Re: General Motors Corporation Truck Group, Pontiac, Michigan
MID 005 356 902

Dear Mr. Valentino:

At our meeting on August 17, 1995, at the General Motors Truck Group Brownfield Redevelopment Project, GM committed to supply the U.S. EPA with updated information related to the SWMU's and AOI's identified in the A. T. Kearney/K. W. Brown Preliminary Review/Visual Site Inspection (1987) and GM environmental activities at the above captioned site. GM plans to provide this information in two separate submittals. The first submittal enclosed here consists of four volumes, entitled, Review of Existing Conditions Report, GM Truck Group, A Brownfield Redevelopment Project. This report follows our site descriptions and internal parcel designations A, B, and C used at our August 17, 1995, meeting. Parcels' A and B are presented in detail. The Parcel C information provided is preliminary. The second submittal will consist of detailed information of Parcel C and will be forwarded December 1, 1995.

As we discussed in our meeting, the site Brownfield Redevelopment has drastically changed the site appearance. Parcels have been sold, and future activities will cause further changes at the site. If U.S. EPA desires further discussion of the attached report on other issues related to the pending action, please telephone me at (313) 556-0821.

Sincerely,

G. Keith West

RE: Schedule for the Development of the Supplemental Review of Existing Conditions Report (Supplemental Report), GM Truck Group, Pontiac East Assembly/Former Pontiac Central Manufacturing and Assembly Plants

---

The following presents the schedule of activities that have been completed during the preparation of the Supplemental Report. These activities are outlined as follows:

Date	Activity	Description
Tues. Oct. 24/95 **COMPLETE**	A meeting with Keith West, Ken Gembel, Randy Alderson, Jim Olson, Jess Tandoc, Steve Jensen and CRA at 1:30p.m., at the GM Truck Engineering Center.	Discussion of the renovation activities of Buildings 33, 34, and 35 at the GM Truck Engineering Center, and locating/copying appropriate supporting documentation. In addition, a review of the activities at the Power Plant will be completed.
Wed. Oct. 25/95 **ONGOING**	CRA, together with Randy Alderson, and Jim Olson, will locate/copy all available appropriate supporting documentation for the GM Engineering Center.	Acquisition of all information regarding the areas of interest (AOIs), identified at the GM Truck Engineering Center.

Thur. Oct. 26/95 Fri. Oct. 27/95 **COMPLETE**	CRA to meet with Ken Gembel to locate/ copy all appropriate supporting documentation for Pontiac East.	Acquisition of all available information regarding the AOIs identified at Pontiac East.
Mon. Nov. 6/95 **COMPLETE**	CRA to fax applicable draft sections of the Report to Jeff Braun, Jean Caufield, Ken Gembel, Randy Alderson, Jim Olson, and Keith West.	Review and comment on AOIs. Summarize all comments and return to CRA.
Mon. Nov. 13/95 **COMPLETE**	CRA to fax applicable draft sections of the Report to Jeff Braun, Jean Caufield, Ken Gembel, Randy Alderson, Jim Olson, and Keith West.	Review and comment on AOIs. Summarize all comments and return to CRA.
Mon. Nov. 20/95 **COMPLETE**	CRA to Federal Express a revised draft of the Supplemental Report to Jeff Braun, Jean Caufield, Ken Gembel, Randy Alderson, and Keith West.	Review and comment on AOIs. Summarize all comments and return to CRA.
Fri. Dec. 1/95 **COMPLETE**	CRA to complete and finalize the Supplemental Report.	CRA to Federal Express the Supplemental Report to the U.S. EPA.

On Monday, December 4, 1995 the Supplemental Report was Federal Expressed to the following individuals:

- Michael Valentino (U.S. EPA Region 5 Office of RCRA)
- Mike Anastasion (U.S. EPA Office of Regional Counsel)
- Jerry Philips (U.S. EPA Region 5 Office of RCRA) (replaced Kevin Pierard)
- Robert Lawson (GM) (also received October 10, 1995 report submittal)
- Keith West (GM Remediation Team)
- Jean Caufield (GM Remediation Team)
- Ken Gembel (GM Pontiac East)
- Jeff Braun (GM Legal Staff)
- Randy Alderson (GM Engineering)

PREFACE

This Report has been developed as a follow up to General Motor's (GM) meeting with the United States Environmental Protection Agency (U.S. EPA) at the Site on August 17, 1995. At the August 17, 1995 meeting, GM outlined the significant "brownfield" redevelopment activities which have been, and are currently being implemented at the Site. The August 17, 1995 meeting, coupled with this follow up Report, (and additional information to be submitted on Parcel C in December 1995) present the Site as it existed during the 1987 U.S. EPA Preliminary Review/Visual Site Inspection (PR/VSI) and how it exists today after significant brownfield redevelopment. As such, the August 17, 1995 meeting, and this Report, serve as a voluntary presentation of the current status of environmental conditions at the Site.

1.0 INTRODUCTION

1.1 GENERAL

Conestoga-Rovers & Associates (CRA) was retained by the General Motors Corporation (GM) to prepare this document entitled "Review of Existing Conditions Report, GM Truck Group, Pontiac East Assembly/Former Pontiac Central Manufacturing and Assembly Plants, A 'Brownfield' Redevelopment Project" (Report). This Report has been prepared for the GM Truck Group's Pontiac East Truck Assembly Plant, and former Pontiac Central Manufacturing and Assembly Plants facility (Facility or Site).

The Facility is situated on approximately 350 acres of land on which over 60 buildings were located prior to 1987. The Facility includes the existing Truck Engineering Center which is located at the west end of the Site. The Facility is generally bounded by South Boulevard, Opdyke Road, and the Grand Trunk Western Railroad in Pontiac, Michigan. The Site location is presented on Figure 1.1. The 1987 Site plan is presented on Figure 1.2. A current Site plan [showing the current (1995) Site redevelopment plans] is presented on Figure 1.3. An aerial photograph of the Site from 1985 is presented on Figure 1.4. A current aerial photograph (1995) of the GM Truck Product Center (formerly Pontiac Central) is presented on Figure 1.5.

1.2 OVERVIEW

Plan 1 presents the Facility as it existed in 1987. In 1991, the core of the Pontiac Central plant was closed and decommissioned. Since 1991, the Site has been extensively redeveloped from a "brownfield" site to present conditions. As indicated on Plan 1, the GM property areas north of South Boulevard identified as Parking Lots A, N, and J are also included. Several of the support features for the Facility that are readily identifiable on Plan 1 include: the North Storm Water Retention Pond; South Storm Water Retention Pond; Waste Water Treatment Plant; Murphy Drain; and the Power Plant.

The Site has been subject to significant redevelopment activities during the last four years. The core of the former Pontiac Central Manufacturing and Assembly Plants (Pontiac Central) has been demolished and rebuilt, or is being redeveloped, and is currently referred to as the Centerpoint Business Campus. The Pontiac East Truck Assembly (Pontiac East) has been substantially upgraded and continues to produce trucks. Additional development at Pontiac East is expected within the next few years.

To facilitate the review of current environmental conditions, the Site has been divided into three major parcels (A, B, and C), as presented on Figure 1.6 (Plan 2). The division of the Site was based upon the status of development in August 1995 in terms of whether GM has retained both ownership/occupancy of the property, whether the property was placed under a long-term lease arrangement with others, or whether the property has been sold (see Plan 2). As presented on Plan 2, Parcel A consists of one parcel, and Parcels B and C have been further subdivided into subparcels B1, B2, B3, and C1, C2, C3, and C4, respectively. Plan 2 also presents the current plan for redevelopment of a major portion of the Facility as the Centerpoint Business Campus. In addition to the restructuring and redevelopment of GM owned facilities, approximately 40 locations will be available for industrial, commercial, and recreational facilities.

Parcel A, which formerly contained the main manufacturing area of Pontiac Central, is now a portion of the Centerpoint Business Campus which includes the new GM Truck Product Center. This parcel has been sold to

a third party and leased back by GM. This was the first area to be significantly redeveloped on Site.

Parcels B1, B2, and B3, formerly parts of Pontiac Central and Pontiac East, are currently owned by GM and on a long-term lease with a developer. The GM Truck Product Development Center is currently under construction in Parcel B3. Various other portions of Parcels B1, B2, and B3 are under active negotiation between the developer and potential investors for construction, lease, and/or sale.

Parcels C1, C2, C3, and C4 are currently owned and operated by GM. Parcel C1 contains both the Power House and GM Truck Engineering Center. The Power House is scheduled for decommissioning within the 1996 to 1998 timeframe. The GM Truck Engineering Center buildings have undergone substantial renovation in the past few years. Additional renovations are planned. The GM Truck Engineering Center will continue to be the GM worldwide engineering center for truck design, testing, and prototype development. Parcel C2 contains the Pontiac East Waste Water Treatment Plant (WWTP). Parcel C3 contains the GM Pontiac East Truck Assembly Plant. The Pontiac East Truck Assembly Plant had substantial renovations in recent years and continues production as one of GM's major assembly facilities. Additional renovations to the Pontiac East Truck Assembly Plant are expected within the next few years. Finally, Parcel C4 contains the area known as Parking Lot J.

1.3 CENTERPOINT BUSINESS CAMPUS DEVELOPMENT

Parcels A and B of the Site are currently being redeveloped to become the Centerpoint Business Campus. GM currently employs approximately 4,500 people at its existing Truck Engineering Center and Pontiac East Truck Assembly Plant. The developer is currently (fall 1995) completing construction of the GM Truck Product Center. Over 3 million square feet of the former Pontiac Central area was decommissioned and/or demolished to create this new state-of-the-art engineering facility. More than 4,000 additional GM personnel will occupy the new GM Truck Product Center. Construction has also been initiated on a new GM Truck Product Development Center, which will

house approximately 1,500 additional GM employees utilizing office, design, and engineering areas.

Future Centerpoint Business Campus peripheral and northwest developments are planned to employ approximately 6,500 additional people. Adjacent developments which are contemplated (or under development) include:

- commercial areas (e.g., gas stations, convenience stores, etc.)
- shopping areas;
- restaurant areas;
- office areas;
- hotels; and
- fitness and entertainment areas.

An overview of the Centerpoint Business Campus is presented in various development promotional materials which are presented in Appendix A. Appendix A also contains relevant information pertinent to the GM Truck Groups Pontiac operations.

1.4 AREAS OF INTEREST

The purpose of this section is to present an overview of the Areas of Interest (AOIs) which are evaluated in this Report. The AOIs discussed within this Report were identified in the following manner:

- 38 Solid Waste Management Units/Areas of Concern identified by U.S. EPA in the 1987 PR/VSI; and
- 43 other areas of environmental concern identified by GM during Site redevelopment activities.

The 38 U.S. EPA Solid Waste Management Units/Areas of Concern and the 43 additional areas of concern identified by GM were sequentially renumbered from 1 to 81 and are collectively reviewed in this

Report. The following discussion further defines the AOIs as presented in this Report.

In March 1987, A.T. Kearney, Inc., and K.W. Brown and Associates, Inc., prepared a report entitled "Preliminary Review/Visual Site Inspection (PR/VSI) Report of the General Motors Truck and Bus Group Pontiac Michigan Plant". The PR/VSI was developed under contract to U.S. EPA Region V. The PR/VSI identified a total of 38 units, of which 32 were identified as Solid Waste Management Units (SWMUs, #1-#31, #17 is repeated twice), and six were identified as additional potential areas of concern (#32-#37). Plan 3 presents the areas identified by U.S. EPA in the March 1987 PR/VSI report. A summary of the areas identified by U.S. EPA in the 1987 PR/VSI is presented in Table 1.1. A current photographic log of the U.S. EPA PR/VSI areas is presented in Appendix B.1.

In Parcel A, there are six areas. Of the six areas in Parcel A, three were pits, two were tank farms, and one was a container transfer station. Parcel B1 contained an underground waste oil tank. Parcel B2 contains the former south retention pond. With the redevelopment of Parcel B2, a new south retention pond is currently being constructed in Parcel C3 and the existing pond is being removed. Parcel B3 contains the north retention pond. The north retention pond collects stormwater runoff from the parking lot north of Pontiac East. The north retention pond will continue to collect stormwater from Pontiac East and from the parking lot of the new Truck Product Center. The remaining PR/VSI areas were located in Parcel C. A summary of the remedial and investigative activities which have been completed to support redevelopment within these areas is presented in Section 5.0 and 6.0, respectively. The status of the 38 areas identified by U.S. EPA in the 1987 PR/VSI is presented in Sections 7.0, 8.0, and 9.0.

As identified above, the second group of areas of environmental concern were identified by GM to support redevelopment of portions of the Facility. Plan 4 identifies the 43 additional areas identified by GM that are located within Parcels A and B. Environmental activities, including investigation and remediation, have been completed by GM in these areas to support decommissioning and demolition of certain areas of the Facility as well

as to support redevelopment as the Centerpoint Business Campus. A summary of the additional GM areas of concern is presented in Table 1.2. The status of the 43 additional areas is presented in Sections 7.0, 8.0, and 9.0. A summary of the remedial and investigative activities which have been completed to support redevelopment within these areas is presented in Section 5.0 and 6.0, respectively

The entire 81 AOIs that have been identified on Site have been consolidated and are presented on Plan 5. These include the 38 areas identified by U.S. EPA in the PR/VSI and the 43 additional areas identified by GM. A summary of all AOIs at the Site are presented in Table 1.3.

It should be noted that the review of the AOIs contained in Parcel C is only of a preliminary nature. As discussed during the August 17, 1995 meeting with U.S. EPA, additional information regarding the AOIs within Parcel C will be submitted in December 1995.

1.5 SCOPE

The scope of this Report includes the following:

- a review of available information concerning the historical use of the Facility for the treatment, storage, or disposal of solid and hazardous waste;
- a review of available information regarding Site physiography, geology/hydrogeology, and other Site location features;
- a summary of remedial measures implemented at the Site to support general Site redevelopment;
- a summary of additional previous environmental investigations; and
- conclusions from existing data and a review of the requirements to collect additional data and/or complete additional remediation.

In addition, this Report contains a variety of appendices which present details regarding the various work plans, results, and remedial activities completed within the AOIs. The appendices include copies of the Site-wide Quality Assurance Project Plan (QAPP) and Health and Safety Plan (HASP) which were utilized to support environmental activities.

1.6 REPORT ORGANIZATION

This Report is organized into the following four Volumes:

1. Volume I - Summary Report

Section 1.0	introduction to and organization of the Report;
Section 2.0	background information including Site description, Site history, and RCRA permitting history;
Section 3.0	environmental setting at the Site;
Section 4.0	Site geology and hydrogeology;
Section 5.0	summary of previous remedial actions;
Section 6.0	summary of additional environmental investigations;
Section 7.0	review of the current status of the Areas of Interest in Parcel A;
Section 8.0	review of the current status of the Areas of Interest in Parcel B;
Section 9.0	review of the current status of the Areas of Interest in Parcel C; and
Section 10.0	summary.

Volume I also includes the following appendices:

Appendix A	Development Plan Promotional Materials	
Appendix B	RCRA Permit Materials	
	Appendix B.1	U.S. EPA Areas of Concern-Photographic Log
	Appendix B.2	Excerpts From The Part B Permit Application
	Appendix B.3	Work Plan For The Removal Of Two Aboveground Storage Tanks and A Concrete Containment Pad From The Hazardous Waste

		Storage Area Of The Pontiac East Assembly Facility In Pontiac, Michigan
	Appendix B.4	Closure Reports
	Appendix B.5	MDNR Closure Letters

2. Volume II - Appendices C to F

Volume II includes the following appendices:

Appendix C	Site Wide Work Plans	
	Appendix C.1	Site Wide Quality Assurance Project Plan
	Appendix C.2	Site Wide Health And Safety Plan
Appendix D	Regional Geologic Information	
	Appendix D.1	Regional Well Logs
	Appendix D.2	Mathematical Simulation Of Groundwater Flow Conditions Under GM's Truck And Coach Division, Pontiac Michigan (CDM 1981)
Appendix E	Buildings 29 Study Area	
	Appendix E.1	Final Report On Low Temperature Thermal Destruction, Building 29 And DUCO Stores
	Appendix E.2	Building 29 Underground Storage Tank Study Area Report
	Appendix E.3	MDNR Closure Letter
Appendix F	Building 43 Study Area	

	Appendix F.1	Final Report, Building 43 Study Area
	Appendix F.2	Project Specifications, Excavation Of Contaminated Material At Building 43

3. Volume III - Appendices G to K

Volume III includes the following appendices:

Appendix G	Building 53 Study Area	
	Appendix G.1	Site Characterization Report And Work Plan For Building 53 Waste Oil Tank
	Appendix G.2	Building 53 Underground Storage Tank Study Area Report
Appendix H	DUCO Stores Study Area	
	Appendix H.1	Final Report On The Findings Of The Soil Gas Survey At DUCO Stores
	Appendix H.2	Site Characterization Report And Work Plan For DUCO Stores
	Appendix H.3	DUCO Stores Study Area Report
Appendix I	"Burn Pile" Study Area	
	Appendix I.1	Summary Report, Burn Pile
Appendix J	DUCO Stores Fuel Line Study Area	

Appendix K Building 33 Study Area

Appendix K.1 Draft Subsurface Investigation/Remedial Alternatives Evaluation, Building 33 Free Product Gasoline Plume

Appendix K.2 Investigation Of Gasoline In Soils Beneath Building 33

Appendix K.3 Building 33 Free Product Report

4. Volume IV - Appendices L to M

Volume IV includes the following appendices:

Appendix L Building 33 Fuel Island Report

Appendix M J-Lot Study Area

Appendix M.1 J-Lot Work Plan

Appendix M.2 J-Lot EOC

Appendix M.3 J-Lot EECA

2.0 FACILITY DESCRIPTION

2.1 FACILITY LOCATION

The Site is located in the City of Pontiac, Oakland County, Michigan on approximately 350 acres of land, as shown on Figure 1.1. The Site is generally bordered by South Boulevard on the north, Opdyke Road on the east, and the Grand Trunk Western Railroad on the southwest. A Site plan is presented on Figure 1.2 (Plan 1). The division of the Site into parcels A, B, and C is schematically presented on Figure 1.3 (Plan 2).

2.2 FACILITY HISTORY

The Facility began producing medium and heavy duty trucks and buses in 1927 at the Pontiac Central manufacturing areas. Major manufacturing activities associated with the production of these vehicles included machining, stamping, plating, smelting, fiberglass laminating, heat treating, painting, and sealing. Manufacturing operations at the Pontiac Central portions of the Site ceased in August 1990 and portions of the Site were closed in the summer of 1991. The Site plan, as it existed in 1987, is presented on Figure 1.2 (see Plan 1). As previously identified, the Site has been divided into 3 parcels to support the evaluation of current Site conditions (see Figure 1.3/Plan 2).

Parcel A includes the core of the former Pontiac Central complex which was closed in 1991. Parcel A was decommissioned during the period from 1991 to 1995 and has been significantly redeveloped. Parcel A houses the new GM Truck Product Center. Currently, Parcel A is owned by a third party and is leased back by GM.

Parcel B includes portions of the former Pontiac Central and present Pontiac East operations. Parcel B is currently owned by GM and is leased to a developer which is redeveloping portions of the parcel to support a variety of commercial and business activities. These commercial and business

activities will support the GM Truck Product and Development Centers, as well as other general development in the area.

Parcel C is currently owned and operated by GM and includes the remaining portions of Pontiac East. These portions include the Pontiac East Truck Assembly Plant, Power Plant, WWTP, and Truck Engineering Center. These facilities have undergone significant upgrading since 1987 to support manufacturing. Certain areas within Parcel C are also scheduled for significant redevelopment and/or upgrading activities within the next five years.

Appendix A contains promotional information related to the Centerpoint Business Campus Development and GM Truck Group's Pontiac operations.

2.3 RCRA REGULATORY HISTORY

In 1981, GM submitted a RCRA Part A permit application to the U.S. EPA Region V, for treatment of hazardous wastes on Site, storage of hazardous wastes on Site over 90 days, and receipt of hazardous wastes from off Site. The Part A application was acknowledged by the U.S. EPA on August 3, 1981. A RCRA Part B permit application was submitted by GM in March 1985. At the time of the Part B permit application, the Facility was operating under RCRA interim status for ownership and operation of a facility which treated and stored hazardous wastes. GM requested withdrawal of the Part B application in July 1987. Two hazardous waste storage units identified in the March 1985 Part B Permit Application were successfully clean closed by GM under the RCRA regulatory authority of the Michigan Department of Natural Resources (MDNR). Closure certification for these two areas was received from MDNR on October 30, 1990 and July 27, 1991, respectively (see Appendix B.5). These two storage units are identified as U.S. EPA areas of concern #1 and #2 in Table 1.1 and their locations are shown on Plan 5.

A summary of the current status of the hazardous waste management units identified in the 1987 PR/VSI is presented below:

SWMU #1 - Container Storage Area (AOI #69)
- Active

SWMU #2 - Former East Tank Farm Area (AOI #75)
- Closed

SWMU #4 - Tank Storage Area (AOI #70)
- Inactive

SWMU #5 - Drum Draining Area (AOI #48)
- Active

SWMU #6 - Former Underground Tank Area (AOI #42)
- Under Closure consideration

SWMU #8 - Waste Purge Solvent Tank Area (AOI #72)
- Active

SWMU #13 - Former Waste Solvent Collection Area (AOI #2)
- Closed

SWMU #24 - Waste Pickle Acid Tank (AOI #61)
- Active

SWMU #26 - Pickle Acid Treatment Tank (AOI #63)
- Active

The following information related to the RCRA permitting history of the Site is presented in Appendix B:

Appendix B	RCRA Permit Materials	
	Appendix B.1	U.S. EPA Areas of Concern - Photographic Log
	Appendix B.2	Excerpts From The Part B Permit Application
	Appendix B.3	Work Plan For The Removal Of Two Aboveground Storage Tanks and A Concrete Containment Pad From The Hazardous Waste Storage Area Of The

Pontiac East Assembly Facility In Pontiac, Michigan

Appendix B.4 Closure Reports

Appendix B.5 MDNR Closure Letters

2.4 DESCRIPTION OF WASTE ACTIVITIES

The Part B Permit application indicated that the Facility generated the following listed wastes:

- F001
- F002
- F003
- F005
- F006
- F019
- D001
- D002

Hazardous waste processes at the Facility included temporary storage and limited treatment. Temporary storage processes consisted of container storage within secondary containment areas and storage in above-ground tanks located within diked containment areas. Relevant information regarding the waste activities is presented in Appendix B.2.

2.5 SITE WIDE ENVIRONMENTAL ACTIVITIES

The majority of the environmental investigative work, and all of the remedial work, has been conducted under the strict adherence to a Site wide Quality Assurance Project Plan (QAPP) and Health and Safety Plan (HASP). Copies of these plans are presented in Appendix C.1 and C.2, respectively. These documents were utilized to support environmental activities associated with Site redevelopment.

3.0 REGIONAL SETTING

3.1 LAND USE

The surrounding land uses to the north and west of the Site are presented on Figure 3.1. Land uses to the south and east of the Site are presented on Figure 3.2. Land uses in the vicinity of the Site are summarized as follows:

Location	*Jurisdiction*	*Land Use*
North	City of Pontiac	Industrial
East	Bloomfield Township	Residential
South	Bloomfield Township	Residential
West	City of Pontiac/Bloomfield Township	Various

All areas adjacent to the Site are serviced by municipal water supplies.

3.2 DEMOGRAPHICS

The populations within a three-mile, five-mile, and ten-mile radius of the Site, in 1990 and 1994, are summarized below:

	Population		
Location	*1990*	*1994*	*% Change (1990-1994)*
Three-mile	53,130	54,519	+2.6
Five-mile	171,040	174,349	+1.9
Ten-mile	708,384	729,197	+2.9

3.3 CLIMATE

The prevailing winds are from the northwest in the winter, and the southwest in the summer months. A wind rose diagram is presented on

Figure 3.3 which identifies the prevailing wind direction and speed. Precipitation data for the period 1931 through 1960, inclusive, indicate the mean annual precipitation to be 30.68 inches with 56 percent of the total precipitation falling during the period from May through October. This area is of a temperate climatic regime having average daily temperatures of 25° F and 72° F for January and July, respectively.

3.4 REGIONAL GEOLOGY

The information on the regional geology of the Site is based on published regional information, as well as other subsurface investigations performed on or in the vicinity of the Site.

3.4.1 Overburden

Topography and overburden in the vicinity of the Site are the result of glacial and post-glacial deposition and erosional processes. Continental glaciers advanced into this area of Michigan at least twice, once in each of the last two glacial stages of the Illinoian and Wisconsinan glaciers of the Pleistocene Epoch. During the Wisconsinan stage, ice sheets of the Huron-Erie glacial lobe advanced from the southeast across the area of the Site. During the advance and retreat of this ice sheet, a series of end moraines (Fort Wayne, Defiance, and Birmingham) and a thick sequence of ground moraine (glacial till) comprised of clay, silt, and rock fragments were deposited in this area. As the ice sheet retreated to the southeast, large volumes of meltwater formed glacial Lake Maumee between the Fort Wayne Moraine and the retreating glacier. The ice again advanced, forming the Defiance Moraine, and subsequently retreated, forming glacial Lake Arkona. As the ice advanced yet again from the east, the Birmingham Moraine was formed.

The surficial geology of the region is presented on Figure 3.4. As indicated on Figure 3.4, the Site is located in an area of terminal, or end moraine. In the area surrounding the Site, the end moraine material may vary

from slightly less than 100 feet to as much as 350 feet. The end moraine material is generally medium textured till with a dominant clay and silt matrix.

The regional well logs available for well locations shown on Figure 3.5 were used to construct an approximate east-west geologic cross-section which is presented on Figure 3.6. The well logs utilized to develop this section are provided for reference in Appendix D.1.

3.4.2 Bedrock

The Coldwater Shale, of Early Mississippian age, is the first bedrock formation encountered below the Site at an elevation of approximately 625 to 650 feet above mean sea level (AMSL) (to an approximate depth of 250 to 350 feet). This shale is dark brown to black, bituminous, fissile, and finely laminated. The Coldwater Shale may be as much as 1,300 feet thick in the vicinity of the Site. Located below the Coldwater Shale are sedimentary formations of the Berea Sandstone-Bedford Shale unit. Figure 3.7 presents the regional bedrock geology.

3.5 REGIONAL HYDROGEOLOGY

Groundwater resources in the Clinton and Rouge River watersheds exist in both the glacial drift and the bedrock of the area. In the region surrounding the Site, groundwater is encountered in four general water bearing units as discussed in the following subsections:

- unconfined water table zone;
- glacial till aquifer(s);
- lower sand and gravel aquifer; and
- bedrock aquifer(s).

3.5.1 Unconfined Water Table Zone

The upper glacial till of the area contains an unconfined water table which is influenced by seasonal precipitation, local drainage patterns, and topography. The water table is located at a depth of approximately 10 to 30 feet below the ground surface (bgs) and the saturated thickness is approximately 5 to 10 feet. The unconfined water table zone is not utilized for water supply purposes. The use of this zone as a potable supply would be generally prohibited by Michigan Department of Public Health regulations (i.e., it is at a depth of less than 25 feet) [Part 127 of Act 368 (Groundwater Quality Control), 1978]. This shallow water table, if present, would not be defined under Michigan Act 451 (Act 451), Part 201, as an "aquifer" for regulatory purposes. It should also be noted that the water table zone is locally absent in certain areas.

3.5.2 Glacial Till Aquifer(s)

The regional glacial till is quite extensive (both areally and vertically). The glacial till is approximately 250 to 350 feet in thickness in the vicinity of the Site. The glacial till moraines consist of poorly stratified clays, sand, and gravel that are not always continuous with depth. This material does not transmit large quantities of water and as a result, water bearing zones within this unit are not considered significant aquifers. However, in some areas, glacial outwash underlies the moraine material. In the vicinity of the Site, the outwash appears in a more complex, bedded sequence with the moraine. It is within these interbedded layers of outwash that larger quantities of water are yielded over longer periods of time. Figure 3.8 identifies the Site location within the regional aquifer characterization. Figure 3.8 identifies that the more usable aquifers are found at greater depths. As identified on Figure 3.9, impervious materials (e.g., aquitards) protect the lower aquifers from surface contamination in the general vicinity of the Site.

3.5.3 Lower Sand and Gravel Aquifer

The regional lower sand and gravel aquifer is glacial outwash that generally consists of beds of well-sorted sand and gravel. This aquifer unit underlies the glacial till and interbedded aquifers described above and shown on Figure 3.8. Although the lower sand and gravel aquifer is not widespread throughout southeastern Michigan, it is prevalent throughout the region of the Site where the outwash is in distinct channels. This unit is considered the most important aquifer in the region as it provides storage for large quantities of water that can be used for both residential and industrial supplies. The lower sand and gravel aquifer is considered to be protected from surface contamination by the more impervious overlying glacial till aquitards (Figure 3.9).

3.5.4 Bedrock Aquifer(s)

On a regional basis, the Coldwater Shale and the Bedford Shale are commonly considered nonproductive aquifers, typically yielding only small amounts of water. However, on a local basis, within parts of the region, the Coldwater Shale contains beds of sandstone. This occasional sandstone, and the Berea Sandstone where present, yield enough water for residential use. A more abundant water supply is found at impractical greater depths and with significant increases in mineral content. The bedrock water resources, like the more usable lower sand and gravel aquifer above them, are considered to be protected from surficial contamination (Figure 3.9).

3.6 REGIONAL HYDROLOGY

The area of the Site is within both the Clinton River and Rouge River basins. The Clinton River basin drains an area of approximately 760 square miles covering almost half of Oakland County and the majority of Macomb County. The Rouge River basin drains an area of approximately 467 square miles and covers portions of Oakland, Wayne, and Washtenaw Counties. The Clinton River discharges into Lake St. Clair to the east, while the

Rouge River discharges into the Detroit River, below Lake St. Clair. The Detroit River flows into Lake Erie. The boundaries of the river basins, with the location of the Site, are indicated on Figure 3.10.

Both river basins contain similar topographic features. Generally, the northwest is made up of undulating morainal hills with narrow sand and gravel plains in-between. The southeast is typically identified by relatively flat level lake plain. The two different areas are separated by relic beaches extending in a northeast direction.

4.0 SITE SETTING

The local setting of the Site, which is based on several subsurface investigations conducted on and in the vicinity of the Site, is presented in the following subsections:

Section 4.1 Site Geology;
Section 4.2 Site Hydrogeology; and
Section 4.3 Site Hydrology.

4.1 SITE GEOLOGY

The description of the geologic units discussed in this section is based upon numerous geotechnical and environmental investigations which have been completed at the Site. Typical cross sections, which are generally representative of the Site conditions, were developed during earlier investigations of Pontiac Central (Parcel A) and Building 33 (Parcel C1). The cross section locations, and associated cross sections, are presented on Figures 4.1 through 4.6. Additional details regarding Site investigations which have been completed are provided in Sections 5.0 and 6.0.

4.1.1 Surficial Fill Unit

The surficial materials encountered consistently throughout the Site are comprised of an interlayering mix of sand, gravel, clay, asphalt, concrete, and other fill. The fill unit ranges in depth from approximately 5 to 15 feet bgs (Figure 3.6). The fill zones encountered at the Site are a result of the various phases of construction which have been completed across the Site since the mid-1920s. Significant volumes of soil materials have been cut and filled during the general "leveling" of the Site which has occurred over the last 70 years. Underlying the surficial fill are the extensive glacial clay/till and interbedded sand and gravel units.

4.1.2 Clay/Till and Interbedded Sands Unit

A glacial clay/till deposit occurs immediately below the surficial fill materials at the Site. Based on Water Well Record logs of wells on or near the Site (see Appendix D.1), the clay/till is continuous across the area. The clay/till is comprised of clay, silt, sand, and gravel, and generally displays low to very low permeability. Numerous sand lenses and outwash channels of limited extent are also encountered within the clay/till.

The two predominant interbedded sand and gravel layers within the clay/till vary in thickness and depth. The first sand layer is about seven feet thick and was encountered in the vicinity of Parcel B1 at a depth of approximately 120 feet bgs. The second sand layer was medium to fine grained and was encountered more extensively within and to the south of the Site at approximately 150 feet bgs. The second sand layer ranged from 10 to 75 feet thick.

The clay/till and interbedded sands and gravels are shown on Figure 3.6, a subsurface cross-section of the Site, based on selected Water Well Records. The glacial till unit generally extends to a depth of about 230 feet bgs where a lower sand and gravel unit is encountered.

4.1.3 Lower Sand and Gravel Unit

Consistent with the regional glacial deposition, the lower sand and gravel unit is encountered at the Site underlying the clay/till and interbedded sand layers. The lower sand and gravel is identified in both Site well logs and nearby residential well logs. The unit is at an elevation of approximately 740 feet AMSL and a depth of about 200 to 220 feet bgs, and may be as thick as 20 to 80 feet. Figure 3.6 shows this lower sand and gravel unit on the regional cross-section.

4.1.4 Coldwater Shale

The Coldwater Shale is the first bedrock formation encountered below the Site. The shale is dark brown to black, bituminous, fissile, and finely laminated. Water well records of test wells drilled along the Grand Trunk Western Railroad, south of the Site, show the shale with associated sandstone and over consolidated clays encountered at about 290 feet bgs.

4.2 SITE HYDROGEOLOGY

The individual hydrogeologic units identified at the Site are discussed in the following sections.

4.2.1 Unconfined Water Table Zone

Shallow unconfined groundwater has been encountered in several areas of the Site, generally at depths of 10 to 20 feet bgs. This groundwater is perched above the clay till in layers of fill material or sand (or sand and gravel) seams of limited extent. As the clay till layer is approximately 100 feet thick between the perched groundwater and the interbedded confined sand aquifer, the perched groundwater is not considered to be hydraulically connected with the lower water bearing zones. It should also be noted that the water table zone is not considered to be an "aquifer" and is locally absent at a variety of locations on Site.

4.2.2 Clay/Till Aquitard and Interbedded Sand Aquifer

In 1981, Camp Dresser and McKee (CDM) performed a hydrogeologic assessment of the Site. The results were presented in a report entitled "Mathematical Simulation of Groundwater Flow Conditions under GM's Truck and Coach Division, Pontiac, Michigan" (CDM, 1981). A copy of this report is presented in Appendix D.2.

The CDM report identifies three primary sand and sand/gravel aquifers beneath the Site. These aquifers occur at depths of 120, 150, and 210 feet bgs, and are approximately 7, 25, and 50 feet thick, respectively.

The "120-foot aquifer" was identified in the well log record of supply well number 7 (Building 43) as a sand aquifer. This aquifer is no longer utilized by the Site for water supply.

The "150-foot aquifer" was used for industrial water supply by the Facility, by means of two wells [#3 (Building 29) and #6 (Building 66)] which were screened in this aquifer. The material in this aquifer unit was identified to consist of medium to fine grained sand.

The "210-foot aquifer" was also utilized by the Facility for industrial water supply (well #7). All portions of the Facility are currently serviced by municipal water.

4.2.3 Lower Sand and Gravel Aquifer

The lower sand and gravel aquifer has been encountered underlying the clay/till aquitard at approximately 210 to 220 feet bgs. Consistent with the regional description of local outwash channels, this aquifer has been used to support industrial wells on Site and residential wells south of the Site.

The lower sand and gravel aquifer is confined by the clay/till aquitard sequence above. This aquifer may also be confined by the Coldwater Shale below.

4.2.4 Coldwater Shale

The Coldwater Shale is not considered a usable aquifer beneath the Site. Because it is overlain by the productive Lower Sand and Gravel Aquifer, the Coldwater Shale may be considered an aquitard with its relatively low permeable material. Available water well records for wells drilled along the

Grand Trunk Western Railroad south of the Site show the shale encountered near 290 feet bgs (no elevation control was available).

4.3 SITE HYDROLOGY

The Site is located at the divide between the Clinton and Rouge River drainage basins. Construction activities at the Site have influenced the divide, and the Site now drains to the Clinton River, through the Murphy Drain. Surface water drainage ultimately discharges to Lake St. Clair, about 20 miles east and southeast from the Site. The Site location, as related to the Clinton River Basin, is presented on Figure 3.10.

5.0 SUMMARY OF PREVIOUS REMEDIAL ACTIONS

The following sections present a summary of three additional AOIs identified by GM, which represent previous major remedial actions that were performed at the Site after 1991.

5.1 PARCEL A

5.1.1 Former Building 29 Tank Farm (AOI #16)

Nine 12,000-gallon steel USTs were installed near the south wall of the exterior of Building 29 in 1946. The tank farm was taken out of service during the summer of 1991 and the tanks were excavated and removed in October 1991. BTEX and PNA constituents were identified in the soils surrounding the former tank farm in confirmatory samples taken at the time of the UST removal. The tanks appeared undamaged during excavation. The soil contamination was, therefore, assumed to be due to routine filling operations. The location of the former Building 29 tank farm remediation area is presented on Plan 5.

The construction and contents of the tanks in the Building 29 tank farm are summarized below.

Building 29 Tank Contents/Construction

Tank No.	*Material*	*Tank Const.*	*Tank Size (gallons)*	*Year Inst.*	*Pipe Const.*	*Pipe Buried*
1	Eng Oil	Steel	12,000	1946	Steel	No
2	15w 40 Eng Oil	Steel	12,000	1946	Steel	No
3	10w 30 Eng Oil	Steel	12,000	1946	Steel	No
4	A90 Trans Oil	Steel	12,000	1946	Steel	No
5	P/S Fluid	Steel	12,000	1946	Steel	No
6	Axle Fluid	Steel	12,000	1946	Steel	No
7	Auto Tr Fluid	Steel	12,000	1946	Steel	No
8	Axle Fluid	Steel	12,000	1946	Steel	No
9	Eng Oil	Steel	12,000	1946	Steel	No

GM notified the Michigan State Police-Fire Marshal Division (MSP-FMD) office on October 16, 1991, that a confirmed release (i.e. residual soil contamination) had occurred at the former Building 29 tank farm. Notification of the release was made based on the analytical results of soil samples taken to satisfy the Fire Marshal's site assessment requirements.

Notification of the release was followed by 20-Day and 45-Day reports submitted to the MDNR Environmental Response Division (ERD) in accordance with LUST requirements. A Corrective Action Plan (CAP) was submitted to the MDNR-ERD on March 16, 1992. Revised pages for the CAP were submitted to the MDNR-ERD on April 30, 1992. The CAP was approved by the MDNR, with changes to the Sampling and Analysis Plan as proposed in GM's June 10, 1992 letter, on June 26, 1992.

Approximately 3,000 cubic yards of soil were removed from the Building 29 tank farm excavation and stored west of the Study Area on the asphalt paved parking lot. The dimensions of the excavation were approximately 130 feet from north to south, 40 feet from east to west, and 17 feet deep. The perimeter of the base of the excavation was 340 feet and the surface area was 5,200 square feet. Excavation on the east side wall was restricted due to bank stability concerns (due to the presence of a steep slope).

A 45-Day report (Maecorp, November 1991), and the Corrective Action Plan (CAP) (June 1992), both state that following receipt of initial verification sampling results, additional soil (approximately 10 cubic yards) was removed from the base of the excavation, and six additional verification samples were collected and analyzed for PNAs. The analytical data for these six samples (non-detect for all PNAs) was presented as Appendix I to the CAP. These samples were taken from the locations of the original verification samples.

Five cubic yards of soil were removed from the excavations in the sidewall area to address elevated benzene levels found. A second confirmatory sample was obtained and analyzed for benzene. Benzene was not detected in the second confirmatory sample.

During the corrective action (undertaken for GM by M. L. Chartier of Detroit, Michigan) in June 1992, contaminated soils were removed and thermally treated. Verification samples were collected in general accordance with the requirements for soil cleanup verification. Four water samples were collected from the base of the excavation in lieu of soil samples due to the presence of water in the excavation. The source of this water was from a water leak in the fire deluge tank (located to the northeast of the excavation). The collection of water samples was deemed unacceptable by MDNR in determining soil cleanup verification.

The soils excavated from the tank area were thermally treated on site. All thermally treated soils were verified non-detect for BTEX and PNAs. The soil was then used as backfill for the tank excavation, or stockpiled along the side of the access road to Building 29, which ran south from the building. A copy of the thermal treatment report for Building 29 is presented in Appendix E.1.

Verification samples could not be collected from the east and south sidewalls of the excavation due to bank stability concerns. Therefore, confirmatory sampling was performed through the installation of seven boreholes following backfilling of the excavation. Areas of PNA contamination above the then current Type B criteria were identified on the east side of the excavation in several boreholes installed by WW Engineering & Science (WWES) in December, 1992.

A final subsurface investigation of this site was conducted by CRA on behalf of GM in January 1994, in order to address remaining comments provided by the MDNR (letter dated November 19, 1993) regarding past UST closure efforts and the previous investigation conducted by WWES.

CRA's investigation included the installation of six additional boreholes to collect soil samples from the former base of the UST excavation, and on the east wall of the former excavation. Other areas of the excavation were previously sampled and confirmed to be closed (Maecorp, November 1991).

The results of the investigation were presented in CRA's February 10, 1995 report (see Appendix E.2). The report concluded that the remediation effort conducted during the UST closure had been successful and that no additional remedial effort was required. This report was accepted by the MDNR by letter dated March 17, 1995 and thus the Building 29 USTs are considered "closed". The MDNR letter stated that this area was removed from the Michigan list of contaminated sites under the former Michigan Environmental Response Act, 1982 PA 307 (see Appendix E.3).

Building 29 was subsequently demolished as part of the redevelopment work and its former location is now a portion of the parking lot for the new Truck Product Center.

5.2 PARCEL B

5.2.1 Building 43 Remediation (AOI #44)

In June 1993, WWES and GM conducted a test excavation of this area to obtain a visual assessment of the extent of potentially affected material in the vicinity of Building 43. The location of the Building 43 remediation area is presented on Plan 5. In August 1994, CRA conducted an additional subsurface soil investigation to substantiate the visual data using soil analytical data. The fill material located adjacent to Building 43 was identified to be comprised of ash and miscellaneous debris. Chemicals of concern for closure activities included volatiles, PNAs, and metals. Based on the visual and analytical data, CRA prepared a report (see Appendix F.1).

CRA subsequently prepared Project Specifications for the Excavation of Contaminated Material at Building 43 for GM in April 1995. The specifications were finalized, a contractor procured, and excavation initiated on July 31, 1995. The excavation was completed in early September 1995. A total of approximately 11,000 cubic yards of material was disposed of off Site. Verification of the removal of impacted material was accomplished through the collection of approximately 40 soil samples from the floor and sidewalls of the

excavation. Closure of the excavation was obtained using Act 451 [Natural Resources and Environmental Protection Act (NREPA)], Part 201, soil cleanup standards.

The Project Specifications utilized to complete the Building 43 remediation are presented in Appendix F.2. A construction report for the Building 43 remediation is currently under development.

After remediation of the contaminated fill adjacent to the building, the demolition contractor initiated activities. Building 43 was demolished during September 1995 to support further Site redevelopment.

5.2.2 Former Building 53 Tank Area (AOI #42)

In August 1991, a 1,000-gallon waste oil steel underground storage tank (UST) was removed from the Building 53 area. The location of the former Building 53 tank area is presented on Plan 5. The tank was originally installed in 1972, for the temporary storage of waste oil, and was found to be in excellent condition upon removal. In November 1991 excavation of the Building 53 UST Study Area was completed. Following characterization, the excavated soils were approved for, and disposed of, at a landfill.

Following the excavation and removal of the tank, soil samples were collected from the excavation, in accordance with MDNR guidelines for verification of soil remediation, to confirm clean closure of the Study Area. Four sidewall and two excavation floor samples were collected and analyzed for lead, cadmium, chromium, BTEX, and PNAs. The analytical data identified BTEX and PNA constituents at levels exceeding the then current Type B criteria in all samples except one which was taken from the east wall of the excavation. Based on the analytical results from the sampling, waste oil related soil contamination was identified and reported on October 22, 1991.

In accordance with the Michigan LUST Act (Act 478), 20-Day and 45-Day reports were prepared and submitted. The 20-Day report was prepared and submitted by GM on October 30, 1991. The 45-Day report was

prepared by Maecorp Incorporated (Maecorp), on GM's behalf, and submitted on December 2, 1991. In the 45-Day report, it was concluded that the waste oil related contamination was due to routine tank operations (e.g., filling and removal activities).

Additional excavation of the Building 53 UST Study Area was completed during November 1991. The limits of the excavation were defined by additional sampling of the excavation sidewalls and floor at previously sampled locations. At the floor locations, samples were taken at the ground surface, and at 1-foot, 2-foot, and 3-foot depths below ground surface. Based on the BTEX and PNA analytical results for these additional samples, the horizontal excavation limits were increased approximately 3 feet to the north and south, and the vertical excavation depth increased from 10 feet to 15 feet bgs. The excavated soils were stockpiled on plastic sheeting, covered, and the excavation backfilled. Composite samples of stockpiled soil were collected and analyzed to determine disposal requirements. Following characterization, the excavated soils were approved for, and disposed of, at a landfill.

The final dimensions of the excavation were reported to be approximately 27 feet from north to south, 13 feet from east to west, and 15 feet deep. The total volume of soil excavated was approximately 190 cubic yards (based on the dimensions of the excavation and volume of the tank).

As groundwater was not encountered during either UST removal or additional excavation activities, and the extent of BTEX and PNA residual soil contamination had been defined, clean closure of the Building 53 UST Study Area was requested by GM on January 22, 1992. The original verification samples (August 1991) did, however, identify levels of lead (24 to 38 mg/kg) and chromium (21 to 35 mg/kg) in the soil, which exceeded Michigan Type A soil standards (e.g., background default inorganic levels).

A supplemental subsurface investigation of the UST area near Building 53 was conducted by CRA on behalf of GM in January 1994, in order to address comments provided by the MDNR (letter dated November 19, 1993) regarding past UST closure efforts. Further information is provided in Appendix G.1.

CRA's investigation included a literature search to further define local background concentrations for lead and chromium and the installation of four boreholes in the area to further define the geology, hydrogeology, and nature of lead and chromium concentrations in area-wide soils, including background conditions. The investigation report dated February 11, 1994, concluded that lead and chromium concentrations previously reported were typical of background levels and that additional remediation was not required. This report was submitted to the MDNR (see Appendix G.2). Responses to MDNR comments on the report were subsequently submitted on March 28, 1994.

After the completion of the remediation activities, and associated decommissioning activities, Building 53 was demolished. This area is currently available for redevelopment. Closure certification of the former Building 53 tank area is currently under consideration by the MDNR.

5.3 PARCEL C

5.3.1 DUCO Stores Remediation (AOI #50)

The DUCO Stores UST area consisted of eight steel tanks, installed in 1927, when the facility was originally constructed. The tanks were numbered one to eight, from south to north. The location of the DUCO Stores Remediation area is presented on Plan 5.

Available information regarding tank construction and contents is provided as follows:

DUCO Stores UST Data

Tank No.	*Material*	*Tank Mat'l*	*Tank Size (gallons)*	*Year Installed*	*Pipe Mat'l*	*Pipe Buried*
1	Gasoline	Steel	12,000	1927	Steel	No
2	Gasoline	Steel	12,000	1927	Steel	No
3	RR End Lube	Steel	12,000	1927	Steel	No
4	Glycol	Steel	12,000	1927	Steel	No
5	Axle Oil 80w90	Steel	12,000	1927	Steel	No
6	#1 Diesel	Steel	12,000	1927	Steel	No
7	#1 Diesel	Steel	12,000	1927	Steel	No
8	#1 Diesel	Steel	12,000	1927	Steel	No

On February 2, 1990 gasoline odors were detected in the Pontiac Central Power House (located to the south of DUCO stores). The source was found to be gasoline which was infiltrating a 12 inch diameter sanitary sewer line which drains northerly from the power house through Building 34. This sanitary sewer runs immediately to the west of the former DUCO Stores UST area.

A pneumatic plug was inserted in the sewer line south of Building 34, and the sewer contents removed, as necessary, by vacuum tanker truck.

In May 1990, a second gasoline release was discovered near the DUCO Stores tank farm. The gasoline was discovered infiltrating into a storm sewer which was located near the Study Area. The sewer was plugged and sewer contents collected through the use of a vacuum tanker truck.

In order to further define the extent of the gasoline plume, GM retained Northeast Research Institute, Inc. (NERI) to perform a soil gas survey of the area in June 1990. The survey consisted of a grid of 53 sample points, installed to a depth of approximately 18 inches bgs, which covered the DUCO Stores UST area, the hazardous material handling storage pad, and loading area. The findings of the soil gas survey were presented to GM by NERI in a September 19, 1990 report entitled "Final Report on the Findings of the

Petrex Soil Gas Survey Conducted for the General Motors Truck and Bus Group at the DUCO Stores Tank Farm Site in Pontiac Michigan" (NERI, 1990) (see Appendix H.1).

The following conclusions were made regarding soil vapors in the DUCO Stores Study Area:

- compounds typically found in gasoline were identified in soil vapors. Concentrations indicted that the likely source was the gasoline tanks in the DUCO Stores, near Building 21; and

- a plume of oil constituents (likely from medium grade oil) was identified. Its source was identified as being in the DUCO Stores UST area, based on concentration data.

Between August 20, 1991 and August 29, 1991, the eight tanks were excavated and removed from the area. During the UST removals, visible evidence of a release was not observed. Therefore, the excavation was sampled to satisfy the site assessment requirements of the MSP-FMD UST rules on permanent UST closures. The results of the site assessment are discussed below.

On September 5, 1991, prior to receipt of the analytical data from the site assessment, diesel fuel was observed to be seeping into the excavation at the north end. The MSP-FMD was notified and corrective actions to recover the diesel fuel were implemented immediately. Approximately 100 gallons of diesel fuel was recovered before seepage ceased.

On September 20, 1991, a 20-Day report was submitted to the MDNR detailing the abatement measures taken subsequent to the diesel release. These measures included the immediate implementation of a plan to recover the diesel fuel from the excavation floor. A 45-Day report was prepared and submitted to the MDNR by Maecorp Incorporated (Maecorp) on August 14, 1991.

Confirmatory sampling was conducted on soils at the base and on the side walls of the open excavation. The results of the confirmatory analytical data were compared with the then current Act 307 Type B direct contact criteria. Due to the significant depth to the first aquifer (approximately 120 feet), and the impermeable nature of the clay soils, the 20x drinking water criteria were considered to be inappropriate. Only five of the thirty six confirmatory samples reported concentrations of benzene or PNAs which were above the then current Type B direct contract criteria. The exceeded parameters included benzene, benzo(a)anthracene, and chrysene. With respect to the then current Type C criteria (MDNR Industrial Cleanup criteria), only benzo(a)anthracene was exceeded in one sample.

Further excavation of the east and west walls was not possible due to the location of existing structures including: buildings, concrete sewers, and a concrete storage pad. However, additional excavation of the base was conducted.

Following the receipt of analytical results from composite samples collected from the soil pile, M.L. Chartier was contracted by GM to perform thermal treatment of the excavated soils. The soils were characterized following treatment and certified by M.L. Chartier as being clean (see Appendix E.1). Approximately 3,000 cubic yards of soil from DUCO Stores were treated by M.L. Chartier. This material was stockpiled on Site.

After excavation of the soil, verification soil samples were collected and submitted for BTEX and PNA analyses. Low residual concentrations, exceeding their respective then current Type B soil cleanup criteria were identified. These soils were found to be limited in extent near the excavation. Further excavation of the east and west walls was not possible (due to existing structures, sewers, etc.), however further excavation of the base was conducted. Sampling results of the excavation floor collected during sampling events in September 1991 and April 1994 indicated no residual BTEX or PNAs at concentrations exceeding the then current Type B direct contact soil values. No additional investigation of the excavation base was required and the excavation was backfilled with clean fill.

Due to the discovery of diesel fuel in the open excavation, CRA was retained to further define the nature and extent of the residual soil contamination in the area. CRA conducted a subsurface investigation including a total of six boreholes installed in January 1994. Soil samples were collected from the boreholes and submitted for BTEX and PNA analyses. A report was prepared and submitted to GM in May 1994. The report indicated that minor residual concentrations of BTEX and PNAs remained in soils at inaccessible locations. The report concluded that no additional work was required to obtain closure for the Site (see Appendices H.1, H.2, and H.3).

5.3.2 Burn Pile Remediation (AOI #71)

The evaluation of the "Burn Pile" had been ongoing since November 1993. The location of the Burn Pile Study Area is presented on Plan 5. The initial investigation was begun by GM personnel and continued by Cook & Associates, Inc., an environmental consulting firm, retained by GM. CRA became involved in the evaluation initially to coordinate the field activities associated with the project. CRA was retained on an as required basis, to continue the investigation.

An overview of activities completed at the Burn Pile is presented in the following sub-sections:

- Phase I Investigation/Excavation;
- Phase II Investigation/Excavation; and
- Off-Site disposal.

5.3.2.1 Phase I Investigation/Excavation

The Phase I investigation at the Burn Pile Study Area began in November 1993. An extensive sub-surface soil investigation was subsequently conducted at the Study Area in March, 1994 by Cook & Associates, Inc. (Cook). In April, 1994 CRA was retained by GM to coordinate field activities at the Burn Pile Study Area and to provide services on an as requested basis. Seventy-six

(76) boreholes were advanced into the native clay/till underlying the Study Area. The boreholes were located on a 50-foot grid initially, and later on a 25-foot grid to better delineate the materials within the Burn Pile Study Area.

In July, 1994 a portion of the Burn Pile was excavated and segregated into "potentially clean" and "potentially affected" soil stockpiles by Barton Malow for GM (to support redevelopment).

Information obtained in the Phase I investigation was used to delineate "potentially clean" and "potentially affected" soil within the Burn Pile Study Area. GM personnel reported that the soil was segregated using this delineation information and by visual observations.

It was reported by GM that approximately 35,500 cubic yards of material was excavated, segregated and stockpiled within the Burn Pile Study Area during the Phase I excavation. Approximately 32,000 cubic yards were stockpiled as "potentially clean" soil, and 3,500 cubic yards were stockpiled as "potentially affected".

5.3.2.2 Phase II Investigation/Excavation

A Phase II field investigation was conducted by CRA from August 10, 1994 to August 26, 1994, after odors were reported by a GM contractor during earth moving operations at the Site (associated with Site redevelopment activities). The investigation was conducted to characterize the nature and extent of affected or potentially affected material remaining at the Burn Pile Study Area after the Phase I excavation. The investigation consisted of the installation of twelve boreholes and four temporary monitoring wells. Soil and groundwater samples were collected and submitted for chemical analysis.

The Phase I and Phase II investigations provided GM with estimated quantities of soils requiring off-Site disposal.

5.3.2.3 Off-Site Disposal

In the Phase II excavation, during the period from October 13, 1994 to October 18, 1994, approximately 6,500 cubic yards of soil, including the Phase I potentially affected soils as well as additional in situ soils, were excavated, loaded, and transported to Waste Management's Eagle Valley Recycling and Disposal Facility in Orion, Michigan.

Verification Sampling

Approximately six inches of soil was removed from underneath the stockpiled soil to ensure that all affected soil was removed and disposed of properly. The limits of the excavation were determined in the field based on the results of the Phase II investigation and field screening of head-space samples with a PID, with the exception of the western edge of the excavation.

The western edge of the excavation was approximately five feet west of the right of way clearance for the Centerpoint Parkway. The west wall of the excavation appeared to contain affected soil and no verification samples were collected.

Once head-space readings from the PID meter indicated no further contamination was detectable (i.e., <1 meter unit), verification samples were collected in accordance with MDNR guidance on verification sampling, with the exception of the west side wall.

Following receipt of the analytical results, one sample was identified to contain constituents above the then current Michigan Type B 20x Drinking Water Cleanup Criteria for soil. An additional excavation of approximately 20 cubic yards of soil was undertaken on December 20, 1994. An additional verification sample was collected. The analytical results of this additional sample indicated that all compounds were below the then current Michigan Type B 20x Drinking Water Cleanup Criteria.

The Phase II excavation was backfilled with clean aggregate by Barton Malow under the direction of GM.

The environmental activity in the Burn Pile Study Area that was associated with the Centerpoint Parkway has been completed. The remaining portion of the Burn Pile is located in Pontiac East. An overview of the Burn Pile activities is presented in the final Summary Report (Appendix I).

6.0 SUMMARY OF PREVIOUS ENVIRONMENTAL INVESTIGATIONS

The following sections present a summary of four additional AOIs identified by GM, which represent previous major environmental investigations that were performed at the Site after 1991.

6.1 PARCEL C

6.1.1 DUCO Stores Fuel Line Study Area (AOI #50)

The investigation of the DUCO Stores Fuel Line evaluated the current status, and results of additional investigations conducted to resolve the outstanding environmental issues. These issues were identified in the Phase II Study area investigation performed by WWES in 1992. The requirements of the LUST Act (P.A. 478, 1988 as amended by Act 645 of 1993) were followed, since the environmental issues within the Study Area were the result of the operation of an UST fuel delivery system. The general location of the Study Area is presented on Plan 5.

WWES installed 12 soil borings and three monitoring wells in Building 11, in the north end of Building 12, and within Building 27. Samples were collected and analyzed for BTEX and lead (water samples only).

The results of the analytical work by WWES identified BTEX constituents at levels exceeding the then current Type B soil cleanup levels for soil in five soil borings. These elevated concentrations were found in both a clay layer and underlying sand lens. The clay layer and sand lens occur approximately between 5 and 15 feet bgs. Analysis of perched water samples collected from three monitoring wells identified concentrations of BTEX constituents and lead above the then current Type B Drinking Water criteria. It should be noted that the perched water zone is not an aquifer and is of limited extent.

In order to further define the extent of the sand lens in which evidence of a gasoline vapor was detected, seven boreholes were installed by CRA in the vicinity of the fuel line in January 1994.

One borehole was installed north of Building 11 in the parking lot area (BHFL7-94), and three boreholes were installed surrounding the previous WWES boreholes in Building 11.

Three additional boreholes were installed by CRA along the alignment of the fuel line further to the south in order to assess the extent of possible, residual gasoline along the length of the fuel line. Samples were collected from each borehole for chemical analysis for BTEX and lead. The results of the analysis did not identify any further areas of residual BTEX constituents in soil at levels of concern.

As part of the redevelopment of the property, a storm sewer was installed through the study area, at a depth of approximately 20 feet, in March 1994. Based on WWES findings, the excavation should have intersected perched water. However, the excavation remained dry indicating that the perched water is minor in extent and/or seasonally dependent. In order to further confirm that perched water did not extend significantly, CRA installed three test excavations in the area. These excavations also remained dry.

CRA's June 1994 final report to GM concluded that no additional investigation or remediation is required or warranted within this area (see Appendix J).

6.1.2 Building 33 Free Product Investigation (AOI #53)

Studies were performed by Gilbert/Commonwealth, Inc. of Michigan and E.C. Jordan Co. [now ABB-Environmental Services, Inc. (ABB-ES)] to determine the nature and extent of the free product discovered during an investigation for new building foundations. The results of these studies indicated that gasoline is trapped in a sand lens under Building 33. The gasoline

was estimated to have an approximate volume of 2,000 gallons. The location of the free product investigation is presented on Plan 5.

To further define the extent of the soils affected by the gasoline, CRA conducted a subsurface investigation of the area which included the installation of 19 boreholes. Four boreholes were installed within the building to redefine the edge of the free product. An additional fifteen boreholes were installed around the perimeter of the study area to investigate if gasoline constituents had migrated significantly. Soil samples were screened using a photoionizing detector and submitted for chemical analysis of BTEX and lead. Appendix K presents the results of investigation of gasoline in soils beneath Building 33.

A monitoring well was installed within one of the interior boreholes to permit sampling of free product and measurement of gasoline thickness.

A free product pumping test was conducted by CRA to assess the feasibility of collecting the gasoline utilizing extraction well methods.

A draft report was prepared and submitted to GM on April 17, 1995 (see Appendix K). The report presented several remedial alternatives which could be utilized for the possible removal of the gasoline.

6.1.3 Building 33 Fuel Island Investigation (AOI #51)

Once manufacturing operations at the Facility ceased in August 1990, and the Facility was closed in the summer of 1991, the USTs which were no longer in service were removed. The investigation of the fuel island study area was to evaluate the current status with respect to outstanding environmental issues identified by the MDNR in their letter dated November 19, 1993. The Building 33 fuel island is located south of Building 33, in an asphalt parking area. The location of the fuel island is presented on Plan 5.

During the investigation, waste oil product was identified in the vicinity of the UST and the Building 33 - Fuel Island. Since the environmental issues within the fuel island investigation study area are the result of the operation of an UST system, the requirements of the LUST Act (P.A. 478, 1988 as amended by Act 645 of 1933) must be addressed.

There is a concrete pad surrounding the fuel island and covering two 12,000-gallon fuel tanks. In the past, a 10,000-gallon tank which contained diesel fuel was removed from the present location of the fuel island, and the fuel island was reconstructed (including installation of the two tanks now present). A release was documented in 1991 and MDNR records indicate that contaminated materials (from a diesel release) may still exist within the Study Area. MDNR records also indicated that 20-Day and 45-Day reports were submitted by GM.

CRA submitted a draft report to GM on this study area in January 1994 recommending further investigative activities (see Appendix L).

6.1.4 Former J-Lot Fill Area (AOI #79)

An initial subsurface investigation of the J-Lot fill area was conducted by ERM in May 1994. The ERM investigation identified the extent of "Potential Petroleum Contamination" at the Site by means of a series of boreholes. However, the report indicated that additional investigation was required to more suitably identify the extent of contamination. The PR/VSI identified this AOI to the north of South Boulevard. The location of the former J-Lot fill area is presented on Plan 5.

In an effort to more suitably identify the extent of contamination, an additional investigation was conducted by CRA to further define the extent of affected soils. The investigation was conducted in August 1994, and consisted of the excavation of 24 test trenches. In general, the excavations identified mixed rubble fill and soil to depths of 1 to 13 feet below grade. Materials deposited in the fill were suspected to be potential sources for contamination.

Based on the findings of the investigation it was determined that an additional broader investigation was warranted to identify any possible migration pathways for constituents encountered. As a result, an Extent of Contamination/Engineering Evaluation and Cost Analysis (EOC/EECA) Work Plan was prepared. The Work Plan was implemented in August and November 1994. The EOC/EECA Work Plan is presented in Appendix M.1.

The characterization of the nature and extent of affected or potentially affected materials at the Site was achieved by conducting a variety of Site investigative activities. The field investigation at the Site included the following activities:

- Site survey and base plan preparation;
- installation of 17 boreholes;
- installation of six monitoring wells;
- collection of soil samples for laboratory, chemical, and geotechnical analysis;
- collection of groundwater samples for laboratory chemical analysis; and
- water level measurements in all monitoring wells.

In order to characterize the subsurface conditions within, around, and below the fill materials, 17 boreholes were completed. The boreholes were advanced to depths of 16 to 44 feet bgs. Eleven of the boreholes were advanced to a depth of approximately 5 to 10 feet into the native clay soils which underlie the surficial fill material. Six of the boreholes were advanced approximately 30 feet into the clay to investigate the hydraulic properties of the clay aquitard. Six groundwater monitoring wells were installed.

In order to provide a vertical profile of potential contamination, two to four fill/soil samples were collected from each borehole and submitted for chemical analysis.

A glacial clay/till deposit exists immediately below and around the fill material in the area. The clay/till unit is continuous across the Site. Borehole stratigraphic logs indicate this clay layer extends to a depth of at least 44 feet bgs at the Site. The thickness of this clay/till unit was not

determined by on Site borings but is reported to be approximately 100 to 250 feet thick (based upon regional information).

The Site hydrogeology was characterized through the installation of 17 boreholes, six monitoring wells, static water level measurements, and laboratory geotechnical tests. In general, no distinct hydrostratigraphic units were identified at the Site. Only perched, discontinuous water zones were identified to exist within the glacial clay/till during the Site investigation. The lack of a continuous water bearing zone, and the low hydraulic conductivity of the glacial clay/till, combine to effectively limit the flow of groundwater on or off Site.

The location of chemical sources and residual compounds were further defined by the EOC investigation. Soils were found to exceed the then current Michigan Type B residential criteria, and in some cases, the Michigan Type C industrial criteria. However, the extent of exceedances was limited to within the J-Lot area boundary. No potential pathways for off-Site migration were identified. The EOC Report is presented in Appendix M.2.

In addition, an EECA report was prepared for the Site by CRA and provided to GM. The report presents potential remedial alternatives for the Site. The EECA Report is presented in Appendix M.3.

7.0 PARCEL A AREAS OF INTEREST

As presented on Figure 1.6, the Site has been divided into three distinct areas comprised of Parcels A, B, and C. The Parcel A AOIs include those areas of concern previously identified by U.S. EPA in the PR/VSI in addition to other areas of environmental concern identified by GM. The AOIs identified in Parcel A include six areas of concern identified in the PR/VSI and 35 additional areas which were identified by GM. The PR/VSI and GM areas are summarized in Table 7.1 and their locations are presented on Figure 7.1.

An evaluation of the status of the 41 AOIs contained in Parcel A is provided in the following subsections. The summary includes a brief history of the AOIs, their current status, and whether they have been closed or decommissioned.

7.1 FORMER DELUGE TANK AREA (AOI #1) (SWMU #12)

The PR/VSI identified the former deluge tanks as an AOI with 8 to 10 separate underground concrete vaults (subunits). The exact location of all of the subunits was not identified during the PR/VSI due to the size of the Facility. These units were designed to collect runoff from fire fighting activities, located in close proximity to numerous fire mains and areas where flammable materials were managed.

During the PR/VSI, the visual inspection of the deluge tanks was limited to a single representative subunit. The former subunit had been previously identified during the PR/VSI as SWMU #12, and not subject to a RCRA permit requirement. The location of the former tank area is presented on Figure 7.1.

The PR/VSI suggested further actions which included structural integrity testing of the unit and subunits, and identification of wastes managed at the units.

During the decommissioning activities, there were ten vaults identified as former deluge tanks. These vaults were used to collect emergency discharges of waste paint sludge from overhead painting operations. There were six vaults found at the Pontiac Central, and four at Pontiac East and the Truck Engineering Center areas.

The six vaults at Pontiac Central, were cleaned, inspected and decommissioned by Cook and Associates. During inspection of the vaults, there were no visible signs of cracks, and pictures were taken where possible to verify the vaults structural integrity. Following decommissioning activities, the vaults were redeveloped. Redevelopment activities generally included demolition or removal/disposal of the subunits. In certain instances the subunits were collapsed into the subbase of proposed buildings and backfilled with clean fill.

A new concrete floor slab was cast-in-place over the area of the former deluge tanks for the construction of the GM Truck Product Center.

7.2 FORMER WASTE SOLVENT COLLECTION AREA (AOI #2) (SWMU #13)

This former waste solvent collection area consisted of three vertical 3,500-gallon aboveground steel tote tanks and a storage area for 55-gallon drums. This area was located in Building 9 on a concrete floor approximately 50 feet long and 15 feet wide. Historically, waste solvent was transferred from this unit to the outdoor waste purge solvent collection tanks located in Parcel C3 (Pontiac East). The location of the former waste solvent collection area is presented on Figure 7.1.

The former waste solvent collection area had been previously identified during the PR/VSI as SWMU #13, and subject to RCRA permit requirements. During the PR/VSI, no releases were identified and the potential for a release was considered low.

The PR/VSI suggested further action was; structural integrity testing should be conducted and performance standards of the RCRA solvent collection area be verified.

During the redevelopment phase of the Facility, the former waste solvent collection area was considered closed. Closure activities generally included cleaning, demolition, and removal/disposal.

The former waste solvent collection area had a new concrete floor slab cast-in-place over the former waste solvent collection area for the construction of the GM Truck Product Center.

7.3 FORMER WASTE PURGE SOLVENT COLLECTION PIT (AOI #3) (SWMU #14)

This area was incorrectly identified in the PR/VSI as a waste purge solvent collection area. During the decommissioning activities, this area was identified as an overflow collection pit, which was used to collect brake fluid and axle oil. The former overflow collection pit was located in Building 9, Bay 71F, and had a capacity of approximately 675 gallons. The location of the former collection pit is presented on Figure 7.1

This pit was previously identified during the PR/VSI as SWMU #14, and not subject to a RCRA permit requirement. The PR/VSI suggested further action was; no further action was required.

Decommissioning activities generally included sweeping, shoveling, chiseling, or pumping of the pits to remove any remaining contents. A high pressure wash was utilized to remove any oil or grease present in the pits. The pits were then fan dried for structural integrity inspection. Following cleaning activities, the pit was found to have no visible cracks or evidence of leaking, and pictures were taken to authenticate the pit as being structurally sound.

Following these decommissioning activities, the pit was redeveloped. Redevelopment activities generally included demolition and backfilling with clean fill.

A new concrete floor slab was cast-in-place over the area of the pit for the construction of the GM Truck Product Center.

7.4 FORMER FLUID COLLECTION PITS (AOI #4) (SWMU #15)

The PR/VSI identified that there were 10 to 13 former fluid collection pits located throughout Pontiac Central. These pits were primarily constructed of concrete with some constructed of concrete encased steel tanks. These former fluid collection pits were designed to collect fluids such as gasoline, diesel, and oil associated with the production of automotive vehicles on the production assembly line.

During the PR/VSI, the visual inspection of the former fluid collection pits was limited to a single representative pit. The pit had been previously identified during the PR/VSI as SWMU #15, and not subject to a RCRA permit requirement. The PR/VSI suggested further action was; structural integrity testing of the pits be completed, otherwise, no further action was required. All the former fluid collection pits, including the pit evaluated during the PR/VSI as SWMU #15, were decommissioned. The location of the representative pit is presented on Figure 7.1.

Decommissioning activities generally included sweeping, shoveling, chiseling, or pumping the fluid collection pits to remove any remaining contents. A high pressure wash was utilized to remove any oil or grease present in the fluid collection pits. The fluid collection pits were then fan dried for structural integrity inspection. The former fluid collection pits were found to have no visible cracks or evidence of leaking, and pictures of the pits were taken when possible, to verify the pits were structurally sound. Following these decommissioning activities, the pits were redeveloped. Redevelopment activities generally included demolition, or removal/disposal and backfilling with clean fill.

A new concrete floor slab was cast-in-place over the areas of these former pits for the construction of the GM Truck Product Center.

7.5 FORMER SLUDGE DOCK AREA (AOI #5) (SWMU #16)

The former sludge dock was a shipping area located on the first floor of Building 44, Bay 65BE2. Waste sludges from the electrophoretic paint dip operation (ELPO), on the second floor, were discharged through a chute into shipping containers. The waste sludge would then be transported to the container storage area. The location of the former sludge dock area is presented on Figure 7.1.

The former sludge dock was identified in the PR/VSI as SWMU #16, and not subject to a RCRA permit requirement. The PR/VSI suggested further action was; air emission monitoring should be considered during sludge dock operations.

In an effort to determine if the sludge dock operation had impacted the soils, a soil investigation near the former sludge dock loading area was performed. Since the indicator chemicals associated with the former sludge dock area operations (lead and PNAs) were not detected at concentrations exceeding their respective then current Act 307 soil cleanup criteria. Therefore, no additional investigation of this area was required. Following these investigation activities, the sludge dock area was redeveloped. Redevelopment activities generally included, dismantling, demolition and removal/disposal of the sludge dock.

The former sludge dock area was developed as part of the new parking lot facility in support of the GM Truck Product Center.

7.6 FORMER WASTE LIFT STATIONS (AOI #6) (SWMU #17)

The former waste lift stations consisted of a network of pump systems designed to transport wastewater to the wastewater treatment plant. The wastewaters pumped to the WWTP consisted of acid wastes, general wastes and cleaner wastes. During the PR/VSI, two holding tanks identified as Green Lee Coolant Storage and 1803 ELPO Storage, were stored at the station location. The former waste lift station was located within a bermed area at the southwest corner of Building 29. The location of the former wastewater lift station is presented on Figure 7.1.

The former wastewater lift stations had been previously identified by the PR/VSI as SWMU #17, and not subject to a RCRA permit requirement. The PR/VSI suggested further actions were; air emission monitoring should be considered during the wastewater lift stations operation, and structural integrity testing of the wastewater lift stations should be completed.

During the decommissioning activities, a structural integrity inspection of all the wastewater lift stations, revealed a crack in the concrete wall of the former "cleaner waste" wet well. In an effort to determine if the operation of the wastewater lift stations impacted the soils, a soil investigation in the vicinity of the crack was completed. Since the indicator chemicals typical of "cleaner waste"(lead, chromium, zinc, naphthalene, and phenanthrene) were not detected at concentrations exceeding their respective then current Act 307 soil criteria, no additional investigation of the wastewater lift stations was required. Following these decommissioning activities, the area of the wastewater lift station was redeveloped. Redevelopment activities generally included, dismantling, demolition and removal/disposal.

The area of the former wastewater lift stations were redeveloped as part of the new parking lot facility in support of the GM Truck Product Center.

7.7 FORMER HEAVY DUTY BODY SHOP HYDRAULIC LIFT PITS (AOI #7, 8, 9)

During the decommissioning activities, these three former heavy duty hydraulic lift pits were identified by GM as additional areas of environmental concern due to historical manufacturing operations. The three former heavy duty body shop hydraulic lift pits were located in Building 4, Bays 41BA, 42BD, and 48BD1, respectively. The locations of the three former heavy duty hydraulic lift pits are presented on Figure 7.1.

Decommissioning activities of the former heavy duty body shop hydraulic lift pits generally included sweeping, shoveling, chiseling, or pumping to remove any remaining contents. A high pressure wash was utilized to remove any oil or grease present in the lift pits. The hydraulic lift pits were then dried for structural integrity inspection.

At the time of inspection by Cook and Associates, these pits were found to contain some water and small amounts of oil. Integrity inspections of these pits found that the water and oil appeared to originate from hairline crack(s) within the pit walls. Following cleaning and reinspection, the pits were redeveloped. Redevelopment activities generally included, demolition, removal/disposal, and backfilling the pits with clean fill.

The three former heavy duty body shop hydraulic lift pits were developed as part of the new parking lot facility in support of the GM Truck Product Center.

7.8 FORMER CREOSOTE TANK (AOI #10)

During decommissioning activities, the former creosote tank was identified by GM as an additional area of environmental concern due to historical manufacturing operations. The location of the former creosote tank is presented on Figure 7.1.

Evidence of a possible former creosote tank existing at the Facility was only found on an insurance company drawing dated 1932. The drawing indicated that the tank was aboveground with secondary containment. Since no other evidence of the creosote tank existed at the time of the decommissioning activities, further investigation of the former creosote tank was not required.

A new concrete floor slab was cast-in-place over the former creosote tank area for the construction of the GM Truck Product Center.

7.9 FORMER PRESS PITS (AOI #11, 12, 13)

During decommissioning activities, these three former press pits were identified by GM as additional areas of environmental concern due to historical manufacturing operations.

Decommissioning activities of the press pits generally included, sweeping, shoveling, chiseling, or pumping to remove any remaining contents. A high pressure wash was utilized to remove any oil or grease present in the press pits. The press pits were then fan dried for structural integrity inspection, at which time water was found leaking through hairline crack(s). No exfiltration of the water is believed to have occurred at these locations because the press pit floors were found to be watertight.

The three former press pits that were inspected during decommissioning activities were identified as follows:

Building	*Bay*	*Process*	*Closure Date*
12	30J	#32791 Press	April 13, 1992
12	31J	#21310 Press	January 14, 1992
12	57K-W	#29470 Press	April 29, 1992

Following these decommissioning activities, the former press pits were redeveloped. Redevelopment activities generally included, excavation, removal/disposal and backfilling the pits with clean fill.

A new concrete floor slab was cast-in-place over these former pit areas for the construction of the GM Truck Product Center.

7.10 FORMER SPRAY PRIMER MIX ROOM PIT (AOI #14)

During decommissioning activities, the former spray primer mix room pit was identified by GM as an additional area of environmental concern due to historical manufacturing operations. The former spray primer mix room pit was located in Building 12, Bay 90L, and had a capacity of approximately 500 gallons. The location of the former spray primer mix room pit is presented on Figure 7.1.

Decommissioning activities of the former spray primer mix room pit generally included was sweeping, shoveling, chiseling, or pumping to remove any remaining contents. A high pressure wash was utilized to remove any oil or grease present in the spray primer mix room pit.

Following cleaning, the structural integrity of the pit was inspected, and found that water was leaking into the pit. The water appeared to originate from hairline crack(s) near the top of the pit. The inspection of the pit also identified that a very mild petroleum odor was present.

In an effort to determine petroleum constituents had impacted the pit, a sample of the water within the pit was collected and analyzed for BTEX and acetone. BTEX and acetone concentrations were significantly below drinking water standards, and therefore, no further investigation of the former spray primer mix room pit was required. Following the investigation activities, the mix room was redeveloped. Redevelopment activities generally included, excavation, removal/disposal and backfilling the pit with clean fill.

As part of the Centerpoint Business Campus Site redevelopment plans, the former spray primer mix room pit was redeveloped as part of the new parking lot facility for the GM Truck Product Center.

7.11 FORMER CYANIDE DESTRUCTION OPERATION (AOI #15)

During decommissioning activities the former cyanide destruction operation was identified by GM as an additional area of environmental concern due to historical manufacturing operations. The location of the former cyanide destruction operation was determined to be on the first floor of Building 29. The location of the former cyanide destruction operation is presented on Figure 7.1.

Inspection of the area revealed no evidence of former pits for the former cyanide operation. The tanks used during the operation were removed in 1976. Since there was no evidence of the former cyanide operation to support decommissioning activities, no further investigation of the operation was required.

The former cyanide destruction operation area was redeveloped as part of the new parking lot facility in support of the GM Truck Product Center.

7.12 FORMER BUILDING 29 TANK FARM (AOI #16)

During decommissioning activities, the former Building 29 tank farm was identified by GM as an additional area of environmental concern. The location of the former Building 29 tank farm is presented on Figure 7.1.

Nine 12,000-gallon steel USTs were installed near the south wall of Building 29 in 1946. The tank farm was utilized for the storage of engine oil, transmission fluids, axle fluids, and power steering fluids. The USTs were removed from service in October 1991 in support of the Centerpoint Business Campus Site redevelopment plans. The Building 29 UST area report is presented in Appendix E.2.

In an effort to determine if the former UST operation had impacted the soils, confirmatory soil samples were taken in support of the UST

removal actions. The analytical results of the soil samples revealed that the soils had been impacted by BTEX and PNA constituents. Since the USTs appeared undamaged during excavation, the source of the soil contamination was assumed to be from routine filling operations. Excavation of approximately 3,000 cubic yards of soil was conducted and thermally treated on Site. The final report on low temperature thermal destruction is presented in Appendix E.1.

In response to a MDNR letter dated November 19, 1993 requesting verification of soil remediation, six additional boreholes were drilled and samples collected. The verification samples confirmed successful closure of the former Building 29 tank farm. Appendix E.2 contains the Building 29 UST Study Area Report (as also discussed in Section 5.3.1).

Acknowledgment of closure was received from the MDNR on March 10, 1995. A copy of the MDNR closure letter is presented in Appendix E.3.

The former Building 29 tank farm was redeveloped as a part of the new parking lot facility for the GM Truck Product Center.

7.13 FORMER PAINT MIX ROOM FIRE DUMP TANK (AOI #17)

During decommissioning activities, the former paint mix room fire "dump" tank was identified by GM as an additional area of environmental concern due to historical manufacturing operations. The location of former paint mix room fire dump tank is presented on Figure 7.1.

The only evidence of the former paint mix room fire "dump" tank, was the drain line to the tank, and the plant engineering design drawings. Since no physical evidence of the former paint mix room fire dump tank was found during decommissioning activities, no further investigation or evaluation was required.

The former paint mix room fire dump tank area has been redeveloped as part of the new parking lot facility for the GM Truck Product Center.

7.14 FORMER PROCESS TRASH COMPACTOR SUMP (AOI #18)

During decommissioning activities, the former process trash compactor sump was identified by GM as an additional area of environmental concern. The former process trash compact sump was located in Building 36, Bay 85N. The location of the former process trash compactor sump is presented on Figure 7.1.

Designed to collect fluids, the sump was set within the pit floor to provide a low point to collect water. At a predetermined float level, the sump would commence automatic pumping of any water present.

Decommissioning of the former process trash compactor sump generally included sweeping, shoveling, chiseling, or pumping to remove any remaining contents. A high pressure wash was utilized to remove any oil or grease present in the sump. The sump was then fan dried for structural integrity inspection.

During the structural integrity inspection of the sump, water was found to be leaking in at the bottom. If any oil would collect in the sump, it would float above the leak point due to the presence of water, and therefore be contained. Since there was no evidence of water exfiltration, no further investigation was required. Following these decommissioning activities, the former process trash compactor sump and area was redeveloped. Redevelopment activities generally included removal/disposal, and backfilling the sump area with clean fill.

The former process trash compactor sump has been redeveloped as part of the new parking lot facility for the GM Truck Product Center.

7.15 FORMER BLACK DIP TANK (AOI #19)

During decommissioning activities, the former black dip tank was identified by GM as an additional area of environmental concern due to historical manufacturing operations. The former black dip tank was located in Building 2, Bay 22BD1, and had a capacity of approximately 10,000 gallons. The location of the former back dip tank is presented on Figure 7.1.

The former black dip tank operation consisted of a dip tank at floor level and a subsurface tank for storing the dip solution during periods of dip tank maintenance. The dip solution used in this operation consisted of xylene, paint thinner, and metals such as chromium and lead. The equipment associated with the black dip tank operation had been removed in 1973, and the tank was removed in 1982.

In an effort to determine if the former black dip tank operation had impacted the soils, a soil investigation in the vicinity of the former black dip tank area was performed. Since the indicator chemicals associated with the black dip tank operation (chromium, lead, and xylene) were not detected in the soil samples at concentrations exceeding their respective then current Act 307 soil cleanup criteria, no additional investigation of the former black dip tank operation was required.

Following the investigation activities, the area of the former black dip tank was redeveloped. Redevelopment activities generally included demolition and removal/disposal.

The former black dip tank has been redeveloped as part of the new parking lot facility for the GM Truck Product Center.

7.16 FORMER PHOSPHATING LOCATIONS (AOI #20, 21, 22)

During decommissioning activities, the former phosphating locations were identified by GM as additional areas of environmental concern

due to historical manufacturing operations. At the time of the investigation, no drawings were found to outline former phosphating equipment layout. Only conveyor pits, tunnels, and overhead conveyor lines were present.

The approximate locations of three former phosphating areas were as follows: AOI #20 was located along the exterior wall near columns 26BE and 27BE in Building 2; AOI #21 was located at the south end near columns 32BD in Building 3; and AOI #22 was located near column 32A in Building 3. The locations of the former phosphating operations are presented on Figure 7.1.

In an effort to determine if the former phosphating operations had impacted the soils, a soil investigation in the vicinity of each former phosphating location was performed. Since the indicator chemicals associated with phosphating operations (butyl-cellosolve, nickel, and zinc) were not detected in the soil samples at concentrations exceeding their respective then current Act 307 soil cleanup criteria, no additional investigation of the former phosphating operations was required. Following the investigation activities, the former phosphating areas were redeveloped. Redevelopment activities generally included demolition and removal/disposal.

The three former phosphating locations have been redeveloped as part of the new landscaped areas surrounding the GM Truck Product Center.

7.17 FORMER TOP COAT PIT (AOI #23)

During decommissioning activities, the former top coat pit was identified by GM as an additional area of environmental concern. The former top coat pit was a two-level room below the plant floor located in Building 3, Bay 24BA1. The location of the former top coat pit is presented on Figure 7.1.

Historically, the upper level served as a pump room and the lower level served as a wet well for the booth water recirculation system, which was used by the top coat paint spray booth.

During decommissioning activities, the former top coat pit was swept, shoveled, chiseled, or pumped to remove any remaining contents. A high pressure wash was utilized to remove any oil or grease present in the top coat pit. The top coat pit was then dried for structural integrity inspection. Following cleaning activities, a crack in the concrete wall was discovered in the lower level of the pit.

In an effort to determine if the former top coat pit operation had impacted the soils, a soil investigation in the vicinity of the crack was performed. Since the indicator chemicals associated with the former top coat pit operations (acetone, ethyl-acetate, lead, methanol, ethyl glycol, chromium, istobutanol, ethylbenzene, and methyl isobutyl ketone) were not detected in the soil samples at concentrations exceeding their respective then current Act 307 soil cleanup criteria, no additional investigation of the former top coat pit operation was required. Following the investigation activities, the former top coat pit was redeveloped. Redevelopment activities generally included excavation, removal/disposal and backfilling the pit with clean fill.

The former top coat pit has been redeveloped as part of the new parking lot facility for the GM Truck Product Center.

7.18 FORMER ELEVATOR TIRE SHAFT (AOI #24)

During decommissioning activities, the former elevator tire shaft was identified by GM as an additional area of environmental concern. The former elevator tire shaft was located in Building 5, Bay 62BD. The location of the former elevator tire shaft is presented on Figure 7.1.

The former elevator tire shaft was constructed to house the elevator piston assembly. The shaft was cylindrical (approximately 6 feet in diameter), constructed of bricks, and was 35 feet below the floor of the elevator

pit. Historically, the elevator piston assembly was known to contain water and periodically leaked hydraulic oil into the tire shaft pit.

Decommissioning activities of the former elevator tire shaft generally included sweeping shoveling, chiseling, or pumping to remove any remaining contents. A high pressure wash was utilized to remove any oil or grease present in the elevator tire shaft. The shaft was then dried for structural integrity inspection. The shaft was found to have water leaking in at the bottom at an approximate rate of 1.5 gallons per week.

In an effort to determine if the former elevator tire shaft operation had impacted the soils, a soil investigation in the vicinity of the former elevator tire shaft was performed. Since the indicator chemicals associated with the former tire shaft operation (PNAs and zinc), were not detected in the soil samples at concentrations exceeding their respective then current Act 307 soil cleanup criteria, no additional investigation of the former elevator tire shaft operation was required.

The two units of the former elevator tire shaft operation that were inspected during decommissioning activities were identified as follows:

Building	*Bay*	*Size (inches L/W/D)*	*Closure Date*
5	62BD	177 x 250 x 72 (Pit)	October 3, 1991
5	62BD	72 x 72 x 420 (Shaft)	October 3, 1991

Following the decommissioning and investigation activities, the former elevation fire shaft was redeveloped. Redevelopment activities generally included, dismantling, demolition, removal/disposal, and backfilling the shaft with clean fill.

The former elevator tire shaft was developed as part of the new parking lot facility for the GM Truck Product Center.

7.19 FORMER PLATING DEPARTMENT (AOI #25)

During decommissioning activities, the former plating department was identified by GM as an additional area of environmental concern due to historical manufacturing operations. The exact location of the plating equipment could not be found as there were no drawings or clues existing at the time of the investigation. The former plating department was located in Building 9, within Bays D and E, between column lines 39 and 59. The general location of the plating department is presented on Figure 7.1.

The exact types of plating processes within this department were unknown. However, typical plating operations for truck manufacturing include decorative chrome, zinc phosphating, cold zinc galvanizing, cadmium plating, and nickel plating.

In an effort to determine if the former plating department operation had impacted the soils, a soil investigation in the vicinity of the former plating department was performed. The indicator chemicals associated with former plating operations were determined to be arsenic, barium, cadmium, chromium, copper, lead, mercury, selenium, silver, and zinc.

In general, arsenic and selenium were both found at varying concentration levels above and below their respective then current Act 307 soil cleanup criteria. Since selenium and arsenic were not used at the former Pontiac Central facility, it was determined that the arsenic and selenium were within the range of naturally-occurring levels in the Site area, and no further investigation was required. Following the investigation activities, the area of the former plating department was redeveloped. Redevelopment activities generally included demolition and removal/disposal of the plating department area.

The former plating department had a new concrete floor slab cast-in-place for the construction of the GM Truck Product Center.

7.20 FORMER BLACK DIP TANK (AOI #26)

The former black dip tank was identified during decommissioning activities by GM as an additional area of environmental concern due to historical manufacturing operations. The exact location of the former black dip tank was not found as no equipment or plant drawings existed at the time of inspection. The former black dip tank was located in Building 9, Bay 37E, and within 10 feet of a gasoline fueling station on one of the assembly lines. The general location of the former black dip tank is presented on Figure 7.1.

Another black dip tank operation is discussed previously in Section 7.15. The dip solution historically used in the former black dip tank consisted of xylene, and metals such as lead and chromium.

In an effort to determine if the former black dip tank operation had impacted the soils, a soil investigation in the vicinity of the former black dip tank was performed. Since the indicator chemicals associated with the former black dip tank operation (chromium, lead, and xylene), as well as those associated with the former gasoline facility station (benzene, toluene, and ethylbenzene), were not detected in the soil samples at concentrations exceeding their respective then current Act 307 soil cleanup criteria, no additional investigation of the former black dip tank operation was required. Following investigation activities, the area of the black dip tank was redeveloped. Redevelopment activities generally included demolition and removal/disposal.

The former black dip tank area had a new concrete floor slab cast-in-place over the former black dip tank area for the construction of GM Truck Product Center.

7.21 FORMER IRON PHOSPHATING AREA (AOI #27)

During decommissioning activities, the former iron phosphating area was identified by GM as an additional area of environmental concern due to historical manufacturing operations. The former iron

phosphating area was located in Building 9, Bay 71E. Since there was no evidence of iron phosphating equipment, and no plant drawings were found, the exact location of the former iron phosphating operation could not be identified. The general location of the phosphating area is presented on Figure 7.1.

In an effort to determine if the former iron phosphating operation had impacted the soils, a soil investigation in the vicinity of the former iron phosphating area was performed. Since the indicator chemicals associated with the former iron phosphating operation (butyl-cellosolve, nickel, and zinc) were not detected in the soil samples at concentrations exceeding their respective then current Act 307 soil cleanup criteria, no additional investigation of the former iron phosphating operation was required. Following the investigation into the former iron phosphating area, the area was redeveloped. Redevelopment activities generally included demolition and removal/disposal.

The former iron phosphating area had a new concrete floor slab cast-in-place over the former iron phosphating area for the construction of the GM Truck Product Center.

7.22 FORMER ENAMEL PIT (AOI #28, 30)

During decommissioning activities, the two former enamel pits were identified by GM as additional areas of environmental concern due to historical manufacturing operations. The two former enamel pits were located in Building 9, near column 68A.

At the time of the investigation, the exact location of both former enamel pit operations was not identified. There were no drawings and no pit footprints to be found. The general locations of the former enamel pits are presented on Figure 7.1.

In an effort to determine if the two former enamel pit operations had impacted the soils, a soil investigation in the vicinity of the former enamel pits was performed. Since the indicator chemicals associated with the two former enamel pit operations [xylene, toluene, methyl ethyl ketone

(MEK), zinc, and chromium] were not detected in the soil samples at concentrations exceeding their respective then current Act 307 soil cleanup criteria, no additional investigation of the two former enamel pit operations was required. Following the investigation activities, the area of the former enamel pit was redeveloped. Redevelopment activities generally included demolition and removal/disposal.

As part of the Centerpoint Business Campus Site redevelopment plans, a new concrete floor slab was cast-in-place over the former enamel pit area for the construction of the GM Truck Product Center.

7.23 FORMER SPRAY BOOTH (AOI #29, 32)

During decommissioning activities, these two former spray booths were identified by GM as additional areas of environmental concern due to historical manufacturing operations.

Since, at the time of the investigation, there was no physical evidence of the former spray booth operations, and no drawings, the exact location of the operation could not be identified. The two former spray booths were located in Building 9, near columns 71E and 53F, respectively. The former spray booth located near column 53F was also located near a degreasing station spray booth. The locations of the spray booths are presented on Figure 7.1.

In an effort to determine if the two former spray booth operations had impacted the soils, a soil investigation in the vicinity of the former spray booth areas was performed. Since the indicator chemicals associated with the two former spray booths, and degreasing operations, [1,1,1-trichloroethane (1,1,1-TCA), and methylene chloride] were not detected in the soil samples at concentrations exceeding their respective then current Act 307 cleanup criteria, no additional investigation of the two former spray booth operations was required. Following the investigation into the two former spray booths, these areas were redeveloped. Redevelopment activities generally included demolition and removal/disposal.

