solids, pH, chloride, sulfate, nitrate (as N), nitrite (as N), and ammonia nitrogen. The sampling events are tentatively scheduled for early December 2007, early March 2008, and July 2008. Due to the scheduled submittal of the revised Remedial Action Plan (RAP) in May of 2008, the team recognizes that the third round of data will not be included in the RAP; however, the data will be considered during the RAP review process.

We recognize that monitoring of groundwater quality at wells located along the Saginaw River will be included in the Operation, Maintenance, and Monitoring (OM&M) Plan to be included with the RAP. The scope of the monitoring activities will be evaluated based on the collection of additional groundwater analytical data.

MDEQ Comment 3:

As requested in the May 19, 2006 correspondence to you, four rounds of quarterly groundwater sampling will be needed from the two new wells to determine seasonal variation.

GM/WMI Response:

We agree to complete three rounds of sampling at the two new well locations, and we understand from discussions with you during our November 5th meeting, that this is acceptable to the MDEQ.

MDEQ Comment 4:

Groundwater from MW183-WT should be sampled for the landfill indicator parameters as it is downgradient from the landfill and those parameters are being found in significant concentrations adjacent to the Saginaw River.

GM/WMI Response:

Agreed.

Sep 17, 2009 18:39

MDEQ Comment 5:

Surface water elevation measurements of the Saginaw River and Secondary Pond must be included on the shallow groundwater elevation maps that are submitted as part of the Groundwater Elevation Monitoring.

GM/WMI Response:

Agreed. A staff gauge will be installed in the Secondary Settling Pond if the previously existing gauge is not usable. From past experience, we know that a gauge placed in the Saginaw River is likely to be destroyed by ice during the winter. Therefore, to provide elevation data for the River, we propose to establish a survey reference point on the Center Street bridge, which is located at the northern end of the Site.

MDEQ Comment 6:

The Workplan indicates a Table of wells proposed for abandonment. We believe that most of the wells should be left in place until the final RAP has been approved. Pléase identify any wells that need to be abandoned in order to demolish the building.

GM/WMI Response:

We would like to abandon all of the wells that are in close proximity to the plant building that are not anticipated to be needed for future monitoring. A list of wells proposed for abandonment is attached.

MDEQ Comment 7:

The RRD staff were on-site at Delphi on October 12, 2007, and found the wells installed by General Motors as part of the free product investigation at SMI. These wells must be included on the appropriate maps.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

GM/WMI Response:

We have identified seven monitoring/recovery wells located on the Former Delphi Plant 2 property that had been inadvertently omitted from the Work Plan figure (MW-148WT, MW-155WT, MW-156WT, MW-159WT, MW-166WT, MW-167WT, and RW-4). These wells will be added to future monitoring well location figures.

MDEQ Comment 8:

In addition to these comments, please understand that any Part 201 Remedial Action Plan (RAP) for a former landfill must be equivalent to all relevant and appropriate requirements of Part 115, Solid Waste, of the Natural Resources and Environmental Protection Act. The RAP for the closed landfill must address performance standards, including but not limited to:

- *Design, construct, and maintain a landfill cap that mitigates infiltration and promotes stormwater control.*

GM/WMI Response:

Based on our discussions with you during our meeting on November 5, 2007, we understand that this comment was included based on recent discussions with MDEQ management in Lansing, to notify GM and WMI that a discussion should be added to the RAP regarding the performance standards of the Green Point Landfill cap system. We further understand that this comment was not included to suggest that additional remedial actions are required at the landfill, rather that text should be added to the RAP to better document the appropriateness of previous decisions. As discussed in our meeting, GM believes these issues had been discussed years ago, often with input and review by MDEQ staff associated with the solid waste regulations, and concurrence had been achieved. Additional text will be added to the RAP to describe the appropriateness of those previous decisions (e.g., design and construction of the cap, the absence of any leachate collection) or to clarify how some of the issues were accounted for in the RAP (e.g., financial assurance mechanism).

MDEQ Comment 9:

The RAP for this site must address the boundary area between the Delphi and SMI facilities. Part 20120(a) requires that contaminants in soil and groundwater must be at concentrations less than the generic residential criteria unless appropriate land use or resource use restrictions are placed on all impacted properties. In addition, the extent of dissolved contaminants, as well as separate phase materials, must be defined. It may be possible to show a divisibility of harm along the property boundary.

GM/WMI Response:

The Former Delphi Plant 2 property is located to the west, and up-gradient of the Site. Impacts from the Delphi property to the SMI property have been documented in the Remedial Investigation and through ongoing monitoring in the LNAPL recovery area south of the main plant building. A technical memorandum presenting the results of an evaluation of light non-aqueous phase liquid (LNAPL) sources in this area was transmitted to you on January 12, 2005, and a copy (without attachments) is attached for your reference. This evaluation used analytical fingerprint analyses to compare the characteristics of LNAPL collected from several locations on the SMI property with LNAPL collected from several locations on the Delphi property. The conclusions of the evaluation are that the LNAPL observed on the Delphi property exhibits a different analytical signature than the LNAPL products sampled at SMI. In addition, the LNAPL found south of the SMI plant building, on GM property, is a likely mixture of LNAPLs that includes LNAPL from the Delphi property, indicating impacts from Delphi to the SMI property.

In addition, groundwater impacts from the southern part of the Former Delphi Plant 2 property to the REALM Peninsula Area, and ultimately to the wetland located west of the Peninsula Area on the Green Point Landfill Property have been documented. These impacts need to be addressed by Delphi in the RAP prepared for the Plant 2 Property.

MDEQ Comment 10:

Many of the concentrations of landfill indicator parameters detailed In the Report are significant. In order to provide more information regarding the equivalency requirements to the LPG, Saginaw Bay District staff expects to discuss the SMI site conditions, specifically what is needed to determine compliance of general chemistry and other parameters with GSI, with Lansing staff In the near future, We suggest that

ARCADIS BBL

a meeting to discuss this and other pertinent issues be scheduled before the RAP submittal date.

GM/WMI Response:

Based on our November 5, 2007, meeting discussions, we do not feel that an additional meeting with the Saginaw Bay District staff is required at this time. However, please let us know if you would like to schedule a second meeting that also involves Lansing staff. If you have any questions or would like to discuss any aspect of this letter, please contact Cheryl Hiatt at 248-753-5799.

Sincerely,

ARCADIS of New York, Inc.

BBL Project #: 0644 644.34 #2.04

Dear Sue:

A memorandum is enclosed, which presents the results of an evaluation of light non-aqueous phase liquid (LNAPL) samples collected from locations on the General Motors Corporation (GM) Saginaw Malleable Iron property, and from the adjacent Delphi property.

Please contact me if you would like to discuss the enclosed data.

Sincerely,

Re: Evaluation of LNAPL Sources – GM Saginaw Malleable Iron Plant

This memorandum describes the analyses and interpretation of data for a series of light-non-aqueous-phase liquid (LNAPL) samples recovered from monitoring wells associated with the Saginaw Malleable Iron (SMI) Plant property, located in Saginaw, Michigan. Figure 1 shows the site area and monitoring well locations. Table 1 lists the samples that have been collected and analyzed as part of this investigation. Laboratory sample identifiers are included in Table 1 to facilitate matching data in the attachments to sample locations.

Total Petroleum Hydrocarbon Fingerprint Analysis

The analysis of total petroleum hydrocarbons (TPH) following modified Method 8015 provides a "fingerprint" of the LNAPL. The analytical output (provided in Attachment 1 for all samples) is a gas chromatogram of the product between approximately the kerosene range and the residual range, and quantification of TPH concentration. The quantification of TPH concentration in NAPL was not a consideration in the forensic evaluation. Each sample was analyzed for the conventional TPH fingerprint. In addition, due to a laboratory error, the MW-147WT and MW-157WT LNAPLs were first analyzed for TPH with n-alkane quantification (included in Attachment 1 as 0307012-01 and -02), and then reanalyzed (0312026-03 and -04) for the more conventional TPH fingerprint, consistent with the remaining samples. The primary objective of the TPH analysis was to identify compositional features of the NAPLs, such as hydrocarbon range, product type (e.g., kerosene-range, diesel-range, lubricating/residual-range, etc.), and degree of weathering.

Comprehensive PAH Fingerprint Analysis

All LNAPL samples underwent PAH fingerprinting analysis, which generated concentration data for a comprehensive suite of constituents, including the alkylated homologue groups of major PAHs (e.g., alkylated naphthalenes, fluorenes), sulfur-containing heterocyclic compounds (e.g., alkylated dibenzothiophenes, naphthobenzothiophenes), and weathering-resistant polyalkane compounds (e.g., alkylated decalins). Including the alkylated homologue groups, the fingerprinting analysis encompasses up to several hundred hydrocarbon compounds, which are reported as 60 target "analytes" (including numerous multi-component homologue groups). The PAH analyses were performed using high-resolution gas chromatography/low-resolution mass spectrometry with selected ion monitoring (HRGC/LRMS-SIM). The method involves a modification of USEPA Method 8270C (SW-846) and is consistent with PAH fingerprinting methods and target constituents cited for the characterization of petroleum (Sauer and Boehm, 1991; Douglas et al, 1992; Brown and Boehm, 1993; Burns, 1993; Sauer and Boehm, 1995; Page et al., 1995; Stout et al., 2002) and other hydrocarbon NAPLs, such as coal tars and creosote (EPRI, 2000). The data are provided as quantification reports and composition histograms in Attachment 2. In addition to providing a comprehensive characterization of the aromatic fraction of petroleum, ratios of alkylated PAHs with similar weathering/degradation resistance have proven to be effective diagnostic indicators of petroleum source (Brown and Boehm, 1993; Page et al., 1995; Stout et al., 2002).

Geochemical Biomarkers Analysis

The modified Method 8270 analysis described above included monitoring ions 191 and 217 for steranes and triterpanes. These aliphatic compound classes are considered geochemical biomarkers because they are indicative of the source petroleum formation and are resistant to weathering and biodegradation alterations (Page et al., 1995; Sauer et al., 1993; Stout et al., 2002). From the selected ion profiles provided in Attachment 3 as the data from this analysis, one can see that these complex aliphatic compounds constitute some of the unresolved complex mixture (UCM) humps that are characteristic of various petroleum product TPH chromatograms (e.g., data in Attachment 1). The use of the geochemical biomarker data in this investigation is primarily qualitative, similar to the use of the TPH fingerprints. An important difference between the TPH fingerprints in Attachment 1 and the geochemical biomarker fingerprints in Attachment 3 is that the TPH fingerprints are more susceptible to weathering/degradation alterations than the biomarker fingerprints. This difference makes the biomarker fingerprints more useful for comparing potentially weathered/degraded NAPLs and/or residues.

Results

The compositional characteristics for the LNAPLs analyzed in this investigation are summarized in Table 2.

Table 2. Summary of Compositional Characteristics.

Sampling Location/Well	TPH Fingerprint	PAH and Related Fraction	Geochemical Biomarkers
203S (suspected representative cutting oil)	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ unresolved complex mixture hump (UCM); n-alkanes absent	Phenanthrenes, Naphthalenes, Fluorenes, Decalins prominent; moderately weathered	Cutting Oil pattern
TP1	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ UCM; n-alkanes absent	Decalins, Fluorenes, Phenanthrenes prominent; moderately weathered	MW-147 pattern
TP2	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ UCM; n-alkanes absent	Decalins, Fluorenes, Phenanthrenes prominent; moderately weathered	MW-147 pattern
QO (quench oil)	$n\text{-}C_{18}$ - $n\text{-}C_{32}$ UCM; $n\text{-}C_{15}$ through $n\text{-}C_{22}$ present	Decalins absent; Phenanthrenes, Fluorenes prominent; slightly weathered	Quench Oil pattern
MW-147WT	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ UCM; n-alkanes absent	Phenanthrenes, Fluorenes, Decalins prominent; moderately weathered	MW-147 pattern
MW-157WT	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ UCM; n-alkanes absent	Phenanthrenes, Naphthalenes, Fluorenes, Decalins prominent; slightly weathered	Cutting Oil pattern
MW-148WT	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ UCM; n-alkanes absent	Phenanthrenes, Fluorenes, Naphthalenes, Decalins prominent; slightly weathered	Cutting Oil pattern
SP (stormwater pond)	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ UCM; n-alkanes absent	Phenanthrenes, Decalins, Naphthalenes, Fluorenes prominent; slightly weathered	MW-147 pattern

The TPH fingerprint analysis revealed chromatograms associated with middle-distillate-range petroleum, featuring UCM ranging from n-C_{15} to n-C_{32} without n-alkanes evident in any monitoring well or test pit samples; the quench oil sample included n-alkanes from n-C_{15} to n-C_{22}. As can be seen from the chromatograms in Attachment A, the quench oil sample UCM was shifted relative to the other samples (n-C_{18} to n-C_{32}), although weathering/degradation could account for the slight shift in the UCM. Thus, the TPH fingerprints did not lead to a forensic conclusion.

The alkylated PAH analysis revealed some homologue groups that were common to several samples. Although decalins are not aromatic compounds, they were analyzed quantitatively along with the alkylated PAH homologues and the several heterocyclic aromatic homologue groups (e.g., dibenzothiophenes). The absence of decalins in the quench oil sample was a distinguishing feature from all other LNAPLs which contained measurable concentrations of decalins. The absence of decalins in the quench oil eliminates the possibility of quench oil as a single, or even primary source of the LNAPL recovered from TP1 and TP2.

Ratios of alkylated dibenzothiophenes to corresponding phenanthrenes-plus-anthrences have been used as effective source markers for middle-distillate-range petroleum and crude oil (e.g., Brown and Boehm, 1993; Sauer et al., 1993; Page et al., 1995). Figure 1 illustrates three apparent source groupings for the LNAPL samples in this investigation. The "cutting oil signature group" is so designated because 203S is presumed to contain cutting oil from operations at the Delphi plant. The LNAPL from MW-147WT exhibited much different PAH source ratios than the other samples and may indicate an unidentified source, despite that well's proximity to MW-157WT, TP1 and TP2 on the SMI property. The quench oil, TP1, TP2, SP, and MW-157WT all exhibited similar PAH ratios in Figure 1. However, the absence of the aliphatic decalins in the quench oil, as noted above, indicated a different or additional NAPL source to TP1 and TP2. Thus, the PAH signatures associated with TP1, TP2, SP and MW-157WT may have resulted from 1) a mixture of cutting oil and the NAPL at MW-147WT, 2) a mixture of cutting oil and quench oil, 3) a mixture of quench oil and the NAPL at MW-147WT, or 4) a mixture of cutting oil, quench oil and the NAPL at MW-147WT.

Sep 17, 2009 18:39

The geochemical biomarker chromatograms (Attachment 3) may be used for qualitative identification. The "patterns" designated in Table 2 refer to the peaks that appear for ions 191 and 217, their relative heights, and the general shape of the UCM. In Table 2, a similar pattern, designated "cutting oil pattern," was observed for LNAPLs 203S, MW-148WT, and MW-157WT; a similar pattern, designated "MW-147," was observed for MW-147WT, TP1, TP2, and SP; and a third different pattern was observed for the quench oil. The biomarker scans, in combination with the diagnostic PAH ratios in Figure 1 suggested that the cutting oil and the LNAPL at MW-147WT contribute to the NAPL in the TP1, TP2, SP and MW-157WT cluster. It is possible, based on the PAH ratios in Figure 1, that some quench oil may have also contributed to the LNAPL in the TP1, TP2, SP and MW-157WT cluster. However, it is very unlikely that there was any quench oil contribution to the LNAPL associated with 203S, MW-148WT, or MW-147WT.

Sep 17, 2009 18:39

Conclusions

- LNAPLs in TP1, TP2, SP and MW-157WT were middle-distillate-range petroleum products reflecting a likely mixture of cutting oil from the Delphi operation, LNAPL from MW-147WT, and possibly quench oil from the SMI operation; and

- Quench oil from the SMI operation is not likely a source of LNAPL collected from 203S, MW-148WT, or MW-147WT.

Dear Ms. Matlock:

This letter and attachments have been prepared on behalf of the General Motors Corporation (GM) and Waste Management, Inc. (WMI) in response to your November 21, 2008, electronic mail transmittal to Ms. Cheryl Hiatt of GM. Your correspondence provided preliminary comments on the July 30, 2008, Remedial Action Plan (RAP) prepared for the Saginaw Malleable Iron Plant Property, and the Green Point Landfill and Drum Remediation Area, in Saginaw, Michigan. We understand that your comments are preliminary and informal. We have prepared this letter response in order to facilitate review by you and also the rest of the project team. MDEQ's comments have been reproduced below, along with responses and references to the attached parts of the RAP that show the proposed changes. We appreciate having this opportunity to address your comments.

MDEQ Technical Comment 1

The pipe from the Schultz property, draining water containing volatile organic compounds from off-site, is proposed to be capped as part of the RAP activities. Annual groundwater monitoring in the area of the pipe should be undertaken to verify that the pipe was the only source of volatile organic compounds in the localized groundwater.

Response

It is agreed that sampling of monitoring well TWW-1 will be added to the annual site monitoring program. The sampling program will continue until a downward trend in

VOC concentrations is established, accomplishing the goal of the sampling effort. When appropriate, a proposal to stop sampling at this location will be made to the MDEQ in the annual report. Edits to the RAP include the addition of TWW-1 as a monitoring point in the Summary Operation Maintenance and Monitoring Plan (Appendix C of the RAP). A track changes version of the appendix text and Figure C-2 showing this change are attached. Reference to the added sampling has also been added to the main text of the RAP (also attached).

MDEQ Technical Comment 2

Groundwater monitoring activities can be eliminated in the UST#7 area as part of this RAP. The UST#7 area is located in the center of the property and groundwater has been monitored in the area since 1994. The gasoline constituents in the area have decreased over time and the most recent data shows contaminants exceed only the drinking water criteria. Site wide property use restrictions against the installation of potable water wells are proposed as part of the RAP.

Response

We agree with your assessment of this area of the Site. Edits to the RAP include the deletion of the limited monitoring program that had been proposed for the UST 7 area. The Summary Operation Maintenance and Monitoring Plan (Appendix C of the RAP) has been modified to show this change. A track changes version of the appendix text and Figure C-2 showing this change are attached. Reference to the sampling program has also been deleted from the main text of the RAP.

MDEQ Technical Comment 3

Figure 2-5 of the RAP must include a notation for the former railyard area, the previous metal feedstock area, and the Saginaw River berm whereby the vegetation in those areas must be maintained at more than 50% cover in order to prevent the inhalation of hazardous substances present in the surface soil.

Response

Agreed. Figure 2-5 has been revised as requested and is provided as an attachment to this letter.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

MDEQ Technical Comment 4

On page 3-5 of the RAP, the list should include the parking lot north of the buffer basin. The Former DRA Hillock Area was included twice on the list.

Response

Agreed. The requested edit has been made, and is shown in the attached track changes version of the RAP text.

MDEQ Technical Comment 5

It is indicated, on page 2-16 and Figure 2-5 of the RAP, that intrusive activity and worker duration restrictions will be placed on the hillock area of the DRA. Appendix D does not include these restrictions for the DRA.

Response

The Restrictive Covenants contained in Appendix D have been revised, and are attached. The noted inconsistency has been corrected.

Richard Kowalski
LFR
Sep 17, 2009 18:39

MDEQ Restrictive Covenant Comment 1

It appears that GM revised the text of the RAP appropriately or provided sufficient explanation in their response to address the comments provided in the DEQ's May 15, 2006 letter.

Response

No response required.

MDEQ Restrictive Covenant Comment 2

Throughout the RAP, and specifically in the LPG's response to MDEQ comment 1 on page 6 of their July 30, 2008 letter, the volatile organic compounds identified in the groundwater at the DRA Hillock area are being attributed to an off-site source and are not being monitored as part of the RAP. The RAP must include an affidavit of unremediated release pursuant to R299.5534 to satisfy this RAP requirement. (As I

Confidential under FOIA
Richard Kowalski
LFR

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

indicated above, I believe the Queen St Dump and the dioxin are also subject to this requirement.)

Response

Affidavits of Unremediated Release(s) will be submitted for each of the areas above with the final Remedial Action Plan. In addition, impacts to groundwater from the adjacent Delphi property in the area northwest of the Green Point Landfill will also be addressed in this way.

MDEQ Restrictive Covenant Comment 3a

In the restrictive covenant (RC) for the 150.97 acre GM-Saginaw Malleable Iron Plant Property it is difficult to match up the specific restrictions proposed in the RC with the appropriate survey designating the area of the property that each restriction applies, specifically:

a. Exhibit 1 gives the legal description for but does not provide a survey for this Property. Exhibit 2, that is suppose to designate "those portions of the Property (defined earlier as the 150.97 acre parcel) that are subject to the land and resource use restrictions specified herein", uses a base survey for the entire 321.38 acre property. This is inconsistent with the text of the RC and legal description provided in Exhibit 1 and makes it difficult to determine where the restrictions set forth in Paragraphs 1, 2a and 2b of the RC apply.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Response

The Restrictive Covenants (RAP Appendix D) have been revised to make it easier for the reader to understand the specific restrictions placed on each area of the site. The revised Restrictive Covenants are attached. You are correct that a combined field survey of the Saginaw Malleable Iron Plant, Green Point Landfill, and Eastern Property Extension was provided in the RAP. We understand that despite having the separate legal descriptions of each property, and a map showing the general locations and type of restrictions, you also require a separate survey map for each individual property. We will provide the additional survey maps in the final RAP.

Sep 17, 2009 18:39

MDEQ Restrictive Covenant Comment 3b.

b. Paragraph 1 on page 3 of the RC does not describe which "specific portions of the Property" depicted in Exhibit 2 are subject to the commercial and industrial land use restriction. This paragraph should be revised to specifically list all those areas depicted in Exhibit 2 (e.g. Melting Department Area, Former Railyard Area) where the land use restriction applies.

Response

The limited Industrial and limited Commercial II, III, and IV categories for land use apply to the entire property with the exception of the Former Railyard and the LNAPL Assessment and Remediation Area. In these two areas of the property, future use is restricted to limited Industrial and limited Commercial II, due to the presence of lead. The Restrictive Covenant has been revised to clarify these restrictions.

MDEQ Restrictive Covenant Comment 3c

c. Paragraph 2b on page 4 of the RC should include the Exhibit No. that depicts the areas subject to the restriction provided for in the paragraph.

Response

Agreed. We have added the requested reference.

MDEQ Restrictive Covenant Comment 3d

d. I could not find a survey in Exhibit 5 that delineates the Former UST # 7 area. This needs to be added. Paragraph 2d on page 5 of the RC should be revised to include the name of the designated area in the sentence that reads "no new enclosed structure suitable for short or long term human habitation shall be constructed on the Property in the area delineated in Exhibit 5 as the Former UST #7 Area…"

Response

A survey of the former UST 7 area will be provided in the final RAP. The requested reference to the site area has also been added to the Restrictive Covenant (attached).

Sep 17, 2009 18:39

MDEQ Restrictive Covenant Comment 3e

e. The third sentence in Paragraph 2h on page 6 of the RC states "Activities in this area of the Property are restricted…," but does not designate the name of the area or provide an Exhibit No. for reference to a survey. The same paragraph also states that "Areas requiring work duration restrictions are shown in Exhibit 6", but when you refer to Exhibit 6 it also includes the surveys for Exhibits 4 and 5. It is unclear which areas are supposed to be included in Exhibit 6, one or all. For clarity, the surveys for Exhibits 4, 5 and 6 should be separated and it should be clear in each restriction the name of the area where the restriction apples and in what exhibit the survey can be located.

Response

The Restrictive Covenants have been revised to clearly identify the specific restrictions on each area. Each area is also now shown in a separate Exhibit for clarity.

Richard Kowalski
LFR
Sep 17, 2009 18:39

MDEQ Restrictive Covenant Comment 4a

(4) Similar to comment 3 above, in the RC for the 122.23 acre REALM, Inc. property it is difficult to match up the specific restrictions proposed in the RC with the appropriate survey designating the area of the property that each restriction applies, specifically:

a. Exhibit 1 gives the legal description for a 122.23 acre parcel of land, but does not provide a survey for this Property. Exhibit 2, that is suppose to designate "those portions of the Property (defined earlier as the 122.23 acre parcel) that are subject to the land and resource use restrictions specified herein", uses a base survey for the entire 321.38 acre property. This is inconsistent with the text of the RC and legal description provided in Exhibit 1 and makes it difficult to determine where the restrictions set forth in Paragraphs 1, 2a, 2b and 2c of the RC apply.

Response

As described in the response to Comment 3a, above, a separate survey map of the whole REALM Green Point Landfill property will be prepared, in addition to the individual survey maps of the Green Point Landfill and the Former Hillock Area of the

Sep 17, 2009 18:39

Drum Remediation Area that were previously provided. The restrictive covenants have also been revised to clearly identify each restricted area.

MDEQ Restrictive Covenant Comment 4b

b. Paragraph 1 on page 3 of the RC does not describe which "specific portions of the Property" depicted in Exhibit 2 are subject to the commercial and industrial land use restriction. This paragraph should be revised to specifically list all those areas depicted in Exhibit 2 (e.g. Terminated Green Point Landfill, Former Hillock Area) where the land use restriction applies.

Response

Agreed. Clarification that the restriction applies to the entire property has been added to the revised Restrictive Covenant.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

MDEQ Restrictive Covenant Comment 4c

c. It is not clear in Paragraph 2b on page 4 of the RC if the restriction applies to the entire Property or just specific areas of the Property that contain contaminated subsurface soils that may result on exposures exceeding the applicable exposure criteria identified in the RAP. If the restriction applies to the entire Property, then the text must be revised to clarify this condition. If the restriction only applies to specific areas of the Property, then those areas must be defined, surveyed separately and referenced to the appropriate exhibit that contains the survey of the area.

Response

The areas of restriction have been clarified in the revised Restrictive Covenants.

MDEQ Restrictive Covenant Comment 4d

d. It is not clear in Paragraph 2d on page 4 of the RC if the restriction on subsurface footings and utilities applies to the entire Property or just specific areas of the Property. Please clarify in the text.

Response

The areas of restriction have been clarified in the revised Restrictive Covenants.

Sep 17, 2009 18:39

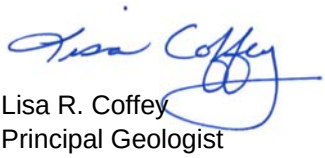
MDEQ Restrictive Covenant Comment 5



(5) The RCs for the 48.18 acre REALM, Inc. East property and the property immediately east and south of the GM-Saginaw Malleable Iron Plant do not contain surveys for Exhibit 2. They instead reference a survey contained in Appendix G of the RAP that includes a survey of the entire 321.38 acre property that does not specifically portray the distinct parcels referenced in these 2 RCs. The RCs must be revised to include separate and distinct surveys for the parcels of property each RC is being recorded.

Response

Agreed. As described above, separate survey maps will be prepared for each property, and will be included in the final RAP, in addition to the legal descriptions already provided.

Sincerely,

ARCADIS

Lisa R. Coffey
Principal Geologist

February 27, 2009

Ms. Cheryl Hiatt
GM Remediation Team
30200 Mound Road
MC: 480-11-W60
Warren, Michigan 48090

Dear Ms Hiatt:

SUBJECT: Approval of a Limited Remedial Action Plan (RAP) for the Saginaw Malleable Iron/Green Point Landfill Site, Saginaw County, Michigan; Site ID No. 82000213

The Department of Environmental Quality (DEQ), Remediation and Redevelopment Division (RRD), has reviewed the RAP for the Saginaw Malleable Iron/Green Point Landfill Site (Facility) dated July 30, 2008, and subsequent modifications set forth in a letter from ARCADIS to Ms. Sue Kaelber-Matlock of the DEQ dated December 31, 2008. The RAP was prepared by ARCADIS on behalf of the General Motors Corporation (GM), the Remediation and Liability Management Company, Inc., and Waste Management, Inc. (WMI), commonly referred to as the liable party group (LPG). The RAP was prepared and submitted to the DEQ pursuant to Consent Judgment No. 98-22686-CE-2 (Consent Judgment), entered on March 16, 1998, between the Department of Attorney General (DAG), the DEQ, GM, and WMI. The RAP has been reviewed by DEQ staff pursuant to Part 201[1] and the Consent Judgment.

Based upon our review, the RAP for the Facility is approved subject to the following conditions being met:

(1) By June 1, 2009, the LPG must complete and submit Affidavits for Unremediated Release(s) as required by Rule 299.5534 of the Part 201 Administrative Rules for the hazardous substance releases listed below that are not being addressed by the LPG as part of the RAP.

- Hazardous substance releases associated with the former city of Saginaw Queen Street waste disposal area.
- Dioxin compounds that have come to be located in Tittabawassee and Saginaw River sediments, and associated river floodplain areas, that are attributed to releases from the Dow Chemical Company manufacturing facility located in Midland, Michigan.
- Hazardous substance releases attributed to the former Saginaw Steering Gear Plant #2 facility.
- Hazardous substance releases associated with improper waste disposal practices on property located to the west of the former drum disposal portion of the Facility.

[1] Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA).

Sep 17, 2009 18:39

(4) The LPG shall submit annual progress reports in accordance with Section XVI of the Consent Judgment and Section 3.18.3 of the RAP.

The DEQ acknowledges that the proposed schedule for recording the restrictive covenants constitutes a modification to the RAP and is hereby requesting the LGP's written agreement to this modification pursuant to Paragraph 18.1 of the Consent Judgment. Please provide the LPG's written agreement regarding the acceptability of this schedule within thirty (30) days of receipt of this letter, or provide a reasonable alternate schedule for consideration by the DEQ. DEQ approval of the RAP is subject to our concurrence on a mutually acceptable schedule for implementation of the remaining response activities required for the RAP.

The determinations presented in this letter are based on information currently known to the DEQ. The DEQ expresses no opinion as to other contaminants beyond those identified and remediated as a part of the approved RAP. The discovery of new information regarding environmental conditions or regulated substances at the Facility that is not known to the DEQ as of the date of this letter may result in a request by the DEQ for additional response activities consistent with the provisions of the Consent Judgment. The DEQ also makes no warranty as to the fitness of this site for any general or specific use, and prospective purchasers or users are advised to use due diligence prior to acquiring or using this site.

Please direct all correspondence and information requested in this letter, and any questions or concerns you may have, to: Ms. Sue Kaelber-Matlock, Project Manager, RRD, Saginaw Bay District Office, at 989-894-6249; by mail to the Remediation & Redevelopment Division, Saginaw Bay District Office, 401 Ketchum Street, Bay City, Michigan 48708; or by email to MATLOCKS@michigan.gov.

RE: Request to Extend the Schedule proposed in the February 27, 2009 MDEQ RAP Approval Letter For Green Point Landfill/Saginaw Malleable Iron Plant Site, Saginaw, MI

Dear Ms. Matlock:

The Site responding parties (composed of General Motors Corporation(GM), Remediation and Liability Management, Inc (REALM), Environmental Corporate Remediation Company, Inc. (ENCORE), and Waste Management, Inc. (WMI)), referred to in this letter as the Group, are in receipt of Michigan Department of Environmental Quality's (MDEQ's) letter approving the Remedial Action Plan (RAP) for the Green Point Landfill/Saginaw Malleable Iron (SMI) Site (Site), located in Saginaw, Michigan, pursuant to the Consent Judgment No 98-22686-CE-2 with the State of Michigan. We understand and will be able to meet the June 1, 2009 deadline for submitting the following 4 Affidavits of Unremediated Release to MDEQ for those environmental releases not being addressed by the RAP:

1) Releases associated with the City of Saginaw former Queen Street Dump;
2) Dioxin contamination in the sediment and floodplain areas of the Site related to the Dow Chemical release in Midland, Michigan;
3) Releases attributed to the Saginaw Steering Gear Plant #2 facility; and
4) Releases associated with improper waste disposal practices on property located west of the former drum disposal portion of the Site.

We will also meet the June 1, 2009 deadline for completing and submitting the remaining surveys for the restrictive covenants for the Site to MDEQ. However, we would like to have an extension on filing the restrictive covenants themselves. As you probably know, GM is in the process of working through loan requirements from the United States government and we have not yet worked out what notifications and review we are required to go through when placing restrictive covenant on government mortgaged property. We would like to request an extension of two months in order to work through our loan requirements.

We would also like to request an extension of two months for the submittal of the Financial Assurance Mechanism (FAM) to work out notification and review requirements for commitment of money, under the loan agreement.

The Group will submit annual progress reports in accordance with Section XVI of the Consent Judgment and Section 3.18.3 of the RAP.

The Group appreciates the consideration of MDEQ in these above schedule modifications and would also like to discuss a schedule for completing the well abandonments for this Site. We have already completed some abandonments, but would like to complete the rest of the well abandonments in the summer of 2010. We will place permanent markers and marker posts in accordance with Section 3.16 of the RAP within 60 days of receiving the recorded restrictive covenants from the Saginaw Register of Deeds Office.

Please feel free to call me at 313-510-4328 should you wish to discuss any of the above or have questions.