A new concrete floor slab was cast-in-place over the former spray booth areas for the construction of the GM Truck Product Center.

7.24 FORMER PHOSPHATING AREAS (AOI #31, 33)

During decommissioning activities, these two former phosphating areas were identified by GM as additional areas of environmental concern due to historical manufacturing operations. The two former phosphating areas were both located in Building 9, Bay 31F and 75F, respectively. The exact location of these areas was not determined since the plans for the operation were not found, and there was no physical evidence of the former phosphating operations. The general locations of the phosphating areas are presented on Figure 7.1.

In an effort to determine if these two former phosphating areas had impacted the soils, a soil investigation the vicinity of the phosphating areas was performed. During the soils investigation in the vicinity of Bay 31F, a slight petroleum odor was noted, and the PID readings were moderately elevated.

Since the indicator chemicals associated with the former phosphating operations, and petroleum odor, (butyl-cellosolve, zinc, nickel and BTEX) were not detected in the soil samples at concentrations exceeding their respective then current Act 307 soil cleanup criteria, no additional investigation of the two former phosphating area operations was required. Following the investigation into these two phosphating locations, these areas were redeveloped. Redevelopment activities generally included demolition and removal/disposal.

A new concrete floor slab was cast-in-place over the former phosphating areas for the construction of the GM Truck Product Center.

7.25 FORMER LOWERATOR (AOI #34)

During decommissioning activities , the former lowerator was identified by GM as an additional area of environmental concern. The lowerator was an elevator located in Building 9, Bay 77C, with a sump located near the south pit wall. The location of the lowerator is presented on Figure 7.1.

The former lowerator was used to lower partially assembled truck frames from the second floor to the first floor. Historically, brake fluid would accumulate on the floor of the lowerator pit.

In an effort to determine if the former lowerator operation had impacted the soils, a soil investigation in the vicinity of the former lowerator sump was performed. Since the indicator chemical associated with the former lowerator operation [triethylene glycol monoethyl ether (TGME)] was not detected in the soil samples at concentrations that are a threat to public health and safety (no Act 307 cleanup criteria are available for this constituent), no additional investigation of the former lowerator operation was required. Following the investigation activities, the area of the former lowerator was redeveloped. Redevelopment activities generally included dismantling, demolition, removal/disposal, and backfilling the pit with clean fill.

The area of the former lowerator was redeveloped as part of the new parking lot facility for the GM Truck Product Center.

7.26 FORMER TRANSFORMER ACCIDENT SITE (AOI #35)

During decommissioning activities, the former transformer accident site was an additional area of environmental concern identified by GM. The former transformer accident site was located in Building 12, Bay 91H. The location of the former transformer accident site is presented on Figure 7.1.

At this location, an electrical transformer was reported to have been dropped on the floor in 1972. Fluids were identified to have leaked onto the floor during this accident.

In an effort to determine if the former transformer accident site had impacted the soils, a soil investigation in the vicinity of the spill was performed. Since the indicator chemicals associated with transformer operations (PCBs) were not detected in the soil samples at concentrations exceeding their respective then current Act 307 soil cleanup criteria, no additional investigation of the former transformer accident site was required. Following the investigation of the accident site, the site was redeveloped. Redevelopment activities generally included excavation, demolition and removal/disposal.

The area of the former transformer accident site was redeveloped as part of the parking lot facility for the GM Truck Product Center.

7.27 FORMER ZINC PLATERS (AOI #36)

During decommissioning activities, the former zinc plating operation was identified by GM as an additional area of environmental concern due to historical manufacturing operations. The former zinc platers (barrel and still platers) were located at the south end of Building 13, near Bay 103G. The location of the former zinc platers is presented on Figure 7.1.

In an effort to determine if the former zinc plater operation had impacted the soils, a soil investigation in the vicinity of the former zinc platers area was performed. Since the indicator chemical associated with these plating operations (zinc) was not detected in the soil samples at concentrations exceeding the then current Act 307 soil cleanup criteria, no additional investigation of the former zinc plating operation was required.

The zinc platers were cleaned, dismantled, and decommissioned between 1984 to 1986. The area of the former zinc platers has been redeveloped as part of the GM Truck Product Center parking lot.

7.28 FORMER WASTEWATER SUMP (AOI #37)

During decommissioning activities, the former wastewater sump was identified by GM as an additional area of environmental concern. The former wastewater sump, and pumping station, were located in Building 13, column 101G, at the north end of the former steam tunnel. The location of the former wastewater sump is presented on Figure 7.1.

In an effort to determine if the former wastewater sump had impacted the soils, a soil investigation in the vicinity of the sump was performed. Since the indicator chemicals associated with the former wastewater sump operation [zinc, and (total) chromium] were not detected in the soil samples at concentrations exceeding their respective then current Act 307 soil cleanup criteria, no additional investigation of the former wastewater sump area was required. Following the investigation activities, the former wastewater sump area was redeveloped. Redevelopment activities generally included excavation and removal/disposal of the sump.

The former wastewater sump was redeveloped as part of the new parking lot facility for the GM Truck Product Center.

7.29 FORMER WASTEWATER TUNNEL (AOI #38)

During decommissioning activities, the former wastewater tunnel was identified by GM as an additional area of environmental concern due to historical manufacturing operations. The former wastewater tunnel was installed in the steam pipe trench when the southern portion of Building 13 was converted from a lumber kiln to a plating shop. The steam pipe trench was aligned north/south below the floor in the center of the building. The location of the former wastewater tunnel is presented on Figure 7.1.

In an effort to determine if the former wastewater tunnel operation had impacted the soils, a soil investigation in the vicinity of the tunnel was performed. Since the indicator chemicals associated with the former wastewater tunnel operation [amenable cyanide, and (total) chromium] were not

detected in the soil samples at concentrations exceeding their respective then current Act 307 soil cleanup criteria, no additional investigation of the former wastewater tunnel area was required.

The former wastewater treatment tunnel was backfilled with clean fill, paved over, and decommissioned in 1982. The former wastewater tunnel was redeveloped as part of the parking lot facility for the GM Truck Product Center.

7.30 FORMER ANODIZER (AOI #39, 40)

During decommissioning activities, two former anodizers were identified by GM as additional areas of environmental concern due to historical manufacturing operations. These two former anodizers were located in the former plating shop at the south end of Building 13, Bay 103G3 and Bay 103J, respectively. The locations of the two former anodizers is presented on Figure 7.1.

In an effort to determine if the former anodizers had impacted the soils, a soil investigation in the vicinity of the two former anodizers was performed. Since the indicator chemical associated with the anodizer operations (chromium) was not detected in the soil samples at concentrations exceeding its then current Act 307 soil cleanup criteria, no additional investigation of the two former anodizer operations was required. Following these investigation activities, the area of the former anodizers were redeveloped. Redevelopment activities generally included demolition, excavation, and removal/disposal.

The area of the former anodizers has been redeveloped as part of the GM Truck Product Center parking lot.

7.31 FORMER CHIP DOCK (AOI #41)

During decommissioning activities, the former chip dock was identified by GM as an additional area of environmental concern due to historical manufacturing operations. The location of the former chip dock is presented on Figure 7.1.

The former chip dock was located in the southwest corner of Building 29, which originally contained two north-south railroad spurs in individually recessed trainwells. These railroad spurs were used to remove ferrous metal shavings and cuttings from the engine factory on the second floor of Building 29.

Gondolas were typically filled with metal shavings and cuttings and then discharged from the second floor into railroad gondola cars at ground level. The material was then sent out as scrap steel. When engine production ceased, the trainwells were backfilled to grade and the area was paved.

In an effort to determine if the former chip dock operation had impacted the soils, a soil investigation in the vicinity of the chip dock was performed. Since the indicator chemicals associated with the former chip dock operation (PNAs and metals) were not detected in the soil samples at concentrations which posed a threat to public health and safety, no additional investigation of the former chip dock operation was required.

The area of the former chip dock was redeveloped as part of the parking lot facility for the GM Truck Product Center.

8.0 PARCEL B AREAS OF INTEREST

Parcel B was segmented into Parcels B1, B2, and B3, respectively, as shown on Figure 1.6. The Parcel B AOIs include those areas previously identified by the U.S. EPA in the PR/VSI in addition to other areas of environmental concern identified by GM.

There are a total of three AOIs identified in Parcel B1, one AOI in Parcel B2, and one AOI in Parcel B3. Of these five AOIs, three AOIs were identified by both U.S. EPA and GM.

An evaluation of the status of the five AOIs identified within of Parcels B1, B2, and B3 is provided in the following subsections. The summary includes a brief history of the AOIs, their current status, and whether they have been closed or decommissioned.

8.1 PARCEL B1

The AOIs identified in Parcel B1 include one area of concern identified in the PR/VSI and two additional areas of concern which were identified by GM. The PR/VSI and GM areas within Parcel B1 are summarized in Table 8.1 and presented on Figure 8.1.

8.1.1 Former Underground Tank Area (AOI #42) (SWMU #6)

The former underground storage tank area consisted of a 1,000-gallon waste oil steel UST. The UST was located east of and adjacent to Building 53, and was originally installed in 1972 for the temporary storage of waste oil. When the PR/VSI was performed, the tank contents were defined as nonhazardous by RCRA. The location of the former UST is presented on Figure 8.1.

The PR/VSI was limited to the area surrounding the intake/discharge stand pipes of the UST. At the time of the investigation, the

PR/VSI recommended that an assessment of the structural integrity of the UST, and surface soil sampling in the area surrounding the intake/discharge stand pipes (due to visible surface staining) be completed.

During remediation activities, the former UST was removed on August 30, 1991. The UST was found to be in excellent condition upon removal. Soil samples that were collected and analyzed during the UST removal, identified waste oil-related soil contamination. These results were then reported to the MDNR on October 22, 1991. In the 45-day report submitted to the MDNR on December 2, 1991, it was concluded that the waste oil-related contamination was due to routine tank operations (such as tank filling).

Based on the soil sampling results for BTEX and PNA constituents, the excavation limits of the former UST area were determined. The volume of soil removed and disposed of at an approved landfill was approximately 190 cubic yards.

On January 22, 1992, a Type B closure of the Building 53 UST Study Area was requested by GM. On November 19, 1993, the MDNR requested additional information be provided prior to granting closure. On February 11, 1994, a final report satisfying the MDNR's request for additional information for the Building 53 UST Study Area (see Appendix G and Section 5.2.2) was submitted for closure. Comments received from the MDNR regarding this report were addressed and submitted to the MDNR on March 28, 1994. The Building 53 UST Study Area is currently undergoing closure consideration by the MDNR. As identified in Section 5.2.2, Building 53 has been demolished.

New manufacturing/distributing and office/research buildings are planned for construction in this area as part of the Centerpoint Business Campus Site redevelopment plans.

8.1.2 Former Construction Debris Site (AOI #43)

During redevelopment activities, the former construction debris site was identified by GM as an additional area of environmental concern. The location of the former construction debris site is presented on Figure 8.1.

The former construction debris site was an area in which construction debris from the renovations of Buildings 33, 34, and 52, located in the Truck Engineering Area (Parcel C1), were received. Due to the construction of new pits in these buildings, the construction debris consisted primarily of soil spoil. Since some of the debris originated from Building 33, an area of a known gasoline release, there existed a potential for the soil excavation spoil to contain BTEX constituents.

In an effort to determine if the former construction debris site operations had impacted the soils, a soil investigation in the vicinity of the debris site was performed. Since the indicator chemicals associated with the former debris (BTEX) were not detected in the soil samples at concentrations exceeding their respective then current Act 307 soil cleanup criteria, no additional investigation of the former construction debris site operation was required.

The former construction debris site is being redeveloped as a manufacturing/distributing and office/research area as part of the Centerpoint Business Campus Site redevelopment plans.

8.1.3 Building 43 Investigation/Remediation (AOI #44)

During redevelopment activities, the Building 43 Study Area, previously identified by GM as the frame rack storage area, was an additional area of environmental concern due to the historical use of the storage area. The location of the Building 43 Study Area is presented on Figure 8.1.

The Building 43 Study Area was historically a location in which some miscellaneous materials had been backfilled. This was evidenced by

buried ash which was unearthed during construction of the former frame storage racks.

In an effort to determine if the Building 43 Study Area materials had impacted the soils, a subsurface soil investigation of the area was performed. During the test pit investigation, a layer of ash was found approximately three feet thick and four feet below ground surface. Also contained in the ash were cured or burned paint sludge, wood, and steel bands. A subsurface soils investigation of the area was also performed to define the extent of potentially affected material at the Study Area. Soil samples were submitted and analyzed for Target Compound List (TCL) Volatile Organic Compounds (VOCs), Semi Volatile Organic Compounds (SVOCs), and Target Analyte List (TAL) metals. Based on the soil sampling results, the excavation limits (for remediation) of the area were determined. The volume of soil excavated in the area during remediation was approximately 11,000 cubic yards. The materials were characterized and disposed of at a Michigan Type II Landfill. The Building 43 Study Area reporting activities are presented in Appendix F (also see Section 5.2.1).

In summary, the investigation/remediation of the Building 43 Study Area has been completed. After completion of the remediation, Building 43 was demolished. CRA is currently preparing a construction report to detail the remedial activities completed at the Building 43 Study Area.

The Building 43 area is being redeveloped as a manufacturing/distributing and office/research area as part of the Centerpoint Business Campus Site redevelopment plans.

8.2 PARCEL B2

8.2.1 Former South Retention Pond (AOI #45) (SWMU #33)

The former south retention pond was approximately 100 yards long, 5 yards deep, and 30 yards wide. Historically, the south

retention pond typically collected stormwater runoff from Pontiac East and the wastewater treatment plant. The location of the former south retention pond is presented on Figure 8.2.

This former south retention pond had been previously identified in the PR/VSI as SWMU #33, and was not subject to RCRA permit requirements. The PR/VSI suggested further action was; sediment sampling be completed in an effort to determine the potential presence of hazardous constituents that may have drained into the south retention pond.

In response, North American Operations (NAO) Facilities Engineering performed a Level One Environmental Site Assessment. The assessment concluded that releases of materials into the pond did not affect the water quality or adjacent soils. In 1985, soil samples from the unit were found to be non-contaminated. In 1991, soil samples were found to have levels of VOCs and PNAs below the detection limits, and levels of metals were found to be below regulatory levels. No additional investigation of the former south retention pond was required.

As part of the Centerpoint Business Campus Site redevelopment, the former south retention pond is being developed as a commercial and office/research area. The new Centerpoint Parkway is also currently under construction in the vicinity of the former south retention pond, which provides primary access within the Centerpoint Business Campus.

8.3 PARCEL B3

8.3.1 North Retention Pond (AOI #46) (SWMU #34)

The north retention pond is approximately 30 yards long, 3 yards deep, and 15 yards wide. Historically, the north retention pond collected stormwater runoff from the northern parking lots of Pontiac East. The location of the north retention pond is presented on Figure 8.3.

The north retention pond had been previously identified in the PR/VSI as SWMU #34, and was not subject to RCRA permit requirements. The PR/VSI suggested further action was; sediment sampling be completed in an effort to determine the potential presence of hazardous constituents.

In response, NAO Facilities Engineering performed a Level One Environmental Site Assessment of the area. The assessment determined that there have been no hazardous constituents released into the north retention pond. No additional investigation of the north retention pond was required.

As part of the Centerpoint Business Campus Site redevelopment, the area in the vicinity of the north retention pond is being developed as a commercial and office/research area. The GM Truck Product Development Center, and Campus Drive, are both under construction, and nearing completion in the vicinity of the north retention pond. The north retention pond currently receives stormwater runoff from existing parking lots and will continue to service these areas in the future.

9.0 PARCEL C AREAS OF INTEREST

This section presents an overview of the Parcel C AOIs and precludes a follow-up report to be submitted in 1995 with additional information on the 35 Parcel C AOIs and other areas identified to be of environmental concern in Parcel C. The follow-up report will contain detailed information on all identified Parcel C AOIs.

As presented on Figure 1.6, the GM Site has been segmented into three distinct areas comprised of Parcels A, B, and C. Parcel C was further separated into individual Parcels C1, C2, C3, and C4. The parcels were separated to identify and independently evaluate Pontiac East, the Waste Water Treatment Plant (WWTP), the Truck Engineering Center, and the former J-Lot fill area. For the purposes of this Report, Parcels C1 through C4 are considered contiguous GM owned and operated parcels. The AOIs in these parcels are discussed in Sections 9.1 through 9.4.

Finally, Section 9.5 presents an evaluation of two additional AOIs. These include the following:

- Murphy Drain, and
- Pits and Sump.

The Murphy Drain is a stormwater outlet located north of South Boulevard. Murphy Drain is evaluated separately because it is not located within any of the defined parcels. The pits and sumps category is considered part of Pontiac Central and Pontiac East. The pits and sumps category refers to over 200 pits and sumps identified during the decommissioning activities of Pontiac Central, in addition to other pits and sumps which will be evaluated in Pontiac East.

The Parcel C AOIs include those areas identified by the U.S. EPA in the PR/VSI, in addition to other areas of interest identified by GM. In total, 29 Parcel C AOIs were identified by U.S. EPA in the PR/VSI. It should be noted that 15 of the 29 areas identified by U.S. EPA in the PR/VSI are located at or within the Wastewater Treatment Plant (WWTP) located at Building 56. An

additional six AOIs have been identified by GM. Of the 35 AOIs identified, seven are located in Parcel C1 (Truck Engineering Center), 18 are located in Parcel C2 (WWTP), seven are located in Parcel C3 (Pontiac East Truck Assembly Plant), and one is located in Parcel C4 (former J lot area). The Murphy Drain AOI is located off Site north of South Boulevard. The pits and sumps are located in both Pontiac Central and Pontiac East.

The locations are presented on Figures 9.1 through 9.4 for Parcels C1 through C4, respectively. The Parcel C AOIs are summarized in Table 9.1. The Murphy Drain location is also presented on Figure 9.1. The pits and sumps locations are not shown on Figures 9.1 through 9.4.

9.1 PARCEL C1

9.1.1 Refuse Process Facility (AOI #47) (SWMU #7)

The refuse process facility, located at the Power Plant, is an area which processes wastes such as cardboard, paper, and wood segregated wastes (including those received from off-Site sources). The refuse process facility also shreds burnable solid wastes generated on Site and locally for supplemental boiler fuel. Heavy materials are reprocessed and metals are magnetically separated and sent off Site to a landfill. Historically, the volume of process waste received was approximately 160 tons/day.

The refuse process facility had been previously identified in the PR/VSI as having a Michigan Act 641 operating license. The refuse process facility was active at the time of the PR/VSI inspection.

The PR/VSI suggested that no further action was required at the refuse process facility.

It should be noted that the Power Plant is scheduled for closure and decommissioning within the 1996 to 1998 timeframe. All buildings on Site will be designed for natural gas heating and existing building heating systems will be converted to natural gas.

9.1.2 Drum Draining Area (AOI #48) (SWMU #5)

The drum draining area consisted of an aboveground concrete sump with metal grid covering the open top. The drum draining area includes two 750-gallon tanks with an output volume of 1,500 gallons per day. Materials managed in the area include oily and ignitable wastes which may contain volatile constituents and heavy metals.

The PR/VSI identified oil and paint stains on the upper grid portion of the unit. In addition, the PR/VSI noted odors typical of VOCs, in the immediate vicinity of the tanks.

The drum draining area had been identified by the PR/VSI as being RCRA regulated and was active at the time of inspection.

The PR/VSI suggested further action was; air monitoring during drum draining operations be conducted and structural integrity testing be completed.

9.1.3 Coal Storage Unit (AOI #49) (SWMU #32)

The coal storage unit, which is located in the Pontiac East (Power Plant) area, is used to manage coal unloaded from railroad cars. The coal storage unit and the Power Plant are scheduled to simultaneously undergo decommissioning activities in the 1996 to 1998 timeframe.

The coal storage unit was identified as a suspected source of an October 12, 1977 release of PCBs (suspected to have arrived from a shipment of contaminated coal) in stormwater runoff to a storm sewer which empties into a tributary of the Clinton River. Additional information regarding this issue will be presented in the follow-up report.

The regulatory status of the coal storage unit was identified in the PR/VSI as being nonregulated. The unit was active at the time of the coal storage unit inspection.

The PR/VSI suggested further action was; monitoring of possible air emissions should be considered during the loading and unloading of coal.

9.1.4 DUCO Stores (AOI #50)

During the Site investigation activities of Parcel C1, DUCO Stores was identified by GM as an additional area of environmental concern due to historical operations. Environmental activities have been completed in the following areas:

- DUCO Stores UST Study Area remediation; and
- DUCO Stores Fuel Line Study Area investigation.

The remediation activity for DUCO Stores is summarized in Section 5.3.1 and is presented in detail in Appendix H and J. The investigation activity for the DUCO Stores Fuel Line is discussed in further detail in Section 6.1.1 and is presented in Appendix J.

The following sections summarize the DUCO Stores activities.

DUCO Stores UST Study Area

The DUCO Stores UST Study Area is a tank farm which consisted of eight steel underground storage tanks (USTs) that were installed in 1927 when the Pontiac Central Plant was originally constructed. The USTs typically contained gasoline, RR end lube, glycol, axle oil, and diesel fuel. The DUCO Stores UST area was located outside of the northwest corner of Building 21.

On September 5, 1991, following removal of the USTs between August 20 and 29, 1991, which were identified to be in good condition, diesel fuel was observed to be seeping into the north end of the excavation. Corrective actions to recover the diesel fuel were implemented immediately and approximately 100 gallons of diesel fuel were recovered before seepage ceased.

Additional remedial activities included the excavation and thermal treatment of approximately 3,000 cy of soil. No additional investigation is required for closure. This is identified in the May 1994 report for the DUCO Stores Study Area submitted to GM (see Appendix H).

DUCO Stores Fuel Line Study Area

The DUCO Stores Fuel Line Study Area was an underground distribution network for gasoline and fuel oil which was installed in 1927 with the original plant buildings. The DUCO Stores Fuel Line has been out of service for approximately 30 years.

In an effort to determine if the former fuel line had impacted the soils and groundwater, investigations in the vicinity of Buildings 11, 12, and 27 were performed in 1992. The indicator chemicals associated with the operation of the former fuel line [BTEX], were detected in five boreholes exceeding their then current Type B soil cleanup criteria. The water samples collected from the perched water zone also exceeded their then current Type B Drinking Water criteria for BTEX and lead.

Additional investigative activities of the Fuel Line Study Area were performed in 1994 to determine the extent of the impacted soils. The soil samples which were collected were analyzed for BTEX and lead. This investigation did not identify any further areas of residual BTEX in soil at levels of concern. In the 10 to 12-foot bgs interval, BTEX concentrations were below the then current Type B direct contact soil criteria.

The final report for the DUCO Stores Fuel Line Study Area was submitted to GM in June 1994 and stated that no additional investigation or remediation was required for this area (see Appendix J).

9.1.5 Building 33 Fuel Island Study Area (AOI #51)

The fuel island is located south of Building 33 in an asphalt parking area. There is a concrete pad surrounding the fuel island which covers two 12,000-gallon fuel tanks. In the past, a 10,000-gallon tank which contained diesel fuel was removed from the present location of the fuel island and the fuel island was reconstructed (including installation of the two tanks now present).

A release was documented in 1991. The fuel island UST was removed and the area was remediated. A report regarding the Building 33 Fuel Island Study Area was submitted to GM in January 1994 (see Appendix L).

9.1.6 Building 35 Tank Farm (AOI #52)

The Building 35 Tank Farm is located directly adjacent to the west side of Building 35. On October 12, 1992, GM reported a suspected release from the AOI following structural integrity testing of the tanks. The release was confirmed on October 21, 1992 following receipt of the results of a second tank test. GM submitted both 20-day and 45-day Abatement Reports to MDNR. The work plan included in the 45-day report included the removal of six 2,000-gallon USTs which stored various fuels and mineral spirits.

Following removal of the USTs, a soil feasibility study was conducted. Final remediation of the area began on November 1, 1994 subsequent to completion of the soil feasibility analysis. Final remediation included the removal of 1,244 cubic yards of contaminated soils.

The Building 35 Tank Farm final closure report is currently being prepared and will be submitted for MDNR review and approval.

9.1.7 Building 33 Free Product Study Area (AOI #53)

The Free Product Study Area is a pure product gasoline plume located beneath Building 33. Building 33 is part of the Truck Engineering Center located immediately west of the new GM Truck Product Center. Based upon the significant investigations, evaluations, and remedial efforts which have been conducted to date, an estimated 2,000 gallons of gasoline is believed to be trapped within a sand lens in the clay till located below the building.

In 1985, a gasoline release was discovered by GM during the foundation investigation for the planned expansion of Building 33. Nineteen geotechnical soil borings were drilled. Free product (gasoline) was found in one borehole, gasoline constituents were found in soils from seven of the borings, gasoline odors were detected in seven borings, and the remaining five borings showed no evidence of gasoline. The National Response Center and the MDNR were notified of the leaking fuel line supplying an abandoned fuel island south of Building 33. The fuel supply line was found to be leaking in 1968/1969. A pressure check was performed on the line. The fuel line and fuel station were abandoned in approximately 1969 following the discovery of the leaking pipe, and the fuel lines capped.

A report was prepared and submitted to GM on April 17, 1995 detailing several remedial alternatives which could be utilized for the removal of gasoline at the Site. This report is presented in Appendix K. GM is currently evaluating the Building 33 remedial options.

It should be noted that Building 33 is scheduled to be completely renovated in 1997. It is currently expected that additional remediation will be completed during the renovation of Building 33.

9.2 PARCEL C2

9.2.1 Former Surface Impoundment (AOI #54) (SWMU #31)

The former surface impoundment was a temporary lagoon used once in 1978 due to an upset in process operations. At the time of the PR/VSI, the former surface impoundment existed as a ground depression and was identified to have contained fly ash generated on Site.

The former surface impoundment was located adjacent to the Wastewater Treatment Tank Area, although the exact location of the impoundment was unknown. The surface impoundment was used for the temporary storage of approximately 70,000 gallons of liquid waste.

The regulatory status of the former surface impoundment was identified by the PR/VSI as non-regulated. The former surface impoundment was inactive at the time of the PR/VSI inspection.

The PR/VSI suggested further action was; soil/sediment sampling should be completed to determine the exact location of the surface impoundment and whether hazardous constituents are present. During construction activities of the Centerpoint Business Campus adjacent to the wastewater treatment tank area, no evidence of flyash or indicators of hazardous constituents were discovered.

9.2.2 General Waste Solids Separator (AOI #55) (SWMU #18)

The Waste Water Treatment Plant (WWTP) for Pontiac East and the former Pontiac Central manufacturing areas is located at and within Building 56. The PR/VSI had identified a variety of units located at the WWTP which are contained entirely within Building 56. These AOIs include:

Description	***AOI#***	***SWMU#***
General Waste Solids Separator	55	18
Acid Waste Sludge Tanks	56	19
Sludge Filter Press	57	20
Sludge Filter Press Sump	58	21

Acid Waste Separator System	59	22
Polymer Tank	60	23
Waste Pickle Acid Tank	61	24
Cleaner Waste Separator	62	25
Pickle Acid Treatment Tank Storage Area	63	26
Former Vacuum Filter Press	64	27
Oil Skimmer Storage Tank	65	28
Wastewater Treatment Tank Area	66	29
Lime Slaker	67	36
Drum Storage Area	68	37
Container Storage Area	69	1

The solids separator consists of two open topped tanks surrounded by a 4-inch concrete berm located in Building 56. The solids separator was designed for the separation of waste solids received via a conveyor belt system.

The regulatory status of the general waste solids separator was identified by the PR/VSI as nonregulated. The general waste solids separator was identified to be active during the PR/VSI inspection.

The PR/VSI suggested further actions were; air monitoring should be considered during operations and structural integrity testing should be performed.

It should also be noted that all components within the WWTP located within Building 56 have been operated and maintained in accordance with applicable operating manuals and manufacturer specifications.

9.2.3 Acid Waste Sludge Tanks (AOI #56) (SWMU #19)

The acid waste sludge tank area is located in the Pontiac East WWTP area, upstairs in Building 56, and consists of three vertical tanks of approximately 5,000 gallons each. The sludge tanks were set up in 1972 and modified in 1978. These tanks serve as temporary storage units for sludge

generated from the Acid Waste Separator System and to be received by the Sludge Filter Press. The acid waste sludge tanks receive wastes which contain heavy metals from the acid waste separator system.

The PR/VSI indicated that there was some evidence of staining and minor splashing at the top of the tank, suggesting the possibility of past releases. The regulatory status of the acid waste sludge tanks had been identified by the PR/VSI as nonregulated. The tanks were active at the time of the acid waste sludge tank PR/VSI inspection.

The PR/VSI suggested that no further action was required.

9.2.4 Sludge Filter Press (AOI #57) (SWMU #20)

The sludge filter press is located in the Pontiac East WWTP area, downstairs in Building 56, and serves to dewater all incoming sludges. During each dewatering cycle, 5.5 cubic yards of sludge are processed. The sludge filter press manages waste sludges (including F019) which may contain volatile constituents, heavy metals, and organics. The PR/VSI indicated that splashing and staining of the surrounding walls was observed at the lower portion of this unit. The PR/VSI had also identified that some minor runoff from this area (trickles) had occurred beneath the outside gate towards the concrete driveway. According to the PR/VSI, odors representative of VOCs were evident in the area.

The regulatory status of the sludge filter press was identified in the PR/VSI as nonregulated. The sludge filter press was active at the time of the PR/VSI inspection.

The PR/VSI suggested further action was; air monitoring should be considered during unit operations.

9.2.5 Sludge Filter Press Sump (AOI #58) (SWMU #21)

The sludge filter press sump is located in the Pontiac East WWTP area, downstairs in Building 56 (next to gondola collection/loading area). This open top unit is constructed entirely of concrete. A piping system in the sludge filter press sump sends the water derived from the Sludge Filter Press back upstairs to the General Waste Solids Separator (Unit #18). All drainage water collected from within Building 56 and the container storage area are received by this sump.

The PR/VSI indicated that there was no evidence of any releases (other than some staining on the overlying grid). The regulatory status of the sludge filter press sump was identified by the PR/VSI as nonregulated. The sludge filter press sump was active at the time of the inspection.

The PR/VSI suggested further action was; air monitoring should be considered during sump operation, as well as structural integrity testing.

9.2.6 Acid Waste Separator System (AOI #59) (SWMU #22)

The acid waste separator system is located in the Pontiac East WWTP area, upstairs in Building 56. The acid waste separator is approximately 10 feet x 40 feet, and receives the majority of its acidic influent from the Power House. Acid wastes containing heavy metals are neutralized to a pH between 6 and 8. Solids which are generated are gravity separated and directed to the acid waste sludge tanks. Waste waters are treated at the wastewater treatment tank area.

The PR/VSI identified no visible evidence of release, although odors representative of VOCs were present. The regulatory status of the acid waste separator system was identified by the PR/VSI as nonregulated.

The PR/VSI suggested further action was; air monitoring should be considered during system operation as well as testing of the structural integrity of the separator system.

9.2.7 Polymer Tank (AOI #60) (SWMU #23)

The polymer tank is located in the Pontiac East WWTP area, upstairs in Building 56. The polymer tank is approximately 10,000 gallons in capacity and is believed to have been out of service for several years.

The regulatory status of the polymer tank was identified by the PR/VSI as nonregulated. The tank was inactive at the time of the PR/VSI inspection.

The PR/VSI suggested that no further action was required.

9.2.8 Waste Pickle Acid Tank (AOI #61) (SWMU #24)

The waste pickle acid tank is located in the Pontiac East WWTP area, upstairs in Building 56. The waste pickle acid tank is a 12,000-gallon steel tank containing ferrous chloride products used in the chemical reduction of hexavalent chromium. Ultimately, this solution receives lime which effectively raises the pH of the waste pickle acid solution. The wastes handled in the tank includes waste pickle acid, which contains lead, chromium, and nickel.

The PR/VSI indicated that some staining and minor corrosion at the tank bottom was identified and odors representative of VOCs were present. The regulatory status of the waste pickle acid tank was identified by the PR/VSI as RCRA regulated. The tank was active at the time of the PR/VSI inspection.

The PR/VSI suggested further action was; routine inspections were required.

9.2.9 Cleaner Waste Separator (AOI #62) (SWMU #25)

The cleaner waste separator is open at the top and measures approximately 15 feet by 40 feet with a capacity of approximately 4,000 gallons. The system is manually operated to skim the oil contained in cleaner wastes. The cleaner waste separator is located in the Pontiac East WWTP area, upstairs in Building 56.

Cleaner wastes managed typically contain complexed organics. The skimmed oil is piped downstairs to the oil skimmer storage tanks. The wastewater obtained from this operation is sent outside to the wastewater treatment tank area.

The PR/VSI indicated that oil staining was observed along the floor inside the bermed area. The regulatory status of the cleaner waste separator was identified by the PR/VSI as nonregulated. This area was active at the time of the PR/VSI inspection.

The PR/VSI suggested further action was; air monitoring should be considered during operations, as well as structural integrity testing of the separator.

9.2.10 Pickle Acid Treatment Tank Storage Area (AOI #63) (SWMU #26)

The pickle acid treatment tank storage area consists of vertical pickle acid treatment operations co-existing with two other vertical tanks. The waste treatment process units utilize 1,200 gal/day ferrous sulfate to chemically reduce hexavalent chromium to trivalent chromium. These tanks have a total capacity of 34,500 gallons. The pickle acid treatment tank storage area is located in the Pontiac East WWTP area, first floor of Building 56.

The pickle acid treatment tank manages waste pickle acid. Waste pickle acid contains lead, chromium, and nickel. The other two

non-SWMU tanks consist of an inactive sulfuric acid treatment tank, and a caustic treatment tank.

The regulatory status of the pickle acid treatment tank storage area was identified by the PR/VSI as RCRA regulated. The tanks were active at the time of the storage area inspection.

The PR/VSI suggested further action was; routine inspections should be performed.

9.2.11 Former Vacuum Filter Press (AOI #64) (SWMU #27)

The two former vacuum filter presses were approximately 16 feet by 12 feet and were used in the sludge dewatering operations. These two former vacuum filter presses were located in the Pontiac East WWTP area, downstairs in Building 56.

The regulatory status of the two former vacuum filter presses was identified by the PR/VSI as nonregulated. The presses were inactive at the time of the PR/VSI inspection.

The PR/VSI suggested that no further action was required.

The two vacuum filter presses have since been dismantled and removed from Building 56.

9.2.12 Oil Skimmer Storage Tank (AOI #65) (SWMU #28)

The oil skimmer storage tank is located in the Pontiac East WWTP area, downstairs in Building 56. The oil skimmer storage tank is a vertical tank which receives oily waste skimmed from the surface of the Waste Separator located upstairs. The oil skimmer storage tank has a capacity of 6,000 gallons. Cleaner waste oil is shipped off Site for disposal.

The regulatory status of the oil skimmer storage tank was identified in the PR/VSI as nonregulated. The tank was active at the time of the PR/VSI inspection.

The PR/VSI suggested further action was; air monitoring should be considered during the oil skimmer storage tank operation.

9.2.13 Wastewater Treatment Tank Area (AOI #66) (SWMU #29)

The wastewater treatment tank area consists of approximately 20 open top vertical tanks located outside Building 56, in the Pontiac East WWTP area. The wastewater treatment tank area has a total capacity of approximately 4 million gallons. The wastewater treatment tanks are designated as follows:

- three tanks for treatment of acid wastes;
- six tanks for the treatment of general wastes;
- two clarifier tanks;
- one equalization tank;
- three sludge thickener tanks which were being converted to provide an additional cleaner waste tank; and
- a smaller (e.g., approximately 5,000 gallons) unidentified aboveground tank located beneath/adjacent to the catwalk leading to the wastewater treatment tank area from Building 56.

It should be noted that all of these tanks are above ground storage tanks (ASTs). The PR/VSI identified the following general concerns:

1. absence of individual tank berms;
2. unidentified drums piled along the sides of several tanks;
3. debris and stained soil adjacent to the tank bottoms and throughout the tank area, although the immediate area was covered with gravel;
4. sludge stains inside one of the tanks implied past levels where overflow conditions may have occurred;
5. corrosion was noted in several tank areas; and

6. visibly stained soil was observed near the drainage collection ditch.

The regulatory status of the wastewater treatment tank area was identified by the PR/VSI as nonregulated.

The PR/VSI suggested further action was; a soil investigation should be completed and proper identification of all unlabeled drums should be provided.

9.2.14 Lime Slaker (AOI #67) (SWMU #36)

The lime slaker was identified during the PR/VSI as an area of concern. The lime slaker is a unit which receives dried pebble lime from a 25-ton vertical storage hopper. The lime is then wetted and the slaked solution is sent to the adjacent wastewater treatment tank area. The lime slaker is located in Pontiac East WWTP, upstairs in Building 56.

The regulatory status of the lime slaker was identified by the PR/VSI as nonregulated. The lime slaker was active at the time of the lime slaker PR/VSI inspection.

The PR/VSI suggested further action was; air monitoring during operation of the lime slaker should be considered.

9.2.15 Drum Storage Area (AOI #68) (SWMU #37)

The drum storage area was identified during the PR/VSI as an area of concern. The drum storage area was used for the storage of product sodium hypochlorite and sodium bisulfate contained in 55-gallon drums. At the time of the PR/VSI, the drums were placed on wooden pallets and stacked. The storage area is located at the Pontiac East WWTP, downstairs in Building 56.

The regulatory status of the drum storage area was identified by the PR/VSI as nonregulated. The drum storage area was active at the time of the PR/VSI inspection.

The PR/VSI suggested further action was; all drums should be properly identified.

9.2.16 Container Storage Area (AOI #69) (SWMU #1)

The container storage area consists of a 12,543-square foot, 8-inch thick epoxy-coated concrete waste management pad, that was constructed in 1980. The waste management pad is divided into two operating halves separated by a 4-foot high, 2-foot thick concrete wall. The west half is a covered drum storage waste accumulation area and the east half operates as an uncovered waste bulking area. This container storage area is located at the Pontiac East WWTP, adjacent to and north of Building 56.

The west half of the waste management pad (the drum storage waste accumulation area) is the only area in which hazardous waste was stored. The east half of the waste management pad (bulking area of the pad) was not used for the storage of hazardous waste. Wastes typically received at the waste management pad included non-hazardous paint sludges, solvents (F003 and F005), chlorinated solvents (F001) and non-hazardous oils.

The drum storage area operated as a hazardous waste storage area under interim status. In March 1985, GM submitted a Part B Permit Application which requested approval to operate the storage pad. In July 1987, GM withdrew its Part B Permit Application and proceeded to close this waste storage area.

Closure activities included decontamination, soil sampling, and excavation of approximately 35 cubic yards of soil north of the bulking pad retaining wall. These activities satisfied the requirements of the waste management pad closure as specified in 40 CFR 265.111. Closure activities are

summarized in the Closure Report dated March 1991 which is presented in Appendix B.4. The MDNR approval of the closure is presented in Appendix B.5.

9.2.17 Tank Storage Area (AOI #70) (SWMU #4)

The tank storage area consists of container storage space, a sludge solidification pit, and six horizontal ASTs, each having a 12,000-gallon capacity. The tank storage area is used for the management of waste materials presently being stored in mobile tanks in the Container Storage Area (AOI #69). A secondary containment area surrounding the tanks has a 33,614-gallon capacity. The tank storage area is located west of Building 56. The tanks (#21-#26) are identified as follows:

#21 - Waste Oil
#22 - Waste Oil/ Glycol
#23 - Waste Glycol
#24 - Low Lead Paint (Flammable)
#25 - High Lead Paint (Flammable)
#26 - Purge Solvent (Flammable)

These wastes contain heavy metals, VOCs and complexed organics. The tank storage area was under construction in 1987 at the time of the PR/VSI inspection.

The regulatory status of the tank storage area was identified by the PR/VSI as RCRA regulated.

The PR/VSI suggested that no further action was required since the tank storage area was under construction.

9.2.18 Burn Pile (AOI #71)

The "Burn Pile" Site is located south of the Pontiac East WWTP and north of the Grand Trunk Western Railroad. It is comprised of an

earth fill matrix with some wood and metal construction debris, paint chips, brick, and metal scraps. The "Burn Pile" originated from historic filling activities conducted on Site.

The Burn Pile was initially evaluated by GM in 1993. The evaluation was continued by Peter Cook and Associates, and CRA, as part of the redevelopment plans for the Centerpoint Business Campus. The "Burn Pile" was situated on property over which the Centerpoint Parkway was constructed.

The evaluation of the Burn Pile consisted of two investigations. The Phase I investigation delineated "potentially clean" and "potentially affected" soil. This investigation resulted in the removal of 32,000 cubic yards of "potentially clean" soil and the stockpiling of 3,500 cubic yards of "potential affected" soil. Phase II soil and groundwater investigations were conducted to characterize the nature and extent of affected or potentially affected materials remaining following Phase I remediation. The Phase I and Phase II investigations resulted in the removal and disposal of approximately 6,500 cubic yards of soil to a Michigan Type II landfill.

An overview of the Burn Pile activities is presented in the Final Summary Report (Appendix I). The Burn Pile remedial activities were completed to support Site redevelopment. All activities were successfully completed. No further activities have been identified to be required.

9.3 PARCEL C3

9.3.1 Waste/Purge Solvent Tanks (AOI #72) (SWMU #18)

The waste/purge solvent tank area consisted of four vertical tanks located outside and adjacent to Building 1 in Pontiac East. The four vertical tanks are situated on a concrete pad several feet high and approximately 15 feet by 30 feet in dimension. These four tanks store waste/purge solvents that have been generated from process operations in Pontiac East.

The regulatory status of the waste/purge solvent tanks was identified by the PR/VSI as RCRA regulated. The tanks were active at the time of the PR/VSI inspection.

The PR/VSI suggested further action was; structural integrity testing should be performed.

9.3.2 Paint Sludge Room (AOI #73) (SWMU #9)

The paint sludge room is located in Pontiac East and contains three concrete sumps approximately 25 feet by 40 feet with open tops located inside Building 1, Plant 6. The paint sludge is collected and transported for storage to the waste container storage area at the Pontiac East WWTP.

The three concrete sumps manage waste paint sludge with elevated levels of lead (i.e., D008), and a proprietary polymer. The waste sludges managed by these sumps include:

- one sump used for color coat paint sludge
- one sump used for clear coat paint sludge
- one sump used as an auxiliary sump for either color coat or clear coat paint sludge depending on process requirements.

The regulatory status of the paint sludge room was identified by the PR/VSI as nonregulated. The paint sludge room was active at the time of the PR/VSI inspection.

The PR/VSI suggested further action was that air emission monitoring be performed during operations as well as structural integrity testing.

9.3.3 Former Container Storage Area (AOI #74) (SWMU #3)

The former container storage area was located in Pontiac East, outside and adjacent to Building 1, Plant 6. This area was constructed with a concrete pad including a 6-inch concrete berm. The former container storage area was typically used for the temporary storage of 55-gallon drums containing solvents and sludges from ongoing construction activities at the Site. The former container storage pad was approximately 20 feet by 50 feet, with a storage capacity of approximately 37,400 gallons.

At the time of the PR/VSI, there was evidence of leaking and unlabeled drums. Several drums were completely open to the air resulting in unidentified odors. The floor of the concrete pad was covered by various sludges which were also identified to be outside the contained concrete area.

The regulatory status of the container storage area was not identified by the PR/VSI. The storage area was active at the time of the container storage inspection.

The PR/VSI suggested further action was; the regulatory status of the container storage area should be determined, air monitoring should be considered, and a soil investigation should be completed around the perimeter of the storage area. In addition, the PR/VSI suggested that the leaking drums, unlabeled drums, management of the storage area, storage practices, and the concrete pad residual sludges should be appropriately addressed.

9.3.4 Former East Tank Farm (AOI #75) (SWMU #2)

The former east tank farm area was identified as a former hazardous waste storage location of approximately 4,500 square feet housing two former vertical 10,000-gallon ignitable waste collection tanks. The former east tank farm area was constructed with a concrete slab which had a 22-inch high curbing to provide tank secondary containment. The tank farm was located south of Building 2, and west of Building 1.

The former waste storage area typically received drummed waste such as chlorinated solvents (F001), waste paints (F003, F005, and D001), and waste solvents (F003, F005, and D001). These drummed wastes had been removed prior to use of the former waste storage area as secondary containment for the two 10,000-gallon hazardous waste storage tanks. These waste storage tanks were used for the storage of waste paint and waste solvent (F003 and F005).

This area operated as a storage area under interim status. In July 1987, GM withdrew its Part B Permit Application and proceeded with closure of this area.

Closure activities were identified in the "Work Plan for the Removal of Two Aboveground Storage Tanks and a Concrete Containment Pad from the Hazardous Waste Storage Area", dated September 21, 1989. The Work Plan was approved, with modification, by the MDNR Waste Management Division.

Closure activities were completed between October 4, 1989 and October 6, 1989. The storage tanks, and containment pad, were cleaned, removed and disposed. Approximately 150 cubic yards of concrete was removed from the area and disposed of as inert material at the Pallards Landfill Facility in Montrose Township, Michigan. The two aboveground storage tanks were cleaned, dismantled, and quartered prior to off-Site disposal. Excavation and disposal of 780 cubic yards of contaminated soils was performed between February 1990 and March 1990.

The Closure Report for the former east tank farm area, dated August 31, 1990, is presented in Appendix B.4. The MDNR approval of the closure, dated October 30, 1990, is presented in Appendix B.5.

9.3.5 Waste Antichip Accumulation Area (AOI #76) (SWMU #11)

The waste antichip accumulation area is located inside Building 1 and contains an open-topped concrete sump which is approximately

25 feet by 40 feet in size. The sump receives waste antichip]spray comprised of a plastic type material (e.g., polyurethane) which is sprayed on the undercarriage of automotive vehicles to prevent chipping by pebbles/debris during vehicle use. The waste antichip sludge is then transferred to the WWTP facilities.

The regulatory status of the waste antichip area was identified by the PR/VSI as nonregulated. The area was active at the time of the PR/VSI.

The PR/VSI suggested further action was; structural integrity testing and air monitoring should be performed due to the open nature of the sump.

9.3.6 Waste Oil Accumulation Tanks (AOI #77) (SWMU #10)

The waste oil accumulation tanks are enclosed steel tanks contained within concrete pits. The number of these waste oil accumulation tanks located throughout Building 1 was unknown at the time of the PR/VSI. One tank was located at column C-36 and evaluated. The waste oil accumulation tanks typically received waste oil, waste power steering fluid, glycol, and waste brake and transmission fluids at assembly line areas. Tank contents were then piped to the wastewater treatment facility.

The regulatory status of the waste oil accumulation tank was identified by the PR/VSI as nonregulated. The area was active at the time of the PR/VSI.

The PR/VSI suggested further action was that structural integrity testing of the waste oil accumulation tanks be completed.

9.3.7 Waste Lift Stations (AOI #78) (SWMU #17)

The waste lift stations consist of a network of pump systems and holding tanks designed to transport wastewater from Pontiac East to the

wastewater treatment plant. A concrete berm 4 inches to 8 inches in height surrounding the station provides secondary containment. The lift station receives wastewater consisting of acid wastes, general wastes, and cleaner wastes.

In August 1988, there was a release of industrial wastewater from the unit due to a power failure. The flow to the storm sewers was blocked upon discovery of the release, and most of the industrial wastewater was recovered on Site. An analysis of the outfall water showed no effect on water quality.

The regulatory status of the wastewater lift station was identified by the PR/VSI as non-regulated. The lift station was active at the time of the inspection.

The PR/VSI suggested further action was; air emission monitoring should be considered during wastewater lift station operation and structural integrity testing of the lift station should be considered.

9.4 PARCEL C4

9.4.1 Former J-Lot Fill Area (AOI #79) (SWMU #30)

The former J-Lot fill area, located within the J-Lot parking area, represents a one-time burial of waste materials sometime between 1950 and 1955.

The regulatory status of the former J-Lot fill area was identified by the PR/VSI as nonregulated. The J-Lot fill area was inactive at the time of the fill area inspection. The PR/VSI recommended that a soil investigation be completed to identify if hazardous constituents were present within the soil.

In response, a Phase I Environmental Site Assessment was conducted by GM North American Operations in March 1993. The report

concluded that historical activities in the vicinity of the former J-Lot fill area may have adversely impacted the soil.

An initial subsurface investigation of the area in the vicinity of the former J-Lot fill area was conducted by ERM in May 1994. The report indicated that the extent of contamination was not suitably defined.

An additional investigation was carried out by CRA to further define the extent of affected soils identified in the ERM investigation. It was determined that an additional broader investigation was warranted to identify any possible migration pathways for the constituents encountered (Appendix M.2) (which was performed during the EOC/EECA).

CRA completed an Extent of Contamination (EOC) Study and developed an Engineering Evaluation and Cost Analysis (EECA). The EECA report identified various removal action alternatives based on the effectiveness, implementability, and cost of each alternative. The J-Lot reports are presented in Appendix M (also see Section 6.1.4).

9.5 OTHER

9.5.1 Murphy Drain (AOI #80) (SWMU #35)

Murphy Drain is a large 48-inch diameter storm sewer which drains to the north of South Boulevard. The location of the drain is presented on Figure 9.1, off Site and north of Parcel C1.

The regulatory status of the Murphy Drain was identified by the PR/VSI as an off-Site NPDES outfall. Murphy Drain was active at the time of the PR/VSI inspection.

The PR/VSI suggested further action was; structural integrity testing of the storm sewer should be completed.

9.5.2 Pits and Sumps (AOI #81)

In addition to the pits and sumps previously discussed in Sections 7.0 and 8.0 of this Report, over 200 additional pits and sumps were identified as an area of interest in Pontiac Central. These areas were located within the areas identified in the Centerpoint Business Campus development plans. This area was redeveloped as the GM Truck Product Center, with supporting several thousand parking areas for the new facility, and landscaped areas.

During the decommissioning activities of Pontiac Central, each pit and sump was thoroughly cleaned to remove any remaining contents. A high pressure wash was utilized to remove any oil or grease present in the pits and sumps. Each area was then dried for structural integrity inspection.

Following the inspection and cleaning of each area, the pits and sumps were classified as to further activities and were subsequently decommissioned. Decommissioning activities generally included demolition and removal/disposal of the pit structures and associated backfill. In certain instances the pits were collapsed into the subbase of proposed buildings.

10.0 SUMMARY

This Report was developed as a preliminary review of the significant environmental activities conducted by GM to support the development of the Centerpoint Business Campus at the former Pontiac Central and Pontiac East manufacturing areas. As discussed with U.S. EPA at the August 17, 1995 meeting conducted at the Centerpoint Business Campus, GM proposed to submit all relevant information related to the significant environmental activities which had, and were, being completed. This Report primarily focused on those environmental activities completed within the former Pontiac Central areas (Parcels A and B). Available information relating to the Pontiac East areas (Parcel C) is also provided. As discussed during the August 17, 1995 meeting, a Supplement to the Review of Existing Conditions Report will be submitted in December 1995 to detail the environmental status of the AOIs within Parcel C.

Parcels A and B: Centerpoint Business Campus (Former Pontiac Central)

The former Pontiac Central manufacturing areas have been subject to major Site redevelopment activities since the PR/VSI was conducted by U.S. EPA in 1987. The former Pontiac Central manufacturing areas (Parcels A and B) were closed, decommissioned, and demolished to provide the core of the development site for the Centerpoint Business Campus. During the decommissioning activities, GM investigated, evaluated, and closed 9 areas of concern identified by U.S. EPA; an additional 37 AOIs identified by GM; and over 200 additional pits and sumps.

Environmental activities completed by GM in the Parcels A and B included:

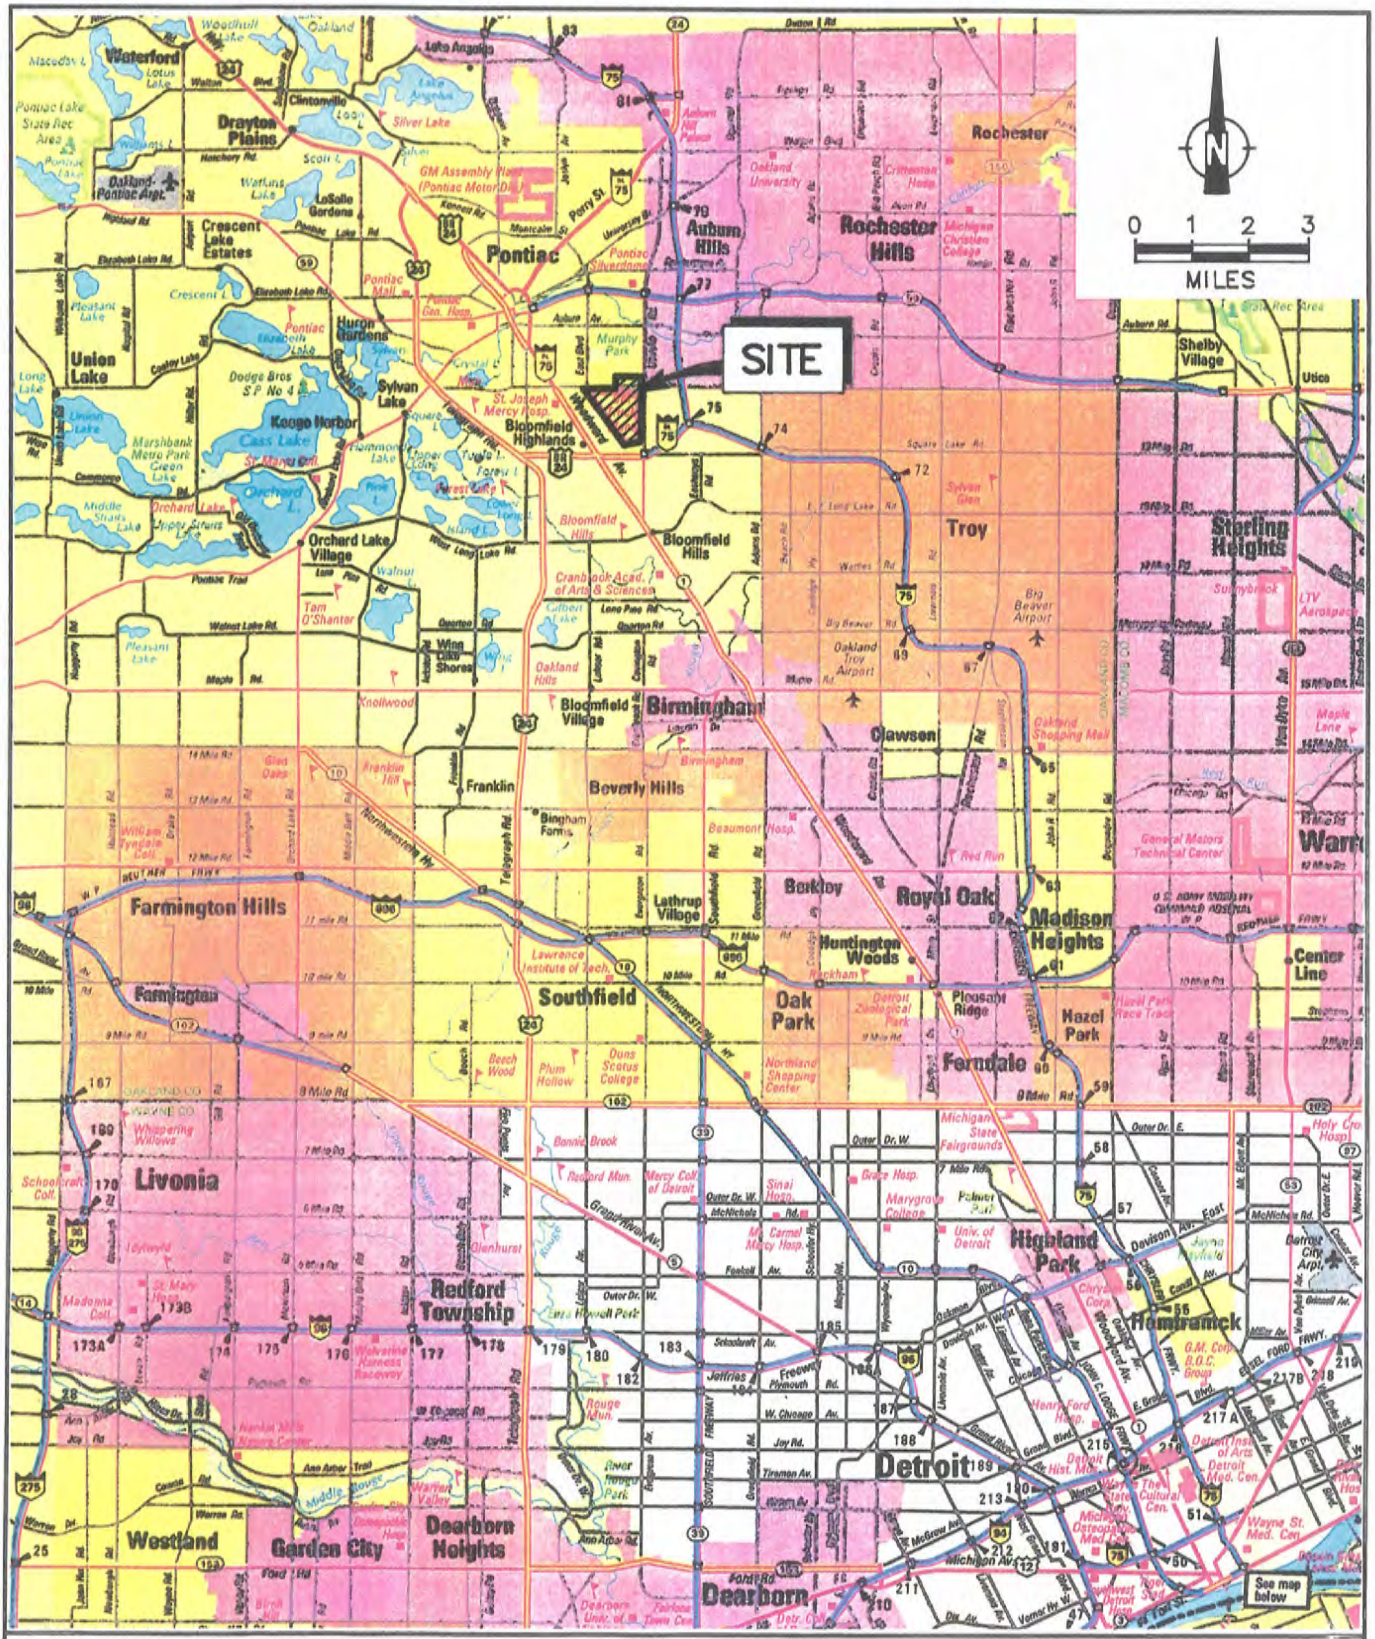
- inspections of all units which conveyed products or waste materials containing hazardous constituents;

- investigations, including installation of boreholes, and monitoring wells, at areas of environmental concern;

- assessment of analytical data and evaluation of remedial action alternatives;

- implementation of decommissioning and remedial activities, including:
  - dismantling of equipment,
  - demolition of structures,
  - excavation of affected soils, and
  - treatment or disposal of affected soils; and

- documentation of remedial activities, including reporting to regulatory agencies, where necessary.



Based upon the activities completed to date, and the significant redevelopment which has occurred, the environmental restoration of Parcels A and B is nearing completion. As a result of, GM believes the environmental investigation and remedial activities necessary in Parcels A and B will be completed to U.S. EPA's satisfaction by the time a RCRA Corrective Actions order could be implemented.

Parcel C: Pontiac East

The Pontiac East areas (Parcel C) have also been significantly upgraded by GM over the period from the U.S. EPA PR/VSI in 1987 to present. These upgrades have included the completion of numerous activities to support ongoing environmental compliance. In addition, significant additional redevelopment within Parcel C is expected within the next few years.

As discussed within this Report, GM has completed environmental activities at a variety of the AOIs identified in Parcel C. This Report presented a preliminary review of the status of these activities. The review of these environmental activities is currently ongoing.

A Supplement to the Review of Existing Conditions Report, which details the current environmental status of the AOIs in Parcel C, will be submitted to U.S. EPA in December 1995.

TABLE 1.1

LIST OF U.S. EPA SWMUs AND AOCs
GENERAL MOTORS CORPORATION
PONTIAC, MICHIGAN

GM Area	*GM Location*	*Number*	*U.S. EPA PR/VSI SWMU #*	*U.S. EPA PR/VSI (1) Operation/Identification*
A	Central	1	12	Former Deluge Tank Area
		2	13	Former Waste Solvent Collection Area
		3	14	Former Waste Purge Solvent Collection Areas
		4	15	Former Fluid Collection Pits
		5	16	Former Sludge Dock
		6	17	Former Waste Lift Stations (2)
B1	Central	7	6	Former Underground Tank Area
B2	Central	8	33	Former South Retention Pond (AOC) (3)
B3	Central	9	34	North Retention Pond (AOC)
C1	East (Eng.)	10	5	Drum Draining Area
		11	7	Refuse Process Facility
		12	32	Coal Storage Unit (AOC)
C2	East (WWTP)	13	1	Container Storage Area
		14	4	Tank Storage Area
		15	18	General Waste Solids Separator
		16	19	Acid Waste Sludge Tanks
		17	20	Sludge Filter Press
		18	21	Sludge Filter Press Sump
		19	22	Acid Waste Separator System
		20	23	Polymer Tank
		21	24	Waste Pickle Acid Tank
		22	25	Cleaner Waste Separator
		23	26	Pickle Acid Treatment Tank
		24	27	Former Vacuum Filter Press
		25	28	Oil Skimmer Storage Tank
		26	29	Wastewater Treatment Tank Area
		27	31	Former Surface Impoundment
		28	36	Lime Slaker (AOC)
		29	37	Drum Storage Area (AOC)

TABLE 1.1

LIST OF U.S. EPA SWMUs AND AOCs
GENERAL MOTORS CORPORATION
PONTIAC, MICHIGAN

GM Area	*GM Location*	*Number*	*U.S. EPA PR/VSI SWMU #*	*U.S. EPA PR/VSI (1) Operation/Identification*
C3	East	30	2	Former East Tank Farm Area
		31	3	Former Container Storage Area
		32	8	Waste/Purge Solvent Tank Area
		33	9	Paint Sludge Room Area
		34	10	Waste Oil Accumulation Tanks
		35	11	Waste Antichip Accumulation Area
		36	17	Waste Lift Stations (2)
C4	East	37	30	Former "J" Lot Fill Area
Other	East	38	35	Murphy Drain (AOC)

Notes:

(1) Preliminary Review/Visual Site Inspection (PR/VSI) Report of the General Motors Truck and Bus Group Pontiac, Michigan, Plant (March 1987).
(2) U.S. EPA PR/VSI SWMU #17 was identified in the PR/VSI to be located in both the Pontiac Central and Pontiac East Areas.
(3) Area of Concern (AOC) identified by U.S. EPA.

TABLE 1.2

ADDITIONAL GM AREAS ASSESSED TO SUPPORT SITE REDEVELOPMENT (1)
GENERAL MOTORS CORPORATION
PONTIAC, MICHIGAN

GM Area	*GM Location*	#	*GM Operation/Identification*
A	Central	1	Former Heavy Duty Body Shop Hydraulic Lift Pit
A	Central	2	Former Heavy Duty Body Shop Hydraulic Lift Pit
A	Central	3	Former Heavy Duty Body Shop Hydraulic Lift Pit
A	Central	4	Former Creosote Tank
A	Central	5	Former #32791 Press Pit
A	Central	6	Former #21310 Press Pit
A	Central	7	Former #29470 Press Pit
A	Central	8	Former Spray Primer Mix Room Pit
A	Central	9	Former Cyanide Destruction Operation
A	Central	10	Former Building 29 Tank Farm
A	Central	11	Former Paint Mix Room Fire Dump Tank
A	Central	12	Former Process Trash Compactor Sump
A	Central	13	Former Black Dip Tank
A	Central	14	Former Phosphating Location
A	Central	15	Former Phosphating Location
A	Central	16	Former Phosphating Location
A	Central	17	Former Top Coat Pit
A	Central	18	Former Elevator Tire Shaft
A	Central	19	Former Plating Department
A	Central	20	Former Black Dip Tank
A	Central	21	Former Iron Phosphating Area
A	Central	22	Former Enamel Pit
A	Central	23	Former Spray Booth
A	Central	24	Former Enamel Pit
A	Central	25	Former Phosphating Area
A	Central	26	Former Spray Booth
A	Central	27	Former Phosphating Area
A	Central	28	Former Lowerator
A	Central	29	Former Transformer Accident Site
A	Central	30	Former Zinc Platers
A	Central	31	Former Wastewater Sump
A	Central	32	Former Wastewater Tunnel
A	Central	33	Former Anodizer
A	Central	34	Former Anodizer
A	Central	35	Former Chip Dock
B1	Central	36	Former Construction Debris Site
B1	Central	37	Building 43 - Investigation/Remediation
C1	East (Eng.)	38	DUCO Stores Investigation/Remediation
C1	East (Eng.)	39	Building 33 - Fuel Island Investigation/Remediation
C1	East (Eng.)	40	Building 35 - Tank Farm Investigation/Remediation
C1	East (Eng.)	41	Building 33 - Free Product Investigation
C2	East (WWTP)	42	Burn Pile Investigation/Remediation
Other	Central	43	Pits and Sumps

Notes:

(1) There are additional areas, beyond those identified by U.S. EPA in the PR/VSI Report (see Table 1.1), which have been addressed by GM to support Site re-development activities.

C3	East	77	Waste Oil Accumulation Tanks (SWMU #10)	Active
C3	East	78	Waste Lift Stations (SWMU #17) (2)	Active
C4	East	79	Former "J" Lot Fill Area (SWMU #30)	Complete
Other	East	80	Murphy Drain (AOC) (SWMU #35)	Active
Other	Central	81	Pits and Sumps	Redeveloped

Notes:

(1) Includes U.S. EPA SWMUs/AOCs and additional areas assessed by GM (see Tables 1.1 and 1.2).
(2) AOI #6 and #78 both refer to U.S. EPA PR/VSI SWMU #17.
Decommissioned - The AOI has been cleaned, structural integrity tested, or inspected, and taken out of service.
Active - The AOI is currently in operation at the Site.
Inactive - The AOI is no longer in use at the Site, but remains in place.
Under Redevelopment - these AOIs are currently under commercial, office/research, and manufacturing development.
Redeveloped - these areas currently form part of either the GM Truck Product Center, parking lot, or landscaping.

TABLE 7.1

PARCEL A - AREAS OF INTEREST
GENERAL MOTORS CORPORATION
PONTIAC, MICHIGAN

GM Area	*GM Location*	*Area #*	*Operation/Identification*	*PR/VSI Identified Regulatory Status*	*U.S. EPA Suggested Further Action*	*GM Action Taken*	*Existing Condition*
A	Central	1	Former Deluge Tank Area (SWMU #12)	Nonregulated; Active	Unit integrity testing	Cleaning, structural integrity testing, demolished, and removed/disposed	GM Truck Product Center
A	Central	2	Former Waste Solvent Collection Area (SWMU #13)	RCRA regulated; Active	Verify RCRA performance standard	Cleaning, structural integrity testing, demolished, and removed/disposed	GM Truck Product Center
A	Central	3	Former Waste Purge Solvent Collection Pits (SWMU #14)	Nonregulated; Active	No further action	Cleaning, structural integrity testing, demolished, backfilled	GM Truck Product Center
A	Central	4	Former Fluid Collection Pits (SWMU #15)	Nonregulated; Active	Unit integrity testing	Cleaning, structural integrity testing, demolished, backfilled	GM Truck Product Center
A	Central	5	Former Sludge Dock (SWMU #16)	Nonregulated; Active	Air monitoring	Soil inv., demolished, removed/disposed	Parking Lot
A	Central	6	Former Waste Lift Stations (SWMU #17)	Nonregulated; Active	Air monitoring; Unit integrity testing	Cleaning, structural integrity testing, soil inv., dismantling, demolition, removal/disposal	Parking Lot
A	Central	7	Former Heavy Duty Body Shop Hydraulic Lift Pit	–	–	Cleaning, structural integrity testing, demolition, removal/disposal, backfilling	Parking Lot
A	Central	8	Former Heavy Duty Body Shop Hydraulic Lift Pit	–	–	Cleaning, structural integrity testing, demolition, removal/disposal, backfilling	Parking Lot
A	Central	9	Former Heavy Duty Body Shop Hydraulic Lift Pit	–	–	Cleaning, structural integrity testing, demolition, removal/disposal, backfilling	Parking Lot
A	Central	10	Former Creosote Tank	–	–	No action required	GM Truck Product Center
A	Central	11	Former #32791 Press Pit	–	–	Cleaning, structural integrity testing, excavation, removal/disposal, backfilling	GM Truck Product Center
A	Central	12	Former #21310 Press Pit	–	–	Cleaning, structural integrity testing, excavation, removal/disposal, backfilling	GM Truck Product Center
A	Central	13	Former #29470 Press Pit	–	–	Cleaning, structural integrity testing, excavation, removal/disposal, backfilling	GM Truck Product Center
A	Central	14	Former Spray Primer Mix Room Pit	–	–	Structural integrity testing, water sampling excavation, removal/disposal, backfilling	Parking Lot
A	Central	15	Former Cyanide Destruction Operation	–	–	No action required	Parking Lot
A	Central	16	Former Building 29 Tank Farm	–	–	UST removal, structural integrity testing, soil investigation, thermal treatment of 3000 c.y. soil	Parking Lot
A	Central	17	Former Paint Mix Room Fire Dump Tank	–	–	No action required	Parking Lot
A	Central	18	Former Process Trash Compactor Sump	–	–	Cleaning, structural integrity testing	Parking Lot
A	Central	19	Former Black Dip Tank	–	–	Soil investigation, demolished, removed/disposed	Landscaped areas
A	Central	20	Former Phosphating Location	–	–	Soil investigation, demolished, removed/disposed	Landscaped areas
A	Central	21	Former Phosphating Location	–	–	Soil investigation, demolished, removed/disposed	Landscaped areas

C1	East (Eng.)	52	Building 35 Investigation/Remediation	–	–	–	Complete
C1	East (Eng.)	53	Building 33 - Free Product Investigation	–	–	–	Complete
C2	East (WWTP)	54	Former Surface Impoundment (SWMU #31)	Nonregulated; Inactive	Soil/sediment sampling	–	Inactive
C2	East (WWTP)	55	General Waste Solids Separator (SWMU #18)	Nonregulated; Active	Air monitoring; unit integrity testing	–	Active
C2	East (WWTP)	56	Acid Waste Sludge Tanks (SWMU #19)	Nonregulated; Active	No further action	–	Active
C2	East (WWTP)	57	Sludge Filter Press (SWMU #20)	Nonregulated; Active	Air monitoring	–	Active
C2	East (WWTP)	58	Sludge Filter Press Sump (SWMU #21)	Nonregulated; Active	Air monitoring; unit integrity testing	–	Active
C2	East (WWTP)	59	Acid Waste Separator System (SWMU #22)	Nonregulated; Active	Air monitoring; unit integrity testing	–	Active
C2	East (WWTP)	60	Polymer Tank (SWMU #23)	Nonregulated; Inactive	No further action	–	Active
C2	East (WWTP)	61	Waste Pickle Acid Tank (SWMU #24)	RCRA regulated; Active	Verify RCRA performance standard	–	Active
C2	East (WWTP)	62	Cleaner Waste Separator (SWMU #25)	Nonregulated; Active	Air monitoring; unit integrity testing	–	Active
C2	East (WWTP)	63	Pickle Acid Treatment Tank (SWMU #26)	RCRA regulated; Active	Verify RCRA performance standard	–	Active
C2	East (WWTP)	64	Former Vacuum Filter Press (SWMU #27)	Nonregulated; Inactive	No further action	–	Removed from Service
C2	East (WWTP)	65	Oil Skimmer Storage Tank (SWMU #28)	Nonregulated; Active	Air monitoring	–	Active
C2	East (WWTP)	66	Wastewater Treatment Tank Area (SWMU #29)	Nonregulated; Active and Inactive subunit tanks	Multimedia testing; unit integrity testing	–	Active
C2	East (WWTP)	67	Lime Slaker (AOC) (SWMU #36)	Nonregulated; Active	Air monitoring	–	Active
C2	East (WWTP)	68	Drum Storage Area (AOC) (SWMU #37)	Nonregulated; Active	No further action	–	Active
C2	East (WWTP)	69	Container Storage Area (SWMU #1)	RCRA regulated; Active	Verify RCRA performance standard	–	Active
C2	East (WWTP)	70	Tank Storage Area (SWMU #4)	RCRA regulated; Inactive	Verify RCRA performance standard	–	Inactive
C2	East (WWTP)	71	Burn Pile Investigation/Remediation	–	–	–	Active
C3	East	72	Waste/Purge Solvent Tank Area (SWMU #8)	RCRA regulated; Active	Verify RCRA performance standard	–	Active
C3	East	73	Paint Sludge Room Area (SWMU #9)	Nonregulated; Active	Air monitoring; unit integrity testing	–	Active
C3	East	74	Former Container Storage Area (SWMU #3)	Temporary storage	Unit monitoring; determine regulatory status	–	Closed
C3	East	75	Former East Tank Farm Area (SWMU #2)	RCRA regulated; Inactive	Verify RCRA performance standard	–	Closed
C3	East	76	Waste Antichip Accumulation Area (SWMU #11)	Nonregulated; Active	Air monitoring; unit integrity testing	–	Active
C3	East	77	Waste Oil Accumulation Tanks (SWMU #10)	Nonregulated; Active	Unit integrity testing	–	Active
C3	East	78	Waste Lift Stations (SWMU #17)	Nonregulated; Active	Air monitoring; unit integrity testing	–	Active
C4	East	79	Former "J" Lot Fill Area Investigation (SWMU #30)	Nonregulated; Inactive	Soil/sediment sampling	–	Inactive
Other	East	80	Murphy Drain (AOC) (SWMU #35)	NPDES discharge permit	Verify NPDES performance standard	–	Active
Other	Central	81	Pits and Sumps	–	–	Decommissioned, demolished, excavated, removed/disposed	Redeveloped

Notes:

Decommissioned - the AOI has been cleaned, and inspected for structural integrity.
GM Action Taken - detailed information of these AOIs will be forwarded December 1, 1995 as per attached cover letter.
Redeveloped - these areas currently form part of either the GM Truck Product Center, parking lot or landscaping.
Removed From Service - the AOI has been dismantled and removed.
Active - the AOI is currently in operation.
Inactive - the AOI is no longer in use.

Developer Etkin Equities Brings Outstanding Credentials To Centerpoint Business Campus

Centerpoint Business Campus is a long-term development of Etkin Equities, one of the nation's leading full-service real estate organizations with major regional offices in Southfield, Michigan and Denver, Colorado. The firm's diverse portfolio contains over 5,000,000 square feet of corporate, professional, industrial, retail, hotel, and residential properties.

Etkin is a valued resource for many of the world's best known corporations which has resulted in a wide range of significant build-to-suit headquarters assignments. Recent examples include: The Technical Center for General Motors Inland Fisher Guide Division in Troy, Michigan; The Volkswagen of America Headquarters in Auburn Hills, Michigan; Delco Chassis Division of General Motors in Brighton, Michigan; The Wickes Manufacturing Company Headquarters in Southfield, Michigan; Rhone-Poulenc's Computer Disk Manufacturing Facility in Colorado Springs, Colorado; and The Core Industries Headquarters in Bloomfield Hills, Michigan.

In 1993, Etkin Equities earned the most prestigious honor in the real estate industry when the Building Owners and Managers Association International presented the 350,000 square foot Brookfield Office Park with the coveted "Suburban Office Park of the Year" award during its annual convention in Baltimore. This award recognizes Brookfield Office Park as the outstanding office park in the United States and Canada. BOMA International recognizes owners whose buildings have demonstrated excellence in office building management, operations, community involvement, tenant relations programs, emergency evacuation procedures, design and overall exceptional service.

Several other Etkin Equities' developments including Franklin Center, City Center Office Park, Timberland Office Park and Volkswagen of America Headquarters have previously won local and six state BOMA regional awards which confirm Etkin's leadership position in delivering the most responsive management, consistent quality and unequalled value.

For leasing information and the availability of prime build-to-suit sites contact our Southfield, Michigan office.

CENTERPOINT BUSINESS CAMPUS

PERSPECTIVE

VOLUME ONE, ISSUE TWO

insight

Centerpoint Business Campus is destined to become one of the nation's premier mixed-use business parks.

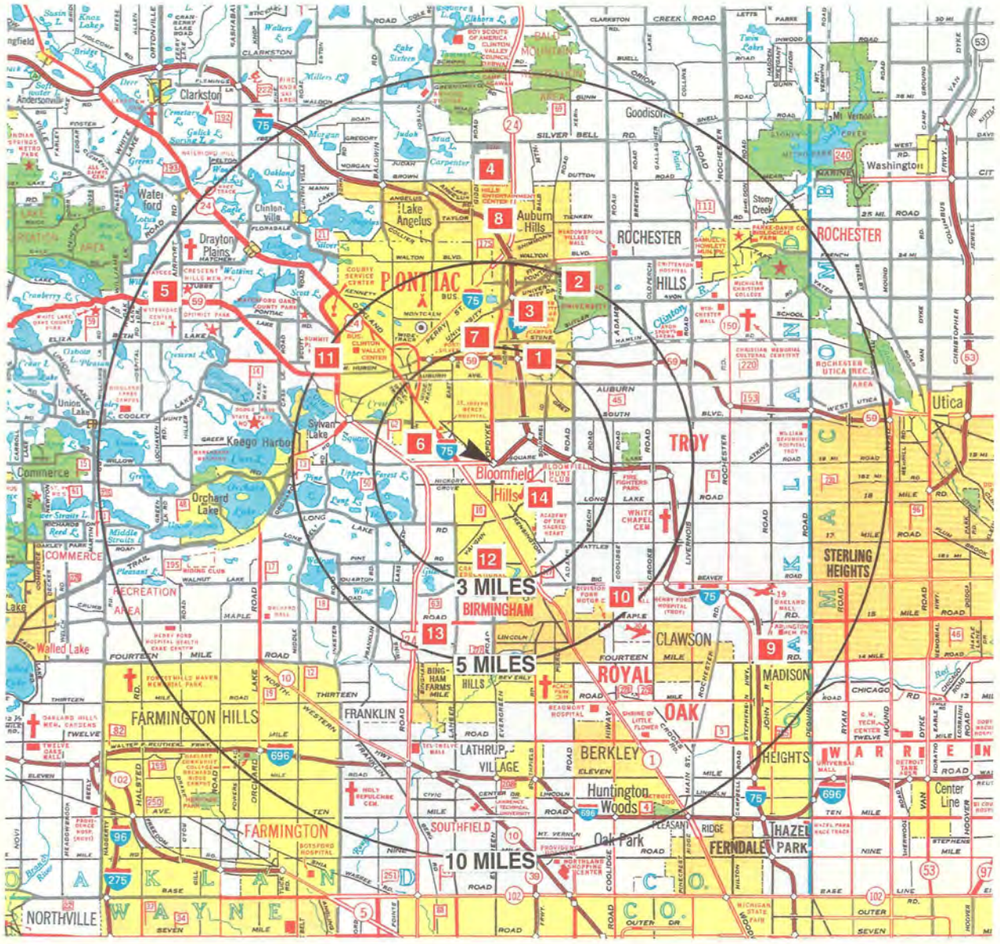
Developer Etkin Equities, in association with General Motors and the City of Pontiac, has established a leading-edge master plan calling for a precise blend of flexibility, efficiency and quality. The result will be a technologically advanced business environment for companies that are as concerned about the quality of life as they are about the quality of their products.

GM's Latest Commitment Brings Etkin Equities' Build-to-Suit Total to 1.5 Million Sq. Ft. at Centerpoint

Once again, Etkin Equities has been singled-out by General Motors to serve as Development Manager for its second major Truck Group facility in the 350-acre Centerpoint Business Campus located in the southeast corner of Pontiac, Michigan.

Construction is set to begin on the new 400,000 square foot Development Center for GM's Truck Group. The majority of the space will be utilized as open office, design and engineering areas for approximately 1,500 employees. A fully equipped "Mock-Up" area of 25,000 square feet will be utilized for vehicle tear-down, prototype assembly and related design development functions. When completed in the summer of 1996, the three-story Development Center will further showcase GM's leadership in the truck industry.

Etkin is currently completing construction of GM's new Truck Product Center and Group Headquarters at Centerpoint. The 1.1 million square foot structure spans over one-third of a mile in length which is comparable in size to a 60-story office tower. Over 3 million square feet of the former Pontiac Central Truck Assembly plant was razed and recycled to create the state-of-the-art facility. More than 4,000 engineers and support personnel will begin to occupy the center later this year.



Southfield-based Giffels Associates designed General Motors' new Development Center with a contemporary metal and glass exterior to compliment GM's Truck Product Center shown in the background.

CENTERPOINT BUSINESS CAMPUS

A Development of:
ETKIN EQUITIES, INC.

Master Planned to World-Class Standards...

Superior From Every Perspective

1. Oakland Community College
2. Oakland University
3. Chrysler Technology Center
4. GM-Orion Assembly Plant
5. Oakland Pontiac Airport
6. St. Joseph Mercy Hospital
7. Pontiac Silverdome
8. Palace of Auburn Hills
9. Oakland Mall
10. Somerset Collection
11. Summit Place Mall
12. Cranbrook Educational Community
13. Oakland Hills Country Club
14. Bloomfield Open Hunt

Centerpoint is ideally situated in the heart of Oakland County. Many leading international corporations have long recognized the wisdom of locating in this thriving area.

Now, Centerpoint presents the finest address for those who choose to be at the center of this world-class location.

Centerpoint Business Campus Market Dynamics...

Accessibility

Access to Centerpoint is exceptionally convenient via Interstate-75, Telegraph Road and Woodward Avenue to Square Lake Road. Opdyke Road also serves as a major north/south feeder running through Bloomfield Township, Pontiac and Auburn Hills.

Centerpoint Parkway provides public roadway access through the center of the site. The parkway also offers unparalleled accessibility to every building in the campus.

Daily traffic volumes adjoining the site exceed 90,000 vehicles:

■ Square Lake Road	62,800
■ Opdyke Road	16,063
■ South Boulevard	13,045

High Income & Population

Household Income	3 Mile Radius	5 Mile Radius	10 Mile Radius
%Under $15,000	15.4	14.9	11.7
%$15,000-$24,999	9.6	9.8	10.0

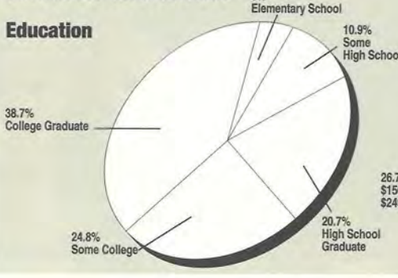
%$35,000-$49,999	13.0	14.0	17.2
%$50,000-$74,999	17.1	18.3	22.9
%$75,000-$99,999	10.7	11.0	11.7
%$100,000+	24.6	22.0	14.4
Average HH Income	**$92,778**	**$84,431**	**$67,111**

Population	3 Mile Radius	5 Mile Radius	10 Mile Radius
1990	53,130	171,040	708,384
1994	54,519	174,349	729,197
1998	56,706	179,343	762,009

Built-In Market

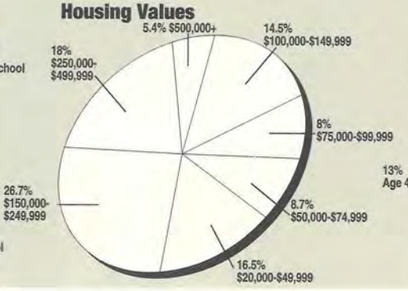
When completed, the Centerpoint Business Campus population alone will provide significant retail and service opportunities. General Motors currently employs approximately 4,500 people at its West Engineering Center and East Truck Manufacturing Facility.

The two new GM Truck facilities will increase that base by an additional 6,000 employees. Phases I & II of the peripheral Centerpoint development are planned to total 6,500 more employees.



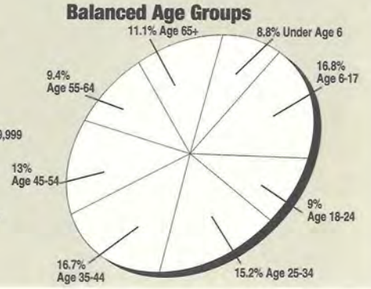
Based on this burgeoning potential and Oakland County's enterprising spirit, Centerpoint represents a remarkable opportunity to capture the forward movement of one of the midwest's most populous, prosperous and proud economic arenas.

Employment levels at Centerpoint Business Campus:

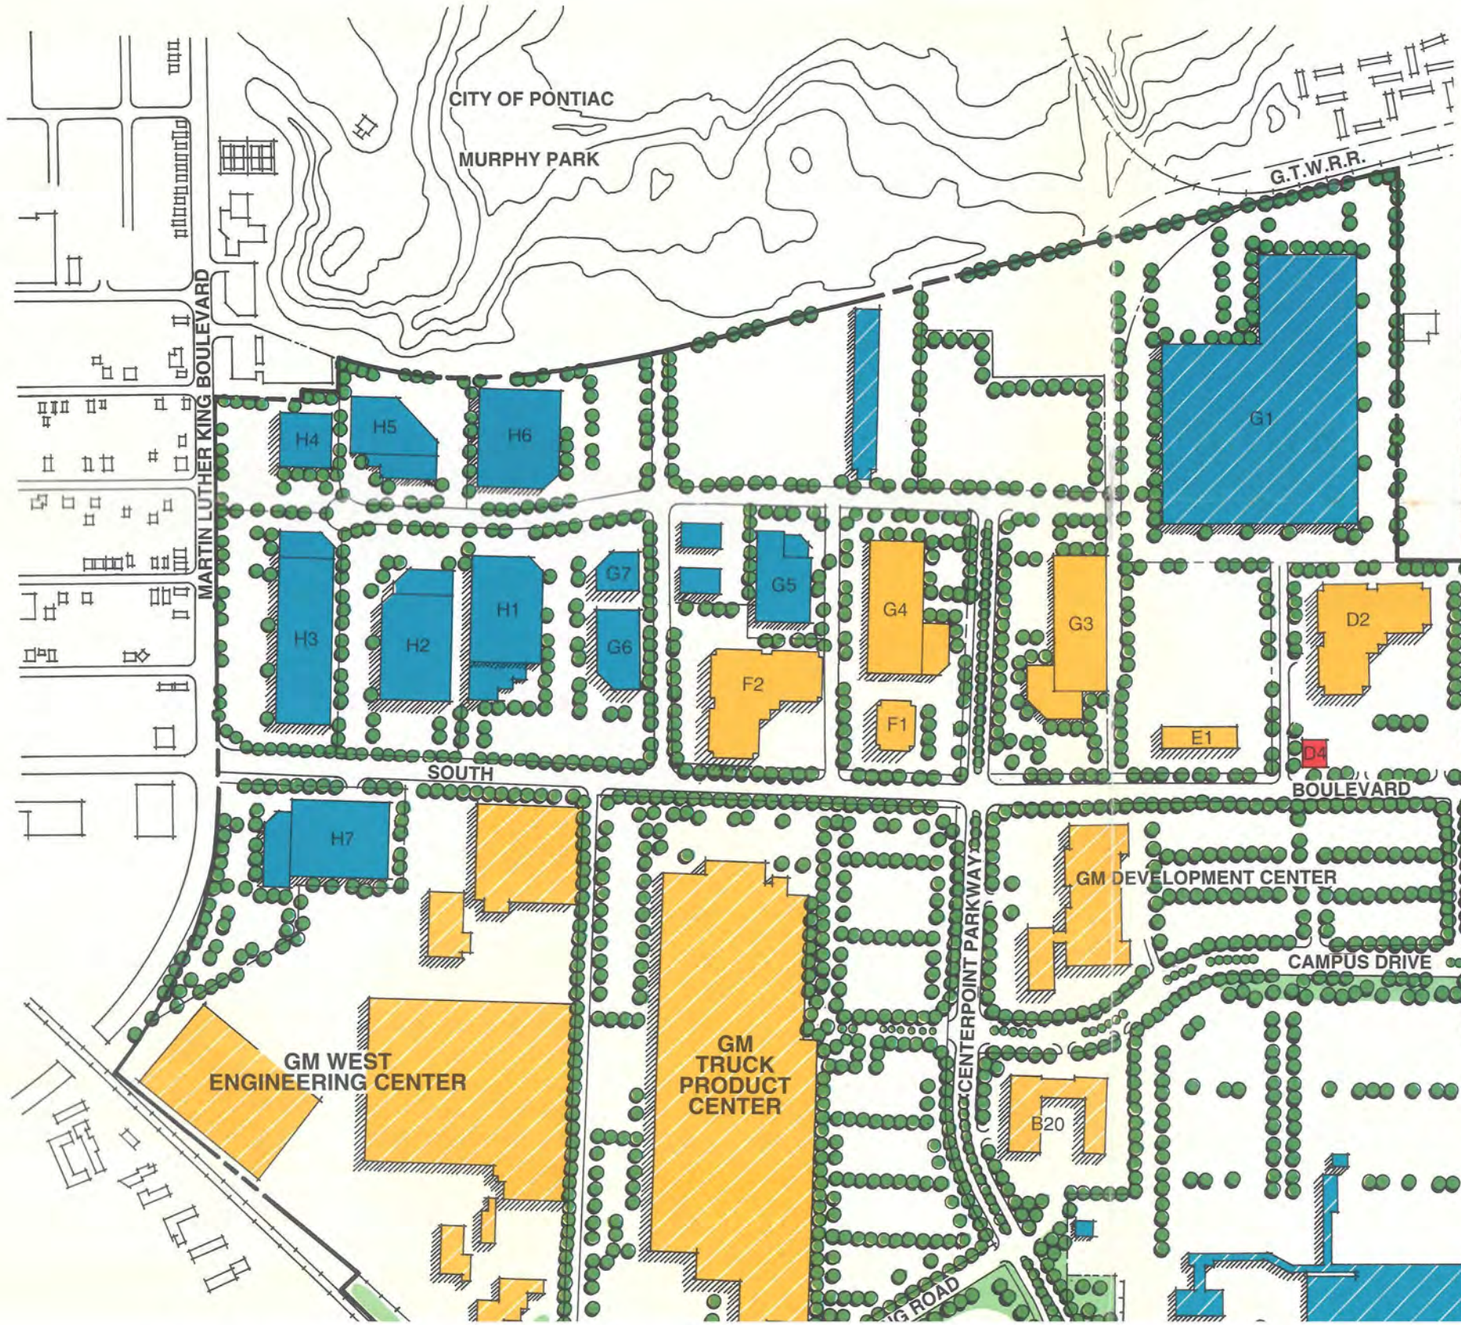


West Engineering Center	1,200 employees
East Truck Manufacturing Facility	4,300 employees/3 shifts
GM Truck Facilities	6,000 office/engineering employees
Future Centerpoint Peripheral Development	2,500 employees
Future Centerpoint Northwest Development	4,000 employees
Total Planned Development	**18,000 employees**

Overview Information



Education



Housing Values

Balanced Age Groups

Master Planned to World-Class Standards...

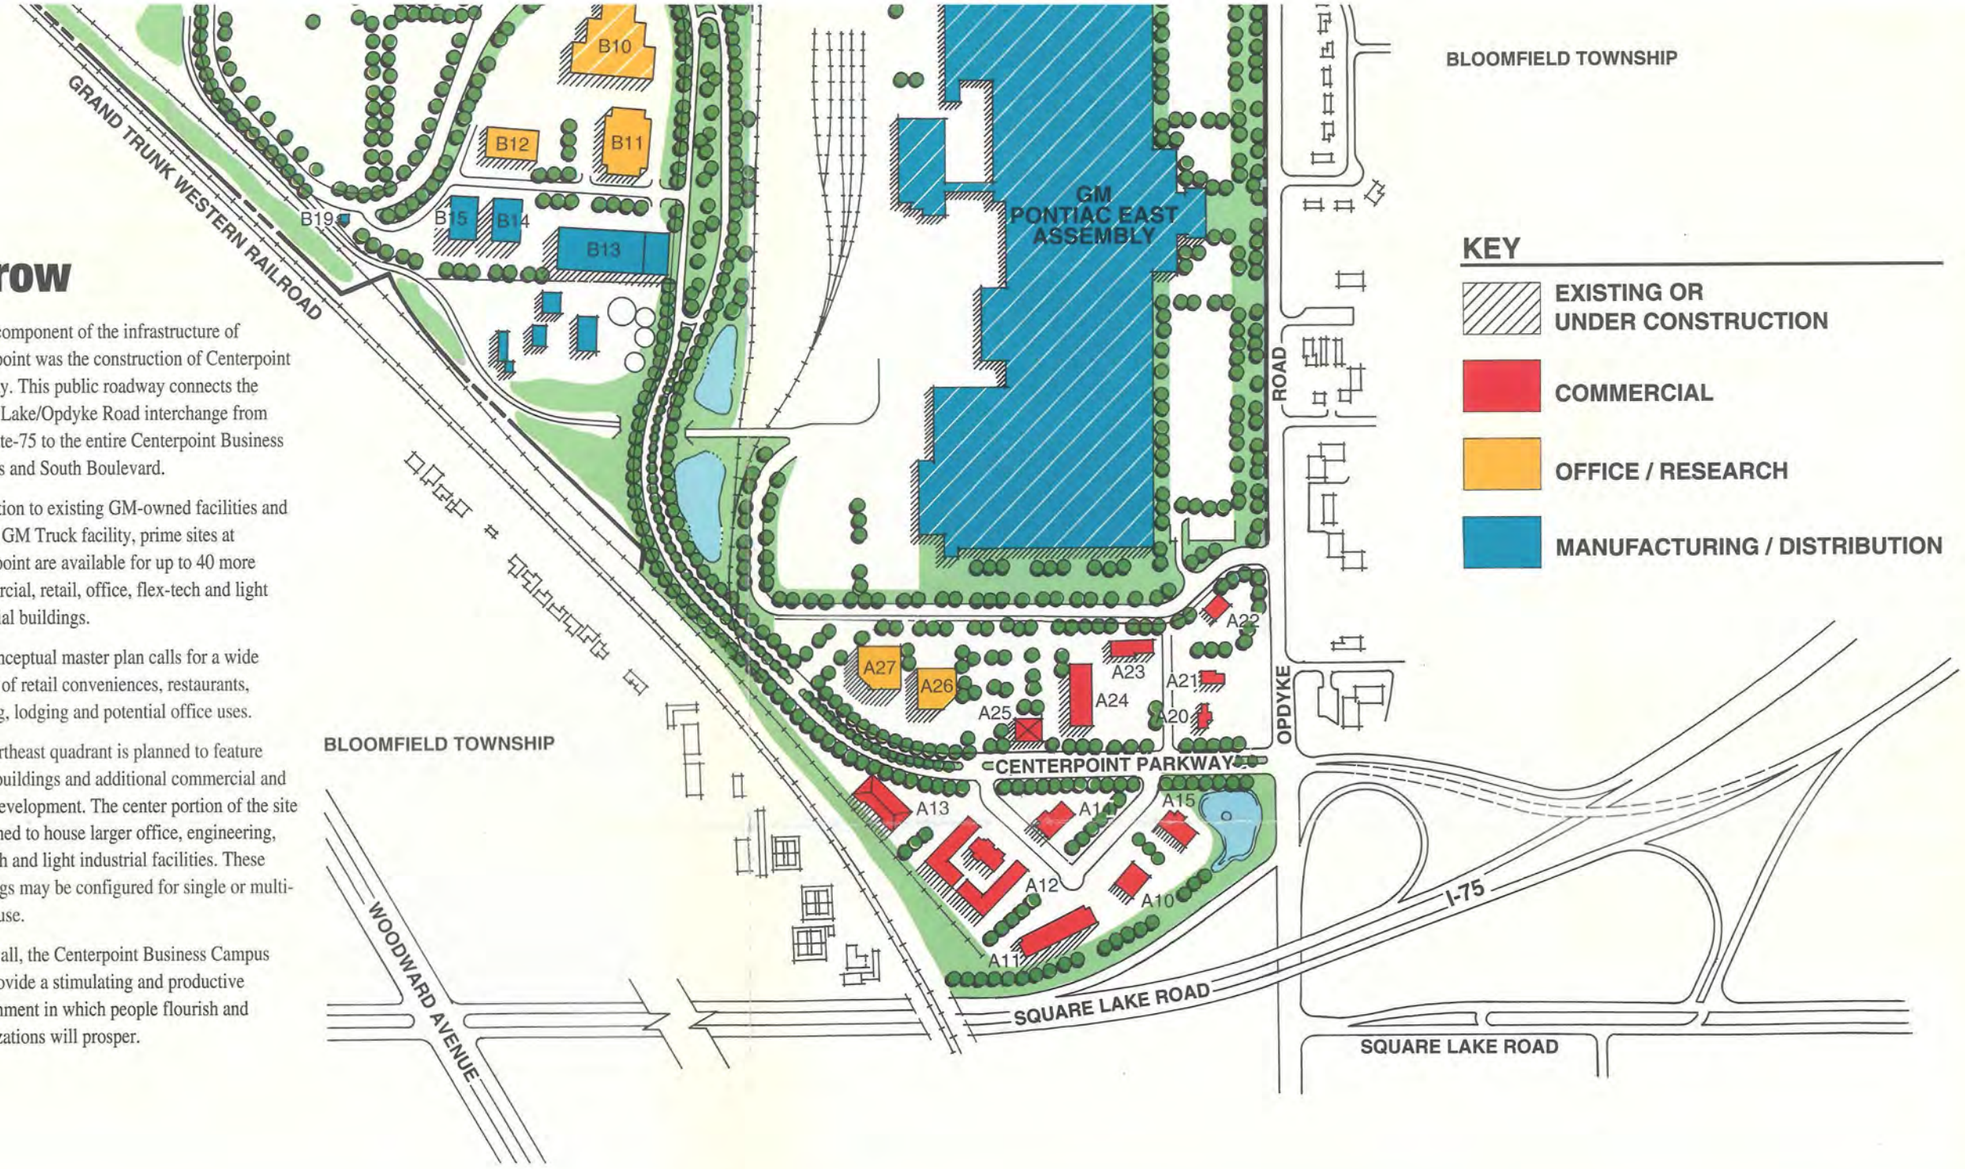
The General Motors Truck Product Center is reflective of the diversity and excellence of Centerpoint's progressive architectural design. Ample nearby parking, tasteful landscaping, uniform lighting and signage enhance the campus-like setting.

The Vision For Tomorrow

Centerpoint Business Campus is destined to become one of the nation's premier mixed-use business parks. Developer Etkin Equities, in association with General Motors, has established a long-range master plan calling for a precise blend of flexibility, function, quality and efficiency. The result will be a technologically advanced business campus for people who are as concerned about the quality of life as they are about the quality of their products.

The wide variety of attractive residential neighborhoods, recreational opportunities and educational facilities in the immediate area provides strong demographic support for the carefully designed mix of office, engineering, retail, service and manufacturing facilities which are planned for the Centerpoint Business Campus.

The 350-acre site is strategically located off Square Lake Road between Woodward Avenue and Interstate-75 in the southeast corner of Pontiac, Michigan. This prime location has long enjoyed exceptionally high demand because of its close proximity to Auburn Hills, Troy and Bloomfield Township to the east and southeast, Bloomfield Hills and Birmingham to the south, and downtown Detroit which lies 30 miles southeast of the site.



A key component of the infrastructure of Centerpoint was the construction of Centerpoint Parkway. This public roadway connects the Square Lake/Opdyke Road interchange from Interstate-75 to the entire Centerpoint Business Campus and South Boulevard.

In addition to existing GM-owned facilities and its new GM Truck facility, prime sites at Centerpoint are available for up to 40 more commercial, retail, office, flex-tech and light industrial buildings.

The conceptual master plan calls for a wide variety of retail conveniences, restaurants, banking, lodging and potential office uses.

The northeast quadrant is planned to feature office buildings and additional commercial and retail development. The center portion of the site is planned to house larger office, engineering, research and light industrial facilities. These buildings may be configured for single or multi-tenant use.

Above all, the Centerpoint Business Campus will provide a stimulating and productive environment in which people flourish and organizations will prosper.

EXCERPTS FROM THE PART B PERMIT APPLICATION

HAZARDOUS WASTE FACILITY

PERMIT APPLICATION

For

The Pontiac East Assembly/Pontiac
Central Manufacturing and Assembly Plant

Truck and Bus Group Operations
General Motors Corporation
Pontiac, Michigan
MID 005356902

Submitted to

The U.S. Environmental Protection Agency Region V

March 8, 1985

PART B CERTIFICATION

I certify under penalty of law that I have personally examined and am familiar with information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine or imprisonment.

This certification is made on behalf of General Motors Corporation.

P. J. Coletta — (Date) 3/26/86

I. EPA I.D. NUMBER: F M I D 0 0 5 3 5 6 9 0 2

FOR OFFICIAL USE ONLY

APPLICATION APPROVED	DATE RECEIVED (yr., mo., & day)	COMMENTS

II. FIRST OR REVISED APPLICATION

Place an "X" in the appropriate box in A or B below *(mark one box only)* to indicate whether this is the first application you are submitting for your facility or a revised application. If this is your first application and you already know your facility's EPA I.D. Number, or if this is a revised application, enter your facility's EPA I.D. Number in Item I above.

A. FIRST APPLICATION *(place an "X" below and provide the appropriate date)*

☐ 1. EXISTING FACILITY *(See instructions for definition of "existing" facility. Complete item below.)*

FOR EXISTING FACILITIES, PROVIDE THE DATE *(yr., mo., & day)* OPERATION BEGAN OR THE DATE CONSTRUCTION COMMENCED *(use the boxes to the left)*

C 8 — YR. | MO. | DAY

☐ 2. NEW FACILITY *(Complete item below.)*

FOR NEW FACILITIES PROVIDE THE DATE *(yr., mo., & day)* OPERATION BEGAN OR IS EXPECTED TO BEGIN

YR. | MO. | DAY

B. REVISED APPLICATION *(place an "X" below and complete Item I above)*

☐ 1. FACILITY HAS INTERIM STATUS

☐ 2. FACILITY HAS A RCRA PERMIT

III. PROCESSES – CODES AND DESIGN CAPACITIES

A. **PROCESS CODE** – Enter the code from the list of process codes below that best describes each process to be used at the facility. Ten lines are provided for entering codes. If more lines are needed, enter the code(s) in the space provided. If a process will be used that is not included in the list of codes below, then describe the process *(including its design capacity)* in the space provided on the form *(Item III-C)*.

B. **PROCESS DESIGN CAPACITY** – For each code entered in column A enter the capacity of the process.

1. AMOUNT – Enter the amount.
2. UNIT OF MEASURE – For each amount entered in column B(1), enter the code from the list of unit measure codes below that describes the unit of measure used. Only the units of measure that are listed below should be used.

PROCESS	PROCESS CODE	APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY
Storage:		
CONTAINER *(barrel, drum, etc.)*	S01	GALLONS OR LITERS
TANK	S02	GALLONS OR LITERS
WASTE PILE	S03	CUBIC YARDS OR CUBIC METERS
SURFACE IMPOUNDMENT	S04	GALLONS OR LITERS
Disposal:		
INJECTION WELL	D79	GALLONS OR LITERS
LANDFILL	D80	ACRE-FEET *(the volume that would cover one acre to a depth of one foot)* OR HECTARE-METER
LAND APPLICATION	D81	ACRES OR HECTARES
OCEAN DISPOSAL	D82	GALLONS PER DAY OR LITERS PER DAY
SURFACE IMPOUNDMENT	D83	GALLONS OR LITERS

PROCESS	PROCESS CODE	APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY
Treatment:		
TANK	T01	GALLONS PER DAY OR LITERS PER DAY
SURFACE IMPOUNDMENT	T02	GALLONS PER DAY OR LITERS PER DAY
INCINERATOR	T03	TONS PER HOUR OR METRIC TONS PER HOUR; GALLONS PER HOUR OR LITERS PER HOUR
OTHER *(Use for physical, chemical, thermal or biological treatment processes not occurring in tanks, surface impoundments or incinerators. Describe the processes in the space provided; Item III-C.)*	T04	GALLONS PER DAY OR LITERS PER DAY

UNIT OF MEASURE	UNIT OF MEASURE CODE
GALLONS	G
LITERS	L
CUBIC YARDS	Y
CUBIC METERS	C
GALLONS PER DAY	U
LITERS PER DAY	V
TONS PER HOUR	D
METRIC TONS PER HOUR	W
GALLONS PER HOUR	E
LITERS PER HOUR	H
ACRE-FEET	A
HECTARE-METER	F
ACRES	B
HECTARES	Q

EXAMPLE FOR COMPLETING ITEM III *(shown in line numbers X-1 and X-2 below)*: A facility has two storage tanks, one tank can hold 200 gallons and the other can hold 400 gallons. The facility also has an incinerator that can burn up to 20 gallons per hour.

LINE NUMBER	A. PROCESS CODE (from list above)	B. PROCESS DESIGN CAPACITY 1. AMOUNT (specify)	B. PROCESS DESIGN CAPACITY 2. UNIT OF MEASURE (enter code)	FOR OFFICIAL USE ONLY
X-1	S 0 2	600	G	
X-2	T 0 3	20	E	
1	S 0 1	210,000	G	
2	S 0 1	366,140	G	
3	S 0 1	374,000	G	
4	S 0 1	193,000	G

6	T 0 4	8,640	U	
7	T 0 4	26,260	U	
8	T 0 4	1,500	U	
9				
10				

C DUP 1

II. PROCESSES *(continued)*

SPACE FOR ADDITIONAL PROCESS CODES OR FOR DESCRIBING OTHER PROCESSES *(code "T04")*. FOR EACH PROCESS ENTERED HERE INCLUDE DESIGN CAPACITY.

Deleted per phone conv w/ Carol with Reg I

~~T04~~ - Spent pickling acid (K062) neutralizing - 1,200 gallons/day
T04 - Container washing - 8,640 gallons per day flow rate
T04 - Solidification of low viscosity sludges - 26,260 gallons per day mixing rate
T04 - Drum residues draining - 1,500 gallons per day

V. DESCRIPTION OF HAZARDOUS WASTES

. **EPA HAZARDOUS WASTE NUMBER** – Enter the four–digit number from 40 CFR, Subpart D for each listed hazardous waste you will handle. If you handle hazardous wastes which are not listed in 40 CFR, Subpart D, enter the four–digit number*(s)* from 40 CFR, Subpart C that describes the characteristics and/or the toxic contaminants of those hazardous wastes.

. **ESTIMATED ANNUAL QUANTITY** – For each **listed waste** entered in column A estimate the quantity of that waste that will be handled on an annual basis. For each **characteristic** or **toxic contaminant** entered in column A estimate the total annual quantity of all the non–listed waste*(s)* that will be handled which possess that characteristic or contaminant.

. **UNIT OF MEASURE** – For each quantity entered in column B enter the unit of measure code. Units of measure which must be used and the appropriate codes are:

ENGLISH UNIT OF MEASURE	CODE	METRIC UNIT OF MEASURE	CODE
POUNDS	P	KILOGRAMS	K
TONS	T	METRIC TONS	M

i. acility records use any other unit of measure for quantity, the units of measure must be converted into one of the required units of measure taking into account the appropriate density or specific gravity of the waste.

. **PROCESSES**

1. PROCESS CODES:
   For listed hazardous waste: For each **listed** hazardous waste entered in column A select the code*(s)* from the list of process codes contained in Item III to indicate how the waste will be stored, treated, and/or disposed of at the facility.
   For non–listed hazardous wastes: For each characteristic or toxic contaminant entered in column A, select the code*(s)* from the list of process codes contained in Item III to indicate all the processes that will be used to store, treat, and/or dispose of all the non–listed hazardous wastes that possess that characteristic or toxic contaminant.
   Note: Four spaces are provided for entering process codes. If more are needed: (1) Enter the first three as described above; (2) Enter "000" in the extreme right box of Item IV-D(1); and (3) Enter in the space provided on page 4, the line number and the additional code*(s)*.

2. PROCESS DESCRIPTION: If a code is not listed for a process that will be used, describe the process in the space provided on the form.

OTE: HAZARDOUS WASTES DESCRIBED BY MORE THAN ONE EPA HAZARDOUS WASTE NUMBER – Hazardous wastes that can be described by ore than one EPA Hazardous Waste Number shall be described on the form as follows:

1. Select one of the EPA Hazardous Waste Numbers and enter it in column A. On the same line complete columns B,C, and D by estimating the total annual quantity of the waste and describing all the processes to be used to treat, store, and/or dispose of the waste.
2. In column A of the next line enter the other EPA Hazardous Waste Number that can be used to describe the waste. In column D(2) on that line enter "included with above" and make no other entries on that line.
3. Repeat step 2 for each other EPA Hazardous Waste Number that can be used to describe the hazardous waste.

XAMPLE FOR COMPLETING ITEM IV *(shown in line numbers X-1, X-2, X-3, and X-4 below)* – A facility will treat and dispose of an estimated 900 pounds r year of chrome shavings from leather tanning and finishing operation. In addition, the facility will treat and dispose of three non–listed wastes. Two wastes e corrosive only and there will be an estimated 200 pounds per year of each waste. The other waste is corrosive and ignitable and there will be an estimated 00 pounds per year of that waste. Treatment will be in an incinerator and disposal will be in a landfill.

. O Z	A. EPA HAZARD. WASTE NO. *(enter code)*	B. ESTIMATED ANNUAL QUANTITY OF WASTE	C. UNIT OF MEASURE *(enter code)*	D. PROCESSES 1. PROCESS CODES *(enter)*	D. PROCESSES 2. PROCESS DESCRIPTION *(If a code is not entered in D(1))*

SECTION B
FACILITY DESCRIPTION

The Pontiac East Assembly Plant and the Pontiac Central Manufacturing and Assembly Plant, hereafter referred to together as "the plant", are located on one geographic site. These plants assemble trucks and buses and manufacture truck and bus components and together are treated as one facility holding EPA Identification No. MID 005356902. The plant, including all on-site hazardous waste facilities and operations, is currently owned and operated by the General Motors (GM) Corporation, Truck and Bus Group. The facility is located at 660 South Boulevard East in the southeastern portion of the City of Pontiac, Michigan, at a latitude of 42°30'40"N, and a longitude of 83°15'27"W. The plant has the following mailing address and telephone number:

Truck and Bus Group
Pontiac Central and East Plants
General Motors Corporation
31 Judson Street
Pontiac, Michigan 48058
(313) 456-4141

The plant, which began producing trucks in 1927, is a producer of medium and heavy duty trucks and buses. The plant is presently undergoing rearrangement so that assembly of light duty trucks can be added to current activities. These rearrangements are anticipated to continue into 1987. Since the plant is principally an assembly plant, most of the wastes generated at the facility result from metal finishing and painting operations, the use of sealers and adhesives, draining fluids from vehicles, and unpacking components and parts. The SIC codes which best reflect the principal products of the plant are: Code 3711, Motor Vehicles.

B.1 GENERAL DESCRIPTION

The hazardous wastes that will be generated include listed wastes such as F001, F002, F003, F005, F006, F019, and some D001, and D002 wastes. The hazardous waste activities at the plant include temporary storage of all the wastes generated at the plant, occasional separation of free liquids (retained wastewater) from sludges, occasional solidification of sludges with a treatment chemical (as required), and emptying of incompletely emptied drums. The container storage areas receive both waste-filled and empty virgin material containers arising from production activities on-site. Wastes and containers are processed here in preparation for separate off-site disposal. This is discussed in more detail in Section D.

B.2. PERMITTING HISTORY AND STATUS

The plant is currently operating under Resource Conservation and Recovery Act (RCRA) interim status for ownership and operation of a facility which stores and treats hazardous wastes. Part A of the Hazardous Waste Permit Application for the plant was acknowledged on August 3, 1981, by the United States Environmental Protection Agency (EPA), Region V.

B.3 MAPPING

B.3.1 Topographic Map (7.5 Minute)

Figure B-1 is a composite of portions of the Pontiac North, Pontiac South, Birmingham and Rochester, 7.5 Minute, USGS topographic maps and shows the land features within 1 mi of the facility. The plant does not have any intake structures, and discharge structures are limited to storm water. All process and sanitary wastewaters are discharged to public sewers. Because of the scale of the drawing, the location of discharge structures cannot be indicated on Figure B-1. The location of these structures and an indication of the plant areas drained by each is indicated on Figure B-2. The legal property boundaries of the plant are the heavy lines in the center of Figure B-1. There are no injection wells known to the applicant within 1/2 mi of the facility. Michigan Department of Public Health, the Michigan Department of Natural Resources, and the Oakland County Health Division were requested to supply information on any wells within 1 mi of the facility. A number of wells were identified to be within 1 mi of the plant property. A list of

the wells is presented in Table B-1 and the location of each well are indicated in Figure B-1 by its well number from Table B-1.

B.3.2 Topographic Map (1 in. = 200 ft)

The hazardous waste facilities at the plant are indicated on the detailed plant map, Figure B-3. The scale of this detailed topographic map is 1 in. = 200 ft, and the date of the maps given as Figures B-1 and B-3 are variable since they are compilations of data from the following list of maps.

well location #4 & 9 dont match map locations on figure B-1

B.3.2.1 100-yr Floodplain--

Based upon flood insurance rate maps, the plant is not located in the 100-yr or the 500-yr floodplain, but the 100-yr floodplain does come within 2600 ft of the northern side of the property as shown on the flood insurance map which is included as Figure B-4. Since the plant is not within the 500-yr floodplain, no flood control or drainage barriers are necessary to protect the plant.

B.3.2.2 Land Use--

The surrounding land uses are presented in Figure B-1. Within 1000 ft of the facility, the properties to the north are zoned industrial or commercial; to the east they are commercial, multi-family, and single family residential; to the south they are multi-family and single family residential; and to the west they are industrial, commercial, and single family residential.

B.3.2.3 Hazardous Waste Management Facility (HWMF) Boundaries--

The HWMF's at the Pontiac Assembly Plant include container storage areas, storage tank areas, sludge bulking areas, and a drum emptying area. All of these operations are on the plant site and HWMF boundaries are shown on Figure B-3.

B.3.2.4 Wind Rose--

An annual average wind rose is shown on Figures B-3 and B-5. This wind rose is based upon data collected at the Detroit City Airport during the years 1948 through 1978.

B.3.2.5 Access Control--

The entire assembly plant property is enclosed by a chainlink fence. The location of the fence and all gates are shown on Figure B-3. All vehicle access points are fitted with lockable gates. Plant security personnel are on duty 24 hr/day, 365 day/yr. Normal commercial vehicle traffic is limited to Gate 29. Normal personnel access to the property is through designated gates

for employees and through the main administrative entrance for visitors. Some deliveries of waste material are made through Gates 1 and 34.

In addition to the plant access control, the HWMF areas have warning signs posted and unauthorized persons are not permitted in these areas.

B.3.2.6 Injection and Withdraw Wells--

See Section B.3.1.

B.3.2.7 Buildings; Treatment, Storage, and Disposal Areas; and Other Structures--

Figure B-3 shows all buildings and other major structures within 1000 ft of the HWMF's. There are no disposal areas at this facility.

B.3.2.8 Recreation Areas--

There are no known recreation areas within 1000 ft of the HWMF.

B.3.2.9 Runoff Control Systems--

The container storage areas are designed to prevent runoff. All precipitation falling on the storage pads is accumulated either to be pumped to the on-site central wastewater treatment plant or transferrred to storage tanks. The runoff from all other areas of the plant not part of HWMF's is collected in stormwater retention ponds and/or is discharged by storm sewers. Run on is prevented by the diking and grading of the surrounding terrain.

B.3.2.10 Access and Internal Roads (Traffic Patterns)--

As seen in Figures B-1 and B-3, the access roads for the plant are South Boulevard and Opdyke Avenue. Most hazardous waste transportation vehicles will enter (see Figure B-3) off Opdyke Road through Gate 29 and proceed to the truck scale to be weighed. After weighing, the trucks will proceed to the HWMF area for loading. After loading, the trucks will be weighed and exit the plant the same way they entered. All internal roads are reinforced concrete or asphalt specifically designed with sufficient bearing for highway vehicle traffic consistent with state legal limits for highway

vehicle use. Under present conditions, shipments of hazardous waste average less than one per day. This is a very insignificant percentage of the total truck traffic in and out of the plant.

B.3.2.11 Sewers--

The on-site sanitary sewer lines handle sewage only (no process wastewater). These sewers discharge to the City of Pontiac public sewers. The locations where these sewer lines cross the property line are shown in Figure B-2.

There are a number of storm sewers which discharge storm water runoff from the property. The locations where storm sewers cross the property lines are shown in Figure B-2.

All process wastewaters are trucked or pumped to the on-site central wastewater treatment plant shown in Figure B-3. After pretreatment, the process wastewaters are discharged to the City of Pontiac public sewers. The location where the treated process wastewater discharge line crosses the property line is shown in Figure B-2.

B.3.2.12 Loading and Unloading Areas--

All hazardous wastes received or to be transported off site are loaded or unloaded in the container storage area and the tank storage areas. On-site accumulation areas and a sister plant are the primary sources of any unloaded waste at this time. Receipt of wastes from off site is primarily for the purpose of consolidation and reshipment.

B.3.2.13 Fire Control Equipment--

A detailed description of the fire control equipment is included in the Contingency Plan (Section F).

B.3.2.14 Surface Waters--

The surface waters within 1 mi of the facility are shown on Figure B-1. The Clinton River is approximately 1 mi to the northeast, and an unnamed tributary of the River Rouge is 4000 ft to the south.

B.4 OPERATIONS MANUAL

A copy of this permit application will also be used as an operations manual and will be reviewed annually, or more frequently, if required by the provisions of any section. If necessary, this manual will be revised after each review. The plant environmental engineer will be responsible for making revisions in the manual. The manual is placed in a three-ring binder so that revisions can be made by changing pages or entire sections. The entire manual is also on a word processing system which allows changes to be made relatively easily. Once a revision is made, the page or section changed will be noted in Table B-2. Each page is marked with a Julian date in the lower right hand corner of each page. This is the revision number that can be used to verify that the page is a copy of the latest revision. The plant environmental engineer will send a copy of any revision to each person holding a registered copy. The name, address, and manual number of each registered copy shall be noted in Table B-3. The original copy (Manual 1) shall be maintained by the plant environmental engineer.

B.5 COMPLIANCE WITH OTHER FEDERAL LAWS

Information will be provided in accordance with the requirements of 40 CFR 270.3 at the request of the EPA Region V office. At the present time, however, this facility is believed to be in compliance with the following Federal Laws: The Wild and Scenic Rivers Act, The National Historic Preservation Act, The Endangered Species Act, The Coastal Zone Management Act, and The Fish and Wildlife Coordination Act.

332/73

SECTION C

WASTE CHARACTERIZATION

C.1 INTRODUCTION

The major activity at the plant is vehicle assembly. The wastes generated result from the use of paints, solvents, sealers, adhesives, vehicle fluids, and component part and packing materials. Hazardous wastes that are managed include listed wastes such as F001, F002, F003, F005, F006, F019, and some characteristic wastes such as D001 and D002. The hazardous waste activities at the plant will include temporary storage of all the wastes generated at the plant, occasional separation of free liquids (retained wastewater) from sludges, occasional solidification of sludges with a drying agent (as required), and emptying of incompletely emptied drums.

C.2 WASTE CHARACTERIZATION

Table C-1 summarizes all of the wastes that are generated at the plant and indicates the various waste types; approximate quantities managed; hazardous waste listing number; hazardous waste characteristics; heating value; and primary waste management method. The information provided on waste generation rates and composition is based upon historical data and is subject to fluctuations based on production levels. Wastes which are known or assumed to be hazardous are underlined. Waste characterizations will be repeated as necessary to insure that they are accurate and up-to-date. At a minimum, they will be repeated annually. A more frequent analysis will be done if changes occur in the materials or process generating the hazardous waste.

There are some wastes received from a sister plant. This receipt is performed merely for the purpose of consolidation of shipments to ultimate disposal. In general, these wastes are similar to the wastes generated on

site. Table C-2 presents a summary of the wastes received from the sister ~~GM~~ plant. Characterization of these received wastes is presented later in this section.

All wastes listed as hazardous wastes in Subpart D of 40 CFR 261 are identified as listed hazardous wastes. None of the internal wastes are tested for reactivity nor for pesticides and herbicides content in the EP Toxicity Procedure because pesticides, herbicides, and reactive materials are not being used in the plant.

Following is a characterization of each waste managed including the process or processes producing the waste, handling methods, methods used to determine if each waste is a hazardous waste, and a detailed analysis (specific for the treatment or disposal method used). A waste data sheet is provided for each waste normally generated or received at the plant. These sheets provide a summary of characterization information and can be used with the Contingency Plan or to prepare manifests.

C.2.1 Paint Sludges (See Table C-3)

Paint sludges are essentially the paint overspray that is collected in wet paint spray booths. The paint sludge is separated from the water by a central sludge system. After separation from the water, the sludge is placed in containers and any free liquids that occur due to dewatering (gravity) are separated and discharged to the on site wastewater treatment plant. The container is transferred to the sludge bulking area where the contents are placed on a concrete pad with other compatible sludges. The sludges are loaded into a large highway vehicle and are hauled in bulk to a secure landfill for disposal. The sludge mixture may include phosphate sludge, filter media, a small amount of waste adhesives and sealers, and oil filters, as well as paint sludge depending on the capabilities of the preselected disposal facility.

The paint sludge is not a listed hazardous waste. Samples of paint sludge from Pontiac Central have been checked for ignitibility, and tested for corrosivity, and EP Toxicity to determine if the waste is a characteristic hazardous waste. Based upon all available information, this waste is not a hazardous waste but due to concerns about the suitability of nonhazardous disposal facilities it is handled as hazardous waste. Paint sludge is being disposed of as a hazardous waste by plant preference. In the future, GM may choose to dispose of paint sludges as nonhazardous waste so long as they do not show the characteristics of being hazardous. There is no analysis available for the new sludge from Pontiac East modernization since that plant will not operate until 1986. When the plant reopens, the analysis will be performed and results submitted.

C.2.2 Waste Purge Solvent (Table C-4)

This waste is generated when the paint in the automatic paint spray equipment is purged during a color change by introducing a purge solvent before a new color is used. The waste solvent is collected and pumped to a storage tank or containers. The containers are taken to the container storage area and the contents transferred to a bulk collection tank or larger container. The waste is currently recycled and reconstituted off site.

This waste is listed as an F003 or F005 hazardous waste. The safety data sheets for the purge solvent and paints indicate the principal solvents in the waste to be toluene, xylene, and methyl ethyl ketone. The waste data sheet for this waste is Table C-4. This waste is managed as hazardous because it is listed.

C.2.3 Phosphate Sludge (Table C-5)

This waste is the sludge that is generated in the phosphating process which is used to prepare the metal surfaces for painting. The waste and disposable filter media are collected in a container as the waste is discharged from the filter. These sludges and filter media are placed in

containers at the source of generation. The contents of the container are transferred to larger containers which are transported to the sludge bulking area. After co-mingling with other compatible sludges, the sludge is hauled to a secure landfill site for disposal. The estimated annual generation rate of combined paint sludge, adhesives and sealers, and phosphate sludge is approximately 3000 tons.

Although GM does not consider this waste to be a wastewater treatment sludge from electroplating, we have elected to manage it as through it were an F006 or F019 waste. This sludge consists of both a filtrate and a process tank precipitate from phosphating operations.

C.2.4 Waste Gasoline

This waste is generated by spillage during vehicle fueling operations, the disposal of off-spec gasoline and the draining of damaged gas tanks. A minimal quantity of this waste is generated and is collected with the waste oil. Gasoline tainted waste oil is skimmed from the bulk collection tank (currently a parked highway tanker) and is mixed with waste paint for disposal.

Waste gasoline is not listed, but it is an ignitable waste (D001). Since the waste is a specified material and contains little or no contamination, no sample analysis has been done. Moreover, once mixed with the waste paint the hazard status of paint is not changed.

C.2.5 Waste Oils (Table C-6)

Waste and lubricating oils are generated by spillage during vehicle and production equipment fluid filling and repair operations. The wastes are pumped from pits along with glycol and occasionally a small amount of waste gasoline. This waste is taken to the bulk collection tanks (currently a highway tanker). The glycol separates by gravity at this point and is removed. The bulk collection storage tank is tested prior to shipment for

flash point and any phase with a flash point under 140°F is managed as gasoline tainted (Section C.2.4). The waste oils are shipped off site for recycling.

This waste is not a listed hazardous waste. Based upon available information, this waste is not a characteristic hazardous waste.

C.2.6 Waste Glycol and Brake Fluid (Table C-7)

This waste represents spillage from fluid fill and repair operations with antifreeze (glycol). This material phase separates as a phase beneath waste oil. The waste is collected in pits and delivered by trucks to bulk collection tanks (currently highway tankers). The waste is shipped off site for incineration or occasionally for reuse by others.

This waste is not a listed hazardous waste, and when previously tested for ignitability had a flash point greater than 200°F. Based upon all available information, this waste is not a hazardous waste.

C.2.7 Central Wastewater Treatment Plant Sludges (Tables C-8, C-9, and C-10)

Two of these sludges are produced by the on-site central wastewater treatment system and are discharged from the grit separators and the water treatment sludge dewatering equipment into containers. Free liquids (wastewater) which are separated by gravity dewatering from the separators are discharged to the wastewater treatment system. Both sludges are placed in containers at the sludge dewatering system. The containers are emptied on the containment sludge bulking area pad and the sludges are hauled in bulk to a secure hazardous waste landfill for disposal.

The EPA had previously made the interpretation that this sludge should be listed as hazardous waste (F006 and F019), but in December 1983, the plant was granted a temporary delisting for this waste. Samples of the wastewater

sludge were analyzed for EP Toxicity. Based upon all available information, the sludge is a temporarily delisted waste and does not have any hazardous waste characteristics.

A third sludge is a precipitate sludge that accumulates in the Central Wastewater Treatment Plant pits and tanks. While we do not consider this a hazardous waste, it has been so managed due to a lack of clarity on its regulatory status. Unless otherwise directed by the EPA or unless determined to have hazardous waste characteristics, GM proposes that this material is not a hazardous waste and need not be managed as a hazardous waste.

C.2.8 Waste Paint (Tables C-11 and C-12)

Two waste paint streams result from operations at the plant. These are designated the high Pb and low Pb waste paints and estimated generation rates are 75 tons per year (TPY) and 100 TPY, respectively. The wastes are removed from the plant for incineration at an approved site.

These wastes are listed because low volumes of F003 and F005 solvents (not to be reclaimed) are co-mingled with the waste paint.

C.2.9 Chlorinated Solvents (Tables C-13 and C-14

This waste is generated from equipment cleaning operations and painting equipment cleanup. Since this is an assembly plant, only a small amount of this waste (4 TPY) is generated. The waste composition varies from a liquid to a sludge. If sufficient quantities of this waste are generated, they will be placed in containers and stored at the container storage area until the waste is pumped into a tank truck to haul it to a reclaimer's facility. Methylene chloride and 1,1,1-trichloroethlane are the chlorinated solvents managed and they are managed separately.

This waste is managed as a listed hazardous waste (F001, F002) because of the toxicity of chlorinated solvents. No characteristic testing has been conducted.

C.2.10 Adhesives and Sealers (Table C-15)

This waste is usually the unused residue left in the original container that has hardened or lost its properties because of solvent evaporation. These wastes are combined with the paint sludge for disposal.

This waste is not a listed hazardous waste, although the virgin material is listed as a Department of Transportation (DOT) flammable material. The waste is not ignitable because of the solvent loss which caused the material to become a waste. Because of the impermeability of this waste, the organic nature of the waste, and expected low metal content, the waste should not be EP toxic for metals. Based upon all available information, this waste is not a hazardous waste. Currently, this waste is co-mingled with a waste which is managed as hazardous.

C.2.11 Waste Received From Sister Plants (Table C-17)

With the exception of the NALCO paint sludge, all wastes currently received from a sister plant have the same characteristics as those wastes as generated at the plant. Wastes are received into the plant under

appropriate waste manifests and are blended into or stored with appropriate on-site generated wastes until sufficient quantities are accumulated for shipment to off-site disposal.

C.3 WASTE ANALYSIS PLAN

The plant does two different types of testing, hazardous waste determination and hazardous waste disposal facility acceptability testing. Wastes are tested periodically in accordance with regulations and to verify their individual acceptability at a particular preselected disposal facility.

C.3.1. Characterization

C.3.1.1 Parameters and Rationale--

All the wastes generated at the plant were evaluated initially to establish their classification as hazardous or nonhazardous wastes. Since some of the wastes are either listed or known to exhibit a hazardous characteristic, those wastes were assumed hazardous and no further hazard determination testing will be performed. Subsequent testing to determine whether a waste is hazardous will be performed if process changes are made which could be expected to alter the nature of the wastes. Characterizations will be repeated as necessary to insure that analyses are accurate and current. At a minimum they will be repeated annually.

Some wastes will continue to be monitored on a routine basis for parameters relevant to their management. These wastes are indicated in Table C-18 along with the test parameters and frequency of analysis. Test parameters and the rationale for their selection are given in Table C-18a. As stated previously, more frequent analyses will be performed if process changes are made which could be expected to alter the nature of the wastes.

C.3.1.2 Sampling Methods--

Table C-19 lists the methods used to sample each category of wastes at the facility. The listed methods are contained in Test Methods for Evaluating Solid Wastes, U.S. EPA SW846, 1982.

TABLE C-1. WASTE CHARACTERIZATION SUMMARY

Type of waste	Quantity (tons/yr)	EPA waste code	Characteristic of concern monitored	Btu/lb	Waste mgt method
Paint sludges	2600	None	I, T	6,300	Secure landfill
Purge solvent	1500	F003, F005	I, T	15,000	Recycle/reclaim
Phosphate sludge	100	None	No	<1,000	Secure landfill
Waste gasoline*		D001	I	15,000	Incinerate/alternate fuels
Waste glycol	80	None	None	5,000	Incinerate/recycle
Waste oils	500	None	I, T	15,000	Recycle/reclaim
Wastewater sludges	4400	Delisted (F006, F019)	T	<2,000	Secure landfill
Chlorinated solvents	<10	F001, F002	None	N/A	Recycle/reclaim
Adhesives and sealers	300	None	I, T	10,000	Secure landfill
Waste paint					
Low lead	100	F003, F005	I	14,300	Alternate fuels/ incineration
High lead	70	F003, F005	I, T	9,850	Incineration/alternate fuels

* Volume included with waste paint.

TABLE C-2. SUMMARY OF WASTES RECEIVED FROM ~~OFF SITE~~ SISTER PLANT

Type of waste	EPA waste code	Characteristics of concern tested for	Btu/lb	Waste Management Method
Waste oils	None	I, T	15,000	Recycle/reclaim
Waste glycol	None	None	5,000	Incinerate/recycle
Paint sludges	None	I, T	9,820	Secure landfill

If quantities transferred in c-1 then add here 01C

TABLE C-3

GM TRUCK AND BUS GROUP WASTE DATA SHEET
PONTIAC PLANTS
Waste Stream Name: Paint Sludge

Proper DOT shipping name: Waste paint related materials, UN 1263
EPA waste No.: None (managed as F006, F019)
EPA hazard class code:
DOT hazard class: Combustible (no placard required)
Waste source: Vehicle spray paint booth operations

Generation rate: 2600 TPY (includes Plant 6 and phosphate sludge)
Potential hazards: Toxic vapors, combustible, heavy metals
Primary disposal method: Secure landfill off site
Alternative disposal method: Incineration off site
Alternative disposal method:
Comments: Contains small amount of waste adhesives and sealers; co-mingled with phosphate sludge and caustic sludge. Transporter to cover loads prior to transit. Must be free of releasable liquids.

Analysis date March 23, 1984
Ignitibility (Solid) no
pH 6.4

Physical state @ 70°F Sludge
Unit weight 73.4 lb/ft^3

Specific weight 1.13 gr/mL
Heat content 7290 Btu/lb

TABLE C-18. ROUTINE WASTE ANALYSES

Waste	Parameters	Frequency
Paint sludge	EP Toxicity (metals) Solid ignitability	Annually
Waste paint	Flash point EP Toxicity (metals)	Annually
Water treatment sludge	EP Toxicity (metals)	Annually
Waste purge solvents	Flash point EP Toxicity (metals)	Annually Annually

TABLE C-18a PARAMETERS AND RATIONALE FOR SELECTION

Hazardous Waste	Parameters	Rationale
Purge solvent	Flash point, toxic	This waste is ignitable and is listed on the basis of Xylene, toluene and MEK.
Gasoline	Flash point	Gasoline as purchased, has a flash point of -40°F making it readily ignitable.
Wastewater treatment sludge	Delisted toxic*	This waste was listed on the basis of cadmium, nickel, chromium (6) and cyanide. Testing is performed to verify that this waste stays within EP toxicity limits and thus qualifies for exclusion.
Waste paint	Flash point	This waste is ignitible based on the flash points of its constituent solvents (see purge solvent, above).
Chlorinated solvents	Toxic	Listed waste F001.

*Additional revisions to be made at a later date.

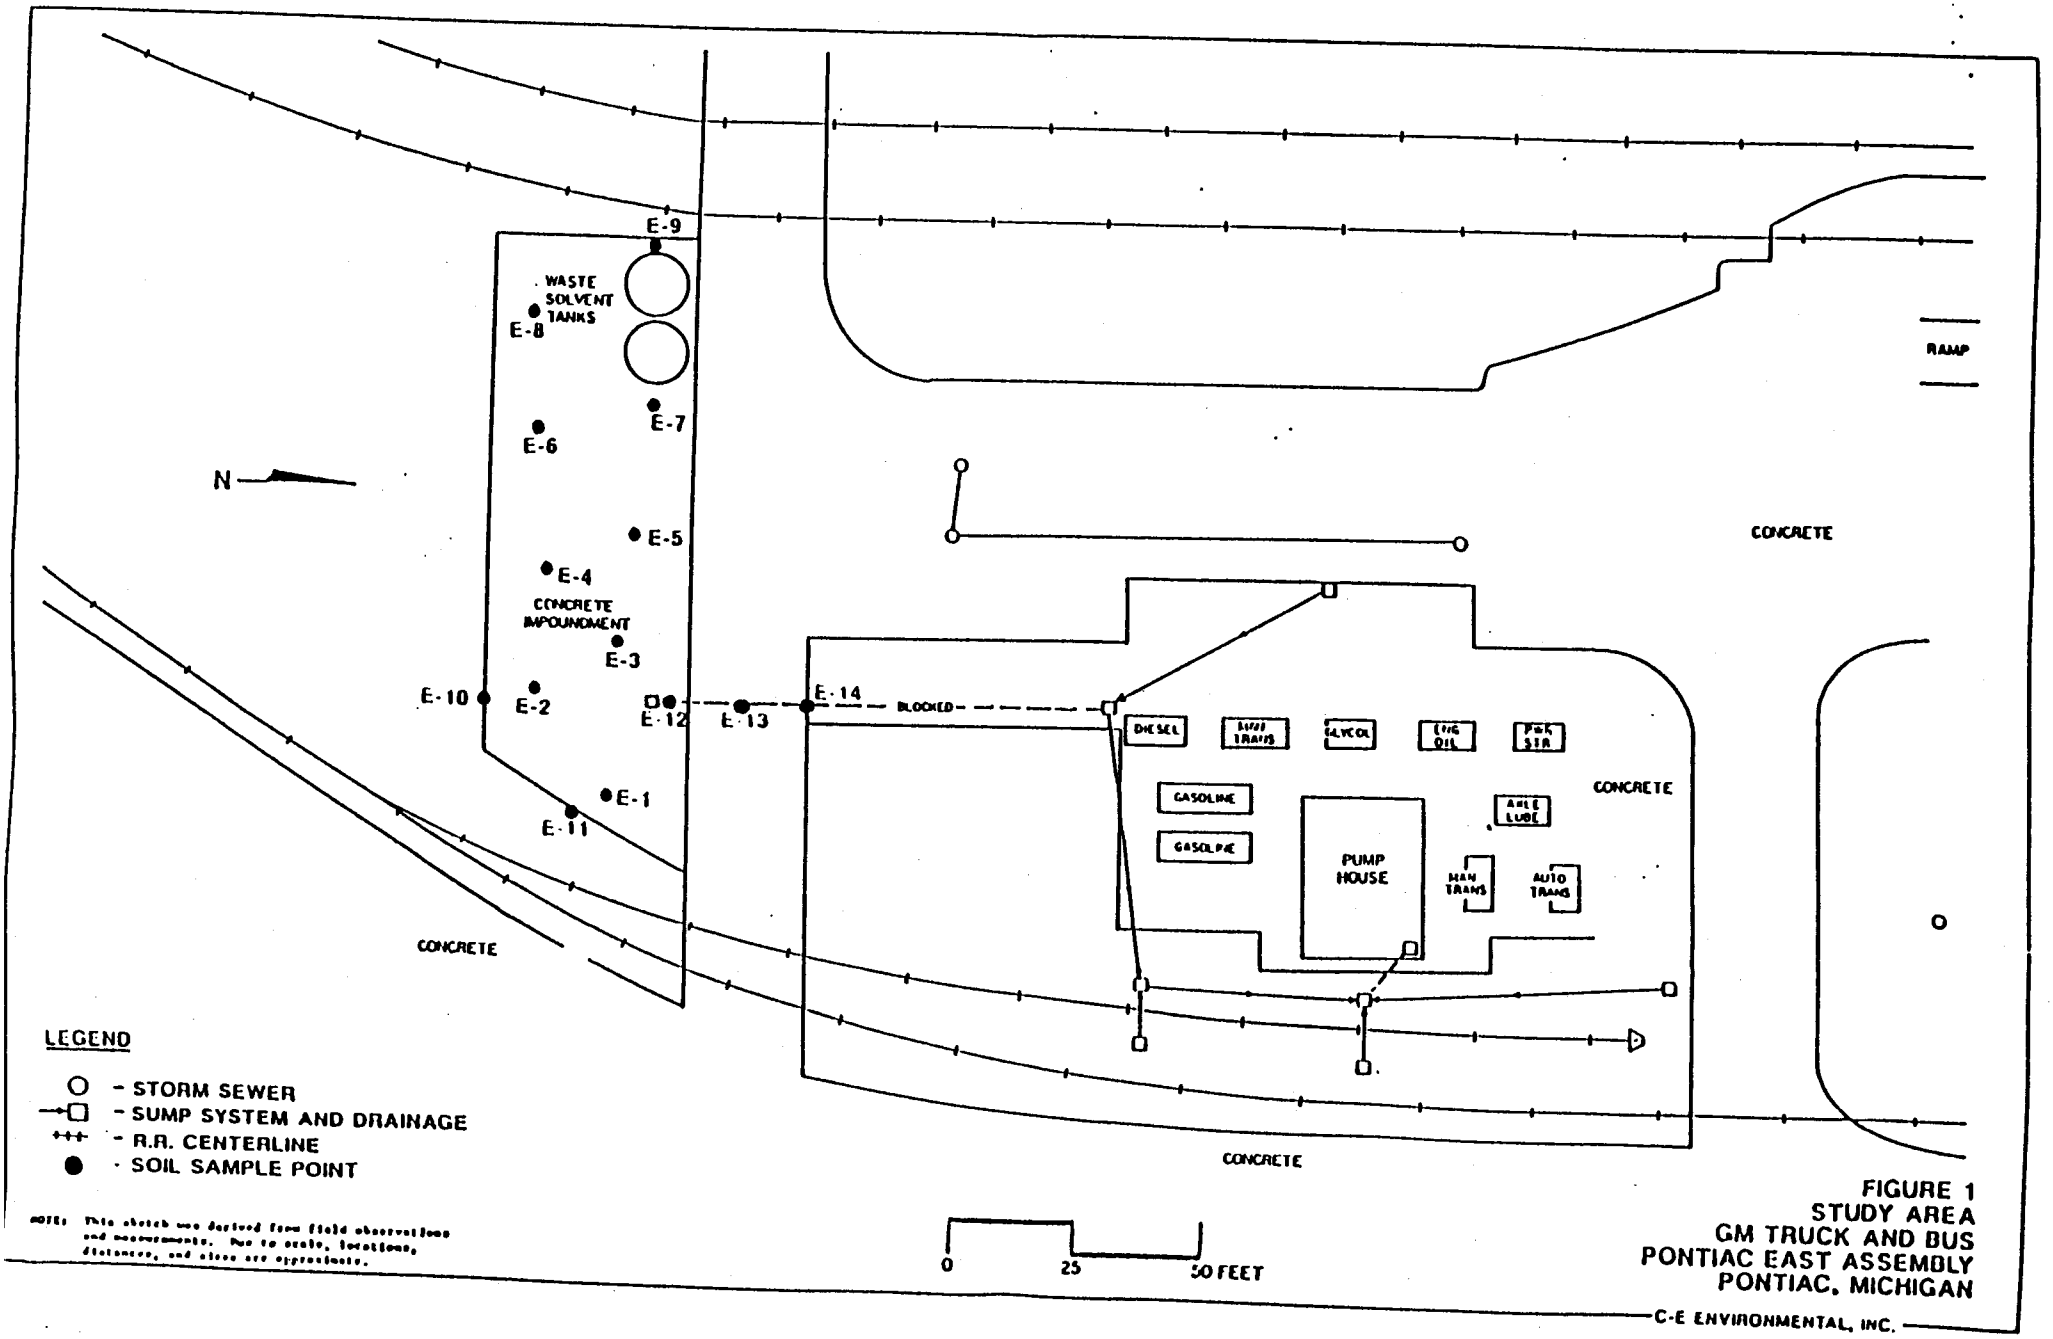
September 21, 1989

INTRODUCTION

General Motors Corporation, Truck & Bus Group, Pontiac East Assembly (GMC-PEA) retained C-E Environmental, Inc. (C-EE) to assist it with the closure of its hazardous waste storage area. Closure of this waste storage area is to proceed in accordance with the closure plan dated September 1987.

GMC-PEA retained C-EE to monitor the closure activities and to conduct confirmatory sampling. As a part of these responsibilities, C-EE collected nine subsurface soil samples from the waste storage area (sample points E-1 through E-9, as shown in Figure 1), six background soil samples (sample points B-1 through B-6), four samples of rinsate generated during the decontamination of the waste area's aboveground tanks and concrete pad (samples C-1 through C-4), and nine series of photoionization readings from the waste storage area (collected at sample points E-1 through E-9). The analytical results for samples E-1 through E-9 were presented in a letter report dated May 25, 1989. The analytical results for samples B-1 through B-6 and C-1 through C-4 were presented in C-EE's report dated July 12, 1989. Copies of these reports are presented in Attachment A. The results of the photoionization readings are presented in Attachment B.



The analytical results for these samples indicate elevated levels of volatile organics and lead near the eastern side of the waste storage area. Due to the presence of these contaminants in this area, C-EE has prepared this work plan to present a plan of action for further investigating the contamination observed in soils at the waste storage area, and establish removal/disposal protocol for the contaminated soils. These items, as well as a brief summary of the analytical findings to date are discussed below.

SUMMARY OF FINDINGS

In accordance with the closure plan, the concrete pad and two aboveground waste storage tanks in the waste storage area were decontaminated. As discussed in the July 12 report, C-EE collected samples of the rinsate generated during these decontamination activities (samples C-1 through C-4). The results of these samples indicated that cleanup standards as specified in the closure plan had been achieved. At this time, GMC-PEA intends to remove and dispose of the tanks and concrete pad. The disposal fate of these materials is discussed below.

As discussed in the May 25 report, volatile organics (ethyl benzene, toluene, and xylene) were detected in soil samples collected at sample points E-1 and E-3 at a depth of 6 to 12 inches. In addition, an elevated level of lead (660 milligrams per kilogram) was observed in the soil sample from sample point E-2 at a depth of 0 to 6 inches.

Volatile organics were detected with a photoionization detector (PID) at all nine sampling points (E-1 through E-9). The highest levels were observed at sampling locations E-1 (300 units) and E-3 (240 units). The PID readings

NOTE: This sketch was derived from field observations and measurements. Due to scale, locations, distances, and sizes are approximate.

FIGURE 1
STUDY AREA

C-E ENVIRONMENTAL, INC.

correspond to parts-per-million when the instrument is measuring benzene - for other vapors and mixtures, these numbers are relative. The next highest PID reading observed was at sampling point E-2 (70 units). The PID readings at the remaining sampling points (E-4 through E-9) decreased as sampling proceeded to the west; however, none of these readings exceeded 26 units. The volatile organics observed with the PID at these sampling points are likely attributable to the migration of the volatile compounds in the soil vapor space beneath the waste storage area concrete pad.

SCOPE OF WORK FOR ADDITIONAL SAMPLING

Based on the analytical results for samples collected from sample points E-1, E-2, and E-3, additional sampling and analyses are required to define the lateral and vertical extent of contamination within the waste storage area and to determine the source of the observed contamination.

To investigate the extent of contamination within the waste storage area, GMC-PEA will collect additional soil samples at sample locations E-1, E-2, E-3, E-10, and E-11. Soil sampling at these locations will commence upon the removal of the concrete pad and tanks located in the waste storage area.

Samples will be collected at 1-foot intervals and screened in the field for volatile organics using a photoionization detector (PID). Soil sampling from locations E-1 through E-3 will begin at a depth of 1 foot since prior sampling at these points proceeded to a depth of 1 foot. Field screening with the PID will be in accordance with the procedures established in the closure plan. If PID readings for the soil samples collected at the shallowest depth indicate that volatile organics are present, soil samples will be collected from the next 1-foot interval and screened with the PID. The process will be repeated until a sample is collected which does not yield a significant PID meter reading. At this sampling level, soil samples will then be collected and analyzed for total lead and (MDNR Scan II) volatile organics.

Method 7420 will be followed for total lead analyses and Method 8020 will be followed for volatile organic analyses. The anticipated level of detection (LOD) for the lead is 20mg/g while the anticipated LOD for the volatile organics is 5mg/g. The selected soil samples from the sampling points is anticipated to be analyzed by Swanson Environmental Services in Novi, Michigan.

The source of contamination observed in the waste storage area is believed to be gasoline which was released in the adjacent tank farm area and migrated to the waste storage area via the sump/drain system which connects the two areas. To confirm that these gasoline spills are the source of contamination observed in the waste storage area, samples of the fill material along the storm drain line between the two areas will be collected at three locations (sample points E-12 through E-14 in Figure 1). Sampling from these three sampling points will proceed in accordance with the procedures established above for sampling points E-1 through E-3, E-10 and E-11.

REMOVAL/DISPOSAL OF CONTAMINATED SOILS

Once the analytical results of the additional subsurface soil samples are received and interpreted, GMC-PEA will arrange for the removal and proper disposal of all contaminated soils located at the waste storage area. Soil removal will begin at sample points E-1 and E-3 and proceed in all directions to the nearest sample point not exhibiting detectable levels of volatile organics or elevated levels of total lead.

The contaminated soils will be excavated by either a tracked or rubber-tired excavator, or similar excavation equipment. Excavated soils will be placed in 20 cubic yard rolloff boxes and covered with tarpaulin (or a similar cover) to prevent exposure to precipitation and wind. Once full, the rolloff boxes shall be moved to the hazardous waste storage pad located at the Central Assembly facility to await proper disposal.

If it is determined that the source of contamination is spilled gasoline from the tank farm area and that the soils are not ignitable as defined by the Resource Conservation and Recovery Act (RCRA) and Michigan Act 64, the contaminated soils will be landfilled at the Michigan Disposal facility in Belleville, Michigan.

If the soils are classified as hazardous due to ignitability or E.P. Toxic lead levels, or if the volatile organic contamination cannot be attributed to the spilled gasoline, the soils will be transported by Inland Waters (EPA ID# MID 982606287) to Wayne Disposal with suitable treatment as necessary.

REMOVAL OF CONCRETE PAD AND TANKS

Based on the analytical results of the rinsate samples collected during the decontamination of the concrete pad and tanks, both the concrete pad and the tanks have been decontaminated in accordance with the decontamination procedures established in the closure plan. Accordingly, these decontaminated items can now be removed and disposed of to allow for the construction of an aboveground storage tank facility in this area.

The concrete pad will be removed with demolition equipment, placed in 20-cubic yard rolloffs, and transported as an inert material to Pollards Landfill (a City Management Facility) in Montrose Township, Michigan. The decontaminated aboveground tanks will be dismantled and scrapped.

1.0 INTRODUCTION

In accordance with the closure activities outlined in the plan "Hazardous Waste Storage Facility Closure Plan," dated December 2, 1987, General Motors Corporation, Truck & Bus Group, Pontiac East Assembly (GMC-PEA) has accomplished the closure of its hazardous waste storage area. The purposes of this closure report are to a) document the methods and events followed by GMC-PEA in accomplishing its closure, and b) certify that the closure activities outlined in the closure plan have been achieved.

The closure plan was developed and implemented by GMC-PEA in accordance with 40 CFR Part 265.111 through 265.115 and the Michigan Act 64, Rule R299.9613. C-E Environmental, Inc. (C-EE) of Farmington Hills, Michigan assisted GMC-PEA with the implementation of the closure plan. A copy of this closure plan, which includes a figure depicting the location of the hazardous waste storage area relative to the GMC-PEA facility, is included in this report as Appendix A.

Over the course of the closure project, the December 1987 Closure Plan was revised/clarified by the documents "Work Plan for the Removal of Two Aboveground Storage Tanks and a Concrete Containment Pad from the Hazardous Waste Storage Area of the Pontiac East Assembly Facility in Pontiac, Michigan," (dated September 21, 1989) and "Analytical Results of Additional Soil Samples Collected at the Pontiac East Assembly Waste Storage Area" (dated November 27, 1989), both by C-EE, and the Michigan Department of Natural Resources' written comments on those two documents dated July 14, 1989; October 5, 1989; October 16, 1989, and January 10, 1990. Copies of the two C-EE documents are presented in Appendix B. Copies of the MDNR's written comments are presented in Appendix C.

2.0 CLOSURE EVENTS

The events and activities associated with the closure of the hazardous waste storage area include the following:

- The powerwashing of the storage area's two aboveground storage tanks and concrete containment pad;
- The collection and analysis of six background soil samples and nine soil samples from below the concrete containment pad;
- The collection and analysis of additional soil samples to define the depth and extent of contamination observed below the containment pad;
- The removal and disposal of the two storage tanks and the concrete containment pad;
- The removal and disposal of contaminated soils located below the concrete containment pad, and
- The collection and analysis of cleanup confirmation soil samples.

These events and activities are discussed in order of occurrence in the following sections.

2.1 POWER-WASHING OF THE WASTE STORAGE TANKS AND CONTAINMENT PAD

Cleanup of the waste storage tanks and the waste storage area concrete containment pad proceeded on March 29 and March 30, 1989, and consisted of power-washing these items with a high-pressure water spray in accordance with the closure plan. Inland Waters, Inc. conducted the power-washing operations. Mr. Timothy Palmer, Environmental Scientist at C-EE, monitored the cleanup operations.

In accordance with the closure plan, Mr. Palmer collected samples of the rinsate from the tank and pad cleaning operations. A letter report summarizing the analytical findings of these rinsate samples was prepared by C-EE and dated July 12, 1989. A copy of this report is included as Appendix D. As discussed in the report, the concrete pad rinsate sample did not exhibit detectable levels of hexavalent chromium (level of detection was 0.05 milligrams per liter, (mg/L)). Lead was detected in the pad rinsate sample at a level of 0.27 mg/L, but this level is below the action level of 5.0 mg/L established in the closure plan.

With the exception of chloroform in a tap water sample collected from the site and in the tank rinsate sample, no volatile organics (by Method 8010/8020, SW-846) were observed in the water samples submitted for analysis. Chloroform detected in the tank rinsate sample (4 micrograms per liter, ug/L) appears to be an artifact similar to the chloroform observed in the tap water (15 to 20 ug/L).

Based on the analytical results of the rinsate samples collected during the decontamination of the concrete pad and tanks, both the pad and the tanks were decontaminated in accordance with the procedures established in the closure plan.

2.2 SAMPLING OF BACKGROUND SOILS

On April 19, 1989, C-EE collected surface soil samples from a total of six locations at the GMC-PEA and the Pontiac Central Assembly sites for the purpose of defining the total lead and total hexavalent chromium background concentrations for both facilities. The analytical results for these samples were presented in C-EE's letter report dated July 12, 1989 (included in this report as Appendix D). The approximate locations

of these background samples are shown in Figure 1 of that report. Data sheets which more accurately indicate the locations of these six samples are presented in Appendix E.

As the July 12 report indicates, no detectable levels (detection level of 0.5 milligrams per kilogram, mg/kg) of total hexavalent chromium were observed in any of the six soil samples collected. The total lead levels observed in the background soil samples ranged from 15 to 240 mg/kg. Per the MDNR's October 5, 1989, letter to GMC-PEA (Appendix C), the four lowest total lead values (15, 24, 57, and 65 mg/kg) observed in the background samples were used to establish the background total lead level for the GMC-PEA site.

2.3 SAMPLING OF SOILS BENEATH THE CONTAINMENT PAD

On April 19, 1989, Mr. Tim Palmer collected soil samples from nine locations (sample locations E-1 through E-9) beneath the waste storage area containment pad in accordance with the closure plan. The methods employed in collecting these samples, the approximate locations of the sampling points, and the analytical results of the samples were presented and discussed in detail in C-EE's letter report dated May 25, 1989 (Appendix F).

As discussed in the May 25 report, an elevated level of total lead (660 mg/kg) was observed in the 0" to 6" core sample collected from sample location E-2. The lead levels in the remaining eight soil samples, however, fell within the background total lead level range established for the site. In addition, no total hexavalent chromium was detected in any of the nine soil samples.

Volatile organics were detected in two of the nine soil samples submitted for analysis. Volatile organics observed in the soil sample from location E-1 at a depth of 6" to 12" included ethyl benzene (300 mg/kg), toluene (175 mg/kg), and total xylenes (1,100 mg/kg). Volatile organics observed in the soil sample from sample location E-3 at a depth of 6" to 12" included ethyl benzene (25 mg/kg) and total xylenes (125 mg/kg). No other volatile organics were detected in the E-1 or E-3 samples. No detectable levels (the level of detection was 10 mg/kg) of volatile organics were observed in the other seven samples.

Based on the analytical results, it was concluded in the May 25 report that soil contamination beneath the waste storage pad appeared limited to the northeastern corner. Additional soil sampling, however, was deemed necessary to help define the extent of the contamination and its source.

The approach to further investigating the observed contamination and establishing removal/disposal methods for the contaminated soils was established in the C-EE prepared work plan dated September 21, 1989 (Appendix B). This plan outlined a sampling strategy which focused around the three sampling points (E-1, E-2, and E-3) exhibiting elevated contaminant levels as well as the stormwater drain line leading up to the containment pad, along which gasoline contaminants from the tank farm area were believed to have migrated. The plan also established removal and disposal methods for the concrete containment pad and the two waste storage tanks.

This work plan was accepted by the MDNR as a modification to the closure plan in its letter dated October 5, 1989. As conditions for approval, however, the MDNR outlined 9 modifications to the work plan in its acceptance letter (Appendix C).

2.4 ADDITIONAL SAMPLING OF SOILS BENEATH CONTAINMENT PAD

In accordance with the MDNR-approved work plan, C-EE collected additional soil samples from beneath the containment pad and to the north of the containment pad along the stormwater drain line servicing the area. The samples were collected by Mr. Steven Ranger, Environmental Engineer at C-EE, and Mr. Thomas Winebrenner, Senior Environmental Technician at C-EE, on October 5 and 6, 1989. The sampling methodologies, sample locations, and analytical results were presented in C-EE's report "Analytical Results

of Additional Soil Samples Collected at the Pontiac East Assembly Waste Storage Area," dated November 27, 1989 (Appendix B).

As discussed in that report, 11 soil samples were collected from 9 locations and analyzed for total lead levels. Included as one of the 11 soil samples was a repeat sample of the soils from location E-2 which had exhibited total lead levels of 660 mg/kg during the initial soil sampling and analysis study. The levels of total lead observed in all of the 11 soil samples (including the E-2 repeat sample) ranged from 6 to 20 mg/kg, well within the total lead level background range established for the site. Based on the high lead levels observed earlier at E-2, a soil sample from E-2 at a depth of 0 to 1 foot was also analyzed for extractable lead (E.P. Toxicity, Lead). No detectable levels of E.P. Toxicity lead were observed in this sample.

Because the analytical results for other samples collected near E-2, and the repeat sample collected at E-2, did not reveal elevated (above background) levels of total lead, the total lead level initially observed in soils from E-2 could not be explained but is believed to be attributable to laboratory error, sampling error, an anomaly, or any combination of the three.

Field analytical measurements made with a photoionization detector as well as laboratory analytical results for benzene, ethyl benzene, toluene, and xylene revealed volatile organic contamination beneath the containment pad in the area of sample locations E-1, E-2, and E-3 to a depth of approximately 2.0 to 2.5 feet, and near sample location E-12 to a depth of approximately 4.0 to 4.5 feet. These four soil sample locations were located around and in proximity to the stormwater sewer manhole located in the waste storage area. Additionally, apparent oil-stained soils (likely resulting from transmission oil releases occurring in the tank farm) were observed at sample locations E-12, E-13, and E-14, along the stormwater drainage line servicing both the waste storage area and the tank farm area.

Though the source of contamination in the waste storage area is not known, based on the observations made during sampling and the analytical results of the additional soil sampling effort, the contamination observed in the waste storage area appeared to emanate from the sewer manhole and the associated drainage line. It was the opinion of GMC-PEA, therefore, that the source of BTEX contamination beneath the waste storage area's containment pad was gasoline releases which migrated along with transmission oil releases along the stormwater drainage trench from the tank farm area into the waste storage area. Accordingly, GMC-PEA proposed to handle the contaminated soils as non-hazardous waste provided they did not meet the characteristic of ignitability.

In its letter dated January 10, 1990 (Appendix C), the MDNR concurred with GMC-PEA that existing data did not appear to indicate that the source of the soil contamination was a listed waste, and agreed that the contaminated soils could be managed as solid wastes provided they did not exhibit the characteristic of an ignitable waste.

2.5 REMOVAL AND DISPOSAL OF THE CONTAINMENT PAD AND STORAGE TANKS

Removal and disposal of the waste storage area's concrete containment pad and two carbon steel aboveground storage tanks commenced on October 4, 1989, and was completed on October 6, 1989. Inland Waters, Inc. conducted the removal operations and arranged for the transportation of the wastes. Ms. Nancy Gassel, Environmental Engineer with C-EE, and Mr. Steve Ranger monitored the removal procedures.

The concrete pad and containment walls were broken down with a jack-hammer attached to an excavator. Once broken down to manageable pieces, the concrete pieces were picked up with the excavator, rinsed down with a high-pressure water spray, and placed in 20 cubic yard rolloff boxes. The underside of the concrete pad was rinsed with the water spray so as to ensure that no contaminated soils were disposed of with the concrete materials. At the conclusion of each working day, plastic tarpaulin was used to cover the exposed soils beneath the concrete pad.

The removed concrete pad and walls were disposed as inert material at the Pollards Landfill Facility (a City Management facility) in Montrose Township, Michigan. A total of approximately 150 cubic yards of concrete was removed.

As specified in the work plan, the aboveground storage tanks were dismantled and scrapped. So as to ensure that they would not again be used for storage purposes, the tanks were quartered prior to transportation offsite.

2.6 EXCAVATION OF CONTAMINATED SOILS AND CLEANUP CONFIRMATION SAMPLING

Excavation and disposal of volatile organic-contaminated soils located at and near the waste storage area proceeded in accordance with the MDNR-approved closure and work plans. Inland Waters, Inc. excavated and transported the contaminated soils from the waste storage area. Soils removed during excavation were disposed of at the Pollards Landfill facility in Montrose Township. Mr. Dave Belan, Geologist at C-EE, and Mr. Ranger monitored the excavation activities on behalf of GMC-PEA. Specific information relating to the excavation and disposal of the soil is presented in the sections below.

2.6.1 Soil Excavation Schedule and Quantities Removed

Soil was removed from the waste storage area over three separate excavation phases. The first excavation phase began on February 12, 1990 and was completed on February 28, 1990. Excavation during this removal phase originally focused upon those contaminated soils delineated in C-EE's November 27, 1989 report "Analytical Results of Additional Soil Samples Collected at the Pontiac East Assembly Waste Storage Area." A total of 17 transport vehicles, equaling approximately 300 cubic yards of soil, were loaded during the first phase of excavation. The lateral and vertical extent of the Phase I excavation and the approximate locations of confirmatory samples collected at the conclusion of the first excavation phase are depicted in Figure 1.

The second excavation phase began on March 12, 1990 and was completed March 14, 1990. Excavation during this second phase of removal focused upon those boundary areas of the original excavation which still exhibited elevated volatile organic contamination based upon confirmatory sampling conducted during the first excavation phase. A total of 23 transport vehicles, equaling approximately 400 cubic yards of soil, were loaded during the second phase of excavation. The lateral and vertical extent of the excavation as it appeared at the conclusion of the second phase of excavation procedures and the approximate locations of confirmatory samples collected at the conclusion of the second excavation phase are depicted in Figure 2.

The third excavation phase began on March 28, 1990 and was completed on March 29, 1990. Like the second excavation phase, excavation on these dates focused on the boundary and floor areas of the excavation area which still exhibited elevated volatile organic contamination based upon the confirmatory sample results from the second phase excavation. A total of 4 transport vehicles, equaling approximately 80 cubic yards of soil, were loaded during the third phase of excavation. The lateral and vertical extent of the excavation as it appeared at the conclusion of the third and final phase of excavation procedures and the approximate locations of confirmatory samples collected at the conclusion of the third excavation phase are depicted in Figure 3.

In general, excavation for all three phases began in the area formerly occupied by the northeast corner of the waste storage area containment pad, and proceeded to the south, west, and then to the north. As the soils were excavated, they were either placed directly into rolloff boxes/dump trains or temporarily placed along the northern edge of the excavation area to await loadout. The last areas excavated centered around that portion of the waste storage area formerly occupied by the stormwater sewer manhole and the area where excavated soils were temporarily stockpiled until loadout.

2.6.2 Observations Made During Excavation Procedures

In general, the soils encountered in the top one to two feet beneath the waste storage pad consisted of a fine to medium grained sand, most likely a backfill sand placed in the area at the time of the concrete containment pad's construction. Below this backfill sand, silty clays and hard-packed gray clays extended to the base of the excavation.

A gravel/sand mix was encountered in the top two feet of the excavation along the eastern and northeastern ends of the concrete containment area in proximity to a surface water drainage ditch which ran along the eastern wall of the concrete containment pad. This sand/gravel seam was moist and appeared to be a source of water infiltration into the excavation during periods of precipitation. Hard-packed clay was observed below this sand/gravel seam.

A sand/gravel seam was also encountered along the north wall of the excavation, under the concrete driveway which borders the waste storage area to the north. This sand/gravel seam extends to a depth of approximately 3 feet. Hard packed clays were observed below the sand/gravel seam. It appears that this sand/gravel seam is a backfill material placed during the construction of the concrete driveway area. A drain tile system services the driveway area and is situated in the sand/gravel seam. During excavation procedures, this drain tile line was severed and several hundred gallons of water were released to the excavation. Clays from another area of the excavation were temporarily backfilled along this northern wall to help prevent future water intrusion into the excavation area from this drain tile system.

The location of the concrete driveway drain tile line (around which the sand/gravel seam was noted) and the area of the excavation from which the clays were borrowed to temporarily seal the ruptured drain tile line are shown in Figure 4. At the conclusion of all excavation procedures, clays from an offsite source were used to reinforce the temporary clay barrier placed along the north wall near the drain tile line. The area of the excavation which was backfilled with clay is also shown in Figure 4.

A moist sand seam extending to a depth of approximately 8 to 10 feet at and to the west of the area formerly occupied by the concrete pad's stormwater sewer manhole and its associated drain line was encountered. Odors resembling sewage and elevated photoionization meter readings were noted in this sand seam. Hard-packed clays were observed below this sand seam. This entire sand seam was excavated. Its approximate location is shown in Figure 4 as the area of excavation extending to a depth of 9 feet (darkly shaded area).

A ceramic drain line which lead into this sand seam is also shown in Figure 4. During excavation procedures, this ceramic line was broken and approximately 500 gallons of water from the line poured into the excavation. This line was sealed with concrete beyond the northern edge of the excavation so as to prevent additional stormwater from the tank farm area from migrating towards the excavated area.

Water which collected in the excavation area due to precipitation, infiltration through the gravel seams noted above, and/or when the two drain lines were excavated/ruptured was removed from the excavation by vacuum truck and delivered to the onsite wastewater treatment plant for processing.

Plastic visqueen sheeting was placed over the tank farm area during the period between the removal of the concrete containment pad and the first phase of soil excavation in an effort to protect the area from precipitation. Plastic sheeting was also placed over the excavation area during the first phase of excavation during periods of inactivity.

C-E ENVIRONMENTAL, INC.

2.6.3 Use of Field Organic Vapor Monitor

During excavation procedures, C-EE personnel collected photoionization meter volatile organic readings of the soils to be excavated using an Organic Vapor Monitor (OVM) Model 580A, manufactured by Thermo-Environmental. Soils which exhibited readings on the OVM above background/ambient readings were excavated by Inland for disposal. Soils not exhibiting detectable levels of volatile organic constituents on the OVM were left in place. OVM readings were also collected for each soil sample submitted for confirmatory and ignitability testing. The OVM was used during all three excavation phases as a means of delineating the extent of excavation. The unit was calibrated on a daily basis using isopropylene vapors at a concentration of 110 parts-per-million as a standard.

2.6.4 Sampling of Contaminated Soils for the Characteristic of Ignitability

Loadout samples of the contaminated soil were collected from each of the rolloff boxes/dump trains used over the course of the project. Each sample collected was a composite of soils placed into each transport vehicle. In accordance with the work plan and the MDNR letter dated January 10, 1990, each sample collected from the transport vehicles was analyzed for the characteristic of ignitability to determine if the waste soils were to be managed as hazardous wastes. National Environmental Testing Laboratories, Inc. (NET) in Pontiac, Michigan performed the ignitability tests on the loadout samples. A total of 44 samples were submitted for ignitability testing. As presented in Table 1, none of these samples exhibited the characteristic of ignitability.

2.6.5 Cleanup Confirmation Sampling Results

At the conclusion of excavation procedures for each excavation phase, C-EE personnel collected cleanup confirmation grab samples from the perimeter sidewalls of the excavation and composite samples from the various floor levels of the excavation. The location of confirmatory samples collected after the first, second and third excavation phases are shown in Figures 1, 2, and 3, respectively. Repeat samples of the second phase confirmation samples were also collected, and are indicated in Figure 2. Confirmatory samples were collected using a stainless steel sampling spoon or a shovel. Sampling equipment was washed in a trisodium phosphate solution and rinsed with water between each sampling event. To help prevent the release of potential volatiles in the soil samples, composite samples from the floor of the excavation were not mixed prior to placement in the sampling jars. Grab soil samples from the sidewalls of the excavation included soils from the top to the base of the excavation. All soil samples were packed in coolers with frozen cold-packs for delivery to the laboratory.

The confirmatory soil samples were analyzed for benzene, ethyl benzene, toluene, and xylene (BTEX) by USEPA Method 8020 (SW-846). The analytical results of the soil samples are shown in Table 2. Unless noted, the level of detection for all samples analyzed was 0.010 mg/kg. Field data sheets for the collected samples are shown in Appendix E. All of the confirmatory samples designated CS and SCS were analyzed by NET. Four duplicate SCS samples and all of the samples designated TCS were analyzed by C-EE's laboratory in Camarillo, California. This C-EE laboratory participates in the EPA's Contract Laboratory Program (CLP).

As shown in Table 2, total xylenes above the level of detection and ranging from 0.021 to 5.500 mg/kg were observed in all ten of the first phase excavation confirmatory samples submitted for analysis. Ethyl benzene and toluene ranging from 0.044 to 1.200 mg/kg and 0.012 to 0.490, respectively, were also observed in the samples CS-1 (2/26), CS-6 (2/28), CS-7 (2/28), CS-8 (2/26), CS-9 (2/26), and CS-10 (2/26). Benzene was not detected in any of the soil samples. Ethyl benzene and toluene were not detected in samples CS-2 (2/26), CS-3 (2/26), CS-4 (2/26), CS-5 (2/28).

Because the OVM did not detect any volatile organics in the soils sampled during excavation procedures, and no odors were observed, the presence of the elevated levels of ETX constituents observed in the confirmatory soil samples were difficult to explain. Possible causes include a) migration of the ETX contaminants from

Notes:
1. All concentrations in mg/kg (parts per million).
2. * - Sample analyzed by National Environmental Testing, Inc., Pontiac, Michigan.
3. ** - Duplicate sample analyzed by C-E Environmental Laboratory, Camarillo, California.

"hot" sources to excavated areas via excavation equipment or foot-traffic tracking, b) carryover by precipitation/water which collected in the excavation area during the time between when OVM readings and confirmatory samples were collected (in the case of the CS-1 through CS-4 samples, this was over one week), c) laboratory error, and/or d) the continued migration of contaminants from the tank farm located north of the waste storage area via the drainage ditch located east of the waste storage area (in proximity to the sample locations of CS-1 and CS-2) and the stormwater drainage line and associated backfill sands (in proximity to the sample locations CS-6, and CS-7).

Based on the relatively high levels of volatile organics observed in the first phase confirmatory samples (most notably samples CS-6 and CS-9), additional soil excavation in the area formerly occupied by the waste storage area was deemed necessary by GMC-PEA.

The results of the confirmatory samples collected at the completion of the second phase of soil excavation are presented in Table 2. As the results show, detectable levels of total xylene ranging from 0.025 to 0.240 mg/kg were detected in all of the second phase excavation confirmatory samples with the exception of CS-6 (3/14) and CS-7 (3/14). Additionally, ethyl benzene was detected in sample CS-8 (3/13) at 0.025 mg/kg and in CS-9 (3/13) at 0.012 mg/kg; and toluene was observed in sample CS-8 (3/13) at 0.013 mg/kg. Though these contaminant levels are approximately two orders of magnitude less than those observed for the first phase excavation confirmatory samples, their presence was again unexplainable.

In an effort to confirm the presence of the contaminants in the soil samples and assess the reliability of the analytical results, the second phase excavation confirmatory samples (except for CS-6) were re-collected and resubmitted for BTEX analysis at NET, and four duplicate samples were submitted to C-EE's laboratory in Camarillo, California. A background soil sample collected approximately 200 feet south of the waste storage area was also collected.

The analytical results for these samples are shown in Table 2. As shown in the table, the analytical results for the repeated samples differ from the original results of the second phase excavation confirmatory results. Most notably, the levels of contaminants observed in the SCS-2 sample were over two orders of magnitude higher than those observed in the CS-2 sample; the levels of contaminants observed in the SCS-3 and SCS-4 samples were approximately one order of magnitude higher than those levels observed in samples CS-3 and CS-4, respectively; and no detectable levels of BTEX were observed in samples SCS-1 and SCS-9 (whereas total xylenes were detected in the CS-1 and CS-9 samples, respectively). No detectable levels of BTEX were observed in the background sample (SCS-200).

Duplicate samples of SCS-4, SCS-8, SCS-9, and SCS-10 were submitted to C-EE's laboratory. No detectable levels of BTEX were observed in these samples, in contrast to the NET obtained analytical results for SCS-4, SCS-8, and SCS-10.
Though contradictory analytical results were obtained during the second phase excavation confirmatory sampling events, GMC-PEA made the decision to proceed with excavation procedures in those sample areas were elevated levels of volatile organic contamination was observed (in proximity to SCS-2, SCS-3, SCS-4, SCS-5, and the base of the excavation).

The analytical results for the cleanup confirmation samples collected at the conclusion of this third excavation phase are shown in Table 2. Two of the samples collected, TCS-2 and TCS-5, exhibited relatively low levels (less than 0.050 mg/kg) of ethyl benzene, toluene, and total xylenes. Both of these samples were collected from locations outside the area formerly occupied by the hazardous waste storage containment pad. The duplicate sample of TCS-8 (TCS-100) exhibited detectable ETX but all at levels less than 0.010 mg/kg. No detectable levels of BTEX were observed in the other TCS samples collected.

As shown in Figure 3, the TCS-2 and TCS-5 samples were collected from locations located outside the lateral extent of the former waste storage area containment pad. These two samples were collected in proximity to

a drainage ditch leading from the tank farm area and the drain tile pipe believed to service the concrete driveway and tank farm area, respectively. The source of contaminants in these two samples will be addressed by GMC-PEA in conjunction with its future dismantlement of the tank farm area. In an effort to prevent the potential migration of contaminants from the tank farm area, GMC-PEA constructed a trench drain system along the northern perimeter of the excavation, and an enhanced drainage system along the eastern perimeter of the excavation.

The portions of the Waste Storage Area which were excavated during the removal of the concrete pad and the subsequent clean-up activities were backfilled during the period of April 23 through 30, 1990, by the Inland Group of Detroit, Michigan. All of the excavated areas were backfilled with clean sand with the exception of the north edge of the Waste Storage Area where a clay wall was installed. The clean sand was compacted to a minimum of 95 percent maximum dry density, and the clay to 90 percent maximum dry density, as determined by using optimum moisture-maximum density curves in accordance with ASTM D 1557. The field densities of each lift of sand and clay backfill were checked by GZA Inc. of Livonia, Michigan, by using a nuclear moisture-density device.

3.0 CONCLUSION

In summary, GMC-PEA has undertaken the closure of its hazardous waste storage area. Events and activities associated with the closure of this hazardous waste storage area included power-washing and removal of the storage area's aboveground storage tanks and concrete containment pad, and the removal and disposal of contaminated soils observed below the area formerly occupied by the concrete containment pad.

The closure activities were conducted in accordance with the "Hazardous Waste Storage Facility Closure Plan" dated December 1987 and approved by the MDNR's Waste Management Division (WMD) for implementation on March 7, 1988. Closure activities were also performed in accordance to the "Work Plan for the Removal of Two Aboveground Storage Tanks and a Concrete Containment Pad from the Hazardous Waste Storage Area," dated September 21, 1989 and approved, with modifications, by the WMD in its letter dated October 5, 1989.

Based on the information provided above in Section 2.0 and the documentation presented in the Appendices, the closure of the Pontiac East Assembly hazardous wastes storage area is deemed complete.

Volatile organic contaminants observed in two of the samples collected during the final phase of confirmatory sampling procedures have been attributed to the nearby tank farm area to the north. The source of contaminants in these two samples will be addressed by GMC-PEA in conjunction with its future dismantlement of the tank farm area. In an effort to prevent the potential migration of contaminants from the tank farm area, GMC-PEA constructed a trench drain system along the northern perimeter of the excavation and an enhanced drainage system along the eastern perimeter of the excavation. Additionally, compacted, clays were placed along the northern perimeter of the excavated area as an additional barrier to contaminant migration from the existing tank farm area.

Dear Mr. Harrett:

SUBJECT: Revised Closure Plan
Truck & Bus Central and East Plants
MID 005 356 902

The Michigan Department of Natural Resources (MDNR) has completed a review of your revised closure plan dated December 2, 1987, pursuant to the requirements of 40 CFR, Part 265, which are adopted by reference in MAC R 299.11003 of the Act 64 administrative rules. Based on this review, and the fact that no significant comments were received during the 30-day public comment period, the MDNR hereby approves your closure plan subject to the conditions enclosed with this letter.

Closure of RCRA interim status units does not release the facility from its responsibilities under the Hazardous and Solid Waste Amendments of 1984 (HSWA). All interim status facilities are subject to the corrective action requirements of these amendments.

If you have any questions, please contact Ms. Andrea Schoenrock, of my staff, at 517-373-3988.

Sincerely,

Alan J. Howard, Chief
Waste Management Division

Dear Ms. Schoenrock:

Enclosed is a revised closure plan for the waste management areas at our Pontiac Central and East plants.

Per your request, the DNR offices will be notified in advance of key events in the closure activities.

If you have any questions, please call me at (313) 456-7529.

Very truly yours,

D. S. Harrett

APPENDICES

Appendix A Pontiac Central and East Plants - Annual Waste Summaries

Appendix B Waste Characterizations

1.0 Introduction

This closure plan describes the methods and sequence of events necessary to close (2) hazardous waste management areas at Truck & Bus - Pontiac Central and East plants. The following plan was developed in accordance with 40CFR 265.111 - 265.115 and Michigan Act 64 Rule R299.9613.

1.1 Background

General Motors Truck & Bus - Pontiac Submitted a RCRA Part A application to the EPA on November 17, 1980 for treatment of hazardous wastes on site, storage of hazardous wastes on site over 90 days, and/or receipt of hazardous wastes from off site. In April, 1985, Truck & Bus - Pontiac Central and East submitted a part B application. On July 1, 1987, the plant requested withdrawal of the part B application after determining that the additional operating latitude afforded by permitted status was not needed: no hazardous wastes require treatment on site, storage over 90 days is not necessary for economical disposal, and all Pontiac Truck & Bus plants manage their hazardous wastes independently, so receipt from off site is not required. When final closure is accomplished Truck & Bus - Pontiac Central will continue its waste management activities under 40CFR262 and Act 64 Part 3 (Generator) rules.

1.2 Purpose and Scope

The purpose of this closure plan is to provide documentation of compliance with 40 CFR 265.111, closure performance standard, which states that an owner or operator of a hazardous waste management facility must close his facility in a manner which:

- Minimizes the need for further maintenance.
- Controls, minimizes or eliminates, to the extent necessary to protect human health and the environment, post-closure escape of hazardous waste, hazardous waste constituents, leachate, contaminated rainfall, or waste decomposition products to the ground or surface waters or to the atmosphere.

The scope of this closure plan includes the following waste management units operated at the Truck & Bus - Pontiac Central and East plants:

- Central plant containerized and bulk waste management pad (storage of listed hazardous wastes).
- East plant container and tank waste management area (storage of listed hazardous waste).

This closure plan describes the steps necessary to remove waste and waste residue from regulated waste management units, decontaminate facility equipment, and document closure. Estimates are also included for the maximum hazardous waste inventory, closure schedule, and final closure date.

2.0 General Facility Information

2.1 Facility Name and Location

Name - General Motors Corporation
Truck & Bus Group
Pontiac Central Mfg. & Assy. / Pontiac East Assembly
Address - 660 S. Boulevard East / 820 S. Opdyke Rd.
Pontiac, Michigan 48053
Facility Contacts
Central - Mr. Dan Harrett
(313) 456-7529
East - Mr. Ken Gembel
(313) 452-2781
EPA ID# - MID005356902

2.2 Facility Description

The General Motors Truck & Bus Group - Pontiac Central and East plants are located in the southeast corner of Pontiac, on a property bounded by South Boulevard on the North, Opdyke Road on the East, East Boulevard on the West, and the Grand Trunk Western Railroad Tracks on the South. Geographical coordinates are the northeast, northwest and southeast 1/4 of section 03, tier 2 north, range 10 east. The facility occupies some 400 acres, of which less than one acre is dedicated to hazardous waste management. A map of the plant property is given as figure 2-1.