Sincerely,

Cheryl R. Hiatt

30200 Mound Road
Warren, Michigan 48090

Dear Ms. Hiatt:

SUBJECT: Schedule Extension Request
Saginaw Malleable Iron/Green Point Landfill Site, Saginaw County
Site ID No. 82000213

By letter dated March 27, 2009 (Letter), the Liable Party Group (LPG) for the Saginaw Malleable Iron/Green Point Landfill Site (Facility) acknowledged receipt of the Department of Environmental Quality (DEQ) February 27, 2009 letter (Approval Letter) approving with conditions the remedial action plan (RAP) for the Facility under the provisions of Consent Judgment No. 98-22686-CE-2 (Consent Judgment) and Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended, and the Part 201 Administrative Rules. In the Approval Letter the DEQ recommended a schedule for completing remaining response actions in satisfaction of the DEQ conditions for approval.

In its Letter the LPG requested an extension of two months for the filing of the restrictive covenants and for submittal of the financial assurance mechanism. The DEQ concurs with the reasons presented by the LPG and therefore concurs with the extension request. With this concurrence the following represents the revised schedule dates:

- Submittal of the FAM for DEQ review and approval - August 7, 2009
- Filing restrictive covenants - August 28, 2009

The DEQ also concurs with the LPG proposal to fully complete well abandonment during the summer of 2010.

As stipulated in the Approval Letter it is important that a mutually acceptable schedule for implementation of the remaining RAP response actions is maintained between the LPG and the DEQ, and complied with. In this regard, please contact me as soon as possible regarding any events, issues, or occurrences that may affect final RAP implementation schedules and response actions.

Dear Ms. Matlock:

The attached *Affidavits of Unremediated Release(s)* have been prepared on behalf of the General Motors Corporation (GM) as requested in your November 21, 2008, electronic mail transmittal to Ms. Cheryl Hiatt of GM. Your correspondence provided preliminary comments on the July 30, 2008, Remedial Action Plan (RAP) prepared for the Saginaw Malleable Iron Plant Property, and the Green Point Landfill and Drum Remediation Area, in Saginaw, Michigan. The attached affidavits compose Attachment 2 of the revised RAP, and are being submitted according to the schedule established in a February 27, 2009 letter from Mr. Andrew Hogarth (MDEQ) to Ms. Hiatt. Additional survey data are being transmitted separately. Please contact me if you have any questions regarding the enclosed information.

Dear Ms. Matlock:

The attached survey information has been prepared on behalf of the General Motors Corporation (GM) as requested in your November 21, 2008, electronic mail transmittal to Ms. Cheryl Hiatt of GM. Your correspondence provided preliminary comments on the July 30, 2008, Remedial Action Plan (RAP) prepared for the Saginaw Malleable Iron Plant Property, and the Green Point Landfill and Drum Remediation Area, in Saginaw, Michigan. The attached survey information completes the Restrictive Covenants contained in Appendix D of the revised RAP, and is being submitted according to the schedule established in a February 27, 2009, letter from Mr. Andrew Hogarth (MDEQ) to Ms. Hiatt. The following survey items are enclosed:

- Saginaw Malleable Iron Plant Property (survey map);
- Former UST 7 Area (survey map and legal description);
- Green Point Landfill Property (survey map);
- REALM Inc. Eastern Property Extension (survey map);
- Former Consumers Property (survey map).

Affidavits of Unremediated Release(s) are being transmitted separately. Please contact me if you have any questions regarding the enclosed information.

MICHIGAN DEPARTMENT OF ENVIRONMENTAL QUALITY

AFFIDAVIT TO SUPPORT UNREMEDIATED RELEASE(S) IN A REMEDIAL ACTION PLAN

(Under the authority of Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 Act 451, as amended), and the Part 201 Administrative Rules promulgated thereunder)

STATE OF Michigan

COUNTY OF Saginaw

The purpose of this Affidavit is to set forth certain information and documentation to enable the Michigan Department of Environmental Quality (hereinafter, the "MDEQ") to make the determinations pursuant to R 299.5534 (hereinafter, "Rule 534") of the Part 201 Administrative Rules (hereinafter, the "Part 201 Rules") promulgated under Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (hereinafter, the "NREPA"). All terms found in this document which are defined in Part 3, Definitions, and Part 201 of the NREPA; and the Part 201 Rules, shall have the same meaning as in the statute and the Part 201 Rules.

The undersigned Affiant, being first duly sworn, deposes and says as follows:

1. THIS AFFIDAVIT is executed by the undersigned, William McFarland, whose title is, Director of Remediation, on behalf of the General Motors Corporation, and President, on behalf of the Remediation and Liability Management Company (hereinafter, "the Affiant") located at Engineering Center - West, Mail Code 480-111-W60, 30200 Mound Rd, Warren, MI 48090.

2. This Affidavit accompanies a Remedial Action Plan ("the RAP") prepared on behalf of the Affiant for the following properties: Saginaw Malleable Iron Property, and REALM, Inc. Green Point Landfill and Drum Remediation Area. The legal description is provided in Attachment 1.

3. The properties referred to in Item Number 2 are associated with a "Facility" as defined in Section 20101(1)(o) of the NREPA.

4. The RAP precisely describes the unremediated release at the Facility. "Unremediated release" means a release for which response activity has not been implemented that satisfies the remedial action requirements of Part 201 of the NREPA and the Part 201 Rules.

5. The Affiant is not liable for the unremediated release associated with improper waste disposal practices on property located to the west of the former Drum Remediation Area, as identified in the RAP.

6. Attached to this Affidavit is information that explains and supports the basis for the conclusion that the Affiant is not liable for the environmental contamination proposed to be omitted from remediation in the RAP.

7. Attached to this Affidavit is documentation that demonstrates divisibility of harm and apportionment of liability as required by Section 20129 of the NREPA.

8. The Affiant acknowledges and agrees to all of the following:

   a. If the MDEQ approves the RAP referenced in Item Number 4 relying on representations about liability that are set forth in this Affidavit, the ability of the MDEQ to subsequently review the liability of the Affiant is not limited or affected by reliance on the Affidavit or approval of the RAP. Upon review of the Affidavit, supporting materials and other information available to the MDEQ at any time, the MDEQ may determine that Affiant is liable for any or all of the contamination omitted from remediation under the RAP, or that the Affiant has not met the burden of demonstrating divisibility of harm and apportionment of liability under Section 20129 of the NREPA.

   b. If the MDEQ later finds the Affiant to be liable for the Facility or to have failed to establish divisibility of harm and apportionment of liability as required by Section 20129 of the NREPA, the Affiant shall promptly undertake remedial action to address that portion of the Facility not covered by the RAP.

   c. A person who is liable who undertakes a remedial action that he or she knows will not, when complete, comprehensively address all contamination at a facility at the time the remedial action is undertaken, except as provided for in R. 299.5534 for unremediated releases, is subject to fines and penalties as provided for under Part 201 of the NREPA for failure to diligently pursue response activity under Section 20114(1)(g) of the NREPA, as well as other applicable state or federal laws.

   d. Response activity undertaken by a person who is liable that does not comprehensively address all contamination at a facility, except unremediated releases addressed through the procedure set forth in R.299.5534, is considered an interim response and not a remedial action.

I affirm that the above representations are true and are based upon my personal knowledge and belief after all reasonable inquiry.

I certify that I am legally authorized to execute this Affidavit and to bind the Affiant to the terms and conditions of this Affidavit.

I understand that intentionally submitting false information to the MDEQ is a felony and may result in fines of up to $25,000 for each violation.

I acknowledge that this Affidavit has been provided pursuant to Rule 534 of the Part 201 Rules.

LEGAL DESCRIPTION OF SITE

The Site encompasses approximately 273 acres, and consists of the Saginaw Malleable Iron (SMI) Plant Property and the REALM Green Point Landfill and Drum Remediation Area (DRA) Property, as shown on Figures 1-1 and 1-2 in the Remedial Action Plan. The SMI Plant Property makes up the northern portion of the Site and includes the inactive SMI Plant and support facilities, including two closed Type III Landfills, two stormwater ponds, and an inoperative Water Recycle System. Foundry operations previously conducted at the SMI Plant consisted of activities related to the casting and heat treating of iron. The southern portion of the Site (now owned by REALM, Inc.) includes the closed Green Point Landfill and the DRA, where drums were previously discovered, excavated, and removed.

The Site is located approximately 1,500 feet north of the confluence of the Tittabawassee and Shiawassee Rivers and is located on the western half of Section 35, T12N, R4E, in the city of Saginaw, Saginaw County, Michigan. A legal description of the SMI Plant Property and the REALM Green Point Landfill and Drum Remediation Area Property is provided below.

During completion of the Remedial Investigation, elevated concentrations of volatile organic compounds (VOCs) were detected in a groundwater sample in the former Drum Remediation Area Hillock Area, located in the southwest corner of the Green Point Landfill property. Through the course of investigation, a drain tile from the adjacent property was located and sampled, confirming that the detected constituents were present in water draining from the neighboring property, which is believed to have been used for waste disposal activities. The neighboring property currently contains scattered debris and scrap vehicles that are visible at the ground surface. The sections of the Remedial Investigation Report that detail the investigation completed in this area follow.

4.5.1.3 Soil Sampling for Appendix IX Parameters

On February 8, 1995 one native soil sample was collected and analyzed for Appendix IX constituents from soil boring MW-126WT, located in the Former Hillock Area of the DRA. The native soil sample was collected from soil boring MW-126WT at a depth interval of 14 to 16 feet bgs. Analytical results are presented in Tables 4-67 through 4-71.

Organic Compounds

No generic IDWP, IDC, GCCP, or CSAT values for VOCs were exceeded in the sample collected from MW-126. SVOCs, dioxins, furans, PCBs, pesticides, and herbicides were not detected above the laboratory detection limits for soil sample MW-126WT.

Inorganic Constituents

The generic IDWP value for cobalt (2,000 ug/kg) was exceeded in the sample collected from MW-126 (9,370 ug/kg).

4.5.1.4 Former Hillock Area Soils Removal

Soils from the Hillock Area of the DRA were removed in February 1997. Excavation of the DRA Hillock was completed on February 6, 1997. Details relating to these excavation efforts were transmitted to the state in the March 18, 1997 monthly report (Saroff, March 1997). A total of 27,125 cubic yards of soil were removed from the Hillock Area and placed within the Green Point Landfill. In addition, five drums from the Hillock Area were located within the excavated materials. The drums were sampled, and shipped off site for appropriate disposal by GM.

4.5.1.5 Wetland Mitigation Area Soil and Groundwater Investigation

Due to construction of the Green Point Landfill cap, which extended over adjacent wetland areas, GM proposed several on-site wetland mitigation areas. To address soil quality in the proposed mitigation areas, soil samples were collected from six soil boring locations. The soil samples were analyzed for TCL VOCs, SVOCs, PCBs, and TAL inorganic constituents. A summary of laboratory analytical data is presented in Tables 4-67 to 4-71.

Groundwater samples were collected from two temporary monitoring wells to investigate groundwater quality in the proposed wetland mitigation area. The groundwater samples were analyzed for TCL VOCs, SVOCs, total and dissolved PCBs, and dissolved TAL inorganic constituents. A summary of laboratory analytical data is presented in Tables 4-21, 4-27, 4-31, and 4-44, and the data are discussed below.

Organic Compounds

Cis-1,2-dichloroethene was the only VOC detected in soils. It was detected at one location, WMB-1 (3 – 3.5'), at a concentration of 7.4 ug/kg. Several SVOCs, primarily PAHs, were detected in soils at several locations (WMB-1, WMB-2, WMB-3, and WMB-4). No PCBs were detected in soil samples from WMB-1 through WMB-6.

Chlorinated VOCs (cis-1,2-dichloroethene, trichloroethene, and vinyl chloride) were detected in the groundwater sample from TWW-1. These concentrations exceed the generic MDEQ IDW criteria for cis-1,2-dichloroethene (70 ug/L), trichloroethene (5.0 ug/L), and vinyl chloride (2.0 ug/L). The GCC for vinyl chloride (570 ug/L) was also exceeded at this location. No SVOCs or PCBs were detected in groundwater samples from TWW-1 or TWW-2.

Richard Kowalski
LFR
Sep 17, 2009 18:39

The groundwater analytical data prompted additional investigation, and is discussed in Section 4.5.1.6.

Inorganic Constituents

No generic GCCP or IDC values for inorganics were exceeded in soil samples. Summary statistics of the inorganic constituents detected above the higher of the generic IDWP values and the SDBLs are presented below.

DRUM REMEDIATION AREA – WETLAND MITIGATION AREA SOIL SAMPLES					
Inorganics	Number of Times			Concentration Range (ug/kg)	Generic IDWP Criteria (ug/kg)
	Analyzed	Detected	Exceeded		
Aluminum	6	6	6	4,480,000 – 14,700,000	4,300
Cobalt	6	1	1	ND – 7,820	6,800
Iron	6	6	2	6,280,000 – 44,600,000	12,000,000
Manganese	6	6	1	114,000 – 1,170,000	440,000

Notes:
ND = Not detected.
Refer to Subsurface Soil Analytical Data Tables for MDEQ criteria qualifiers.
Site-specific background values have been substituted for MDEQ criteria for cobalt, iron, and manganese.

Three inorganic constituents were detected in groundwater from TWW-1 and/or TWW-2. No generic GCC criteria values were exceeded for these samples. The generic IDW criteria for manganese and sodium were exceeded at TWW-1. The generic IDW criteria for thallium was exceeded at TWW-2 during two sampling events (Figure 4-17).

Sep 17, 2009 18:39

4.5.1.6 Supplemental Groundwater Investigations

The detection of chlorinated VOCs in groundwater at TWW-1 prompted additional groundwater investigation in the DRA. Results of these additional investigations are presented in Table 4-72 .

In August 1998, two new temporary monitoring wells (TW-241WT and TW-242) were installed along the western property boundary, upgradient of temporary well TWW-1. Groundwater samples were collected from the two new wells and from TWW-1, and analyzed for TCL VOCs. As shown on Figure 4-20, VOCs were not detected at the northern-most well (TW-241WT). At the second new well, 1,2-dichloroethene was detected at a concentration of 1.5 ug/L, a concentration significantly lower than the total VOC concentration of 622 ug/L previously detected at MW-126WT to the south along the property boundary.

Groundwater samples were collected from ten additional temporary well points placed in the vicinity of TWW-1 in May 1999. The analytical data are show in Table 4-72 and on Figure 4-20. Summary statistics of the constituents detected above the IDW criteria during the initial Wetland Mitigation Area investigation and the supplemental groundwater investigations are presented below.

DRUM REMEDIAITON AREA – SUPPLEMENTAL GROUNDWATER INVESTIGATIONS					
VOCs	Number of Times			Concentration Range (ug/L)	Generic IDW Criteria (ug/L)
	Analyzed	Detected	Exceeded		
1,1-Dichloroethene	17	1	1	ND – 51	7.0
1,2-Dichloroethene, Total	15	8	5	ND – 11,000	70
Methylene chloride	17	3	3	ND – 54	5.0
Trichloroethene	17	1	1	ND – 630	5.0
Vinyl chloride	17	12	10	ND – 2,300	2.0

Notes:
Refer to DRA Groundwater Analytical Data Tables for MDEQ criteria qualifiers.

4.5.1.7 Supplemental Test Pit Investigation

In August 2000, a test pit program was initiated in the vicinity of temporary monitoring well TWW-1 to look for a possible point source for the VOCs detected in groundwater. Test pits were completed radially outward from TWW-1, as shown in Figure 4-20. A drain tile was found extending in an east-west direction from the adjacent junkyard property and passing approximately 10 feet south of TWW-1. No fill or waste materials were observed in any of the test pits. Survey data demonstrated a grade within the drain tile from west to east, and flow within the tile was observed. Water samples were collected from the up- and down-stream sections of the tile, and analyses were completed for VOCs, PCBs, and inorganic constituents. The constituents detected in the drain tile samples are the same as those detected at TWW-1. The analytical data are shown in Tables 4-73 through 4-75.

LFR
Sep 17, 2009 18:39

Organic Compounds

Chlorinated VOCs (1,1-dichloroethane, cis-1,2-dichloroethene, and vinyl chloride) were detected in water samples collected from upstream and downstream sections of the drain tile. No generic GCC, FESL, or WSSL values were exceeded in these samples. The concentration of cis-1,2-dichloroethene in the downstream sample (170 ug/L) exceeded the generic MDEQ IDW criteria (70 ug/L). The concentrations of vinyl chloride in both the upstream (37 ug/L) and downstream (80 ug/L) sections of the drain tile exceeded the generic MDEQ IDW criteria (2.0 ug/L).

PCBs were not detected in unfiltered water from either the upstream or downstream section of the drain tile.

Inorganic Constituents

No generic GCC values for inorganics were exceeded in the drain tile samples. The generic IDW criteria for dissolved manganese (2,100 ug/L) was exceeded in both the upstream (5,730 ug/L) and downstream (2,810 ug/L) drain tile samples.

4.5.2 Green Point Landfill Leachate Assessment

To assess the need for a leachate management plan for the Green Point Landfill, groundwater and leachate analytical data for samples collected from monitoring wells located within or in close proximity to the Landfill were evaluated. Results of the Leachate Assessment may be found in the *Combined CEDR and 35 Percent Design Report* submitted to the MDEQ in February 1996 (BBL, February 1996). A summary of this evaluation is presented below, updated based on revised MDEQ criteria.

6.2.2 Site Interior

Drum Remediation Area

Soil samples were collected from test pits that were located in the DRA Hillock. Analyses indicated VOCs, SVOCs, and PCBs in one or more samples at concentrations exceeding the MDEQ generic IDC criteria. The soil and fill that comprise the DRA Hillock were excavated and placed within the fill materials of the Green Point Landfill prior to capping.

One monitoring well (MW-126WT) was installed within the DRA Hillock Area, and additional monitoring wells were installed along the southern perimeter of the site, just south of the DRA. Groundwater collected from monitoring well MW-126WT was found to contain VOCs (vinyl chloride, cis-1,2-dichloroethene, and TCE), and one SVOC (bis[2-ethylhexyl]phthalate) at concentrations above the generic RDW criteria. This well was screened within the fill materials that have since been excavated and moved to the Green Point Landfill. The former well location is also hydraulically downgradient of a junkyard located on the adjacent property. Groundwater samples collected from the monitoring wells located along the downgradient southern perimeter of the area were found to contain only iron at concentrations above criteria. VOCs were detected at a shallow temporary well installed north of the former DRA hillock. A series of groundwater samples were collected from locations surrounding the temporary well. A test pit program was subsequently implemented to look for the source of the VOCs detected at the temporary well and surrounding groundwater sample locations. During the test pit program, a concrete drain tile was found that extends from the neighboring junkyard property, passing approximately 10 feet south of the temporary monitoring well. Flow within the pipe is from west to east, onto the REALM property. The drain tile was sampled at the property boundary and at a location south and east of the temporary well. The same group of VOC constituents previously detected at the temporary well were detected in water samples obtained from the pipe (both upstream and downstream samples). These results indicate migration of VOCs to the site from an off-site source.

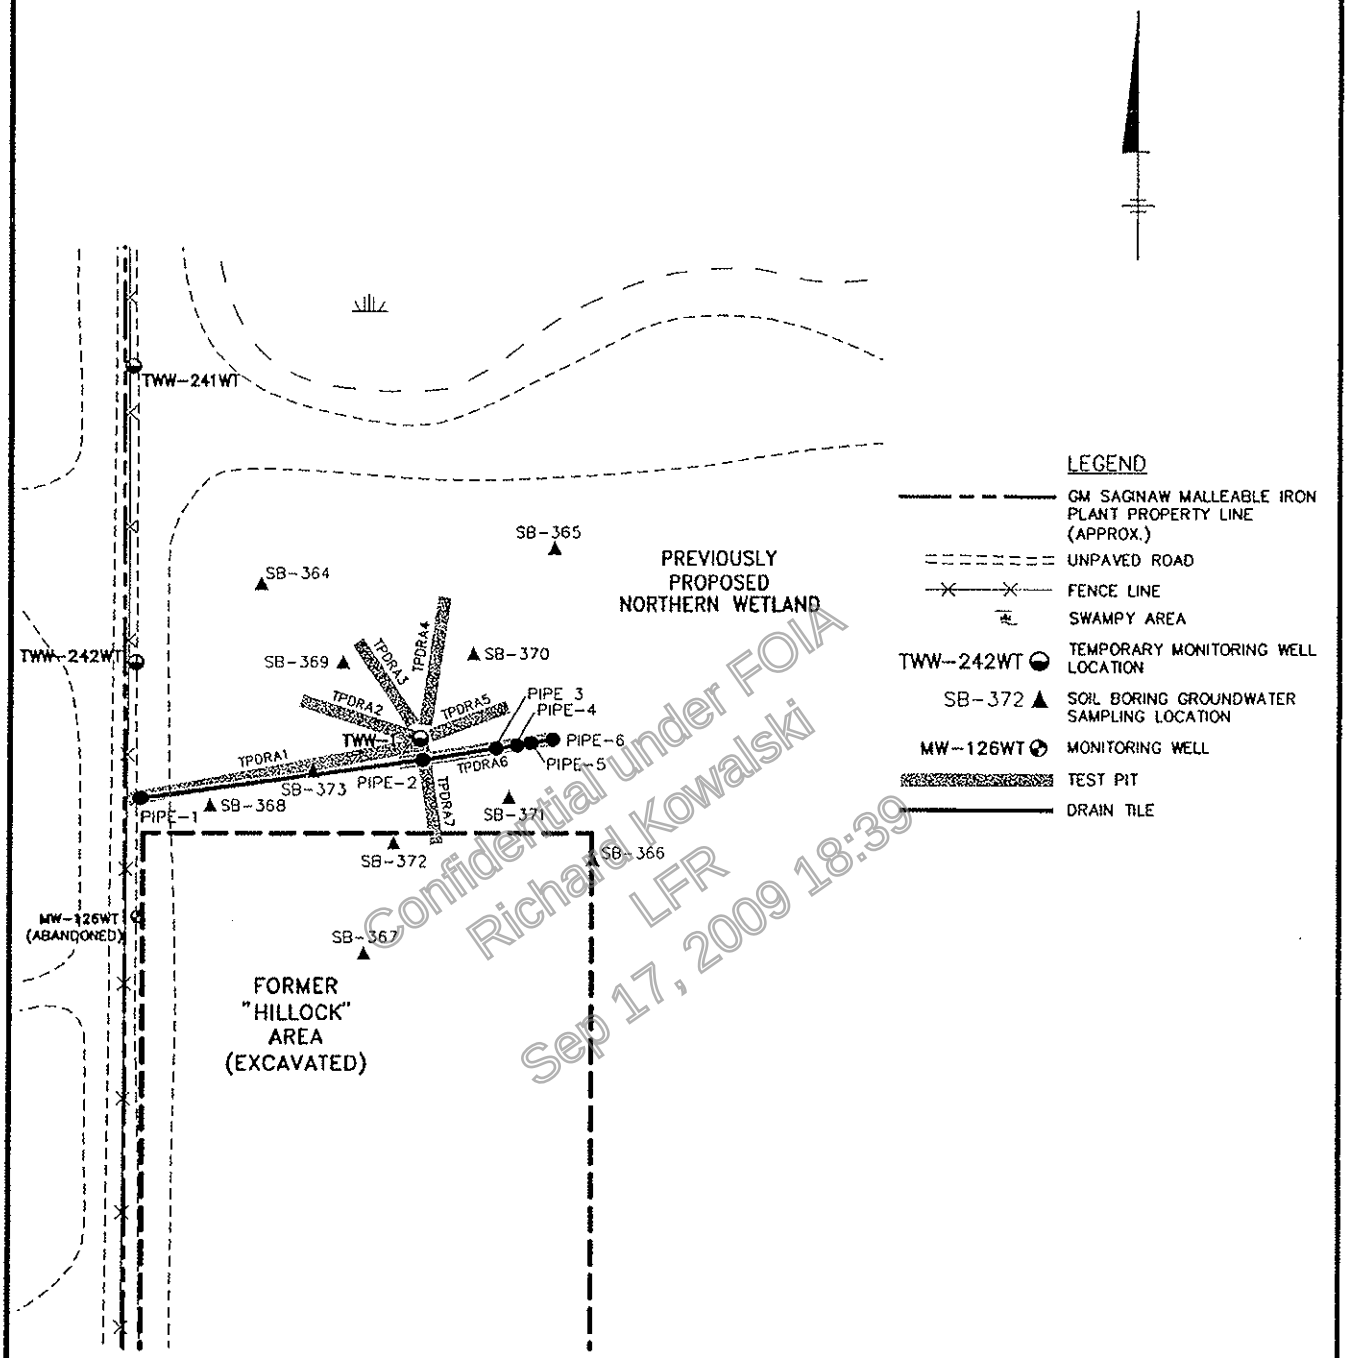
LFR
Sep 17, 2009 18:39

Green Point Landfill



Samples were collected of the leachate within the Green Point Landfill and groundwater samples were collected from locations immediately below and surrounding the landfill. The following constituents were detected at concentrations above generic IDW criteria: benzene, 1,4-dioxane, vinyl chloride, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, bis(2-ethylhexyl)phthalate, PCB Aroclors 1242 (within leachate samples only), 1248, and 1254, manganese, sodium, iron, lead, aluminum, antimony, barium, magnesium, and nickel. The distribution of these constituents in the subsurface in the areas surrounding the landfill appears to be limited, with concentrations above criteria observed at wells screened within the landfill or at locations at the landfill perimeter. The landfill cap has been completed, limiting the infiltration of precipitation, with the anticipated result of reducing the hydraulic mound previously interpreted at the landfill. A post-closure groundwater monitoring program is being implemented.

Former UST # 7

Lead and BTEX constituents were detected in subsurface soil and groundwater in the immediate vicinity of the former UST #7. The subsurface impacts appear to be limited to a small area, and the natural attenuation processes of soil sorption and intrinsic biodegradation via methanogenesis and sulfate reduction are ongoing in the area, as discussed in the Former UST #7 Area, Supplemental Investigation Report (BBL, May 1997). An MDEQ-approved interim action consisting of monitored natural attenuation is being implemented in this area of the site.

MICHIGAN DEPARTMENT OF ENVIRONMENTAL QUALITY

AFFIDAVIT TO SUPPORT UNREMEDIATED RELEASE(S) IN A REMEDIAL ACTION PLAN

(Under the authority of Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 Act 451, as amended), and the Part 201 Administrative Rules promulgated thereunder)

STATE OF Michigan

COUNTY OF Saginaw

The purpose of this Affidavit is to set forth certain information and documentation to enable the Michigan Department of Environmental Quality (hereinafter, the "MDEQ") to make the determinations pursuant to R 299.5534 (hereinafter, "Rule 534") of the Part 201 Administrative Rules (hereinafter, the "Part 201 Rules") promulgated under Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (hereinafter, the "NREPA"). All terms found in this document which are defined in Part 3, Definitions, and Part 201 of the NREPA; and the Part 201 Rules, shall have the same meaning as in the statute and the Part 201 Rules.

The undersigned Affiant, being first duly sworn, deposes and says as follows:

1. THIS AFFIDAVIT is executed by the undersigned, William McFarland, whose title is, Director of Remediation, on behalf of the General Motors Corporation, and President, on behalf of the Remediation and Liability Management Company (hereinafter, "the Affiant") located at Engineering Center - West, Mail Code 480-111-W60, 30200 Mound Rd, Warren, MI 48090.

2. This Affidavit accompanies a Remedial Action Plan ("the RAP") prepared on behalf of the Affiant for the following properties: Saginaw Malleable Iron Property, and REALM, Inc. Green Point Landfill and Drum Remediation Area. The legal description is provided in Attachment 1.

3. The properties referred to in Item Number 2 are associated with a "Facility" as defined in Section 20101(1)(o) of the NREPA.

4. The RAP precisely describes the unremediated release at the Facility. "Unremediated release" means a release for which response activity has not been implemented that satisfies the remedial action requirements of Part 201 of the NREPA and the Part 201 Rules.

5. The Affiant is not liable for the unremediated release associated with the former City of Saginaw Queen Street (Center Street) waste disposal area, as identified in the RAP and described in Attachment 2.

6. Attached to this Affidavit is information that explains and supports the basis for the conclusion that the Affiant is not liable for the environmental contamination proposed to be omitted from remediation in the RAP.

7. Attached to this Affidavit is documentation that demonstrates divisibility of harm and apportionment of liability as required by Section 20129 of the NREPA.

Sep 17, 2009 18:39

8. The Affiant acknowledges and agrees to all of the following:

   a. If the MDEQ approves the RAP referenced in Item Number 4 relying on representations about liability that are set forth in this Affidavit, the ability of the MDEQ to subsequently review the liability of the Affiant is not limited or affected by reliance on the Affidavit or approval of the RAP. Upon review of the Affidavit, supporting materials and other information available to the MDEQ at any time, the MDEQ may determine that Affiant is liable for any or all of the contamination omitted from remediation under the RAP, or that the Affiant has not met the burden of demonstrating divisibility of harm and apportionment of liability under Section 20129 of the NREPA.

   b. If the MDEQ later finds the Affiant to be liable for the Facility or to have failed to establish divisibility of harm and apportionment of liability as required by Section 20129 of the NREPA, the Affiant shall promptly undertake remedial action to address that portion of the Facility not covered by the RAP.

   c. A person who is liable who undertakes a remedial action that he or she knows will not, when complete, comprehensively address all contamination at a facility at the time the remedial action is undertaken, except as provided for in R. 299.5534 for unremediated releases, is subject to fines and penalties as provided for under Part 201 of the NREPA for failure to diligently pursue response activity under Section 20114(1)(g) of the NREPA, as well as other applicable state or federal laws.

   d. Response activity undertaken by a person who is liable that does not comprehensively address all contamination at a facility, except unremediated releases addressed through the procedure set forth in R.299.5534, is considered an interim response and not a remedial action.

I affirm that the above representations are true and are based upon my personal knowledge and belief after all reasonable inquiry.

I certify that I am legally authorized to execute this Affidavit and to bind the Affiant to the terms and conditions of this Affidavit.

I understand that intentionally submitting false information to the MDEQ is a felony and may result in fines of up to $25,000 for each violation.

I acknowledge that this Affidavit has been provided pursuant to Rule 534 of the Part 201 Rules.

LEGAL DESCRIPTION OF SITE

The Site encompasses approximately 273 acres, and consists of the Saginaw Malleable Iron (SMI) Plant Property and the REALM Green Point Landfill and Drum Remediation Area (DRA) Property, as shown on Figures 1-1 and 1-2 in the Remedial Action Plan. The SMI Plant Property makes up the northern portion of the Site and includes the inactive SMI Plant and support facilities, including two closed Type III Landfills, two stormwater ponds, and an inoperative Water Recycle System. Foundry operations previously conducted at the SMI Plant consisted of activities related to the casting and heat treating of iron. The southern portion of the Site (now owned by REALM, Inc.) includes the closed Green Point Landfill and the DRA, where drums were previously discovered, excavated, and removed.

The Site is located approximately 1,500 feet north of the confluence of the Tittabawassee and Shiawassee Rivers and is located on the western half of Section 35, T12N, R4E, in the city of Saginaw, Saginaw County, Michigan. A legal description of the SMI Plant Property and the REALM Green Point Landfill and Drum Remediation Area Property is provided below.

A former public waste dumping area, referred to as the Queen Street Dump, was located in the vicinity of existing Center Street at the northern end of the Saginaw Malleable Iron Plant property, and extending off site to the north. Sanborn Fire Insurance Maps show a *"Dumping Ground"* in this area in 1950 and 1967 (Map #210). This dump was active prior to the development of modern waste management practices and laws enacted to control such activities and ensure protectiveness. This dumping area was not associated with any known GM activity or source, and was acquired through the purchase of land to expand the manufacturing facility. Once acquired by GM, the area was used as a landscaped entryway into the plant property. Aerial photos from 1970 show a newly constructed plant access driveway at the former location of Queen Street.

Subsurface investigations were conducted in this area during the Remedial Investigation, and waste materials were identified at depths of 13 to 17 feet, and were found to correlate with the presence of oil sheens on the water table. Key sections of the Remedial Investigation Report that detail the investigation completed in this area follow.

MONITORING WELLS - B-3 OIL SHEEN INVESTIGATION AREA					
VOCs	Number of Times			Concentration Range (ug/L)	Generic IDW Criteria (ug/L)
	Analyzed	Detected	Exceeded		
Benzene	16	12	6	ND - 10	5.0
Vinyl Chloride	16	2	2	ND - 31	2.0

Notes:
ND = Not detected.
Refer to Permanent Monitoring Well Analytical Data Tables for MDEQ criteria qualifiers.

No generic GCC, FESL, or WSSL values were exceeded in these samples.

Semivolatile Organic Compounds (Figures 4-7 and 4-9)

Select SVOCs were detected in groundwater samples from four of the monitoring wells (MW-143WT, MW-144WT, X-1A, and X-1CR) involved in the oil sheen investigation. No generic IDW, GCC, FESL or WSSL values were exceeded in these samples.