2.3 Waste Characteristics

2.3.1 Wastes Managed in Central Plants Waste Management Pad

The Central plants waste management pad receives non-hazardous paint sludges in bulk from all three Truck & bus - Pontiac plants, solidifies them with lime as needed, and loads them into 35 yard licensed hazardous waste hauling vehicles for shipment (by plant preference) to a licensed hazardous waste landfill. Laboratory analyses show this waste stream to be consistently non-hazardous. In addition, wastewater treatment sludges were managed in bulk here while they were under a temporary delisting, and are now managed in 15 yard licensed rolloff boxes as a F019 listed waste. (This waste stream was listed as F006/F019 until the F006 listing was revised to exclude phosphating in December, 1986.)Parked road tankers on this pad are used to store non-hazardous oils and glycol. Containers of waste paint and solvent (listed wastes F003, F005) chlorinated solvents (listed waste F001), and non-hazardous oils are brought to the pad from the plant to be emptied and consolidated in the appropriate bulk tank here or at the Pontiac East facility (described in the next section). Incompletely emptied containers of non-hazardous adhesives and sealers are brought to this pad to be emptied and the residue consolidated with the paint sludges. Pebble lime is stored in a pile on the pad and is used as required to solidify

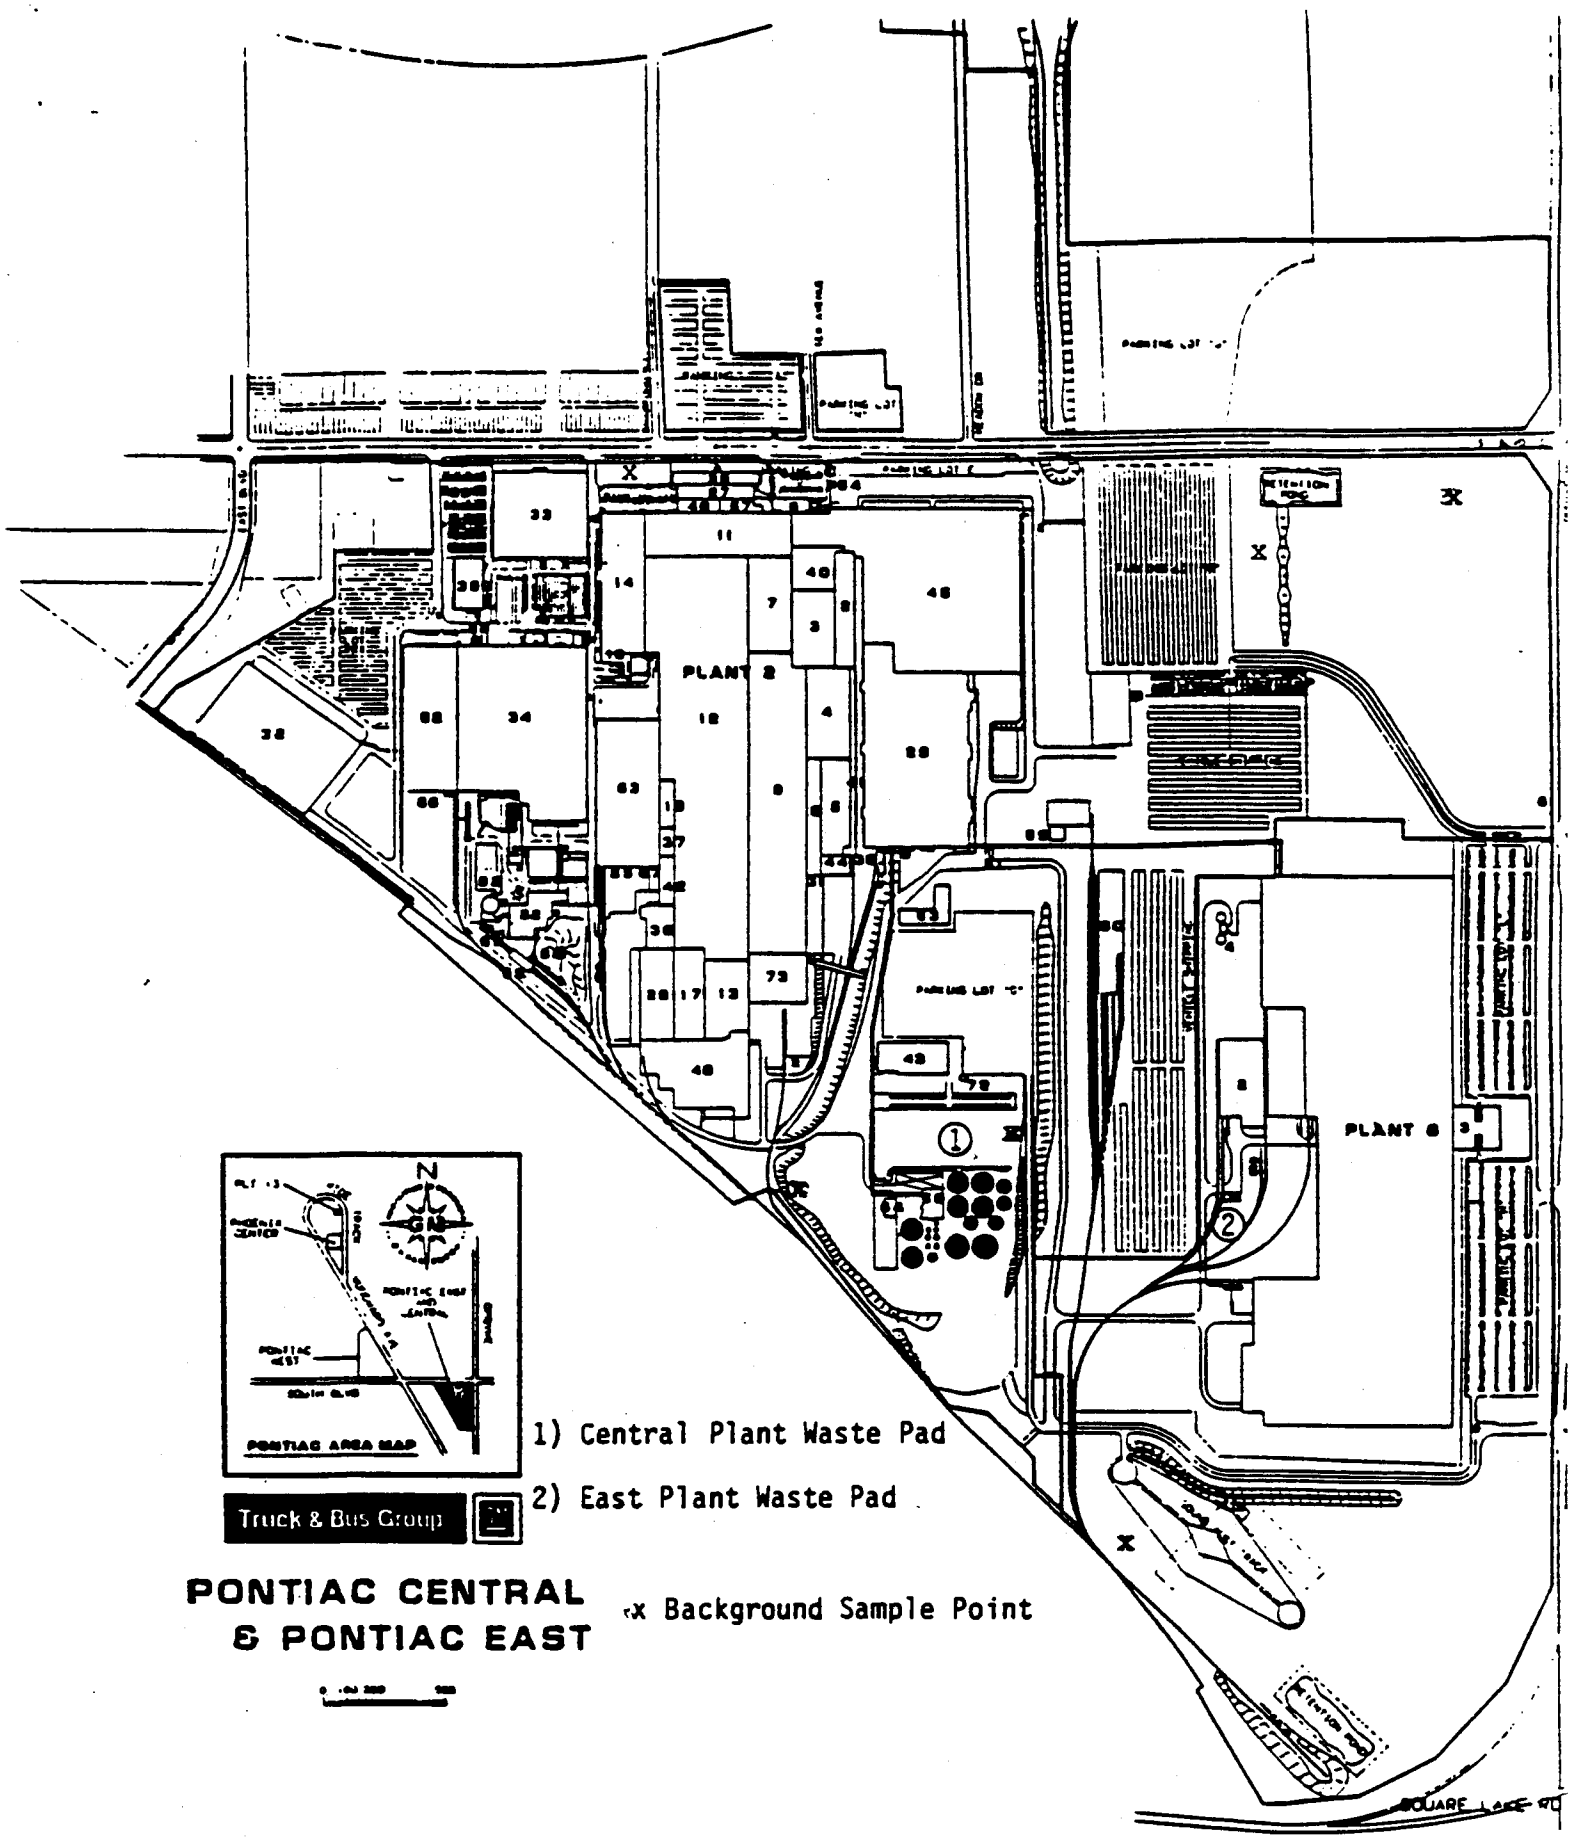

Fig. 2-1 Facility Map

the sludges to meet the acceptance criteria of the disposal facility. All transporting vehicles are owned by contract haulers, who decontaminate the vehicle prior to its return to this facility.

The Pontiac Central waste management pad consists of a 12,543 square foot, 8 inch thick concrete area constructed in 1980, reinforced with PVC waterstop in all joints. Two drains carry precipitation and free liquids into the adjoining wastewater treatment plant; this plant in turn discharges to the City of Pontiac POTW and is beholden to its discharge limitations. (No discharge excursions of any sort have occurred; therefore it may be concluded that runoff from hazardous waste operations may be properly handled in the wastewater treatment system.) Recent inspections of this facility indicate it to be in excellent condition with no apparent cracks or other evidences of failure.

2.3.2 Wastes Managed in the East Plant Waste Management Pad

The East Plant waste management pad received drummed waste paints, solvents, chlorinated solvents, non-hazardous sealers and adhesives, and empty drums generated in the East Plant until the end of 1984. At that time the plant shut down for retooling and the production operations were relocated to the Central plant. A new waste management pad was constructed at Pontiac East to be operated as an accumulation facility and the old waste management pad was converted to secondary containment for hazardous waste tanks being used by Pontiac Central plants. These tanks were relocated from another containment area (since closed and covered by a building expansion). These tanks are presently used for waste paint and waste solvent (listed wastes F003, F005). With the activation of a new tank group at Pontiac Central these tanks will be idled; neither Pontiac Central nor Pontiac East plants foresee reusing this installation.

The Pontiac East pad consists of a 4,500 square foot irregular concrete slab. During its use as a container management area it had 4 inch curbing all around; the diking was raised to 18" to provide tank secondary containment. The age and details of construction of this pad are not known but it serviced a plant constructed in 1972; visual inspection indicates it to be in excellent condition.

Previous hazardous wastes brought to this area in drums include:

1) Waste paints - F003, F005, D001
2) Waste solvents - F003, F005, D001
3) Chlorinated solvents - F001

Some containers of hazardous wastes may have remained in this area over 90 days. All containerized waste has long since been removed from this containment area; as noted previously its present use is solely as secondary containment for two hazardous waste storage tanks. These tanks have not leaked or overflowed since their installation in this area. The tanks are freestanding, with no associated pumps or piping.

2.4 Estimated Maximum Hazardous Waste Inventory

The following table lists the expected maxima of hazardous wastes to be found in either containment area. These maxima may not represent the current quantities stored as waste removal activities are ongoing.

Hazardous Waste	Tank/Container/Bulk	Central Pad	East Pad
CWT Sludge (F019)	Container	30 YD^3	-
Waste Paint (F003/ F005)	Tank	-	12,000 gal.
Waste Paint (F003/ F005)	Container	1,000 gal.	-
Waste Solvent (F003/ F005)	Tank	-	12,000 gal.
Waste Solvent (F003/ F005)	Container	1,000 gal.	-
Other Wastes			
Paint Sludges	Bulk	40 YD^3	-
Waste Oil	Tank	Gal.	-
Waste Glycol	Tank	Gal.	-
Waste Sealers/Adhesives	Bulk	5 YD^3	-

3.0 Closure Methods

3.1 Central Plants Waste Management Pad

The Central plants waste management pad will continue in use as an accumulation facility; therefore, closure will entail removal of wastes and investigation only to the extent necessary to determine whether contamination has escaped the confines of the facility. If contamination is found outside the waste management area, closure will then encompass sampling, testing and removals as appropriate to define and abate the contaminated areas. As the production operations are dependent on this facility, half the area will be investigated, remediated and restored at a time. When closure is complete, the entire facility will be returned to operation.

3.2 East Plant Waste Management Pad

The East plants waste management pad will undergo decontamination sampling, testing and remediation as appropriate to render the area clean. Closure will be final; there are no plans to reactivate this facility in any capacity. The tanks will be decontaminated and stored for future reuse; the concrete will be cored and if contamination is found, excavated as necessary to define and abate any contamination. Restoration of any excavated areas following decontamination is at the option of Pontiac East Assembly and is not within the scope of this closure plan.

4.0 Decontamination Methods

4.1 Central Plants Waste Management Pad

The Pontiac Central waste management pad is to be divided into two sections by a concrete wall; this wall will serve as a barrier between the covered and open areas of the facility and will form the division between areas of investigation and closure activity: half the area will undergo closure while the other half remains active. Following is the decontamination method for either half.

All loose material will be removed by shoveling or scraping and disposed of in the same manner as paint sludge, i.e., secure landfill by preference. Following this, cleaning will proceed using high pressure or ultrahigh pressure water. The collected liquid will be disposed of to the wastewater treatment plant which routinely receives runoff from this area. Cleaning will be repeated until no solids appear in samples of the wash water. At this point the liquid from the cleaning activity will be sampled and analyzed for volatile organics, lead and chromium (VI) using the EPA methods described in Section 4.3. The pad will be considered clean when lead and chromium (VI) in the rinsate is not statistically above soil background, and volatile organic constituents are below detection limits. (Although cyanide is also a listed constituent of F019 sludges, no cyanide has been used in any process at Pontiac Central since 1967. The area being decontaminated dates from 1980; therefore, no cyanide was introduced to the pad.)

Soils underlying the waste management pad will be sampled by coring the concrete at the low points in each section of the pad. These low points will be adjacent to the drains in each section. Inspection of the pad for cracks or other evidence of loss of integrity will determine if other locations are to be sampled. The soil sampling procedure is described in section 5.1.2.

All sampling and handling procedures will be consistent with SW-846, Test Methods for Evaluating Solid Wastes (2nd edition).

4.2 East Plant Waste Management Area

The tanks at the Pontiac East facility will be emptied of all pumpable contents, then waterblasted to remove adhering residue using ultrahigh pressure equipment. Liquids generated by the cleaning process will be collected for disposal as an F003/F005 waste. The tank interior will be considered clean when volatile organic compounds in the rinsate are nondetectable. The tanks have no associated pumps or piping to be decontaminated. Following the cleaning of the tanks the concrete containment pad will be cleaned using high pressure water; the liquids collected will be disposed to the central wastewater system as was done for the Central plants waste management pad. Scrubbing will be repeated until no further residue can be collected. The liquid

collected will be analyzed for volatile organics, lead and chromium (VI) using EPA test methods described in section 4.3. The concrete will be considered clean when lead and chromium (VI) in the rinsate is not statistically above soil background at the 95% confidence level, and volatile organic compounds are below detection limits. All sampling and handling procedures will be in accordance with EPA SW-846, 'Test Methods for Evaluating Solid Waste' (second edition). Soils underlying the waste management pad will be sampled by coring the concrete at the indicated grid locations.

4.3 Test Methods

Analytical methods to be used to document decontamination are as follows:

Parameter	Test Method
Lead	SW-846 Method 7420 or 7421
Chromium (VI)	SW-846 Method 7195, 7196 or 7197
Volatile Organic Compounds	SW-846 - 8010, EPA Method 601
	SW-846 - 8020, EPA Method 602

5.0 Closure Documentation

5.1 Central Plants Waste Management Pad

Documentation of closure of the central plants waste pad will consist of the following:

- Documentation of pad decontamination.
- Documentation of removal of underlying soils shown to contain hazardous wastes or hazardous constituents.

Documentation of closure in these areas is designed to be consistent with MDNR's draft guidance document 'how clean is clean'.

5.1.2. Sampling of Underlying Soils

The sampling points are shown in figure 5-1. Owing to the small area involved, a maximum of nine samples will be collected. At a minimum, the samples will be drawn at the lowest point in each area, with additional samples taken at cracks if any are found to be present following cleaning. Soil samples will be taken initially at the 0-.5 foot and .5-1.0 foot level. Samples will be taken with a hand auger through the concrete coring. Between samples the sampling auger will be decontaminated by scraping off adhering soils, washing with detergent and rinsing with distilled or deionized water. The following procedure will be used to analyze and interpret the soils samples obtained.

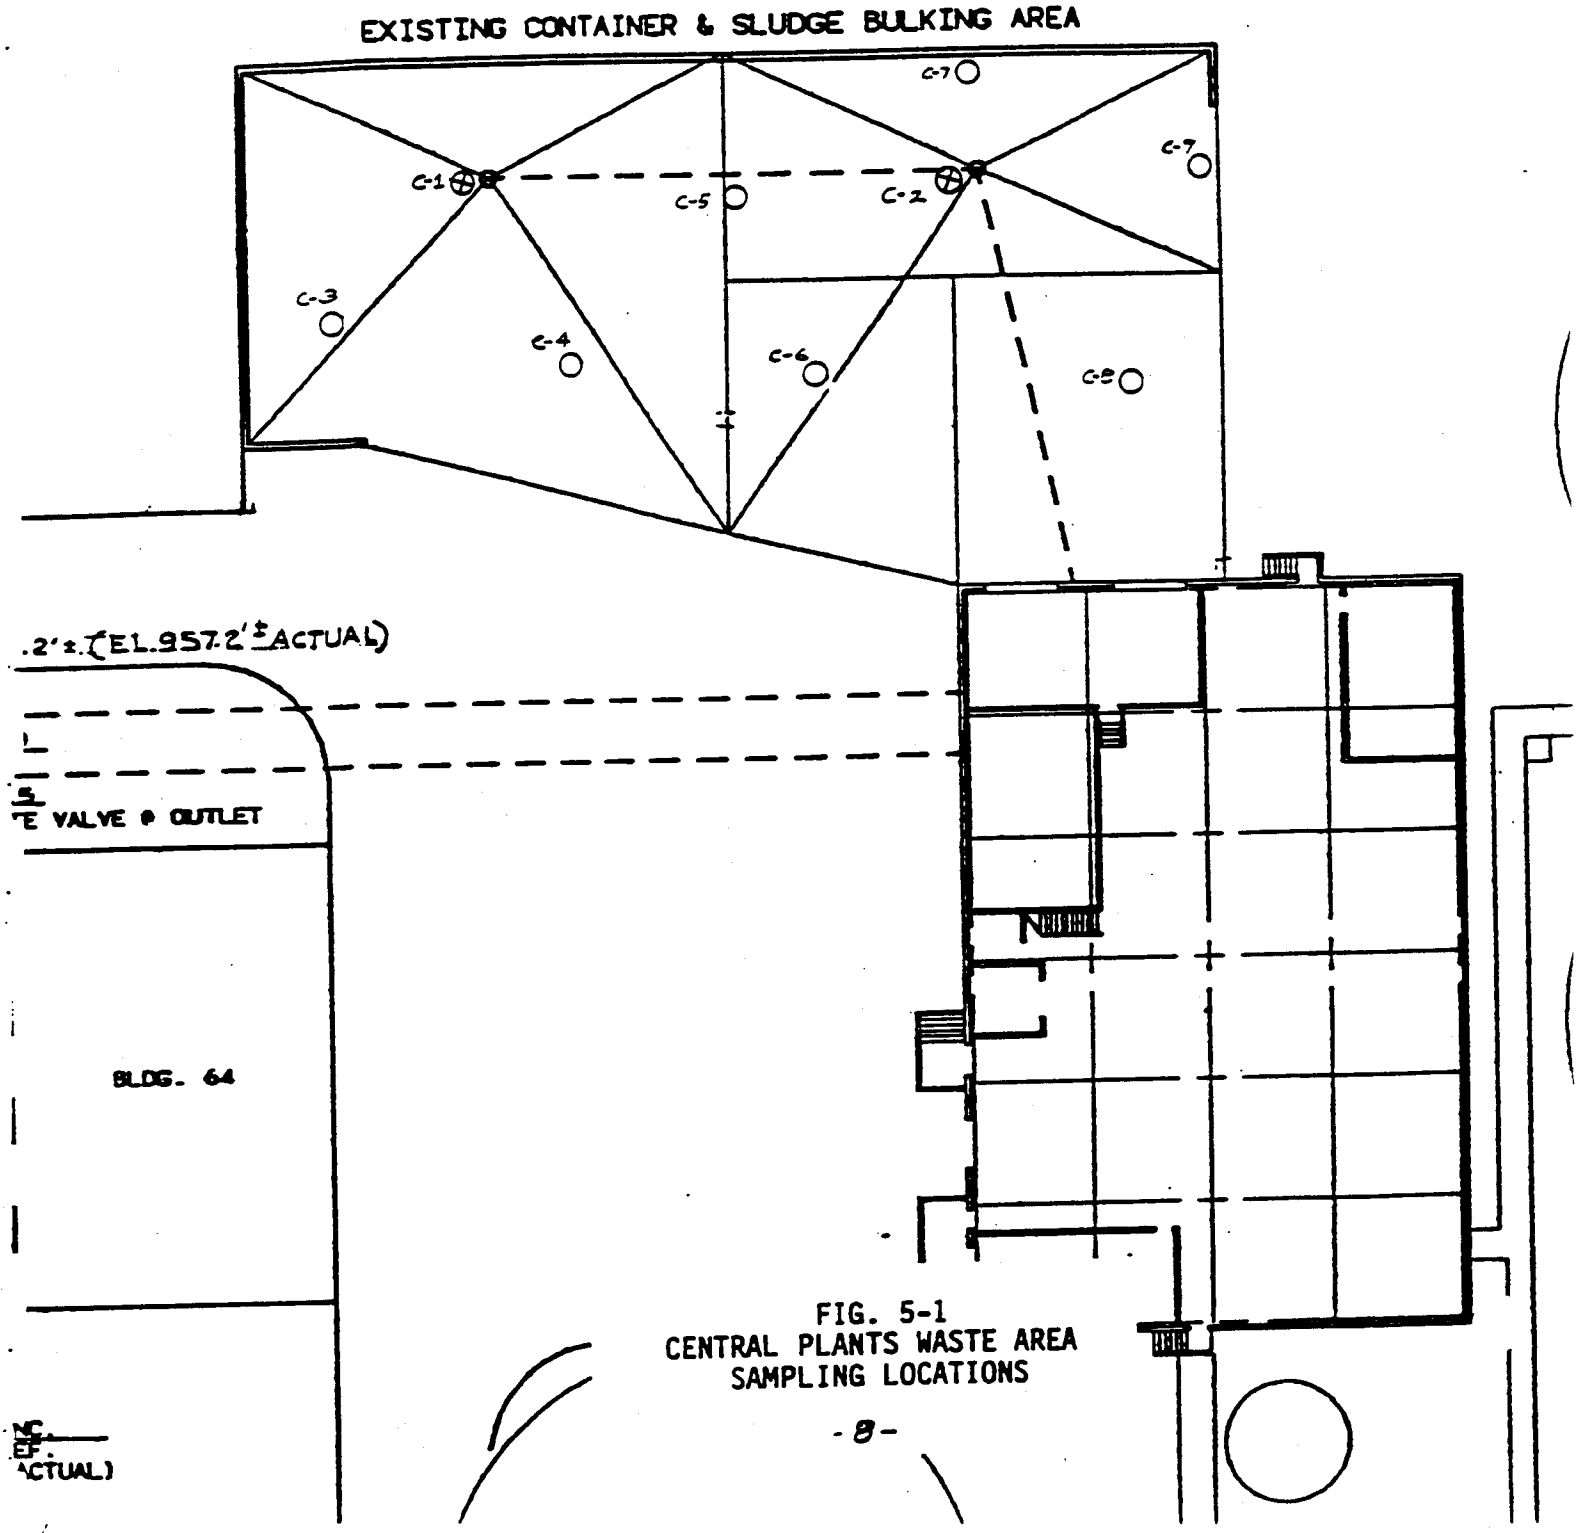

FIG. 5-1
CENTRAL PLANTS WASTE AREA
SAMPLING LOCATIONS

5.1.2 a Establishing Soil Background

Background soil parameters will be determined by samples taken at six background locations as indicated on Figure 2-1. The samples will be collected from approximately the same soil types and elevations as the soils underlying the pad. The background soil samples will be analyzed for total metals.

5.1.2 b Soils Analyses

These analyses may be performed on samples taken at the site:

- Total metals analyses for lead and chrome (VI)
- EP toxicity for lead and chrome (VI)
- Photoionization detection readings
- Volatile organics (methods 601 and 602)

Total metal concentrations of the underlying soils will be compared with the levels in the background samples to determine if contaminants have penetrated the concrete pad and impacted the underlying soils. Comparison will be by the Gossett Student's T-test at the 95% confidence level. This method is used to determine if a statistically significant difference exists between background soils and soils in areas at risk of contamination. If a statistically significant difference is found, soils impaction by contaminants will be presumed to have occurred. EP toxicity analyses of soils samples showing statistically elevated levels of metals will determine the disposition of impacted soils requiring removal. If the EP toxicity threshold levels are exceeded the soils will be removed and disposed as a hazardous waste. If the EP toxicity thresholds are not exceeded the soils will be removed and disposed as an Act 641 waste.

Photoionization detection (PID) readings will be taken at the site with a PID meter at the sampling location identified. The meter will be calibrated according to the manufacturer's recommendations. Readings will be taken on all samples from various depths at each location. Samples will be placed in sample jars and covered with foil. After 30 minutes the instrument probe will be inserted through the foil into the sample jar headspace and a reading taken.

If the samples taken at the shallowest depth indicate that volatile organics are present, samples will be taken from the next lowest level and tested in a like manner. The process will be repeated until a sample is obtained which yields a negative result with the PID meter. This sampling level will then be sampled using appropriate containers for volatile organics analysis (40 ml vials).

Laboratory VOA will be made using EPA method 601 for purgeable halocarbons hand method 602 for aromatic hydrocarbons. Samples taken will observe appropriate sample preservation and chain of custody practices.

The sample screening technique described above is designed to expedite the portion of the closure process devoted to definition of the scope of remediation, while still meeting the intent of MDNR's closure guidelines. This procedure will ensure that at least one sample from each sampling location undergoes analysis for volatile organics using EPA methods 601 and 602.

5.1.2 c Criteria for Determination of Scope of Removal

If the following criteria are all met the soil will be left in place:

- Volatile organic compounds using EPA methods 601 and 602 are nondetectable.

- Total lead and chrome (VI) are not statistically above background according to the Gossett Student's T-test.

If soils at any sampling plant fail either criteria they will be removed. Removal of soil around a contaminated point will be within a radius equal to the distance between adjacent boring locations. Soils determined to be contaminated with metals statistically above background, but below EP toxicity limits, will be disposed of as an act 641 waste. Soils contaminated with metals above EP toxicity limits or with volatile organics will be disposed of as an Act 64 waste.

Following removal of the lowest confirmed contaminated level, additional samples will be taken of the next level and analyzed for the contaminants found in the previous level. If contaminants are found, additional soil removal will be performed. If no contaminants are found, cleanup is complete.

5.1.2 d Restoration of Concrete Containment

Since the Central plants waste management pad is to continue in service after decontamination, the facility will be restored following soils sampling and any soils removal. After all contamination has been removed, the underlying voids will be backfilled and compacted to original grade. Reinforcing mesh will be placed and the original concrete edges will be treated with an epoxy bonding agent, per the manufacturer's instructions, to ensure a seal between the new and existing concrete. Corings where no contamination was found will be repaired in a similar manner with the exception of reinforcing steel.

5.2 Pontiac East Waste Management Area

5.2.1 Decontamination of Tanks

The tanks at Pontiac East managed listed hazardous wastes (paint and solvents, EPA codes F003, F005). All pumpable waste will be removed and disposed of in the normal manner. Following this the

tanks will be cleaned three times using high pressure or ultrahigh pressure water. Liquids generated from the first cleaning at a minimum will be disposed of as a listed hazardous waste; waste from subsequent cleanings will be tested to determine its acceptability in the central wastewater treatment system. The tanks will be considered clean when the rinsate contains nondetectable levels of volatile organics as determined by EPA methods 601 and 602.

5.2.2 Cleaning of Containment Area

Following the tank cleaning the concrete containment area will be cleaned by high pressure water. The rinsate will be collected and analyzed for volatile organics using EPA methods 601 and 602. The concrete will be considered clean when volatile organics in the rinsewater are nondetectable by the above methods.

5.2.3 Sampling of Underlying Soils

The sampling locations are shown in figure 5-2. Owing to the small area involved a maximum of nine samples will be collected. At a minimum, samples will be collected in low areas and cracked or otherwise unsound locations of the containment area. Soils samples will be taken at 0-.5 feet and .5-1.0 feet below the bottom of the concrete slab. Samples will be taken with a hand auger through the concrete coring. Between samples the sampling auger will be decontaminated by scraping off adhering soils, followed by washing with detergent and rinsing with distilled or deionized water.

The following procedure will be used to analyze and interpret the soil samples obtained.

5.2.3 a Establishing Soil Background

Background soil parameters will be as determined from soil samples taken at six background locations as shown on Figure 2-1. The samples will be taken from approximately the same soil types and elevations as the soils underlying the pad. The background samples will be analyzed for total metals.

5.2.3 b Soils Analyses

These analyses may be performed on samples taken at the site.

- Total metals analyses for lead and chrome (VI).
- EP toxicity for lead and chrome (VI).
- Photoionization detection readings.
- Volatile organics (EPA methods 601 and 602)

Total metals concentrations of the underlying soils will be compared with the levels in the background samples to determine if contaminants have penetrated the concrete pad and impacted the

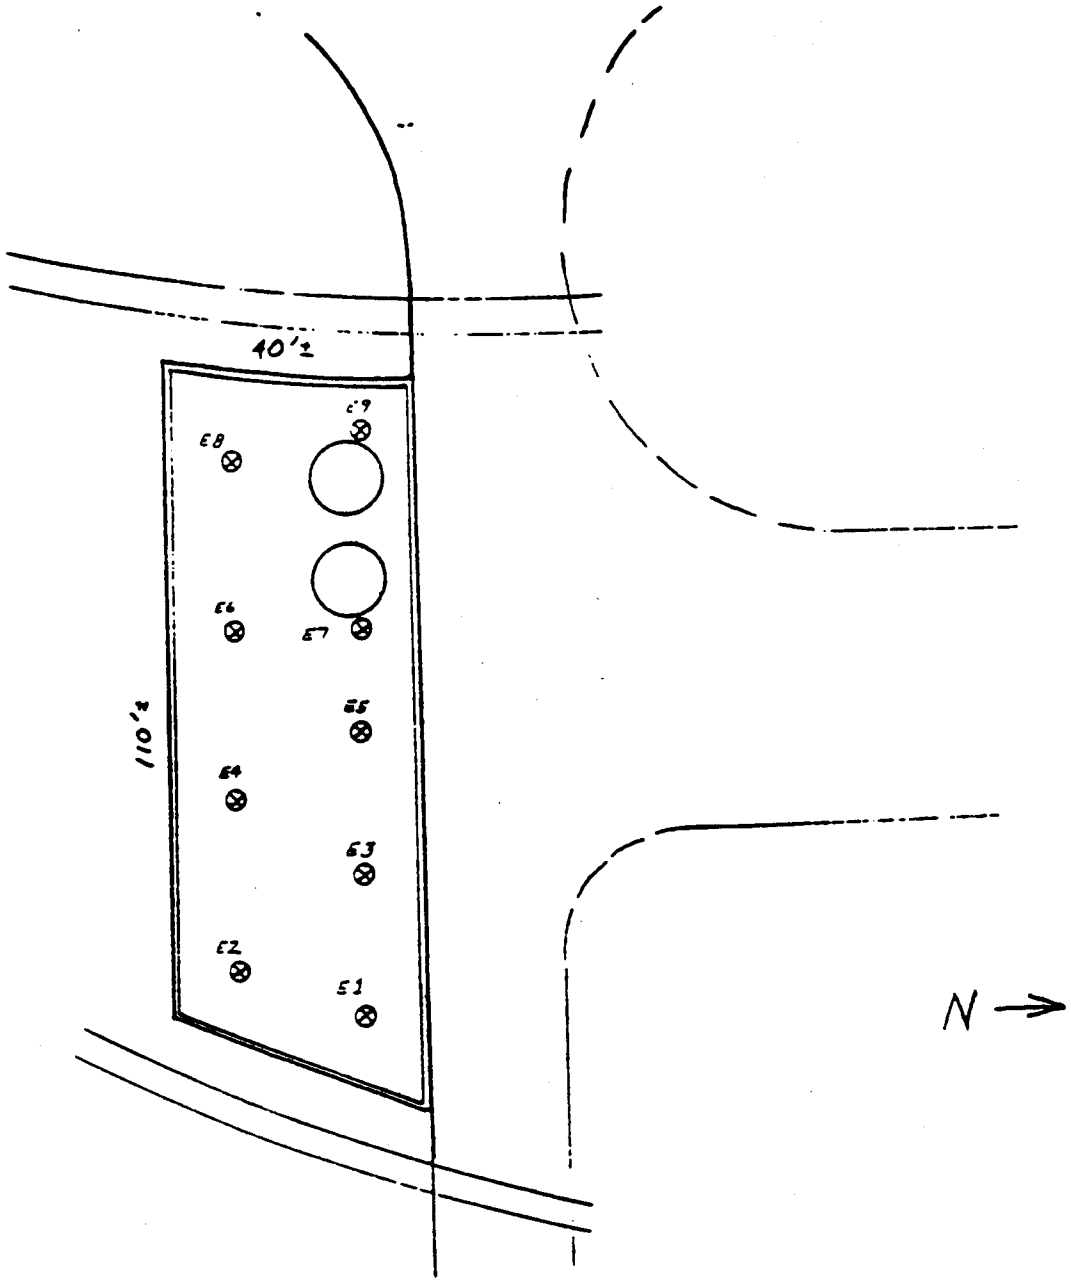

FIG. 5-2
EAST PLANT WASTE AREA
SAMPLING LOCATIONS

underlying soils. Comparison will be by the Gossett Student's T-test. This method is used to determine if a statistically significant difference exists between the background soils and soils in areas at risk of contamination. If a statistically significant difference is found, soils impaction by contaminants will be presumed to have occurred. EP toxicity analyses of soils showing statistically elevated levels of metals will determine the disposition of impacted soils requiring removal. If the EP toxicity thresholds are exceeded the soils will be removed and disposed of as a hazardous waste. If the EP toxicity thresholds are not exceeded the soils will be removed and disposed of as an Act 641 waste.

Photoionization detection (PID) readings will be taken at the site with a PID meter at each identified sampling location. The meter will be calibrated according to the manufacturer's recommendations. Readings will be taken on all samples from various depths at each location. Samples will be placed in glass sample jars and covered with foil. After 30 minutes the meter probe will be inserted through the foil into the sample jar headspeace and a reading taken.

If readings taken on samples from the shallowest depth indicate volatile organics are present, samples will be taken from the next lowest level and tested in a similar manner. The process will be repeated until a sample is obtained which yields a negative result with a PID meter. This sampling level will then be sampled will then be sampled using appropriate methods and containers for volatile organics analysis (40 ml glass vials).

Laboratory VOA will be made using EPA method 601 for purgeable halocarbons and EPA method 602 for aromatic hydrocarbons. Samples taken will observe appropriate sample preservation and chain of custody practices.

The sample screening technique described above is designed to expedite the portion of the closure process devoted to definition of the scope of remediation, while still meeting the intent of EPA's closure guidelines. The procedure will ensure that at least one sample from each sampling location undergoes analysis for volatile organics using EPA methods 601 and 602.

5.2.3 C Criteria for Determination of Scope of Removal

If the following criteria are all met the soils will be left in place:

- Volatile organics using EPA methods 601 and 602 are nondetectable.
- Total lead and chrome (VI) are not statistically above background according to the Gossett Student's T-test.

If soils at any sampling location fail either criteria they will be removed. Removal of soil around a contaminated area will be within a radius equal to the distance between adjacent boring locations.

Soils determined to be contaminated with metals statistically above background, but below EP toxicity limits, will be disposed of as an Act 641 waste. Soils contaminated with metals above EP toxicity limits or with organics will be disposed of as an Act 64 waste.

Following removal of the lowest confirmed contaminated level, additional samples will be taken of the next level and analyzed for the contaminents found in the previous level. If contaminants are found, additional soil removals will be performed. If no contaminants are found, cleanup is complete.

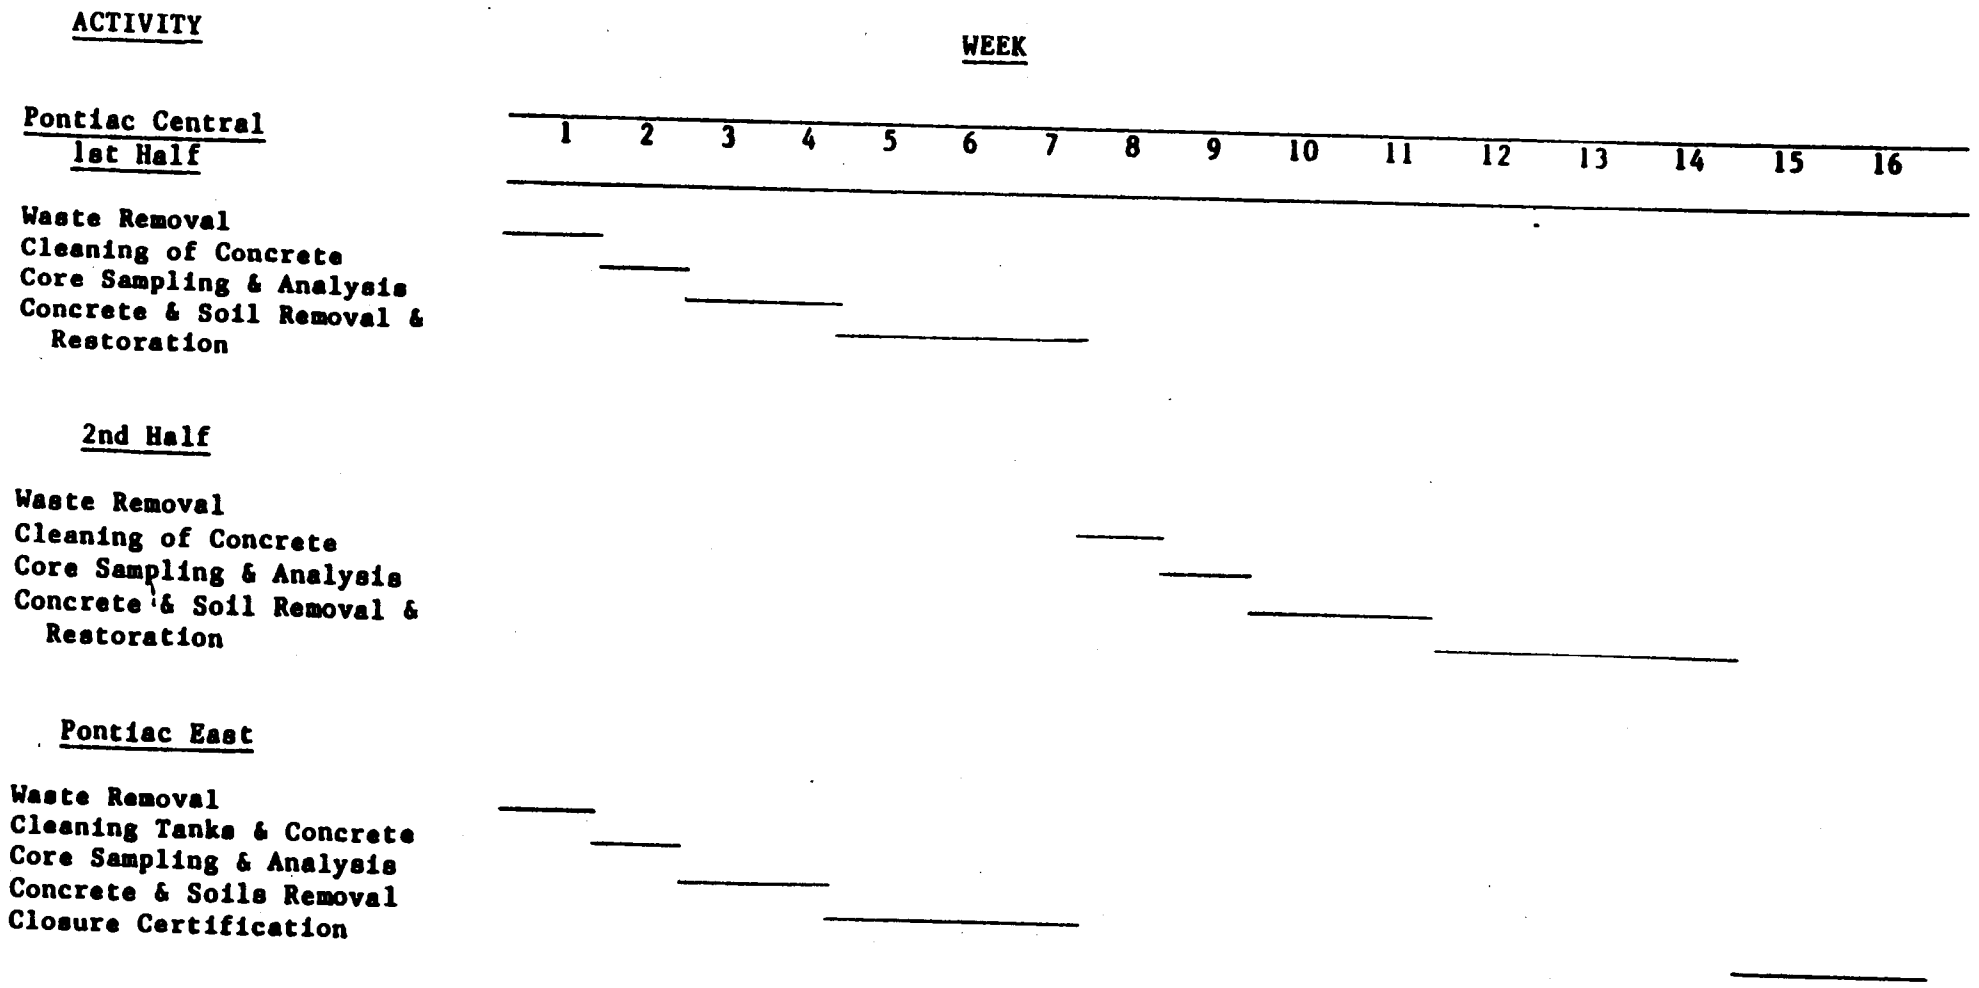
As no reuse of this area is contemplated once closure is completed, restoration of the area is not within the scope of closure.

6.0 Decontamination of Equipment

Heavy equipment used in soils excavation will be cleaned with high pressure water in a contained area. The collected rinsate will be tested to determine its acceptability in the central wastewater treatment system. The equipment shall be considered clean when the rinsate contains nondetectable concentrations of volatile organics using EPA methods 601 and 602.

7.0 Closure Documentation Report

Upon completion of onsite closure activities GM Truck & Bus Pontiac will submit to MDNR a report documenting that closure activities were conducted according to the approved closure plan. The items addressed in the report will include all the applicable items in MDNR's 'draft certification closure checklist'. The documentation report will be signed and sealed by a registered professional engineer. Truck & Bus - Pontiac will also submit a letter to MDNR certifying that closure was completed according to the approved closure plan.



8.0 Estimated Closure Schedule

Truck & Bus - Pontiac will begin closure activity within 30 days of receipt of approval of the closure plan. The closure schedule detailed in figure 6-1 is predicated upon receipt of approval during a season when frost is not or will not become an impediment to closure sampling and remediation activities.

9.0 Closure Cost Estimate

The estimated cost to close the hazardous waste storage areas at Truck & Bus - Pontiac is estimated at $45,000 to $50,000. Table 6-2 details the costs associated with closure.

APPENDIX B

REVISIONS/CLARIFICATIONS TO THE CLOSURE PLAN DATED SEPTEMBER 21, 1989 AND NOVEMBER 27, 1989

"Work Plan for the Removal of Two Aboveground Storage Tanks and a Concrete Containment Pad from the Hazardous Waste Storage Area of the Pontiac East Assembly Facility, in Pontiac, Michigan"

Prepared by:

C-E ENVIRONMENTAL, INC.

Prepared for:

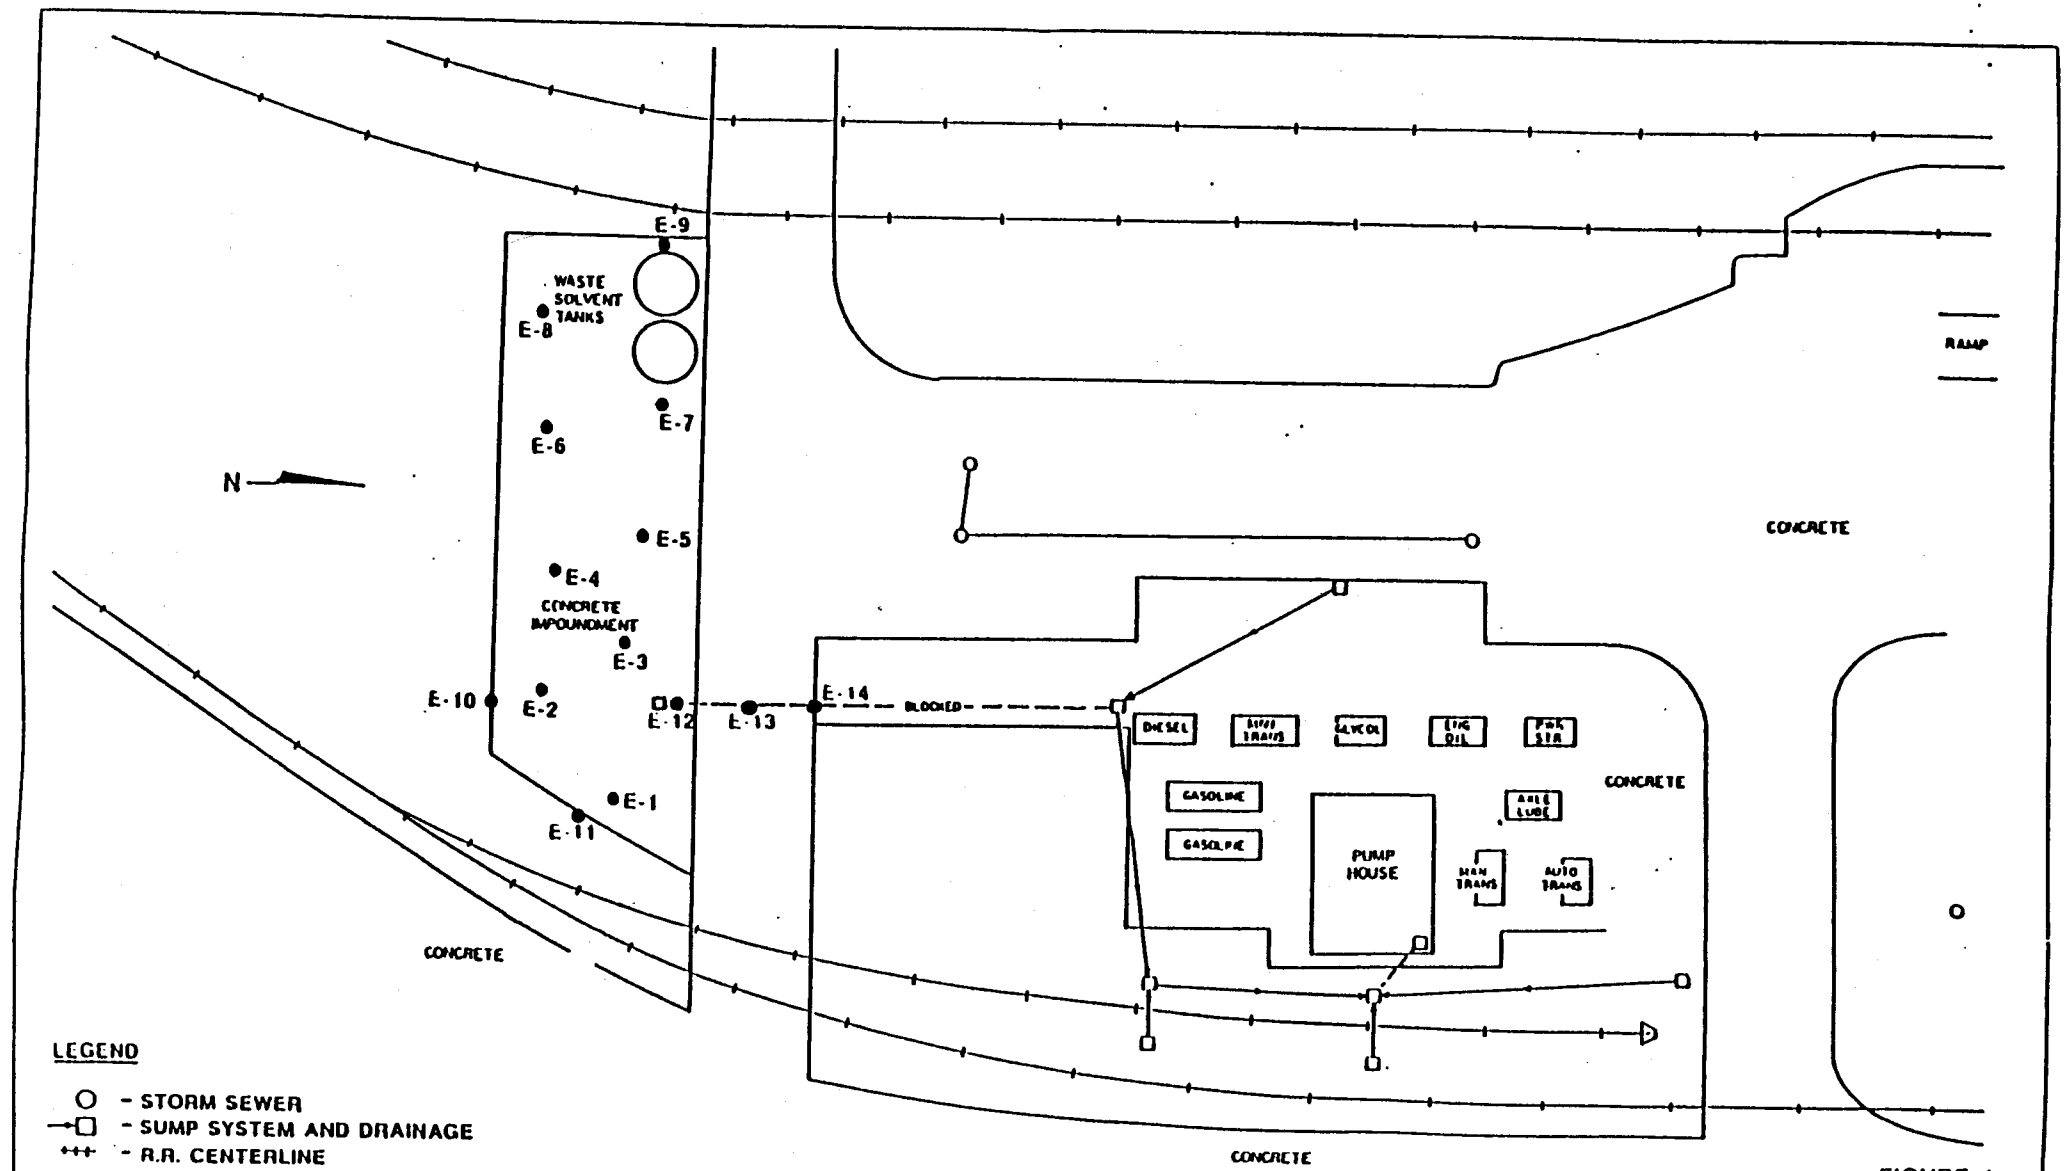
General Motors Corporation
Pontiac East Assembly

September 21, 1989

INTRODUCTION

General Motors Corporation, Truck & Bus Group, Pontiac East Assembly (GMC-PEA) retained C-E Environmental, Inc. (C-EE) to assist it with the closure of its hazardous waste storage area. Closure of this waste storage area is to proceed in accordance with the closure plan dated September 1987.

GMC-PEA retained C-EE to monitor the closure activities and to conduct confirmatory sampling. As a part of these responsibilities, C-EE collected nine subsurface soil samples from the waste storage area (sample points E-1 through E-9, as shown in Figure 1), six background soil samples (sample points B-1 through B-6), four samples of rinsate generated during the decontamination of the waste area's aboveground tanks and concrete pad (samples C-1 through C-4), and nine series of photoionization readings from the waste storage area (collected at sample points E-1 through E-9). The analytical results for samples E-1 through E-9 were presented in a letter report dated May 25, 1989. The analytical results for samples B-1 through B-6 and C-1 through C-4 were presented in C-EE's report dated July 12, 1989. Copies of these reports are presented in Attachment A. The results of the photoionization readings are presented in Attachment B.



The analytical results for these samples indicate elevated levels of volatile organics and lead near the eastern side of the waste storage area. Due to the presence of these contaminants in this area, C-EE has prepared this work plan to present a plan of action for further investigating the contamination observed in soils at the waste storage area, and establish removal/disposal protocol for the contaminated soils. These items, as well as a brief summary of the analytical findings to date are discussed below.

SUMMARY OF FINDINGS

In accordance with the closure plan, the concrete pad and two aboveground waste storage tanks in the waste storage area were decontaminated. As discussed in the July 12 report, C-EE collected samples of the rinsate generated during these decontamination activities (samples C-1 through C-4). The results of these samples indicated that cleanup standards as specified in the closure plan had been achieved. At this time, GMC-PEA intends to remove and dispose of the tanks and concrete pad. The disposal fate of these materials is discussed below.

As discussed in the May 25 report, volatile organics (ethyl benzene, toluene, and xylene) were detected in soil samples collected at sample points E-1 and E-3 at a depth of 6 to 12 inches. In addition, an elevated level of lead (660 milligrams per kilogram) was observed in the soil sample from sample point E-2 at a depth of 0 to 6 inches.

Volatile organics were detected with a photoionization detector (PID) at all nine sampling points (E-1 through E-9). The highest levels were observed at sampling locations E-1 (300 units) and E-3 (240 units). The PID readings

NOTE: This sketch was derived from field observations and measurements. Due to scale, locations, distances, and sizes are approximate.

FIGURE 1
STUDY AREA
GM TRUCK AND BUS
PONTIAC EAST ASSEMBLY
PONTIAC, MICHIGAN

C-E ENVIRONMENTAL, INC.

correspond to parts-per-million when the instrument is measuring benzene - for other vapors and mixtures, these numbers are relative. The next highest PID reading observed was at sampling point E-2 (70 units). The PID readings at the remaining sampling points (E-4 through E-9) decreased as sampling proceeded to the west; however, none of these readings exceeded 26 units. The volatile organics observed with the PID at these sampling points are likely attributable to the migration of the volatile compounds in the soil vapor space beneath the waste storage area concrete pad.

SCOPE OF WORK FOR ADDITIONAL SAMPLING

Based on the analytical results for samples collected from sample points E-1, E-2, and E-3, additional sampling and analyses are required to define the lateral and vertical extent of contamination within the waste storage area and to determine the source of the observed contamination.

To investigate the extent of contamination within the waste storage area, GMC-PEA will collect additional soil samples at sample locations E-1, E-2, E-3, E-10, and E-11. Soil sampling at these locations will commence upon the removal of the concrete pad and tanks located in the waste storage area.

Samples will be collected at 1-foot intervals and screened in the field for volatile organics using a photoionization detector (PID). Soil sampling from locations E-1 through E-3 will begin at a depth of 1 foot since prior sampling at these points proceeded to a depth of 1 foot. Field screening with the PID will be in accordance with the procedures established in the closure plan. If PID readings for the soil samples collected at the shallowest depth indicate that volatile organics are present, soil samples will be collected from the next 1-foot interval and screened with the PID. The process will be repeated until a sample is collected which does not yield a significant PID meter reading. At this sampling level, soil samples will then be collected and analyzed for total lead and (MDNR Scan II) volatile organics.

Method 7420 will be followed for total lead analyses and Method 8020 will be followed for volatile organic analyses. The anticipated level of detection (LOD) for the lead is 20mg/g while the anticipated LOD for the volatile organics is 5mg/g. The selected soil samples from the sampling points is anticipated to be analyzed by Swanson Environmental Services in Novi, Michigan.

The source of contamination observed in the waste storage area is believed to be gasoline which was released in the adjacent tank farm area and migrated to the waste storage area via the sump/drain system which connects the two areas. To confirm that these gasoline spills are the source of contamination observed in the waste storage area, samples of the fill material along the storm drain line between the two areas will be collected at three locations (sample points E-12 through E-14 in Figure 1). Sampling from these three sampling points will proceed in accordance with the procedures established above for sampling points E-1 through E-3, E-10 and E-11.

REMOVAL/DISPOSAL OF CONTAMINATED SOILS

Once the analytical results of the additional subsurface soil samples are received and interpreted, GMC-PEA will arrange for the removal and proper disposal of all contaminated soils located at the waste storage area. Soil removal will begin at sample points E-1 and E-3 and proceed in all directions to the nearest sample point not exhibiting detectable levels of volatile organics or elevated levels of total lead.

The contaminated soils will be excavated by either a tracked or rubber-tired excavator, or similar excavation equipment. Excavated soils will be placed in 20 cubic yard rolloff boxes and covered with tarpaulin (or a similar cover) to prevent exposure to precipitation and wind. Once full, the rolloff boxes shall be moved to the hazardous waste storage pad located at the Central Assembly facility to await proper disposal.

If it is determined that the source of contamination is spilled gasoline from the tank farm area and that the soils are not ignitable as defined by the Resource Conservation and Recovery Act (RCRA) and Michigan Act 64, the contaminated soils will be landfilled at the Michigan Disposal facility in Belleville, Michigan.

If the soils are classified as hazardous due to ignitability or E.P. Toxic lead levels, or if the volatile organic contamination cannot be attributed to the spilled gasoline, the soils will be transported by Inland Waters (EPA ID# MID 982606287) to Wayne Disposal with suitable treatment as necessary.

REMOVAL OF CONCRETE PAD AND TANKS

Based on the analytical results of the rinsate samples collected during the decontamination of the concrete pad and tanks, both the concrete pad and the tanks have been decontaminated in accordance with the decontamination procedures established in the closure plan. Accordingly, these decontaminated items can now be removed and disposed of to allow for the construction of an aboveground storage tank facility in this area.

The concrete pad will be removed with demolition equipment, placed in 20-cubic yard rolloffs, and transported as an inert material to Pollards Landfill (a City Management Facility) in Montrose Township, Michigan. The decontaminated aboveground tanks will be dismantled and scrapped.

Owner/Operator Closure Certification

I, Craig B. Parr, Plant Manager, General Motors Corporation, Truck and Bus Group, Pontiac Central Assembly Plant, hereby state and certify that, to the best of my knowledge and belief, the Hazardous Waste Storage Area of the Pontiac Central Assembly Plant has been closed in accordance with the approved closure plan and its approved revisions/clarifications (presented and discussed in the attached report), and that closure was completed according to the attached chronology. Certification made on behalf of General Motors Corporation.

CLOSURE CERTIFICATION CHRONOLOGY

PHASE I

1/17/90	-	Began water blasting accumulation pad west
1/18/90	-	Completed water blasting accumulation pad west
	-	Sampled accumulation pad west rinsate
	-	Cored and sampled C-1 and C-3
1/29/90	-	Began and completed water blasting accumulation pad east
	-	Sampled accumulation pad east rinsate
	-	Began water blasting bulking pad west
	-	Cored and sampled C-4
1/30/90	-	Completed water blasting bulking pad west
	-	Sampled bulking pad west rinsate
1/31/90	-	Cored and sampled C-2, C-5, C-6 and C-7
2/8/90	-	Began and completed water blasting bulking pad east
	-	Sampled bulking pad east rinsate
	-	Cored and sampled C-8 and C-9

PHASE II

6/25/90	-	Began and completed water blasting accumulation pad west
	-	Sampled accumulation pad west rinsate
	-	Collected ambient sample of accumulation pad west rinsate
	-	Cored and sampled C-10, C-11, C-12, and C-13
11/27/90	-	Excavated and sampled soil north of bulking pad retaining wall
12/5/90	-	Additional excavation and sampling of soil north of bulking pad retaining wall

ANALYTICAL RESULTS OF ADDITIONAL SOIL SAMPLES COLLECTED AT THE PONTIAC EAST ASSEMBLY WASTE STORAGE AREA

Presented To

GENERAL MOTORS CORPORATION - TRUCK & BUS GROUP
Pontiac, Michigan

November 1989

1.0 INTRODUCTION

C-E Environmental, Inc. (C-EE) is presently assisting General Motors Corporation, Truck & Bus Group, Pontiac East Assembly (GMC-PEA) with the closure of its waste storage area. In accordance with the document "Work Plan for the Removal of Two Aboveground Storage Tanks and a Concrete Containment Pad from the Hazardous Waste Storage Area of the Pontiac East Assembly Facility" dated September 21, 1989, and the Michigan Department of Natural Resource's comments concerning that Work Plan, C-EE collected additional soil samples from the waste storage area. This additional soil sampling was necessary to define the lateral and vertical extent of contamination within the waste storage area and to determine the source of the observed contamination. The location of the waste storage area in relation to the GMC-PEA plant and the analytical results from previous soil sampling efforts can be found in the Work Plan.

2.0 SOIL SAMPLING PROTOCOL

In accordance with the Work Plan, the additional soil sampling was conducted after the waste storage tanks and concrete containment pad had been decontaminated and removed. Soil samples were collected from ten different locations at depths varying between zero and four feet. The sampling locations are shown in Figure 1. Steven Ranger, Environmental Engineer at C-EE, and Thomas Winebrenner, Senior Environmental Technician for C-EE, collected the samples on October 5 and 6, 1989. A hand auger with a stainless-steel bucket was used to collect the samples. The sampling equipment was washed with a trisodium phosphate solution and rinsed with distilled water between each sampling event.

Samples were collected at 1-foot intervals and screened in the field for volatile organics using a photoionization detector (PID). Soil sampling from locations E-1 and E-3 began at a depth of 1 foot because prior sampling at these points proceeded to a depth of 1 foot. The sampling rationale for location E-2 is discussed below in Section 4.0.

Field screening with the PID was conducted in accordance with the procedures established in the hazardous waste storage area's closure plan. Due to the presence of operating construction equipment near the area, the background PID meter readings ranged unsteadily from 0 to 2 units. The PID results for the samples are presented in Table 1.

If PID readings for the soil samples collected at the shallowest depth indicated that volatile organics were present above background levels, soil samples were collected from the next 1-foot interval and screened with the PID. The process was repeated at each sample location until a sample was collected which did not yield a PID meter reading above background. At this sampling level, soil samples were collected for analysis.

3.0 SOIL SAMPLING OBSERVATIONS

During sample collection procedures, the surface soils near locations E-1, E-

Notes:

1. PID calibrated to benzene-units are parts-per-million relative to benzene.
2. ND - Not Detectable.
3. N/A - Not Applicable.

3, and E-12 were distinguished by a strong solvent-like odor. No staining of these surface soils, however, was evident. Samples of these soils were labelled and allowed to sit undisturbed in sample jars for up to 1 hour. After concentrating in the sample jars, the vapors from the contaminated soils of E-1, E-3, and E-12 most closely resembled gasoline.

Visibly contaminated soils (appearing as heavily oil-stained) were observed at depths ranging from 2 to 4 feet at sample locations E-12, E-13, and E-14. The soils at these three locations were characterized as backfill sands to a depth of approximately 4.0 to 4.5 feet. Clayey sands were encountered at these locations at a depth of approximately 4.5 feet.

Backfill sands and gravel were encountered at sampling locations E-1, E-2, E-3, E-10, E-11, E-15, and E-16 at depths ranging from 0 to 1.0 feet. Clays were encountered in these 7 sampling locations at depths ranging from 0.5 feet to 2.0 feet.

4.0 ANALYSES PERFORMED ON THE SAMPLES

With the exception of sample E-2 at 0 to 1 foot, the samples submitted for analysis were analyzed for total lead (SW-846, Method 7420), and benzene, ethylbenzene, toluene, and xylene (BETX) volatile organic compounds (SW-846, Method 8020). As discussed below, sample E-2 at 0 to 1 foot was analyzed for extraction procedure toxicity lead (E.P. Tox Lead) instead of the BETX volatile organic compounds. Analysis of the soil samples was conducted by Swanson Environmental, Inc., in Brookfield, Wisconsin under a contract it holds directly with GMC-PEA.

Previous analysis of soil samples collected from location E-2 at a depth of 0 to 1 foot revealed the presence of total lead at 660 milligrams per kilogram of soil. Under this additional soil sampling program, a second soil sample was collected from E-2 and analyzed for both total lead and E.P. Tox Lead to a) either confirm or refute the findings of the initial sampling event, and b) determine if the soils were hazardous due to elevated lead levels.

5.0 ANALYTICAL RESULTS

The analytical results for the metals are presented in the attached Table 2, and the analytical results for the volatile organic compounds are presented in Table 3. As shown in Table 2, the total lead levels detected in the soil samples analyzed did not exceed background lead levels for the GMC-PEA site (background levels were presented in the July 12, 1989 letter report submitted by C-EE to GMC-PEA). In addition, no detectable levels of E.P. Toxicity lead was observed in the sample analyzed from sample location E-2 at 0-1'.

BETX volatile organic compounds were detected in three of the ten soil samples analyzed. However, one of these samples, which was from sampling location E-15 at 0.5-1.0 feet, was found to have toluene at the detection limit of 0.02 mg/kg and no other volatile organic compounds. Volatile organic compounds

detected in the soil sample from sampling location E-1 at a depth of 1.5 to 2.0 feet include ethylbenzene (0.11 mg/kg), toluene (0.16 mg/kg), and xylene (0.48 mg/kg). Volatile organics detected in the soil sample from sampling location E-2 at a depth of 1.5 to 2.0 feet include benzene (0.06 mg/kg) and xylene (0.12 mg/kg).

6.0 DISCUSSION OF OBSERVATIONS AND ANALYTICAL RESULTS

Based on observations made during the soil sampling efforts and the analytical results from this and previous sample analyses, the contamination observed at the west storage area appears to eminate from the sewer manhole and associated drainage trench. While the source of the contamination in the waste storage area is not known, it is believed to be gasoline which was released in the adjacent tank farm area and has migrated to the waste storage area via the sump/drain system connecting the two areas. This belief is supported by the following:

- Only the typical gasoline constituents (namely ethyl benzene, toluene, and xylenes) were observed in the initial sampling results conducted at the waste storage area. If the soil contamination at the waste storage area was attributable to releases of waste solvent used at the site, analytes such as methyl ethyl ketone, acetone, and chlorinated solvents would be expected to be observed in the soils because they are and/or were commonly used as solvents at the site and were stored as wastes in the waste storage area.

- Oily material, whose source is believed to be spills of transmission fluid at the tank farm area, was observed in the drain system trench at sample locations E-12, E-13, and E-14 at depths of 2.0 to 4.5 feet. The appearance of oily materials in the drainage trench appears to indicate, therefore, that this drain system is a migratory pathway for materials released in the tank farm area.

- After allowing them to concentrate, the vapors from the contaminated soils collected at locations E-1, E-3, and E-12 exhibited an odor which resembled gasoline.

Based on the above supporting information, C-EE and GMC-PEA believe that the contamination in the soils at the waste storage area is attributable to releases of gasoline in the tank farm area. Accordingly, GMC-PEA will seek to dispose of this contaminated material as non-hazardous, gasoline-contaminated soil.

The elevated lead level observed at E-2 during the initial sampling program for the area cannot be explained. Because the results for other samples collected near E-2, and the repeat sample collected at E-2, do not reveal elevated lead levels, the relatively high lead level initially encountered at E-2 is believed to be attributable to laboratory error, sampling error, an anomaly, or any combination of the three.

7.0 EXTENT OF CLEANUP BASED ON SAMPLING RESULTS

Excavation of the contaminated soils at the waste storage area will proceed in the manner as specified in the Work Plan dated September 21, 1989. The projected extent of excavation is shown in Figure 2. Based on Figure 2, approximately 150 cubic yards of material will be removed. Water encountered during excavation of the drainage system area will be collected and sent to either the onsite wastewater treatment plant or, if untreatable onsite, sent offsite for treatment.

Confirmatory samples will be collected from the base and four of the walls of the excavation to ensure that all gasoline-contaminated materials have been removed from the waste storage area. These samples will be analyzed for benzene, ethylbenzene, toluene and total xylene by USEPA Method 8020. The base sample will be a composite of a minimum of four soil samples. The wall samples will be collected from randomly selected sampling points along the east, west, north and south walls of the excavation.

Dear Mr. Gembel:

Subject: Closure Activities
Pontiac East Assembly Hazardous Waste Storage Area

As we discussed at our meeting July 13, 1989, the Michigan Department of Natural Resources has reviewed the analytical results of the rinsate testing performed during cleaning of the concrete containment pad. Based on these results, it has been determined that it is acceptable for the concrete containment pad to be removed and disposed of as an inert material. Disposal of the concrete containment pad and the associated tanks may proceed immediately. However, further actions, such as sampling and/or excavation, should await review of the work plan which is to be submitted to MDNR for approval.

Sincerely,

Liane J. Shekter Smith

SUBJECT: Closure Activities-Additional Work Plan
Hazardous Waste Management Area
Pontiac East Assembly
MID 005 356 902

The Michigan Department of Natural Resources, Waste Management Division (WMD), has completed its review of GMC Truck & Bus Group-Pontiac East Assembly's (GMC-PEA) work plan for the above referenced hazardous waste management area, submitted on September 21, 1989.

The work plan was prepared by GMC-PEA following initial closure activities for the hazardous waste management area pursuant to the closure plan submitted on December 4, 1987, and approved by WMD on March 7, 1988. The work plan, as modified by the attached "Conditions for Approval," is hereby approved.

If you have any questions regarding this approval, please contact Ms. Liane Shekter Smith of my staff at 517-335-4790.

Sincerely,

Alan J. Howard, Chief
Waste Management Division
517-373-9523

Conditions for Approval

General Motors Corporation
Truck & Bus Group
Pontiac East Assembly
820 S. Opdyke Road
Pontiac, Michigan 48053

MID 005 356 902

1. The statistical comparison of inorganic analytical data to the background results shall be done utilizing the four lowest values of the six background samples which were analyzed.

2. The limit of detection for soil samples analyzed for lead using SW-846 method 7420 shall be 10 mg/kg. The limit of detection for soil samples analyzed for MDNR Scan II compounds using SW-846 Method 8020 shall be 20 ug/kg. These levels shall be confirmed with the analytical laboratory prior to sampling.

3. Excavated materials shall be placed in roll off boxes and covered as described in the work plan. These contaminated materials shall then be sampled and tested as necessary to determine if the contaminated materials are hazardous waste. A minimum of four (4) samples shall be required to characterize the waste for disposal.

4. All hazardous wastes shall be disposed in accordance with the land disposal restrictions specified in 40 CFR Part 268.

5. If unexpected conditions develop or an unexpected event occurs during these activities which necessitates an amended closure plan or work plan, then an amended closure plan or work plan shall be submitted within 30 days after the unexpected event to WMD for approval.

6. After the concrete has been removed from the hazardous waste management area, steps shall be taken to ensure that contaminated soils are not exposed. The area shall be tarped or soil materials shall be excavated and placed in covered containers while awaiting necessary analytical results.

7. In addition to the sampling strategy described in the work plan, two confirmatory samples shall be obtained and analyzed for total lead (SW-846 Method 7420) and MDNR Scan II (SW-846 Method 8020) from the western area of the hazardous waste management area. The samples shall be taken at an approximate depth of six (6) inches at locations determined by GMC-PEA and approved by WMD.

8. Soil sampling at locations E-10 and E-11 shall be conducted in the same manner as described for E-1 through E-3 in the work plan. All samples taken at these locations (E-1 through E-3, E-10 and E-11)

shall be analyzed for total lead and MDNR Scan II as described in the work plan and subject to the conditions specified herein.

9. The third paragraph on page 4 shall be modified to reflect that contaminated soils will be landfilled at the Wayne Disposal facility consistent with paragraph four on the same page.

Dear Mr. Gembel:

SUBJECT: Closure Activities - Hazardous Waste Management Area
Pontiac East Assembly
MID 005 356 902

As you requested, this letter is intended to clarify the disposal options for soil materials removed as a result of closure activities for the Pontiac East Assembly hazardous waste management area. Since the soils show detectable levels of organic constituents, the soil is considered contaminated, and the management of contaminated soil is dependent upon the source of contamination. Existing data does not show or indicate that the source of contamination is a listed waste. It has been agreed that the source of contamination is therefore a characteristic waste. The soil must be managed as a hazardous waste if the soil exhibits any characteristic of a hazardous waste. In this instance, the organic constituents detected are aromatic hydrocarbons, so the soil must be sampled and analyzed for ignitability to determine if the soil is a hazardous waste. If the soil does not exhibit the characteristic of ignitability, then the soil may be managed as a solid waste.

If you have any additional questions, please contact me.

Sincerely,

Liane J. Shekter Smith

APPENDIX D

ANALYTICAL REPORT DATED JULY 12, 1989

COMBUSTION ENGINEERING

89718.DOC
5395-00 file

July 12, 1989

Mr. Ken Gembel
Pontiac East Assembly - Truck & Bus Group
General Motors Corporation
31 Judson Street
Pontiac, MI 48058

Dear Mr. Gembel:

Subject: Analytical Results of Rinsate Samples Collected During Cleanup of the Pontiac East Assembly Waste Storage Area

C-E Environmental, Inc. (C-EE) is presently assisting General Motors Corporation, Truck & Bus Group, Pontiac East Assembly (GM-PEA) with the closure of its waste storage area. As a part of this closure project, two tanks in, and the concrete containment pad of, the GMC-PEA waste storage area required cleaning.

On March 29 and 30, 1989, Mr. Tim Palmer, Environmental Scientist at C-EE monitored the cleanup of these items. The cleanup of the pad and tanks consisted of power-washing these items with a high-pressure water spray and was performed in accordance with the "Hazardous Waste Storage Facility Closure Plan" for GMC-PEA dated September, 1987. Inland Waters, Inc. conducted the cleanup of the pad and the two tanks.

In accordance with the closure plan, Mr. Palmer collected samples of the rinsate from the tank and pad cleaning operations. The tank rinsate sample (Sample C-3) was a composite sample consisting of rinse water collected from both tanks. This sample was analyzed for volatile organic compounds (SW-846, Method 8010/8020). The containment pad rinsate samples (Sample C-1 and C-4)

C-E Environmental, Inc.
A subsidiary of
Combustion Engineering, Inc.

33493 Fourteen Mile Road
Suite 50
Farmington Hills, MI 48331

(313) 661-3100

consisted of rinse waters which were collected in the containment pad's sump. Sample C-1 was analyzed for volatile organic compounds, and sample C-4 was analyzed for hexavalent chromium (SW-846, Method 7195-7), and lead (SW-846, Method 7420). A sample of the tap water (Sample C-2) used for rinsing the tanks and containment pad was also collected and analyzed for volatile organic compounds.

Analysis of the water samples was conducted by Burmah Technical Services, Inc. of Pontiac, Michigan. The analytical results for the metals are presented in the attached Table 1. The analytical results for the volatile organic compounds are presented in Table 2.

No detectable level of hexavalent chromium was observed in the containment pad rinsate. The level of detection (LOD) for the hexavalent chromium was 0.05 milligrams per liter (0.05 mg/L). Lead was detected in the pad rinsate sample at a level of 0.27 mg/L. This level, however, is far below the action level of 5.0 mg/L established in the closure plan.

With the exception of chloroform in the tap water and tank rinsate samples, no detectable levels of volatile organics were observed in the collected water samples. The chloroform detected in the tank rinsate sample appears to be attributable to the chloroform detected in the tap water. The LOD for the volatile organic compounds is 10 micrograms per liter (10 ug/L).

On May 25, 1989, C-EE submitted a letter report to GMC-PEA on the analytical results for soil samples collected from the waste storage area. In this letter, C-EE referenced background soil samples which were collected by Mr. Palmer on April 19, 1989 and analyzed for lead and hexavalent chromium. As you requested during our telephone conversation of June 28, 1989, the approximate locations of these background samples are presented in the attached Figure 1 and the analytical results for these samples are presented in Table 1. More detailed location diagrams for these background samples will be provided in the final closure report.

COMBUSTION ENGINEERING

If you have any questions, please call me at 661-3100. I look forward to continued work with you on this project.

Sincerely,

C-E ENVIRONMENTAL, INC.

ANALYTICAL REPORT DATED MAY 25, 1989

COMBUSTION ENGINEERING

89526.DOC
5395-00

May 25, 1989

Mr. Ken Gembel
Pontiac East Assembly - Truck & Bus Group
General Motors Corporation
31 Judson Street
Pontiac, Michigan 48058

Dear Mr. Gembel:

Subject: Analytical Results of Soil Samples Collected at the Pontiac East Assembly Waste Storage Area

C-E Environmental, Inc. (C-EE) is presently assisting General Motors Corporation, Truck and Bus Group, Pontiac East Assembly (GMC-PEA) with the closure of its waste storage area. The location of this waste storage area in relation to the GMC-PEA plant is shown in Figure 1. As a part of this closure project, C-EE collected and analyzed samples of soil located beneath the concrete containment pad in the waste storage area. The samples were collected by Mr. Tim Palmer, Environmental Scientist at C-EE, on April 19, 1989. Samples were collected from nine different locations at depths ranging from 0" to 6" and 6" to 12". The approximate locations of these sampling points are shown in Figure 2.

The samples were analyzed for total lead (SW-846, Method 7420), total hexavalent chromium (SW-846, Method 7195), and volatile organic compounds (SW-846, Method 8010/8020). Analysis of the soil samples was conducted by Burmah Technical Services, Inc., in Pontiac, Michigan. The analytical results for the metals are presented in the attached Table 1. The analytical results for the volatile organic compounds are presented in Table 2.

As the results show, the soil sample collected at sampling point E-2 at a depth of 0" to 6" exhibited an elevated (above background) total lead level of 660 milligrams per kilogram (mg/kg). The lead level in the remaining eight soil samples submitted for lead analysis did not exceed background lead levels observed for the GMC-PEA site. No detectable levels of hexavalent chromium were found in any of the nine samples submitted for analysis. The level of detection for hexavalent chromium was 0.5 mg/kg.

COMBUSTION ENGINEERING

Elevated levels of volatile organics were observed in two of the soil samples submitted for analysis. Volatile organic compounds observed in the soil sample collected at sampling point E-1 at a depth of 6" to 12" included ethyl benzene (275 to 300 mg/kg), toluene (150 to 175 mg/kg), and xylene (1,000 to 1,100 mg/kg). Volatile organics observed in the soil sample collected at sampling point E-3 at a depth of 6" to 12" included ethyl benzene (20 to 25 mg/kg) and xylene (100 to 125 mg/kg). No other organic volatile compounds were observed in the soil samples submitted from sampling points E-1 and E-3. In addition, no detectable levels of volatile organic compounds were observed in the other seven soil samples submitted for analysis. The level of detection for the volatile organic compounds was 10 mg/kg.

Based on the analytical results, subsurface soil contamination in the waste storage area appears to be limited to the northeastern corner of the storage pad area. Additional sampling and analysis, however, is needed to fully define the lateral and vertical extent of contamination in this area and to determine the proper disposition of the contaminated materials.

In light of the proximity of the observed contaminated soils to the tank farm area located north of the waste storage pad (refer to Figure 1), and the known history of gasoline releases at and near the tank farm area, it is likely that the contaminated soils observed in the waste storage area are attributable to gasoline releases migrating from the tank farm area rather than releases occurring at the waste storage area.

If you have any questions regarding the analytical results, please call me at (313) 661-3100. It has been a pleasure working with you on this project.

Sincerely,

C-E ENVIRONMENTAL, INC.

Steven M. Ranger

Owner/Operator Closure Certification

I, Craig B. Parr, Plant Manager, General Motors Corporation, Truck and Bus Group, Pontiac Central Assembly Plant, hereby state and certify that, to the best of my knowledge and belief, the Hazardous Waste Storage Area of the Pontiac Central Assembly Plant has been closed in accordance with the approved closure plan and its approved revisions/clarifications (presented and discussed in the attached report), and that closure was completed according to the attached chronology. Certification made on behalf of General Motors Corporation.

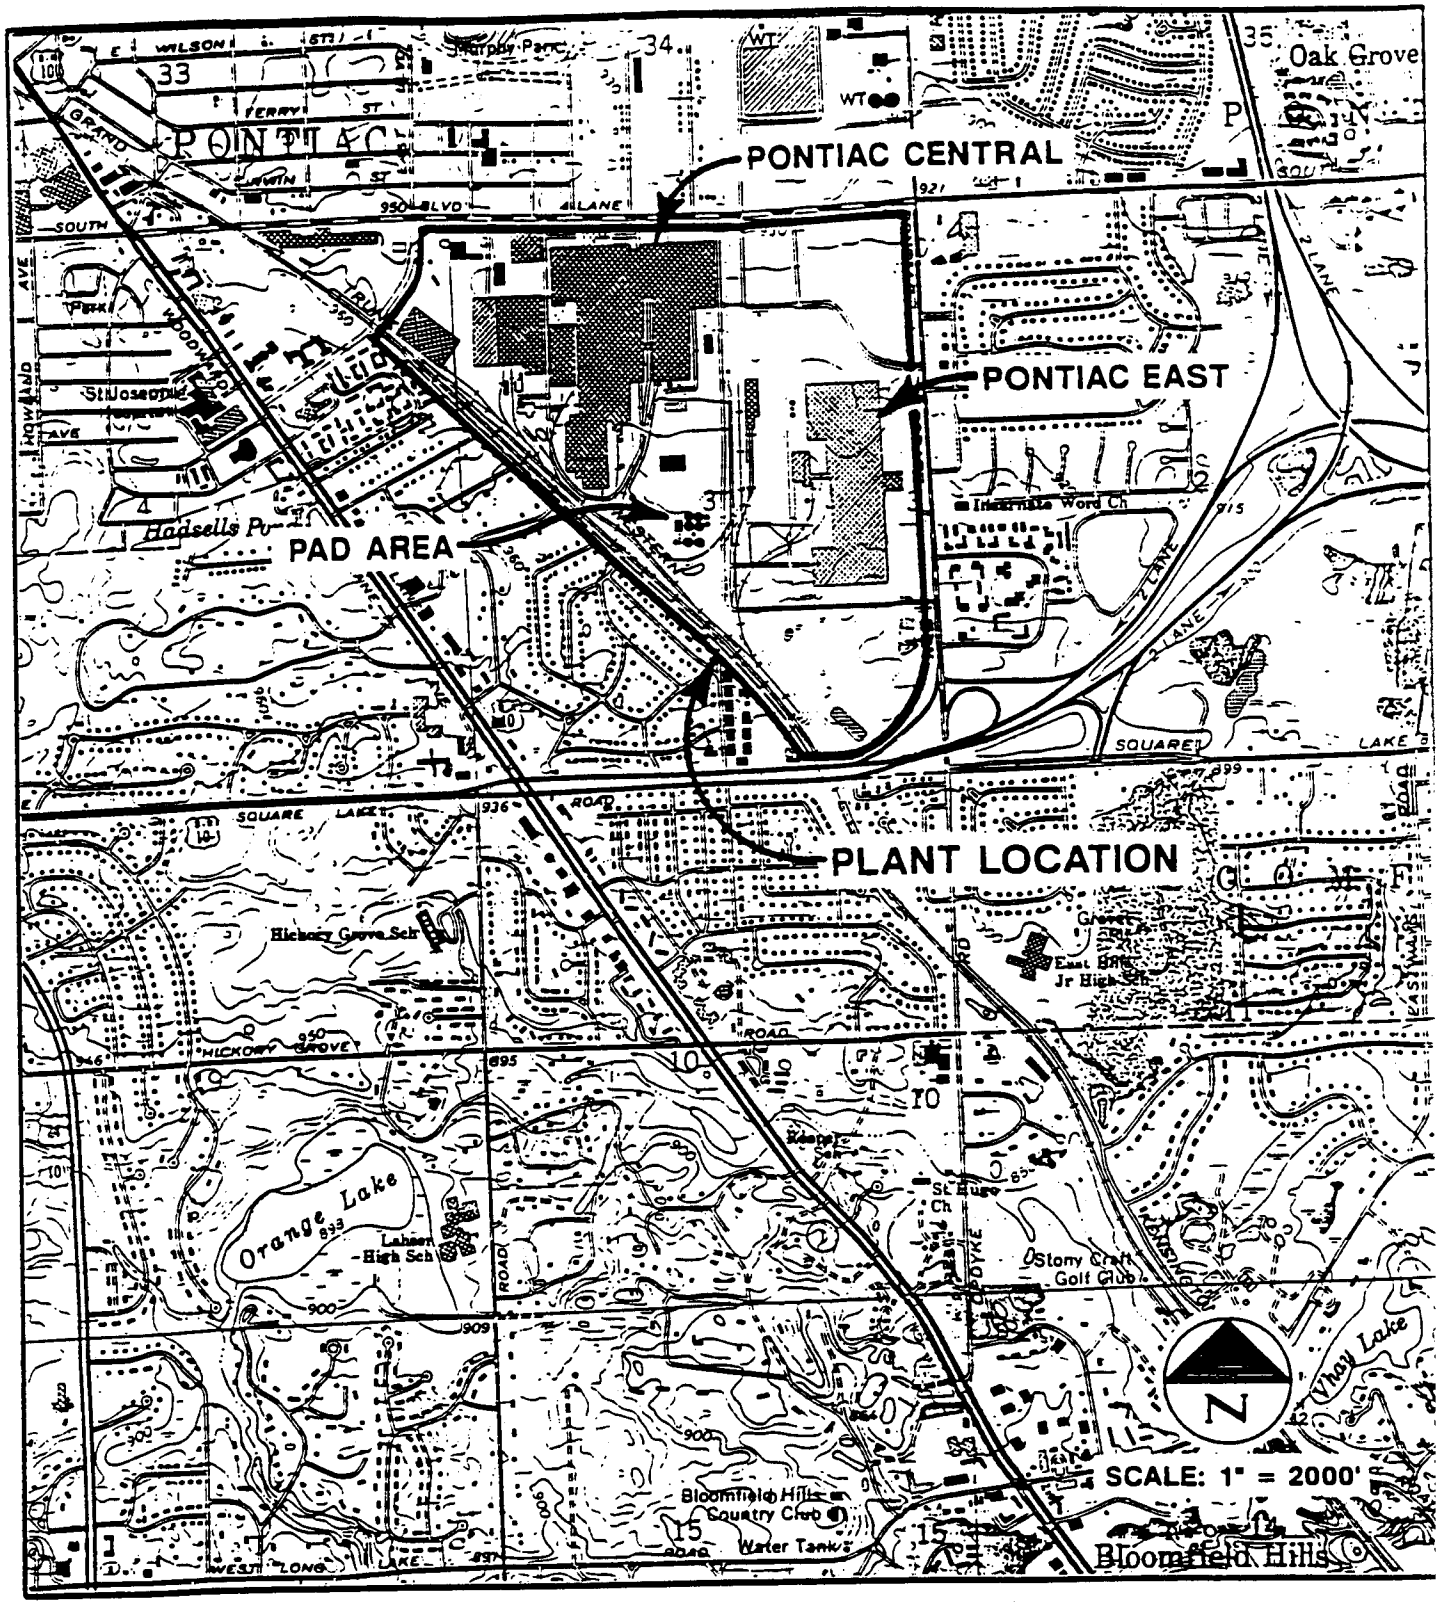
INTRODUCTION



General Motors Corporation, Truck & Bus Group, has retained McNamee Industrial Services, Inc., to provide environmental services pertaining to closure and documentation of the Hazardous Waste Management Facility at the Pontiac, Michigan, Central Plant. The waste management activities at the facility are conducted in compliance with RCRA interim status standards (40 CPR 265) and Michigan Act 64 Rules. Original permit application was for on-site hazardous waste treatment, hazardous waste storage over 90 days and receipt of off-site hazardous wastes. However, since the facility performs no hazardous waste treatment, does not store hazardous waste over 90 days and handles only on-site generated hazardous wastes, a reduction in hazardous waste management status was requested. Although application was made for a permit to manage hazardous wastes at the entire waste management facility, hazardous waste was stored only on the drum accumulation area of the pad. The bulking area of the pad was not used for storage of hazardous waste. Upon completion of the Closure, Truck & Bus - Pontiac Central Plant will perform its hazardous waste management activities under 40 CFR 262 and Act 64, Part 3 (Generator) Rules.

FACILITY DESCRIPTION

Pontiac Central and East Plants occupy approximately 400 acres in the southeast corner of Pontiac, Michigan (Figure 1). The Central Plant waste management facility is adjacent to the wastewater treatment plant in the south-central area of the site as seen in Figure 2. It was constructed in 1980 and is comprised of a 12,543 square foot concrete pad divided into two operating halves, the west half of which is a covered waste accumulation facility and the east half an uncovered waste bulking facility. Both pads are constructed of 8-inch thick reinforced concrete with PVC waterstops at the joints. They are separated by a 4-foot high, 2-foot thick concrete wall. An epoxy topcoating covers the entire accumulation pad. A 2-foot high concrete "dike-style" wall encloses three sides of the bulking pad. The pads are drained by two gravity drains, one in the accumulation pad and one in the bulking pad, which carry liquids to the wastewater treatment plant for necessary treatment before discharge to the City of Pontiac POTW.

PURPOSE AND SCOPE

This report is intended to satisfy the documentation requirement of the waste management pad closure as specified in 40 CFR 265.111, the Closure Performance Standard. To this end, a written closure plan (Appendix A) was submitted by General Motors to the Michigan Department of Natural Resources (MDNR) for approval. The plan was subsequently approved by MDNR officials in March, 1988 (Appendix B).

An initial closure certification report was completed by McNamee Industrial Services, Inc., and submitted to the MDNR in April 1990. Upon their review, a notice of deficiency letter (Appendix C) was submitted to General Motors Corporation, informing them of additional activities necessary to comply with certification requirements. For purposes of clarity within this report, initial closure activities are referred to as Phase I activities, and closure activities performed in response to the MDNR notice of deficiency letter are referred to as Phase II activities.

Closure Performance Standard

In compliance with 40 CFR 265, Subpart G, General Motors Corporation (as the Facility owner/operator) has retained McNamee Industrial Services, Inc., to undertake the necessary steps to perform the decontamination, environmental characterization and documentation of closure of the subject waste management pads. The Closure Performance Standard, in part, says:

> The owner or operator must close the facility in a manner that controls, minimizes or eliminates, to the extent necessary to protect human health and the environment, post-closure escape of hazardous waste, hazardous constituents, leachate, contaminated run-off, or hazardous waste decomposition products to the ground or surface waters or to the atmosphere...

BACKGROUND SOIL CONDITIONS

As part of the closure, it was necessary to determine background soil quality for site-specific constituents, including total hexavalent chromium and total lead. Sample locations (Figure 3) were selected by General Motors personnel in accordance with the MDNR guidance document "How Clean is Clean". The samples were collected from depths of approximately six inches at Pontiac Central and Pontiac East Plant sites considered to be "uncontaminated" and undisturbed. Sample collection logs are found within Appendix D. Samples from the background sites and waste management pad were collected from similar soil/sediment horizons.

The total lead and hexavalent chromium background concentrations (Table 1) revealed from chemical analyses were statistically compared to concentrations detected in the soil samples below the waste management pad to determine whether environmental impact has occurred as a result of hazardous waste management activities at the unit. These comparisons were made using the Gossett Student's T-test at the 95% confidence level, the results of which appear in the Analytical Results Section below.

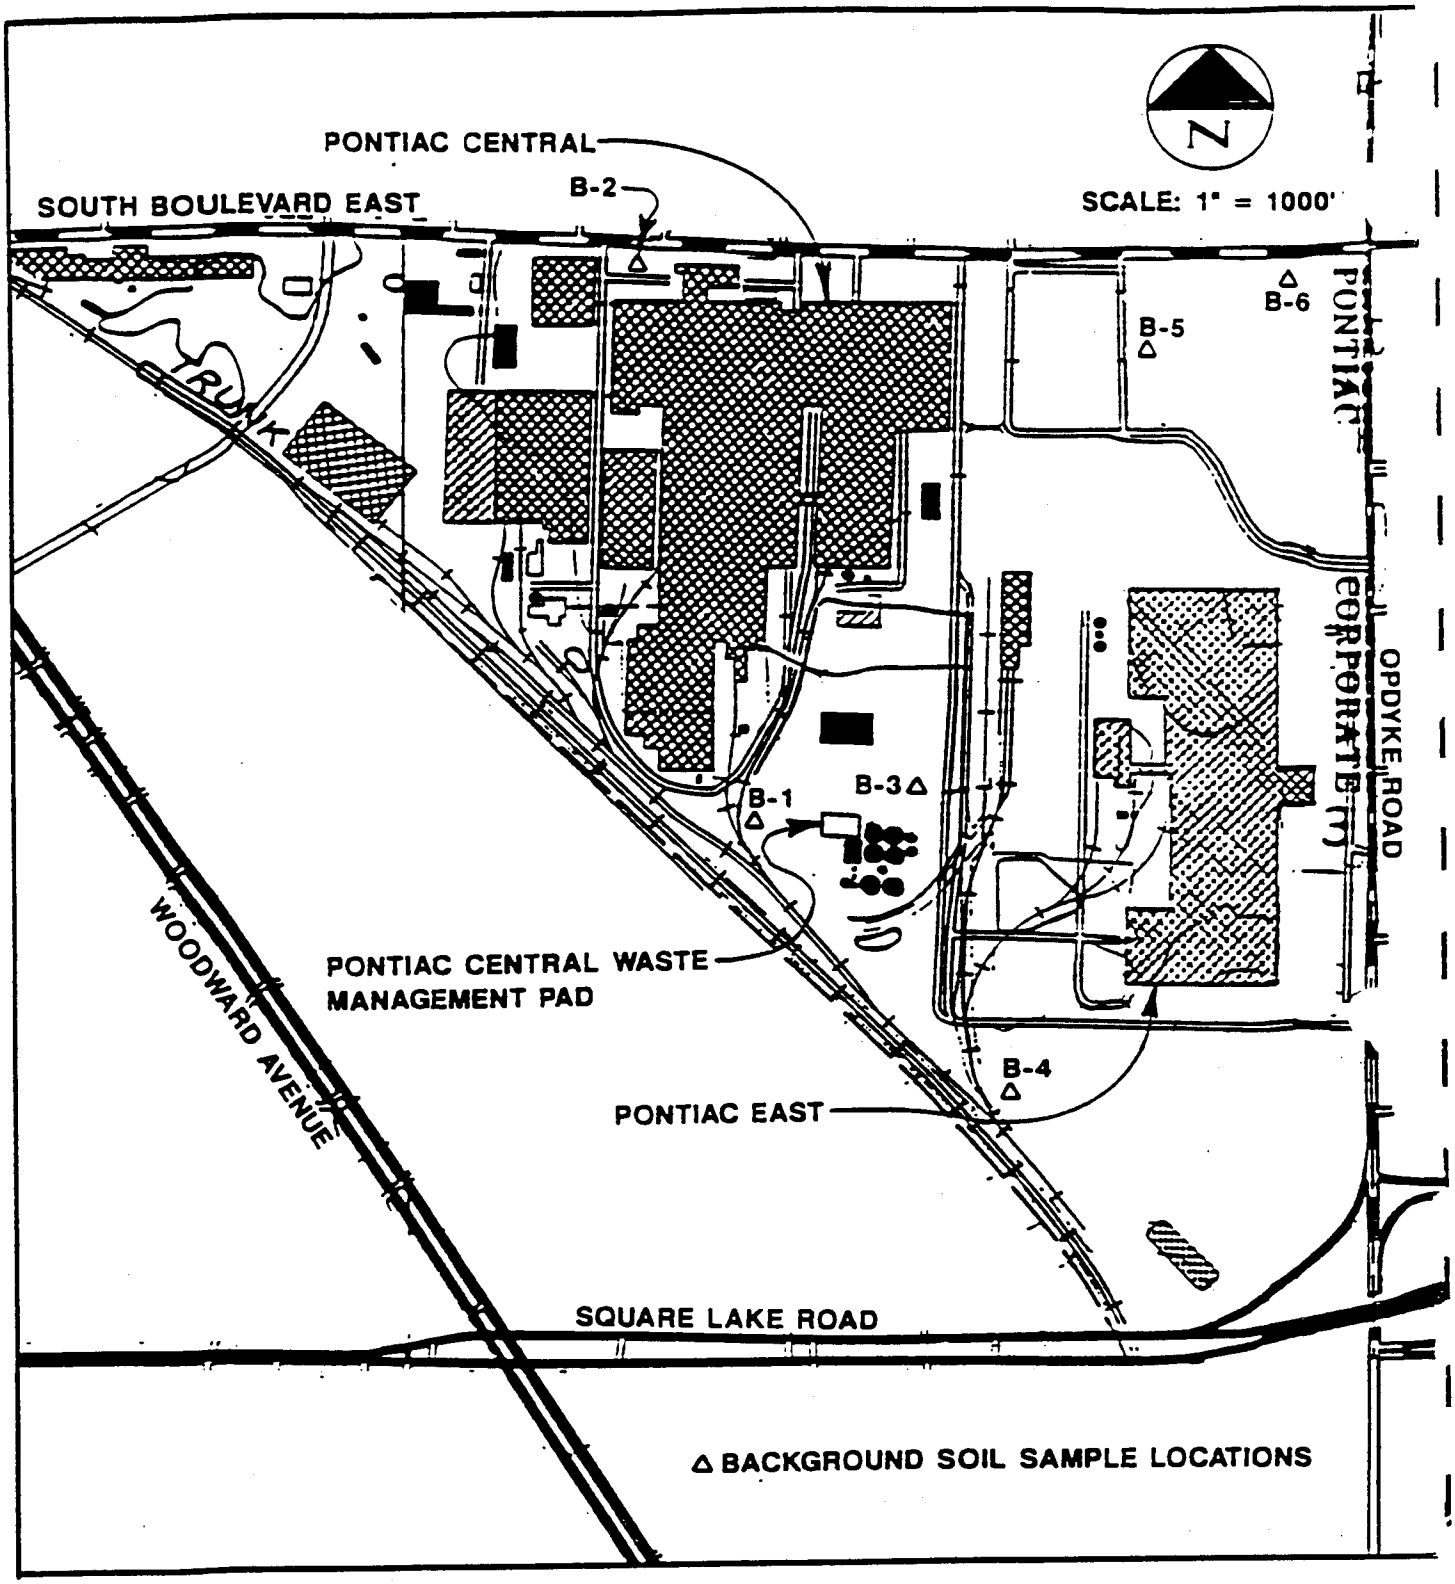

Table 1

Background Soil Samples

Analytical Results for Metals (in mg/kg)

Analyte	B-1	B-2*	B-3*	B-4	B-5	B-6	B-6 Duplicate
Total Hexavalent Chromium	<0.5	<0.5	<0.5	<0.5	<0.5	<0.5	<0.5
Total Lead	65	240	140	15	24	57	64

*Not used in calculation of background soil conditions due to apparent elevated concentrations of total lead.