Polychlorinated Biphenyls (PCBs) (Figure 4-10)

PCBs were detected in unfiltered groundwater samples collected from monitoring wells in the X-1 cluster. PCBs exceeding generic IDW values are summarized below.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

MONITORING WELLS - B-3 OIL SHEEN INVESTIGATION AREA					
PCBs, unfiltered	Number of Times			Concentration Range (ug/L)	Generic IDW Criteria (ug/L)
	Analyzed	Detected	Exceeded		
Aroclor-1248	13	6	2	ND - 1.9	0.50
Aroclor-1254	13	1	1	ND - 1.1	0.50
Total Aroclors	13	6	2	ND - 3.0	0.50

Notes:
ND = Not detected.

PCBs were detected above generic MDEQ IDW criteria in unfiltered samples collected from monitoring wells X-1A and X-1B during the July 1995 sampling event. Concentrations of PCBs in these wells have decreased over time. Samples collected from monitoring wells X-1A and X-1B during the May 2000 sampling event had reported PCB concentrations of 0.13 ug/L and 0.097 ug/L, respectively.

No PCBs have been detected in filtered samples from the X-1 cluster. PCBs were not detected in unfiltered or filtered groundwater samples collected from the monitoring wells adjacent to the X-1 monitoring cluster that were included in the B-3 Oil Sheen Investigation.

4.5.9 Center Street Oil Sheen Investigation

The delineation of the Center Street oil sheens was completed through a series of monitoring well and soil boring installations conducted between January and June 1995 (see Section 2.2.8). The results of this investigation were

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

presented to the MDEQ in the *Center Street Oil Sheen Supplemental Investigation Report* (BBL, April 1997) and are summarized below.

Table 4-110 summarizes the monitoring wells, temporary wells and soil borings installed in the Center Street Area. The horizontal extent of the oil sheen is depicted on Figure 2-11, and shows the monitoring wells and borings at which oil sheens were observed in soil samples. The observed oil sheens are distributed in two areas along Center Street, one at the intersection between Center Street and the plant access road (MW-103 cluster, MW-145WT, and SB-315), and one further south along the plant access road (MW-104 cluster, MW-146WT, SB-319, SB-320, and SB-321). The vertical distribution of the oil sheens appears to correspond to the water table and the depth of the fill materials observed in this area. The oil sheens observed in the monitoring wells and soil borings were identified at depths ranging from 8 to 12 feet bgs. The water table depth observed during the installation of these wells and borings was typically about 12 to 13 feet bgs. Typically the fill materials present were encountered to depths ranging from 13 to 17 feet bgs.

4.5.9.1 Soil Boring Program

The analytical characterization of the oil sheens was performed using soil samples collected from soil borings SB-319 (14 to 16 feet bgs) and MW-145WT (7 to 17 feet bgs). Both soil samples were analyzed for TCL VOCs, TCL SVOCs, TCL PCBs, and an oil characterization scan by USEPA Method 8015A. The soil analytical results are summarized in Tables 4-111 through 4-113 for the parameters listed above.

Confidential under FOIA
Richard Kowalski
LFR
Sep 17, 2009 18:39

Volatile Organic Compounds

A detailed summary of the analytical results for the VOCs is presented in Table 4-111. Select VOCs were detected in both soil samples. No compounds exceeded the generic IDWP, GCCP, IDC, or CSAT values for VOCs.

Semivolatile Organic Compounds

A detailed summary of the analytical results for the SVOCs is presented in Table 4-80. Select VOCs were detected in both soil samples. No compounds exceeded the generic IDWP, GCCP, IDC, or CSAT values for SVOCs.

Polychlorinated Biphenyls (PCBs)

A summary of the analytical results for the PCBs is presented in Table 4-82. PCBs were not detected in either soil sample.

Oil Characterization

Results of the oil characterization scans for the soil samples indicated fingerprints closest to those of motor oil, but were inconclusive.

4.5.9.2 Well Installation Program

The analytical characterization of the oil sheens was performed using the first round of groundwater samples collected from the temporary and permanent monitoring well locations. The groundwater samples were analyzed for TCL VOCs; TCL SVOCs; and TCL PCBs. The groundwater analytical results are summarized in Tables 4-114 through 4-116 for the parameters listed above. At one location (MW-141WT), groundwater was analyzed for Appendix IX

Sep 17, 2009 18:39

compounds at the request of MDEQ. The groundwater results for Appendix IX compounds are also summarized in Tables 4-114 through 4-116.

Volatile Organic Compounds (Figures 4-2, 4-3, and 4-4)

The VOC results (Table 4-114) indicate that relatively low concentrations of select VOCs are present in groundwater samples from four monitoring wells: MW-103WT, MW-140WT, MW-145, and MW-146. No compounds exceeded the generic RDW/IDW, GCC, FESL, or WSSL values for VOCs.

Semivolatile Organic Compounds (Figures 4-2, 4-5, and 4-6)

SVOC results are summarized in Table 4-115. Select SVOCs were detected in fourteen of the wells included in the Center Street Investigation. Compounds exceeding the generic RDW/IDW values for SVOCs are summarized below.

MONITORING WELLS – CENTER STREET OIL SHEEN INVESTIGATION AREA					
PCBs	**Number of Times**			**Concentration Range (ug/L)**	**Generic IDW Criteria (ug/L)**
	Analyzed	**Detected**	**Exceeded**		
benzo(a)anthracene	37	1	1	ND - 5.3 J	5.0
benzo(b)fluoranthene	37	1	1	ND - 5.9 J	5.0
bis(2-ethylhexyl)phthalate	37	15	4	ND - 19	6.0
chrysene	37	1	1	ND - 7.0 J	5.0

Notes:
J = Estimated concentration.
ND = Not detected.
Refer to Center Street Analytical Data Tables for MDEQ criteria qualifiers.

Confidential under FOIA
Richard Kowalski

Sep 17, 2009 18:39

The generic GCC values for benzo(a)anthracene (5.0 ug/L), benzo(b)fluoranthene (5.0 ug/L), and chrysene (5.0 ug/L) were exceeded at TW-203WT; however, these PAHs were not detected at nearby permanent monitoring wells. These compounds tend to adsorb to particulate matter, and may be related to sample turbidity. No filtered SVOC samples were available for comparison. No generic FESL or WSSL values were exceeded in these samples.

Polychlorinated Biphenyls (PCBs) (Figures 4-2 and 4-7)

Table 4-116 summarizes the results of groundwater analyses for PCBs. No PCBs were detected in unfiltered or filtered groundwater samples collected from monitoring wells included in the Center Street Investigation.

Discussion

There currently are, and have been, no known GM operations in the area of the Center Street Oil Sheen Investigation that would account for the oil sheens observed at the soil boring and monitoring well locations.

Based on the RI and historical data, the oil sheens present in the Center Street area are likely associated with the former Queen Street dump, and the oil sheens have probably been present in the Center Street area since prior to 1969. The occurrence of the oil sheens correlate with the horizontal and vertical extent of the former Queen Street dump, and the presence of oil sheens diminishes to the north, south and west outside the limits of the former dump area. At all locations where an oil sheen was observed at monitoring wells, temporary wells, or soil boring locations, fill materials were determined to be in direct contact with the shallow groundwater. The extent of the oil sheens east of the site has not been determined.

Sep 17, 2009 18:39

The effect of subsurface utilities on groundwater flow and the migration of oil sheens has been reviewed and determined not to be a factor in the distribution of the oil sheens along Center Street. This is based on the following information:

- The depths of the underground utilities along Center Street range from approximately 4 to 8 feet bgs. The average depth to groundwater in the Center Street area during the RI typically was approximately from 13 feet bgs, which is well below the depths of the utility trenches in this area.

- The existing distribution of oil sheens in the Center Street area does not correlate with the location of existing underground utilities, or the known locations of abandoned utility lines in this area.

The local direction of shallow groundwater movement in the Center Street area is generally to the southeast, which does not allow for a correlation between the observed distribution of oil sheens and a potential source area located in the vicinity of the SMI plant. The nearest occurrence of oil sheens or separate-phase product at the site is approximately 2,000 feet southeast at the SMI plant building LNAPL Investigation Area. The distribution of the oil sheens associated with the LNAPL Assessment and Remediation Area have been delineated, and do not extend into the Center Street area.

4.5.10 LNAPL Assessment and Remediation Area

As discussed previously in Section 2.2.9, the LNAPL Assessment and Remediation Area has gone through several phases of investigation. The results of the investigations were presented to the MDEQ in the *LNAPL Assessment and Recovery Remedial Investigation Interim Report* (BBL, November 1995) and the *LNAPL Assessment and Recovery Report* (BBL, January 1998a), and are summarized below.

Confidential under FOIA
Richard Kowalski

Sep 17, 2009 18:39

4.5.10.1 LNAPL Analytical Results

LNAPL samples collected at seven monitoring wells (MW-147WT, MW-148WT, MW-157WT, MW-158WT, MW-160WT, MW-172WT, MW-178WT), one recovery well (RW-1), the 30-inch sewer line, and the 42-inch sewer line, were submitted to Quanterra/STL Laboratories to be analyzed for TCL VOCs, TCL SVOCs, and TCL PCBs. Seven samples (MW-147WT, MW-148WT, MW-157WT, MW-158WT, RW-1, the abandoned 30-inch sewer line, and the 42-inch sewer line) were also analyzed for total petroleum hydrocarbons (TPH by USEPA Method 8015A), following the methods in the site QAPP (BBL, May 1996a). Select LNAPL samples were also analyzed for physical parameters: Specific Gravity (ASTM Method D2196-86), Interfacial Tension (ASTM Method D2285), and Viscosity (Method SM18). The LNAPL Assessment and Remediation Area analytical data are presented in Tables 4-117 through 4-128.

Volatile Organic Compounds

Select VOCs were detected in the LNAPL samples (Table 4-118). The maximum concentrations of BTEX compounds in LNAPL were: benzene (2.3 ppm), ethylbenzene (4.8 ppm), toluene (5.2 ppm), and total xylenes (140 ppm). The maximum concentrations of chlorinated compounds in LNAPL were: chloromethane (0.5 ppm), 1,2-dichlorobenzene (0.6 ppm), total 1,2-dichloroethene (65 ppm), methylene chloride (0.7 ppm), trichloroethene (51 ppm), and tetrachloroethene (0.27 ppm). Other VOCs detected in LNAPL samples were: acetone (7.9 ppm), 2-butanone (0.9 ppm), and styrene (2.1 ppm).

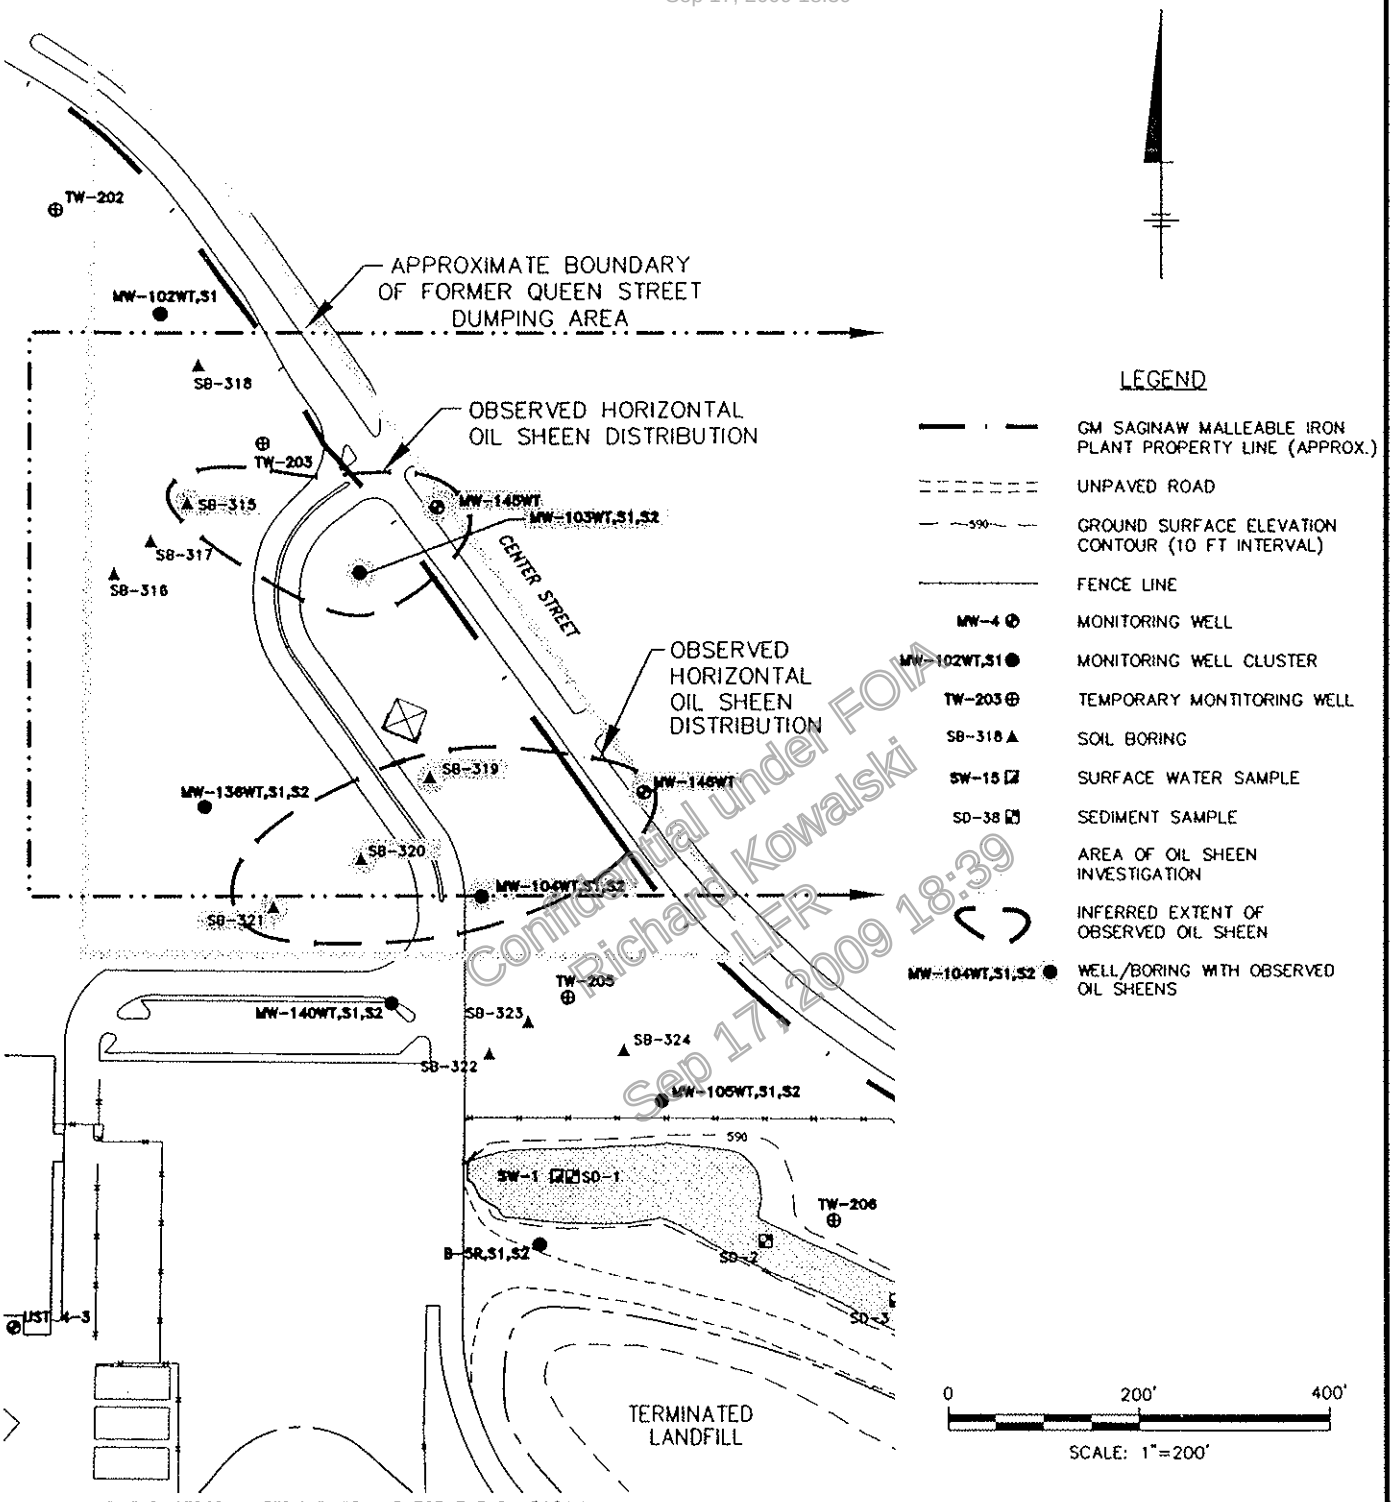
6.2.1 Site Perimeter

Center Street Oil Sheen

The extent of oil sheens in the vicinity of Center Street was investigated through the completion of soil borings and monitoring wells. The oil sheen area was found to correlate with the waste associated with the Former Queen Street Dump, and not with any known GM source. The area of the sheens extends to the northeast past the GM SMI site perimeter. VOC and SVOC compounds were detected in soil and groundwater within the area of oil sheen investigation; PCBs were not detected.

Saginaw River Boundary



Xylene was detected at an estimated concentration of 56 ug/L, above the generic GSI criteria of 35 ug/L at one Saginaw River perimeter well (MW-6CAUG) on one of three sampling dates. Phenol was detected at a concentration of 6,200 ug/L (above the generic GSI criteria of 210 ug/L), during one of two sampling events at monitoring well MW-111S3, screened within the lower sand unit, and located east of the Secondary Settling Pond. Bis(2-ethylhexyl)phthalate was detected at a concentration of 54 ug/L (above the generic GSI criteria of 32 ug/L) at monitoring well MW-111WT in June 1995. During the second and third site-wide groundwater sampling events in June 1996 and in May 2000, bis(2-ethylhexyl)phthalate was not detected above GSI criteria at any river perimeter monitoring well. The dioxin/furan TEF obtained for an unfiltered groundwater sample collected at river perimeter monitoring well B-7R (0.000001008 ug/L) was below the generic GSI criteria of 0.00001 ug/L. Dioxins/furans were not detected in a second sample obtained from monitoring well B-7R.

The generic GSI criteria for PCBs is 0.2 ug/L, equal to or less than the target detection limits (TDLs), which range from 0.2 to 0.4 ug/L for various PCB Aroclors. Therefore, any PCB detection above the detection limit along the Saginaw River is above GSI criteria. The generic GSI criteria for PCBs was exceeded for groundwater at six water table monitoring wells and at one deeper monitoring well on one or more dates. Groundwater samples collected along the river were analyzed for both total (unfiltered) and dissolved (filtered) PCBs. At the seven permanent monitoring well locations, PCBs were detected in the unfiltered samples only, indicating that PCBs were adsorbed to particulates that are larger in size than the filter size of 0.45 microns. The impact of particulates on unfiltered groundwater samples is further demonstrated by the analytical data collected from the temporary monitoring wells. At these locations, PCB concentrations were significantly higher than those detected in samples collected from nearby permanent monitoring wells (generally by orders of magnitude). These data demonstrate that the higher particulate content of groundwater collected from the temporary wells (e.g., The temporary wells were installed for screening purposes, and as such they were not developed as thoroughly as the permanent wells) resulted in higher detections of the particulate-sorbed PCBs. Similarly, PCBs were initially detected in unfiltered groundwater samples from permanent monitoring wells, which were installed in soils containing low concentrations of PCBs. However, the PCB concentrations consistently declined through time. The groundwater samples collected from the monitoring wells along the Saginaw River in May 2000 were non-detect for PCBs (filtered and unfiltered samples). These samples were collected using a modified sampling procedure as described in the QAPP addendum (Attachment L-A), which incorporates a peristaltic pump to allow lower purging and sampling rates, which are closer to the natural groundwater flow rates in the soil. This method minimizes sample turbidity and the introduction of particulates and associated adsorbed compounds that are not mobile under in-situ conditions. The absence of detectable levels of PCBs in these samples strongly supports GM's position that the PCBs previously detected in monitoring wells located along the Saginaw River are the result of particulates being introduced into the samples as a result of the drilling and sampling methods used to collect the samples.

Detections of inorganic constituents at concentrations above the corresponding generic GSI criteria were noted at one or more locations for arsenic (MW-149WT, one sampling event), copper (MW-108S4, one sampling event), , manganese (MW-111WT, two sampling events; MW-149WT, one sampling event), and thallium (MW-149WT, one sampling event; MW-108WT, one sampling event; MW-112WT, one sampling event; X-4AR, one sampling event).

MICHIGAN DEPARTMENT OF ENVIRONMENTAL QUALITY

AFFIDAVIT TO SUPPORT UNREMEDIATED RELEASE(S) IN A REMEDIAL ACTION PLAN

(Under the authority of Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 Act 451, as amended), and the Part 201 Administrative Rules promulgated thereunder)

STATE OF Michigan

COUNTY OF Saginaw

The purpose of this Affidavit is to set forth certain information and documentation to enable the Michigan Department of Environmental Quality (hereinafter, the "MDEQ") to make the determinations pursuant to R 299.5534 (hereinafter, "Rule 534") of the Part 201 Administrative Rules (hereinafter, the "Part 201 Rules") promulgated under Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (hereinafter, the "NREPA"). All terms found in this document which are defined in Part 3, Definitions, and Part 201 of the NREPA; and the Part 201 Rules, shall have the same meaning as in the statute and the Part 201 Rules.

The undersigned Affiant, being first duly sworn, deposes and says as follows:

1. THIS AFFIDAVIT is executed by the undersigned, William McFarland, whose title is, Director of Remediation, on behalf of the General Motors Corporation, and President, on behalf of the Remediation and Liability Management Company (hereinafter, "the Affiant") located at Engineering Center - West, Mail Code 480-111-W60, 30200 Mound Rd, Warren, MI 48090.

2. This Affidavit accompanies a Remedial Action Plan ("the RAP") prepared on behalf of the Affiant for the following properties: Saginaw Malleable Iron Property, and REALM, Inc. Green Point Landfill and Drum Remediation Area. The legal description is provided in Attachment 1.

3. The properties referred to in Item Number 2 are associated with a "Facility" as defined in Section 20101(1)(o) of the NREPA.

4. The RAP precisely describes the unremediated release at the Facility. "Unremediated release" means a release for which response activity has not been implemented that satisfies the remedial action requirements of Part 201 of the NREPA and the Part 201 Rules.

5. The Affiant is not liable for the unremediated releases associated with the Dow Chemical manufacturing facility located in Midland, Michigan, as identified in Attachment 2.

6. Attached to this Affidavit is information that explains and supports the basis for the conclusion that the Affiant is not liable for the environmental contamination proposed to be omitted from remediation in the RAP.

7. Attached to this Affidavit is documentation that demonstrates divisibility of harm and apportionment of liability as required by Section 20129 of the NREPA.

8. The Affiant acknowledges and agrees to all of the following:

   a. If the MDEQ approves the RAP referenced in Item Number 4 relying on representations about liability that are set forth in this Affidavit, the ability of the MDEQ to subsequently review the liability of the Affiant is not limited or affected by reliance on the Affidavit or approval of the RAP. Upon review of the Affidavit, supporting materials and other information available to the MDEQ at any time, the MDEQ may determine that Affiant is liable for any or all of the contamination omitted from remediation under the RAP, or that the Affiant has not met the burden of demonstrating divisibility of harm and apportionment of liability under Section 20129 of the NREPA.

   b. If the MDEQ later finds the Affiant to be liable for the Facility or to have failed to establish divisibility of harm and apportionment of liability as required by Section 20129 of the NREPA, the Affiant shall promptly undertake remedial action to address that portion of the Facility not covered by the RAP.

   c. A person who is liable who undertakes a remedial action that he or she knows will not, when complete, comprehensively address all contamination at a facility at the time the remedial action is undertaken, except as provided for in R. 299.5534 for unremediated releases, is subject to fines and penalties as provided for under Part 201 of the NREPA for failure to diligently pursue response activity under Section 20114(1)(g) of the NREPA, as well as other applicable state or federal laws.

   d. Response activity undertaken by a person who is liable that does not comprehensively address all contamination at a facility, except unremediated releases addressed through the procedure set forth in R.299.5534, is considered an interim response and not a remedial action.

I affirm that the above representations are true and are based upon my personal knowledge and belief after all reasonable inquiry.

I certify that I am legally authorized to execute this Affidavit and to bind the Affiant to the terms and conditions of this Affidavit.

I understand that intentionally submitting false information to the MDEQ is a felony and may result in fines of up to $25,000 for each violation.

I acknowledge that this Affidavit has been provided pursuant to Rule 534 of the Part 201 Rules.

LEGAL DESCRIPTION OF SITE

The Site encompasses approximately 273 acres, and consists of the Saginaw Malleable Iron (SMI) Plant Property and the REALM Green Point Landfill and Drum Remediation Area (DRA) Property, as shown on Figures 1-1 and 1-2 in the Remedial Action Plan. The SMI Plant Property makes up the northern portion of the Site and includes the inactive SMI Plant and support facilities, including two closed Type III Landfills, two stormwater ponds, and an inoperative Water Recycle System. Foundry operations previously conducted at the SMI Plant consisted of activities related to the casting and heat treating of iron. The southern portion of the Site (now owned by REALM, Inc.) includes the closed Green Point Landfill and the DRA, where drums were previously discovered, excavated, and removed.

The Site is located approximately 1,500 feet north of the confluence of the Tittabawassee and Shiawassee Rivers and is located on the western half of Section 35, T12N, R4E, in the city of Saginaw, Saginaw County, Michigan. A legal description of the SMI Plant Property and the REALM Green Point Landfill and Drum Remediation Area Property is provided below.

In April 2000, elevated concentrations of dioxin and furan compounds were identified in soil samples collected in a farm field located east of the REALM Green Point Landfill property. Through extensive sampling programs conducted by the MDEQ and the DOW Chemical Corporation (DOW), the presence of dioxin and furan compounds was traced from the DOW plant located in Midland Michigan, throughout the flood plains and river sediments of the Tittabawassee and Saginaw Rivers. A sediment removal action was completed in the Saginaw River adjacent to the GM SMI and REALM Green Point Landfill properties. Additional information regarding the distribution of dioxin and furan compounds is provided in the attached report, *Phase II Tittabawassee/Saginaw River Dioxin Flood Plain Sampling Study*. The presence of these compounds has not been extensively studied at the Site; however, based on the presence of the Site within the flood plain of the Tittabawassee and Saginaw Rivers, these compounds are likely present.

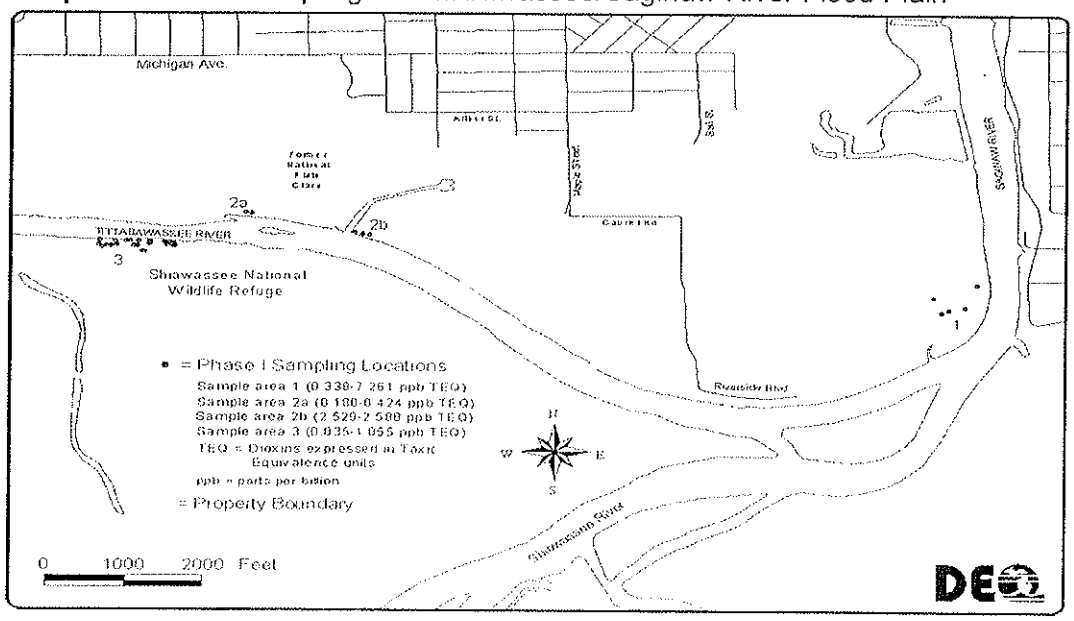
Final Report
Phase II Tittabawassee/Saginaw River Dioxin Flood Plain Sampling Study

I. Executive Summary



Soil samples collected during the development of a wetland mitigation project identified elevated levels of dioxin and furan compounds (hereinafter collectively referred to as dioxin) in a farm field located near the confluence of the Tittabawassee and Saginaw Rivers. The samples, collected during April 2000, identified concentrations of dioxin as high as 2,200 parts per trillion (ppt) toxic equivalents (TEQ). The dioxin concentration was nearly 25 times the residential direct contact criterion (RDCC) of 90 ppt TEQ established under Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (Part 201). The Part 201 RDCC of 90 ppt is the concentration of dioxin in soil determined to be safe for direct contact from residential exposure. Concern over the public and environmental health implications of these sample results prompted the Department of Environmental Quality (DEQ), Remediation and Redevelopment Division (RRD), to develop and implement a phased soil sampling and assessment program in the Tittabawassee River flood plain to determine the source and extent of the contamination.

Summary - Phase I

The Phase I portion of the soil sampling program was implemented during the period December 2000 through July 2001. The RRD collected 34 soil samples from five locations within a two-mile stretch of the Tittabawassee River flood plain between Center Road in Saginaw Township, Saginaw County, and the Saginaw River confluence. The Phase I sample locations are identified in Map 1. Soil samples were collected at depths ranging from the ground surface to 15 inches below ground level (bgl). Analytical results identified concentrations ranging from 35 to 7,300 ppt TEQ. Only 7 of the 34 samples contained dioxin TEQ concentrations less than the Part 201 RDCC (90 ppt TEQ). A summary of Phase I TEQ sample results is presented in Table 1. The Phase I individual dioxin congener results are presented in Appendix G.

The Phase I final report was completed during October 2001. The following determinations were presented in the final report:

- Elevated concentrations of dioxin were confirmed within the lower Tittabawassee River flood plain near the river's confluence with the Saginaw River.

- Dioxin concentrations were consistently found above the Part 201 RDCC (90 ppt TEQ), and were identified as high as 80 times the Part 201 RDCC.

- Human use of the flood plain increases upstream of the Phase I sample area. Residential properties are located within the flood plain, the majority located within the Shields area of Thomas Township and Saginaw Township. Public park lands and agricultural operations are also located within the flood plain.

- A Phase II sampling program was recommended to further evaluate the extent of contamination above the Part 201 RDCC occurring within the flood plain upstream of the Phase I sample area.

Summary – Sediment Study

The DEQ collected and analyzed Tittabawassee River sediment samples during spring/ summer 2001, as part of the Baseline Characterization of Saginaw Bay Watershed Sediment Study (DEQ Sediment Study). The objective of the DEQ Sediment Study was to provide baseline concentrations of contaminants in Tittabawassee River sediments both upstream and downstream of the city of Midland (Midland). Dioxins and furans were analyzed as part of this study. Surface sediment samples were collected from the Chippewa River, Pine River, and Tittabawassee River beginning immediately upstream of Midland and continuing downstream to the beginning of the Saginaw River. Sediment cores were collected and analyzed in select areas. Some flood plain soil samples were also collected for analysis. Sample locations and results are presented in Appendix H.