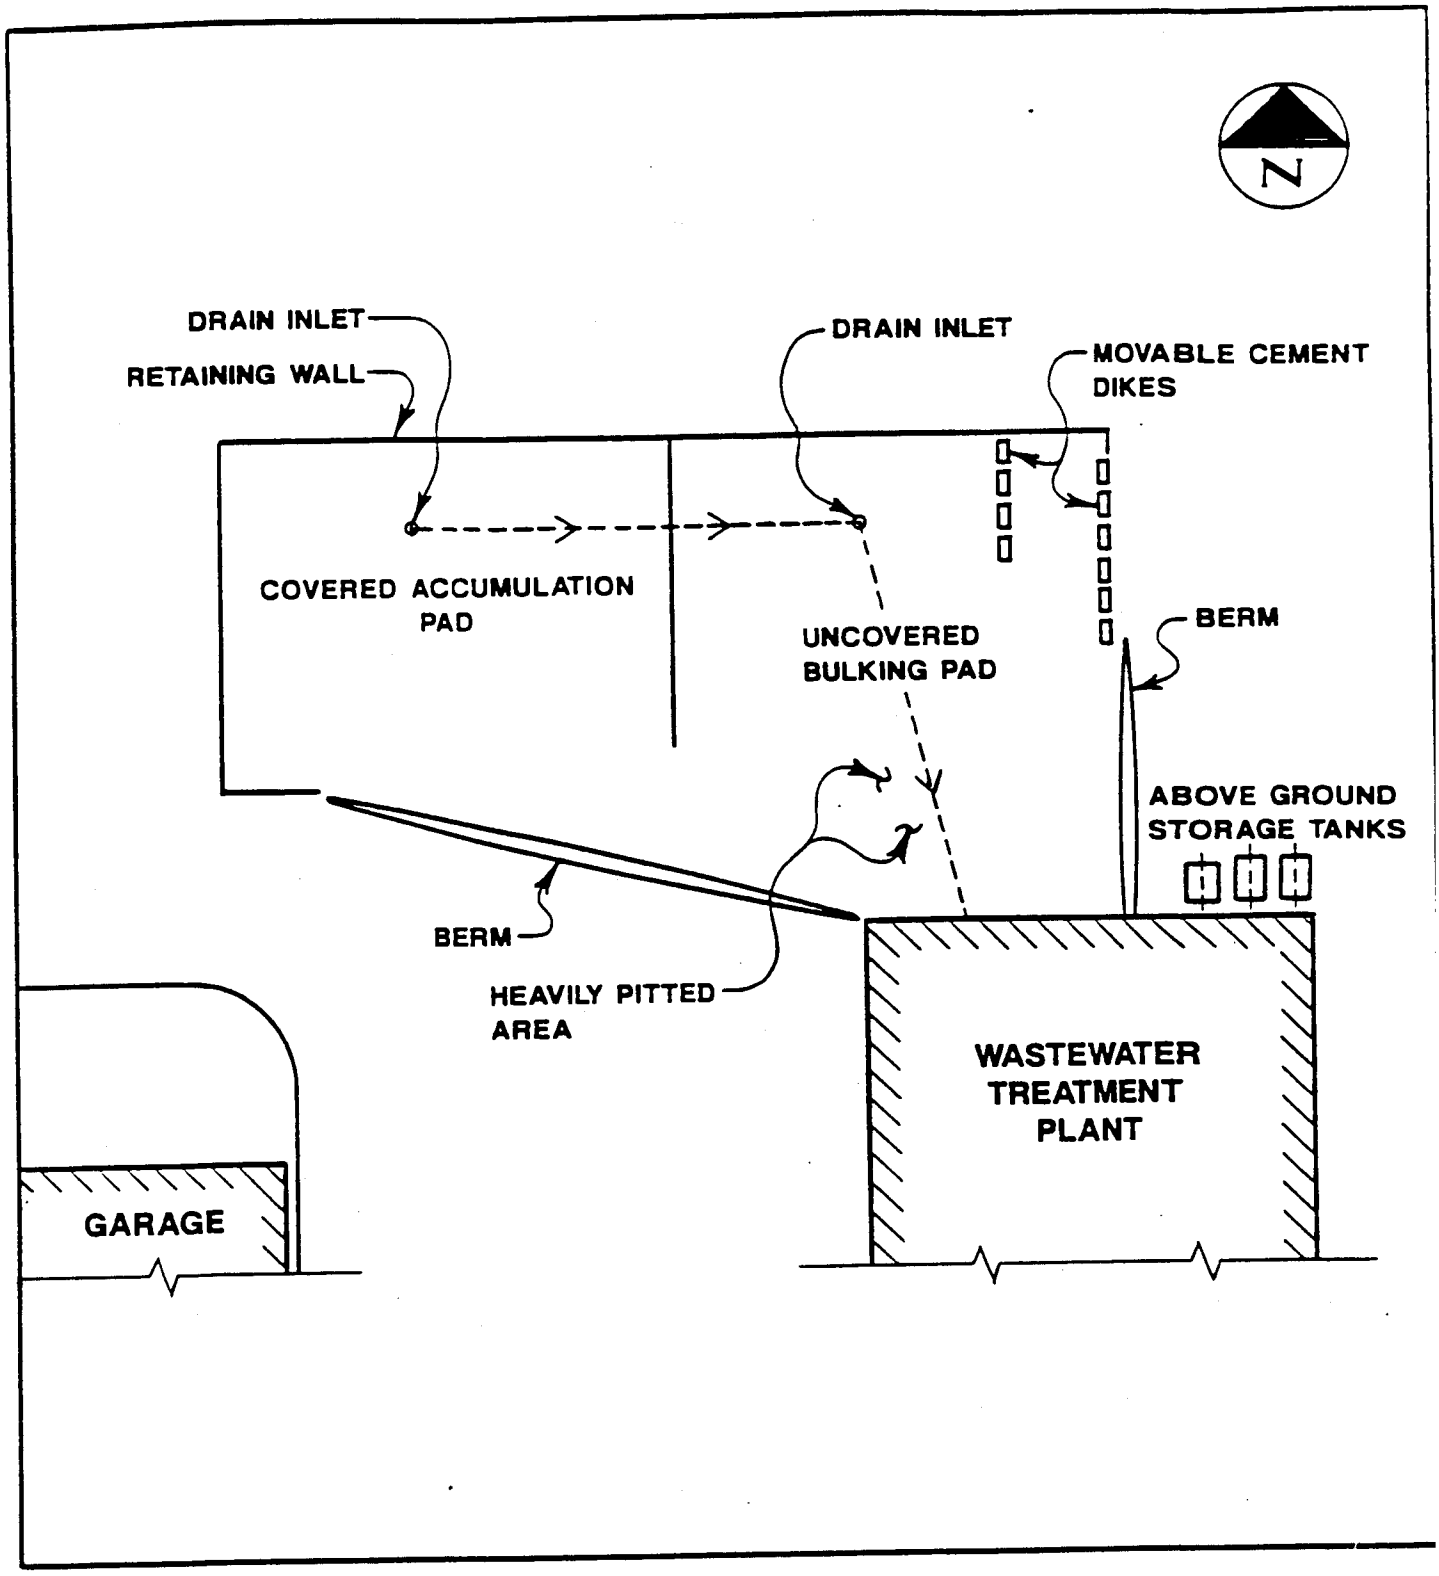
FIELD ACTIVITIES

As part of the closure requirements, the pad's working surfaces were decontaminated with ultra high-pressure water rinses followed by sampling and chemical analyses of site specific compounds. A series of soil borings were also conducted to enable the collection of soil samples for chemical analysis.

PAD DECONTAMINATION



As described previously, the waste management pad (Figure 4) is divided into two operating sections, a waste accumulation pad (covered) on the west, and a waste bulking pad (uncovered) on the east. Since the waste management facility had to remain active while manufacturing operations were ongoing at the plant, it had to be at least partially functional during decontamination and investigation activities. To achieve this, both the accumulation and bulking pads were divided into an active half and a "decontamination/investigation" half. This enabled cleaning and sampling to occur concurrent with normal waste management activities. Decontamination and investigation began with the west half of the accumulation pad and continued eastward, ending with the east half of the bulking pad. Although sufficient notice was made to MDNR regulatory officials by General Motors Corporation staff, no on-site MDNR inspections were made of either Phase I or Phase II field activities.

Phase I

Decontamination of both the accumulation pad and the bulking pad was accomplished by manually scraping sludge, product, and residue off the pads followed by a pressurized water rinse. In this manner, most of the adhering material was removed, to be either bulked as additional nonhazardous waste or transported as a liquid to the treatment plant by one of two gravity drains. These operations are routinely performed two to four times per year as part of normal pad management. Following preliminary scraping and pressure washing, an ultra high-pressure water blaster was mobilized to complete the decontamination procedures. With the water blaster, any remaining sludge and paint residue was removed from the retaining walls, dikes, and floors and was diverted to the in-place drainage system.

Washing of the accumulation pad accomplished removal of nearly all visible solid material adhering to the concrete sealer, which was in very good condition. The bulking pad did not have a concrete sealer and contained an area where the floor was severely pitted. This area, in the south-central area of the pad, was not intensely blasted since the high pressure may have

caused further pitting. While the final washwater from the covered pad was free of visible solids, the uncovered pad final washwater was slightly clouded with what appeared to be fine concrete particulates in solution.

McNAMEE

SINCE 1914

LEGEND

SCALE: 1" = 40'±

FIGURE 4

WASTE MANAGEMENT PAD
SITE MAP, GM TRUCK AND
BUS, PONTIAC CENTRAL

The degraded condition of portions of the bulking pad can be attributed to the lack of a concrete sealer, sludge routinely being in contact with the pad, exposure to the elements, and the high volume of heavy traffic necessary for bulking operations. Pitting of the concrete in the southern area of the pad has advanced to the point of exposing the underlying steel reinforcing rods. The underlying soil, however, was not exposed. Also, in this area, the PVC waterstops at several of the joints is either in very poor condition or missing, reducing the integrity of the pad.

Another area of concern relevant to the bulking pad was the northern perimeter outside the retaining wall. Bulking operations, which include the addition of pebble lime to sludge by use of a front-end loader, has resulted in spillage of minor amounts of sludge over the wall and directly onto the soil. Furthermore, the southwest areas of the covered pad and the northwest areas of the uncovered pad are low and do not drain well, making it necessary for pooled liquids in these areas to be pumped by the on-site licensed liquid waste handler. These fluids are subsequently discharged to the treatment plant for routine wastewater treatment. All liquids are confined to the pads by either the concrete walls on the west and north sides, the wall dividing the pads, and by concrete berms on the south and east sides.

Phase II

Following MDNR's review of the initial closure report, a notice of deficiency was issued to General Motors officials. Within the notice were requests to perform a subsequent water blasting of the accumulation pad west and additional soils investigation. The decontamination and sampling procedures employed were identical to Phase I, as required in the Closure Plan. In addition to sampling of the rinsate, a blank sample of the rinsate was left open to the pad atmosphere during blasting to collect chemical data on ambient conditions.

SAMPLING OF RINSATE AND SOIL

Chemical analysis of site specific heavy metals (lead and hexavalent chromium) and volatile organic compounds (VOC's) was performed on the clean rinsate and on selected soil samples for purposes of defining the general environmental quality of the facility.

DECONTAMINATION RINSATE

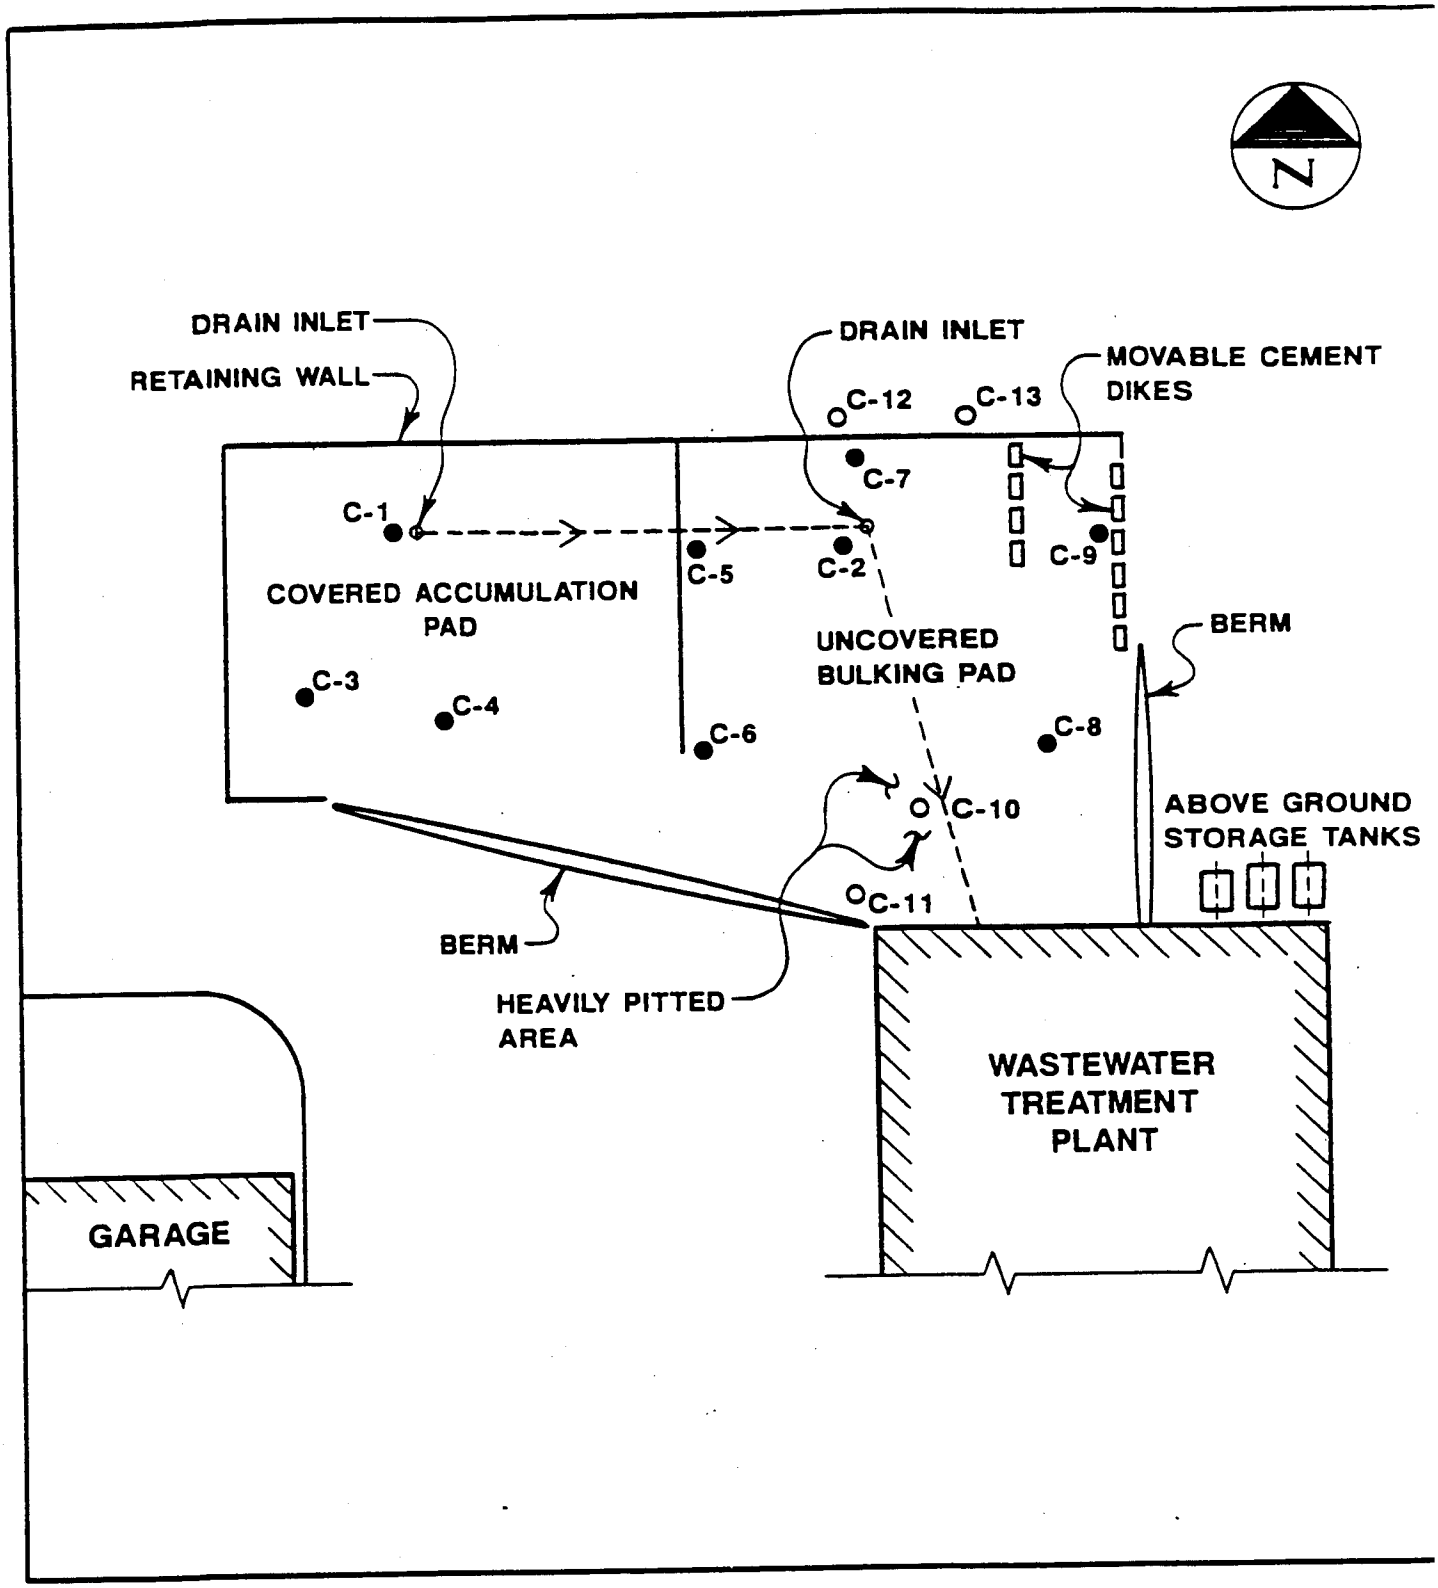
Phase I

After high-pressure water blasting of the pads was completed, a series of rinsate samples were collected for laboratory analysis, including one sample from each pad quarter for a total of four sampling events. Samples were collected from low areas of the pad floors after blasting had removed adhering residue and the rinsate was as free of solids as possible. As was specified in the Closure Plan, decontamination was considered complete only after laboratory analysis confirmed that metals concentrations were statistically lower than background samples and VOC's were non-detectable. Upon collection, samples were retained in laboratory supplied, pre-preserved bottles and were chilled and transported to the laboratory under strict chain-of-custody (all chain of custody documentation appears in Appendix E) for analysis of lead and hexavalent chromium and parameters within the EPA Method 601 and 602 scans.

Although pad decontamination efforts were successful in removing sludge and paint solids from the walls, dikes and floors of the facility, low concentrations of ambient VOC's were always present at the facility during decontamination activities due to one-half of the pad actively being used for routine storage, bulking and solidifying of non-hazardous waste. VOC presence was monitored by periodic photoionization detector (PID) readings of the ambient air within the pad area. Readings fluctuated between 0.8 and 2.5 ppm. These ambient VOC's may have mixed with washwater mist and become incorporated into the rinsate that was subsequently collected for laboratory analysis. Therefore, sample characterization is probably not purely indicative of decontamination efforts, but is likely to contain "background" data in the form of ambient VOC's.

Phase II

As noted in the Decontamination section above, a subsequent water blasting event took place on the accumulation pad west. Protocol was consistent with the Closure Plan and identical to that of Phase I. Sample results from both phases are noted in the Analytical Results section.



SOIL

Phase I

To provide chemical quality data on the soil underlying the waste management pads, a series of nine soil borings were performed through the pad and soil samples were collected for laboratory analysis. Analytes included site specific heavy metals, (total and EP TOX lead and hexavalent chromium) and VOC's within the EPA Methods 8010 and 8020. Figure 5 depicts soil sample locations for Phase I, labeled C-1 through C-9, and for Phase II, labeled C-10 through C-13.

Sampling locations were selected by General Motors personnel in accordance with the guidelines found in the MDNR "How Clean is Clean" document. In general, the locations were selected to provide representative soil types and soil quality data in consideration of pad dimensions and areas subject to potential environmental impact. Sampling depths were selected to correspond with background soil sample horizons, with the 0.5 and 1.0-foot intervals targeted to provide a degree of vertical control. Deeper sampling was not a part of this assignment.

Sampling was accomplished by coring through the concrete pad with a 10-inch diameter, water cooled rotary coring device, followed by hand augering through the soils to depths of 0.5 foot and 1.0 foot beneath the pad-soil interface. To prevent the possibility of contaminants invading the core void, coring and sampling was conducted directly following water blasting. After cores were removed, any cooling water standing in the hole was bailed out with a sterile jar to provide a dry sampling environment. A stainless steel, three inch diameter decontaminated hand auger was used to recover soil samples from the specified horizons. Upon extraction of the auger from the boring, the soil on top of the bucket was discarded and the soil from within the interior of the bucket was collected with a decontaminated hand shovel and retained in laboratory supplied bottles. For each horizon sampled, a 4-ounce laboratory jar was partially filled with soil and secured with a tightly fitting cap of aluminum foil. These samples were put aside for approximately 30 minutes each to allow build up of any volatiles in the headspace. Photoionization readings were then conducted by piercing the foil and inserting the probe of a calibrated PID (Photovac TIP II) within it. Subsequently, two 4-ounce laboratory supplied jars were packed with the subject soil for laboratory analysis by EPA Methods 8010 and 8020, and a 1-liter jar was filled for laboratory analysis of total and EP TOX lead and hexavalent chromium.

FIGURE 5

**WASTE MANAGEMENT PA
SHOWING SOIL SAMPLE
LOCATIONS, GM TRUCK &
BUS, PONTIAC CENTRAL**

To assure the quality and representativeness of the samples, the auger was scraped free of adhering soil after each sampling event and washed in a trisodium phosphate and distilled water solution followed by a triple rinse with distilled water.

Phase II

As requested by MDNR, a series of four additional soil borings was performed to provide chemical data on areas of concern within and proximal to the bulking pad. Phase II borings are labeled C-10 (pitted area), C-11 (unsealed joint area), C-12 (north perimeter west-side) and C-13 (north perimeter east-side). Methodologies for procuring samples were identical to those within Phase I, with the exception that the samples collected from outside the north retaining wall were collected at depths 0.5 and 1.0 feet below grade surface since the area is not covered with concrete.

ANALYTICAL RESULTS

Chemical analysis of rinsate and soil samples was performed by NET Midwest, Inc., Laboratories of Pontiac, Michigan. Collection methods, parameters and test methods were in accordance with the Closure Plan.

Table 2 provides data concerning the parameters, test methods and detection limits used for soil and rinsate samples. A complete laboratory record of analysis is included in Appendix F.

Xylene Isomers	8020	20 ug/kg	602	2 ug/kg

SOIL SAMPLES

Soil types beneath the waste management pads varied considerably, ranging from a dense, gray, indigenous lacustrine clay to a pebbly sand and silt fill material. In general, a silty sand fill approximately seven inches thick, underlain by a dense, native lacustrine clay dominates the pad area. The western and eastern edges of the facility tend to be higher in clay content while the northern and interior portions are higher in silt and sand content. Boring C-8 was comprised almost entirely of a crushed limestone aggregate, probably material from a former thoroughfare surface. A review of logs from soil borings completed earlier at the adjacent WWTP indicates a layer of fill consistently covering the general area, ranging in thickness between three and six feet. Underlying the fill is found a highly variable suite of sediments approximately 25 feet in thickness. These sediments appear to be interfingered clays, silts and sands, representative of a till sequence. Below this is consistently found an extensive layer of very stiff, moist, blue lacustrine clay. The deepest boring was terminated at 60 feet, the lower 30 feet of which was comprised of the dense blue clay. Soil boring logs completed as part of this project are found in Appendix G, while a complete set of soil boring logs completed prior to construction of the present WWTP are found in Appendix H.

Metals concentrations from soil samples were compared to background soil samples using the Gossett Student's T-test at the 95% confidence level to determine if a statistically significant difference exists, indicating potential environmental impact to soil beneath the waste management.

It was not possible to perform the Student's test on the hexavalent chromium due to insufficient data. All seven background samples were less than detection limit (<0.5 mg/kg) and all nine waste management pad soil samples were less than detection limit (<0.2 mg/kg), resulting in a lack of independently random, normally distributed populations necessary for statistical comparison.The absence of detectable concentration of hexavalent chromium, however, indicates that environmental impact from hexavalent chromium has not occurred.

Statistical comparison of lead is as follows:

Case	Group	Lead (mg/kg)
1	1	65.00
2	1	15.00
3	1	24.00
4	1	57.00
5	1	64.00
6	2	16.00
7	2	13.00
8	2	20.00
9	2	23.00
10	2	8.90
11	2	26.00
12	2	13.00
13	2	8.40
14	2	39.00

Group 1 = background samples
Group 2 = waste management pad samples

Independent samples: T-test on lead

Group	h	$\bar{X}_1$	S_1
1	5	45.00	23.696
2	9	18.584	9.746

Separate variances T = 2.383 DF = 4.8 prob. = .065

Pooled variances T = 2.992 DF = 12 prob. = .011

Note: h = number of samples

$\bar{X}_1$ = mean

S_1 = standard deviation

The objective of the statistical analysis was to test at a significance level of 0.01 whether or not the true average concentrations of lead differs between the two groups. Assumptions used for the statistical analysis are as follows:

1. Independent random samples from two normally distributed populations. The population variances are assumed to be normal.

2. $H_O = \mu 1 = \mu 2 = 2 \qquad HA = \mu 1 \neq \mu 2$

3. 95% confidence level

4. $$T = \frac{(\bar{X}_1 - \bar{X}_2) - 0}{S_p \quad 1/h_1, + 1/h_2} \qquad t_{12} \text{ under } H_O$$

5. Reject H_O if $| T | \geq t, 12, 0.95 = 1.7823$
   Do not reject otherwise.

Results of the analysis conclude:

$T = 2.992$

Because $T = 2.992$ exceeds $t_{12}, 0.95$ we reject H_O and conclude that the true average concentrations of lead are different in the two groups, with the concentrations of lead less in the soil underlying the pad. Neither halogenated nor aromatic VOC's (Methods 601 and 602) were detected by the analytical laboratory in any of the Phase I soil samples. Total VOC's were detected, however, in the field using a portable benzene equivalent calibrated PID (Photovac TIP-II) and head space methodology. Photoionization readings are found in Table 3. A summary of laboratory analyses of soil samples is found in Table 4.

RINSATE SAMPLES

Analytical results documenting waste management pad decontamination indicate that hexavalent chromium was not present at concentrations above detection limit while total lead varied in concentrations between 0.06 mg/L and 1.4 mg/L. Analysis of volatile organic compounds indicate that the west half of the accumulation pad rinsate contained a total of 1 mg/L purgeable halocarbons, with methylene chloride comprising 0.980 mg/L of the total. The accumulation pad east contained a total of 0.004 mg/L chloroform, while the bulking pad east contained concentrations of ethylbenzene and toluene at 0.035 and 0.045 mg/L, respectively. A total of 0.022 mg/L chloroform, 0.003 mg/L ethylbenzene and 0.002 mg/L toluene was present in the bulking pad rinsate. A summary of laboratory analyses of rinsate samples appears in Table 5.

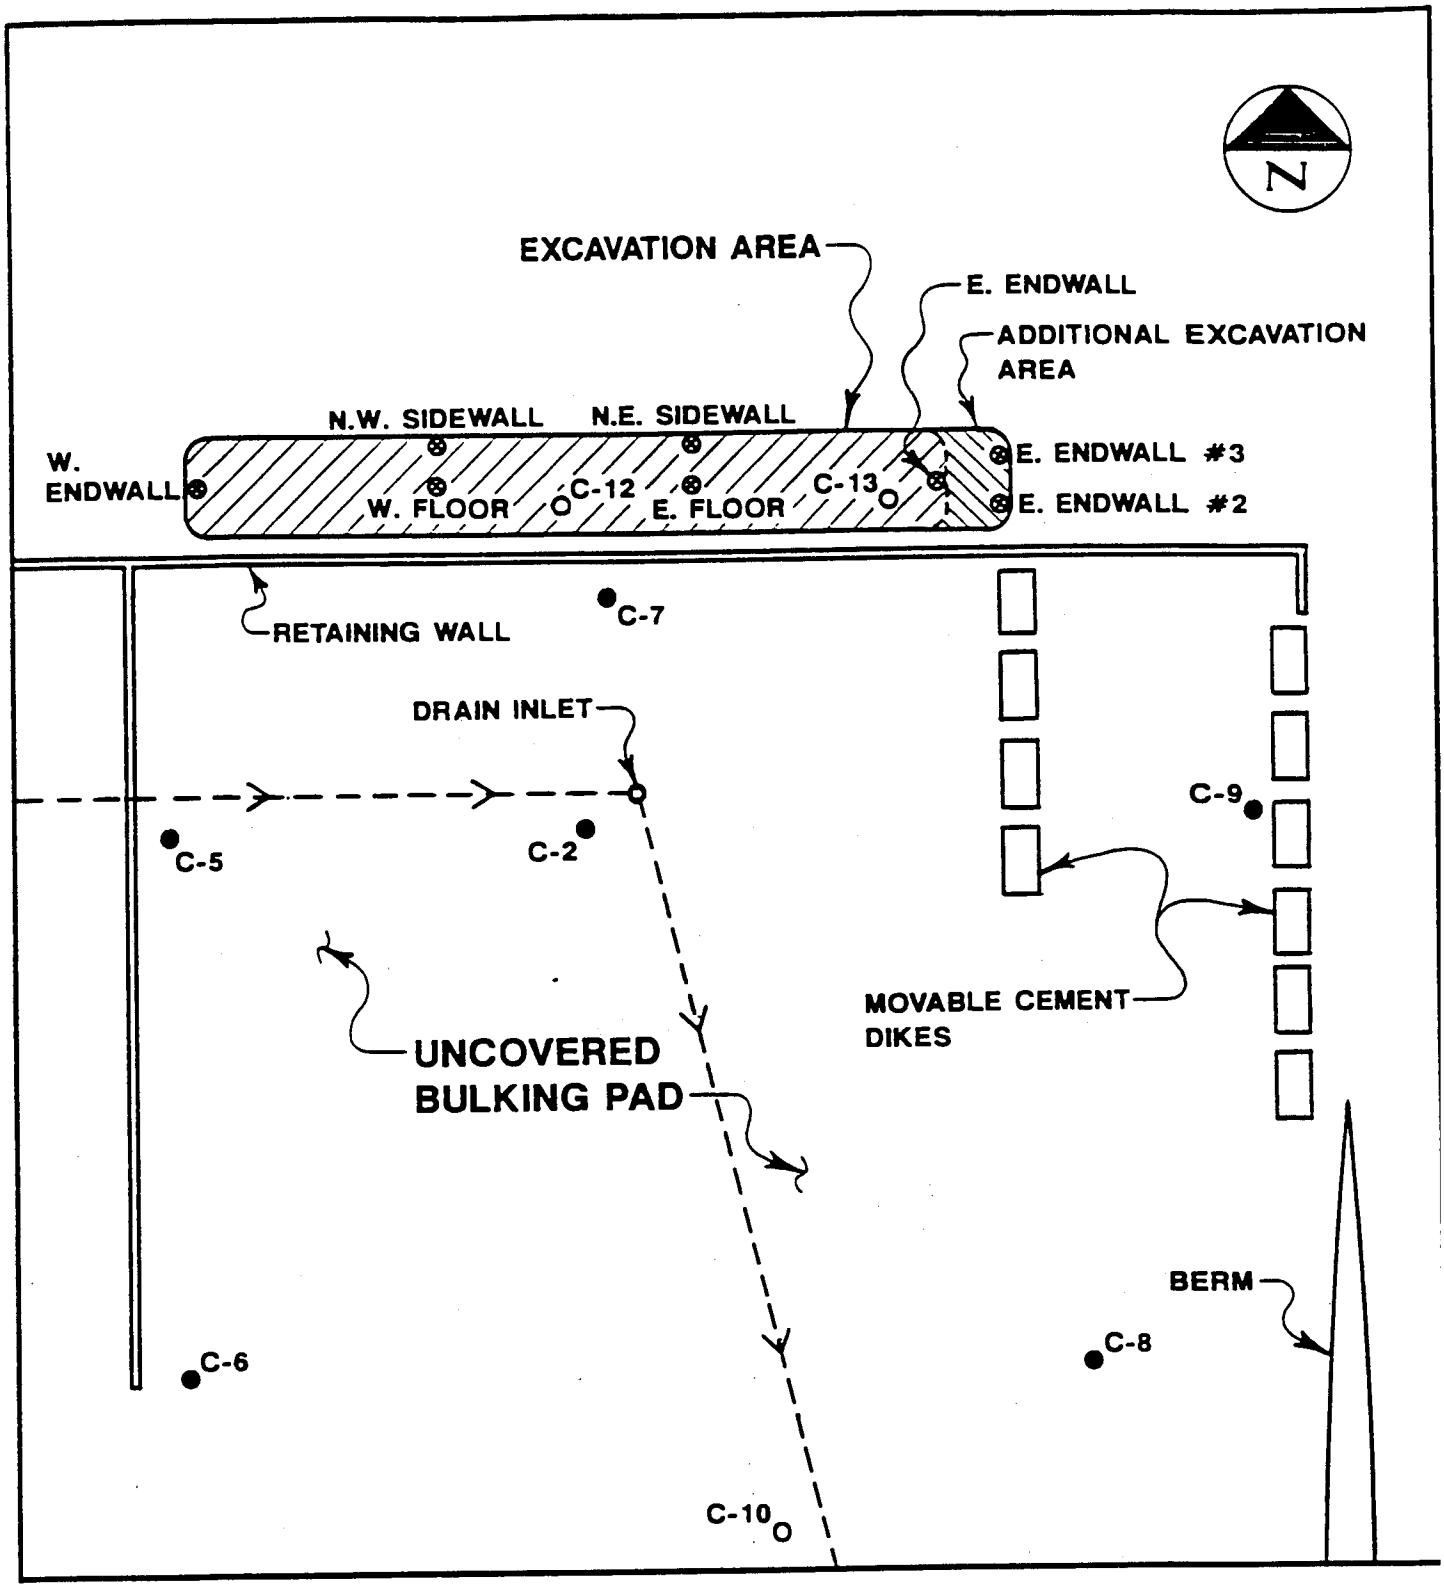
SOIL REMEDIATION

In order to satisfy MDNR requirements for approval of the waste management pad certification, a limited soil remediation was requested for soils adjacent to the east end of the north retaining wall of the bulking pad. To achieve the remediation, a limited soil excavation was performed, followed by waste soil characterization and excavation sampling and analysis.



The first round of excavation resulted in an elongated trench approximately 60 feet long by four feet wide by four feet deep, for an equivalent of approximately 33 cubic yards of waste. All excavation activities were monitored by a McNamee Industrial Service representative who screened ambient conditions and spoils with a PID using the protocol set forth in the closure plan.

When non-detected PID readings were achieved on representative floor, endwall and sidewall samples, composite soil samples were collected for laboratory analysis of benzene, toluene, ethylbenzene and xylene.

The analyses revealed non-detectable concentrations for all samples except the east endwall composite, which contained 70 ug/kg xylene. In response to the detection, another round of excavation was conducted, resulting in another five cubic yards of material being excavated.

To provide an additional degree of chemical characterization of the expanded excavation, two additional composite samples were collected and analyzed (labeled as east endwall composite #2 and east endwall composite #3). Since xylene was the only compound detected in the east endwall sample from the initial excavation, it was the only compound analyzed for in the subsequent excavation.

Xylene was not detected in east endwall samples #2 and #3, thus providing sufficient data to document an adequate clean-up, has been achieved. Table 6 provides a summary of excavation analyses, while Figure 6 depicts the excavation location and attendant sampling.

SUMMARY AND CONCLUSIONS

As part of a reduction in operating latitude needed for waste management activities at General Motors Truck & Bus Group, Pontiac Central Manufacturing and Assembly Plant's waste management facility, a waste management pad closure has been conducted in compliance with 40 CFR 265.111, the Closure Performance Standard. Closure included decontamination of a 12,543-square-foot concrete pad by removal of sludge and residue with ultra high-pressure water blasting, followed by rinsate sampling and coring and sampling of soil beneath and adjacent to the pad to enable laboratory analysis of site-specific metals and volatile organic compounds (VOC's). In addition, a limited excavation of soils adjacent to the pad was performed. This report provides documentation of field activities, laboratory analyses, and interpretations necessary to provide environmental characterization of the site.

Because the waste management pad had to remain partially active during decontamination and sampling activities, it was necessary to divide the facility into quarters, allowing half of the accumulation pad and half of the bulking pad to remain operable at all times. In this manner, decontamination and sampling could proceed with minimal disturbance to normal waste management activities.

Pad closure was conducted in two phases, with Phase I being comprised of an initial round of decontamination, sampling and analysis, followed by a preliminary certification report documenting the activities and analysis. Based on a notice of deficiency letter to General Motors from MDNR, a second phase of additional decontamination, sampling and analyses were implemented. This phase, Phase II, was targeted at areas of the pad which either were not satisfactorily decontaminated or were in need of further chemical characterization. Analytical results from the Phase II soil samples prompted the need for the limited soil excavation.

Decontamination began with the removal of bulk sludge by scraping, followed with an initial pressurized water rinse and, finally, rinsing with an ultra high-pressure water blaster. The resultant rinsate was diverted to the on-site drainage system which flowed to the adjacent wastewater treatment plant for normal treatment. Pooled rinsate was sampled and subsequently vacuumed and hauled to the wastewater treatment plant by the on-site licensed hazardous waste hauler.

Soil characterization was accomplished by coring through the concrete pad at nine locations selected by GM personnel in accordance with the guidelines set forth in the MDNR document, "How Clean is Clean." Samples were procured at 0.5-foot and 1.0-foot below the pad and soil interface using a decontaminated stainless steel auger. Samples were stored in laboratory supplied bottles and transported to the laboratory under strict laboratory directed protocol and chain-of-custody. A separate sample of each soil horizon was collected for in-field photoionization analysis.

Although Phase I water blasting was successful in removing nearly all visible residue, as evidenced by the lack of solids in the rinsate, a notable concentration of volatile organic compounds was present in the west half covered waste accumulation pad rinsate, particularly methylene chloride at a concentration of 0.980 mg/L. The rinsate from the other half of the accumulation pad contained only a single volatile organic compound, chloroform, at a concentration of only 0.004 mg/L. The rinsate from the east half of the bulking pad contained 0.035 mg/L ethylbenzene and 0.045 mg/L toluene. VOC's detected in the west half of the bulking pad included 0.022 mg/L chloroform, 0.003 mg/L ethylbenzene and 0.002 mg/L toluene.

Overall, VOC concentrations in the Phase I rinsate appear anomalously high since water blasting was successful in removing nearly all visible sludge residue, resulting in a final rinsate that was free of solids. VOC concentrations in the accumulation pad west rinsate may be attributed to ambient VOC's liberated from the active portions of the facility.

Phase II water blasting of the accumulation pad west was successful in fully decontaminating the pad, as is evident by the lack of detectable VOC's.

Total hexavalent chromium was not found to be present above detection limits in any of the rinsate samples, Phase I or II, while total lead varied between 0.06 mg/L in the accumulation pad east sample to 1.4 mg/L in the bulking pad east sample.

Metals analysis of soil samples was performed by Student T-test statistical comparison to background soil samples. The comparison test demonstrated the lack of environmental impact from the unit by lead to soils beneath the pad due to metals. Hexavalent chromium was not detected in either the background or waste management pad soil samples, also indicating a lack of environmental impact.

No VOC's, using EPA methods 8010 and 8020, were detected by the laboratory in the soils underlying the pad investigated during Phase I sampling (C-1 through C-9). In-field photoionization readings of the soil samples, however, indicate the potential presence of an unknown volatile organic compound or compounds in several of the samples.

Four Phase II soil samples were collected in areas of this pad subject to potential invasion by contaminants, namely a pitted area of the pad and an area where the waterstop was missing from a joint, as well as soil due north of the north retaining wall of the east bulking pad. Analyses indicated minor impact to the soil, prompting the excavation of approximately 33 - 35 cubic yards of soil. That soil was properly transported, manifested and disposed of at a licensed Type II landfill. Waste disposal shipper/manifests are included as Appendix I.

The overall condition of the accumulation pad was excellent, with minimal concrete pitting, an effective concrete sealant and tight joints. The overall condition of the bulking pad was poor to good with areas of severe concrete pitting, a lack of concrete sealant and several areas where the waterstop at the joints was missing or disrupted.

RECOMMENDATIONS

Certify closure of the accumulation pad based on the chemical quality of rinsate and soil beneath the pad.

Certify closure of the bulking pad based on the chemical quality of rinsate and lack of EPA Method 601 and 602 volatile organic compounds and low metal concentrations in the soil beneath the pad.

Basic improvements to the facility should be provided to insure that liquids drain properly and waste is confined to the pad.

Attn: Andrea Schoenrock

Dear Ms. Schoenrock:

Enclosed is a revised closure plan for the waste management areas at our Pontiac Central and East plants.

Per your request, the DNR offices will be notified in advance of key events in the closure activities.

If you have any questions, please call me at (313) 456-7529.

Very truly yours,

D. S. Harrett

APPENDICES

Appendix A Pontiac Central and East Plants - Annual Waste Summaries

Appendix B Waste Characterizations

1.0 Introduction

This closure plan describes the methods and sequence of events necessary to close (2) hazardous waste management areas at Truck & Bus - Pontiac Central and East plants. The following plan was developed in accordance with 40CFR 265.111 - 265.115 and Michigan Act 64 Rule R299.9613.

1.1 Background

General Motors Truck & Bus - Pontiac Submitted a RCRA Part A application to the EPA on November 17, 1980 for treatment of hazardous wastes on site, storage of hazardous wastes on site over 90 days, and/or receipt of hazardous wastes from off site. In April, 1985, Truck & Bus - Pontiac Central and East submitted a part B application. On July 1, 1987, the plant requested withdrawal of the part B application after determining that the additional operating latitude afforded by permitted status was not needed: no hazardous wastes require treatment on site, storage over 90 days is not necessary for economical disposal, and all Pontiac Truck & Bus plants manage their hazardous wastes independently, so receipt from off site is not required. When final closure is accomplished Truck & Bus - Pontiac Central will continue its waste management activities under 40CFR262 and Act 64 Part 3 (Generator) rules.

1.2 Purpose and Scope

The purpose of this closure plan is to provide documentation of compliance with 40 CFR 265.111, closure performance standard, which states that an owner or operator of a hazardous waste management facility must close his facility in a manner which:

- Minimizes the need for further maintenance.
- Controls, minimizes or eliminates, to the extent necessary to protect human health and the environment, post-closure escape of hazardous waste, hazardous waste constituents, leachate, contaminated rainfall, or waste decomposition products to the ground or surface waters or to the atmosphere.

The scope of this closure plan includes the following waste management units operated at the Truck & Bus - Pontiac Central and East plants:

- Central plant containerized and bulk waste management pad (storage of listed hazardous wastes).
- East plant container and tank waste management area (storage of listed hazardous waste).

This closure plan describes the steps necessary to remove waste and waste residue from regulated waste management units, decontaminate facility equipment, and document closure. Estimates are also included for the maximum hazardous waste inventory, closure schedule, and final closure date.

2.0 General Facility Information

2.1 Facility Name and Location

Name - General Motors Corporation

EPA ID# - MID005356902

2.2 Facility Description

The General Motors Truck & Bus Group - Pontiac Central and East plants are located in the southeast corner of Pontiac, on a property bounded by South Boulevard on the North, Opdyke Road on the East, East Boulevard on the West, and the Grand Trunk Western Railroad Tracks on the South. Geographical coordinates are the northeast, northwest and southeast 1/4 of section 03, tier 2 north, range 10 east. The facility occupies some 400 acres, of which less than one acre is dedicated to hazardous waste management. A map of the plant property is given as figure 2-1.

2.3 Waste Characteristics

2.3.1 Wastes Managed in Central Plants Waste Management Pad

The Central plants waste management pad receives non-hazardous paint sludges in bulk from all three Truck & bus - Pontiac plants, solidifies them with lime as needed, and loads them into 35 yard licensed hazardous waste hauling vehicles for shipment (by plant preference) to a licensed hazardous waste landfill. Laboratory analyses show this waste stream to be consistently non-hazardous. In addition, wastewater treatment sludges were managed in bulk here while they were under a temporary delisting, and are now managed in 15 yard licensed rolloff boxes as a F019 listed waste. (This waste stream was listed as F006/F019 until the F006 listing was revised to exclude phosphating in December, 1986.)Parked road tankers on this pad are used to store non-hazardous oils and glycol. Containers of waste paint and solvent (listed wastes F003, F005) chlorinated solvents (listed waste F001), and non-hazardous oils are brought to the pad from the plant to be emptied and consolidated in the appropriate bulk tank here or at the Pontiac East facility (described in the next section). Incompletely emptied containers of non-hazardous adhesives and sealers are brought to this pad to be emptied and the residue consolidated with the paint sludges. Pebble lime is stored in a pile on the pad and is used as required to solidify

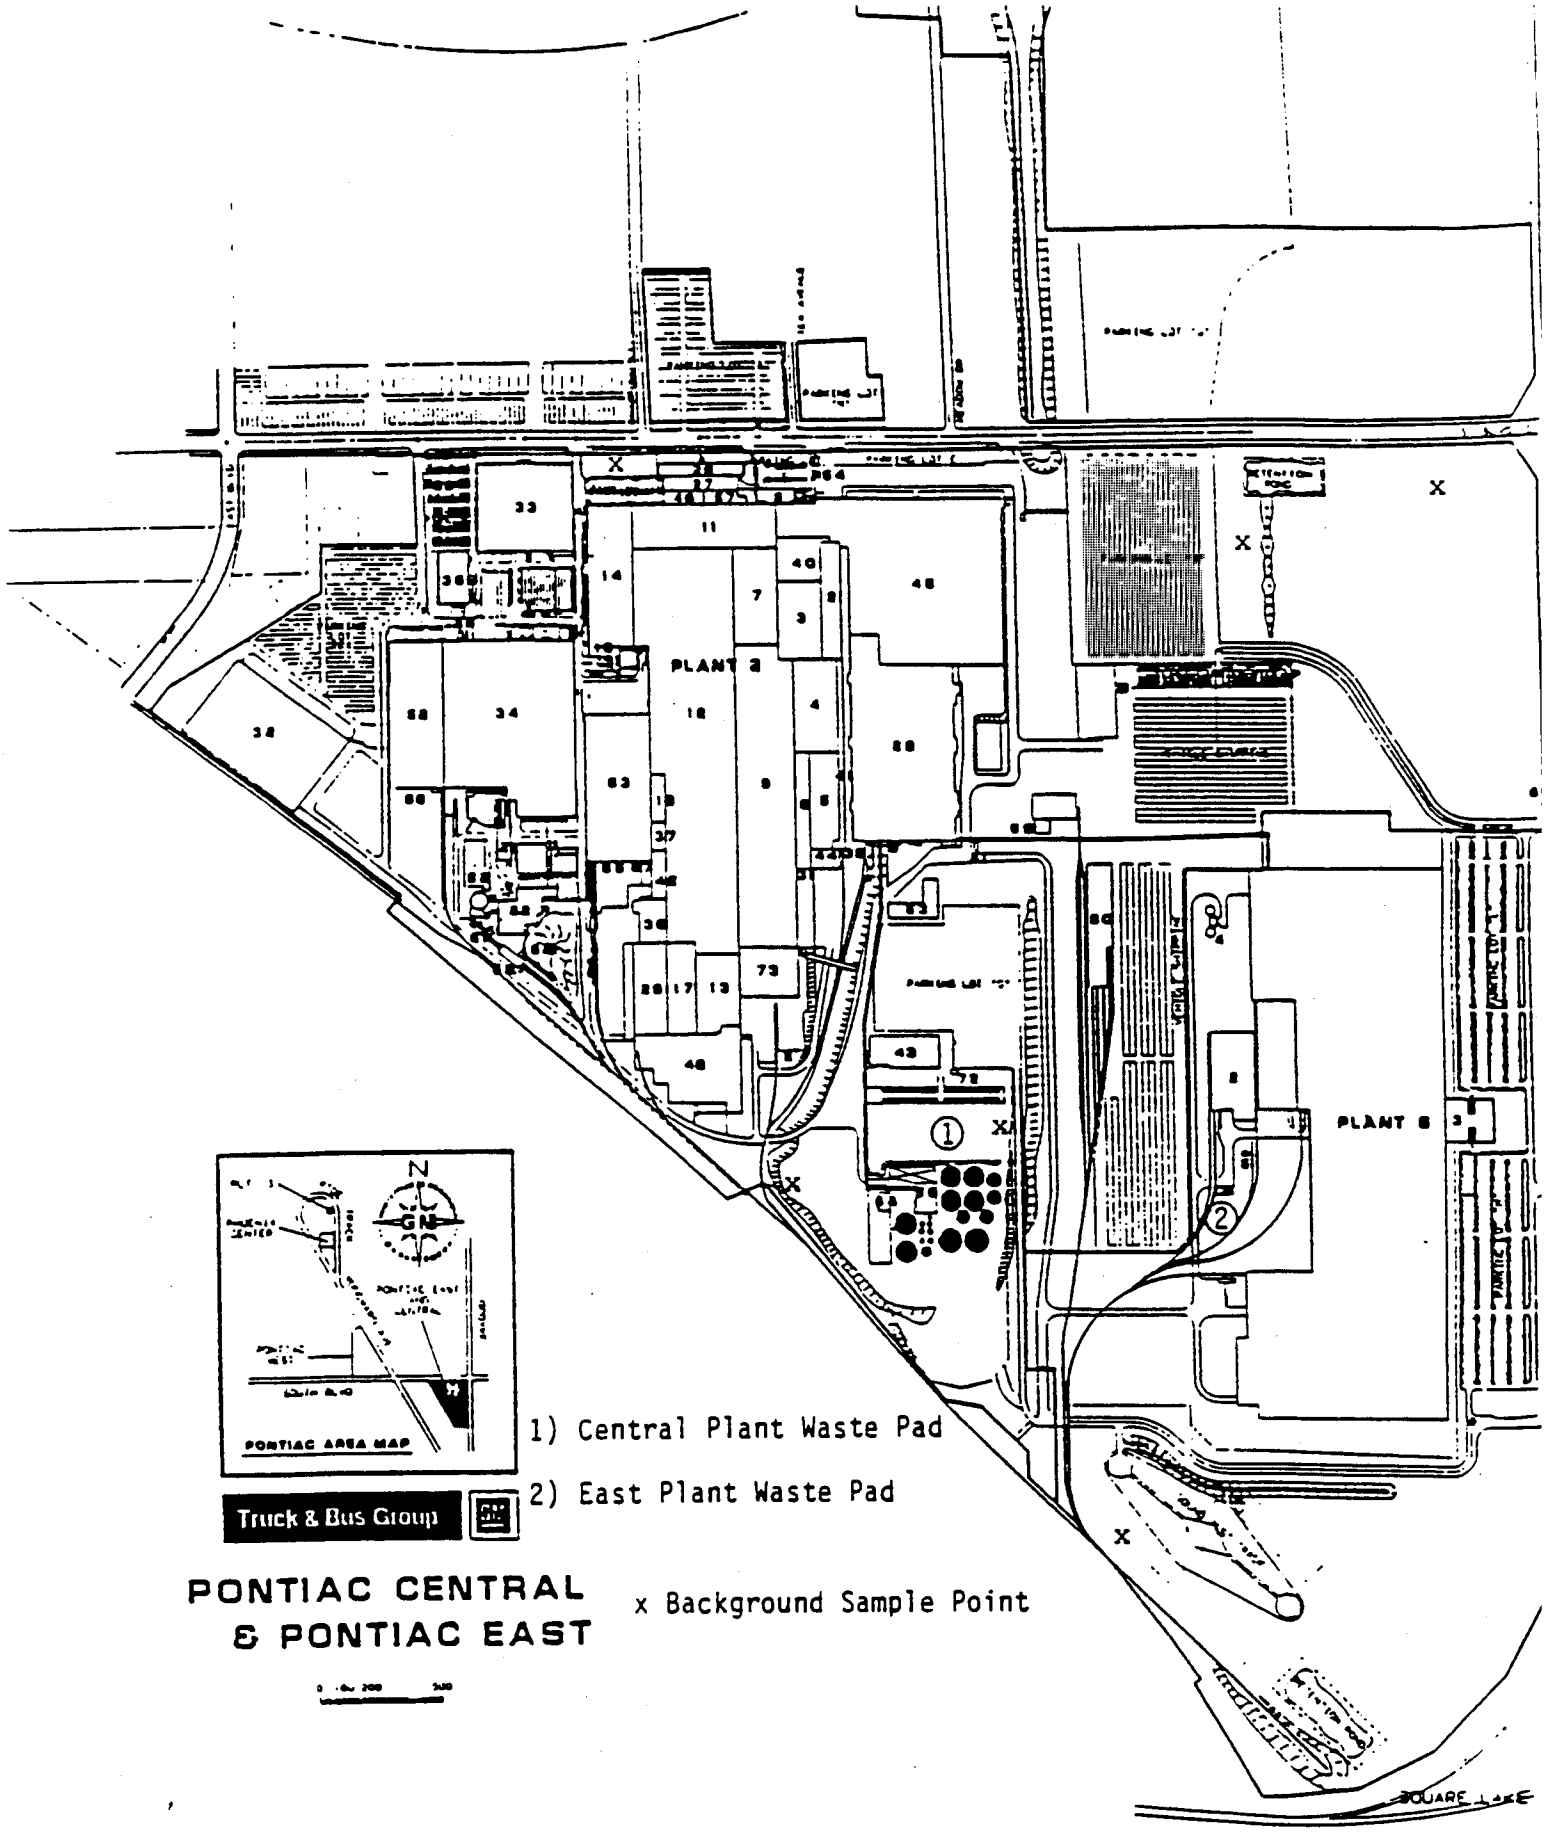

Fig. 2-1 Facility Map

the sludges to meet the acceptance criteria of the disposal facility. All transporting vehicles are owned by contract haulers, who decontaminate the vehicle prior to its return to this facility.

The Pontiac Central waste management pad consists of a 12,543 square foot, 8 inch thick concrete area constructed in 1980, reinforced with PVC waterstop in all joints. Two drains carry precipitation and free liquids into the adjoining wastewater treatment plant; this plant in turn discharges to the City of Pontiac POTW and is beholden to its discharge limitations. (No discharge excursions of any sort have occurred; therefore it may be concluded that runoff from hazardous waste operations may be properly handled in the wastewater treatment system.) Recent inspections of this facility indicate it to be in excellent condition with no apparent cracks or other evidences of failure.

2.3.2 Wastes Managed in the East Plant Waste Management Pad

The East Plant waste management pad received drummed waste paints, solvents, chlorinated solvents, non-hazardous sealers and adhesives, and empty drums generated in the East Plant until the end of 1984. At that time the plant shut down for retooling and the production operations were relocated to the Central plant. A new waste management pad was constructed at Pontiac East to be operated as an accumulation facility and the old waste management pad was converted to secondary containment for hazardous waste tanks being used by Pontiac Central plants. These tanks were relocated from another containment area (since closed and covered by a building expansion). These tanks are presently used for waste paint and waste solvent (listed wastes F003, F005). With the activation of a new tank group at Pontiac Central these tanks will be idled; neither Pontiac Central nor Pontiac East plants foresee reusing this installation.

The Pontiac East pad consists of a 4,500 square foot irregular concrete slab. During its use as a container management area it had 4 inch curbing all around; the diking was raised to 18" to provide tank secondary containment. The age and details of construction of this pad are not known but it serviced a plant constructed in 1972; visual inspection indicates it to be in excellent condition.

Previous hazardous wastes brought to this area in drums include:

1) Waste paints - F003, F005, D001
2) Waste solvents - F003, F005, D001
3) Chlorinated solvents - F001

Some containers of hazardous wastes may have remained in this area over 90 days. All containerized waste has long since been removed from this containment area; as noted previously its present use is solely as secondary containment for two hazardous waste storage tanks. These tanks have not leaked or overflowed since their installation in this area. The tanks are freestanding, with no associated pumps or piping.

2.4 Estimated Maximum Hazardous Waste Inventory

The following table lists the expected maxima of hazardous wastes to be found in either containment area. These maxima may not represent the current quantities stored as waste removal activities are ongoing.

Hazardous Waste	Tank/Container/Bulk	Central Pad	East Pad
CWT Sludge (F019)	Container	30 YD^3	-
Waste Paint (F003/ F005)	Tank	-	12,000 gal.
Waste Paint (F003/ F005)	Container	1,000 gal.	-
Waste Solvent (F003/ F005)	Tank	-	12,000 gal.
Waste Solvent (F003/ F005)	Container	1,000 gal.	-
Other Wastes			
Paint Sludges	Bulk	40 YD^3	-
Waste Oil	Tank	Gal.	-
Waste Glycol	Tank	Gal_3	-
Waste Sealers/Adhesives	Bulk	5 YD^3	-

3.0 Closure Methods

3.1 Central Plants Waste Management Pad

The Central plants waste management pad will continue in use as an accumulation facility; therefore, closure will entail removal of wastes and investigation only to the extent necessary to determine whether contamination has escaped the confines of the facility. If contamination is found outside the waste management area, closure will then encompass sampling, testing and removals as appropriate to define and abate the contaminated areas. As the production operations are dependent on this facility, half the area will be investigated, remediated and restored at a time. When closure is complete, the entire facility will be returned to operation.

3.2 East Plant Waste Management Pad

The East plants waste management pad will undergo decontamination sampling, testing and remediation as appropriate to render the area clean. Closure will be final; there are no plans to reactivate this facility in any capacity. The tanks will be decontaminated and stored for future reuse; the concrete will be cored and if contamination is found, excavated as necessary to define and abate any contamination. Restoration of any excavated areas following decontamination is at the option of Pontiac East Assembly and is not within the scope of this closure plan.

4.0 Decontamination Methods

4.1 Central Plants Waste Management Pad

The Pontiac Central waste management pad is to be divided into two sections by a concrete wall; this wall will serve as a barrier between the covered and open areas of the facility and will form the division between areas of investigation and closure activity: half the area will undergo closure while the other half remains active. Following is the decontamination method for either half.

All loose material will be removed by shoveling or scraping and disposed of in the same manner as paint sludge, i.e., secure landfill by preference. Following this, cleaning will proceed using high pressure or ultrahigh pressure water. The collected liquid will be disposed of to the wastewater treatment plant which routinely receives runoff from this area. Cleaning will be repeated until no solids appear in samples of the wash water. At this point the liquid from the cleaning activity will be sampled and analyzed for volatile organics, lead and chromium (VI) using the EPA methods described in Section 4.3. The pad will be considered clean when lead and chromium (VI) in the rinsate is not statistically above soil background, and volatile organic constituents are below detection limits. (Although cyanide is also a listed constituent of F019 sludges, no cyanide has been used in any process at Pontiac Central since 1967. The area being decontaminated dates from 1980; therefore, no cyanide was introduced to the pad.)

Soils underlying the waste management pad will be sampled by coring the concrete at the low points in each section of the pad. These low points will be adjacent to the drains in each section. Inspection of the pad for cracks or other evidence of loss of integrity will determine if other locations are to be sampled. The soil sampling procedure is described in section 5.1.2.

All sampling and handling procedures will be consistent with SW-846, Test Methods for Evaluating Solid Wastes (2nd edition).

4.2 East Plant Waste Management Area

The tanks at the Pontiac East facility will be emptied of all pumpable contents, then waterblasted to remove adhering residue using ultrahigh pressure equipment. Liquids generated by the cleaning process will be collected for disposal as an F003/F005 waste. The tank interior will be considered clean when volatile organic compounds in the rinsate are nondetectable. The tanks have no associated pumps or piping to be decontaminated. Following the cleaning of the tanks the concrete containment pad will be cleaned using high pressure water; the liquids collected will be disposed to the central wastewater system as was done for the Central plants waste management pad. Scrubbing will be repeated until no further residue can be collected. The liquid

collected will be analyzed for volatile organics, lead and chromium (VI) using EPA test methods described in section 4.3. The concrete will be considered clean when lead and chromium (VI) in the rinsate is not statistically above soil background at the 95% confidence level, and volatile organic compounds are below detection limits. All sampling and handling procedures will be in accordance with EPA SW-846, 'Test Methods for Evaluating Solid Waste' (second edition). Soils underlying the waste management pad will be sampled by coring the concrete at the indicated grid locations.

4.3 Test Methods

Analytical methods to be used to document decontamination are as follows:

Parameter	Test Method
Lead	SW-846 Method 7420 or 7421
Chromium (VI)	SW-846 Method 7195, 7196 or 7197
Volatile Organic Compounds	SW-846 - 8010, EPA Method 601 SW-846 - 8020, EPA Method 602

5.0 Closure Documentation

5.1 Central Plants Waste Management Pad

Documentation of closure of the central plants waste pad will consist of the following:

- Documentation of pad decontamination.
- Documentation of removal of underlying soils shown to contain hazardous wastes or hazardous constituents.

Documentation of closure in these areas is designed to be consistent with MDNR's draft guidance document 'how clean is clean'.

5.1.2. Sampling of Underlying Soils

The sampling points are shown in figure 5-1. Owing to the small area involved, a maximum of nine samples will be collected. At a minimum, the samples will be drawn at the lowest point in each area, with additional samples taken at cracks if any are found to be present following cleaning. Soil samples will be taken initially at the 0-.5 foot and .5-1.0 foot level. Samples will be taken with a hand auger through the concrete coring. Between samples the sampling auger will be decontaminated by scraping off adhering soils, washing with detergent and rinsing with distilled or deionized water. The following procedure will be used to analyze and interpret the soils samples obtained.

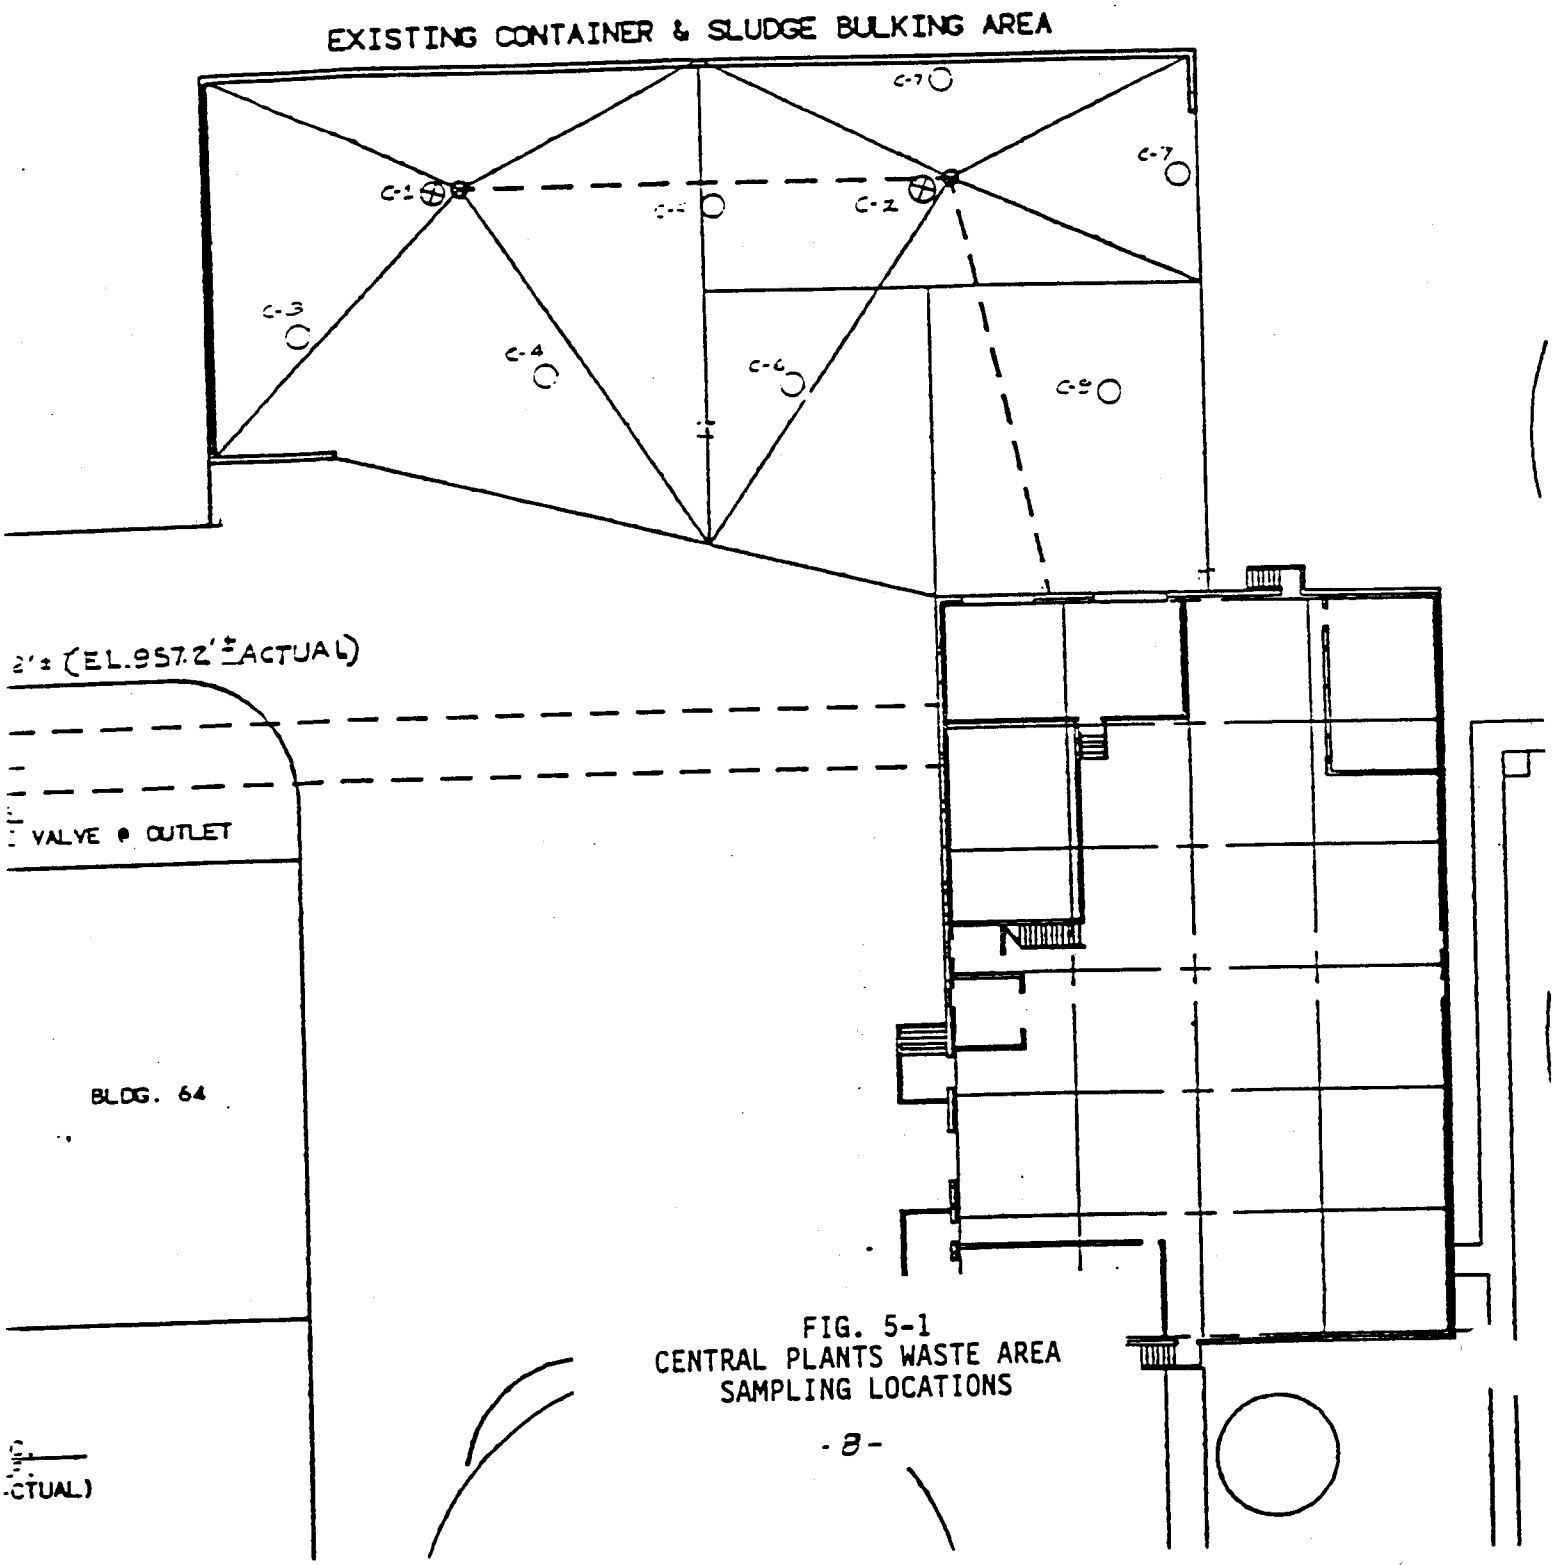

FIG. 5-1
CENTRAL PLANTS WASTE AREA
SAMPLING LOCATIONS

5.1.2 a Establishing Soil Background

Background soil parameters will be determined by samples taken at six background locations as indicated on Figure 2-1. The samples will be collected from approximately the same soil types and elevations as the soils underlying the pad. The background soil samples will be analyzed for total metals.

5.1.2 b Soils Analyses

These analyses may be performed on samples taken at the site:

- Total metals analyses for lead and chrome (VI)
- EP toxicity for lead and chrome (VI)
- Photoionization detection readings
- Volatile organics (methods 601 and 602)

Total metal concentrations of the underlying soils will be compared with the levels in the background samples to determine if contaminants have penetrated the concrete pad and impacted the underlying soils. Comparison will be by the Gossett Student's T-test at the 95% confidence level. This method is used to determine if a statistically significant difference exists between background soils and soils in areas at risk of contamination. If a statistically significant difference is found, soils impaction by contaminants will be presumed to have occurred. EP toxicity analyses of soils samples showing statistically elevated levels of metals will determine the disposition of impacted soils requiring removal. If the EP toxicity threshold levels are exceeded the soils will be removed and disposed as a hazardous waste. If the EP toxicity thresholds are not exceeded the soils will be removed and disposed as an Act 641 waste.

Photoionization detection (PID) readings will be taken at the site with a PID meter at the sampling location identified. The meter will be calibrated according to the manufacturer's recommendations. Readings will be taken on all samples from various depths at each location. Samples will be placed in sample jars and covered with foil. After 30 minutes the instrument probe will be inserted through the foil into the sample jar headspace and a reading taken.

If the samples taken at the shallowest depth indicate that volatile organics are present, samples will be taken from the next lowest level and tested in a like manner. The process will be repeated until a sample is obtained which yields a negative result with the PID meter. This sampling level will then be sampled using appropriate containers for volatile organics analysis (40 ml vials).

Laboratory VOA will be made using EPA method 601 for purgeable halocarbons hand method 602 for aromatic hydrocarbons. Samples taken will observe appropriate sample preservation and chain of custody practices.

The sample screening technique described above is designed to expedite the portion of the closure process devoted to definition of the scope of remediation, while still meeting the intent of MDNR's closure guidelines. This procedure will ensure that at least one sample from each sampling location undergoes analysis for volatile organics using EPA methods 601 and 602.

5.1.2 c Criteria for Determination of Scope of Removal

If the following criteria are all met the soil will be left in place:

- Volatile organic compounds using EPA methods 601 and 602 are nondetectable.

- Total lead and chrome (VI) are not statistically above background according to the Gossett Student's T-test.

If soils at any sampling plant fail either criteria they will be removed. Removal of soil around a contaminated point will be within a radius equal to the distance between adjacent boring locations. Soils determined to be contaminated with metals statistically above background, but below EP toxicity limits, will be disposed of as an act 641 waste. Soils contaminated with metals above EP toxicity limits or with volatile organics will be disposed of as an Act 64 waste.

Following removal of the lowest confirmed contaminated level, additional samples will be taken of the next level and analyzed for the contaminants found in the previous level. If contaminants are found, additional soil removal will be performed. If no contaminants are found, cleanup is complete.

5.1.2 d Restoration of Concrete Containment

Since the Central plants waste management pad is to continue in service after decontamination, the facility will be restored following soils sampling and any soils removal. After all contamination has been removed, the underlying voids will be backfilled and compacted to original grade. Reinforcing mesh will be placed and the original concrete edges will be treated with an epoxy bonding agent, per the manufacturer's instructions, to ensure a seal between the new and existing concrete. Corings where no contamination was found will be repaired in a similar manner with the exception of reinforcing steel.

5.2 Pontiac East Waste Management Area

5.2.1 Decontamination of Tanks

The tanks at Pontiac East managed listed hazardous wastes (paint and solvents, EPA codes F003, F005). All pumpable waste will be removed and disposed of in the normal manner. Following this the

tanks will be cleaned three times using high pressure or ultrahigh pressure water. Liquids generated from the first cleaning at a minimum will be disposed of as a listed hazardous waste; waste from subsequent cleanings will be tested to determine its acceptability in the central wastewater treatment system. The tanks will be considered clean when the rinsate contains nondetectable levels of volatile organics as determined by EPA methods 601 and 602.

5.2.2 Cleaning of Containment Area

Following the tank cleaning the concrete containment area will be cleaned by high pressure water. The rinsate will be collected and analyzed for volatile organics using EPA methods 601 and 602. The concrete will be considered clean when volatile organics in the rinsewater are nondetectable by the above methods.

5.2.3 Sampling of Underlying Soils

The sampling locations are shown in figure 5-2. Owing to the small area involved a maximum of nine samples will be collected. At a minimum, samples will be collected in low areas and cracked or otherwise unsound locations of the containment area. Soils samples will be taken at 0-.5 feet and .5-1.0 feet below the bottom of the concrete slab. Samples will be taken with a hand auger through the concrete coring. Between samples the sampling auger will be decontaminated by scraping off adhering soils, followed by washing with detergent and rinsing with distilled or deionized water.

The following procedure will be used to analyze and interpret the soil samples obtained.

5.2.3 a Establishing Soil Background

Background soil parameters will be as determined from soil samples taken at six background locations as shown on Figure 2-1. The samples will be taken from approximately the same soil types and elevations as the soils underlying the pad. The background samples will be analyzed for total metals.

5.2.3 b Soils Analyses

These analyses may be performed on samples taken at the site.

- Total metals analyses for lead and chrome (VI).
- EP toxicity for lead and chrome (VI).
- Photoionization detection readings.
- Volatile organics (EPA methods 601 and 602)

Total metals concentrations of the underlying soils will be compared with the levels in the background samples to determine if contaminants have penetrated the concrete pad and impacted the

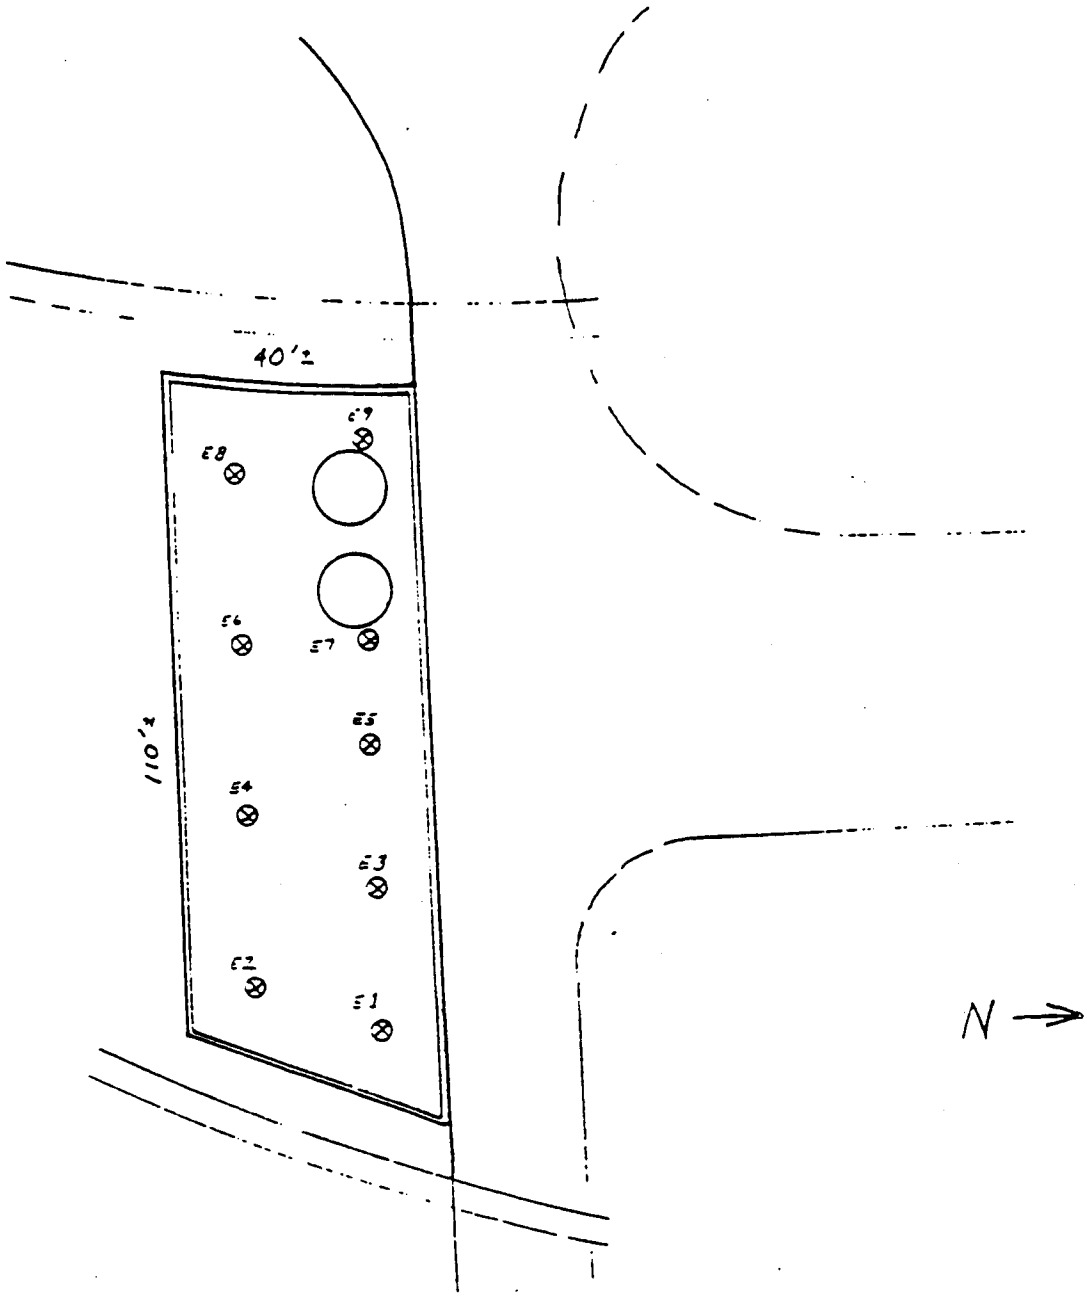

FIG. 5-2
EAST PLANT WASTE AREA
SAMPLING LOCATIONS

underlying soils. Comparison will be by the Gossett Student's T-test. This method is used to determine if a statistically significant difference exists between the background soils and soils in areas at risk of contamination. If a statistically significant difference is found, soils impaction by contaminants will be presumed to have occurred. EP toxicity analyses of soils showing statistically elevated levels of metals will determine the disposition of impacted soils requiring removal. If the EP toxicity thresholds are exceeded the soils will be removed and disposed of as a hazardous waste. If the EP toxicity thresholds are not exceeded the soils will be removed and disposed of as an Act 641 waste.

Photoionization detection (PID) readings will be taken at the site with a PID meter at each identified sampling location. The meter will be calibrated according to the manufacturer's recommendations. Readings will be taken on all samples from various depths at each location. Samples will be placed in glass sample jars and covered with foil. After 30 minutes the meter probe will be inserted through the foil into the sample jar headspeace and a reading taken.

If readings taken on samples from the shallowest depth indicate volatile organics are present, samples will be taken from the next lowest level and tested in a similar manner. The process will be repeated until a sample is obtained which yields a negative result with a PID meter. This sampling level will then be sampled will then be sampled using appropriate methods and containers for volatile organics analysis (40 ml glass vials).

Laboratory VOA will be made using EPA method 601 for purgeable halocarbons and EPA method 602 for aromatic hydrocarbons. Samples taken will observe appropriate sample preservation and chain of custody practices.

The sample screening technique described above is designed to expedite the portion of the closure process devoted to definition of the scope of remediation, while still meeting the intent of EPA's closure guidelines. The procedure will ensure that at least one sample from each sampling location undergoes analysis for volatile organics using EPA methods 601 and 602.

5.2.3 C Criteria for Determination of Scope of Removal

If the following criteria are all met the soils will be left in place:

- Volatile organics using EPA methods 601 and 602 are nondetectable.
- Total lead and chrome (VI) are not statistically above background according to the Gossett Student's T-test.

If soils and any sampling location fail either criteria they will be removed. Removal of soil around a contaminated area will be within a radius equal to the distance between adjacent boring locations.

Soils determined to be contaminated with metals statistically above background, but below EP toxicity limits, will be disposed of as an Act 641 waste. Soils contaminated with metals above EP toxicity limits or with organics will be disposed of as an Act 64 waste.

Following removal of the lowest confirmed contaminated level, additional samples will be taken of the next level and analyzed for the contaminents found in the previous level. If contaminants are found, additional soil removals will be performed. If no contaminants are found, cleanup is complete.

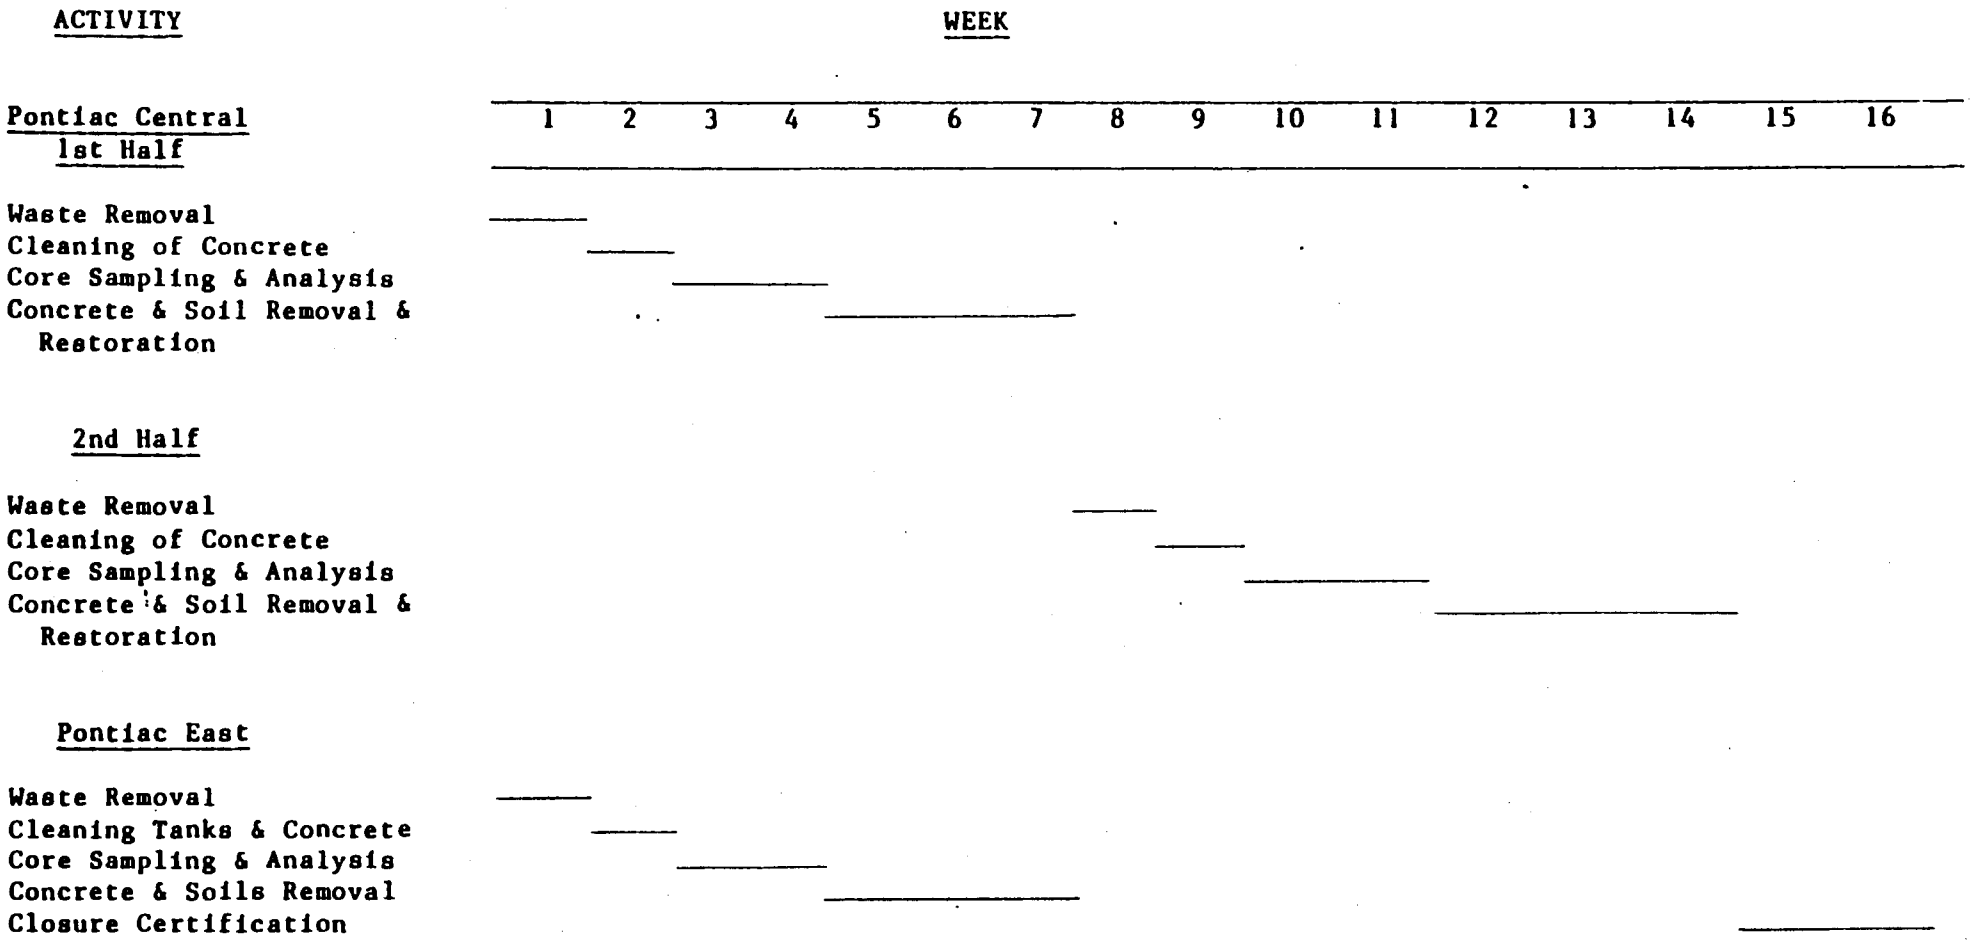
As no reuse of this area is contemplated once closure is completed, restoration of the area is not within the scope of closure.

6.0 Decontamination of Equipment

Heavy equipment used in soils excavation will be cleaned with high pressure water in a contained area. The collected rinsate will be tested to determine its acceptability in the central wastewater treatment system. The equipment shall be considered clean when the rinsate contains nondetectable concentrations of volatile organics using EPA methods 601 and 602.