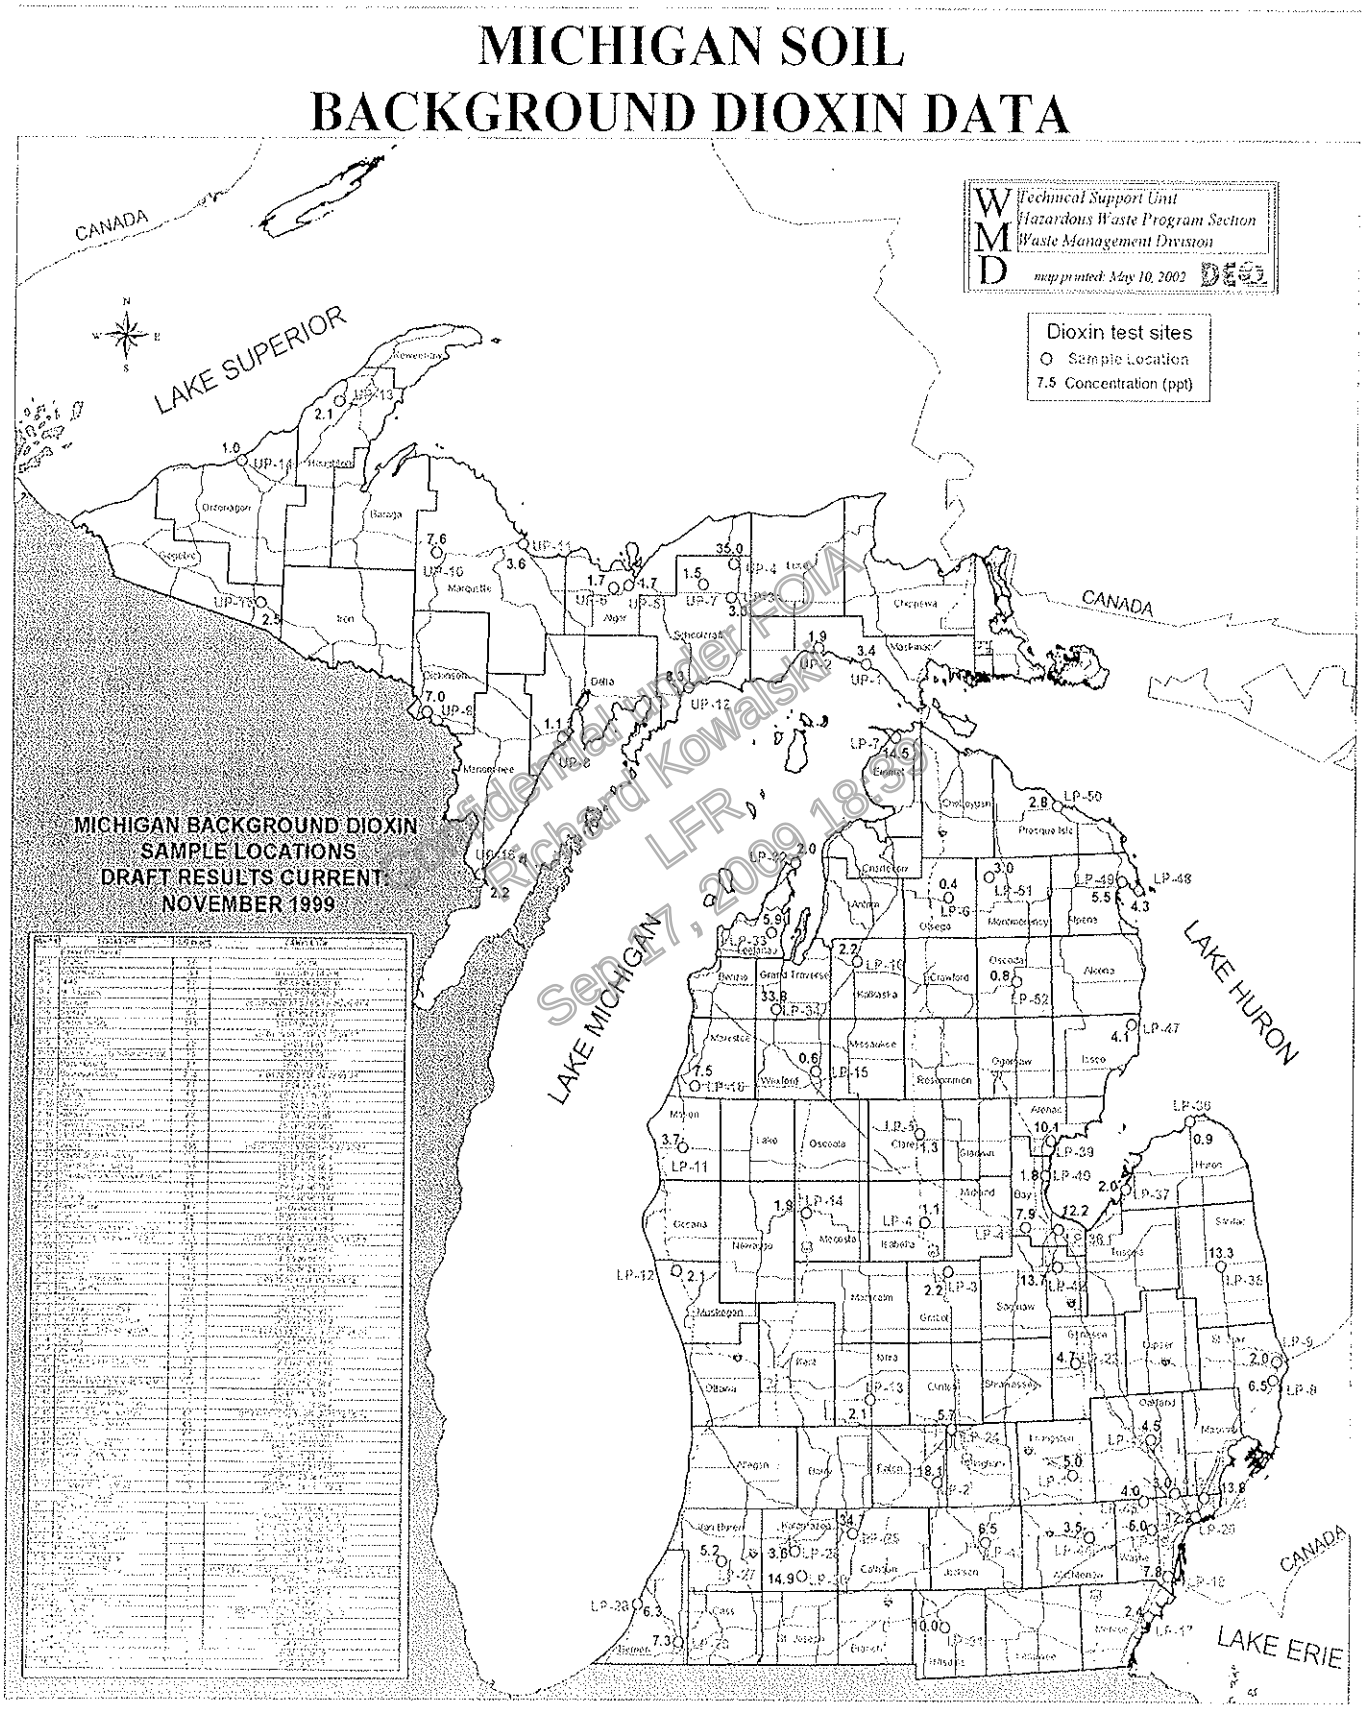
Sep 17, 2009 18:39

The DEQ Sediment Study final report was completed and distributed during the summer of 2002. The study results presented in the final report indicate the following:

- Dioxin concentrations from sediment and flood plain soil sample locations upstream of Midland are consistent with the average dioxin concentration in soil samples collected statewide from areas where there are no known dioxin release source(s) (hereinafter referred to as statewide background, see Figure 1).



- Dioxin is present at elevated concentrations in sediment and flood plain soil samples collected downstream of Midland. The extent of contamination is pervasive throughout the study area downstream of Midland. Sediment contamination ranged up to 2100 ppt TEQ and was present to the downstream limit of the study area, approximately 20 miles downstream of Midland. All flood plain soil samples collected downstream of Midland exceeded the Part 201 RDCC with concentrations ranging between 300 and 1500 ppt TEQ.

- The variability of dioxin concentrations in river sediment samples is believed to be a result of the variability of river water flow and site-specific sediment deposition characteristics.

Summary – Phase II

A Phase II flood plain soil sampling program (Phase II) was developed based on the results of the Phase I Report and the DEQ Sediment Study. Flood plain soil samples were collected from the Chippewa, Pine, and Tittabawassee Rivers upstream of Midland, and at specific locations along the Tittabawassee River downstream of Midland to the beginning of the Saginaw River. Phase II soil samples were collected and analyzed during the period from May through December 2002 from the locations shown (see Figure 2). Initial observations of the Phase II sample results identified the following:

- The majority of flood plain soil sample dioxin concentrations downstream of Midland exceed the Part 201 RDCC, indicating that dioxin contamination of flood plain soil downstream of Midland is pervasive.

- Flood plain soil samples collected upstream of Midland contain dioxin concentrations consistent with statewide background concentrations.

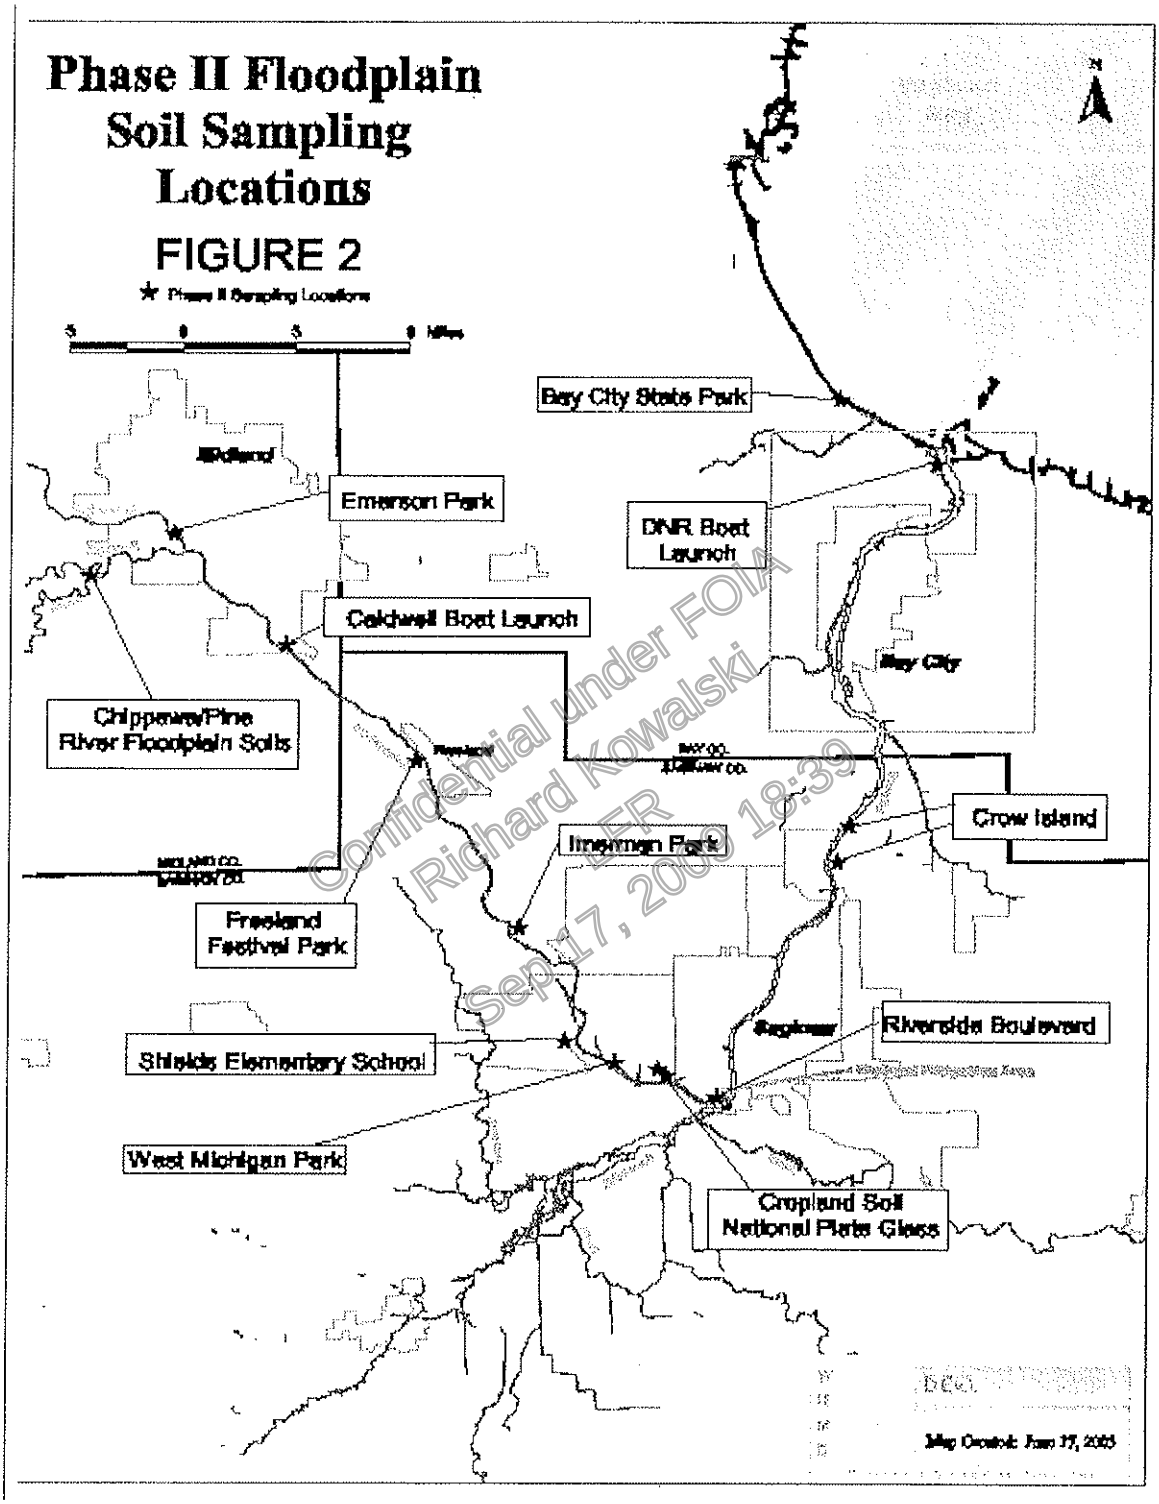
- Dioxin concentrations from sample locations located downstream of Midland, but outside the estimated 100-year flood plain, are consistent with statewide background concentrations.

- The deepest initial Phase II soil sample (12-15") did not define the vertical extent of dioxin contamination. Soil samples were analyzed from three deep soil borings collected from Freeland Festival Park to improve understanding regarding the vertical extent of dioxin contamination. These additional samples indicate that dioxin contamination above statewide background concentrations exist at the park to a depth of four feet bgl. Additional deep soil sampling is necessary to determine if this vertical distribution of dioxin is consistent throughout the flood plain.

- The concentration of co-planar polychlorinated biphenyl (PCB) compounds represents an insignificant contribution to the total dioxin-like toxicity at all Phase II sample locations.

- Eggs from chickens that free range on flood plain soil exhibit elevated concentrations of dioxin. It is possible that food products from other animals raised on the flood plain could be affected.

- Dioxin concentrations in flood plain drinking water well samples were not determined to exceed applicable regulatory criteria.



- Saginaw River and Saginaw Bay navigation channel sediment samples collected in 1999 by the U.S. Army Corps of Engineers (USACE) indicate that dioxin contaminated sediment from the Tittabawassee River has migrated into the Saginaw River and the inner portions of the Saginaw Bay. Initial soil samples collected by the RRD from the Saginaw River and Saginaw Bay shoreline areas appear to confirm these results, though additional sampling of these areas is needed.

MICHIGAN DEPARTMENT OF ENVIRONMENTAL QUALITY

AFFIDAVIT TO SUPPORT UNREMEDIATED RELEASE(S) IN A REMEDIAL ACTION PLAN

(Under the authority of Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 Act 451, as amended), and the Part 201 Administrative Rules promulgated thereunder)

STATE OF Michigan

COUNTY OF Saginaw

The purpose of this Affidavit is to set forth certain information and documentation to enable the Michigan Department of Environmental Quality (hereinafter, the "MDEQ") to make the determinations pursuant to R 299.5534 (hereinafter, "Rule 534") of the Part 201 Administrative Rules (hereinafter, the "Part 201 Rules") promulgated under Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (hereinafter, the "NREPA"). All terms found in this document which are defined in Part 3, Definitions, and Part 201 of the NREPA; and the Part 201 Rules, shall have the same meaning as in the statute and the Part 201 Rules.

The undersigned Affiant, being first duly sworn, deposes and says as follows:

1. THIS AFFIDAVIT is executed by the undersigned, William McFarland, whose title is, Director of Remediation, on behalf of the General Motors Corporation, and President, on behalf of the Remediation and Liability Management Company (hereinafter, "the Affiant") located at Engineering Center - West, Mail Code 480-111-W60, 30200 Mound Rd, Warren, MI 48090.

2. This Affidavit accompanies a Remedial Action Plan ("the RAP") prepared on behalf of the Affiant for the following properties: Saginaw Malleable Iron Property, and REALM, Inc. Green Point Landfill and Drum Remediation Area. The legal description is provided in Attachment 1.