7.0 Closure Documentation Report

Upon completion of onsite closure activities GM Truck & Bus Pontiac will submit to MDNR a report documenting that closure activities were conducted according to the approved closure plan. The items addressed in the report will include all the applicable items in MDNR's 'draft certification closure checklist'. The documentation report will be signed and sealed by a registered professional engineer. Truck & Bus - Pontiac will also submit a letter to MDNR certifying that closure was completed according to the approved closure plan.



8.0 Estimated Closure Schedule

Truck & Bus - Pontiac will begin closure activity within 30 days of receipt of approval of the closure plan. The closure schedule detailed in figure 6-1 is predicated upon receipt of approval during a season when frost is not or will not become an impediment to closure sampling and remediation activities.

9.0 Closure Cost Estimate

The estimated cost to close the hazardous waste storage areas at Truck & Bus - Pontiac is estimated at $45,000 to $50,000. Table 6-2 details the costs associated with closure.

FIG. 6-1
CLOSURE SCHEDULE

Mr. D. S. Harrett
Environmental Engineering
GMC - Truck & Bus Group
31 Judson Street
Pontiac, Michigan 48058

Dear Mr. Harrett:

SUBJECT: Revised Closure Plan
Truck & Bus Central and East Plants
MID 005 356 902

The Michigan Department of Natural Resources (MDNR) has completed a review of your revised closure plan dated December 2, 1987, pursuant to the requirements of 40 CFR, Part 265, which are adopted by reference in MAC R 299.11003 of the Act 64 administrative rules. Based on this review, and the fact that no significant comments were received during the 30-day public comment period, the MDNR hereby approves your closure plan subject to the conditions enclosed with this letter.

Closure of RCRA interim status units does not release the facility from its responsibilities under the Hazardous and Solid Waste Amendments of 1984 (HSWA). All interim status facilities are subject to the corrective action requirements of these amendments.

If you have any questions, please contact Ms. Andrea Schoenrock, of my staff, at 517-373-3988.

Sincerely,

Alan J. Howard, Chief
Waste Management Division
517-373-2730

APPENDIX B1

AMENDMENT TO CLOSURE PLAN REQUEST

Truck & Bus Group
General Motors Corporation
31 Judson Street
Pontiac, Michigan 48058

Truck & Bus Group

November 13, 1990

Liane Shekter Smith
Michigan DNR
Waste Management Division
S. Ottawa Building
P.O. Box 30241
Lansing, MI 48909

SUBJECT: Closure of Truck & Bus Pontiac Central Assembly
Hazardous Waste Storage Area (MID 005356902)

Dear Ms. Smith,

On November 8, 1990, at a meeting between Michigan Department of Natural Resources (MDNR) and General Motors (GM) representatives, the MDNR suggested that an amendment to the closure plan, for the subject facility, be made. Specifically, this amendment would clarify that constituents, detected during the implementation of the closure plan, that did not originate from hazardous waste activities at the unit, need not be addressed during closure. This letter is a request for an amendment to the closure plan for the subject facility.

The unit at the subject facility consists of a drum storage pad and a waste pile. During implementation of the closure plan, Phase II sampling indicated the presence of very low levels of xylene at two locations under the unit. In a letter, dated September 12, 1990, the presence of the xylene was demonstrated not to have originated from hazardous waste activities at the unit. The MDNR concurred with this position in a letter dated October 16, 1990 from Alan J. Howard to GM. GM Truck & Bus will further investigate the extent and significance of the presence of xylene after closure of this unit.

The requested amendment can be accomplished by adding language to Section 5.1.2 c of the closure plan. The attached pages show the current and suggested revised wording for the applicable section of the closure plan. With this change the closure plan will distinguish between detected constituents that originated from hazardous waste activities at the unit and those originating from other sources.

As requested in the above referenced October 16, 1990 letter, a revised schedule is attached. This revised schedule represents the work that will be performed during the remainder of the closure period. Although some activities are concurrent and are not reliant upon other activities, the dates shown on the schedule are subject to change. The actual dates depend upon several factors including but not limited to lab turn-around time and results of verification sampling. Currently it is not expected that any additional time will be required, beyond April 16, 1991, to complete closure of the unit. If, however, problems arise that would necessitate more time, a request will be made within 30 days of the unexpected event and at least 30 days prior to the end of the closure period.

If you have any questions or concerns, please call me at (313) 456-2289.

Sincerely,

Steven R. Thurman
GM Truck & Bus Group

Chuck Wyrick, GM T&B - Pontiac Central

5.1.2 c Criteria for Determination of Scope of Removal

If the following criteria are all met, the soil will be left in place:

- Volatile organic compounds using EPA methods 601 and 602 are non-detectable
- Total lead and chromium (VI) are not statistically above background according to the Gossett Student's T-test.

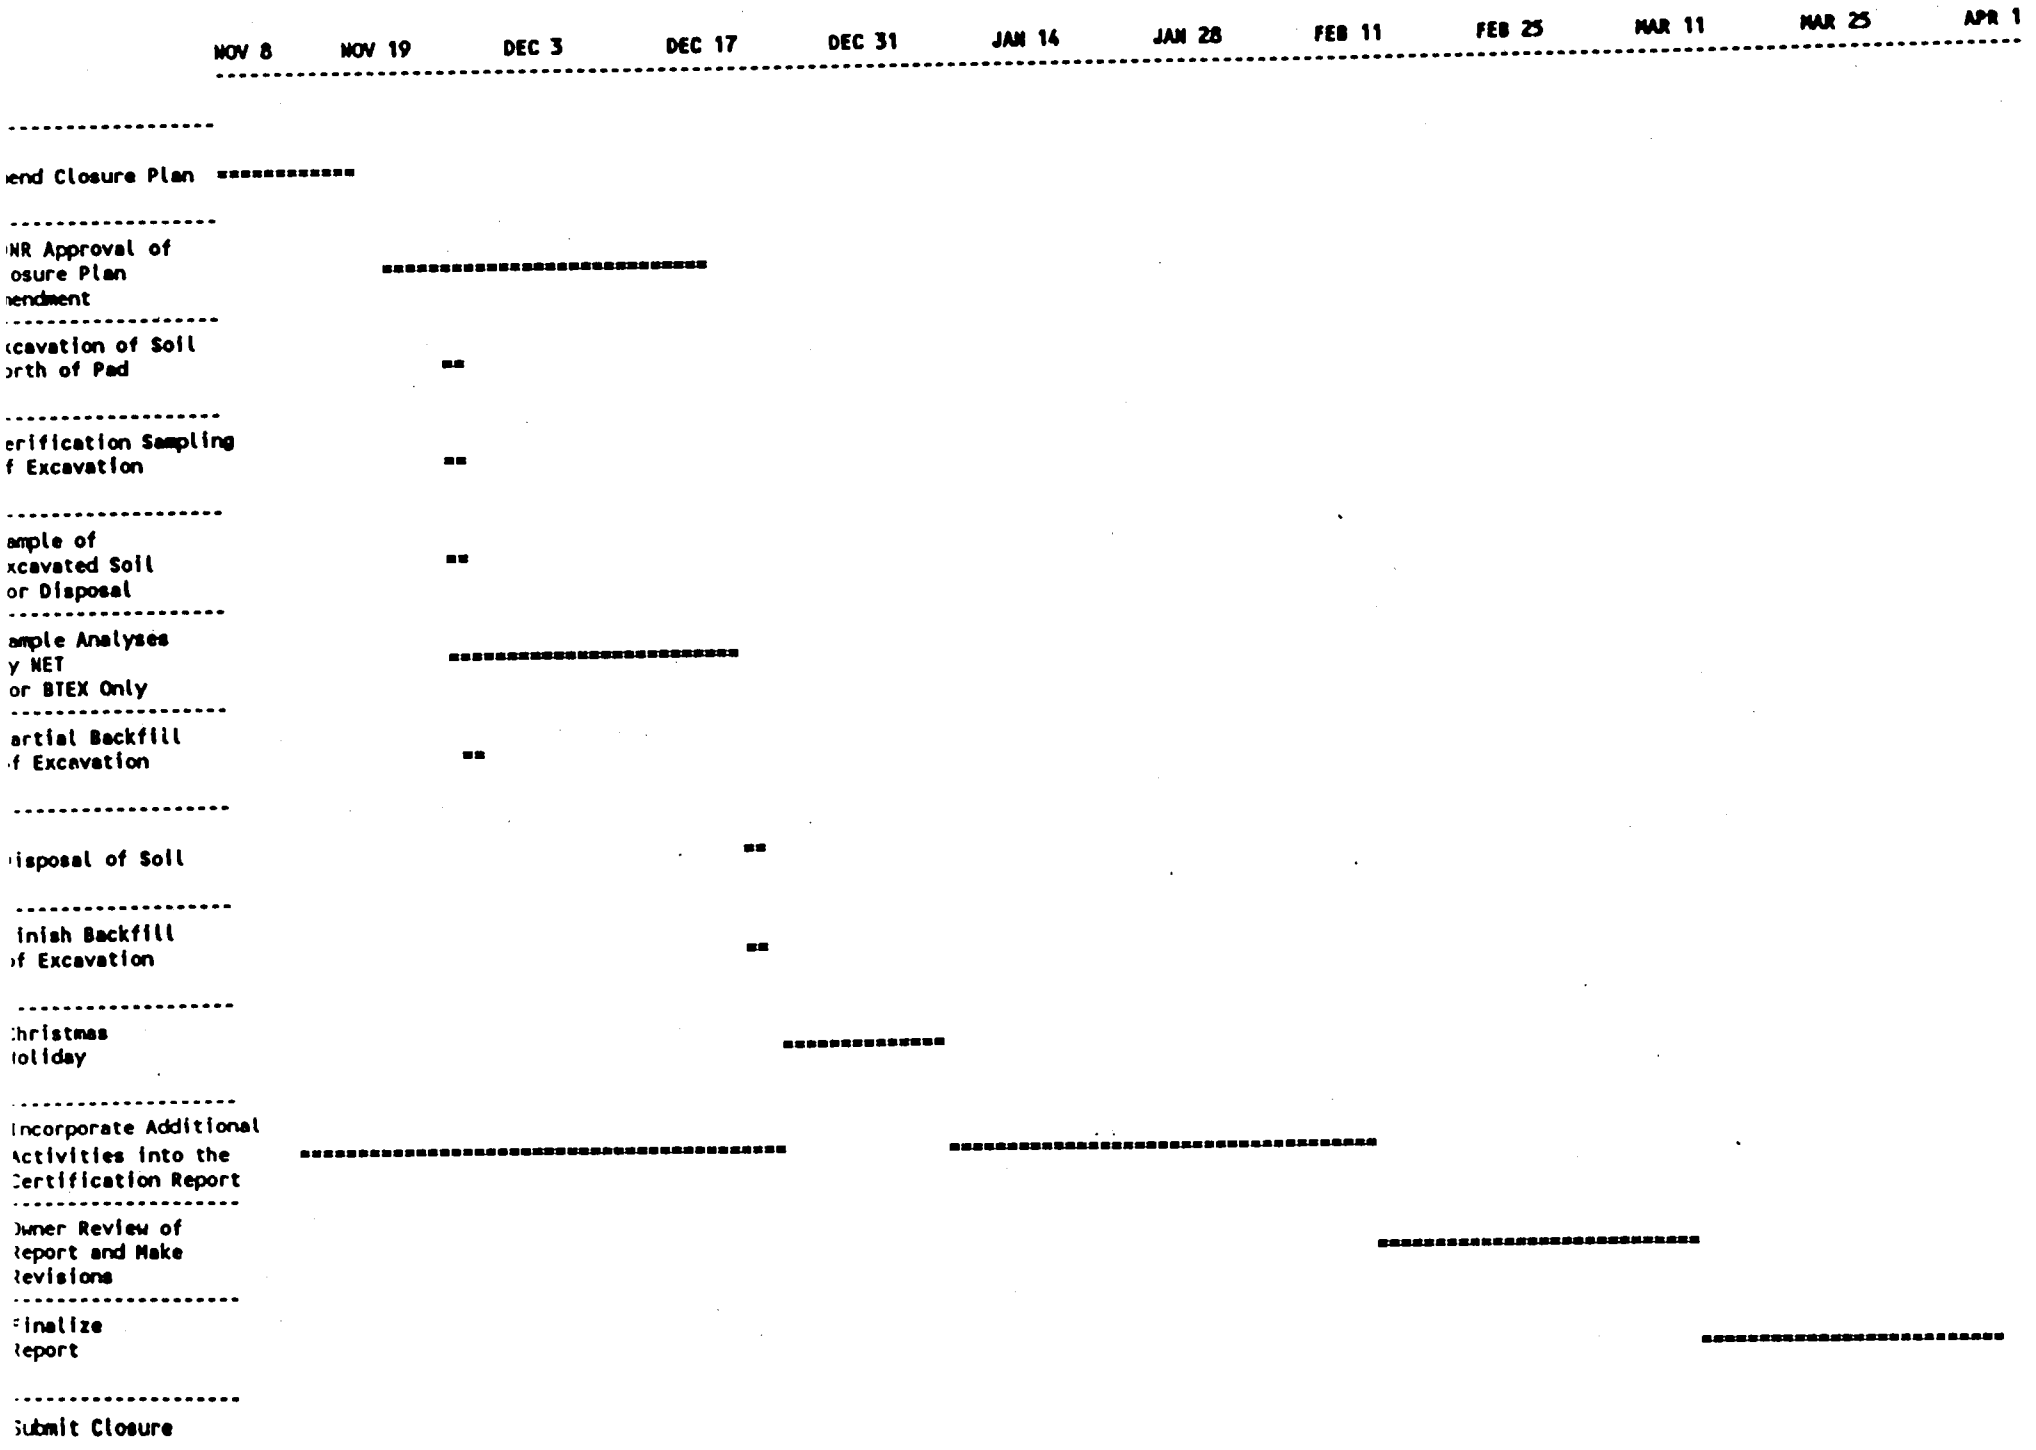
If soils at any sampling point fail either criteria they will be removed. Removal of soil around a contaminated point will be within a radius equal to the distance between adjacent boring locations. Soils determined to be contaminated with metals statistically above background, but below EP toxicity limits, will be disposed of as an Act 641 waste. Soils contaminated with metals above toxicity limits or with volatile organics will be disposed of as an Act 64 waste.

Following removal of the lowest confirmed contaminated level, additional samples will be taken of the next level and analyzed for the contaminants found in the previous level. If contaminants are found, additional soil removal will be performed. If no contaminants are found, cleanup is complete.

5.1.2 c Criteria for Determination of Scope of Removal

If the following criteria are all met, the soil will be left in place:

- Volatile organic compounds using EPA methods 601 and 602 are non-detectable
- Total lead and chromium (VI) are not statistically above background according to the Gossett Student's T-test.



If soils at any sampling point fail either criteria they will be removed.

If it is demonstrated that the reason for failure of either of the above criteria is due to sources other than hazardous waste activity at the unit, this fact will be documented and the soils will be left in place. In addition, detection of constituents that originate from other sources does not warrant expanding the investigation for purposes of obtaining a determination of clean closure. Although not addressed during closure, these constituents that are demonstrated to have originated from other sources, may be subject to corrective action requirements under the federal Hazardous and Solid Waste Amendments of 1984 (HSWA) to the Resource Conservation and Recovery Act of 1976 (RCRA).

Removal of soil around a contaminated point will be within a radius equal to the distance between adjacent boring locations. Soils determined to be contaminated with metals statistically above background, but below EP toxicity limits, will be disposed of as an Act 641 waste. Soils contaminated with metals above toxicity limits or with volatile organics will be disposed of as an Act 64 waste.

Following removal of the lowest confirmed contaminated level, additional samples will be taken of the next level and analyzed for the contaminants found in the previous level. If contaminants are found, additional soil removal will be performed. If no contaminants are found, cleanup is complete.

CENTRAL PLAN

Mr. Steven R. Thurman
General Motors Corporation
Truck & Bus Group
Central Office Plant Engineering
31 Judson Street
Pontiac, Michigan 48058

Dear Mr. Thurman:

SUBJECT: Closure Plan Amendment Approval
Hazardous Waste Storage Area
Pontiac Central Assembly
MID 005 356 902

The Michigan Department of Natural Resources (Department), Waste Management Division, has completed its review of the closure plan amendment request, submitted November 15, 1990. Based on this review, and the fact that no significant comments were received during the public comment period, the Department hereby approves the closure plan amendment for the hazardous waste management area at its facility located at 660 South Boulevard East in Pontiac, Michigan. In accordance with R 299.9601(3) and 40 CFR 265.112(d)(4), which is adopted by reference in R 299.11003, the modified closure plan is the approved closure plan.

The approved closure plan amendment modifies the criteria specified in the closure plan governing the scope of required remediation. The approved closure plan amendment specifies that organic contamination, which originated from sources other than hazardous waste activities at the unit, will be addressed as part of the corrective action requirements under the federal Hazardous and Solid Waste Amendments of 1984 (HSWA) to the Resource Conservation and Recovery Act of 1976 (RCRA). As a reminder, closure of interim status units does not release General Motors Corporation from any plant-wide corrective action responsibilities it may have under HSWA and RCRA.

If you have any questions or comments, please contact Ms. Liane Shekter Smith of the Hazardous Waste Permits Section at 517-335-4790.

Sincerely,

Alan J. Howard, Chief
Waste Management Division

CENTRAL

Mr. Steven R. Thurman
Central Office Plant Engineering
Truck & Bus Group
General Motors Corporation
31 Judson Street
Pontiac, Michigan 48058

Dear Mr. Thurman:

SUBJECT: Closure Certification Documentation Package
Hazardous Waste Storage Area
Pontiac Central Assembly
MID 005 356 902

The Michigan Department of Natural Resources (MDNR), Waste Management Division (WMD), has reviewed the closure certification for the hazardous waste storage area located at Pontiac Central Assembly pursuant to the Michigan Hazardous Waste Management Act, 1979 P.A. 64, as amended. Your submittal, received on April 18, 1990, is not complete. WMD is therefore unable to release General Motors Corporation from the financial capability requirements for closure and liability coverage under Part 7 of the Act 64 Rules. As we discussed at our meeting May 2, 1990, additional soil sampling must be performed and documentation submitted to WMD for your closure certification to be considered complete.

Additional Soil Sampling

The approved closure plan required that "inspection of the pad for cracks or other evidence of loss of integrity will determine if other locations are to be sampled." The closure certification document states that sludge has spilled outside the dikes of the bulking area onto the soil, that the concrete pad shows evidence of pitting to the point of exposing the steel reinforcing rods, and that at several of the joints the waterstops are in poor condition or missing. These conditions all describe severe loss of integrity of the uncovered pad. Therefore, additional soil sampling is required in order to fulfill the requirements of the approved closure plan and determine whether contamination has escaped the confines of the hazardous waste management area.

Consistent with the approved closure plan, the following soil sampling plan must be implemented by General Motors Corporation at the hazardous

waste management area of the Pontiac Central assembly facility. These activities are still part of Pontiac Central's closure process and must be conducted according to the approved closure plan and the additional requirements included in this letter. Any concrete coring, soil sampling, sample management, decontamination, rinsate management or other closure activities must be performed in a similar manner so that the data collected as part of this additional sampling event will be comparable to the existing sampling results, and to ensure protection of the environment in accordance with 40 CFR 265.111 the closure performance standard.

Soil samples, at a minimum, must be obtained from the locations shown on the figure enclosed. These locations represent areas of concern which were not previously sampled. Samples must be obtained from the same depths and intervals as the previous samples, and placed in appropriate containers and stored in the same manner as the previous samples. Analytical testing on these soil samples must consist of the same analytical parameters as required in the approved closure plan using the appropriate analytical methods. The approved closure plan did not specify required detection limits for these analyses, therefore, the detection limits in the attached table must be incorporated into any additional analytical work done at the site. These detection limits are consistent with the detection limits achieved by the MDNR Environmental Laboratory.

Conditions for determining if soils are contaminated, for removal of contaminated soils and disposal requirements are presented in the approved closure plan, and must be followed. However, the statistical comparison of inorganic analytical data to the background results should be done utilizing the four lowest values of the six background samples which were analyzed, B-1, B-4, B-5 and B-6. Samples B-2 and B-3 had elevated lead levels inconsistent with the other background lead values, with the samples obtained so far at the hazardous waste management area at Pontiac Central and with typical lead values from the samples obtained as part of the closure activities for the hazardous waste management area at Pontiac East. Therefore, samples B-2 and B-3 are not believed to represent background conditions for lead in the on-site soils.

Since these elevated lead levels are not suspected as having resulted from hazardous waste management activities at the interim status unit, further delineation of potential soil contamination at these locations (B-2 and B-3) will <u>not</u> be required as part of closure of the unit. However, closure of the interim status unit does not release General Motors Corporation from any plant-wide corrective action responsibilities under the federal Hazardous and Solid Waste Amendments of 1984 (HSWA) to the Resource Conservation and Recovery Act of 1976 (RCRA).

Closure activities must be performed within the allotted time for the closure period. Since closure at this facility began on January 16, 1990, closure activities are required to be completed by July 16, 1990. In accordance with 40 CFR §265.113(b), General Motors Corporation must adhere to the schedule of actions specified by the plan. Failure to

comply with the approved plan makes the facility liable for formal enforcement action.

Additional Documentation

The following additional documentation is required as part of your closure certification documentation package:

-- Certification statements must be provided by General Motors Corporation and by an independent, registered engineer. These statements must be supplemented by the language provided in 40 CFR §270.11(d). In addition, the closure certification must include documentation that the official signing the closure certification statement for General Motors Corporation is authorized to do so as specified in 40 CFR §270.11.

-- A copy of the approved closure plan and letter of closure plan approval must be included in the closure certification documentation package.

-- Copies of the soil boring logs or equivalent field information for the six background samples must be included. The soil boring logs should identify when and where the samples were obtained, the depth and interval of each sample, and the type of soil material that was sampled (i.e., silty sand, clayey silt, etc.). In addition, a labelled location plan must also be included.

-- The closure certification must include the dates on which various closure activities were performed.

-- Supporting documentation must be provided in order to substantiate the theory that volatile organic contamination in the washwater may be the result of ambient conditions.

Approved Closure Plan Amendment Process

Please note that the requirements in this letter do not reflect an amendment to your closure plan, but rather clarification of the requirements of your approved closure plan. If you wish to deviate from the approved closure plan in any way, you must first obtain written approval from the Department pursuant to the formal procedures and substantive criteria established in 40 CFR §265.112(c) for amending approved closure plans, adopted by reference in Michigan's Administrative Rules 299.9601(1) and (3), and 299.11003. These rules require that a facility with an approved closure plan may submit a written request to authorize a change to the approved closure plan according to the following schedule:

a) 60 days prior to a proposed change in facility design or operation;

b) within 60 days after an unexpected event which has affected the closure plan;

c) within 30 days after an unexpected event which occurs during the closure period.

A requested closure plan amendment must be approved by the Department prior to implementation by the facility. As a reminder, any request to extend the closure period must be submitted to WMD at least 30 days prior to the expiration of the 180-day closure period, as required by 40 CFR §265.113(c). In addition, a closure certification documentation package must be submitted to WMD within 60 days of completion of closure activities as required by 40 CFR §265.115.

If you have any questions, please contact me.

Sincerely,

Liane J. Shekter Smith

Dear Mr. Harrett:

SUBJECT: Revised Closure Plan
Truck & Bus Central and East Plants
MID 005 356 902

The Michigan Department of Natural Resources (MDNR) has completed a review of your revised closure plan dated December 2, 1987, pursuant to the requirements of 40 CFR, Part 265, which are adopted by reference in MAC R 299.11003 of the Act 64 administrative rules. Based on this review, and the fact that no significant comments were received during the 30-day public comment period, the MDNR hereby approves your closure plan subject to the conditions enclosed with this letter.

Closure of RCRA interim status units does not release the facility from its responsibilities under the Hazardous and Solid Waste Amendments of 1984 (HSWA). All interim status facilities are subject to the corrective ıction requirements of these amendments.

f you have any questions, please contact Ms. Andrea Schoenrock, of my taff, at 517-373-3988.

Sincerely,

Alan J. Howard, Chief
Waste Management Division

SUBJECT: Closure Activities-Additional Work Plan
Hazardous Waste Management Area
Pontiac East Assembly
MID 005 356 902

The Michigan Department of Natural Resources, Waste Management Division (WMD), has completed its review of GMC Truck & Bus Group-Pontiac East Assembly's (GMC-PEA) work plan for the above referenced hazardous waste management area, submitted on September 21, 1989.

The work plan was prepared by GMC-PEA following initial closure activities for the hazardous waste management area pursuant to the closure plan submitted on December 4, 1987, and approved by WMD on March 7, 1988. The work plan, as modified by the attached "Conditions for Approval," is hereby approved.

If you have any questions regarding this approval, please contact Ms. Liane Shekter Smith of my staff at 517-335-4790.

Sincerely,

Alan J. Howard, Chief
Waste Management Division
517-373-9523

Conditions for Approval

General Motors Corporation
Truck & Bus Group
Pontiac East Assembly
820 S. Opdyke Road
Pontiac, Michigan 48053

MID 005 356 902

1. The statistical comparison of inorganic analytical data to the background results shall be done utilizing the four lowest values of the six background samples which were analyzed.

2. The limit of detection for soil samples analyzed for lead using SW-846 method 7420 shall be 10 mg/kg. The limit of detection for soil samples analyzed for MDNR Scan II compounds using SW-846 Method 8020 shall be 20 ug/kg. These levels shall be confirmed with the analytical laboratory prior to sampling.

3. Excavated materials shall be placed in roll off boxes and covered as described in the work plan. These contaminated materials shall then be sampled and tested as necessary to determine if the contaminated materials are hazardous waste. A minimum of four (4) samples shall be required to characterize the waste for disposal.

4. All hazardous wastes shall be disposed in accordance with the land disposal restrictions specified in 40 CFR Part 268.

5. If unexpected conditions develop or an unexpected event occurs during these activities which necessitates an amended closure plan or work plan, then an amended closure plan or work plan shall be submitted within 30 days after the unexpected event to WMD for approval.

6. After the concrete has been removed from the hazardous waste management area, steps shall be taken to ensure that contaminated soils are not exposed. The area shall be tarped or soil materials shall be excavated and placed in covered containers while awaiting necessary analytical results.

7. In addition to the sampling strategy described in the work plan, two confirmatory samples shall be obtained and analyzed for total lead (SW-846 Method 7420) and MDNR Scan II (SW-846 Method 8020) from the western area of the hazardous waste management area. The samples shall be taken at an approximate depth of six (6) inches at locations determined by GMC-PEA and approved by WMD.

8. Soil sampling at locations E-10 and E-11 shall be conducted in the same manner as described for E-1 through E-3 in the work plan. All samples taken at these locations (E-1 through E-3, E-10 and E-11)

shall be analyzed for total lead and MDNR Scan II as described in the work plan and subject to the conditions specified herein.

9. The third paragraph on page 4 shall be modified to reflect that contaminated soils will be landfilled at the Wayne Disposal facility consistent with paragraph four on the same page.

Dear Mr. Gembel:

SUBJECT: Release from Financial Capability Requirements for Closure
Hazardous Waste Storage Area
Pontiac East Assembly, MID 005 356 902

The Michigan Department of Natural Resources has completed a review of the closure certification for the facility referenced above pursuant to the Michigan Hazardous Waste Management Act, 1979 P.A. 64, as amended (Act 64). Based upon your closure certification submitted September 7, 1990, General Motors Corporation, Pontiac East Assembly, is hereby released from the financial capability requirements for closure of the hazardous waste storage area at the Pontiac East Assembly facility under Part 7 of the Act 64 Rules. General Motors Corporation is therefore no longer required to use the corporate guarantee to demonstrate financial capability for closure of the hazardous waste storage area, at the Pontiac East Assembly facility. Please note that closure of the entire facility (Pontiac East Assembly and Pontiac Central Assembly) will not be completed until a complete closure certification is received for the hazardous waste management area at the Pontiac Central Assembly facility, as these plants are identified under one U.S. EPA identification number.

This release of the financial capability requirement for the closure of the hazardous waste storage area at Pontiac East Assembly does not release your company from any corrective action responsibilities under the Resource Conservation and Recovery Act of 1976, as amended by the Hazardous and Solid Waste Amendments of 1984.

Please contact Ms. Liane Shekter Smith of the Waste Management Division at 517-335-4790, if you have any questions regarding this matter.

Sincerely,

David F. Hales

CENTRAL [illegible]

Mr. Steven R. Thurman
General Motors Corporation
Truck & Bus Group
Central Office Plant Engineering
31 Judson Street
Pontiac, Michigan 48058

Dear Mr. Thurman:

SUBJECT: Closure Plan Amendment Approval
Hazardous Waste Storage Area
Pontiac Central Assembly
MID 005 356 902

The Michigan Department of Natural Resources (Department), Waste Management Division, has completed its review of the closure plan amendment request, submitted November 15, 1990. Based on this review, and the fact that no significant comments were received during the public comment period, the Department hereby approves the closure plan amendment for the hazardous waste management area at its facility located at 660 South Boulevard East in Pontiac, Michigan. In accordance with R 299.9601(3) and 40 CFR 265.112(d)(4), which is adopted by reference in R 299.11003, the modified closure plan is the approved closure plan.

The approved closure plan amendment modifies the criteria specified in the closure plan governing the scope of required remediation. The approved closure plan amendment specifies that organic contamination, which originated from sources other than hazardous waste activities at the unit, will be addressed as part of the corrective action requirements under the federal Hazardous and Solid Waste Amendments of 1984 (HSWA) to the Resource Conservation and Recovery Act of 1976 (RCRA). As a reminder, closure of interim status units does not release General Motors Corporation from any plant-wide corrective action responsibilities it may have under HSWA and RCRA.

If you have any questions or comments, please contact Ms. Liane Shekter Smith of the Hazardous Waste Permits Section at 517-335-4790.

Sincerely,

Alan J. Howard, Chief
Waste Management Division

Mr. Ken Gembel
General Motors Corporation
Truck & Bus Group
Pontiac East Assembly
31 Judson Street
Pontiac, Michigan 48058

Dear Mr. Gembel:

SUBJECT: Release from Financial Capability Requirements for Closure
Hazardous Waste Storage Area
Pontiac East Assembly, MID 005 356 902

The Michigan Department of Natural Resources has completed a review of the closure certification for the facility referenced above pursuant to the Michigan Hazardous Waste Management Act, 1979 P.A. 64, as amended (Act 64). Based upon your closure certification submitted September 7, 1990, General Motors Corporation, Pontiac East Assembly, is hereby released from the financial capability requirements for closure of the hazardous waste storage area at the Pontiac East Assembly facility under Part 7 of the Act 64 Rules. General Motors Corporation is therefore no longer required to use the corporate guarantee to demonstrate financial capability for closure of the hazardous waste storage area, at the Pontiac East Assembly facility. Please note that closure of the entire facility (Pontiac East Assembly and Pontiac Central Assembly) will not be completed until a complete closure certification is received for the hazardous waste management area at the Pontiac Central Assembly facility, as these plants are identified under one U.S. EPA identification number.

This release of the financial capability requirement for the closure of the hazardous waste storage area at Pontiac East Assembly does not release your company from any corrective action responsibilities under the Resource Conservation and Recovery Act of 1976, as amended by the Hazardous and Solid Waste Amendments of 1984.

Please contact Ms. Liane Shekter Smith of the Waste Management Division at 517-335-4790, if you have any questions regarding this matter.

Sincerely,

David F. Hales
ACTING Director
517-373-2329

Mr. Steven Thurman
General Motors Corporation
Truck & Bus Group
Central Office Plant Engineering
31 Judson Street
Pontiac, Michigan 48058

Dear Mr. Thurman:

SUBJECT: Release from Financial Capability Requirements for Closure
Hazardous Waste Storage Area
Pontiac Central Assembly, MID 005 356 902

The Michigan Department of Natural Resources has completed a review of the closure certification for the facility referenced above pursuant to the Michigan Hazardous Waste Management Act, 1979 P.A. 64, as amended (Act 64). Based upon your April 12, 1991, and May 28, 1991, closure certification, General Motors Corporation, Pontiac Central Assembly, is hereby released from the financial capability requirements for closure and liability coverage under Part 7 of the Act 64 Rules. General Motors Corporation is therefore no longer required to use the financial test to demonstrate financial capability for closure of this facility.

This release of financial capability requirements for the closure of the hazardous waste storage area does not release your company from any corrective action responsibilities under the Resource Conservation and Recovery Act of 1976, as amended by the Hazardous and Solid Waste Amendments of 1984.

Please contact Ms. Liane Shekter Smith, Environmental Engineer, Waste Management Division, at 517-335-4790, if you have any questions regarding this matter.

Sincerely,

Delbert Rector
Director

1.0 INTRODUCTION

This Quality Assurance Project Plan (QAPP) presents the organization, objectives, functional activities, and specific quality assurance (QA) and quality control (QC) activities associated with the Site Assessment sampling of soil and groundwater at the Pontiac Central Manufacturing Facility (Site) in Pontiac, Michigan. This QAPP also describes the specific protocols which will be followed for sampling, sample handling and storage, chain-of-custody, laboratory and field analysis.

All QA/QC procedures will be in accordance with applicable professional technical standards, USEPA requirements, government regulations and guidelines, and specific project goals and requirements. This QAPP has been prepared by Conestoga-Rovers & Associates (CRA) in accordance with all USEPA QAPP guidance documents, in particular, "Interim Guidelines and Specifications for Preparing Quality Assurance Project Plans" (QAMS-005/80).

2.0 PROJECT DESCRIPTION

This QAPP has been developed for the Site Assessment sampling of soil and groundwater at the Pontiac Central Manufacturing Facility Site in Pontiac, Michigan. The plan has been prepared to establish the QA/QC procedures particular to the groundwater remediation at this Site.

2.1 PROJECT OBJECTIVES AND SCOPE

The evaluation of the data collected will determine the type and extent of contamination, if any, located on Site.

2.2 PARAMETERS TO BE TESTED AND FREQUENCY

Sample matrices, analytical parameters and frequencies of sample collection are presented in Table 2.1.

2.3 DATA QUALITY OBJECTIVE

Data quality objectives (DQOs) are qualitative and quantitative statements which specify the quality of the data required to support decisions made during Site Assessment activities and are based on the end uses of the data to be collected. As such, different data uses may require different levels of data quality. There are five analytical levels which address various data uses and the QA/QC effort and methods required to achieve the desired level of quality.

DQOs have been established in accordance with the USEPA guidance document entitled "Data Quality Objectives for Remedial Response Activities - Development Process", dated March 1987, in conjunction with the document, "Data Quality Objectives for Remedial

TABLE 2.1

SUMMARY OF SAMPLING AND ANALYSIS PROGRAM
PONTIAC CENTRAL MANUFACTURING FACILITY
PONTIAC, MICHIGAN

Sample Matrix	*Field Parameters*	*Laboratory Parameters*	*Investigative (1) Samples*	*Field Blanks*	*Field Duplicates*	*Matrix Spike (2) MS/MSD*	*Total*
Groundwater/ Sewer Water	Groundwater Elevations pH Specific Conductance Temperature	TAL metals TCL VOCs TCL SVOCs TCL Pesticides/PCBs TRPH Chloride					
Soil	Soil Elevations	BTEX PNAs Formaldehyde					

Notes:

(1) One trip blank sample, which consists of two filled 40 mL preserved glass vials for VOC aqueous samples shall be shipped with each cooler of aqueous VOC samples.

(2) Matrix spike/matrix spike duplicate (MS/MSD) analyses are required for organic analyses. Samples designated for MS/MSD analyses will be collected, with extra sample volumes for water samples, at a frequency of one per group of twenty (20) or fewer investigative samples. Triple the normal sample volumes will be collected for extractable orgnanics. Inorganic analyses require one matrix spike/laboratory duplicate (MS/DUP) to be analyzed at a frequency of one per group of twenty (20) or fewer investigative samples.

Response Activities - Example Scenario RI/FS Activities at a Site with Contaminated Soils and Groundwater", dated March 1987. Reference to these documents ensures that the database developed during the Site activities meets the objective and quality necessary for its intended use.

DQOs can be classified for the measurement data by defining the level of analytical support assigned to each type of data measurement.

The following defines the different levels of analytical support:

i) Level I - Field screening or analysis using portable instruments;
ii) Level II - Field analyses using more sophisticated portable analytical instruments;
iii) Level III - All analyses performed in off-Site analytical laboratories using USEPA procedures other than the Contract Laboratory Program (CLP) Routine Analytical Services (RAS);
iv) Level IV - CLP-RAS performed in a CLP analytical laboratory using CLP procedures; and
v) Level V - Non-standard analytical methods performed in an off-Site laboratory.

Table 2.2 presents the level of analytical support for each group of parameters.

3.0 PROJECT ORGANIZATION AND RESPONSIBILITY

A summary of the key personnel with QA responsibilities follows:

General Motors Corporation (GM)

- general overview of the project to ensure that GM's objectives for the project are met;
- participation in key negotiations with MDNR; and
- management guidance to CRA's Project Manager.

Glenn Turchan - Project Manager

- general overview of the project to ensure that GM's objectives are met;
- participation in key negotiations with MDNR;
- preparation and review of Site Assessment reports; and
- liaison with MDNR.

Lou Almeida - QA/QC Officer - Analytical Activities - CRA

- system audits - laboratory activities;
- overview and review field QA/QC;
- coordinate supply of performance evaluation samples;
- review laboratory QA/QC;
- data validation and assessment;
- advise on data corrective action procedures; and
- QA/QC representation of project activities.

Frank Ring - QA/QC Officer - Field Activities - CRA

- management of field activities and field QA/QC;
- data assessment;
- technical representation of field activities; and
- preparation of standard operating procedures (SOPs) for field activities.

Project Laboratory - Earth Tech

- will perform all chemical analyses of groundwater, treatment system effluent and air samples collected during the monitoring activities.

Project Manager - Project Laboratory - To be determined

- coordinate laboratory analyses;
- supervise in-house chain-of-custody;
- schedule sample analyses;
- overview data review;
- overview preparation of analytical reports; and
- approval of the QAPP.

Operations Manager - Project Laboratory - To be determined

- coordinate laboratory analysis;
- supervise in-house chain-of-custody;
- schedule sample analyses;
- oversee data review;
- oversee preparation of analytical reports; and
- approve final analytical reports prior to submission to CRA.

QA Officer - Project Laboratory - To be determined

- overview laboratory quality assurance;
- overview QA/QC documentation;
- conduct detailed data review;
- decide laboratory actions, if required;
- technical representation of laboratory QA procedures;
- preparation of laboratory SOPs; and
- approval of the QAPP.

Sample Custodian - Project Laboratory - To be determined

- receive samples and sign accompanying documents (chain-of-custody);
- notify technical staff of samples that require immediate attention; and
- control and regulate access to samples and log all sample movements.

Primary responsibility for project quality rests with CRA's QA/QC Officers - Analytical and Field Activities. Ultimate responsibility for project quality rests with the CRA Project Manager. Independent quality assurance will be provided by the Project Laboratory's Project Manager and QA Officer prior to release of all data to CRA.

4.0 QUALITY ASSURANCE OBJECTIVES FOR MEASUREMENT DATA

The overall QA objective is to develop and implement procedures for field sampling, chain-of-custody, laboratory analyses and reporting that will provide results which are legally defensible in a court of law. Specific procedures for sampling, chain-of-custody, laboratory instrument calibration, laboratory analysis, reporting of data, internal quality control, audits, preventive maintenance of laboratory and field equipment and corrective action are described in other sections of this QAPP. The purpose of this section is to address the specific objectives for accuracy, precision, completeness, representativeness and comparability.

4.1 LEVEL OF QA EFFORT

Field blank, trip blank, duplicate and matrix spike samples will be analyzed to assess the quality of the data resulting from the field sampling program. Field and trip blanks consist of analyte-free water and will be submitted to the analytical laboratory to provide the means to assess the quality of the data resulting from the field sampling program. Field blank samples are analyzed to check for procedural contamination at the Site which may cause sample contamination. Trip blanks are used to assess the potential for contamination of samples due to contaminant migration during sample shipment and storage. Field duplicate samples are analyzed to check for sampling and analytical reproducibility. Matrix spikes provide information about the effect of the sample matrix on the preparation and measurement methodology. All matrix spikes are performed in duplicate.

The general level of the QA effort will be one field duplicate and one field blank per ten groundwater monitoring samples or a minimum of one per groundwater sampling event. One volatile organic compound (VOC) trip blank sample consisting of deionized ultra pure water will be included along with each shipment of multiple aqueous VOC, groundwater monitoring samples.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples are prepared from the monitoring samples. MS/MSD water samples typically must be collected at triple the volume for VOC analysis and double the volume for extractable organics. One MS/MSD sample will be collected/designated for every 20 groundwater monitoring samples or a minimum of one per groundwater sampling event.

The number of MS/MSD, duplicate and field blank samples to be collected are specified in Section 5.0.

The level of QA effort provided for groundwater and treated water samples will be equivalent to the level of QC effort specified in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846 3rd edition, November 1986 (SW-846) and "Methods for the Chemical Analysis of Water and Wastes", EPA-600/4-70-020, revised March 1983 (EPA-WW). The level of QA effort for air samples will be equivalent to the level of QA effort specified in "Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air", EPA-600/4-84-041, 1984 and the "NIOSH Manual of Analytical Methods", 3rd Edition, Volume 2, February 1984.

The level of QA effort for the field measurements of pH and specific conductance will consist of collecting duplicate samples and verifying instrument calibration. Temperature readings will be obtained with the pH or conductivity measurements. Water level measurements will be to the nearest 0.01 ft. using an electric sounding water level meter.

4.2 ACCURACY, PRECISION AND SENSITIVITY OF ANALYSES

The fundamental QA objective with respect to accuracy and precision of laboratory analytical data is to achieve the QC acceptance criteria of the analytical protocols referenced in Section 8.0.

The sensitivity of the analyses are provided in Table 4.1.

4.3 COMPLETENESS, REPRESENTATIVENESS AND COMPARABILITY

Completeness is a measure of the amount of valid data obtained from a measurement system compared to the amount that was expected to be obtained under normal conditions. It is expected that the Project Laboratory will provide data meeting QC acceptance criteria for 80 percent or more for all samples tested using the referenced methods. Following completion of the analytical testing, the percent completeness will be calculated by the following equation:

$$\text{Completeness} = \frac{\text{Valid Data Obtained}}{\text{Total Data Planned}} \times 100$$

Representativeness expresses the degree to which data accurately and precisely represent a characteristic of a population, parameter variations at a sampling point, a process condition or an environmental condition. Representativeness is a qualitative parameter which is dependent upon the proper design of the sampling program and proper laboratory protocol. The sampling network was designed to provide data representative of Site conditions. During development of this network, consideration was given to the historical Site operations, existing analytical data and physical setting and processes. Representativeness will be satisfied by insuring that the long-term monitoring plan is followed, proper sampling techniques are used, proper analytical procedures are followed and holding times of the samples are not exceeded in the laboratory.

Comparability expresses the confidence with which one data set can be compared with another. The extent to which existing and planned analytical data will be comparable depends on the similarity of sampling and analytical methods. The procedures used to obtain the planned

Notes:

(1) The targeted quantitiation limits for soil are based on dry weight. Actual sample quantitation limits are highly matrix dependent. Target quantitation limits presented are for guidance only. Targeted quantitation limits may be affected by mositure content, matrix interferences, QA/QC problems and high concentrations of target and non-target analytes.

(2) When a MDNR quantitation limit for metals has not been established, a limit has been provided from the referenced methods.

analytical data, as documented in the QAPP, are expected to provide comparable data. These new analytical data, however, may not be directly comparable to existing data because of difference in procedures and QA objectives.

4.4 FIELD MEASUREMENTS

Measurement data will be generated in many field activities. These activities include, but are not limited to, the following:

i) documenting time and weather conditions;
ii) collecting water level data;
iii) determining pH, specific conductivity, and temperature of groundwater samples; and
iv) verifying well development and pre-sampling purge volumes.

The general QA objective for such measurement data is to obtain reproducible and comparable measurements to a degree of accuracy consistent with the use of standardized procedures.

5.0 SAMPLING PROCEDURES

The following subsections presents the procedures for sampling the various media at the Site.

5.1 EQUIPMENT CLEANING

All sampling equipment which may come in contact with potentially contaminated materials shall be decontaminated prior to field use and after each sample is collected to prevent cross-contamination of the samples. Duplicate samples shall be collected concurrently with original samples, therefore, sampling equipment will not be decontaminated before collection of the duplicate. Decontamination of equipment will be performed as follows:

i) clean water and non-phosphate detergent wash using a brush, if necessary, to remove all visible foreign matter;
ii) rinse thoroughly with potable water;
iii) rinse with pesticide-grade isopropyl alcohol;
iv) rinse thoroughly with deionized water;
v) allow the equipment to air dry on a clean plastic sheet as long as possible; and
vi) wrap in aluminum foil until use.

Following final rinse, openings will be visually inspected to verify they are free of particulates and other material which may contribute to possible sample cross-contamination.

Fluids used for cleaning will not be recycled. All wash water, rinse water and decontamination fluids will be transferred to the groundwater treatment system where it will be treated.

5.2 FIELD SAMPLING

5.2.1 Sample Labeling

Each sample will be labeled with a unique sample number that will facilitate tracking and cross-referencing of sample information. The sample numbering system to be used is described as follows:

Example: GW-090192-WP-001

GW	- designates types of sample (GW-groundwater, TW-treated water, G-air emissions)
090192	- designates date of collection presented as month/day/year
WP	- sampler's initials
001	- sequential number starting with 001 at the start of the project

Field QC samples also will be numbered with a unique sample site number, consistent with the numbering system described above to prevent laboratory bias of field QC samples.

5.2.2 Field Log

The field logbook will be a bound document with consecutively numbered pages. The entries for each day will commence on a new page which will be dated. All entries will be made only in waterproof black ink. Corrections will be made by marking through the error with a single line, so as to remain legible, and initialing this action followed by writing the correction.

The following information will be recorded in the field logbook for each sample collected:

i) site location identification;
ii) unique sample identification number;
iii) date and time (in military time format) of sample collection;
iv) weather conditions;
v) designation as to the sample matrix;
vi) designation as to the means of collection (grab, bailer, etc.);
vii) brief description of the sample;
viii) name of sampler;
ix) analyses to be performed on sample; and
x) any other relevant comments such as odor, staining, texture, filtering, preservation, etc.

5.2.3 Chain-Of-Custody Forms

CRA chain-of-custody records will be used to track all samples from time of sampling to the arrival of samples at the laboratory.

Each sample container being shipped to the laboratory will contain a chain-of-custody form. The chain-of-custody form consists of four copies which are distributed to the sampler, to the shipper, to the laboratory and to the office file of CRA. The sampler and shipper will maintain their copies while the other two copies are enclosed in a waterproof enclosure within the shipping container. The laboratory, upon receiving the samples, will complete the remaining copies. The laboratory will maintain one copy for its records. The executed original will be returned to CRA with the data deliverables package. A typical chain-of-custody form is presented on Figure 5.1.

CHAIN OF CUSTODY RECORD

SHIPPED TO (Laboratory Name):

REFERENCE NUMBER:

SAMPLER'S SIGNATURE: _____ PRINTED NAME: _____

SEQ. No.	DATE	TIME	SAMPLE No.	SAMPLE TYPE	No. OF CONTAINERS	PARAMETERS	REMARKS

5.2.4 Sample Containers and Handling

Required sample containers, sample preservation methods, maximum holding times and filling instructions are provided in Table 5.1.

All samples will be placed in appropriate sample containers, labeled and properly sealed. The sample labels will include sample number, place of collection, date and time of collection and analyses to be performed. Samples will be cushioned within the shipping coolers by the use of vermiculite, foam chips and/or bubble wrap. Samples will be kept cool by the use of sealed plastic bags of ice or cooler packs. A trip blank will accompany each shipment of groundwater samples submitted for VOC analysis.

Samples will be shipped by commercial courier on a daily basis to the Project Laboratory. The exception to this will be samples which are collected on a Sunday or holiday. For samples collected on a Sunday or holiday, additional ice will be placed in the coolers, the coolers will be sealed and kept in a designated secure area where it will be picked up by the courier on the next business day.

Two seals comprised of CRA chain-of-custody tape will be placed over the lid on the front and back of each shipping cooler prior to shipment to secure the lid and provide evidence that the samples have not been tampered with en route to the laboratory. Clear tape will be placed over the seals to ensure that they are not accidentally broken during shipment.

Upon receipt of the cooler at the laboratory, the cooler will be inspected by the Sample Custodian. The condition of the cooler and seal will be noted on the chain-of-custody form by the Sample Custodian.

The Sample Custodian then will check the contents of the cooler with those samples listed on the chain-of-custody form. Any damage

Formaldehyde	500 mL glass jar	Iced, 4° C	30 days for analysis	Fill to shoulder of jar	Overnight or Hand Deliver	Bubble Pack or Foam Chips

Note:

(1) These are technical holding times, i.e., are based on time elapsed from time of sample collection.

to the samples or discrepancies in the accompanying documentation will be recorded in the remarks column of the chain-of-custody form, dated and signed. Any damage or discrepancies will be reported to the Project Manager who will contact CRA for resolution.

5.3 SAMPLING PROTOCOLS

5.3.1 Groundwater Monitoring Well Sampling Protocols

Groundwater samples will be obtained using the sampling protocol which follows:

i) The depth of water in each well will be measured to the nearest 0.01 foot using an electric tape. The measuring device will be precleaned prior to use in each well using the cleaning sequence provided in Section 5.1.

ii) Prior to sampling, each well will be purged using a pre-cleaned stainless steel bottom-filling bailer, or a disposable teflon or PVC bailer. The monitoring wells will be purged by removing a minimum of three standing well volumes of groundwater where the volume of standing water is calculated as follows:

$$V = 0.041 \ d^2 \ h$$

where:

V = volume of standing water in gallons
d = diameter of the well in inches
h = depth of water in feet

Field measurements of pH, conductivity and temperature of the evacuated water will be obtained and recorded following removal of

each standing well volume and prior to sample collection. Well purging will continue until three consecutive and consistent readings (± 0.2 units for pH, ± five percent for conductivity and ± two degrees for temperature) of pH, conductivity and temperature are obtained or a maximum of five standing well volumes have been removed. In the event that a well is bailed dry prior to achieving three well volumes, groundwater will be permitted to recover to a level sufficient for sample collection. The time that the well was bailed dry will be recorded and the well will be monitored for recovery. Upon recovery, the sample will be collected. All waste groundwater not collected for analysis will be contained and transferred to the treatment system where it will be treated.

iii) After purging the required volume of well water or immediately after well development, water samples will be collected using a pre-cleaned stainless-steel bailer or a disposable teflon or PVC bailer attached to polypropylene rope. The bailer will be emptied directly into the appropriate sample containers. Containers will be filled in order of decreasing analyte volatility, using techniques which will minimize sample agitation. New polypropylene rope will be used for each monitoring well.

iv) The protocols for placing samples in appropriate containers, preservation and shipping are included in Table 5.1.

v) Field duplicate samples will be collected;

vi) Samples for matrix spike analysis will be collected from a well representative of the condition of the majority of the monitoring wells, turbid or non turbid. Samples will be collected from the representative monitoring wells using the same protocol as for the field duplicate with increased sample volume being collected. The chain-of-custody forms sent to the project laboratory will indicate the samples collected for matrix spike analysis.

vii) If disposable bailers are not used, rinsate blank sample will be collected. These samples will consist of distilled or deionized water poured into, and then sampled out of, a precleaned bailer. This will provide a quality assurance check on the decontamination procedures employed for the bailers and sample containers.

5.3.2 Soil Sampling Protocols

5.3.2.1 Soil Borings

For soil samples designated to be collected from exploratory boreholes for chemical analysis, a split barrel sampler shall be used to retrieve soil, as outlined below:

1. A new pair of disposable latex gloves will be used at each sampling location and for the preparation of samples from different vertical zones at each individual location.

2. Prior to use at each sampling location, all sampling equipment not previously decontaminated will be cleaned in accordance with Section 5.1.

3. A split spoon sampler will be driven through the designated sampling interval.

4. The split spoon sampler will be retrieved and opened upon a sheet of aluminum foil.

5. Using a clean cutting tool, the entire core surface will be trimmed and disposed and the core will be cut longitudinally. A continuous sample will be removed from the sampler. The sample will be removed using

clean stainless steel spatulas, spoons or other appropriate sampling equipment. The sample shall be placed in the appropriate sample container and sealed with a teflon lined cap. The protocols for containerizing, preserving and shipping the soil samples are included in Table 5.1.

6. All equipment used during the sampling procedures which may have come in contact with contaminated soils, shall be decontaminated in accordance with Section 5.1.

7. A field duplicate sample will be collected for each set of ten soil samples collected.

8. A field (rinsate) blank sample will be collected for each set of ten soil samples collected. The field blank will consist of deionized water poured over the sampling tools after they have been cleaned using the field decontamination procedures.

9. A matrix spike (MS) and matrix spike duplicate (MSD) will be collected for each set of 20 soil samples collected.

10. A new pair of disposable gloves and clean sampling tools shall be used to prepare the sample from the underlying sample interval in accordance with the procedures described for preparation of the surface sample.

5.3.2.2 Surface Soil/Sediment Samples

For samples designated to be collected from surface soil/sediment or solid waste chemical analysis, a sample will be collected using the same general sampling protocol as described for soil borings with the following exceptions.

1. The soil sample will be retrieved with a stainless steel cup or spoon.
2. The soil sample will be placed in the sample jars using clean stainless steel spatulas or other appropriate sampling equipment.

6.0 SAMPLE CUSTODY AND DOCUMENT CONTROL

It is USEPA Policy to follow the chain-of-custody protocols as described in "NEIC Policies and Procedures", EPA-330/9-78-001-R, revised August 1991. This custody is in three parts: sample collection, laboratory analysis and final evidence files. Final evidence files, including all originals of laboratory reports and purge files, are maintained under document control in a secure area.

A sample or evidence file is under your custody if it:

i) is in your possession;
ii) is in your view, after being in your possession;
iii) is in your possession and you place it in a secured location; or
iv) is in a designated secure area.

6.1 FIELD CHAIN-OF-CUSTODY PROCEDURES

The sample packaging and shipment procedures summarized below will insure that the samples will arrive at the laboratory with the chain-of-custody intact. The protocol for specific sample numbering using case numbers and traffic report numbers, if applicable, and other sample designations are included in Section 5.0.

6.1.1 Field Procedures

The following chain-of-custody procedures will be used in the field:

i) The field sampler is personally responsible for the care and custody of the samples until they are transferred or properly dispatched. As few people as possible should handle the samples.

ii) All bottles will be labeled with unique sample numbers.

iii) Sample labels are to be completed for each sample using waterproof ink unless prohibited by weather conditions.

6.1.2 Field Logbooks/Documentation

Field logbook will provide the means of recording data collecting activities performed. As such, entries will be described in as much detail as possible so that persons going to the Site could reconstruct a particular situation without reliance on memory.

The title page of each logbook will contain the following:

i) person to whom the logbook is assigned
ii) logbook number;
iii) project name
iv) project start date; and
v) end date.

Entries into the logbook will contain a variety of information. At the beginning of each entry, the date, start time, weather, names of all sampling team members present, level of personal protection being used, and the signature of the person making the entry will be entered. The names of visitors to the Site, field sampling or investigation team personnel and the purpose of their visit will also be recorded in the field logbook.

Measurements made and samples collected will be recorded. All entries will be made in ink and no erasures will be made. If an incorrect entry is made, the information will be crossed out with a single strike mark. Whenever a sample is collected, or a measurement is made, a

detailed description of the location of the station, which includes compass direction and distance taken of the station, if any, will also be noted. All equipment used to make measurements will be identified, along with the data of calibration.

Samples will be collected following the sampling procedures presented in Section 5.0. The equipment used to collect samples will be noted, along with the time of sampling, sample description, depth at which the sample was collected, volume and number of containers. Sample identification number will be assigned during sample collection. Field QC samples, which will receive an entirely separate sample identification number, will be submitted blind to avoid laboratory bias of field QC samples.

6.1.3 Transfer of Custody and Shipment Procedures

The following custody and shipping procedures will be followed:

i) Samples are accompanied by a properly completed chain-of-custody form. The sample numbers and locations will be listed on the chain-of-custody form. When transferring the possession of samples, the individuals relinquishing and receiving will sign, date, and note the time on the record. This record documents transfer of custody of samples from the sampler to another person, to the laboratory, or to/from a secure storage area.

ii) Samples will be properly packaged for shipment and dispatched to the appropriate laboratory for analysis, with a separate signed custody record enclosed in each sample box or cooler. Shipping containers will be secured with strapping tape and custody seals for shipment to the laboratory. The preferred procedure includes use of a custody seal attached to the front right and back left of the cooler. The custody seals

are covered with clear plastic tape. The cooler is strapped shut with strapping tape in at least two locations.

iii) Whenever samples are split with a source or government agency, a separate chain-of-custody record is prepared for those samples and marked to indicate with whom the samples are being split. The person relinquishing the samples to the facility or agency should request the representative's signature acknowledging sample receipt. If the representative is unavailable or refuses to sign, this is noted in the "Received By" space.

iv) All shipments will be accompanied by the chain-of-custody record identifying the contents. The original record will accompany the shipment, and the pink and goldenrod copies will be retained by the sampler for returning to the sampling office.

v) If the samples are sent by common carrier, a bill of lading should be used. Receipts of bills of lading will be retained as part of the permanent documentation. Commercial carriers are not required to sign off on the custody form as long as the custody forms are sealed inside the sample cooler and the custody seals remain intact.

6.2 LABORATORY CHAIN-OF-CUSTODY PROCEDURES

The sample custodian will assign a unique number to each incoming sample for use in the laboratory. The unique number and customer number will then be entered into the sample receiving log. The laboratory date of receipt will also be noted.

Laboratory custody procedures and document control for those samples analyzed by the Project Laboratory will be consistent with their standard laboratory protocols.

6.3 STORAGE OF SAMPLES

After the sample custodian has prepared the sample receiving log, the chain-of-custody will be checked to ensure that all samples are stored in the appropriate locations. All samples will be stored within an access controlled location and will be maintained under the preservation requirements specified in Table 5.1 until completion of all analytical work or, as a minimum, for 30 days after receipt of the final report by CRA.

6.4 FINAL EVIDENCE FILES CUSTODY PROCEDURES

Evidential files for the entire project will be maintained by CRA and will consist of the following:

i) project plan;
ii) project log books;
iii) field data records;
iv) sample identification documents;
v) chain-of-custody records;
vi) correspondence;
vii) references, literature;
viii) final data packages;
ix) miscellaneous - photos, maps, drawings, etc.; and
x) final report.

The evidentiary file materials will be the responsibility of the evidentiary file custodian with respect to maintenance and document removal.

The Project Laboratory will be responsible for maintaining analytical log books and laboratory data. Raw laboratory data files will be inventoried and maintained by the Project Laboratory for a period of five

years, at which time CRA will advise the Project Laboratory regarding the need for additional storage.

7.0 CALIBRATION PROCEDURES AND FREQUENCY

This section describes procedures for maintaining the accuracy for all the instruments and measuring equipment which are used for conducting field tests and laboratory analyses. These instruments and equipment should be calibrated prior to each use or on a scheduled periodic basis.

7.1 FIELD INSTRUMENTS/EQUIPMENT

Instruments and equipment used to gather, generate, or measure environmental data will be calibrated with sufficient frequency and in such a manner that accuracy and reproducibility of results are consistent with the manufacturer's specification.

Equipment to be used during the field sampling will be examined to certify that it is in operating condition. This includes checking the manufacturer's operating manual for each instrument to ensure that all maintenance requirements are being observed. Field notes from previous sampling trips will be reviewed so that the notation on any prior equipment problem are not overlooked, and all necessary repairs to equipment have been carried out.

7.1.1 Field Instrument Calibration

Calibration of the field instruments used during water sampling will be done prior to the collection of each water sample if data indicate a change (>±10 percent) in pH and/or conductivity from the last location sampled. Calibration of field instruments will be conducted at least daily during water sampling. The field equipment will be maintained, calibrated and operated in a manner consistent with the manufacturer's guidelines and USEPA standard methods. However, since the majority of

field measurements will be limited to pH, conductivity and temperature the following procedures will be conducted, at a minimum:

A) Calibration of pH Meter

The pH meter will be calibrated with commercially obtained pH 7, 4 and 10 buffer solutions. The pH calibration will be temperature compensated, and will be performed immediately before initiating a sampling event. Calibration checks will be performed with every sample collected. In the event that the result fails to be within 0.1 pH units, the meter must be recalibrated and all samples after the last calibration must be remeasured.

Calibration will be performed in accordance with the following procedure:

1) rinse the probe in deionized water;
2) insert probe in a fresh pH 7 buffer solution;
3) slide battery compartment cover back to the first stop exposing the adjustment potentiometers;
4) adjust the "CAL" potentiometer such that the display reads 7.00;
5) remove the probe; rinse in deionized water;
6) insert probe in a fresh pH 4 or pH 10 buffer solution;
7) adjust the slope potentiometer until the correct pH is displayed; and
8) remove probe; rinse in deionized water.

B) Calibration of the Specific Conductivity Meter

The specific conductivity meter is factory calibrated, but the calibration should be checked periodically and the probe thoroughly rinsed between samples. Calibration of the specific conductivity meter will be performed as follows:

1) rinse probe in deionized water;
2) wipe probe and allow to dry;

3) the conductivity displayed should be zero in air;
4) adjust the zero potentiometer if necessary;
5) immerse the probe in a solution of known conductivity;
6) adjust the "SPAN" potentiometer such that the correct conductivity is displayed; and
7) rinse probe thoroughly with deionized water and allow to dry.

C) Calibration of Temperature

Temperature measurements are performed in conjunction with specific conductance measurements and the meter is factory calibrated.

D) Calibration of Water Level

Water level measurements are obtained to the nearest 0.01 foot using an electronic sounding water level meter. No field calibration is possible.

7.2 LABORATORY INSTRUMENTS

Calibration of laboratory equipment will be based on approved written procedures. Records of calibration, repairs, or replacement will be filed and maintained by the designated laboratory personnel performing quality control activities. These records will be filed at the location where the work is performed and will be subject to QA audit. For all instruments, the laboratory will maintain a properly trained repair staff with in-house spare parts or will maintain service contracts with vendors.

The records of calibration will be kept as follows:

i) If possible, each instrument will have record of calibration permanently affixed with an assigned record number.

ii) A label will be affixed to each instrument showing description, manufacturer, model numbers, date of last calibration and by whom

calibrated (signature), due date of next calibration and compensation or correction figures, as appropriate.

iii) A written stepwise calibration procedure will be available for each piece of test and measurement equipment.

iv) Any instrument that is not calibrated to within the manufacturer's original specification will display an appropriate warning tag.

8.0 ANALYTICAL PROCEDURES

The samples collected for chemical analyses will be analyzed using the methods listed in Table 8.1.

TABLE 8.1

9.0 INTERNAL QUALITY CONTROL CHECKS AND FREQUENCY

This section presents the internal quality control checks and frequency procedures which will be employed for field and laboratory measurements.

9.1 FIELD QC

Quality control procedures for field measurements will be limited to checking the reproducibility of the measurement in the field by obtaining multiple readings and by calibrating the instruments (where appropriate).

Quality control of field sampling will involve collecting field duplicates and field blanks in accordance with the applicable procedures and frequencies described in Sections 4.1 and 5.0, and the level of effort indicated in Table 2.1.

9.2 LABORATORY QC

Specific procedures related to internal laboratory QC samples (namely, matrix spikes, surrogate spikes, blanks, QC check samples and matrix spike duplicates) are detailed in the following subsections.

The internal QC checks for the methods of analyses will follow the appropriate methods specified in Table 8.1 and criteria outlined in the applicable SOPs which are presented in Attachment I.

9.2.1 Initial and Continuing Calibration Checks

The compliance requirements for satisfactory instrument calibration are established to ensure that the instrument is capable of producing acceptable quantitative data. The initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an analysis run, while the continuing calibration checks document that the initial calibration is still valid, and that satisfactory maintenance and adjustment of the instrument on a day-to-day basis is achieved. The specific control criteria and action requirements for these calibrations will be as specified in the SOPs which are presented in Attachment I.

9.2.2 Method Blank Samples

A method blank sample will be analyzed by the laboratory at a frequency of one blank per twenty analyses or, in the event that an analytical round consists of less than twenty samples, one method blank sample will be analyzed. The method blank sample, an aliquot of analyte-free water, will be carried through the entire analytical procedure.

9.2.3 Matrix Spike/Matrix Spike Duplicates

A matrix spike and matrix spike duplicate (MS/MSD) sample set will be analyzed at a minimum frequency of one per twenty investigative samples. Acceptance criteria and compounds that will be used for matrix spikes are identified in Table 9.1. Percent spike recoveries will be used to evaluate analytical accuracy while percent difference between the matrix spike and matrix spike duplicate will be used to assess analytical precision.

	Copper	80-120	(20)	(NE)	(NE)
	Lead	80-120	(20)	(NE)	(NE)
	Nickel	80-120	(20)	(NE)	(NE)
	Selenium	80-120	(20)	(NE)	(NE)
	Silver	80-120	(20)	(NE)	(NE)
	Thallium	80-120	(20)	(NE)	(NE)
	Zinc	80-120	(20)	(NE)	(NE)

Notes:

(1) Values in parentheses are relative percent difference control limits. The values presented are the current control limits in effect which are recalculated on a periodic basis. The control limits used to evaluate the data will be the values in effect when the samples are analyzed.

NE Limits are not established, when sufficient laboratory data are available, standard limits will be calculated.

9.2.4 Surrogates

Surrogates are used in all GC and GC/MS analyses. Every blank, standard, and environmental sample including MS/MSD samples will be spiked with surrogate compounds prior to purging volatiles or extracting semi-volatiles.

Surrogates will be spiked into samples according to the appropriate analytical methods. Surrogate spike recoveries will fall within the control limits set by procedures specified in the SOP. The control limits are presented in Table 9.2 for analytes falling within the quantitation limits without dilution. Dilution of samples to bring the analyte concentration into the linear range of calibration may dilute the surrogates out of the quantitation limit; assessment of analytical quality in these cases will be based in the quality control embodied in the check, matrix spike and matrix spike duplicate samples.

9.2.5 Blind Check Samples

As supplied by the USEPA, an analytical batch may contain a blind check sample. In general, the blind check sample may be obtained from USEPA and supplied to CRA. The analytes employed in this check sample will be a representative subset of the analytes of interest.

The percent recovery of analytes from the check samples will be calculated as defined in Section 13.2.

9.2.6 Trip Blank Samples

Trip blank samples will be submitted with monitoring well VOC samples only, and will be used to determine if cross-contamination occurs during the shipment and storage of investigative samples. Trip blank

Analysis	*Compound*	*Control Limits (1)* *Recovery (%) Water Matrix*	*Recovery (%) Solid Matrix*
TCL VOCs/ BTEX	4-Bromofluorobenzene	57-107	66-117
	Toluene-d8	86-110	81-113
	Dibromofluoromethane	87-118	80-127
TCL SVOCs	2,4,6-Tribromophenol	34-116	24-100
	2-Fluorobiphenyl	40-106	35-101
	2-Fluorophenol	17-72	28-87
	Nitrobenzene-d5	36-102	26-96
	Phenol-d6	10-48	26-92
	Terphenyl	39-120	31-115
TCL Pesticides/PCBs	Decachlorobiphenyl	60-150	60-150
	Tetrachloro-m-xylene	60-150	60-150
PNAs	2-Fluorophenol	40-106	35-101
	Nitrobenzene-d5	36-102	26-96
	Terphenyl	39-120	31-115

Notes:

(1) Values in parentheses are relative percent difference control limits. The values presented are the current control limits in effect which are recalculated on a periodic basis. The control limits used to evaluate the data will be the values in effect when the samples are analyzed.

* Specified in applicable laboratory SOP.

samples are prepared in the laboratory, prior to the sampling event, by filling two 40-mL vials with organic-free deionized water. The trip blank samples are kept with the investigative samples throughout the duration of the sampling event, and upon return to the laboratory, are analyzed for VOCs to determine the presence of organic compounds introduced during storage at the Site and during shipment to the laboratory.

10.0 DATA REDUCTION, VALIDATION AND REPORTING

The Project Laboratory will perform analytical data reduction and review in-house under the direction of the Project Laboratory QA Officer. The Project Laboratory QA Officer will be responsible for assessing data quality and advising of any data which were rated "preliminary" or "unacceptable" or other qualifications based on the established QC criteria. The Project Laboratory will provide Level III (or equivalent) deliverables. Data reduction, review and reporting by the Project Laboratory conducted as detailed in the following procedure:

i) Raw data produced and checked by the responsible analyst is turned over for independent review by another analyst.

ii) The area supervisor or senior analyst reviews the data for attainment of quality control criteria established by the QAPP.

iii) The area supervisor or senior analyst will decide whether any sample reanalysis is required. It should be noted that reanalyses required during corrective action procedures may be initiated by the responsible analyst as described in Section 14.0.

iv) Upon completion of all reviews and acceptance of the raw data by the supervisor, a report will be generated and sent to the Project Manager.

v) The Project Manager will complete a thorough inspection of all reports.

vi) Upon acceptance of the preliminary reports by the Project Manager, final reports will be generated and signed by the Operations Manager or his designee.

vii) A thorough review of a percentage of all data packages is performed by the Project Laboratory Quality Assurance Officer or his designee.

Field data from direct-reading instruments (pH, conductance, temperature) will not require reduction. Laboratory data reduction will be performed using the equations in the analytical methods referenced in Table 8.1.

The QA/QC Officer - Analytical Activities will conduct an evaluation of data reduction and reporting by the laboratory. These evaluations will consider the finished data sheets, field blank data and recovery data for surrogate and matrix spikes. The material will be checked for legibility, completeness, correctness and the presence of requisite dates, initials, and signatures. The results of these checks will be assessed and reported to the CRA's Project Manager noting any discrepancies and their effect upon the acceptability of the data. All information garnered for QA/QC checks will be discussed in a QA/QC Validation report.

Validation of the analytical data will be performed by the QA/QC Officer - Analytical Activities based on the applicable evaluation criteria outlined in "National Functional Guidelines for Organic Data Review", Draft December 1990, revised June 1991 and "Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis", Draft October 1989. The assessment of analytical and field data will include checks for adherence to laboratory QA procedures and accuracy and precision criteria; and the presence of transmittal errors and anomalously high or low parameter values. The results of these data validations will be reported to the Project Manager, noting any problems and their effect upon the acceptability of the data.

Data produced from field measurements and sample collection activities that are used in the project reports will be appropriately identified and appended to the report. Where data have been reduced or summarized, the method of reduction will be documented in the report. In addition, field data will be audited by the QA/QC Officer Field Activities for anomalously high or low values that may appear to be inconsistent with other data.

Laboratory data packages will consist of the following deliverables:

i) a case narrative that includes a summary of analytical methods used and a description of any unusual action or conditions;
ii) dates of sample receipt, extraction/digestion and analysis;
iii) laboratory and field sample identification numbers;
iv) samples results in tabular format;
v) method blank sample summaries;
vi) surrogate compound recovery data and matrix spike/matrix spike duplicate recovery data and control limits;
vii) check sample data; and
viii) executed chain-of-custody forms.

11.0 PERFORMANCE AND SYSTEM AUDITS

Performance and system audits of both field and laboratory activities may be conducted to verify that sampling and analysis are performed in accordance with the procedures established in the QAPP. The audits of field and laboratory activities include two separate independent parts; internal and external audits.

11.1 FIELD AUDITS

Internal audits of field activities (sampling and measurements) will be conducted by the CRA QA/QC Officer - Field Activities. The audits will include examination of field sampling records, field instrument operating records, sample collection, handling and packaging in compliance with the established procedures, maintenance of QA procedures, chain-of-custody, etc. These audits will be conducted to correct deficiencies, and to verify that QA procedures are maintained throughout the remediation. The audits will involve review of field measurement records, instrumentation calibration records and sample documentation.

Any external audits will be conducted by MDNR.

11.2 LABORATORY AUDITS

The internal performance and system audits of the laboratory may be conducted by the CRA QA/QC Officer-Analytical Activities. The system audits, which will be conducted as deemed necessary by the CRA project manager or the CRA QA/QC Officer - Analytical Activities and will include examination laboratory documentation of sample receiving, sample log-in, sample storage, chain-of-custody procedure, sample preparation and analysis, instrument operating records, etc. The performance audits may be conducted on a quarterly basis. Blind QC samples will be prepared and

submitted along with project samples to the laboratory for analysis throughout the project. The QA officer will evaluate the analytical results of these blind performance samples to ensure the laboratory maintains acceptable performance.

Any external audits of the laboratories will be conducted by MDNR.

12.0 PREVENTIVE MAINTENANCE

All analytical instruments to be used in this project will be serviced by the laboratory personnel at regularly scheduled intervals in accordance with the manufacturers recommendations. Instruments may also be serviced at other times due to failure. Requisite servicing beyond the abilities of the laboratory personnel will be performed by the equipment manufacturer or its designated representative.

Daily checks of each instrument will be by the analyst who has been assigned responsibility for that instrument. This will include changing gas chromatography instrumentation inlet liners, tuning gas chromatography/mass spectrometry instrumentation, checking operation of data systems, checking for leaks, etc. Manufacturer's recommended procedures will be followed in every case.

Table 12.1 presents routine preventive maintenance for laboratory field instruments.

The pH and conductivity meters will be calibrated in the field as described in Section 7.1. In addition, the following preventative maintenance measures will be taken in the field:

Water Level Tape - Clean probe and lower three feet of tape with detergent wash and distilled water rinse to prevent hard water and iron buildup.

TABLE 12.1

ROUTINE PREVENTIVE MAINTENANCE
PROCEDURES AND SCHEDULES
PONTIAC CENTRAL MANUFACTURING FACILITY
PONTIAC, MICHIGAN

Instrument	*Maintenance Procedures/Schedule*	*Spare Parts in Stock*
Gas Chromatograph/Mass Spectrometer (GC/MS)	1. Replace pump oil as needed. 2. Change septa weekly or as often as needed. 3. Change gas line dryers as needed. 4. Replace electron multiplier as often as needed. 5. Replace gas jet splitter as needed. 6. Replace GC injector glass liner weekly or as often as needed. 7. Replace GC column as needed. 8. Check to ensure that gas supply is sufficient for the day's activity, and the delivery pressures are set as described in the SOP. 9. Check to ensure the pressure on the primary regulator never run below 100 psi.	1. Syringes 2. Septa 3. Various electronic components 4. Glass jet splitter 5. GC column 6. Glass liner
Gas Chromatograph	1. Change septa weekly or as often as needed. 2. Change gas line dryers as needed. 3. Replace GC injector glass liner weekly or as often as needed. 4. Replace GC column as needed. 5. Clean/replace GC detector as needed. 6. Check to ensure that gas supply is sufficient for the day's activity, and the delivery pressures are set as described in the SOP. 7. Check to ensure the pressure on the primary regulator never run below 100 psi.	1. Syringes 2. Septa 3. Detectors 4. Glass liner 5. GC column

TABLE 12.1

pH Meter	1. Check battery (if used in field); and replace if discharged. 2. After use in samples containing free oil, wash the electrode in soap and rinse thoroughly with water. Immerse the lower third of the electrode in diluted HCl (1:9) solution for 10 minutes to remove any film formed. Rinse thoroughly with water. 3. Keep electrode properly filled with appropriate filling electrolyte solution.	1. Standard buffers 2. Electrolyte filling solution 3. Spare electrode
Specific Conductivity Meter	1. Check battery (if used in field); and replace if discharged. 2. After use in samples containing free oil, wash the electrode in soap and rinse thoroughly with water.	1. Standard solution 2. Spare electrodes

13.0 SPECIFIC ROUTINE PROCEDURES USED TO ASSESS DATA PRECISION, ACCURACY AND COMPLETENESS

The following sections include the procedures and formulae utilized to assess the levels of precision, accuracy and completeness achieved during the associated sample analyses.

13.1 FIELD MEASUREMENTS

Field data will be assessed by the CRA QA/QC Officer - Field Activities who will review the field results for compliance with the established QC criteria that are specified in the QAPP and the Plan. Accuracy of the field measurements will be assessed using daily instrument calibration, calibration check, and analysis of blanks. Precision will be assessed on the basis of reproducibility by multiple readings of a single sample. Data completeness will be calculated using the following equation:

$$\text{Completeness} = \frac{\text{Valid (Usable) Data Obtained}}{\text{Total Data Planned}} \times 100$$

The required level of completeness will be 80 percent.

13.2 LABORATORY DATA

Laboratory results will be assessed for compliance with required precision, accuracy, completeness and sensitivity as follows:

13.2.1 Precision

Precision of laboratory analysis will be assessed by comparing the analytical results between MS/MSD samples. The relative

percent difference (%RPD) will be calculated from the results of MS/MSD samples.

13.2.2 Accuracy

Accuracy of laboratory results will be assessed for compliance with the established QC criteria that are described in Sections 4.0 and 9.0 of the QAPP using the analytical results of method blanks, reagent/preparation blank, MS/MSD samples, field blank and trip blanks. The percent recovery (%R) of matrix spike samples will be calculated.

13.2.3 Completeness

Completeness will be assessed by comparing the number of valid results (as determined by CRA QA/QC Officer - Analytical Activities) to the total possible number of results using the formula presented in Section 13.1. The required level of completeness for laboratory analyses will be 80 percent.

13.2.4 Sensitivity

The achievement of method detection limits depend on instrumental sensitivity and matrix effects. Therefore, it is important to monitor the instrumental sensitivity to ensure the data quality through constant instrument performance. The instrumental sensitivity will be monitored through the analysis of method blank, calibration check sample and laboratory control sample.

13.3 STATISTICAL EVALUATIONS

In examination of data and determination of its precision and accuracy, standard statistical formulae will be used.

13.3.1 Arithmetic Mean

The arithmetic mean is the average obtained by dividing a sum by the number of its addends. A number of recovery results are averaged together to improve the accuracy of the measurement. Figure 13.1, equation 1 summarizes the formula to be used to determine the arithmetic mean.

13.3.2 Standard Deviation

The standard deviation is the square root of the average squared difference between the individual values and the average value. A number of recovery results are evaluated to find the numerical variation in the data which is then used in the determination of the percent relative standard deviation. Figure 13.1 equation 2 summarizes the formula to be used to determine the standard deviation.

13.3.3 Percent Relative Standard Deviation (%RSD)

The percent relative standard deviation is the percentage obtained by dividing the standard deviation of the values by the arithmetic mean of the values and multiplying by 100. The %RSD is calculated on a series of measurements to evaluate an instruments analytical precision (e.g., initial calibration). Figure 13.1, equation 3 summarizes the formula to be used to determine %RSD.

Equation 1 Determination of Arithmetic Mean ($\bar{X}$)

$$\bar{X} = \frac{\sum_{i=1}^{n} X_i}{n}$$

where n = number of measurements

X_i = value of measurements

Equation 2 Determination of Standard Deviation (σ_{n-1})

$$\sigma_{n-1} = \sqrt{\frac{\sum_{i=1}^{n} (X_i - \bar{X})^2}{n-1}}$$

where n = number of measurements

X_i = value of measurements

$\bar{X}$ = arithmetic mean

Equation 3 Determination of Percent Relative Standard Deviation (% RSD)

$$\% \text{ RSD} = \frac{\sigma_{n-1}}{\bar{X}} \times 100$$

where σ_{n-1} = standard deviation

$\bar{X}$ = arithmetic mean

Equation 4 Determination of Percent Recovery (% R)

$$\% \text{ R} = \frac{\text{SSR} - \text{SR}}{\text{SA}} \times 100$$

where SSR = Spiked Sample Result

SR = Sample Result or Background

SA = Spike Added

Equation 5 Determination of Relative Percent Difference (RPD)

$$\text{RPD} = \left(\frac{|R_1 - R_2|}{\left[\frac{R_1 + R_2}{2} \right]} \right) \times 100$$

where R_1 = value of first result

R_2 = value of second result

figure 13.1

STATISTICAL FORMULAE
J-LOT
PONTIAC CENTRAL MANUFACTURING FACILITY
Pontiac, Michigan

CRA

13.3.4 Percent Recovery (%R)

The percent recovery of a parameter is the percentage obtained by dividing the amount recovered by the true amount added and multiplying by 100. The percent recoveries of spiked samples are evaluated to establish the analytical accuracy of a measurement. Figure 13.1, equation 4 summarizes the formula to be used to determine the percent recovery.

13.3.5 Relative Percent Difference (RPD)

The relative percent difference is the percentage obtained by dividing the difference between two numbers by their arithmetic mean and multiplying by 100. The RPD is used to evaluate the analytical precision of two replicate measurements (e.g., matrix spike/matrix spike duplicate). Figure 13.1, equation 5 summarizes the formula to be used to determine RPD.

14.0 CORRECTIVE ACTION

The need for corrective action may be identified by system or performance audits or by standard QC procedures. The essential steps in the corrective action system will be:

i) checking the predetermined limits for data acceptability beyond which corrective action is required;
ii) identifying and defining problems;
iii) assigning responsibility for investigating the problem;
iv) investigating and determining the cause of the problem;
v) determination of a corrective action to eliminate the problem (this may include reanalyses or resampling and analyses);
vi) assigning and accepting responsibility for implementing the corrective action;
vii) implementing the corrective action and evaluating the effectiveness;
viii) verifying that the corrective action has eliminated the problem; and
ix) documenting the corrective action taken.

For each measurement system, the QA/QC Officer - Laboratory Activities or the analyst will be responsible for initiating the corrective action and the laboratory supervisor will be responsible for implementing the corrective action. The corrective action taken will depend upon the QA/QC criteria that did not meet the necessary criteria, and may range from qualifying the data to resampling at the Site. All problems requiring corrective action and the corrective action employed to resolve the problem will be reported. Field corrective action will consist of instrument recalibration, replacement of probes, or the instrument itself, and will be recorded in the field logbook.

15.0 QUALITY ASSURANCE REPORT TO MANAGEMENT

Management will receive reports on the performance of the measurement system and data quality following each sampling round and at the conclusion of the project.

Minimally, these reports will include:

i) assessment of measurement quality indicators, i.e., data accuracy, precision and completeness;
ii) results of system audits; and
iii) QA problems, action taken and resolutions.

The CRA QA/QC Officer - Analytical Activities will be responsible within the organizational structure for preparing these reports. The final report for the project will also include a separate QA section which will summarize data quality information contained in the periodic QA/QC reports to management, and details an overall data assessment and validation in accordance with the data quality objectives outlined in this QAPP.

ELECTRONIC DATA
DELIVERABLE REQUIREMENTS

ELECTRONIC DATABASE STANDARD
FIELD NAMES AND DESCRIPTION

Field Name		*Description*
LAB	C5-	Lab Name (First 3 letters are the lab name, last 2 are the city)
WORKNO	C8-	Work Order Number (issued by Lab)
LABID	C13-	Issued by Lab. I.D. for the work being done. Must have suffix designation of blank, B(blank), C (check), S (spike), D (duplicate), P (spike duplicate)
CRAID	C50-	CRA sample I.D. Usually a concatenation of fields starting with SRTP and ending with an incremented number representing the order in which the sample was taken. On sample label.
SDAT	D8-	Date sample collected
RDAT	D8-	Date sample received by Lab
EDAT	D8-	Extraction Date. Should be 14 days from SDAT for semi-volatiles.
LDATE	D8-	Leach date. Leachate analysis of soil by Reg. 347 to determine if sample is waste. (For disposal of soil samples)
ADAT	D8-	Date of analysis. Should be 14 days from EDAT for semi-volatiles.
MTHPRE	C10-	Designated reference (i.e. SW846, ASTM, EPA)
METHOD	C17-	Method of analysis of sample. The method will dictate the analytes to be found in sample (i.e. Method 602).
MTHDSC	C50-	Description of method
CL	C2-	Class of analand A - Acid Extractable B - Base Neutral Extractable I - Inorganics M - Metals V - Volatile Organics NR - Non Routine/Esoteric/Special Biologicals/Miscellaneous
ANALAND	C50-	The name of whatever was measured.
CASRN	C15-	Registry number of ANALAND. CASRN may have synonym parameters.
SRTP	C10-	MATRIX (SOURCE TYPE) GW - Groundwater AR - Air SW - Surface Water WS - Waste QC - All quantity control samples like rinses and blanks NR - Non routine (leachate wells and sewage etc.)
MEAST	C10-	Measurement Result
C1	C5-	Flags/Qualifiers, provided by Lab
UNITS	C10-	Unit of measure for MEAST and DETLIM
DETLIM	C10-	Detection limit
DRYWT	C1-	D or W - if result is not a dry weight conversion, the concentration is an as received result (meaning was not multiplied by total solids)
SURFLG	C1-	Y to designate the ANALAND as a surrogate
TIC	C1-	Y to designate the ANALAND as tentatively identified
UCL	C10-	Upper control limit
LCL	C10-	Lower control limit UCL and LCL range for result from surrogate, matrix spike and check
BATCH	C12-	Lab QC Batch Number (run number)
SIGDIG	C2-	Significant Digits
DILFAC	C10-	The factor that the sample was diluted by
RPD	C10-	Relative Percent Difference Results
URPDLMT	C10-	Upper RPD Limit
LRPDLMT	C10-	Lower RPD Limit

FRED C. HART ASSOCIATES, INC.

I. INTRODUCTION

This SOP has been written to follow Method 8260 as closely as possible, and has been customized to cover the equipment and techniques being used at WW Engineering and Science, Livonia, Michigan. It will be used as the default method for all volatile analysis unless another method is specifically requested. This SOP is restricted to use by analysts familiar with Method 8260, experienced in the use of purge and trap systems, gas chromatograph/mass spectrometers, and skilled in the interpretation of mass spectra and their use as a quantitative tool. For more specific method references and instructions refer to SW-846, 3rd edition, Method 8260.

Method 8260 is a Gas Chromatography/Mass Spectrometry (GC/MS) procedure for determining volatile organics in a variety of matrices. It is limited to compounds that elute as sharp peaks from a capillary GC column. Such compounds include low molecular weight halogenated hydrocarbons, aromatics, ketones, nitriles, acetates, acrylates, ethers and sulfides. It is applicable to nearly types of samples, regardless of water content, including ground water, aqueous sludges, caustic liquors, acid liquors, waste solvents, oily wastes, mousses, tars, fibrous wastes, polymeric emulsions, filter cakes, spent carbons, spent catalysts, soils and sediments. The sample is introduced into the system using a purge and trap concentrator or by direct injection.

When using the purge and trap technique, an inert gas is bubbled through the liquid sample at an ambient or slightly elevated temperature, and the volatile components are transferred from the aqueous phase to the vapor phase. The vapor is swept through a sorbent column where the volatile components are trapped. After purging is completed, the sorbent column is heated and back flushed withe inert gas to desorb the components onto a gas chromatographic column. The gas chromatographic column is heated to separate and elute the components, which are then detected with a mass spectrometer which provides quantitation and qualification.
This method is applicable to most volatile organic compounds that have boiling points below 200ø C, and that are insoluble or slightly soluble in water. Volatile, water soluble compounds can be included in this analytical technique, however, for the more soluble compounds, quantitation limits are higher because of poor purging efficiency.

Whether purged or injected directly on column, interferences naturally present in the sample can also cause elevated detection limits and hamper the analysis. Naturally occurring interferences can vary considerably from site to site.

Sample contamination can also cause elevated detection limits or give false positives, and can come from a variety of sources. Improper sampling techniques can contaminate the sample at the job site. During shipment and storage volatile organics (particularly Methylene Chloride and fluorocarbons) can diffuse through the septum and into the sample. During analysis, contamination can come from impurities in the purge gas, or from organic compounds out gassing from the plumbing ahead of the trap where they were deposited by a previously analyzed high level sample. To reduce this ,the use of non-TFE plastic coating, non-TFE thread sealants, and flow controllers with rubber components in the purging device have been eliminated where possible, and a reagent blank is run whenever an unusually high concentrated sample is analyzed, or cross contamination is suspected.

II. PRE-ANALYSIS SECTION C

1.0 OVERVIEW

1.1 The pre-analysis section covers everything that is required prior to running samples. This section includes target lists, equipment used, individual instrument setups, and standard preparation.

2.0 TARGET LISTS, MDL's, PQL's, QUANTITATION IONS, SURROGATES, AND INTERNAL STANDARDS

2.1 Table 1 lists internal standards, surrogates, and Method 8260 target compounds including MDL's, quantitation ions, secondary ions, and internal standard/target matches.

2.2 Table 2 lists the Practical Quantitation Limits (PQL) for water and soil matricies of selected compounds. Compounds not listed in Table 2 have no PQL's determined at this time.

3.0 EQUIPMENT/SET UP CONDITIONS

3.1 Table 3 describes the GC/MS and Pruge and Trap methods used in this SOP. These are guidelines only and may differ depending on equipment.

4.0 STANDARDS

4.1 Great care must be taken to maintain the integrity of all standard solutions. All standards are contained in glass, screw cap bottles or crimp cap vials. The bottle should have minimal head space present, and be capped with lids or mini-inert valves possessing Teflon liners. All standards are stored in a freezer separate from samples, protected from light, between -10ø C and -20ø C. Once any standard begins to fail the continuing calibration it will be replaced. At a minimum, gas standards are replaced every two months and all other standards are replaced every 6 months. Reactive compounds such as 2-chloroethylvinyl ether and styrene may need to be prepared more frequently.

4.2 When standard mixes are purchased, only certified solutions are allowed. When prepared in house from neat compounds, a percent purity adjustment factor is used if the purity of the compound is less than 96%, either by using more of the chemical, or adjusting the final concentration. When the chemical has greater than or equal to 96% purity, no adjustment is necessary. All solvents used to dilute the standards or for final rinsing of glassware are pesticide or purge and trap grade purity. All water used to dilute the standards or for final rinsing of glassware should be free of any organic compounds of interest. All solvents used in standards prep are stored separately from other laboratory solvents and chemicals. When weighing of standards is involved, a calibrated analytical balance is used. All weights are recorded to the nearest ten-thousandth of a gram (0.0001g). When volumes are used, the liquid is allowed to come to ambient temperature before use.

4.3 All standards used in the laboratory must be recorded in standards log books. Vendors, lot numbers, concentrations, purities, etc. must all be recorded. Each standard made or received is given a unique reference number.

4.4 Standards preparation is broken down into specific sections detailing internal standard/surrogate preparation, main volatile standard mix preparation, and BFB preparation.

THE RECORD

4.5 Internal and Surrogate Standards are combined into one mixture. The stocks are purchased from a variety of suppliers and are normally at concentrations of 2,000 and 2,500 ug/ml. To make a 50 ppm (ug/ml) solution for daily use, measure 25 ul of 2,000 ppm and 20 ul of 2,500 ppm solution and mix with sufficient Methanol to make 1.0 ml of total solution. If the stock concentrations vary from those listed, adjust as necessary .

4.6 The volatiles standard consists of a variety of stock solutions and mixtures either purchased or prepared in the laboratory. The exact mixtures may vary depending of availability of commercial mixtures. Since many individual standard solutions and commercial mixtures are used, no specific mixing instructions are possible. The compound list from Table 1 should be used to determine the composition of the VOA standard. Standards purchased either as individuals or mixtures, should be obtained and prepared as necessary to obtain a final concentration of 50ug/ml of each component.

4.7 BFB, for tuning requirements, is made as a separate solution since both 8260 and 524.2 methods are done in the laboratory, a solution concentration of 25 ug/ml is made from purchased stock solution. 2ul of this solution purged in 5.0ml DIW is equivalent to a direct injection of 50 ng of 4-Bromofluorobenzene(BFB).

4.8 Medium level soil extraction standards.

4.8.1 For solid matacies that must be Methanol extracted, three standards are used in place of the normal internal/surrogate standard and matrix spike standard during the analysis. The first is a solution containing only the internal standard at the normal concentration. The second solution consists of 25ug/ml of the surrogate standards and the final solution consists of the matrix spike compounds also at a concentraton of 25ug/ml. Based on a 4.0g initial sample weight in 10.0ml methanol, and 100ul added to 5.0ml reagent water, the concentration of the surrogate and matrix spike compounds will be 6,250ug/Kg wet weight basis.

III. ANALYSIS SECTION

5.0 OVERVIEW

5.1 This section covers everything involved with data acquisition. Sections included in run order are BFB analysis, initial and continuing calibrations, blanks, method certifications, MDL studies, sample analysis, dilutions, and spikes.

5.2 The experience of the analyst performing GC/MS analysis is invaluable to the success of the methods. Each day that analysis is performed, the daily calibration standard should be evaluated to determine if the chromatographic system is operating properly. Questions that should be asked are: Do the peaks look normal?; Is the response obtained comparable to the response from previous calibrations? Careful examination of the standard chromatogram can indicate whether the column is still usable, the injector is leaking, the septum needs replacing, etc. If any major changes are made to the system (e.g., column changed), re-calibration of the system must take place.

CONTROLLED DOCUMENT - DO NOT COPY

5.3 Every 12 hour shift must begin with the analysis of 4-Bromofluorobenzene (BFB), followed by either a 5 point curve or a continuing calibration standard, and then a blank. BFB must pass the required tuning criteria (Table 4) before any subsequent analysis can begin. There is a 12 hour window that all acquisitions must be started in, beginning at the injection time of BFB. Any compound requiring quantitation under Method 8260 must have an average response factor, first or second degree curve generated from a 5 point calibration and that curve must pass the required System Performance Check Compounds (SPCC) or Continuing Calibration Compounds (CCC) criteria. A daily calibration standard is run on days that a curve is not, and it also must pass the required criteria. The analytical system must be demonstrated to be free from contamination under the conditions of the analysis by running a laboratory reagent blank at least at the beginning of every 12 hour shift. Only then can the analysis of actual samples begin. All volatile samples must be analyzed within 14 days of collection, provided that the vials have been preserved to a pH of less than 2 if aromatics are part of the scan, otherwise the sample must be analyzed within 7 days. A matrix spike and matrix spike duplicate must be run on each analytical batch (up to 20 samples). A Laboratory Control Spike (LCS) will be run on a daily basis immediately after the method blank and will consist of the same spike compounds found in the MS/MSD but spiked into reagent water or laboratory sand. Additional quality control method requirements are specified in the Quality Control section (17.0).

6.0 TUNING CRITERIA

6.1 No analysis of any kind may begin until 50 ng of 4-Bromofluorobenzene (BFB) injected onto the system produces a spectra that passes the tuning criteria given in Table 4.

TABLE 4

BFB KEY ION ABUNDANCE CRITERIA

Mass	Ion Abundance Criterion

95	base peak, 100% relative abundance
96	5 to 9% of mass 95
173	less than 2% of mass 174
174	greater than 50% of mass 95
175	5 to 9% of mass 174
176	greater than 95% but less than 101% of mass 174
177	5 to 9% of mass 176

CONTROLLED DOCUMENT DO NOT COPY

Spectrum manipulation may consist only of sequential scan additions and simple background subtraction to remove column bleed ions. No excessive manipulation of the BFB peak is allowed.

7.0 INITIAL CALIBRATION

7.1 In addition to passing the BFB tuning criteria, a 5 point calibration curve is required for initial calibration. The current curve that is used consitsts of: 10, 20, 50 , 100 and 150 ug/L. Other values may be used to either expand the curve range or extend the accuracy and precision. Prepare the standards as directed in Section 7.2. All target compounds must be included in the 5 point curve including internal standards and surrogates. Since the internal standards and surrogates are in the same solution, they will be run at a constant concentration of 50 ug/L throughout the curve.

7.2 Remove the plunger from a 5 ml luer lock syringe. Fill the syringe with reagent water. Replace the syringe plunger and compress the sample. Tilt the syringe so the tip is pointed up and vent any residual air while adjusting the sample curve to 5ml. Next, using microliter syringes, add the indicated amount of standard specified in Table 5. Be sure that needle of the microliter syringe is well beneath the surface of the reagent water in the 5ml syringe. Attach the 5ml syringe to the three port valve on the purging device. Open the valve and inject the sample into the purging vessel.

ENSECO ENVIRONMENTAL TECH

TABLE 5

STANDARD VOLUMES REQUIRED FOR 5 POINT CURVE

Amt. of VOA	Std. Req'd
10 ug/L	1ul of 50 mg/L Std
20 ug/L	2ul of 50 mg/L Std
50 ug/L	5ul of 50 mg/L Std
100 ug/L	10ul of 50 mg/L Std
150 ug/L	15ul of 50 mg/L Std.

7.3 Calculate RFs for each compound using the quantitation ion, and the internal standard ion listed in Table 1. The RF is calculated as follows:

$$RF = \frac{Ax * Cis}{Ais * Cx}$$

where:

Ax = Area of the characteristic ion for the target compound being measured.

Ais = Area of the characteristic ion for the specific internal standard.

Cx = Concentration of the compound being measured.

Cis = Concentration of the specific internal standard.

Alternately a linear regression curve or quadratic curve may be used instead of average RF.

7.4 For compounds not listed in Table 1, a major ion that is dissimilar to potential coeluting or interfering ions should be chosen as the quantitation ion. The internal standard chosen should be one that has a retention time closest to the compound being measured. The ion is used should be consistent with the ones listed in Table 1.

7.5 Perform these same operations for all 5 points of the curve.

EARTH TECH CONTROLLED DOCUMENT DO NOT COPY

7.6 An average RF of all 5 points of the curve must be calculated for each compound. Five compounds are used as the System Performance Check Compounds, or SPCC's. They are Chloromethane, 1,1-Dichloroethane, Bromoform, 1,1,2,2-Tetrachloroethane, and Chlorobenzene. These compounds must have an average RF of at least 0.300 (0.250 for Bromoform and 0.150 for Chloromethane). Analysis cannot begin unless this criteria is met. These compounds typically have RF's of 0.2 - 0.6 and this check is used to monitor compound instability and degradation caused by contaminated lines or active sites in the system. Examples of these occurrences are:

7.6.1 Chloromethane which is the most likely compound to be lost if the purge flow is too fast.

7.6.2 Bromoform is one of the compounds most likely to be purged very poorly if the purge flow is too slow and to be affected by cold spots and/or active sites in the transfer lines. Response of its quantitation ion (m/z 173) is directly affected by the tuning of the GC/MS to meet the instrument performance criteria for BFB at ions m/z 174/176. Increasing the m/z 174/176 ratio may improve Bromoform response.

7.6.3 Tetrachloroethane and 1,1-Dichloroethane are degraded by contaminated transfer lines in purge and trap systems and/or active sites in the trapping material.

7.7 The Percent Relative Standard Deviation (% RSD) also must be calculated for all compounds. Using the RF's from the initial calibration, calculate the % RSD using the following formula:

$$\% \text{ RSD} = (SD/x) * 100$$

where:

RSD = relative standard deviation.

x = mean of the five curve points for a compound.

SD = standard deviation of average RF's for a compound.

7.7.1 All compounds should have a % RSD of less than 30%. The 6 compounds used as Calibration Check Compounds (CCC's) are: 1,1-Dichloroethene, Chloroform, 1,2-Dichloropropane, Toluene, Ethylbenzene, Vinyl Chloride. These compounds must have a % RSD of less than 30%. This last criterion must be met in order for the initial calibration to be valid.

7.8 The internal standard responses and retention times of the initial calibration runs must be evaluated immediately after or during data acquisition, and pass the requirements listed in Section 17.3,

CONTROLLED DOCUMENT - DO NOT COPY

8.0 CONTINUING CALIBRATION

8.1 On 12 hour shifts when an initial calibration curve is not run, a mid-level continuing calibration standard containing each compound being quantitated is run immediately after BFB (usually 50ng/L). This is done to verify instrument sensitivity, and to confirm the initial calibration curve is still valid. The continuing calibration standard is verified similarly to the initial calibration curve, by checking the SPCC's and the CCC's.

8.1.1 System Performance Check Compounds (SPCC's): A system performance check must be made each 12 hour. shift. If the SPCC criteria are met, a comparison of response factors is made for all compounds. This is the same check that is applied during the initial calibration. The response factor for the SPCC compounds must be $\geq$ 0.300 (0.250 for Bromoform and 0.150 for Chloromethane). If these minimum response factors are not met, the system must be evaluation, and corrective action must be taken before sample analysis begins. Some possible problems are standard mixture degradation, active sites in the injection port inlet, sites in the column or chromatographic system.

8.1.2 Calibration Check Compounds (CCC's): After the SPCC's are met, the CCC's are used to check the validity of the initial calibration. Calculate the percent difference using the following formula:

$$\% \text{ Difference} = [(((\text{average RF}) - (\text{RF})) / (\text{average RF})) * 100]$$

where: (average RF) = average response factor from 5 point initial calibration curve.

(RF) = response factor from daily continuing calibration standard.

8.1.2.1 If the difference for any compound is greater than 20%, the laboratory should consider this a warning limit. The percent difference for each CCC must be less than 25% for the continuing calibration to be valid. If this criteria is not met for any CCC, sample analyses cannot begin and corrective action must be taken. Problems similar to those listed under SPCC's could affect this criteria. If no source of the problem can be determined after corrective action has been taken, a new five point calibration must be generated before quantitative sample analysis begins.

9.0 BLANK

9.1 After BFB and the curve or continuing calibration has been run, a reagent water blank is required before any samples are analyzed to show that the analytical system is free from interferences and contamination. At a minimum, a blank is run at this point during every 12 hour shift. A blank will be run more frequently if contamination is suspected from a high level sample.

9.2 If medium level soil extractions are to be analyzed, a blank consisting of Methanol that has been through all stages of the sample preparation process will be run.

9.3 For soil analysis, a method blank consisting of clean, dried, laboratory sand will be run if low level soil samples are to be analyzed.

10.0 INSTRUMENT/ANALYST/METHOD CERTIFICATION

10.1 Before the analyses of any actual samples, each analyst must demonstrate the ability to generate acceptable accuracy and precision by running a one time analyst certification. While the analyst certification is not instrument dependent, this certification is required on every instrument that will be running samples to demonstrate instrument ability to generate acceptable accuracy and precision. Any time a major modification of the instrument is made, this certification will need to be re-run. The solution to be analyzed will consist of all compounds listed in Table 6, Method 8240B, Revision 2, November 1990 and will be prepared at 2 and 5 times the level of the lowest calibrations standard. Each solution will be run in duplicate and must meet the acceptance criteria listed in Table 6, Method 8240B, Revision 2, November 1990.

10.2 When one or more of the analytes tested fail the acceptance criteria, the analyst must proceed according to Section 10.3.

10.3 Locate and correct the source of the problem and repeat the test for all analytes that failed to meet the criteria. Repeated failure, however, will confirm a general problem with the analyst or instrument. Samples may not be analyzed by any analyst until the certification has been successfully completed.

11.0 MDL

11.1 Every analyte to be quantitated by Method 8260 must have a Method Detection Limit (MDL) study performed on it. Results obtained for analytes that have not had an MDL calculated by this method must be considered estimated. The method detection limit (MDL) is defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the value is above zero.

11.2 The procedure followed for a MDL study is based on the method given in the Federal Register, Part 136, Appendix B, 7-1-91 edition, revision 1.11. All Method 8260 quality control procedures governing the analyses must be followed.

11.2.1 Seven replicate analyses are performed using reagent water spiked with every analyte of interest, at 1 to 10 times the estimated MDL or at the required PQL concentration.

11.2.2 The standard deviation of the amount found for each analyte of the seven runs is calculated and multiplied by the appropiate Students t value . The resulting number is the calculated MDL.

11.2.3 If the amount spiked is between 1 and 10 times the estiimated MDL, and there are no non-detected recoveries in the set of seven, the MDL result is acceptable. If not the MDL must be re-run, only for the compounds that did not pass. If the study needs to be re-run at a different concentration, the entire set of seven needs to be re-run. If the study does not pass due to poor reproducibility on one of the samples, only that run needs to be re-analyzed. All seven runs do not need to be run in the same 12 hour shift.

12.0 SAMPLE ANALYSIS

12.1 All volatile samples must be run within 14 days of sample collection. Instrument set up conditions should be the same as those used for the standard calibration. For all sample analysis, blank subtraction is not allowed. If the initial analysis of a sample has a concentration of analytes that exceeds the upper level of the 5 point initial calibration curve by more than 20%, the sample must be re-analyzed at a dilution (Section 14.0), or the data must be qualified. Secondary ion quantitation is allowed only when there are interferences with the primary quantitation ion. Samples analyzed following a sample that had high levels of analytes or saturated ions must be re-analyzed if carry-over is suspected. All samples and standard solutions must be allowed to warm to ambient temperature before analyses. All samples, standards, and quality control samples must be spiked with the internal standard/surrogate standard mix. Sample analysis falls into three different categories, purge and trap low level waters and soils, medium level Methanol extracted soils, and high level wastes. All low level soil samples must be analyzed by heated purge.

12.2 Low Level Water Purge and Trap Analysis

12.2.1 Remove the plunger from a 5 mL luer lock syringe. Open the sample which has been allowed to come to ambient temperature, and carefully pour the sample into the syringe barrel tilt the syringe so the tip is pointed up and vent any residual air while adjusting the sample volume to 5.0 mL. This process of taking an aliquot destroys the validity of the sample for future analysis; therefore, if there is only one VOA sample vial, the analyst should fill a second vial by gently pouring the remainder of the sample into a head space free vial to protect against possible loss of sample integrity. This second sample is maintained only until such time when the analyst has determined that the first sample has been analyzed properly.

12.2.2 Pull back slightly on the plunger to create a small head space. Add 5 uL of internal standard/surrogate spiking solution through the tip of the syringe. The addition of 5 uL of the internal standard/surrogate spiking solution to 5 mL of sample results in a concentration of 50 ug/L of each surrogate and 50 ug/L of each internal standard.

12.2.3 Attach the syringe to the three port valve on the purging device. Open the valve and inject the sample into the purging chamber. Close the valve.

12.2.4 Follow the procedure in Section 3.0 for purging and data acquisition.

12.2.5 If, after quantitating the sample according to Section 16.0 any compound(s) exceed(s) the upper calibration standard by more than 20%, the sample will be re-analyzed following the dilution procedure outlined in Section 14.0.

CONTROLLED DOCUMENT

12.3 Low Level Heated Soil Analysis

12.3.1 This is designed for samples containing individual purgeable compounds of less than1 mg/kg. It is limited to sediment/soil samples and waste that is of a similar consistency (granular and porous). The low level method is based on purging a heated sediment/soil sample mixed with reagent water containing the surrogate and internal standards. Analyze all reagent blanks and standards under the same conditions as the samples. The GC/MS system should be set up, calibrated and ready to analyze samples prior to the preparation of the sample to avoid the loss of volatiles compounds. Follow the initial and daily calibration instructions, including addition of a 40ø C purge temperature.

12.3.2 Remove the plunger from a 5 mL Luerlock type syringe and fill until overflowing with reagent water. Replace the syringe plunger and compress the sample. tilt the syringe so the tip is pointed up and vent any residual air while adjusting the sample volume to 5.0 mL.

12.3.3 Withdraw the plunger slightly and add 5 uL of the internal standard/surrogate spiking solution to the syringe through the tip. The addition of 5 uL of the surrogate/internal standard spiking solution to 5 mL of reagent water results in a concentration of 50 ug/L of each surrogate and 50 ug/L of each internal standard.

12.3.4 Use a 5 g (wet weight) sample if the expected concentration is less than 0.2 mg/kg or a 1g (wet weight) sample for expected concentrations between 0.2 and 1 mg/kg.

12.3.5 The sample consists of the entire contents of the sample container. Do not discard any supernatant liquids. Mix the contents of the sample container with a narrow metal spatula. Weigh the amount determined in 11.3.4 into a tared sample vial. Note and record the actual weight to the nearest 0.1 g. These steps must be performed in a laboratory free of solvent fumes to avoid sample contamination

12.3.6 Add the 5 ml of spiked reagent water to the vial.

12.3.7 Follow the procedure in Section 3.0 for purging and data acquisition.

12.3.8 If, after quantitating the sample according to Section 1560 any compound(s) exceed(s) the upper curve level by more than 20%, the sample will be re-analyzed using Section 14.

12.4 Medium Level Soil Extraction

12.4.1 This method is based on extracting the sample with methanol and is used for samples that have concentrations of analytes greater than1 mg/Kg, and/or for analytes that are insoluble in water. An aliquot of the extract is added to reagent water and purged according to Section 12.2.

12.4.2 The sample consists of the entire contents of the sample container. Do not discard any supernatant liquids. Mix the contents of the sample container with a narrow metal spatula. Weigh 4.0 ñ 0.1g (wet weight) of sample into a tared vial. Using a top loading balance.

12.4.3 Quickly add 9.0 mL of Methanol to the vial for samples and 8.0mL of Methanol for matrix spikes and spike duplicates. Add 1.0ml of surrogate standard to each vial and 1.0ml of matrix spike solution to the MS/MSD vials (See section 4.8). Stopper and shake for 2 min. NOTE: Steps 12.4.2 and 12.4.3 must be performed rapidly and without interruption to minimize loss of volatile organics. These steps must be performed in a laboratory free from solvent fumes.

12.4.4 If the samples will not be analyzed immediately, transfer enough of the Methanol from the extraction to completely fill a 1.5 ml auto sampler vials with no head space. They may be stored at -10ø C to -20ø Cin the dark, prior to analysis. Do the same for a sample of the reagent Methanol for use as a method blank.

12.4.5 Remove the plunger from a 5 mL Luerlock type syringe and fill until overflowing with reagent water. Replace the plunger and compress the water to vent trapped air. Adjust the volume to 5.0 ml. Withdraw the plunger slightly and add 5 uL of the medium level internal standard solution to the syringe through the tip. Now add 100 ul or less of the Methanol extract.

12.4.6 Attach the syringe to the three port valve on the purging device. Open the syringe valve and inject the water/methanol sample into the purging chamber. Close the purge valve.

12.4.7 Follow the procedure in Section 3.0 for purging and acquisition.

12.4.8 If, after quantitating the sample according to Section 16.0 any compound(s) exceed(s) the upper limit by more than 20%, the sample will be re-analyzed using a volume of the Methanol extraction that is calculated to give an estimated final concentration beteen 50ug/Kg and100ug/Kg without dry weight corrections or dilutions.

13.0 SPIKES

13.1 Purge and trap water spikes

13.1.1 Following the sample analysis procedures from Section 12.0, analyze a matrix spike by spiking a 5 ml sample with 5 uL of the 50 mg/L matrix spike standard, and 5 ul of internal standard/surrogate mix. Disregarding any dilutions, this is equivalent to a concentration of 50 ug/L of each compound.

13.1.2 Follow 13.1.1 for the matrix spike duplicate analysis.

13.1.3 Repeat 13.1.1 substituting blank reagent water instead of a sample for the laboratory control spike..

13.2 Purge and trap Soil Spikes

13.2.1 Following the sample analysis procedures from Section 12.0, analyze a matrix spike by spiking a 5 g sample with 5 uL of the 50 mg/L matrix spiking standard, and 5 ul of internal standard/surrogate mix. Disregarding any dilutions, this is equivalent to a concentration of 50 ug/Kg of each compound.

13.2.2 Follow 13.2.1 for the matrix spike duplicate analysis.

13.2.3 Repeat 13.2.1 substituting blank reagent water and laboratory clean and dried sand instead of a sample for the laboratory control spike.

13.3 Purge and trap Methanol Extracted Soil spikes

13.3.1 Following the sample analysis procedures from Section 12.0, analyze a matrix spike and spike duplicate by spiking 5 ml of reagent water with the same amount of Methanol extracted sample as 12.4.

13.3.2 Follow 13.3.1 for the matrix spike duplicate analysis.

13.3.3 Repeat 13.3.1 substituting blank reagent water and Methanol instead of a sample for the laboratory control spike.

14.0 DILUTIONS

14.1 Any sample with an analyte concentration greater than 20% above the high point of the curve requires a dilution. The following procedure is appropriate for diluting low level water samples and the medium level Methanol extracted samples, as well as Methanol soluble waste samples. All steps must be performed without delays until the diluted sample is in the 5 ml syringe. All dilutions should keep the response of the major constituents (previously saturated peaks) in the upper half of the linear range of the curve.

CONTROLLED DOCUMENT - DO NOT COPY

14.2 Dilutions for high level water samples and Methanol extracted soil samples should be done directly in the 5 ml syringe to be attached to the concentrator. A 5 ml syringe is filled with reagent water and only enough headspace to accommodate the aliquot of sample or extract to be added is left. An appropriate aliquot of the sample or extract should then be injected directly into the syringe and 5 ul of the internal/surrogate standard should be added. The syringe is then attached to the concentrator and follow the procedure in Section 3.0 for purging and acquisition. Intermediate dilutions may be necessary.

14.3 Dilutions for Methanol soluble wastes should be made in methanol by weighing 1.0g of the waste sample into a tared 20 ml vial, which was previously marked with a 10 ml volume. Enough methanol to bring the volume to the 10 ml level is then added. The weight of the waste should be recorded to the nearest 0.1 g. The vial should then be shaken for 2 minutes. An appropriate aliquot of the methanol dilution should then be added to a 5 ml syringe, along with 5 ul of internal/surrogate standard and enough reagent water to bring the final volume to 5.0 ml. The analysts should then attach the syringe to the concentrator and follow the procedure in Section 3.0 for purging and acquisition. Intermediate dilutions may be necessary for extremely high levels.

14.4 Any time Methanol extract aliquots of samples are analyzed on the GC/MS, Equal aliquots of Methanol should be analyzed in the method blank.

IV. POST-ANALYSIS SECTION

15.0 OVERVIEW

15.1 This section covers all post analysis work-up procedures. It includes qualitative and quantitative calculations and policies, quality control procedures including internal standard retention times and areas, surrogate recoveries, spikes and spike recoveries, and data qualifiers.

16.0 QUALITATIVE IDENTIFICATION AND QUANTITATION

16.1 Qualitative Identification

16.1.1 All target analytes are identified by comparison of the sample mass spectrum with the mass spectrum of a standard of the suspected compound (standard reference spectrum), and (2) elution of sample component at the same GC relative retention time (RRT) as those of the standard component retention time.

16.2 Mass Spectra

16.2.1 Mass spectra for standard reference should be obtained on the users GC/MS. These standard reference spectra are obtained through analysis of the calibration standards.

16.2.1.1 All ions present in the standard mass spectra at a relative intensity greater than 10% (most abundant ion in the spectrum equals 100%) must be present in the sample spectrum. The relative intensities of these ions must agree within ñ20% between the standard and sample spectra. For example: an ion with an abundance of 50% in the standard spectra, must be between 30 and 70% abundance in the sample spectra.

16.3 Retention Time

16.3.1 The sample component Relative Retention Time (RRT) must compare within ñ 0.06 RRT units of the RRT of the standard component. If coelution of interfering components prohibits accurate assignment of the sample component RRT from the total ion chromatogram, the RRT should be assigned by using extracted ion current profiles for ions unique to the component of interest.

16.3.2 For samples containing components not associated with the calibration standards, a library search may be made for the purpose of tentative identification. All target analytes are identified by comparison of the sample mass spectrum with the mass spectrum from the NBS library using the procedure outlined in Section 16.4.

16.4 NBS Library Searches

16.4.1 The relative intensities of major ions in the reference spectrum should be present in the sample spectrum.

16.4.2 The relative intensities of the major ions should agree within ñ20%.

16.4.3 Molecular ions present in the reference spectrum should be present in the sample spectrum.

16.4.4 Ions present in the sample spectrum but not in the reference spectrum should be reviewed for possible background contamination or presence of coeluting compounds.

16.4.5 Ions present in the reference spectrum but not in the sample spectrum should be reviewed for possible subtraction from the sample spectrum because of background contamination or coeluting peaks. Data system library reduction programs can sometimes create these discrepancies. Computer generated library search routines should not use normalization routines that would misrepresent the library or unknown spectra when compared to each other. Only after visual comparison of sample with the nearest library searches will the mass spectral interpretation specialist assign a tentative identification.

16.5 Quantitative Analysis

16.5.1 When a compound has been identified, the quantitation of that compound will be based on the integrated abundance from the EICP of the primary characteristic ion given in Table 1. Quantitation will take place using the internal standard technique. The internal standard used shall be the one listed in Table 1. All quantitative results will be reported without correction for recovery data, and without subtraction of blank amounts.

16.5.2 Calculate the concentration of each identified analyte in the sample as follows:

16.5.3 Water and Water-Miscible Waste:

$$RF = \frac{Ax * Cis}{Ais * RF} * DF = ug/L$$

where:

Ax = Area of the characteristic ion for the target compound being measured.

Ais = Area of the characteristic ion for the specific internal standard.

Cis = Concentration of the specific internal standard in ug/L.

RF = Response Factor of appropriate standard.

DF = any Dilution Factors required.

CONTROLLED DOCUMENT REGION COPY

16.5.4 Sediment/Soil, Sludge, and Waste:

$$RF = \frac{Ax * Cis}{Ais * RF} * \frac{L\ purged}{Kg\ sample} * DF = ug/kg$$

where:

Ax = Area of the characteristic ion for the target compound being measured.

Ais = Area of the characteristic ion for the specific internal standard.

Cis = Concentration of the specific internal standard in ug/L.

RF = Response Factor of appropriate standard.

DF = any Dilution Factors required.

16.5.5 When requested, an estimate of concentration for analytes not present in the quantitation standard will be made. The formulas given above will be used with the following modifications: The areas for Ax and Ais should be the EICP for that internal standard closest to the compound, and the area for Ax should be the most abundant ion in the spectrum. The concentration obtained will be reported indicating that the value is an estimated.

17.0 QUALITY CONTROL

17.1 Each laboratory that uses these methods is required to operate a formal quality control program. The program consist of the following requirements previously covered:

17.1.1 BFB (Section 6.0)

17.1.2 Initial Calibration (Section 7.0)

17.1.3 Continuing Calibration Standard (Section 8.0)

17.1.4 Blank (Section 9.0)

17.1.5 Instrument/Analyst/Method Certification (Section 10.0)

17.1.6 MDL Study (Section 11.0)

17.2 In addition to the above, the following quality control requirements must be followed.

17.3 The internal standard responses and retention times in the calibration standard must be evaluated immediately after or during data acquisition. The retention time for all internal standards must be within 0.00 RRT units from the last continuing calibration standard. The EICP area for all internal standards must be within a factor of two (-50% to +100%) from the last daily calibration standard.

17.3.1 If it appears that a sample matrix effect is causing a deviation, the sample will be re-run to confirm the matrix problem. If it passess the second time, the second run will be reported. If it does not work this second time, all compounds associated with the internal standard that was out will be considered estimated. If many samples are out of control for no apparent reason, the mass spectrometer needs to be inspected for malfunctions and corrections must be made, as appropriate. When corrections are made, reanalysis of samples analyzed while the system was malfunctioning are necessary.

17.4 All surrogate recoveries must fall within the specified recovery windows (Table 6).

17.4.1 If any surrogate compound is out of control due to matrix problems, the sample will be re-run and reported as in section 17.3.1. If many samples are out of control for no apparent reason, the mass spectrometer needs to be inspected for malfunctions and corrections must be made, as appropriate. When corrections are made, re analysis of samples analyzed while the system was malfunctioning are necessary.

17.4.2 Until thirty samples of a given matrix have been analyzed, the recovery windows used are the ones provided in Table 6 if those are the surrogates being used, and 70-120% if they are not the same surrogate compounds. Once thirty water samples and thirty soil samples have been analyzed, in house recovery windows will be generated (Section 17.4.2.1)and used (Table 6). For surrogate compounds that are the same as those in Table 6, the lab generated limits must be within those control limits. At a minimum surrogate recovery limits will be updated annually on a matrix by matrix basis.

17.4.2.1 Calculate the average percent recovery (p) and standard deviation of the percent recovery (s) for each of the surrogates.

17.4.2.2 Calculate the upper and lower control limit for each surrogate standard. This should be done as follows: Upper Control Limit (UCL) = p + 3s
Lower Control Limit (LCL) = p - 3s

17.4.2.3 Two standard deviations will be used when 3 standard deviations gives a negative lower control limit.

CONTROLLED DOCUMENT

TABLE 6

GC/MS SURROGATE RECOVERY ACCEPTANCE WINDOWS

LAST UPDATED: January, 1994

	Low/Medium	Low/Medium
Surrogate Compound	Water	Soil/Sediment
4-Bromofluorobenzene	86-114	74-111
1,2-Dichloroethane-d4	76-113	70-111
Toluene-d8	88-110	81-116

water and soil windows based on SW-846 Method 8260 limits

17.5 The laboratory must analyze a matrix spike, a matrix spike duplicate, and a laboratory control sample, at a minimum once for every 20 water samples, and every 20 soil samples to assess accuracy. If only one to ten samples are analyzed in a month, at least one matrix spike, one matrix spike duplicate, and one laboratory control sample is required. Generally the set of quality control samples are run at random during the batch of 20 samples

17.6 The following compounds are required in the matrix spikes and laboratory control samples: 1,1-Dichloroethene, Trichloroethene, Chlorobenzene, Toluene, and Benzene. The spiking procedure is outlined in Section 17.0. All recoveries must be within the limits specified in Tables 7 and 8.

17.6.1 If any individual matrix spike recovery falls outside the designated recovery range, or, once in house precision limits are generated any percent difference exceeds the allowable limits, that analyte has failed the acceptance criteria and the result for that analyte in the unspiked sample will be considered estimated. The out of control analyte must then be checked in the laboratory control sample to verify that the out of control matrix spike recovery or matrix spike duplicate precision is due to a matrix interference, and not an out of control system.

17.6.2 If the laboratory control sample is also out of control, no data for any sample in the batch of 20 for that analyte can be reported unqualified. The samples must be re-run or qualified as estimated. The problem must be immediately identified and corrected before any further samples for that analyte can be run. If the laboratory control sample is within its' limits, then only the compound that was out in the spiked aliquot of the sample needs to be estimated in the unspiked sample, not the entire batch of samples. If the laboratory control sample is out of control, and the matrix spike/matrix spike duplicate were acceptable, no data will be estimated.

17.6.2.1 Until 5 matrix spikes, matrix spike duplicates, and laboratory control samples have been analyzed, the recoveries of the matrix spike, matrix spike duplicate, and laboratory control sample will be validated against the method windows given in Tables 7 and 8. Since there are no precision limits provided in the method, until 5 matrix spike duplicates have been analyzed, only accuracy will be monitored.

17.6.2.2 Once five sets of the quality controls samples of a given matrix (waters and soils) have been analyzed, calculate the average percent recovery (R) and the standard deviation of the percent recovery (SD) per matrix. Express the accuracy assessment as a percent recovery interval from R - 3SD to R + 3SD. If R = 90% and SD = 10%, for example, the accuracy interval is expressed as 60-120%. Another set of limits will be calculated the same way for the laboratory control sample windows. Precision windows will be calculated by taking the average of the 5% differences ± 3 standard deviations. Windows will be updated at a minimum annually.

I. INTRODUCTION

Method 8270 is used to determine the concentration of semi-volatile organic compounds in extracts prepared from all types of solid waste matrices, soils, and ground water. Direct injection of a sample is used in limited applications. This method is used to quantify most neutral, acidic, and basic organic compounds that are soluble in methylene chloride and capable of being eluted without derivatization as sharp peaks from a gas chromatographic fused-silica capillary column coated with a slightly polar silicone. Such compounds include polynuclear aromatic hydrocarbons, chlorinated hydrocarbons and pesticides, phthalate esters, organophosphate esters, nitrosoamines, haloethers, aldehydes, ethers, ketones, anilines, pyridines, quinolines, aromatic nitro compounds, and phenols, including nitrophenols. The following compounds may require special treatment when being determined by this method. Benzidine can be subject to oxidative losses during solvent concentration and it's chromatography must be watched for broadening. Hexachlorocyclopentadiene is subject to thermal decomposition in the inlet of the gas chromatograph, chemical reaction in acetone solution and photochemical decomposition. N-nitrosodimethylamine is difficult to separate from the solvent under the chromatographic conditions described. N-nitrososdiphenylamine decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine. Pentachlorophenol, 2,4-Dinitrophenol, 4-Nitrophenol, 4,6-Dinitro-2-Methylphenol, 4-Chloro-3-Methylphenol, Benzoic Acid, 2-Nitroaniline, 3-Nitroaniline, 4-Chloroaniline, and Benzyl Alcohol are subject to erratic chromatographic behavior, especially if the GC system is contaminated with high boiling material. This method is restricted for use by or under the supervision of analysts experienced in the use of gas chromatography/mass spectrometry and skilled in the interpretation of mass spectra. Each analyst must demonstrate the ability to generate acceptable results with this method. Interferences naturally present in the sample can cause elevated detection limits and hamper the analysis. Naturally occurring interferences can vary considerably from site to site. Sample contamination can also cause raised detection limits or false positives, and can come from a variety of sources. Improper sampling techniques can contaminate the sample at the job site. During analysis, contamination can come from impurities in the purge gas, or from organic compounds present in extraction solvents. To reduce this the use of non-TFE plastic coating, non-TFE thread sealants, and flow controllers with rubber components have been eliminated where possible, and a reagent blank is run whenever an unusually concentrated sample is analyzed, or cross contamination is suspected.

II. PRE-ANALYSIS SECTION

1.0 OVERVIEW

1.1 The pre-analysis section covers everything that is required prior to running samples. This section includes target lists, equipment used, individual instrument setups, and standard preparation.

2.0 TARGET LISTS, MDL's, PQL's, QUANTITATION IONS, SURROGATES AND INTERNAL STANDARDS.

2.1 Table 1 lists internal standards, surrogates and current target compounds including MDL's, quantitation ions, secondary ions and internal standard/target matches.

2.2 Table 2 lists the Practical Quantitation Limits (PQL) for water and soil matrices of selected compounds. Compounds not listed in Table 2 have no PQL's determined at this time.

Scan Range: 35-460 amu Scan Rate: 1.3 scans/second
Source: 250° C Electron energy: 70 volts (nominal)

4.0 STANDARDS

4.1 Stock quantitation standard solutions: Standard solutions are prepared from pure standard materials or purchased as certified solutions.

4.1.1 Commercially prepared stock standards are used to prepare the majority of quantitation working standards. They commonly come as mixes of compounds at 2000 ug/ml sealed in various glass ampules that are combined during preparation. The stock standards are mixed in individual crimp cap vials to give a five point calibration curve of 10, 20, 50, 80 and 120 ng/ul concentrations, Surrogates are present at a constant concentration of 50 and 100 ng/ul (BN and Acid). Internal standards are present at a constant 40 ng/ul concentration

4.1.2 Lab made stock standard solutions are prepared by accurately weighing about 0.1000 g of pure materials. The material is dissolved in methylene chloride or other suitable solvent and dilute to volume in a 10 mL volumetric flask. When compound purity is assayed to be 96% or greater, the weight is used without correction to calculate the concentration of the stock standard.

4.1.3 The stock standard solutions are transferred into Teflon-sealed screw-cap bottles, stored at -10 to -20° C and protected from light. Stock standard solutions are monitored for signs of degradation or evaporation.

4.1.4 The multi-component 8270 calibration mix standard will be re-diluted from stock monthly or sooner if compounds fail the CCC and SPCC criterion. The 8270 multi-component stock standard mix itself will be replaced every six months or sooner if necessary. Single component, and non-reactive mixes will be replaced annually or sooner if comparison with quality control check standards indicates a problem.

4.2 Internal standard solutions: The internal standards used are d4-1,4-Dichlorobenzene, Naphthalene-d8, Acenaphthene-d10, Phenanthrene-d10, Chrysene-d12 and Perylene-d12. Each 1 ml

of sample extract undergoing analysis is spiked with the internal standard solution to a concentration of 40 ng/uL.

4.3 GC/MS tuning standard: The methylene chloride tune standard solution contains 50 ng/uL of Decafluorotriphenylphosphine (DFTPP).

4.4 Surrogate standards: The surrogate standards used are Phenol-d6, 2-Fluorophenol, 2,4,6-Tribromophenol, Nitrobenzene-d5, 2-Fluorobiphenyl, and Terphenyl-d14. These standards are purchased as solutions at 2000 ug/ml for acid surrogates and 1000 ug/ml for BN surrogates. These are diluted in acetone to 100 and 50 ug/ml, respectively. 1.0ml added to 1.0L of water sample results in an extract concentration of 100 and 50 ng/ul. 1.0ml added to 30g of soil sample results in 1700 and 3300 ng/ul respectively.

4.5 Matrix spike standards: The compounds in the base-neutral matrix spike solution are Acenaphthene, 1,4-Dichlorobenzene, 2,4,-Dinitrotoluene, N-Nitrosodi-n-Propylamine, Pyrene, and 1,2,4-Trichlorobenzene. The acid spike contains 4-Chloro-3-Methyl phenol, 2-Chlorophenol, 4-Nitrophenol, Pentachlorophenol, and Phenol. The acid spike compounds are purchased at a concentration of 2000ug/ml in methanol. The base/neutral compounds have a concentration of 1000 ug/ml in methylene chloride. They are combined to give a final 1.0L for waters, give a final concentration of 100 and 50 ng/ul. 1.0ml added to 30g of soil results in 1700 and 3300 ng/ul respectively.

III. ANALYSIS SECTION

5.0 OVERVIEW

5.1 This section covers everything involved with data acquisition. Sections included in run order are DFTPP analysis, initial and continuing calibrations, blanks, method certifications, MDL studies, sample analysis, dilutions, and spikes.

5.2 The experience of the analyst performing GC/MS analyses is invaluable to the success of the methods. Each day that analysis is performed, the daily calibration standard should be evaluated to determine if the chromatographic system is operating properly. Questions that should be asked are: Do the peaks look normal?; Is the response obtained comparable to the response from previous calibrations? Careful examination of the standard chromatogram can indicate whether the column is still usable, the injector is leaking, the septum needs replacing, etc. If any changes are made to the system (e.g., column changed), re-calibration of the system must take place.

5.3 Every 12 hour shift must begin with the analysis of Decafluorotriphenylphosphine (DFTPP), followed by either a 5 point curve or a continuing calibration standard, and then a blank. DFTPP must pass the required tuning criteria (Table 4) before any subsequent analysis can begin. There is a 12 hour window that all acquisitions must be started in, beginning at the injection time of DFTPP. Any compound requiring quantitation under Method 8270 must have an average response factor, first or second degree curve generated from a 5 point calibration and that curve must pass the required System Performance Check Compounds (SPCC) or Continuing Calibration Compounds (CCC). A daily calibration standard is run on days that a curve is not, and it also must pass the required criteria. The analytical system must be demonstrated to be free from contamination under the conditions of the analysis by running a laboratory reagent blank at least at the beginning of every 12 hour shift. Only then can the analysis of actual samples begin. A matrix spike and matrix spike duplicate must be run on each analytical batch (up to 20 samples). A Laboratory Control Spike (LCS) will be run on a

daily basis immediately after the method blank and will consist of the same spike compounds found in the MS/MSD but spiked into reagent water or laboratory sand. Additional quality control method requirements are specified in the Quality Control section (17.0).

5.4 The internal standards selected in Paragraph 5.2 should permit most of the components of interest in a chromatogram to have retention times of 0.80-1.20 relative to one of the internal standards. The base peak ion from the specific internal standard is used as the primary ion for quantitation (see Table 1). Only if interferences are noted can the next most intense ion be used as the quantitation ion. In this instance the RF for that compound must also be recalculated before any quantitation can take place.

6.0 TUNING CRITERIA

6.1 Each GC/MS system is hardware-tuned to meet the criteria in Table 4 for a 50-ng, or less (1 ul) injection of DFTPP. Background subtraction is designed only to eliminate column bleed or instrument background ions.

TABLE 4
DFTPP KEY IONS AND ION ABUNDANCE CRITERIA

Mass	Ion Abundance Criteria
51	30-60% of mass 198
68	<2% of mass 69
70	<2% of mass 69
127	40-60% of mass 198
197	<1% of mass 198
198	Base peak, 100% relative abundance
199	5-9% of mass 198
275	10-30% of mass 198
365	>1% of mass 198
441	Present but less than mass 443
442	>40% of mass 198
443	17-23% of mass 442

J.W. Eichelberger, L.E. Harris, and W.L. Budde. "Reference Compound to Calibrate Ion Abundance Measurement in Gas Chromatography-Mass Spectrometry", Analytical Chemistry, 47, 995 (1975).

7.0 INITIAL CALIBRATION

7.1 Calibration standards: Calibration standards are at 10, 20, 50, 80 and 160 ng/uL.

7.2 1 uL of each calibration standard is analyzed. Figure 1 shows a chromatogram, with the proper chromatography, of a calibration standard containing the Method 8270 base/neutral and acid analytes. A RF is now calculated for each compound using the quantitation ion given in Table 1, using the following formula:

$$RF = (AxCis)/(AisCx)$$

where

Ax = Area of the characteristic ion for the compound being measured

Ais = Area of the characteristic ion for the specific internal standard
Cx = Concentration of the compound being measured (ng/uL)
Cis = Concentration of the specific internal standard (ng/uL)

7.3 A system performance check must be performed to ensure that average RF's are met before the calibration curve can be used. The System Performance Check Compounds (SPCC's) are listed in Table 5. The minimum acceptable average RF for these compounds SPCC's is 0.050. These SPCC's typically have very low RF's (0.1-0.2) and tend to decrease in response as the chromatographic system or the standard material begins to deteriorate. They are usually the first to show poor performance. Therefore, they must meet the minimum requirement when the system is calibrated. Alternately, a linear regression or quadratic calibration may be used in place of average RF.

7.4 The percent relative standard deviation (% RSD = 100[SD/RF]) is calculated for each compound. The % RSD for each individual Calibration Check Compound (CCC) (see Table 6) must be less than 30%. The relative retention times of each compound in each calibration run should agree within 0.06 relative retention time units.

TABLE 5
SYSTEM PERFORMANCE CHECK COMPOUNDS (SPCC's)

Base/Neutral Fraction	Acid Fraction
N-nitroso-di-n-propylamine	2,4-Dinitrophenol
Hexachlorocyclopentadiene	4-Nitrophenol

TABLE 6
CALIBRATION CHECK COMPOUNDS (CCC's)

Base/Neutral Fraction	Acid Fraction
Acenaphthene	4-Chloro-3-methylphenol
1,4-Dichlorobenzene	2,4-Dichlorophenol
Hexachlorobutadiene	2-Nitrophenol
N-Nitroso-di-n-phenylamine	Phenol
Di-n-octylphthalate	Pentachlorophenol
Fluoranthene	2,4,6-Trichlorophenol
Benzo(a)pyrene	

8.0 CONTINUING CALIBRATION

8.1 A Calibration standard at a mid-level concentration (typically 50 ng/ul) containing all semi-volatile analytes, including all required surrogates and internal standards, are performed immediately following an acceptable DFTPP run during every 12-hr analysis if an initial calibration is not performed. The response factors from the standards are compared with the average response factor from the initial calibration for a specific instrument.

8.2 System Performance Check Compounds (SPCC's): A system performance check is made on every continuing calibration standard. The SPCC criteria must be met in order for the continuing calibration standard to pass. The same SPCC compounds from Table 5 are used for the continuing calibration run. The minimum RF for semi-volatile SPCC's is 0.050. If the minimum response factors are not met, the system is evaluated, and corrective action is taken before sample analysis begins. Some possible problems are standard mixture degradation, injection port inlet contamination,

contamination at the front end of the analytical column, and active sites in the column or chromatographic system. This check must always be met before analysis begins

8.3 Calibration Check Compounds (CCC's): After the system performance check is met, the CCC's listed in Table 6 are used to check the validity of the initial calibration. Calculate the percent difference using:

$$\% \text{ Difference} = \frac{RFi - RFc}{RFi} \times 100$$

where: RFi = average response factor from initial calibration
RFc = response factor from current verification check standard

8.4 If the percent difference for each CCC is less than 25%, the initial calibration is assumed to be valid. If any one CCC has a greater than 25% difference from the initial calibration curve corrective action must be taken. Problems similar to those listed under SPCC's could affect this criterion. If no source of the problem can be determined after corrective action has taken place, the instrument is considered out of control. At a minimum the continuing calibration standard must be re-run. If necessary, a new curve will be run. The CCC criterion must always be met before sample analysis begins.

9.0 BLANK

9.1 After DFTPP and the curve or continuing calibration has been run, a reagent water blank is required before any samples are analyzed showing that the analytical system is free from interferences and contamination. At a minimum a blank is run at this point during every 12 hour shift. A blank will be run more frequently if contamination is suspected from a high level sample or if laboratory contamination is in question. The blank samples should be carried through all stages of the sample preparation and measurement steps, and will be spiked with internal standards and surrogates.

9.2 Since blanks are normally part of the extraction process batch, on those days where the only samples from previous batches are to be re-run, no blank will be analyzed prior to sample analysis.

10.0 INSTRUMENT/ANALYST/METHOD CERTIFICATION

10.1 Before the analyses of any actual samples, each analyst must demonstrate the ability to generate acceptable accuracy and precision by running a one time analyst certification. While the analyst certification is not instrument dependent, this certification is required on every instrument that will be running samples to demonstrate instrument ability to generate acceptable accuracy and precision. Any time a major modification of the instrument is made, such as a new type of column, trap, or a new concentrator, this certification will need to be re-run. The analytes required are listed in Table 7.

10.2 Prepare the certification samples at 2 and 5 times the lowest calibration level by spiking the appropriate matrix with solutions containing all analytes of interest. Samples are extracted normally and spiked with the appropriate level of internal standards. Each level is analyzed in duplicate.

10.3 Calculate the average recovery (x) in ug/L, and the standard deviation of the recovery (s) in ug/L, for each analyte.

10.3.1 For each analyte calculate the appropriate range, x, using the percent range, Ps, in Table 7 for each level analyzed and compare with the data in Table 7. If x for all analytes meet the acceptance

criteria, the system and analyst performance is acceptable and analysis of actual samples can begin. If any individual x falls outside the range for accuracy, then the system performance is unacceptable for that analyte.

10.3.2 When one or more of the analytes tested fail at least one of the acceptance criteria, the analyst must proceed according to 10.4.

10.4 Locate and correct the source of the problem and repeat the test for all analytes that failed to meet the criteria. Repeated failure, however, will confirm a general problem with the measurement system. If this occurs, locate and correct the source of the problem and repeat the test for all compounds in Table 7 beginning with Section 10.1. Samples may not be analyzed by any analyst or on any instrument until the analyst/instrument certification has been successfully completed

11.0 MDL STUDIES

11.1 Every analyte to be quantitated by Method 8270 must have a Method Detection Limit (MDL) study performed on it. Results obtained for analytes that have not had an MDL calculated by this method must be considered estimated. The method detection limit (MDL) is defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the value is above zero. PQL's listed in Method 8270 are used as Operating Detection Limits.

11.2 The procedure followed for a MDL study is based on the method given in the Federal Register, Part 136, Appendix B, 7-1-91 edition, revision 1.11. All Method 8270 quality control procedures governing the analyses must be followed.

11.2.1 Seven replicate analyses are performed using reagent water spiked with every analyte of interest, at 1 to 10 times the estimated MDL or at the required PQL concentration.

11.2.2 The standard deviation of the amount found for each analyte of the seven runs is calculated and multiplied by the appropriate Students t value . The resulting number is the calculated MDL.

11.2.3 If the amount spiked is between 1 and 10 times the calculated MDL, and there are no non-detect recoveries in the set of seven, the MDL result is acceptable. If not the MDL must be re-run, only for the compounds that did not pass. If the study needs to be re-run at a different concentration, the entire set of seven needs to be re-run. If the study does not pass due to poor reproducibility on one of the samples, only that run needs to be re-analyzed. All seven runs do not need to be run in the same 12 hour shift.

12.0 SAMPLE ANALYSIS

12.1 All extracts are stored at -10 to -20° C in the dark in a freezer separate from any standards.

12.2 Every sample extract is spiked with the internal standard solution prior to analysis to a concentration of 40ng/ul.

12.3 The extract is analyzed using the GC/MS operating conditions given in Table 3. All samples to be analyzed contain 50 ng/ul of base/neutral and 100 ng/ul of acid surrogates.

13.0 SPIKES

13.1 The laboratory must analyze a matrix spike, a matrix spike duplicate, and a laboratory control sample, containing the compounds referenced in the appropriate QC documents, attached, at a minimum once for every 20 water samples, and every 20 soil samples to assess accuracy. If only one to ten samples are analyzed in a month, at least one matrix spike, one matrix spike duplicate, and one laboratory control sample is required. Generally the set of quality control samples are run at the beginning of the batch of 20 samples, and when possible towards the end of the 12 hour sequence. Running the quality control samples at the end of the shift will help to document that the instrument was still operating correctly during the entire 12 hour shift.

13.2 If any individual matrix spike recovery falls outside the designated recovery range, or, once in house precision limits are generated any percent difference exceeds the allowable limits, that analyte has failed the acceptance criteria and the result for that analyte in the unspiked sample will be considered estimated. The out of control analyte must then be checked in the laboratory control sample to verify that the out of control matrix spike recovery or matrix spike duplicate precision is due to a matrix interference, and not an out of control system.

13.3 If the laboratory control sample is also out of control, no data for any sample run that day for that analyte can be reported unqualified. The samples must be re-run or qualified as estimated. The problem must be immediately identified and corrected before any further samples for that analyte can be run. If the laboratory control sample is within its' limits, then only the compound that was out in the spiked aliquot of the sample needs to be estimated in the unspiked sample, not the entire batch of samples. If the laboratory control sample is out of control, and the matrix spike/matrix spike duplicate were acceptable, no data will be estimated.

13.4 Until 5 matrix spikes, matrix spike duplicates, and laboratory control samples have been analyzed, the recoveries of the matrix spike, matrix spike duplicate, and laboratory control sample will be validated against the method windows given in the attached quality control documents. Since there are no precision limits provided in the method, until 5 matrix spike duplicates have been analyzed, only accuracy will be monitored.

13.4.1 Once five sets of the quality controls samples of a given matrix (waters, and soils) have been analyzed, calculate the average percent recovery (R) and the standard deviation of the percent recovery (SD) per matrix. Express the accuracy assessment as a percent recovery interval from R - 3SD to R + 3SD. If R = 90% and SD = 10%, for example, the accuracy interval is expressed as 60-120%. Another set of limits will be calculated the same way for the laboratory control sample windows. Precision windows will be calculated by taking the average of the 5 % differences +3 standard deviations. Windows will be updated at a minimum, annually.

14.0 DILUTIONS

14.1 Any sample with an analyte concentration greater than 20% above high point of the curve requires a dilution. All dilutions should keep the response of the major constituents (previously saturated peaks) in the upper half of the linear range of the curve.

IV. POST ANALYSIS SECTION

15.0 OVERVIEW

15.1 This section covers all post analysis work-up procedures. It includes qualitative and quantitative calculations and policies, quality control procedures including internal standard retention times and areas, surrogate recoveries, spikes and spike recoveries, and data qualifiers.

16.0 QUALITATIVE IDENTIFICATION AND QUANTITATION

16.1 Qualitative analysis

16.1.1 An analyte (ie those listed in Table 1) is identified by comparison of the sample mass spectrum with the mass spectrum of a standard of the suspected compound (standard reference spectrum). These standard reference spectra are obtained through analysis of the calibration standards. Two criteria must be satisfied to verify identification: (1) elution of sample component at the same GC relative retention time (RRT) as the standard component; and (2) correspondence of the sample component and the standard component mass spectrum.

16.1.2 The sample component RRT must compare to within ± 0.06 RRT units of the RRT of the standard component in the daily continuing calibration standard. If coelution of interfering components prohibits accurate assignment of the sample component RRT from the total ion chromatogram, the RRT is assigned by using extracted ion current profiles for ions unique to the component of interest.

16.1.3 All ions present in the standard mass spectra at a relative intensity greater than 10% (most abundant ion in the spectrum equals 100%), must be present in the sample spectrum.

16.1.4 The relative intensities of ions specified in Paragraph 8.1.3 must agree within plus or minus 20% between the standard and sample spectra. (Example: For an ion with an abundance of 50% in the standard spectra, the corresponding sample abundance must be between 30 and 70 percent).

16.1.5 For samples containing components not associated with the calibration standards, a library search can be made for the purpose of tentative identification. Only after visual comparison of sample spectra with the nearest library searches will the mass spectral interpretation specialist assign a tentative identification. Guidelines for making tentative identification are:

16.1.5.1 Relative intensities of major ions in the reference spectrum should be present in the sample spectrum.

16.1.5.2 The relative intensities of the major ions should agree within ± 20%.

16.1.5.3 Molecular ions present in the reference spectrum should be present in the sample spectrum.

16.1.5.4 Ions present in the sample spectrum but not in the reference spectrum should be reviewed for possible background contamination or presence of co-eluting compounds.

16.1.5.5 Ions present in the reference spectrum but not in the sample spectrum should be reviewed for possible subtraction from the sample spectrum because of background contamination or coeluting peaks. Data system library reduction programs can sometimes create these discrepancies.

16.2 Quantitative analysis

16.2.1 When a compound has been identified, the quantitation of that compound will be based on the integrated abundance from the EICP of the primary characteristic ion. Quantitation will take place using the internal standard technique. The internal standard used shall be the one nearest the retention time of that of a given analyte.

16.2.2 Calculate the concentration of each identified analyte in the sample as follows:

$$\text{Concentration (ug/L)} = \frac{Ax*Is*Vt}{Ais*RF*Vo*Vi}$$

where:
Ax = Area of characteristic ion for compound being measured
Is = Amount of internal standard injected (ng)
Vt = Volume of total extract, taking into account dilutions (uL)
Ais = Area of characteristic ion for the internal standard
RF = Response factor for compound being measured (Paragraph 6.5.2)
Vo = Volume of water extracted (mL)
Vi = Volume of extract injected (uL)

Sediment/Soil Sludge:

$$\text{concentration (ug/kg)} = \frac{Ax*Is*Vt}{Ais*RF*Vo*Ws*D}$$

where Ax, Is, Vt, Ais, RF, Vi are the same as for water
Ws = Weight of sample extracted or diluted in grams
D = (100-% Moisture in sample)/100, or 1 for a wet-weight basis

16.2.3 When requested, an estimate of concentration for non calibrated components in the sample should be made. The formulas given above should be used with the following modifications: The area Ax should be the most abundant ion in the spectrum, and the RF for the compound should be assumed to be 1. The concentration obtained should be reported indicating that the value is an estimate and which internal standard was used to determine concentration. The nearest internal standard free of interferences will be used.

16.2.4 If the response for any quantitation ion exceeds the initial calibration curve range of the GC/MS system, a dilution of the extract is made. Additional internal standard is added to the diluted extract to maintain the required 40 ng/uL of each internal standard in the extracted volume. The diluted extract is then re analyzed.

17.0 QUALITY CONTROL

17.1 Each laboratory that uses these methods is required to operate a formal quality control program. The program consist of the following requirements previously covered:

17.1.1 DFTPP (Section 6.0)

17.1.2 5 Point Initial Calibration (Section 7.0)

17.1.3 Continuing Calibration (Section 8.0)

17.1.4 Blank (Section 9.0)

In addition to the above requirements, the following is also required.

17.2 Internal Standards

17.2.1 The internal standard responses and retention times in all runs following the continuing calibration standard must be evaluated immediately after or during data acquisition. The retention time for all internal standards must be within ±30 sec from current 12 hour continuing calibration check standard. The EICP area for all internal standards must stay within a factor of two (-50% to +100%) from the current 12 hour continuing calibration standard.

17.2.2 If it appears that a sample matrix effect is causing deviation, the sample will be re-run to confirm the matrix problem. If it passes the second time, the second run will be reported. If it does not work the second time, all compounds associated with the internal standard that was out will be considered estimated. If many samples are out of control for no apparent reason, the mass spectrometer needs to be inspected for malfunctions and corrections must be made, as appropriate. When corrections are made, re-analysis of samples analyzed while the system was malfunction are necessary.

17.3 Surrogates

17.3.1 All samples (except waste dilution) must be spiked with surrogate standards. If any surrogate compound is out of control , the sample will be treated as in section 17.2.2.

17.3.2 Until thirty samples of a given matrix have been analyzed, the recovery windows used are the ones provided in Table 6 if those are the surrogates being used, and 70-130% if they are not the same surrogate compounds. Once thirty water samples and thirty soil samples have been analyzed, in house recovery windows will be generated and used (Table 6). For surrogate compounds that are the same as those in Table 6, the lab generated limits must be within those control limits. At a minimum surrogate recovery limits will be updated annually on a matrix by matrix basis.

17.3.3 Calculate the average percent recovery (p) and standard deviation of the percent recovery (s) for each of the surrogates.

17.3.4 Calculate the upper and lower control limit for each surrogate standard. This should be done as follows:
Upper Control Limit (UCL) = p + 3s
Lower Control Limit (LCL) = p - 3s

17.3.5 Two standard deviations will be used when 3 standard deviations gives a negative lower control limit.

17.3.6 Table 6 lists the method and current surrogate control windows. If any of these limits exceed the method limits, then the default is the method limits. At a minimum, surrogate windows are updated annually.

17.3.7 All surrogate recoveries must fall within the specified recovery windows (Table 6). If recovery is not within limits, the following procedures are performed.Check to be sure that there are no errors in calculations, surrogate solutions and internal standards. Also, check instrument performance. Recalculate the data and/or re analyze the extract if any of the above checks reveal a problem. Re-extracted and re analyze the sample if none of the above are a problem or flag the data as "estimated concentration".

TABLE 6

SURROGATE SPIKE RECOVERY LIMITS FOR WATER AND SOIL/SEDIMENT SAMPLES

	Method	% Recoveries
Surrogate Compound	Water	Soil/Sediment
Nitrobenzene-d5	35-114	23-120

MODIFIED EPA METHOD 8080
PESTICIDES AND PCB'S

1.0 SCOPE AND APPLICATION

This method covers the determination of 32 PCB's and Pesticides. This is a direct inject gas chromatographic (GC) method applicable to the determination of the components listed in Table 1, and is used for the characterization of groundwater, soil, sludge, water-miscible waste, and non-water-miscible waste of any or all of the listed compounds. A second analytical technique (different column or GC/MS) can be utilized to confirm any measurements.

2.0 METHOD SUMMARY

Samples are extracted as described in Section 8.1 along with applicable blanks and quality control samples. All samples are then cleaned up before analysis. Extracted samples are injected into a GC system equipped with an electron capture detector (ECD). Concentration of samples is determined by comparing levels of samples to the levels of a 5 point calibration curve. The method provides two optional gas chromatic columns that may be helpful in resolving the compounds of interest from interferences that may occur.

3.0 ANALYSIS RATE

Instrumental analysis including blanks, duplicates, and standards will allow the analysis of 5 samples in an eight hour period.

4.0 INTERFERENCES

Solvents, glassware and reagents produce artifacts which interfere with the analysis. In addition, phthalate esters and matrix interferences can pose major problems when analyzing pesticides using ECD. Absolute cleanliness is required in the preparation and analysis of samples.

5.0 MATERIALS AND REAGENTS

5.1 Chemicals

- Sodium thiosulfate, ACS granular
- Sulfuric acid, ACS grade
- Acetone, pesticide grad
- Hexane, pesticide grade
- Iso-Octane, pesticide grade
- Methylene Chloride, pesticide grade
- Florisil, PR grade
- Copper Turnings

5.2 Glassware and Hardware
- Various size volumetrics
- Various size microsyringes
- 1.5 ml Autosampler vials with teflon-faced silicon septum
- 40 ml septum vial
- 100 ml amber bottles

5.3 Instrumentation
- Electron capture detector (ECD)
- Chrome Perfect Data System

6.0 SAMPLE COLLECTION, PRESERVATION, & HANDLING

Samples should be collected in either unpreserved 1000 ml amber bottles (liquids, sludges) or unpreserved 125 ml amber containers (soils). Samples are stored at 4°C and brought to ambient temperature just prior to extraction.

7.0 STANDARD PREPARATION

7.1. Stock Standards

Stock standard solutions may be purchased as certified solutions or prepared from pure standard materials. Prepare stock standard solutions in hexane using assayed liquids. Each PCB standard is prepared separately, except for 1221/1254 and 1016/1260 where the first PCB is early and the second is late. Most single-peak pesticides are together in one standard (Supelpreme). A second standard (called Scan 3 mix) containing additional compounds sometimes requested includes a-chlordane and g-chlordane, 2,4'-DDT, Mirex, and PBB. In addition technical grade chlordane and toxaphene each are prepared separately due to their multi-peak responses, or can be run together.

Stored at 4°C, PTFE top vial.

All standards must be replaced after one year, or sooner if comparison with check standards indicates a problem. Calibration standards should be replaced every six months or sooner.

7.1.1 Standard Preparation from Certified Solutions

Commercially prepared stock standards can be used at any concentration if they are certified by the manufacturer or by an independent source.

CONTROLLED DOCUMENT - DO NOT COPY

(Supelco or PE Express standards are prepackaged at various concentrations.)

Certified solutions are generally used as stock standards unless the analyst wishes to analyze a partial list or prepare a check standard, in which case standards are made gravimetrically from neat compounds. Certified solutions are diluted in hexane to the desired concentration.

7.1.2 Standard Preparation by Gravimetric Method from Neat Compounds

To prepare a standard at approximately 1000 ppm, weigh 0.10g (100 mg) of compound into a 100 ml volumetric. Add hexane (some toluene may be necessary to dissolve some compounds) and stir with a magnetic stirrer or sonicate until all compound is dissolved. The actual concentration of the standard can be calculated as follows:

$$\frac{\text{mg compound}}{0.100\text{ L solvent}} = _____\ \text{ppm}$$

For example:

$$\frac{101\text{ mg PCB 1242}}{0.1\text{ L hex}} = 1010\text{ ppm PCB 1242}$$

7.2 Intermediate Standards

Intermediate standards are generally made by diluting the stock standard 1:100 in hexane.

7.3 Working Standards

Working standard concentrations (for continuing calibration verification) for the various standards are listed below:

PCBs	0.050, 0.10, 0.20, 050 and 1.0 ppm each,				separately	
Toxaphene	0.10.	0.20.	0.50,	0.80,	1.0	ppm
Chlordane	0.020,	0.040,	0.10,	0.16,	0.20	ppm
Pest Mix	0.010,	0.020,	0.050,	0.080,	0.10	ppm

8.0 PROCEDURE

8.1 Sample Prep

8.1.1 Extraction Summary

Samples are extracted as described below along with applicable blanks and quality control samples. All samples are then cleaned up before analysis. (These are summaries only, for detailed extraction procedures please refer to extraction SOP's).

8.1.1.1 Water Samples:
Water samples are extracted with methylene chloride. 1L of sample is shaken with 60 ml $MeCl_2$ for 2 min. The $MeCl_2$ is drawn off and the process is repeated two more times. The sample is then dried through a sodium sulfate column. It is then concentrated to 4 ml and changed over to hexane and blown down to 4 ml.

8.1.1.2 Soil samples:
50 g of sample are sonicated with 100 ml hexane for 3 minutes. This process is repeated twice with additional 100 ml portions of hexane. The sample is then poured through a sodium sulfate filled funnel into a turbovap tube and blown down to 2-4 ml.

8.1.1.3 Oil/Liquid Waste Samples:
0.5 g of sample is injected into 300 ml of hexane, mixed thoroughly, and blown down to 5 ml.

8.1.1.4 Wipes: Sample is sonicated with 50 ml hexane for 3 minutes. This process is repeated with another 50 ml of hexane. The sample is then poured through a sodium sulfate funnel into a turbovat tube and blown down to 4 ml.

8.1.2 Clean-Up

(The following are summaries only, for detailed cleanup procedures please refer to clean up SOP's).

8.1.2.1 Clean Up Process for PCB's
Approximately 500 ul is removed from the 4ml of sample available, and is placed in a 1.5 ml (autosampler) vial. More may be taken if the sample is especially dirty. To this vial is added an equal volume of conc. sulfuric acid by a disposable pipet. This is shaken and allowed to sit ten minutes or until the two layers separate, whichever is greater. The top layer is then

removed and placed in a clean 1.5 ml vial. This procedure is repeated until the extract is clear. Once it is clean, a level line is marked on the vial, 500 ul of iso-octane is added, and it is then blown down with purified nitrogen to a final volume of 500 ul.

8.1.2.2 Clean Up Process for Pesticides

Unfortunately, cleanup for pesticides is limited. The sample may be blown down with iso-octane and copper may be added to it, but florisil and sulfuric acid may not be added as they will react with the pesticides in the sample. Dirty samples and samples extracted for BNA's and PCB's/Pesticides are put through an Alumina column to remove BNA surrogates and other interferences.

8.2 Initial Calibration

8.2.1 PCB Curve

A iso-octane blank is run first (at 1.0 ul) to prove the system is clean. Then each PCB standard is injected at 0.050, 0.10, 0.20, 0.50, 1.0 ppm.

8.2.2 Pesticide Curve

The first injection, called a "slug" is 1 ul of the 10 ppm "Supelpreme" standard. The purpose of this is to fill any active sites in the system. A few iso-octanesare injected to clean out the system, and then an Endrin/DDT breakdown standard is run (0.050 ppm). Using the formulas below, the analyst must calculate % breakdown for endrin and DDT. If % breakdown is $\leq$ 15% analysis may proceed. If not, the glass injection sleeve is replaced, and approximately 3 inches of the capillary column is removed from the injector end. The breakdown standard is then rerun to prove acceptable breakdown. The breakdown standard should be run each day to check for active sites.

Breakdown Calculations

$$\frac{\text{Area Endrin Ald. + Endrin Ketone}}{\text{Area Endrin Ald. + Endrin Ketone + Endrin}} \times 100 = \% \text{ Endrin Breakdown}$$

$$\frac{\text{Area DDE+ DDD}}{\text{Area DDE + DDD + DDT}} \times 100 = \% \text{ DDT Breakdown}$$

The curve consists of 0.01, 0.02, 0.05, 0.80, 0.10 ng levels.

8.2.3 Calibration

Plot five poiont calibration curve of concentration vs. response in area or height.

8.2.4 QC Check Sample

Prepare a QC check sample at the same level as one of the midlevel curve standards. This check sample should be prepared separately from the calibration standards.

Analyze the check sample according to section 8.3 and 8.4 for each parameter compare the percent recovery of the check sample to established acceptance limits. If all parameters are acceptable, the analysis of samples can begin. If any of the recoveries are outside established limits, the analyst must repeat the test for the parameters that failed. If the second test fails, a new calibration curve must be created and the process repeated.

8.3 Sample Analysis

1 ul of sample is injected onto the column. depends on the extraction

Identify the parameters in the sample by comparing the retention times of the peaks in the sample chromatogram with those of the peaks in standard chromatograms. The width of the retention time window used to make identifications should be based upon measurements of actual retention time variations of standards over the course of 72 hours.. Three times the standard deviation of a retention time for a compound can be used to calculate a suggested window size; however, the experience of the analyst should weigh heavily in the interpretation of chromatograms.

CONTROLLED COPY DO NOT COPY

If the response for a peak exceeds the working range of the system, prepare a dilution of the sample and reanalyze.

The following criteria must be met to make a qualitative identification:

- The retention times of the peaks in the sample chromatogram must match the retention time of those peaks in the standard chromatogram.
- All positive pesticide identifications must be confirmed on a second column.
- For PCB, Toxaphene, and Chlordane identification guidelines, see Section 11.0.

8.4 Calculations

After identifying a parameter, the analyst should quantitate that parameter using the guidelines listed below.

First calculate the ng of compound in the extract (if not using a calibration curve):

$$ng = \frac{(pk.\ ht.\ sample)}{(CF)}$$

Then calculate the concentration of compound in the original sample.

Water Samples:

$$\text{Conc. (ug/l)} = \frac{(CC)(DF)(VT)}{(VI)(VS)} \bullet (1\ ug/1000\ ng)(1000\ ul/1\ ml)$$

Soil/Waste Samples:

$$\text{Conc. (mg/kg)} = \frac{(CC)(DF)(VT)}{(VI)(VS)} \bullet (1\ ug/1000\ ng)(1mg/1000ug)(1000ul/1ml)(1000g/1kg)$$

Wipes:

$$\text{Conc. (ug)} = \frac{(CC)(DF)(VT)}{(VI)} \bullet (1000\ ul/1\ ml)(1\ ng/1000\ ng)$$

Where:
DF = dilution factor
CC = ng in sample obtained from calibration curve or CF
VI = ul of sample injected
VS = initial volume of sample (L)
WS = initial weight of sample (g)
VT = total volume of extract (ml)

CONTROLLED DOCUMENT - DO NOT COPY

8.5 QC Requirements

8.5.1 Method QC

For each analytical batch a laboratory control sample and method preparation blank must be analyzed and recoveries calculated and compared to established control limits.

8.5.2 Matrix QC

A matrix spike and matrix spike duplicate must also be ran for every 20 samples of the same matrix (or once per batch of samples).

8.5.3 Continuing Calibration Verification

The calibration check standard or continuing calibration verification (CCV) standard must be analyzed at a frequency of after every 10 samples analyzed. The recoveries of the CCV must fall within an 85-115% recovery range.

8.5.4 Surrogate

The analyst should monitor the extraction efficiency and matrix effects by spiking each sample with a surrogate before extraction. If surrogate recovery is <50%, data must be qualified due to matrix interferences.

9.0 SAFETY

10.0 CORRECTIVE ACTION

See Corrective Action SOP.

11.0 IDENTIFICATION OF MULTI-RESPONSE COMPOUNDS: PCBs, TOXAPHENE, AND CHLORDANE

Each PCB contains peaks with the same retention time, however, the relative size of peaks to one another is unique for each alachlor. Each PCB has a distinct pattern of peaks, therefore in order to call a sample positive for a PCB it must match the pattern of the standard. The pattern may be changed by a complex matrix or by weathering of the PCB, therefore experienced analytical judgement must be used. PCB 1221 is unique and presents a whole different set of challenges. It elutes very early and is the simplest of patterns. It is the alachlor that is the most affected by matrix, therefore extreme caution must be used when identifying it.

PCBs can be grouped into two distinct groups, those that elute early and those that elute late.

Toxaphene and Chlordane each have unique patterns.

11.1 Early Eluting PCBs

11.1.1 Identification

Each PCB has been separated into groupings. Refer to Figure F1 for all of the following statements, for ease of identification (also refer to Chart 1):

- The initial and by far the most significant criteria will be the relation of peaks in group B.
- Secondly the absence or presence of group C.
- The final criteria is the proportion of group A to group B.
- Most of the time the peaks in group B will be sufficient to determine which PCB is present, use the other two criteria only when your determination is inconclusive.

*PCB 1221 consists of the early peaks of all the other pcbs in this group, exhibit caution in the identification of this alachlor.

11.1.2 Quantitation

- Use at least three (3) peaks.
- Do not use peaks that are disproportionate due to matrix interference.

11.2.2 Quantitation

- Use at least three (3) peaks
- Do not use peaks that are disproportionate due to matrix interference.

11.3 Samples Containing More Than One PCB

11.3.1 Identification

Only one early PCB can be identified as a PCB per sample. Once an alachlor is identified the same peaks cannot be used to identified a different PCB (e.g., it would be impossible to identify both 1248 and

CONTROLLED DOCUMENT - DO NOT COPY

1242 in the same sample. If both PCBs were present it would appear to be more like one or the other).

Though there are early and late PCBs, there is not a clear dividing line where one set stops and the other begins. PCB patterns may be distorted by overlapping peaks. This is very important to realize when attempting to identify each PCB present. Figure F3 demonstrates what a sample containing two PCBs would look like in the area of overlap, and what peaks to use to identify each PCB. Use group A to identify the early eluting PCBs and group B for late eluting PCBs.

Be careful when a sample contains high levels of an early eluting PCB not to call the later eluting peaks of that PCB a separate alachlor (look at proportions).

11.4 Identifying Toxaphene and Chlordane

The same precautions and guidelines that apply to PCBs are used for identifying these two multi-response pesticides.

PURGEABLE AROMATICS
EPA METHOD #8020

1.0 SCOPE & APPLICATION

This method covers the determination of 7 purgeable aromatic compounds. This is a purge and trap gas chromatographic (GC) method applicable to the determination of the compounds listed in Table 1, and is used for the characterization of municipal and industrial discharges of any or all of the listed compounds. A second analytical technique (dual column or GC/MS) can be utilized to confirm any measurements.

2.0 METHOD SUMMARY

An inert gas is bubbled through a 5-ml water sample contained in a specially designed purging chamber at ambient temperature or heated for soils at (40°C). The analytes are efficiently transferred from the aqueous phase to the vapor phase. The vapor is swept through a sorbent trap where the analytes are trapped. After purging is completed, the trap is heated and backflushed with the inert gas to desorb the analytes onto a gas chromatographic column. The gas chromatograph is temperature programmed to separate the analytes which are then detected with a photoionization detector.

The method provides an optional gas chromatographic column that may be helpful in resolving the compounds of interest from interferences that may occur.

3.0 ANALYSIS RATE

Instrumental analysis including blanks, standards, methods, matrix spikes and duplicates will allow approximately 16 runs in an eight hour period. This is limited, however, by the sample matrix.

4.0 INTERFERENCES

4.1 Impurities in the purge gas and organic compounds outgassing from the plumbing ahead of the trap account for the majority of contamination problems.

The analytical system must be demonstrated to be free from contamination under the conditions of the analysis by running laboratory reagent blanks as described in Section 8.2.

4.2 The use of non-Teflon plastic tubing, non-Teflon thread sealants, or flow controllers with rubber components in the purge and trap system should be avoided.

4.3 Contamination by carry-over can occur whenever high level and low level samples are sequentially analyzed. To reduce carry-over, the purging device and sample syringe must be rinsed with reagent water between sample analyses. Whenever an unusually concentrated sample is encountered, it should be followed by an analysis of reagent water in the same purging device to check for cross contamination. For samples containing large amounts of water soluble materials, suspended solids, high boiling compounds or high aromatic levels, it may be necessary to wash the purging device with a detergent solution, rinse it with distilled water, and then dry it in an oven at 105°C between analyses. The trap and other parts of the system are also subject to contamination; therefore, frequent bakeout and purging of the entire system may be required.

5.0 MATERIALS & REAGENTS

5.1 Chemicals

- Reagent water (organic free)
- Methanol (purge and trap grade)
- Pure stock standard materials or certified pre-mix standard
- Sodium thiosulfate (ACS), granular

5.2 Glassware and Hardware

- Various size volumetric flasks
- Various size microsyringes
- 15 ml screw-top vial with teflon-faced silicon septum
- 5/25 ml. gas tight syringes
- 40 ml. septum vial

5.3 Instrumentation

- Gas Chromatographs
- Photo-Ionization Detctor
- Data System
- Tekmar LSC-2; ALS 10 Place Automatic Purge & Trap Units
- Tekmar LSC-2; LSC-2000, ALS 1016, ALS 10 Place Purge and Trap

CONTROLLED DOCUMENT DO NOT COPY

6.0 SAMPLE COLLECTION, PRESERVATION, & HANDLING

All samples must be iced or refrigerated from the time of collection until analysis. If the sample containers free or combined chlorine, add sodium thiosulfate preservative (10 mg/40 ml is sufficient for up to 5 ppm Cl_2) to the empty sample bottle just prior to shipping to the sampling site. EPA Methods 330.4 and 330.5 may be used for measurements of residual chlorine. Field test kits are available for this purpose.

Grab samples must be collected in glass containers having a total volume of at least 25 ml. Fill the sample bottle just to overflowing in such a manner that no air bubbles pass through the sample as the bottle is being filled. Seal the bottle so that no air bubbles are entrapped in it. If preservative has been added, shake vigorously for one minute. Maintain the hermetic seal on the sample bottle until time of analysis.

All samples must be analyzed within 14 days of collection.

7.0 STANDARD PREPARATION

7.1. Stock Standard

Stock standard solutions may be purchased as certified solutions or prepared from pure standard materials. Prepare stock standard solutions in methanol using assayed liquids. Stock standards are diluted in methanol to make 10ppm intermediate standards.

Transfer the stock standard solution into a Teflon-sealed screw-cap bottle. Store at 4°C and protect from light.

All standards must be replaced after six months, or sooner if comparison with check standards indicates a problem.

7.1.1 Standard Preparation from Certified Solutions

Commercially prepared stock standards can be used at any concentration if they are certified by the manufacturer or by an independent source. (Supelco Purgeable Aromatics Kit 602-S, prepackaged as 200 mg/L in methanol.)

Certified solutions are generally used as stock standards unless the analyst wishes to analyze a partial list, in which case standards are made volumetrically from neat compounds. An intermediate standard at 10ppm is prepared in methanol by diluting the certified solution

7.1.2 Standard Preparation by Volumetric Method from

Neat Compounds

To make a 10,000 ppm stock standard, an amount of each analyte based on the density, and calculated with the formula below, is injected into a 100 ml volumetric flask partially filled with methanol. The flask is brought to volume and inverted three times (after replacing ground glass stopper) to insure proper mixing.

$$\frac{1}{\text{density}} \times 1000 = \text{(ul of analyte injected)}$$

Example for benzene:

$$\frac{1}{0.874} \times 1000 = 1114 \text{ ul}$$

The stock standard is then diluted in methanol to obtain a 5 ppm intermediate standard.

7.2 Working Standards

Working standards include calibration standards and continuing calibration verification standards. These standards are made by diluting intermediate standard into the 5 ml sample syringe which contains 5 ml of organic-free water. These standards must be loaded into the purging device immediately to avoid volatilization. Working standards must contain all compounds of interest and may be prepared from one or more intermediate standards.

8.0 PROCEDURES

8.1 Sample Prep

8.1.1 Water samples require no preparation prior to analysis.

8.1.2 All soils are extracted using a modified high-level extraction procedure if they contain analytes above the range of the curve. 10 grams of soil sample is weighed into a 40 ml vial to which is added 10.0 ml of methanol. The vial is then fitted with a Teflon coated septa cap and shaken for 30 seconds. A methanol blank is prepared by adding 10 ml methanol to another 40 ml vial when prepping samples. A separate methanol blank should be prepared and analyzed each time a batch of samples is prepped. Using a disposable Pasteur pipet, approximately 4

CONTROLLED DOCUMENT - DO NOT COPY

ml of extract is transferred to a small vial, and refrigerated until analyzed.

8.1.3 Waste samples are prepped by adding 1.0 g of sample into a 50 ml volumetric, partially filled with methanol. The volumetric is then brought to the line with methanol and inverted 3 times to ensure proper mixing. The analyst should also prepare and analyze a methanol blank with each set of samples prepped.

8.2 Initial Calibration

A water blank is injected initially. If the blank shows a contamination peak, water must be purged and the blank rerun. If the water is free of analyte, the standards may be injected, beginning with the lowest and proceeding to the highest. A series of standards consisting of 1,5,20,50 and 100 ug/l concentrations, are normally employed in the generation of the calibration curve. Analyze each calibration standard according to section 8.3 and plot peak area responses vs. concentration of the standard,

Prepare a QC check sample (also called a Laboratory Control Sample or LCS) containing 20 ug/l of each parameter. This check sample should be prepared separately from the calibration standards.

Analyze the check sample according to section 8.3 for each parameter compare the percent recovery of the check sample to establish acceptance limits. If all parameters are acceptable, the analysis of samples can begin. If any of the recoveries are outside established limits, the analyst must repeat the test for the parameters that failed. If the second test fails, a new calibration curve must be created and the process repeated.

8.3 Sample Analysis

Allow the sample to come to ambient temperature prior to introducing it to the syringe. Remove the plunger from a 5 ml syringe. Open the sample bottle (or standard) and carefully pour the sample into the syringe barrel to just short of overflowing. Replace the syringe plunger. Vent any residual air while adjusting the sample volume to 5.0 ml. Since this process of taking an aliquot destroys the validity of the sample for future analysis, the analyst should fill a second syringe or place remaining sample in a 20 ml vial with no headspace at this time to protect against possible loss of analytes. Add 10.0 ul of the surrogate spiking solution, if applicable, and inject sample into purging chamber.

Detailed instrument conditions are included on Analysis summary page (pg. 15).

Identify the parameters in the sample by comparing the retention times of the peaks in the sample chromatogram with those of the peaks in standard chromatograms. The width of the retention time window used to make identifications should be based upon measurements of actual retention time variations of standards over the course of 72 hours.. Three times the standard deviation of a retention time for a compound can be used to calculate a window size; however, the experience of the analyst should weigh heavily in the interpretation of chromatograms.

If the response for a peak exceeds the working range of the system, prepare a dilution of the sample with reagent water from the aliquot in the second syringe and reanalyze.

Assuming no dilution is needed, detection limits are reported at the Practical Detection Limits (PDLs), which generally correspond to the lowest calibration standard. If a dilution is needed, the detection limits should be calculated using the calculations in section 8.4, where CC=water PDL.

8.4 Calculations

Five working standards (1,5,20,50,100 ppb) must be calibrated and plotted of peak area on the vertical axis versus concentration in ug/l on the horizontal axis.

Water Samples:

conc. (ug/l) = (CC)(DF)

Soil/Waste Samples:

conc. (mg/kg) = (CC)(DF)(PE)(1L/1000 ml)(1 mg/1000 ug)(1000 g/1 kg)

or, simplified (CC)(DF)(PF)/1000.

Act 307 Soil Samples:

Soils analyzed for Act 307 detection limits must be based on dry weight of soil; therefore, the following additional calculation is necessary:

adj. conc.(mg/kg) = conc./%S

where: DF = Dilution factor
CC = value obtained from the calibration curve (or water PDL if calculating detection limits)

CONFIDENTIAL DOCUMENT - NON-CONFORM

PF = Preparation factor, ie: 10 ml MeOH/20 g sample = 0.5
%S= % solid (fraction, ie: 95% solid = 0.95)

NOTE: When calculating soil detection limits, it is important to use the water PDL. For soil samples run at 1:10, report soil PDL unless % solid is so low that the calculated detection limit is greater than the PDL.

8.5 QC Requirements

8.5.1 Method QC

For each working day a laboratory control sample (at 20 ug/l) and method preparation blank must be analyzed and recoveries calculated and compared to established control limits.

8.5.2 Matrix QC

A matrix spike, a matrix spike duplicate, or a duplicate, must also be ran for every 20 samples of the same matrix (or once per batch of samples). Recovering must be calcuated and compared to established control limits (see Table 4). If both MS and MSD are outside limits, and match, a CCV should be run to prove matrix interference.

8.5.3 Continuing Calibration Verification

After analyzing ten samples or once per day (whichever is more frequent), the analyst must perform a continuing calibration verification (CCV). A CCV consists of the calibration standard analyzed at 20 ug/l. All compounds must be within an 85-115% recovery range in order for analysis to continue. The CCV must pass for all compounds of interest before running additional samples. If the CCV fails, analyst should remake the standard. If the remade standard fails, analyst should run the LCS standard. If all standards fail, a new curve should be run.

8.5.4 Surrogate

The analyst should monitor both the performance of the analytical system and the effectiveness of the method with each sample matrix by spiking each sample, standard, and reagent blanks with surrogate compounds. Surrogates used have been chosen on the basis of stability and lack of interference or coelution with compounds of interest.

Prepare a stock spiking solution containing 10 mg/l of each surrogate compound. Add 10 ul of this spiking solution directly into the 5 ml

syringe for every sample, standard, and blank. Recoveries of the surrogate compound must be monitored.

If any one surrogate fails, the analyst must determine the cause of the failure.

-If surrogate in CCV also fails, and a freshly made standard show a change in calibration, a new curve must be run and samples re-analyzed.

-If surrogate in one or more samples (from the same client and location) fails, but the surrogate in the CCV passes, the analyst should select a representative sample to re-analyze.

-If the surrogate in the re-analyzed sample passes, then all affected samples must be re-analyzed.

-If the surrogate in the re-analyzed sample fails (or matches the original run) a matrix spike and matrix spike duplicate (MS/MSD) should be run on that sample.

-If the MS/MSD passes for all compounds of interest, the analyst should note the low surrogate recovery, but NOT qualify the data.

-If the MS/MSD fails, the analyst should qualify the data.

The following surrogates are used:

Fluorobenzene at 50ppb

Bromofluorobenzene at 20ppb

9.0 SAFETY

9.1 The toxicity or carcinogenicity of each reagent used in this method has not been precisely defined; however, each chemical compound should be treated as a potentially health hazard. From this viewpoint, exposure to these chemicals must be reduced to the lowest possible level by whatever means available. The laboratory is responsible for maintaining a current awareness file of OSHA regulations regarding the safe handling of the chemicals specified in this method. A reference file of material handling data sheets should also be made available to all personnel involved in the chemical analysis. Additional references to laboratory safety are available and have been identified for the information of the analyst.

9.2 The following parameters covered by this method have been tentatively classified as known or suspected human or mammalian carcinogens: benzene and 1,4-dichlorobenzene. Primary standards of these toxic compounds should be prepared in a hood. A NIOSH/MESA approved toxic gas respirator should be worn when the analyst handles high concentrations of these toxic compounds.

Method for Chemical Analysis of Water and Wastes
Revised March 1983
USEPA Method 200.7

4.0 SCOPE AND APPLICATION

4.1 Inductively coupled plasma atomic emission spectroscopy (ICP) determines a wide range of elements in solution, such as metals. The method is applicable to a large number of metals in a large variety of matricies. Most matricies require solubilization or digestion prior to analysis.

5.0 SUMMARY OF METHOD

5.1 Prior to analysis, samples must be solubilized or digested using appropriate Sample Preparation Methods. See Methods 3005-3050/200.0/200.7.

5.2 This method describes the sequential, multielemental determination of elements by ICP. The method measures element-emitted light by optical spectrometry. Samples are nebulized and the resulting aerosol is transported to the plasma torch. Element-specific atomic-line emission spectra are produced by a radio-frequency inductively coupled plasma. The spectra are dispersed by a grating spectrometer, and the intensities of required for trace element determination. Background must be measured adjacent to analyte lines on samples during analysis. The position selected for the background-intensity as occurs at the analyte wavelength measured. Background correction is not required in cases of line broadening where a background correction measurement would actually

degrade the analytical result. The possibility of additional interferences named in Section 3.0 should also be recognized and appropriate corrections made; tests for their presence are described in Section 8.5.

Table 1
RECOMMENDED WAVELENGTHS AND
ESTIMATED INSTRUMENTAL DETECTION LIMIT

Element	Wavelength[a] (nm)	Estimated Detection Limit[b] (ug/l)
Arsenic	193.696	53
Barium	233.527	2
Beryllium	313.042	0.3
Boron	249.773	5
Calcium	422.673	10
Chromium	267.716	7
Cobalt	228.614	7
Copper	324.754	6
Iron	238.204	7
Magnesium	383.826	30
Manganese	257.610	2
Molybdenum	202.030	8
Nickel	231.604	15
Selenium	196.026	75
Silicon	251.610	58
Silver	328.068	7
Sodium	589.592	29
Thallium	190.864	40
Titanium	334.941	1
Vanadium	292.402	8
Zinc	213.856	2

a The wavelengths listed are recommended because of their sensitivity and overall acceptance. Other wavelengths may be substituted if they can provide the needed sensitivity and are treated with the same corrective techniques for spectrial interference (see Paragraph 3.1). In time, other elements may be added as more information becomes available and as required.

b The estimated instrumental detection limits shown are taken from Reference 1 in Section 10.0 below. They are given as a guide for an instrumental limit. The actual method detection limits are sample dependent and may vary as the sample matrix varies.

FAPP CONTROLLED DOCUMENT DO NOT COPY

6.0 INTERFERENCES

6.1 Spectral interferences are caused by: (1) overlap of a spectral line from another element; (2) unresolved overlap of molecular band spectra; (3) background contribution from continuous or recombination phenomena; and (4) stray light from the line emission of high-concentration elements. Spectral overlap can be compensated for by computer-correcting the raw data after monitoring and measuring the interfering element. Unresolved overlap requires selection of an alternate wavelength. Background contribution and stray light can usually be compensate for by a background correction adjacent to the analyte line.

Users of simultaneous multielement instruments must verify the absence of spectral interference from an element in a sample for which there is no instrument detection channel. Potential spectral interferences for the recommended wavelengths are given in Table 2. The data in Table 2 are intended as rudimentary guides for indicating potential interferences; for this purpose, linear relations between concentration and intensity for the analytes and the interferents can be assumed.

6.1.1 The interference is expressed as analyte concentration equivalents (i.e., false analyte concentrations) arising from 100 mg/L of the interference element. For example, assume that As is to be determined (at 193.696 nm) in a sample containing approximately 10 mg/L for As equivalent to approximately 1.3 mg/L. Therefore, the presence of 10 mg/L of A1 would result in a false signal for As equivalent to approximately 0.13 mg/L. The user is cautioned that other instruments may exhibit somewhat different levels of interference than those shown in Table 2. The interference effects must be evaluated for each individual instrument since the intensities will vary with operating conditions, power, viewing height, argon flow rate, etc.

6.1.2 The dashes in Table 2 indicate that no measurable interferences were observed even at higher interferent concentrations. Generally, interferences were discernible if they produced peaks, or background shifts, corresponding to 2 to 5% of the peaks generated by the analyte concentrations.

6.1.3 At present, information on the listed silver and potassium wavelengths is not available, but is has been reported that second-order energy from the magnesium 383.231-nm wavelength interferes with the listed potassium line at 766.491 nm.

Table 2

ANALYTE CONCENTRATION EQUIVALENTS ARISING FROM INTERFERENCE AT THE 100-mg/L LEVEL

Vanadium	292.402	---	---	0.05	---	0.005	---	---	---	0.02	---
Zinc	213.856	---	---	---	0.14	---	---	---	0.29	---	---

a Dashes indicate that no interference was observed even when interferents were introduced at the following levels:

Al - 1000 mg/L
Ca - 1000 mg/L
Cr - 200 mg/L
Cu - 200 mg/L
Fe - 1000 mg/L
Mg - 1000 mg/L
Mn - 200 mg/L
Tl - 200 mg/L
V - 200 mg/L

b The figures recorded as analyte concentrations are not the actual observed concentrations; to obtain those figures, add the listed concentration to the interferent figure.

FOR ENVIRONMENT BC USE ONLY
UNCONTROLLED COPY

6.2 Physical interferences are effects associated with the sample nebulization and transport processes. Changes in viscosity and surface tension can cause significant inaccuracies, especially in samples containing high dissolved solids or high acid concentrations. If physical interferences are present, they must be reduced by diluting the sample, by using a peristaltic pump or by using the standard additional methods. Another problem that can occur with high dissolved solids is salt buildup at the tip of the nebulizer, which affects aerosol flow rate and causes instrumental drift. The problem can be controlled by wetting the argon prior to nebulization, using a tip washer, or diluting the sample. Also, it has been reported that better control of the argon flow rate improves instrument performance; this is accomplished with the use of mass flow controllers.

6.3 Chemical interferences include molecular compound formation, ionization effects, and solute vaporization effects. Normally, these effects are not significant with the ICP technique. If observed, they can be minimized by careful selection of operating conditions (incident power, observation position, and so forth), by buffering of the sample, by matrix matching, and by standard addition procedures. Chemical interferences are highly dependent on matrix type and the specific analyte element.

7.0 APPARATUS, MATERIALS, AND REAGENTS

7.1 Inductively coupled argon plasma emission spectrometer:

7.1.1 Computer-controlled emission spectrometer with background correction.

7.1.2 Radio frequency generator.

7.1.3 Argon gas supply: Welding grade or better.

7.1.4 Eppendorf pipettors or comparable capable of delivering 0.05 - 10 mls

7.1.5 Class A volumetric flasks, various volumes.

7.1.6 Class A reusable pipets, various volumes.

CONTROLLED DOCUMENT DO NOT COPY

7.2 Operating conditions: The analyst should follow the instructions provided by the instrument's manufacturer. For operation with organic solvents, use of the auxiliary argon inlet is recommended, as are solvent-resistant tubing, increased plasma (coolant) argon flow, decreased nebulizer flow, and increased RF power to obtain stable operation and precise measurements. Sensitivity, instrumental detection limit, precision, linear dynamic range, and interference effects must be established for each individual analyte line on that particular instrument. All measurements must be within instrument linear range where coordination factors are valid. The analyst must (1) verify that the instrument configuration and operating conditions satisfy the analytical requirements and (2) maintain quality control data confirming instrument performance and analytical results.

7.3 Reagents

7.3.1 Acids used in the preparation of standards and for sample processing must be reagent grade or better. Redistilled acids may be used.