3. The properties referred to in Item Number 2 are associated with a "Facility" as defined in Section 20101(1)(o) of the NREPA.

4. The RAP precisely describes the unremediated release at the Facility. "Unremediated release" means a release for which response activity has not been implemented that satisfies the remedial action requirements of Part 201 of the NREPA and the Part 201 Rules.

5. The Affiant is not liable for the unremediated releases associated with the former Delphi Saginaw Steering Gear Plant 2, as identified in the RAP and in Attachment 2.

6. Attached to this Affidavit is information that explains and supports the basis for the conclusion that the Affiant is not liable for the environmental contamination proposed to be omitted from remediation in the RAP.

7. Attached to this Affidavit is documentation that demonstrates divisibility of harm and apportionment of liability as required by Section 20129 of the NREPA.

8. The Affiant acknowledges and agrees to all of the following:

   a. If the MDEQ approves the RAP referenced in Item Number 4 relying on representations about liability that are set forth in this Affidavit, the ability of the MDEQ to subsequently review the liability of the Affiant is not limited or affected by reliance on the Affidavit or approval of the RAP. Upon review of the Affidavit, supporting materials and other information available to the MDEQ at any time, the MDEQ may determine that Affiant is liable for any or all of the contamination omitted from remediation under the RAP, or that the Affiant has not met the burden of demonstrating divisibility of harm and apportionment of liability under Section 20129 of the NREPA.

   b. If the MDEQ later finds the Affiant to be liable for the Facility or to have failed to establish divisibility of harm and apportionment of liability as required by Section 20129 of the NREPA, the Affiant shall promptly undertake remedial action to address that portion of the Facility not covered by the RAP.

   c. A person who is liable who undertakes a remedial action that he or she knows will not, when complete, comprehensively address all contamination at a facility at the time the remedial action is undertaken, except as provided for in R. 299.5534 for unremediated releases, is subject to fines and penalties as provided for under Part 201 of the NREPA for failure to diligently pursue response activity under Section 20114(1)(g) of the NREPA, as well as other applicable state or federal laws.

   d. Response activity undertaken by a person who is liable that does not comprehensively address all contamination at a facility, except unremediated releases addressed through the procedure set forth in R.299.5534, is considered an interim response and not a remedial action.

I affirm that the above representations are true and are based upon my personal knowledge and belief after all reasonable inquiry.

I certify that I am legally authorized to execute this Affidavit and to bind the Affiant to the terms and conditions of this Affidavit.

I understand that intentionally submitting false information to the MDEQ is a felony and may result in fines of up to $25,000 for each violation.

I acknowledge that this Affidavit has been provided pursuant to Rule 534 of the Part 201 Rules.

LEGAL DESCRIPTION OF SITE

The Site encompasses approximately 273 acres, and consists of the Saginaw Malleable Iron (SMI) Plant Property and the REALM Green Point Landfill and Drum Remediation Area (DRA) Property, as shown on Figures 1-1 and 1-2 in the Remedial Action Plan. The SMI Plant Property makes up the northern portion of the Site and includes the inactive SMI Plant and support facilities, including two closed Type III Landfills, two stormwater ponds, and an inoperative Water Recycle System. Foundry operations previously conducted at the SMI Plant consisted of activities related to the casting and heat treating of iron. The southern portion of the Site (now owned by REALM, Inc.) includes the closed Green Point Landfill and the DRA, where drums were previously discovered, excavated, and removed.

The Site is located approximately 1,500 feet north of the confluence of the Tittabawassee and Shiawassee Rivers and is located on the western half of Section 35, T12N, R4E, in the city of Saginaw, Saginaw County, Michigan. A legal description of the SMI Plant Property and the REALM Green Point Landfill and Drum Remediation Area Property is provided below.

There are two areas of the facility that have been impacted by the upgradient former Delphi Plant 2 property. The first is the light non-aqueous phase liquid (LNAPL) recovery area located south of the main plant building on the Saginaw Malleable Iron Plant property. A fingerprinting study completed in the area (copy attached) shows that LNAPL has migrated from the Delphi property in the past. An LNAPL plume in this area has been addressed in the Remedial Action Plan; however, LNAPL still exists on the adjacent upgradient Delphi property. It is expected that this LNAPL could, and is likely to migrate onto the GM property due to natural groundwater gradients or due to the gradient induced by the existing recovery system. In addition, an abandoned 30-inch sewer line that extends from the Delphi property onto the SMI property was cut near the location of recovery well RW-1. This pipe contained LNAPL, which flowed out of the pipe when it was uncovered. The pipe has been left open to allow LNAPL to drain from the pipe to the recovery system. This pipe provides an ongoing potential migration route for LNAPL from the Delphi property to the SMI property. Future contributions of LNAPL from the adjacent property are identified as *unremediated releases*.

The second area of the facility impacted by the former Delphi Plant 2 was identified during investigation of the adjacent REALM Peninsula Area Property, located north-west of the Green Point Landfill. Volatile organic compounds (VOCs) have migrated in groundwater from the Delphi property, near the manufacturing building, southward onto the REALM Peninsula Area property, and have migrated towards the wetland located in the north-west corner of the Green Point Landfill property. Data for these two site areas follow.

Re: Evaluation of LNAPL Sources – GM Saginaw Malleable Iron Plant

This memorandum describes the analyses and interpretation of data for a series of light-non-aqueous-phase liquid (LNAPL) samples recovered from monitoring wells associated with the Saginaw Malleable Iron (SMI) Plant property, located in Saginaw, Michigan. Figure 1 shows the site area and monitoring well locations. Table 1 lists the samples that have been collected and analyzed as part of this investigation. Laboratory sample identifiers are included in Table 1 to facilitate matching data in the attachments to sample locations.

Total Petroleum Hydrocarbon Fingerprint Analysis

The analysis of total petroleum hydrocarbons (TPH) following modified Method 8015 provides a "fingerprint" of the LNAPL. The analytical output (provided in Attachment 1 for all samples) is a gas chromatogram of the product between approximately the kerosene range and the residual range, and quantification of TPH concentration. The quantification of TPH concentration in NAPL was not a consideration in the forensic evaluation. Each sample was analyzed for the conventional TPH fingerprint. In addition, due to a laboratory error, the MW-147WT and MW-157WT LNAPLs were first analyzed for TPH with n-alkane quantification (included in Attachment 1 as 0307012-01 and -02), and then reanalyzed (0312026-03 and -04) for the more conventional TPH fingerprint, consistent with the remaining samples. The primary objective of the TPH analysis was to identify compositional features of the NAPLs, such as hydrocarbon range, product type (e.g., kerosene-range, diesel-range, lubricating/residual-range, etc.), and degree of weathering.

Comprehensive PAH Fingerprint Analysis

All LNAPL samples underwent PAH fingerprinting analysis, which generated concentration data for a comprehensive suite of constituents, including the alkylated homologue groups of major PAHs (e.g., alkylated naphthalenes, fluorenes), sulfur-containing heterocyclic compounds (e.g., alkylated dibenzothiophenes, naphthobenzothiophenes), and weathering-resistant polyalkane compounds (e.g., alkylated decalins). Including the alkylated homologue groups, the fingerprinting analysis encompasses up to several hundred hydrocarbon compounds, which are reported as 60 target "analytes" (including numerous multi-component homologue groups). The PAH analyses were performed using high-resolution gas chromatography/low-resolution mass spectrometry with selected ion monitoring (HRGC/LRMS-SIM). The method involves a modification of USEPA Method 8270C (SW-846) and is consistent with PAH fingerprinting methods and target constituents cited for the characterization of petroleum (Sauer and Boehm, 1991; Douglas et al, 1992; Brown and Boehm, 1993; Burns, 1993; Sauer and Boehm, 1995; Page et al., 1995; Stout et al., 2002) and other hydrocarbon NAPLs, such as coal tars and creosote (EPRI, 2000). The data are provided as quantification reports and composition histograms in Attachment 2. In addition to providing a comprehensive characterization of the aromatic fraction of petroleum, ratios of alkylated PAHs with similar weathering/degradation resistance have proven to be effective diagnostic indicators of petroleum source (Brown and Boehm, 1993; Page et al., 1995; Stout et al., 2002).

Geochemical Biomarkers Analysis

The modified Method 8270 analysis described above included monitoring ions 191 and 217 for steranes and triterpanes. These aliphatic compound classes are considered geochemical biomarkers because they are indicative of the source petroleum formation and are resistant to weathering and biodegradation alterations (Page et al., 1995; Sauer et al., 1993; Stout et al., 2002). From the selected ion profiles provided in Attachment 3 as the data from this analysis, one can see that these complex aliphatic compounds constitute some of the unresolved complex mixture (UCM) humps that are characteristic of various petroleum product TPH chromatograms (e.g., data in Attachment 1). The use of the geochemical biomarker data in this investigation is primarily qualitative, similar to the use of the TPH fingerprints. An important difference between the TPH fingerprints in Attachment 1 and the geochemical biomarker fingerprints in Attachment 3 is that the TPH fingerprints are more susceptible to weathering/degradation alterations than the biomarker fingerprints. This difference makes the biomarker fingerprints more useful for comparing potentially weathered/degraded NAPLs and/or residues.

Results

The compositional characteristics for the LNAPLs analyzed in this investigation are summarized in Table 2.

Table 2. Summary of Compositional Characteristics.

Sampling Location/Well	TPH Fingerprint	PAH and Related Fraction	Geochemical Biomarkers
203S (suspected representative cutting oil)	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ unresolved complex mixture hump (UCM); n-alkanes absent	Phenanthrenes, Naphthalenes, Fluorenes, Decalins prominent; moderately weathered	Cutting Oil pattern
TP1	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ UCM; n-alkanes absent	Decalins, Fluorenes, Phenanthrenes prominent; moderately weathered	MW-147 pattern
TP2	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ UCM; n-alkanes absent	Decalins, Fluorenes, Phenanthrenes prominent; moderately weathered	MW-147 pattern
QO (quench oil)	$n\text{-}C_{18}$ - $n\text{-}C_{32}$ UCM; $n\text{-}C_{15}$ through $n\text{-}C_{22}$ present	Decalins absent; Phenanthrenes, Fluorenes prominent; slightly weathered	Quench Oil pattern
MW-147WT	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ UCM; n-alkanes absent	Phenanthrenes, Fluorenes, Decalins prominent; moderately weathered	MW-147 pattern
MW-157WT	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ UCM; n-alkanes absent	Phenanthrenes, Naphthalenes, Fluorenes, Decalins prominent; slightly weathered	Cutting Oil pattern
MW-148WT	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ UCM; n-alkanes absent	Phenanthrenes, Fluorenes, Naphthalenes, Decalins prominent; slightly weathered	Cutting Oil pattern
SP (stormwater pond)	$n\text{-}C_{15}$ - $n\text{-}C_{32}$ UCM; n-alkanes absent	Phenanthrenes, Decalins, Naphthalenes, Fluorenes prominent; slightly weathered	MW-147 pattern

The TPH fingerprint analysis revealed chromatograms associated with middle-distillate-range petroleum, featuring UCM ranging from n-C_{15} to n-C_{32} without n-alkanes evident in any monitoring well or test pit samples; the quench oil sample included n-alkanes from n-C_{15} to n-C_{22}. As can be seen from the chromatograms in Attachment A, the quench oil sample UCM was shifted relative to the other samples (n-C_{18} to n-C_{32}), although weathering/degradation could account for the slight shift in the UCM. Thus, the TPH fingerprints did not lead to a forensic conclusion.

The alkylated PAH analysis revealed some homologue groups that were common to several samples. Although decalins are not aromatic compounds, they were analyzed quantitatively along with the alkylated PAH homologues and the several heterocyclic aromatic homologue groups (e.g., dibenzothiophenes). The absence of decalins in the quench oil sample was a distinguishing feature from all other LNAPLs which contained measurable concentrations of decalins. The absence of decalins in the quench oil eliminates the possibility of quench oil as a single, or even primary source of the LNAPL recovered from TP1 and TP2.

Ratios of alkylated dibenzothiophenes to corresponding phenanthrenes-plus-anthrences have been used as effective source markers for middle-distillate-range petroleum and crude oil (e.g., Brown and Boehm, 1993; Sauer et al., 1993; Page et al., 1995). Figure 1 illustrates three apparent source groupings for the LNAPL samples in this investigation. The "cutting oil signature group" is so designated because 203S is presumed to contain cutting oil from operations at the Delphi plant. The LNAPL from MW-147WT exhibited much different PAH source ratios than the other samples and may indicate an unidentified source, despite that well's proximity to MW-157WT, TP1 and TP2 on the SMI property. The quench oil, TP1, TP2, SP, and MW-157WT all exhibited similar PAH ratios in Figure 1. However, the absence of the aliphatic decalins in the quench oil, as noted above, indicated a different or additional NAPL source to TP1 and TP2. Thus, the PAH signatures associated with TP1, TP2, SP and MW-157WT may have resulted from 1) a mixture of cutting oil and the NAPL at MW-147WT, 2) a mixture of cutting oil and quench oil, 3) a mixture of quench oil and the NAPL at MW-147WT, or 4) a mixture of cutting oil, quench oil and the NAPL at MW-147WT.

The geochemical biomarker chromatograms (Attachment 3) may be used for qualitative identification. The "patterns" designated in Table 2 refer to the peaks that appear for ions 191 and 217, their relative heights, and the general shape of the UCM. In Table 2, a similar pattern, designated "cutting oil pattern," was observed for LNAPLs 203S, MW-148WT, and MW-157WT; a similar pattern, designated "MW-147," was observed for MW-147WT, TP1, TP2, and SP; and a third different pattern was observed for the quench oil. The biomarker scans, in combination with the diagnostic PAH ratios in Figure 1 suggested that the cutting oil and the LNAPL at MW-147WT contribute to the NAPL in the TP1, TP2, SP and MW-157WT cluster. It is possible, based on the PAH ratios in Figure 1, that some quench oil may have also contributed to the LNAPL in the TP1, TP2, SP and MW-157WT cluster. However, it is very unlikely that there was any quench oil contribution to the LNAPL associated with 203S, MW-148WT, or MW-147WT.

Conclusions

- LNAPLs in TP1, TP2, SP and MW-157WT were middle-distillate-range petroleum products reflecting a likely mixture of cutting oil from the Delphi operation, LNAPL from MW-147WT, and possibly quench oil from the SMI operation; and

- Quench oil from the SMI operation is not likely a source of LNAPL collected from 203S, MW-148WT, or MW-147WT.

4. Summary and Conclusions

Based on the distribution of VOCs in groundwater observed at the Peninsula Area, we believe that the VOC compounds detected above the generic MDEQ criteria have migrated to the property from the adjacent Plant 2 property, north of the Peninsula. The VOCs detected above criteria are consistently found at greater concentrations with depth, and previous soil investigation did not detect significant concentrations of these compounds in the soil above the water table on the Peninsula property. This distribution indicates the likelihood of an off-Site source. This belief is further supported by the detection of similar elevated VOC concentrations on the upgradient Delphi property. A progression from parent (e.g., trichloroethene) to daughter degradation product VOCs (e.g. vinyl chloride) is also observed along the groundwater flow path from the Delphi Site onto the REALM property. The distribution of the SVOCs detected above criteria also suggests an off-Site source; however, because of elevated detection limits for the SVOC samples collected at the Delphi property, this could not be verified with existing data.

Iron has been detected at multiple locations at and surrounding the Site at concentrations above the IDW criteria. The IDW criteria were used for screening purposes; however, since the groundwater is not used for drinking water purposes, additional future monitoring for iron is not recommended. Barium was detected at one interior Site location at a concentration above the IDW criteria. Additional future monitoring for barium is also not recommended due to the lack of groundwater use. The elevated concentrations of selenium in the southern part of the Site may be related to an on-Site source. However, the concentrations of selenium are below the GSI criteria of 5 ug/L upgradient of the wetland at monitoring wells MW01-118WT, MW04-118S1, MW04-122WT, MW04-122S1, MW04-123WT and MW04-123S1, with a maximum selenium detection of 2.3 ug/L, well below the GSI criteria. Selenium will be sampled for in another round of groundwater sampling, due to the detection of selenium in the surface water sample at a concentration above the FCV. At the time of collection of the surface water sample, the surface water present amounted to a small stagnant pool of water. It is recommended that additional surface water samples be collected during a period of time when the area of standing surface water is expanded and not frozen.

Zinc	6.0 B	14	116	17.6	13.4	12.3

Notes:
Data shown for only those inorganic analytes detected in one or more sample(s).
Analyses were also completed for cadmium, silver, and mercury.
GSI criteria were calculated using a hardness of 370 mg/CaCO3/L.
See Generic Notes pages.