7.3.1.1 Concentrated hydrochloric acid, trace metal grade (Fisher Cat #A50B-211).

7.3.1.2 Concentrated hydrochloric acid, Optima grade (Fisher Cat #A466-1).

7.3.1.3 Hydrochloric acid, trace metal grade (1:1): Add 500 mls concentrated HCl to 400 mls. ASTM Type II water. Cool. Dilute to 1L.

7.3.1.4 Concentrated nitric acid, trace metal grade (Fisher Cat. #A509-211).

7.3.1.5 Concentrated nitric acid, Optima grade (Fisher Cat. #A-467-1).

7.3.2 ASTM Type II water (ASTM D1093): Water should be monitored for impurities.

7.3.3 Standard stock solutions may be purchased or prepared from ultra high purity grade chemicals or metals (99.99 to 99.999% pure). All salts must be dried for 1 hour at 105 degrees C, unless otherwise specified.

(CAUTION: Many metal salts are extremely toxic if inhaled or swallowed. Wash hands thoroughly after handling.)

8.0 INSTRUMENTAL CONDITIONS

Incident Watts	650
Reflected Watts	000 to 005
Plate Volts	3300-3600
Plate Current	60-110 ma
Drive Volts	2-5
Coolant Flow	24 psi
Plasma Flow	32 psi
Carrier Flow	36 psi

CONTROLLED DOCUMENT
UNCONTROLLED COPY

9.0 PROCEDURE

9.1 Follow manufacturer's operating instructions.

9.2 Preliminary treatment of all matrices is always necessary because of the complexity and variability of sample matrices. Solubization and digestion procedures are presented in Sample Preparation Methods (Methods 3005-3050/200.0/200.7).

9.3 Set up the instrument with proper operating parameters established in Paragraph 7.2. The instrument must be allowed to become thermally stable before beginning (usually requiring at least 30 minutes of operation prior to calibration).

Three sets of standards should be prepared with ASTM Type II water and the following acid concentrations:

10.0 CALCULATIONS

10.1 The concentration of each sample is read directly from the computer and dilution factors should be taken into account in the ID weight files.

11.0 QUALITY CONTROL

11.1 All quality control data should be maintained and available for easy reference or inspection.

11.2 Dilute and reanalyze samples that are more concentrated than the linear calibration limit.

11.3 Employ a minimum of one laboratory blank per sample batch to determine if contamination of any memory effects are occurring.

11.4 Analyze one spike and one method spike duplicate (MSD) for every 20 samples. A spike and method spike duplicate are samples into which a calculated extra amount of metal is pipetted in. This checks the accuracy of the sample preparation method.

11.5 It is recommended that whenever a new or unusual sample matrix is encountered, a series of tests be performed prior to reporting concentration data for analyte elements. These tests, as outlined in 5.1 through 5.3, will ensure the analyst that neither positive nor negative interferences are operating on any of the analyte elements to distort the accuracy of the reported values.

11.5.1 Serial dilution: If the analyte concentration sufficiently high (minimally, a factor of 10 above the instrument detection limit after dilution), an analysis of 1:4 agree within 10% of the original determination. If not, a chemical physical interference effect should be suspected.

11.5.2 Matrix spike addition: An analyte spike added to a portion of a prepared sample, or its dilution, should be recovered to within to 115% of the known value. The spike addition should produce a minor level of 10 times and a maximum of 100 times the instrumental detection limit. If the spike is not recovered within the specific limit matrix effect should be suspected. The use of a standard-add analysis procedure can usually compensate for this effect. CAUTION: The standard-addition technique does not detect coincidental spectrial overlap. If suspected, use of computer compensation, an alternative wavelength, or comparison of an alternate method is recommended.

CONTROLLED DOCUMENT

11.5.3 Standard addition: The standard-addition technique involves adding known amounts of standard to one or more aliquots of the process sample solution. This technique compensates for a sample constitute that enhances or depresses the analyte signal, thus producing a different slope from that of the calibration standards. It will not correct additive interferences which cause a baseline shift. The signal version of this technique is the single addition method, in which identical aliquots of the sample solution, each of volume V_X, are taken. To the first (labeled A) is added a small volume V_S of a standard solution of concentration c_S. To the second (labeled B) is added same volume V_S of the solvent. The analytical signals of A and B measured and corrected for nonanalyte signals. The unknown sample concentration c_X is calculated.:

$$c_X = \frac{S_B V_S c_S}{(S_A - S_B) V_X}$$

where S_A and S_B are the analytical signals (corrected for the blank) of solutions A and B, respectively. Vs and cs should be chosen so that S_A is roughly twice S_B on the average. It is best if Vs is made much less to the sample matrix. If a separation or concentration step is used, the additions are best made first and carried through the entire procedure. For the results of this technique to be valid, the following limitations must be taken into consideration:

1. The analytical curve must be linear.
2. The chemical form of the analyte added must respond the same way as the analyte in the sample.
3. The interference effect must be constant over the working range of concern.
4. The signal must be corrected for any additive interference.

The absorbance of each solution is determined and then plotted on the vertical axis of a graph, with the concentrations of known standards plotted on the horizontal axis. When the resulting line is extrapolated back to zero absorbance, the point of interception of the abscissa is the concentration of the unknown. The abscissa on the left of the ordinate is scaled the same as on the right side, but in the opposite direction from the ordinate. An example of a plot so obtained is shown in Figure 1.

11.5.4 A method of standard addition must be performed on any TCLP sample whose spike recovery is not greater than 50%.

11.6 Check the instrument standardization by analyzing appropriate quality control check standards as follows.

11.6.1 Check instrument calibration using a calibration blank and a calibration standard.

11.6.2 An ICS (initial calibration standard) is placed after the calibration standard and blank. Acceptable limits are ±5% of original calibration standard.

11.6.3 An IEC (interelement correction) standard is placed at the beginning and end of each run. Acceptable limits are ±20% of its actual concentration.

11.6.4 An ICV (initial calibration verification) is placed after the ICS in each run. Acceptable limits are ±10% of CCV standard concentration.

11.6.5 Verify calibration every 10 samples with a blank and CCV.

11.6.6 At the end of each run, verify calibration using a calibration blank, IEC, and CCV.

11.6.6.1 The results of the check standard are to agree within 10% of the expected value; if not, terminate the analysis, correct the problem, and recalibrate the instrument.

11.6.6.2 The results of the calibration blank are to agree within three standard deviations of the mean blank value. If not, repeat the analysis two more times and average the results. If the average is not within three standard deviations of the background mean, terminate the analysis, correct the problem, recalibrate, and reanalyze the previous 10 samples.

11.7 Verify the interelement and background correction factors at the beginning and end of an analytical run or twice during every 8-hour work shift, whichever is more frequent.

CONTROLLED DOCUMENT
FAA

I. Safety

A. Before operating A.A., make sure exhaust fan, (located on the north wall by the light switches) is on.

B. Gas Cylinders

1. When turning on gases, always turn on air supply before acetylene. When turning instrument off, always turn acetylene off before air.

2. All gas cylinders must be securely fastened to the wall or counter.

3. Bleed air and gas lines after analysis.

D. The analyst must comply with all standard operating procedures for health and safety as outlined in the "WWES Laboratory Safety Manual."

1. Gloves and safety glasses must be worn at all times when handling digested samples.

II. Maintenance {Read Procedure prior to cleaning assembly}

A. The analysis of petroleum samples tend to leave organic residues inside the flame assembly. Each time the flame is used the following procedures must be followed to eliminate this residue.

1. Aspirate acetone for 5 minutes.
2. Aspirate 1% nitric acid for 5 minutes.
3. Turn flame off and let burner head cool down.
4. Remove the burner head.
5. Pour enough water through the neck of the burner chamber to remove all traces of organic solvent.
6. Reconnect burner head.
7. Change the cork O-ring (located in the end cap) with the rubber O -ring used for water analysis.

a. Unscrew the four end cap screws.
b. Shift the endcap assembly away from the burner chamber.
c. Remove the O-ring, and replace.

B. Cleaning the burner head - if an uneven flame occurs along the slot of the burner head, or if organic residues are present, the burner head slot must be attended to:

1. Remove any particulate matter in the slot with a razor blade or a small, thin piece of metal.
2. Remove scrapings from inside and outside the burner head.
3. If required, soak the burner head in a detergent solution overnight, rinse with D.I. water and dry with compressed air.

C. Be sure lamp is clean. Remove fingerprints and dust with Kimwipes.

D. Clean AAS windows with a Kimwipe.

III. Procedure

A. Lamp Installation

1. Insert the appropriate lamp into the turret, and position the lamp in front of the window.

2. Plug the lamp into an HCl (Hollow Cathode Lamp) port. (If HCl port 1 is used for analysis, a second lamp can be warming up in HCl port 2.

3. Turn instrument on by pressing the green button, located at the lower left corner of the A.A. unit.

4. Wait until the instrument has gone through the internal diagnostics check. This will take approximately two minutes.

B. Element Select Mode

1. If diagnostics proceeds without error, the Element Select Mode screen page will appear.

2. Enter date, (yy/mm/dd) and press soft key labeled [DATE].

3. Key in the atomic number of the element to be determined and press [ELEMENT] soft key.

4. The lamp current setting will display a preset default value. If an alternative current is to be used, key in the new mA value and press [L. Curr].

5. Select [FLAME MODE].

6. For current Wavelengths, Slit Widths, Flame Gases and

CONTROLLED DOCUMENT - DO NOT COPY

Sensitivity Checks, see appendix A of FLAA protocol.

* 7. Refer to P-E 1100B Operator's Manual for individual metal specifications including:

a. Alternate Wavelengths and Slits
b. Characteristic Concentrations
c. Sensitivity Check
d. Linear Range
e. Bead/Spoiler
f. Recommended Flame

8. If a stored program is to be used, press [User Index]. This enables the analyst to call up a program which has been established to run a particular elemental analysis.

a. Once the User Index is on the screen, press the number of the program to be used. Press [Recall], to load program. (Allow 3-4 minutes)

b. This automatically sets the preprogrammed wavelength, fuel and air flows, lamp current, standard concentrations, hold time, and replicates.

c. If any changes need to be made to the program, Press [Prog] key and make any changes using cursor arrows and the keypad.

d. Functions of the other keys in User Index:

1. [STORE FILE]: Stores a program.
2. [RECALL FILE]: Loads a stored program.
3. [DELETE FILE]: Removes a stored program.
4. [RENUMBER #:#]: Changes location of program.
5. [PAGE UP]: Moves to following screen.
6. [PAGE DOWN]: Moves to previous screen.

e. Go to Section C.

9. If no program is to be used, depress [Setup] mode key to put the Spectrophotometer into Setup Mode.

C. Setup Mode

1. The Setup Mode screen displays the energy level and a bar graph of the lamps intensity.

2. Energy levels depend on the installed lamp. Typically, ranges are between 50-75.

3. Align the lamp and optimize the wavelength, using the following steps:

FAA CONTROLLED COPY - DO NOT COPY

a. To optimize lamp intensity, rotate the lamp in one direction until the greatest intensity is achieved. (the bar graph will increase to the right). If the bar graph goes off the screen, press [Gain] key and graph will readjust.

b. Once rotation of the lamp is completed, align with the two set screws located on the turret. Use the coarse adjustment screw first. Obtain the highest intensity level, then fine adjust with the second screw.

4. In SETUP MODE, there are four soft keys allowing the user to make adjustments to the lamp current, slit width wavelength and background source.

   a. [LAMP CURRENT]: Adjusts current.
   b. [SLIT]: Adjusts slit width.
   c. [WAVELENGTH]: Adjusts wavelength
   d. [BG CORR ON/OFF]: Turns on background correction

5. Allow the instrument and the radiation source to warm up. This usually will take 15-30 minutes.

D. Burner head installation

1. Install the burner unit and appropriate head.

   a. Secure unit with the burner unit securing screws, located at the base of the furnace assembly.

   b. Push in the Burner Interlock Handle.

      NOTE: Flame will not ignite if burner interlock handle is not fully inserted.

   c. Install the required burner head.

      1. Select the appropriate burner head for the determination (flame to be used).
      2. Turn the knurled locking ring several turns counter-clockwise to loosen.
      3. Insert the base of the burner head into the neck of the burner chamber.
      4. Push down the burner head until it bottoms in the metal bracket.
      5. Tighten the knurled locking ring and at the same time push down on the burner head to make sure that the base sits properly in the neck of the burner chamber.
      6. Slip the loops of the burner head hold-down cables over the hooks in the rear of the metal bracket.

EA CONTROLLED DOCUMENT

NOTE: Flame will not light if cables are not fastened.

d. Rotate the flame igniter tube over the burner head by hand to check that the tube does not strike the burner head. If it strikes the head, raise the igniter assembly by pushing it upwards from underneath until the igniter tube clears the burner head.
e. Plug in the FUEL connector.
f. Plug in the NEBulizer connector.
g. At this point, check to see if the burner head is blocking the path of the wavelength.

1. Use a white index card with a small cross drawn on one edge, 3/8 inch at intersection: (Figure 1)

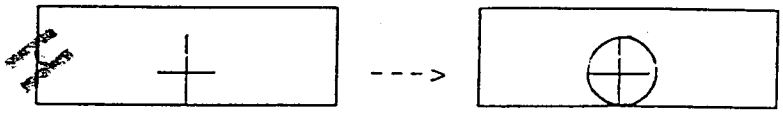

figure 1 figure 2

2. Align the wavelength path by centering the light with the cross on the card. (Figure 2) This can be done using the following knobs:

a. Rotational control--located just below the chamber, this knob allows the burner head to rotate left or right.
b. Vertical control--located on the lower left of the flame base, this knob adjusts the assembly up or down.
c. Horizontal control--located on the lower right of the flame base, this knob adjusts the assembly back and forth.

3. Avoid erroneous high absorbance due to the burner head completely blocking the wavelength path.

2. Depress [Cont] mode key to put the Spectrometer into Continuous Mode.

E. Burner Head Alignment

1. After waiting 15-30 minutes for the lamp to warm-up, the instrument is ready for flame ignition.

CONTROLLED DOCUMENT
FOR REFERENCE ONLY
UNCONTROLLED COPY

2. Safety

a. Ensure that the burner head is installed properly.
b. Ensure the burner head hold-down cables are correctly attached.
c. Ensure the FUEL and NEBulizer connectors are properly connected.
d. Ensure the siphon interlock is filled with water.
e. Ensure the float moves freely.
f. To avoid flashbacks, do not allow the burner head slot to become clogged.
g. Never open the cover on the siphon interlock while the flame is burning.
h. Do not adjust the nebulizer when using a nitrous oxide/acetylene flame.

Flame ignition

a. Gas flows can be stored in the programs. For current gas flow rates, used on the PE 1100B, see appendix B, FLAA protocol.

b. Place the tubing to the nebulizer in the rinse solution, containing deionized water, 2% nitric acid and 2% hydrochloric acid.

c. Turn air on. (Valve located on wall just left of the AAS)

d. Turn acetylene on so that the valve is open all the way. Twist valve back 1/4 turn.

NOTE: If nitrous oxide is to be used, plug regulator in. Turn nitrous oxide on in a similar manner as the acetylene.

e. Press red [Flame ON/OFF] button and allow a few seconds for the flame to ignite. Flame will automatically ignite.

f. Program will automatically adjust fuel and oxidant levels for that particular analysis.
g. For manual fuel adjustment, press [Atom contr] soft key.

1. [C2H2 <---]: decreases acetylene flow
2. [C2H2 --->]: increases acetylene flow
3. [OXIDANT --->]: increases air flow
4. [OXIDANT <---]: decreases air flow
5. [SELECT N2O]: selects nitrous oxide

NOTE: When the nitrous oxide/acetylene flame is first ignited, the flame may separate or split, forming a 'V'j along the burner

EPA CONTROLLED COPY UNCONTROLLED

slot. As the burner head warms up the 'V' will close and form a normal flame suitable for analytical operation.

h. Aspirate with water or solvent at all times. When using organic solvents, use methanol as transitional solvent between water and organic.

4. Aligning burner head in Continuous Mode

a. Aspirate blank and press soft key labeled [Autozero].
b. Once the instrument has been zeroed, aspirate the highest standard.
c. Adjust to the highest absorbency using (in order) the Rotational, Vertical and Horizontal adjustment knob.

d. Adjust the nebulizer flow for highest absorbance.
e. Check Characteristic Concentration

1. Aspirate the blank, press [AUTOZERO]
2. Enter the required standard concentration. (See PE manual for requirements)
3. Aspirate standard
4. Press [CHAR. CONC]
5. A value will appear on the screen, this value should be within 10% of the cookbook value given by Perkin-Elmer. If value is considerably outside this range go back to step 4a and readjust alignment. Recheck C.C.

4. Press [Run] soft-key. The user is now ready to standardize the instrument.

IV. Calibration of Standards

A. To go into PROGRAM ELEMENT MODE press [Prog] soft key.

B. Screen description

1. The top line will show the following default settings and cannot be changed in this mode:

a. FURNACE or FLAME
b. Wavelength (nm)
c. Slit (nm)
d. Date

2. The following can be altered by using the cursor and keypad:

a. Technique: (AA, BG, AA-BG, EMMIS), most analyses will

FAR CONTROLLED DOCUMENT - DO NOT COPY

use AA-BG, see individual SOP's for requirements.

b. Signal Processing: (PA: Peak Area , PH: Peak Height) Do not change default setting
c. Read Delay: Set for 1 second
d. Replicates: All flame work requires 3 replicates per reading. An average will then be taken.
e. Background Full Scale: Set to Auto.
f. Lamp Current: Set in SETUP mode, do not change.
g. Integration Time: Set for 3 seconds.
h. Printer: Choose DATA/SUPPL & CALIB. This prints the AA readings, BG readings and a printout of the calibration curve.
i. Plot Full Scale: Set to Auto.
j. Calibration: Set to Auto.
k. Calibration units: press [mg/l] for flame work
l. Sample units: press [mg/l] for flame work
m. S1-S8: allows the concentrations of 8 standards to be entered. See the individual element SOP's for the particular requirements.
n. Reslope: Since no autosampler is programmed with flame analysis, this can be left blank. Manually, the mid-range standard can be entered, and used to reslope the calibration curve. Alternatively, the actual standard soft-key does the same job.

C. After all values have been entered in PROGRAM MODE, press the [Print] soft-key. Press [PRINT SCREEN] for a permanent copy of the program.

D. Press [PRINTER ON/OFF] to turn the printer on. The box should turn green. The user is now ready to calibrate the curve and run samples.

E. Press [Run] to enter run mode.

1. See individual metal SOP's for standard preparation.

2. Calibration Procedure

a. Press [STDS 1-4] and [STDS 5-8]. If any standard points from a previous calibration (indicated by a green box) are present, clear last calibration by pressing 0, and then the standard point. (The green box clears).

b. Aspirate the blank and press [AUTOZERO]. Absorbance value should read zero. Perform this twice to establish your baseline.

c. Aspirate the standard with the lowest concentration and press the soft key for that concentration.

CONTROLLED DOCUMENT

d. Absorbance and concentration will be shown on screen printed out.

e. Repeat for the remaining standards.

f. After the final standard is read, the calibration curve will be printed.

g. Verify the concentrations by running each against the new curve. (See Section E-3) Concentration values must agree within 10% of the actual concentration of standards. (See QC Section VI for Actions of Non-Conformance)

h. If the curve is valid, the user is now ready to run samples.

E. Running Samples

1. The following is the order in which samples are to be run: (See QC Section VI for a definition of abbreviations and requirements):

a. ICB (Calibration Blank)
b. ICV: 1 (First Standard verification)
c. ICV: 2 (Second Standard verification)
d. ICV: 3 (Any addition standards that need verification)
e. LCS (Outside reference)
f. MPB (Digested method blank)
g. LS (Digested lab spike)
h. Sample (QC batch sample)
i. Dup (Sample duplicate)
j. SPK (Matrix Spike)
k. MSD (Matrix Spike Duplicate)
l. All remaining samples.
*m. Curve must be checked every 10 samples using a minimum of a CCB and midrange CCV.

2. Procedure

a. Aspirate sample and press [Read] button.
b. Results will be shown on the screen and on the print-out. A final concentration, based on the average of three replicates, along with the absorbance and background absorbance will by printed.
c. Aspirate remaining samples in the same manner as step 2a.
d. If a dilution is required, press [WT/VOL CORREC]

1. Enter solution volume and press [VOL (L)].
2. Enter solution mass and press [WT (G)]
3. Aspirate sample and press [Read]

V. Shutdown

A. After aspirating the last sample return tube to rinse water, and flush system out for 3-5 minutes.

B. Press [Flame On/Off]

C. Press [Atom. Cont.] to purge the gas lines.

D. Press [Fuel] and [Oxidation] soft keys until the pressure gauges on tanks read zero.

E. Turn acetylene off.

F. Turn air off.

G. Turn AA unit off.

H. Turn printer off.

I. Clean area around AAS unit.

CONTROLLED DOCUMENT - DO NOT COPY
FTL TECH

VI. Quality Assurance

A. Quality Control Samples

1. Definitions of Abbreviations and Nonconformance Actions (The following QC sample shall be included for each analytical batch of samples).

a. ICB--Initial Calibration Blank

The initial calibration blank is a reagent blank that is analyzed as a sample once a calibration curve has been generated for a particular test. The ICB will check how close your curve passes through zero. Acceptance limits for an ICB is + or - the test reporting D.L. If the ICB is outside these limits the instrument must be recalibrated and the ICB reanalyzed.

b. ICV--Initial Calibration Verification

The initial calibration standard is a mid range standard. This standard is analyzed as a sample and calculated against your standard curve. The ICV will check the precision of your curve. Acceptance limits for this standard are + or - 10% or as stated for a particular method. If the ICV falls outside these limits the instrument must be recalibrated and the process repeated.

c. LCS--Laboratory Control Standard

The laboratory control sample is a known reference sample that is traceable to an outside source. The purpose of the LCS QC type is to validate the accuracy of your analysis. Acceptance limits for this QC type are based upon a 95% confidence limit generated from historical data for this test. If the LCS falls outside the established limits, the analytical batch must be flagged for re-extraction, re-digestion or reanalysis.

d. MPB--Method Prepared Blank

The method preparation blank is a blank that has been carried through the entire analytical process including any sample pretreatment procedures. The MPB will monitor any contaminates that may affect the sample results. General acceptance limits for a MPB is + or - the test ODL. For some specific tests the MPB values may be subtracted from the regular sample results if outlined in the method. If contamination is detected in the MPB, the entire pretreatment batch must be flagged for re-extraction or digestion. If it is not possible to re-prep the samples then all

analyses reported for that batch must be qualified.

e. LS--Laboratory Spike

The laboratory spike is an aliquot of deionized water that has been spiked with a known amount of stock reference standard or spiking solution. The purpose of the laboratory spike is to verify the analyst's spiking procedure and assure that any matrix interference shown by the spike and spike duplicate is really matrix induced.

f. CCB--Continuing Calibration Blank

The continuing calibration blank is a reagent blank that is analyzed as a sample, generally after 10 samples have been tested. The CCB must be run prior to re-zeroing an instrument. The CCB will validate whether significant instrument drift has occurred during the analytical run. Frequency of analysis is after every 10 samples. Acceptance limits are + or - the test ODL concentration. If the CCB falls outside the control limits, the instrument must be recalibrated, and all samples since the last successful CCB must be rerun.

g. CCV--Continuing Calibration Verification

The CCV is the midrange standard that was analyzed as the ICV. The CCV will validate any drift of the curve. Acceptance limits for this QC are + or - 20%, or as stated for a particular method. If the CCV falls outside the acceptance window, the instrument must be recalibrated and all samples since the last successful CCV must be rerun.

h. SPK--Matrix Spike

The sample matrix spike is an aliquot of a sample that has been spiked with a known amount of a stock reference standard or spiking solution. Spikes are run at a frequency of one per matrix type up to a maximum of 20 samples. The purpose of the SPK is to monitor sample matrix effects on the test. Acceptance limits are 80-120%.

i. DUP--Sample Duplicate

The sample duplicate is a replicate analysis of a particular sample that has been carried through the entire analytical process. A DUP is required for each matrix type within the analytical batch at a frequency equivalent to the SPK. The purpose of the DUP is to monitor precision within the analytical process.

CONFIDENTIAL

j. MSD--Matrix Spike Duplicate

A spike duplicate is an aliquot of the same sample used for the spike that has been spiked with a known amount of a stock reference standard or spiking solution. A spike duplicate is required for each matrix type within a digestion. Frequency is the same as the SPK. Acceptance limits are 80-120%.

2. Calibration protocol and Confirmation

a. A calibration curve must be prepared each day with a minimum of a reagent blank and three standards. The correlation coefficient should be greater than 0.995. If this fails the problem must be corrected.

b. Calibration should be performed by using appropriate standards that bracket the range of samples to be analyzed.

c. An initial calibration blank (ICB) is run immediately after the curve. The ICB must not be greater than or equal to + or - the reported detection limit.

d. The residual error from the fit of the ICV should not be greater than 10% for any standard.

e. The LCS must be + or - 20% the true value.

f. Run a CCB and A CCV every 10 samples. The CCV must be + or - 20% the true value.

g. At least one spiked sample and spiked duplicate sample must be run for every batch of 20 samples (of similar matrix). The recoveries must fall within the control limits. If not, determine the problem and qualify the nonconformance.

h. % RSD of duplicate injections must be <20% if above the detection limit. If unacceptable, then rerun. If out of limits, determine the problem and qualify the nonconformance.

i. Dilute samples with analyte concentrations that exceed the highest standard.

j. During calibration, efforts should be made to ensure that the instrument reaches baseline prior to analysis of each standard. {Automatic BOC performed on the PE 1100B}.

VII. Calculations and Data Handling

A. Concentrations are read directly from then calibration curve.

B. Printed results from the AA are in final concentration form.

C. Blank correction has not been employed in the metals lab. If the MPB is greater then the detection limit, this value is recorded. The source of the contamination is determined, and the recorded value is qualified.

D. If dilution of sample is required, then multiply the result from the calibration curve by the dilution factor:

C * (V1 /V2)

1. C = concentration from calibration curve
2. V1 = final volume of the Sample (mls)
3. V2 = sample aliquot (mls)

E. Calculations for solid samples, report all results as mg/kg:

(C * V1) / W

1. C = mg/l concentration from calibration curve
2. V1 = final volume of sample (ml)
3. W = weight of sample (grams)

F. The following forms and logs must be fully filled:

1. Maintenance log
2. PE 1100B Flame instrument log
3. Benchsheets

AA-4 SOP

1: KCl Must be added to samples and standards prior to analysis.
2: LnCl2 Must be added to samples and standards prior to analysis.
3: May be ran to 2 ppb with a special curve from 2 to 250. Please see SOP for more information.
4: Cold Vapor method. See SOP for detailed instructions for this metal.
5: Emmision method. Requires two curves using S1, S2, S3. Please refer to SOP.
6: Must use red filter.
7: CsCl2 Must be added to samples and standards prior to analysis.
8: HCl (10% V/V) Must be added to nondigested samples and standards prior to analysis.
9: Head must be turned so that the Chk ABS is achelved with the Std Chk.
10: Use small head (N2O head).
11: Wear special UV glasses to avoid eye damage.

Perkin-Elmer 5000 Atomic Absorption Spectrophotometer

1. Turn Monitor on, [press yellow button].
2. Depress reset button to boot the system.
3. Screen will display the following:

   LINEAR REGRESSION 3.2 AA - Copyright (C) 1987 - EDI engineering & Science

   Options:
   A. Enter Regression Data
   B. Print Reports (there are no reports waiting)
   C. Exit The Program

4. To run analysis, enter [A]. The following screen will appear:

   LINEAR REGRESSION 3.2 AA - Copyright (C) 1987 - EDI Engineering & Science

   Please enter header information now. If you do not wish to enter more reports, type DONE when asked for the Analyst.

   Analyst (or DONE) :

5. Type in your name or initials. Press [Enter]
6. The current date will appear. If this date is incorrect, type in the correct date, (MM-DD-YY). Press [Enter]
7. Under (Parameter :) type in the element you will be analyzing. Press [Enter]
8. Under (Matrix :) type in the matrix of the sample, (example: water, soil, leachate, sludge). Press [Enter]
9. Under (Standard Units :) type [mg/l]. Press [Enter]
10. Under (Observed Units :) type [mg/l]. Press [Enter]
11. The program will then ask:

    Is this data correct? (Y/N)

    If the information is correct, type Y. If incorrect, type N and repeat steps 4-10. You may also cursor to the mistake and change the entry.

12. The following screen will appear:

    LINEAR REGRESSION 3.2 AA - Copyright (C) 1987 - EDI Engineering & Science

    Please enter standards data now. Press <x> to regress your data.

Standards	Observations

13. Enter your initial standard concentration, press [Enter]. You are now ready to run the calibration curve.

Perkin Elmer 1100B Atomic Absorption Spectrophotometer
Equipment Protocol for GFAA analysis

Approvals: Laboratory Manager: T J Geyer Date: 3/23/94
Area Supervisor: R Ruckstuhl Date: 3/23/94
QA Supervisor: Gary E. Spencer Date: 3/23/94
Revision Number: 1 By: TJG Effective Date: 3/23/94
Total Number of Pages: 16 Pages Revised: —

CONTROLLED DOCUMENT
HARD COPY
DO NOT COPY

I. Scope and Application

Graphite furnace atomic absorption spectroscopy (GFAAS) is a reliable method for determining trace level concentrations of metals in environmental samples. With proper pretreatment of samples, this method is applicable to soil samples, drinking, surface, and saline waters, and domestic and industrial wastes.

II. Instrumentation

A. Perkin-Elmer 1100B Atomic Absorption Spectrophotometer
B. Perkin-Elmer AS40 Autosampler
C. Perkin-Elmer HGA 400 Graphite Furnace

III. Safety

A. Before operating A.A., make sure exhaust fan, (located on the north wall by the light switches) is on.

B. The analyst must comply with all standard operating procedures for health and safety as oulined in the "WWES Laboratory Safety Manual."

1. Gloves and safety glasses must be worn at all times when handling digested samples, and concentrated acids.
2. UV radiation is emitted during the atomization stage, therefore, UV protected eyeglasses should be worn if looking at furnace. Ordinary safety glasses will, in general, provide sufficient protection, but additional side shields will ensure a further margin of safety.

C. Fasten all gas cylinders securely to a wall or counter.

D. The furnace generates high temperatures. The furnace controller will indicate when the furnace is cooled down after a heating cycle. Do not attempt to manually inject a sample before the furnace cools down. This may subject the operator to hazardous fumes from sample volatilization. There is also the potential for a severe burn.

IV. Maintenance

A. Clean furnace windows periodically.

1. See section VII-D-7 for cleaning conditions.
2. Procedure

a. Unscrew the two halves of the window.
b. Remove glass disk and wipe with a Kimwipe.
c. Replace window in the left and right hand assembly.
d. Absorbance due to windows should be <0.100.

B. Change pyrocoated, graphite tubes if wear is evident.

1. Environmental Express provides graphite tubes with inserted L'Vov platforms.
2. Procedure

a. Turn argon off by pressing the gas release valve to the 'open' position. The valve is located on the lower right of the graphite furnace box.
b. Shift the right hand side of the furnace assembly as far to the right as possible.
c. Remove the old graphite tube, and replace with the new tube and platform. Make sure the the platform grooves are pointing toward the left hand side of the furnace assembly, and the injection hole is centrally alligned.
d. Push back the right hand assembly and, simultaneously, press the gas release valve to the 'On' position.
e. Condition the tube with the following program:

Step	Furnace Temp.	Ramp	Hold
1	2650	60	2
2	20	1	20
3	2650	10	10
4	20	1	20
5	2650	10	10
6	20	1	20
7	2650	10	10

C. Change contact tubes if wear is impeding analytical results. (See PE 1100 B, User's Manual for instructions)

D. Keep work area clean.

E. Be sure lamp is clean. Remove fingerprints and dust with a Kimwipe.

F. Clean AAS windows with a Kimwipe.

CONFIDENTIAL - PROPRIETARY DOCUMENT - DO NOT COPY

V. Procedure: Initial AAS set-up

A. Turn on the Argon gas supply to the furnace. Turn the valve all the way open, twist the valve back 1/4 turn. (Pressure is set at 400 kPa)

B. Turn on the cooling water to the furnace. (Water is located on the south wall, use top valve)

C. Turn on the AS40 Autosampler. (Red switch is located on the lower, right side of Autosampler Control)

D. Turn on the HGA 400 graphite furnace programmer. (Red switch is located on the lower, right side of Graphite Furnace Control box). Adjust gas flow to 300 mLs/min.

E. Lamp Installation

1. Insert the appropriate lamp into the turret, and position the lamp in front of the window.

2. Plug the lamp into an HCl (Hollow Cathode Lamp) port. (If HCl port 1 is used for analysis, a second lamp can be warming up in HCL port 2).

3. Turn instrument on by pressing the green button, located at the lower, left corner of the A.A. unit.

4. Wait until the instrument has gone through the internal diagnostics check. This will take approximately two minutes.

VI. Program: Element Select Mode

A. If diagnostics proceeds without error, the Element Select Mode screen page will appear.

B. Enter date, (yy/mm/dd) and press soft key labeled [DATE].

C. Key in the atomic number of the element to be determined and press [ELEMENT] soft key.

D. The lamp current setting will display a preset default value. If an alternative current is to be used, key in the new mA value and press [L. Curr].

E. Select [FURNACE MODE].

F. For current Wavelengths, Slit Widths, and Sensitivity Checks, see individual metals SOP's.

CONFIDENTIAL DOCUMENT FOR USE ONLY BY CH2M HILL

G. Alternatively, Refer to P-E 1100B Operator's Manual for individual metal specifications including:

1. Alternate Wavelengths and Slits
2. Characteristic Concentrations
3. Sensitivity Check
4. Modifiers

H. If a stored program is to be used, press [User Index]. This enables the analyst to call up a program which has been established to run a particular elemental analysis.

1. Once the User Index is on the screen, press the number of the program to be used. Press [Recall], to load program. (Allow 3-4 minutes)

2. This automatically sets the preprogrammed wavelength, lamp current, standard concentrations, and replicates.

3. If any changes need to be made to the program, Press [Prog] key and make any changes using cursor arrows and the keypad.

4. Functions of the other keys in User Index:

   a. [STORE FILE]: Stores a program.
   b. [RECALL FILE]: Loads a stored program.
   c. [DELETE FILE]: Removes a stored program.
   d. [RENUMBER #:#]: Changes location of program.
   e. [PAGE UP]: Moves to following screen.
   f. [PAGE DOWN]: Moves to previous screen.

5. Go to Section C.

I. If no program is to be used, depress [Setup] mode key to put the Spectrophotometer into Setup Mode.

J. Setup Mode

1. The Setup Mode screen displays the energy level and a bar graph of the lamps intensity.

2. Energy levels depend on the installed lamp. Typically, ranges are between 50-75.

3. Align the lamp and optimize the wavelenghth, using the following steps:

   a. To optimize lamp intensity, rotate the lamp in one direction until the greatest intesity is achieved. (the bar graph will increase to the right). If the bar graph goes off the screen, press [Gain] key and graph will readjust.

CONFIDENTIAL DOCUMENT - DO NOT COPY

b. Once rotation of the lamp is completed, align with he two set screws located on the turret. Use the coarse adjustment screw first. Obtain the highest intensity level, then fine adjust with the second screw.

c. In SETUP MODE, there are four soft keys allowing the user to make adjustments to the lamp current, slit width wavelength and background source.

1. [LAMP CURRENT]: Adjusts current.
2. [SLIT]: Adjusts slit width.
3. [WAVELENGTH]: Adjusts wavelength
4. [BG CORR ON/OFF]: Turns on background correction

d. Allow the instrument and the radiation source to warm up. This usually will take 15-30 minutes.

VII. Furnace Assembly Installation

A. Depress [Cont] mode key to put the Spectrometer into Continuous Mode.

B. Press [Autozero].

C. Assembly Procedure:

1. Slide the furnace assembly and autosampler into the AA unit.
2. Lock the two handles located at the base of the furnace, and make sure the assembly is firmly in place.
3. Place the drain hose into a container.

D. Furnace Alignment

1. Press [Setup] soft key.
2. Make sure the background is turned off. If it is not, press [BG CORR. ON/OFF] (one box will appear on screen).
3. Press [Gain] and wait 2-3 minutes for wavelength to stabilize.
4. Press [Cont] to enter continuous mode, again.
5. Press [Autozero]
6. Remove both the right and left hand windows, located on the furnace. Windows come out by twisting and pulling in an outward motion.
7. Check both windows- if windows appear dirty, wipe clean with a Kimwipe, (See Section IV-A).
8. Rotate assembly out of the radiation beam.
9. Press [AUTOZERO].
10. Replace Assembly to the original position. If value is 0.000 go to step VII-D-11.

a. Release the lever.
b. Shift entire furnace left or right and obtain the value

closest to 0.000.

c. Use the large knob located under the left window, and adjust to 0.000, this adjusts the assembly up and down.
d. Use the small knob located in front, to adjust assembly back and forth.
e. Once 0.000 appears on the screen, go back to step VII-D-10, and repeat.

11. With the reading at 0.000 the beam is unimpeded. Place the left and right windows back into the assembly.

    a. If the absorbance due to the windows is ≤0.100, go to step VII-D-12
    b. If the absorbance due to the windows is >0.100, go to step IV-A-1, clean windows and repeat step IV
    c. Record the absorbance in the Furnace Run Log.

12. Press [Setup]
13. Turn on Background Correction by pressing [BG CORR. ON/OFF] and allow 10 minutes for D2 lamp to warm up.
14. The user is now ready to program the furnace, set the autosampler, check the characteristic concentration, calibrate the curve, and run samples.

VIII. Autosampler

A. When the autosampler was initially turned on, it automatically rinsed out the capillary tubing with four rinses of a 0.1% nitric acid/water solution. The sampling arm then moved to a resting position.

B. Autosampler alignment procedure:

1. Using the handwheel, swing the sampling arm over to the furnace so that the capillary tip is positioned just above the sample introduction port.
2. Turn the LOCK release, (located on the front of the sampler) clockwise. This allows movement of the autosampler platform.
3. With the horizontal control (located on the front of the sampler) and the lateral control (located on the left side of the sampler), carefully align the sampler so that the capillary tip can be lowered into the sample introduction hole in the graphite tube without striking the edge. Perform this alignment very carefully to avoid damaging the capillary tip.
4. When the capillary tip is correctly aligned, turn LOCK control counterclockwise to secure.
5. Lower the tip into the graphite tube until it is 2-3 mm above L'Vov platform.
6. Located next to the sampling arm are two knobs. Use the knob to adjust the tip to the required height above the platform.
7. The capillary tip is at the correct height when the sample droplet contacts smoothly with the graphite platform.

C. Press [STAND BY] to set sampling arm into its working position.

D. A digital readout of 20 ul will be displayed. This indicates the introduction of 20 ul to the graphite system. Alternate volumes can be used by entering the value on the keyboard, and then pressing [SAMPLE VOLUME].

E. A digital readout of 0 ul is present at the alternate volume position. If the user wishes to automatically introduce the matrix modifier, enter the volume using the keypad, then press the button, [ALT VOLUME]. The sampling arm with take the indicated volume of sample, inject into the graphite tube, and then take the indicated volume of modifier, and inject this solution onto the sample.

F. Enter the number of relicates per sample reading and press [REPL].

NOTE: The number of replicates indicated on the autosampler must equal the number of replicates on the AAS program.

G. Enter the number of standards and press [#STDS].

H. Enter the last sample position and press [LAST SAMPLE].

I. Press [Reset] to move the tray to the AZ position.

J. The autosampler is now ready to assist in the calibration of the curve.

IX. Programming the PE HGA 400 programmer

A. Adjust the gas flow to 300 mLs/min using the ADJ.GAS knob located at the base of the graphite box.

1. MINIFLOW can be used, See P-E Operator's Manual and the individual metal SOP's for specific requirements.

2. Gas valve must be in the ON postion.

B. Specific programs, found on the particular SOP's can be entered by keying in the values using the keypad and the following buttons:

1. [STEP]
2. [TEMP]
3. [RAMP TIME]
4. [HOLD TIME]

C. After entering the atomization step (usually step 4 or 5) press the following:

1. [REC]: records value to printer
2. [READ]: reads a value at peak absorbance
3. [STOP FLOW]: stops the flow of purge gas
4. BOC is performed automatically within the AAS unit.

D. Enter the atomization temp and go to Section X.

X. Calibration of Optical Temperature Sensor

A. Press [MANUAL TEMP]. The graphite tube will heat to the atomization temperature.

B. With [MANUAL TEMP] on, adjust the CAL knob, (located on the furnace) until both a red light and a green light occur simultaneously.

C. The user is now ready to check the Characteristic Mass, Calibrate a working curve and run samples.

XI. Checking Characteristic Mass

A. Located in the individual metal SOP's are cookbook values for the Characteristic Mass M(o) of a particular element.

1. The Characteristic Mass is the mass of analyte that gives 1% absorption or 0.0044 absorbance.

2. $$M(o) = \frac{uL * ug/L * 0.0044}{A\text{-}s}$$

3. The value should be within 20% of the cookbook value.
4. The characteristic mass is generally measured in peak area.
5. If the value is within 20%, the setup check out, and no further action is required.
6. If the C.M. >20%, then troubleshoot for low absorbance.
7. If the C.M. <20%, then

   a. Check for accuracy of the standard
   b. Check for contamination

B. Procedure

1. Press [Run] soft key.
2. Prepare a reference solution of the analyte element that will generate an absorbance signal of 0.2 A.
3. Set the blank solution in postion 1.

   a. Press on autosampler [1], [MANUAL], [START/STOP]
   b. 20 ul of blank will be injected into the furnace.

c. The furnace program will automatically dry, atomize, and read the concentration of the metal.

4. At the end of the HGA program, note the absorbance reading obtained for the blank solution (PEAK AREA).
5. Repeat Step XI-B-3 by placing an aliquot of the reference solution into the graphite tube.
6. When the measurement is complete, press [CHAR. MASS] soft key.
7. Key in the blank value, press [BLANK VALUE] soft key.
8. Key in the volume of the reference solution, press [VOLUME].
9. Key in the concentration of the reference solution and press [CONC] soft key.
10. Press [CALC. MASS], the characteristic mass is displayed on screen.
11. Compare the value obtained with the cookbook value. (See section XI-A)

XII. Calibration of Curve

A. To go into PROGRAM ELEMENT MODE press [Prog] soft key.

B. Screen description

1. The top line will show the following default settings and cannot be changed in this mode:

   a. FURNACE or FLAME
   b. Wavelength (nm)
   c. Slit (nm)
   d. Date

C. The following can be altered by using the cursor and keypad:

1. Technique: (AA, BG, AA-BG, EMMIS), most analyses will use AA-BG, see individual SOP's for requirements.
2. Signal Processing: (PA: Peak Area, PH: Peak Height)
3. Read delay: Not Applicable with furnace
4. Replicates: Furnace work requires a minimum of two replicates per run. An average will then be taken.
5. Background Full Scale: Set to Auto.
6. Lamp Current: Set in SETUP mode, do not change.
7. Integration time: This is equal to the atomization time set on the HGA 400 programmer.
8. Printer: Choose DATA/SUPPL & CALIB. This prints the AA readings, BG readings and a printout of the calibration curve.
9. Plot Full Scale: Set to Auto.
10. Calibration: Set to auto.
11. Calibration Units: press [ug/l] for furnace work.
12. Sample units: press [ug/l] for furnace work.
13. S1-S8: allows the concentrations of 8 standards to be entered. See the individual element SOP's for the particular requirements.
14. Reslope: Set with the midrange standard concentraition.

D. After all values have been entered in PROGRAM MODE, press the [Print] soft key. Press [PRINT SCREEN] for a permanent copy of the program.

E. Press [PRINTER ON/OFF] to turn the printer on. The box should turn green. The user is now ready to calibrate the curve and run samples.

F. Press [Run] to enter run mode.

1. Calibration procedure: (See individual metal SOP's for standard preparation)

   a. Press [STDS 1-4] and [STDS 5-8]. If any standard points from a previous calibration (indicated by a green box) are present, clear the last calibration by pressing [0], and then the standard point. (The green box clears).
   b. Load the calibration blank solution in the AZ position of the autosampler and add the indicated amount of matrix modifier. (See inidividual SOP's).
   c. Load S1-S3 in the remaining calibration positions on the autosampler. These standards must correspond to the the AA program in section XII-C-13. (Any remaining standards can be loaded in position 1-5, and manually calibrated, by running the standard and pressing the corresponding soft key [S4]-[S8]).
   d. On the autosampler press [RESET], [START/STOP].
   e. The standards will run according to the amount of replicates the user has indicated.
   f. A curve will automatically be calibrated.

2. Verification of the curve

   a. After the final standard is read, the calibration curve will be printed.
   b. Verify the calibration curve by running the blank, a low range (around the M.D.L.) sample, and the midrange standard. The midrange standard must agree within 10% of the actual concentration.
   c. If the curve is valid, the user is now ready to run samples.

APPROVED CONTROLLED DOCUMENT DO NOT COPY

3. Running Samples

a. The following is the order in which samples are to be run: (See QC Section ___ for a definition of the abbreviations and requirements):

1. ICB (Calibration Blank)
2. ICV (Midrange Standard)
*3. LDL (Low Detection Limit Check)
4. LCS (Outside Reference)
5. MPB (Digested Method Blank)
6. LS (Digested Lab Spike)
7. Sample (QC Batch Sample)
8. Dup (Sample duplicate)
9. SPK (Matrix Spike)
10. MSD (Matrix Spike Duplicate)
11. All Remaining Samples.
12. Curve must be checked every 10 samples using a minimum of a CCB and the midrange CCV. (See QC sections for actions of nonconformance)

4. Procedure

a. Pour 2.0 mLs of sample into Autosampler cups.
b. Add the appropriate amount of matrix modifier.
c. Place cups in proper locations. [Record locations in graphite run log]
d. Press [1], [MANUAL], [START/STOP].
e. Graphite furnace will analyze until the indicated last sample is reached.
f. If dilution is required, press [WT/VOL CORRECT]

1. Enter solution volume and press [VOL (L)]
2. Enter solution mass and press [WT (G)]

ETECH CONTROLLED DOCUMENT - DO NOT COPY

XIII. Quality Assurance

A. Quality Control Samples

1. Definitions of Abbreviations and Nonconformance Actions (The following QC sample shall be included for each analytical batch of samples).

a. ICB--Initial Calibration Blank

The initial calibration blank is a reagent blank that is analyzed as a sample once a calibration curve has been generated for a particular test. The ICB will check how close your curve passes through zero. Acceptance limits for an ICB is + or - the test reporting D.L. If the ICB is outside these limits the instrument must be recalibrated and the ICB reanalyzed.

b. ICV--Initial Calibration Verification

The initial calibration standard is a mid range standard. This standard is analyzed as a sample and calculated against your standard curve. The ICV will check the precision of your curve. Acceptance limits for this standard are + or - 10% or as stated for a particular method. If the ICV falls outside these limits the instrument must be recalibrated and the process repeated.

c. LCS--Laboratory Control Standard

The laboratory control sample is a known reference sample that is traceable to an outside source. The purpose of the LCS QC type is to validate the accuracy of your analysis. Acceptance limits for this QC type are based upon a 95% confidence limit generated from historical data for this test. If the LCS falls outside the established limits, the analytical batch must be flagged for re-extraction, re-digestion or reanalysis.

d. MPB--Method Prepared Blank

The method preparation blank is a blank that has been carried through the entire analytical process including any sample pretreatment procedures. The MPB will monitor any contaminates that may affect the sample results. General acceptance limits for a MPB is + or - the test ODL. For some specific tests the MPB values may be subtracted from the regular sample results if outlined in the method. If contamination is detected in the MPB, the entire pretreatment batch must be flagged for re-extraction or digestion. If it is not possible to re-prep the samples then all

CONTROLLED COPY NOT FOR DISTRIBUTION

analyses reported for that batch must be qualified.

e. LS--Laboratory Spike

The laboratory spike is an aliquot of deionized water that has been spiked with a known amount of stock reference standard or spiking solution. The purpose of the laboratory spike is to verify the analyst's spiking procedure and assure that any matrix interference shown by the spike and spike duplicate is really matrix induced.

f. CCB--Continuing Calibration Blank

The continuing calibration blank is a reagent blank that is analyzed as a sample, generally after 10 samples have been tested. The CCB must be run prior to re-zeroing an instrument. The CCB will validate whether significant instrument drift has occurred during the analytical run. Frequency of analysis is after every 10 samples. Acceptance limits are + or - the test ODL concentration. If the CCB falls outside the control limits, the instrument must be recalibrated, and all samples since the last successful CCB must be rerun.

g. CCV--Continuing Calibration Verification

The CCV is the midrange standard that was analyzed as the ICV. The CCV will validate any drift of the curve. Acceptance limits for this QC are + or - 20%, or as stated for a particular method. If the CCV falls outside the acceptance window, the instrument must be recalibrated and all samples since the last successful CCV must be rerun.

h. SPK--Matrix Spike

The sample matrix spike is an aliquot of a sample that has been spiked with a known amount of a stock reference standard or spiking solution. Spikes are run at a frequency of one per matrix type up to a maximum of 20 samples. The purpose of the SPK is to monitor sample matrix effects on the test. Acceptance limits are 80-120%.

i. DUP--Sample Duplicate

The sample duplicate is a replicate analysis of a particular sample that has been carried through the entire analytical process. A DUP is required for each matrix type within the analytical batch at a frequency equivalent to the SPK. The purpose of the DUP is to monitor precision within the analytical process.

CONFIDENTIAL

j. MSD--Matrix Spike Duplicate

A spike duplicate is an aliquot of the same sample used for the spike that has been spiked with a known amount of a stock reference standard or spiking solution. A spike duplicate is required for each matrix type within a digestion. Frequency is the same as the SPK. Acceptance limits are 80-120%.

2. Calibration protocol and Confirmation

a. A calibration curve must be prepared each day with a minimum of a reagent blank and three standards. The correlation coefficient should be greater than 0.995. If this fails the problem must be corrected.

b. Calibration should be performed by using appropriate standards that bracket the range of samples to be analyzed.

c. An initial calibration blank (ICB) is run immediately after the curve. The ICB must not be greater than or equal to + or - the reported detection limit.

d. The residual error from the fit of the ICV should not be greater than 10% for any standard.

e. The LCS must be + or - 20% the true value.

f. Run a CCB and A CCV every 10 samples. The CCV must be + or - 20% the true value.

g. At least one spiked sample and spiked duplicate sample must be run for every batch of 20 samples (of similar matrix). The recoveries must fall within the control limits. If not, determine the problem and qualify the nonconformance.

h. % RSD of duplicate injections must be <20% if above the detection limit. If unacceptable, then rerun. If out of limits, determine the problem and qualify the nonconformance.

i. Dilute samples with analyte concentrations that exceed the highest standard.

j. During calibration, efforts should be made to ensure that the instrument reaches baseline prior to analysis of each standard. {Automatic BOC performed on the PE 1100B}.

CONTROLLED DOCUMENT
UNCONTROLLED COPY

VIV. Shutdown

A. Turn cooling water off.

B. Turn Autosampler off.

C. Turn Graphite Furnace Control Box off.

D. Turn off Argon gas.

E. Turn AAS unit off.

F. Remove graphite furnace/autosampler assembly and place on rack.

G. Turn printer off.

H. Clean area around AAS unit

XV. Calculations and Data Handling

A. Concentrations are read directly from the calibration curve.

B. Printed results from the AA are in final concentration form.

C. Blank correction has not been employed in the metals lab. If the MPB is greater than the detection limit, this value is recorded. The source of the contamination is determined, and the recorded value is qualified.

D. If dilution of the sample is required, then multiply the result from the calibration curve by the dilution factor.

C * (V1 / V2)

1. C = concentration from calibration curve
2. V1 = final volume of the sample (mLs)
3. V2 = sample aliquot (mLs)

E. Calculations for solid samples, report all results as ug/kg.

(C * V1) / W

1. C = ug/L concentration from calibration curve
2. V1 = final volume of sample (mLs)
3. W = weight of sample (grams)

F. The following forms and logs must be fully filled:

1. Maintenance log
2. PE 1100B furnace run log
3. Benchsheets

USEPA METHOD 3050
FLAME/ICP DIGESTION OF SOIL, SLUDGE AND SEDIMENT

Approvals: Laboratory Manager: T J Geyer Date: 3/23/94
Area Supervisor: [signature] Date: 3/23/94
QA supervisor: Gary E. Spencer Date: 3/23/94
Revision Number: 1 By: TJG Effective Date: 3/23/94
Total Number of Pages: 6 Pages Revised: —

FAX CONTROLLED DOCUMENT NOT COPIED

TITLE: Standard Operating Procedure for the Acid Digestion of Sediments, Sludge, and Soils for metals analysis by Flame AA or ICP

I. Scope and Application

- Specific Method Utilized: Method 3050, EPA Test Methods for Evaluating Solid Waste, Volume One, Section A, 1986.
- Procedure can be used for the preparation of solid wastes, including soils, sludges and Sediments.
- Specific analytes(s) being determined: Al, As, Ba, Be, Cd, Ca, Cr, Co, cu, Fe, Pb, Mg, Mn, Ni, K, Se, Na, Tl, V, Zn
- Required Reporting Limits: Refer to ICP or FLAA detection limit study, for the individual element limits of detection using the ARL 3560 B, ICP Analyzer or P-E 1100 B, A.A.

II. Summary

A two gram sample (wet weight) is digested using nitric acid, hydrochloric acid and hydrogen peroxide. The sample is concentrated to approximately 5-10 mLs, then, brought up to a final volume of 50 mls using milli-Q, deionized water. The elements are analyzed using the ICP unit or FLAA. Results are reported according to the dry weight of the sample.

III. Definitions

- ICP: Inductively Coupled Plasma

IV. Responsibilities

- The technician is responsible for QA/QC preparation of samples prior to digestion. This includes sample batching and spiking.
- The technician is responsible for making sure glassware is clean and contamination-free.

- The analyst is responsible for informing the group leader of any supplies that are needed, or ordering the supplies.

- The technician is responsible for determining the dry weight of the solid sample.

V. Interferences and Helpful Hints

- Helpful Hints

  a. Sludge and Soil samples can contain diverse matrix types, thoroughly homogenize before digestion.
  b. Maintain consistency when weighing sample or adding acids.
  c. Interferences are discussed in the referring analytical method.
  d. HCl is not recommended for Ag digestion.
  e. Periodically, observe and stir flasks. Do not let them go dry. Rinse flask sides off with deionized water.
  f. Bring samples up to volume using graduated, conical, centrifuge tubes.

- **CAUTION:** This method uses hot, concentrated acids, so caution and proper protective wear must be utilized, including goggles, gloves and lab coat. Add acids and peroxides under the hood.

VI. Sampling, Sample preservation, and Holding Times

- Sampling Methodologies

  a. Sampling Conditions: all sample containers must be prewashed with detergents, acids, and Type II water.
  b. Container Specifications: Plastic or Glass

- Preservative: Soils must be stored in a refrigerator at 4 °C.

- Holding times: 28 days

VII. Safety

- All work is to be done under the hood.
- Avoid breathing acid fumes.
- Avoid body contact with sample. Wear safety equipment including safety glasses, gloves, and lab coat. In case of contact with acid, run cold water over affected area for 10-15 minutes. Use the eyerinse sink if acid contacts eyes. Report all accidents to the group leader.
- Be careful not to touch the hot plate. An operating hot plate unit can cause injury.

VIII. Quality Control Requirements

- Type and Frequency of QC Check

  a. (MPB) Method Prepared Blank

  A deionized water blank must be carried through the entire digestion procedure. Run one method blank every twenty samples, or one per batch. The method blank is used to determine elemental contamination that may be found in the deionized water.

  b. (LS) Laboratory Spike

  A prepared standard, of known concentration, is digested. The concentration of the laboratory standard used in this lab will be 0.50 ppm - 1.0 ppm for elements of concern (two to five times the D.L.) Run one laboratory spike every twenty samples, or one per batch.

  c. (DUP) Sample duplicate

  A sample duplicate will be digested every twenty samples, or one duplicate per batch. An equal, homogeneous representation of the original sample is used. Duplicate values should be less than or equal to 20% relative percent difference.

  d. (SPK) or (MS) and (MSD) Matrix Spike and Matrix Spike Dup.

  Spiked samples of known concentration will be digested every twenty samples, or one every batch. The recommended spiking levels are two to five times the sample concentrations. Levels should be equal to those of the LS. SPK and MSD recoveries should be within 80-120%.

- Evaluation procedure

  a. Samples are analyzed using the ICP or FLAA.
  b. Corrective action: If samples fall outside QA/QC ranges, sample is redigested and reanalyzed.

IX. Apparatus and Materials

- Specifications for Apparatus, Instruments, and Equipment

  a. Hot Plates: Thermolyne
  b. Stir Plate
  c. Analytical balance: Sartorius 0.01 g
  d. Drying Oven: VWR 1310

- Materials: (digestion)

  a. 150 mL beakers
  b. 50-100 mL graduated cylinders
  c. Watchglasses

CONFIDENTIAL - PROPERTY OF

d. Pipets
e. Whatman No. 41 filter papers
f. Filters/Funnels
g. Water bottles

o Materials: (dry weight determination)

a. Aluminum weighing trays
b. wooden tongue depressors

X. Reagents and Standards

o Specifications for Reagents

a. Concentrated Nitric Acid: (trace metal grade)
b. Concentrated Hydrochloric Acid: (trace metal grade)
c. Hydrogen Peroxide: (30%)
d. Certified Reference Solutions

o Specifications for Standards

A 100 ppm multi-elemental Spiking Solution (SPEX) is used to spike samples. Spiking stock solutions are received, logged into a standards/reagent notebook, and stored at room temperature until expiration date. Samples are logged by: date received, element, concentration, quantity, manufacturer and expiration date. If standards are prepared, procedure is logged in one of the following logbooks: AA run log, ICP run log or standards preparation log.

XI. Procedure for the determination of percent dry weights

1. Record all data on the percent dry weight worksheet found in the percent dry weight notebook.

2. Use Sartorius (A200S) analytical balance.

3. Weigh and record aluminum pan.

4. Weigh out, approximately 20.00 g of sample, [Record weight].

5. Place in oven and let dry for 24 hours at 105 degrees C.

6. Cool in dessicator, reweigh dry sample, [Record weight].

7. Calculations:

   a. Net, Dry = Gross, Dry - Pan Tare
   b. % Dry Weight = (Sample, Dry)/(Sample, Wet) * 100%

8. Use percent dry weight in final, concentration, calculation.

XII. Procedure for the digestion of soil, sludge and sediment

IMPORTANT: BE SURE TO FILL OUT DIGESTION LOG WITH: DATE OF DIGESTION, ANALYSTS INITIALS, CLIENT, DILUTION, TESTS, DIGESTION METHOD, SAMPLE, BATCH Q.C. AND SPIKING INFORMATION.

1. Rinse, with 1:1 nitric acid, 50 mL graduated cylinders and 150 mL beakers.

2. Arrange samples on counter and label the beakers with the job number, sample number, dilution and tests. Label tests as follows:

    1. TM: total metals run by ICP
    2. FLAA: metals run by AA flame
    3. X: individual metal (example: Pb)

3. Batch quality control is run every 20 samples or as requested by a specific client. Label six beakers as follows:

    1. MPB (Date of Digestion): Method Prepared Blank
    2. LS (Date of Digestion): Laboratory Spike
    3. Sample #
    4. Sample #-DUP: Duplicate
    5. Sample #-SPK or MS: Matrix Spike
    6. Sample #-MSD: Matrix Spike Duplicate

4. Stir samples and form a consistent, homogeneous mixture. Use a pestle and mortar for consistency. Remove any large stones.

5. Weigh out 2.00 g of sample into a 150 mL beaker. [Record weight on the beaker and in the digestion logbook. Also, record final volume of solution: Example 2.02 g / 50 mL]

** PERFORM ALL REMAINING STEPS UNDER THE HOOD **

6. Add 5.0 mL concentrated trace metal nitric acid and 10 mL milli-Q water. Mix the slurry. Cover with watchglass. Spike designated QC sample.

7. Heat at 95 degrees C for 10-15 minutes. Cool, add 5.0 mLs additional trace metal nitric acid.

8. Let sample evaporate to approximately 5.0 mLs. Remove from hotplate and Cool. [Do not let sample go dry]

9. Add 2.0 mLs water and 1.0 mL 30% hydrogen peroxide. Place on hotplate and evaporate. Continue adding peroxide until effervescence is minimal, and no noticeable change in sample appearance. Do not exceed 10 mLs peroxide. Cool.

10. Add 5.0 mLs hydrochloric acid. Cover with watchglass. Heat for an additional 15-20 minutes (until fumes are a light yellow. Remove from hotplate and cool.

11. Rinse watchglasses into beakers. Wash the sides of the beaker.

12. Rinse 50 mL volumetric flasks with DI water. Rinse filters and Whatman #41 filter paper with 1:1 nitric acid.

13. Filter the sample into the volumetric flask. Rinse the beaker a minimum of three times.

14. Label the plastic centrifuge cylinder exactly as the beaker was labeled. Sample number, tests and dilution.

15. Keep the batch together and place on the counter for analysis.

XII. Data Reporting

- The concentrations determined are to be reported on the basis of dry weights
- Enter date of digestion in LIMS.
- Record sample number, date of digestion, spike concentration method of digestion, final dilution, and test in digestion notebook.

SW-846 Test Methods for Evaluating Solid Wastes
Vol. 1A, September, 1986
USEPA Method 7211

4.0 PARAMETER LIST

4.1 Copper

5.0 SCOPE AND APPLICATION

5.1 This method is the graphite furnace atomic absorption method for the analysis of copper in aqueous and non-aqueous samples.

6.0 SUMMARY OF TEST METHOD

6.1 Graphite furnace atomic absorption spectroscopy (GFAAS) is a fast and reliable method for the quantification of trace metals in environmental samples. Its sensitivity and ability to analyze diverse sample types makes it the most prevalent method in use for the determination of metals at ppb and sub-ppb levels.

CONTROLLED DOCUMENT

Prior to analysis, most samples need some type of dissolution procedure performed on them. This 'pretreatment' of the sample usually involves heating the sample in the presence of a combination of HNO_3, and H_2O_2. Please refer to methods 3020 or 3050 for a more in-depth discussion of these techniques.

In GFAAS, the sample is pipetted into a graphite tube using a hand pipette or some type of mechanical pump able to dispense microliter quantities. The tube is heated to a low temperature (around 110C) by passing a current through the graphite. When the sample is completely dried, the tube is heated to a higher temperature. This step, called the pyrolysis or char step, attempts to volatilize any organics and/or any easily-volatilized metals which could interfere in the atomization step. At this point, the furnace may or may not cool the tube down. The decision to cool the tube down is based on the design of the furnace; the newer transversal heating method not needing a cool-down step. Next, the tube is heated quickly (in about 1 second) to the atomization temperature. The metal of interest is volatilized from the tube, creating free atoms in the ground state. Light from an emission source (usually an HCL or EDL) is passed through the tube containing the atoms The lamp usually contains only the metal of interest, hence the wavelengths of light emitted from the source correspond to the wavelengths of light that the free atoms can absorb. The free atoms absorb the light as it is passed through the tube, causing a decrease in the intensity of the light reaching the detector. This decrease in intensity is directly proportional to the number of free atoms, and hence, the concentration of the analyte in the sample.

A standard curve is constructed by measuring the absorbance of known concentrations of the analytes and linearly or nonlinearly plotting concentration versus absorbance. The absorbance of the unknown sample is then measured, and the value for the concentration is extrapolated from the standard curve.

7.0 INTERFERENCES AND CORRECTIVE PROCEDURES

7.1 Continuum background correction cannot correct for all types of background interference. The use of Zeeman background correction will correct this problem.

7.2 Interference from a smoke-producing matrix may be reduced by extending the char time and/or charring at a higher temp.

7.3 Anion interference studies show that the nitrate anion is preferred. If another anion is required, a minimum amount should be used. This applies particularly to hydrochloric and, to a lesser extent, to sulfuric and phosphoric acids.

7.4 Contamination can be major sources of error because of the low sensitivities of the furnace. Work areas and glassware should be kept clean. Pyrolytic graphite can also become contaminated. As many as 5 to 10 high-temperature burns may be required to clean the tube before use.

7.5 To suppress sulfate interference (up to 1500 ppm) lanthanum may be added as the nitrate to both samples and calibration standards.

7.6 To eliminate other interferences use magnesium nitrate/palladium as a matrix modifier.

7.7 Use plastic glassware whenever possible.

8.0 SAFETY PRECAUTIONS

8.1 The analyst must comply with all standard operating procedures for health and safety as outlined in the "WWES Laboratory Safety Manual".

8.2 Gloves and safety glasses must be worn at all times when handling concentrated acids. Gloves are also recommended when handling digested samples.

8.3 Fasten all gas cylinders securely to a wall, counter, etc.

8.4 Check the AA Hood to be sure it is operating correctly.

8.5 The graphite tube during atomization emits intense UV radiation. UV protected eyeglasses should be worn.

8.6 During the read step strong magnetic fields are created. Anyone wearing an electronic pacemaker or having metallic implants should remain at least 0.6 meters away from the furnace during operation.

8.7 See "GFAA Instrument Setup and Operation," Standard Operating Procedures.

9.0 SAMPLE SIZE, COLLECTION, PRESERVATION AND HANDLING PROCEDURES

Measurement	Digestion Vol. Req.[a] (ml)	Collection Volume (ml)[b]	Preservative	Holding Time
Metals (except mercury):				
Total recoverable	100	500	HNO_3 to pH <2	6 mo
Dissolved	100	500	Filter on Site; HNO_3 to pH <2	6 mo
Suspended	100	500	Filter on site	6 mo
Total	100	500	HNO_3 to pH <2	6 mo

[a]Solid samples must be at least 200 g and usually require no preservation other than storing at 4°C until analyzed.

[b]Either plastic or glass containers may be used.

10.0 APPARATUS/INSTRUMENTATION

10.1 Atomic Absorption Spectrophotometer: Single or double beam instrument having a grating monochromator, photomultiplier detector, adjustable slits, and a wavelength range of 190 to 800 nm.

10.1.1 Perkin-Elmer 1100 B A.A.S.
10.1.2 Perkin-Elmer 4100 ZL A.A.S.

10.2 Copper hollow cathode lamp or electrodeless discharge lamp.

10.3 Graphite furnace. Any furnace capable of reaching the specified temperatures.

10.4 Class A volumetric pipets.

10.5 Class A volumetric flasks.

10.6 Eppendorf pipets (capable of delivering 10 ul to 1000 ul).

CONTROLLED COPY - DO NOT COPY

11.0 ROUTINE PREVENTIVE MAINTENANCE

11.1 Change graphite tubes if wear is evident. Be sure to condition the tube prior to analysis.

11.2 Clean furnace windows periodically.

11.3 Clean filters once per week. Be sure they are dry when you replace them.

11.4 Keep work area clean.

11.5 Be sure lamp is clean. Remove fingerprints, dust, etc. with a Kimwipe©.

11.6 Clean AA windows with a Kimwipe©.

11.7 See SOP for GFAA Instrument Setup and Operation

12.0 CHEMICALS AND REAGENTS

12.1 Distilled deionized water (ASTM Type II)

12.2 Concentrated nitric acid, optima grade (HNO_3).

12.3 Milli-Q water (ASTM Type I)

12.4 Concentrated nitric acid, trace metal grade (HNO_3).

12.5 1000 mg/l copper stock standard solution.

12.6 Laboratory control sample (LCS) from a different source than the stock standard.

12.7 Magnesium Nitrate/Palladium Modifier

12.7.1 Preparation of 1% Palladium Solution

To 0.5 grams of high purity Pd powder, add 5 ml conc. HNO3 and 5 ml of deionized water. Heat for approximately 1 hour until the volume is reduced to about 1-2 ml. Add 1-2 ml nitric acid plus 100 ul of concentrated HCl and 5 ml of water and warm for 30 minutes. Repeat this second step until a total of 5 ml of nitric acid have been added, then dilute to 50 ml. This solution is stable for several months.

12.7.2 Preparation of 1 % Magnesium nitrate solution

To 1.7 grams of Mg(NO3)2-6H2O, add 1 ml concentrated nitric acid and bring to a total volume of 100 ml with deionized water.

12.7.3 Preparation of Palladium Nitrate-Madnesium nitrate

Take 15 ml of 1% Pd and 10 ml of 1% Mg(NO3)2 and dilute to 50 ml with 1% nitric acid. A 5 ul volume injected into the graphite furnace will contain 15 ug Pd and 10 ug Mg(NO3)2.

13.0 STANDARDS

13.1 Rinse volumetric flasks several times with ASTM Type II water.

13.2 Label the flasks as follows:

10 ug/l Cu-100 ml volumetric flask
30 ug/l Cu-100 ml volumetric flask
60 ug/l Cu-100 ml volumetric flask
10,000 ug/l Cu-100 ml volumetric flask

13.3 Add approximately 20 ml ASTM Type II water to each flask.

13.4 Acid match each working standard to the matrix to be analyzed.

13.5 Preserve 10,000 ppb std and other stds used for serial dilution at 1.0% HNO_3.

13.6 Pipet 1 ml 1000 ppm Cu stock standard into 100 ml flask labeled 10,000 ug/l Cu.

13.7 Dilute flask to volume, mix making sure the solution is well equilibrated.

13.8 Pipet 0.10 ml of the 10,000 ug/l standard and transfer it to the 100 ml flask labeled 10 ug/l Cu. Dilute to volume and mix.

13.9 Pipet 0.2 ml of the 10,000 ug/l standard and transfer it to the 100 ml flask labeled 100 ug/l Cu. Dilute to volume and mix.

13.10 Pipet 0.6 ml of the 10,000 ug/l standard and transfer it to the 100 ml flask labeled 60 ug/l 60. Dilute to volume and mix.

13.11 Complete the standards log book (see Appendix J).

5	2650	1	6
6	20	1	5

Wavelength: 324.8 nm with a 0.7 nm slit

Modifier: 0.005 mg Pd + 0.003 mg $Mg(NO_3)_2$ per 5 ul

Lamp: Hollow Cathode

Sensitivity check (P-E 1100 B) @ 20 ul: 0.11 A-s @ 5.0 ug/l

M(O) (P-E 1100 B): 4.0

17.0 FLOW CHART

18.0 CALCULATIONS/DATA HANDLING

18.1 For determination of metal concentration read the metal value from the calibration curve or directly from the read-out system of the instrument.

18.2 If dilution of sample was required then multiply the result from the calibration curve by the dilution factor:

CONTROLLED DOCUMENT - DO NOT COPY

A(V/C) = concentration in sample

A=concentration from calibration curve
V=final volume of sample (mls)
C=sample aliquot (mls)

18.3 For solid samples, report all results as mg/kg as follows:

(AxV)/W = mg/kg sample

A=mg/l concentration from calibration curve
V=final volume of sample (ml)
W=weight of sample (grams)

18.4 See SOP for GFAA Instrument Setup and Operation.

19.0 DATA REPORTING

19.1 Fill out all benchsheets, initialize and date.

19.2 Fill out all instrument and maintenance log books.

CONTROLLED DOCUMENT - DO NOT COPY

20.0 QUALITY ASSURANCE

20.1 A calibration curve must be prepared each day with a minimum of a reagent blank and three standards. The correlation coefficient must be ≥ 0.995. If this fails the problem must be corrected.

20.2 An initial calibration blank (ICB) is run immediately after the curve and must not be greater than or equal to +/- the reported detection limit.

20.3 An initial calibration verification (ICV) is analyzed next. This is a mid-range standard and must be $\pm 10\%$ of the true value.

20.4 A laboratory control sample (LCS) is analyzed next. This is a non-digested separate source Q.A. sample to check the accuracy of the standards. This must be $\pm 20\%$ of the true value.

20.5 Run continuing calibration verifications (CCV) every 10 samples and at the end of the run. These must be $\pm 20\%$ of the true value.

20.6 Run continuing calibration blanks (CCB) every 10 samples and at the end of the run. These must not be greater than or equal to +/- the reported detection limit.

20.7 At least one spiked sample and spiked duplicate sample must be run for every 20 samples or with each matrix type. The recoveries must fall within Lims Control Limits. If not, flag the data as estimated.

20.8 % RSD of duplicate injections must be $<20\%$ if above the detection limit. If unacceptable, then rerun. If still unacceptable then estimate the data.

Wavelength: 193.7 nm with a 0.7 L nm slit

Modifier: 0.005 mg Pd + 0.003 mg $Mg(NO_3)_2$ per 5 ul

Lamp: Electrodeless Discharge or Hollow Cathode

Sensitivity check (P-E 1100 B) @ 20 ul: 0.15 A-s @ 25 ug/l

M(O) (P-E 1100 B): 15.0

17.0 FLOW CHART

18.0 CALCULATIONS/DATA HANDLING

18.1 For determination of metal concentration read the metal value from the calibration curve or directly from the read-out system of the instrument.

18.2 If dilution of sample was required then multiply the result from the calibration curve by the dilution factor:

A(V/C) = concentration in sample

A=concentration from calibration curve
V=final volume of sample (mls)
C=sample aliquot (mls)

18.3 For solid samples, report all results as mg/kg as follows:

(AxV)/W = mg/kg sample

A=mg/l concentration from calibration curve
V=final volume of sample (ml)
W=weight of sample (grams)

18.4 See SOP for GFAA Instrument Setup and Operation.

19.0 DATA REPORTING

19.1 Fill out all benchsheets, initialize and date.

19.2 Fill out all instrument and maintenance log books.

CONTROLLED COPY DO NOT COPY

20.0 QUALITY ASSURANCE

20.1 A calibration curve must be prepared each day with a minimum of a reagent blank and three standards. The correlation coefficient must be ≥ 0.995. If this fails the problem must be corrected.

20.2 An initial calibration blank (ICB) is run immediately after the curve and must not be greater than or equal to +/- the reported detection limit.

20.3 An initial calibration verification (ICV) is analyzed next. This is a mid-range standard and must be ±10% of the true value.

20.4 A laboratory control sample (LCS) is analyzed next. This is a non-digested separate source Q.A. sample to check the accuracy of the standards. This must be ±20% of the true value.

20.5 Run continuing calibration verifications (CCV) every 10 samples and at the end of the run. These must be ±20% of the true value.

20.6 Run continuing calibration blanks (CCB) every 10 samples and at the end of the run. These must not be greater than of equal to +/- the reported detection limit.

20.7 At least one spiked sample and spiked duplicate sample must be run for every 20 samples or with each matrix type. The recoveries must fall within Lims Control Limits. If not, flag the data as estimated.

20.8 % RSD of duplicate injections must be <20% if above the detection limit. If unacceptable, then rerun. If still unacceptable then estimate the data.

4.0 PARAMETER LIST

4.1 Cadmium

5.0 SCOPE AND APPLICATION

5.1 This method is the graphite furnace atomic absorption method for the analysis of cadmium in aqueous and non-aqueous samples.

6.0 SUMMARY OF TEST METHOD

6.1 Graphite furnace atomic absorption spectroscopy (GFAAS) is a fast and reliable method for the quantification of trace metals in environmental samples. Its sensitivity and ability to analyze diverse sample types makes it the most prevalent method in use for the determination of metals at ppb and sub-ppb levels.

CONFIDENTIAL DOCUMENT - NON-CONFIDENTIAL

Prior to analysis, most samples need some type of dissolution procedure performed on them. This 'pretreatment' of the sample usually involves heating the sample in the presence of a combination of HNO_3, and H_2O_2. Please refer to methods 3020 or 3050 for a more in-depth discussion of these techniques.

In GFAAS, the sample is pipetted into a graphite tube using a hand pipette or some type of mechanical pump able to dispense microliter quantities. The tube is heated to a low temperature (around 110C) by passing a current through the graphite. When the sample is completely dried, the tube is heated to a higher temperature. This step, called the pyrolysis or char step, attempts to volatilize any organics and/or any easily-volatilized metals which could interfere in the atomization step. At this point, the furnace may or may not cool the tube down. The decision to cool the tube down is based on the design of the furnace; the newer transversal heating method not needing a cool-down step. Next, the tube is heated quickly (in about 1 second) to the atomization temperature. The metal of interest is volatilized from the tube, creating free atoms in the ground state. Light from an emission source (usually an HCL or EDL) is passed through the tube containing the atoms The lamp usually contains only the metal of interest, hence the wavelengths of light emitted from the source correspond to the wavelengths of light that the free atoms can absorb. The free atoms absorb the light as it is passed through the tube, causing a decrease in the intensity of the light reaching the detector. This decrease in intensity is directly proportional to the number of free atoms, and hence, the concentration of the analyte in the sample.

A standard curve is constructed by measuring the absorbance of known concentrations of the analytes and linearly or nonlinearly plotting concentration versus absorbance. The absorbance of the unknown sample is then measured, and the value for the concentration is extrapolated from the standard curve.

7.0 INTERFERENCES AND CORRECTIVE PROCEDURES

7.1 Continuum background correction cannot correct for all types of background interference. The use of Zeeman background correction will correct this problem.

7.2 Interference from a smoke-producing matrix may be reduced by extending the char time and/or charring at a higher temp.

7.3 Anion interference studies show that the nitrate anion is preferred. If another anion is required, a minimum amount should be used. This applies particularly to hydrochloric and, to a lesser extent, to sulfuric and phosphoric acids.

7.4 Contamination can be major sources of error because of the low sensitivities of the furnace. Work areas and glassware should be kept clean. Pyrolytic graphite

can also become contaminated. As many as 5 to 10 high-temperature burns may be required to clean the tube before use.

7.5 To suppress sulfate interference (up to 1500 ppm) lanthanum may be added as the nitrate to both samples and calibration standards.

7.6 To eliminate other interferences use magnesium nitrate/palladium as a matrix modifier.

7.7 Use plastic glassware whenever possible.

8.0 SAFETY PRECAUTIONS

8.1 The analyst must comply with all standard operating procedures for health and safety as outlined in the "WWES Laboratory Safety Manual".

8.2 Gloves and safety glasses must be worn at all times when handling concentrated acids. Gloves are also recommended when handling digested samples.

8.3 Fasten all gas cylinders securely to a wall or counter.

8.4 Check the AA Hood to be sure it is operating correctly.

8.5 The graphite tube during atomization emits intense UV radiation. UV protected eyeglasses should be worn.

8.6 During the read step strong magnetic fields are created. Anyone wearing an electronic pacemaker or having metallic implants should remain at least 0.6 meters away from the furnace during operation.

8.7 See "GFAA Instrument Setup and Operation," Standard Operating Procedures.

11.0 ROUTINE PREVENTIVE MAINTENANCE

11.1 Change graphite tubes if wear is evident. Be sure to condition the tube prior to analysis.

11.2 Clean furnace windows periodically.

11.3 Clean filters once per week. Be sure they are dry when you replace them.

11.4 Keep work area clean.

11.5 Be sure lamp is clean. Remove fingerprints, dust, etc. with a Kimwipe©.

11.6 Clean AA windows with a Kimwipe©.

11.7 See SOP for GFAA Instrument Setup and Operation

12.0 CHEMICALS AND REAGENTS

12.1 Distilled deionized water (ASTM Type I).

12.2 Concentrated nitric acid, optima grade (HNO_3).

12.3 Milli-Q water (ASTM Type I)

12.4 Concentrated nitric acid, trace metal grade (HNO_3).

12.5 1000 mg/l cadmium stock standard solution.

12.6 Laboratory control sample (LCS) from a different source than the stock standard.

12.7 Magnesium Nitrate/Palladium Modifier or Ammonium Phosphate

12.7.1 Preparation of 1% Palladium Solution

To 0.5 grams of high purity Pd powder, add 5 ml conc HNO3 and 5 ml of deionized water. Heat for approximately 1 hour until the volume is reduced to about 1-2 ml. Add 1-2 ml nitric acid plus 100 ul of concentrated HCl and 5 ml of water and warm for 30 minutes. Repeat this second step until a total of 5 ml of nitric acid have been added, then dilute to 50 ml. This solution is stable for several months.

EPA CONTROLLED DOCUMENT DO NOT COPY

12.7.2 Preparation of 1 % Magnesium nitrate solution

To 1.7 grams of Mg(NO3)2-6H2O, add 1 ml concentrated nitric acid and bring to a total volume of 100 ml with deionized water.

12.7.3 Preparation of Palladium Nitrate-Madnesium nitrate

Take 15 ml of 1% Pd and 10 ml of 1% Mg(NO3)2 and dilute to 50 ml with 1% nitric acid. A 5 ul volume injected into the graphite furnace will contain 15 ug Pd and 10 ug Mg(NO3)2.

4.0 PARAMETER LIST

4.1 Lead

5.0 SCOPE AND APPLICATION

5.1 This method is the graphite furnace atomic absorption method for the analysis of Lead in aqueous and non-aqueous samples.

6.0 SUMMARY OF TEST METHOD

6.1 Graphite furnace atomic absorption spectroscopy (GFAAS) is a fast and reliable method for the quantification of trace metals in environmental samples. Its sensitivity and ability to analyze diverse sample types makes it the most prevalent method in use for the determination of metals at ppb and sub-ppb levels.

CONTROLLED DOCUMENT - FOR INTERNAL USE ONLY

Prior to analysis, most samples need some type of dissolution procedure performed on them. This 'pretreatment' of the sample usually involves heating the sample in the presence of a combination of HNO_3, and H_2O_2. Please refer to methods 3020 or 3050 for a more in-depth discussion of these techniques.

In GFAAS, the sample is pipetted into a graphite tube using a hand pipette or some type of mechanical pump able to dispense microliter quantities. The tube is heated to a low temperature (around 110C) by passing a current through the graphite. When the sample is completely dried, the tube is heated to a higher temperature. This step, called the pyrolysis or char step, attempts to volatilize any organics and/or any easily-volatilized metals which could interfere in the atomization step. At this point, the furnace may or may not cool the tube down. The decision to cool the tube down is based on the design of the furnace; the newer transversal heating method not needing a cool-down step. Next, the tube is heated quickly (in about 1 second) to the atomization temperature. The metal of interest is volatilized from the tube, creating free atoms in the ground state. Light from an emission source (usually an HCL or EDL) is passed through the tube containing the atoms The lamp usually contains only the metal of interest, hence the wavelengths of light emitted from the source correspond to the wavelengths of light that the free atoms can absorb. The free atoms absorb the light as it is passed through the tube, causing a decrease in the intensity of the light reaching the detector. This decrease in intensity is directly proportional to the number of free atoms, and hence, the concentration of the analyte in the sample.

A standard curve is constructed by measuring the absorbance of known concentrations of the analytes and linearly or nonlinearly plotting concentration versus absorbance. The absorbance of the unknown sample is then measured, and the value for the concentration is extrapolated from the standard curve.

7.0 INTERFERENCES AND CORRECTIVE PROCEDURES

7.1 Continuum background correction cannot correct for all types of background interference. The use of Zeeman background correction will correct this problem.

7.2 Interference from a smoke-producing matrix may be reduced by extending the char time and/or charring at a higher temp.

7.3 Anion interference studies show that the nitrate anion is preferred. If another anion is required, a minimum amount should be used. This applies particularly to hydrochloric and, to a lesser extent, to sulfuric and phosphoric acids.

7.4 Contamination can be major sources of error because of the low sensitivities of the furnace. Work areas and glassware should be kept clean. Pyrolytic graphite

can also become contaminated. As many as 5 to 10 high-temperature burns may be required to clean the tube before use.

7.5 To suppress sulfate interference (up to 1500 ppm) lanthanum may be added as the nitrate to both samples and calibration standards.

7.6 To eliminate other interferences use magnesium nitrate/palladium as a matrix modifier.

7.7 Use plastic glassware whenever possible.

8.0 SAFETY PRECAUTIONS

8.1 The analyst must comply with all standard operating procedures for health and safety as outlined in the "WWES Laboratory Safety Manual".

8.2 Gloves and safety glasses must be worn at all times when handling concentrated acids. Gloves are also recommended when handling digested samples.

8.3 Fasten all gas cylinders securely to a wall, counter, etc.

8.4 Check the AA Hood to be sure it is operating correctly.

8.5 The graphite tube during atomization emits intense UV radiation. UV protected eyeglasses should be worn.

8.6 During the read step strong magnetic fields are created. Anyone wearing an electronic pacemaker or having metallic implants should remain at least 0.6 meters away from the furnace during operation.

8.7 See "GFAA Instrument Setup and Operation," Standard Operating Procedures.

9.0 SAMPLE SIZE, COLLECTION, PRESERVATION AND HANDLING PROCEDURES

Measurement	Digestion Vol. Req.[a] (ml)	Collection Volume (ml)[b]	Preservative	Holding Time
Metals (except mercury):				
Total recoverable	100	500	HNO_3 to pH <2	6 mo
Dissolved	100	500	Filter on Site; HNO_3 to pH <2	6 mo
Suspended	100	500	Filter on site	6 mo
Total	100	500	HNO_3 to pH <2	6 mo

[a]Solid samples must be at least 200 g and usually require no preservation other than storing at 4°C until analyzed.
[b]Either plastic or glass containers may be used.

10.0 APPARATUS/INSTRUMENTATION

10.1 Atomic Absorption Spectrophotometer - Single or double beam instrument having a grating monochromator, photomultiplier detector, adjustable slits, and a wavelength range of 190 to 800 nm.

10.1.1 Perkin-Elmer 1100 B A.A.S.
10.1.2 Perkin-Elmer 4100 ZL A.A.S.

10.2 Hollow Cathode Lamp or Electrodeless Discharge Lamp

10.3 Graphite furnace. Any furnace capable of reaching the specified temperatures.

10.4 Class A volumetric pipets.

10.5 Class A volumetric flasks.

10.6 Eppendorf pipets (capable of delivering 10 ul to 1000 ul).

CONTROLLED DOCUMENT DO NOT COPY

11.0 ROUTINE PREVENTIVE MAINTENANCE

11.1 Change graphite tubes if wear is evident. Be sure to condition the tube prior to analysis.

11.2 Clean furnace windows periodically.

11.3 Clean filters once per week. Be sure they are dry when you replace them.

11.4 Keep work area clean.

11.5 Be sure lamp is clean. Remove fingerprints, dust, etc. with a Kimwipe©.

11.6 Clean AA windows with a Kimwipe©.

11.7 See SOP for GFAA Instrument Setup and Operation

12.0 CHEMICALS AND REAGENTS

12.1 Distilled deionized water (ASTM Type II).

12.2 Concentrated nitric acid, optima grade (HNO_3).

12.3 Milli-Q water (ASTM Type I).

12.4 Concentrated nitric acid, trace metal grade (HNO_3).

12.5 1000 mg/l lead stock standard solution.

12.6 Laboratory control sample (LCS) from a different source than the stock standard.

12.7 Palladium + Magnesium Nitrate solution or Ammonium Phosphate

12.7.1 Preparation of 1 % Palladium Solution

To 0.5 grams of high purity Pd powder, add 5 ml conc. nitric acid and 5 ml of deionized water. Heat for approximately 1 hour until the volume is reduced to about 1-2 ml. Add 1-2 ml nitric acid plus 100 ul of conc. HCl and 5 ml water and warm for 30 minutes. Repeat this second step until a total of 5 ml of nitric acid have been added, then dilute to 50 ml. This solution is stable for several months.

12.7.2 Preparation of 1 % Magnesium nitrate solution

To 1.7 grams of $Mg(NO3)2\text{-}6H2O$, add 1 ml concentrated nitric acid and bring to a total volume of 100 ml with deionized water.

12.7.3 Preparation of Palladium-Magnesium Nitrate solution

Take 15 ml of 1% Pd and 10 ml of 1% $Mg(NO3)2$ and dilute to 50 ml with 1% nitric acid. A 5 ul volume injected into the graphite furnace will contain 15 ug Pd and 10 ug magnesium nitrate.

13.0 STANDARDS

13.1 Rinse volumetric flasks several times with ASTM Type II water.

13.2 Label the flasks as follows:

20.0 ug/l Pb-100 ml volumetric flask
60.0 ug/l Pb-100 ml volumetric flask
120.0 ug/l Pb-100 ml volumetric flask

10,000 ug/l Pb-100 ml volumetric flask

13.3 Add approximately 20 ml ASTM Type II water to each flask.

13.4 Acid match each working standard to the matrix to be analyzed.

13.5 Preserve 10,000 ppb std and other stds used for serial dilution at 1.0% HNO_3.

13.6 Pipet 1.0 ml 1,000 ppm Pb stock standard into 100 ml flask labeled 10,000 ug/l Pb.

13.7 Dilute flask to volume, mix making sure the solution is well equilibrated.

13.8 Pipet 0.20 ml of the 10,000 ug/l standard and transfer it to the 100 ml flask labeled 20.0 ug/l Pb. Dilute to volume and mix.

13.9 Pipet 0.60 ml of the 10,000 ug/l standard and transfer it to the 100 ml flask labeled 60.0 ug/l Pb. Dilute to volume and mix.

13.10 Pipet 1.2 ml of the 10,000 ug/l standard and transfer it to the 100 ml flask labeled 120.0 ug/l Pb. Dilute to volume and mix.

18.0 CALCULATIONS/DATA HANDLING

18.1 For determination of metal concentration read the metal value from the calibration curve or directly from the read-out system of the instrument.

18.2 If dilution of sample was required then multiply the result from the calibration curve by the dilution factor:

A(V/C) = concentration in sample

A=concentration from calibration curve
V=final volume of sample (mls)
C=sample aliquot (mls)

18.3 For solid samples, report all results as mg/kg as follows:

(AxV)/W = mg/kg sample

A=mg/l concentration from calibration curve
V=final volume of sample (ml)
W=weight of sample (grams)

18.4 See SOP for GFAA Instrument Setup and Operation.

19.0 DATA REPORTING

19.1 Fill out all benchsheets, initialize and date.

19.2 Fill out all instrument and maintenance log books.

CONFIDENTIAL DOCUMENT - DO NOT COPY

20.0 QUALITY ASSURANCE

20.1 A calibration curve must be prepared each day with a minimum of a reagent blank and three standards. The correlation coefficient must be ≥ 0.995. If this fails the problem must be corrected.

20.2 An initial calibration blank (ICB) is run immediately after the curve and must not be greater than or equal to +/- the reported detection limit.

20.3 An initial calibration verification (ICV) is analyzed next. This is a mid-range standard and must be ±10% of the true value.

20.4 A laboratory control sample (LCS) is analyzed next. This is a non-digested separate source Q.A. sample to check the accuracy of the standards. This must be ±20% of the true value.

20.5 Run continuing calibration verifications (CCV) every 10 samples and at the end of the run. These must be ±20% of the true value.

20.6 Run continuing calibration blanks (CCB) every 10 samples and at the end of the run. These must not be greater than of equal to +/- the reported detection limit.

20.7 At least one spiked sample and spiked duplicate sample must be run for every 20 samples or with each matrix type. The recoveries must fall within Lims Control Limits. If not, flag the data as estimated.

20.8 % RSD of duplicate injections must be <20% if above the detection limit. If unacceptable, then rerun. If still unacceptable then estimate the data.

Please refer to methods 3020 or 3050 for a more in-depth discussion of these techniques.

In GFAAS, the sample is pipetted into a graphite tube using a hand pipette or some type of mechanical pump able to dispense microliter quantities. The tube is heated to a low temperature (around 110C) by passing a current through the graphite. When the sample is completely dried, the tube is heated to a higher temperature. This step, called the pyrolysis or char step, attempts to volatilize any organics and/or any easily-volatilized metals which could interfere in the atomization step. At this point, the furnace may or may not cool the tube down. The decision to cool the tube down is based on the design of the furnace; the newer transversal heating method not needing a cool-down step. Next, the tube is heated quickly (in about 1 second) to the atomization temperature. The metal of interest is volatilized from the tube, creating free atoms in the ground state. Light from an emission source (usually an HCL or EDL) is passed through the tube containing the atoms The lamp usually contains only the metal of interest, hence the wavelengths of light emitted from the source correspond to the wavelengths of light that the free atoms can absorb. The free atoms absorb the light as it is passed through the tube, causing a decrease in the intensity of the light reaching the detector. This decrease in intensity is directly proportional to the number of free atoms, and hence, the concentration of the analyte in the sample.

A standard curve is constructed by measuring the absorbance of known concentrations of the analytes and linearly or nonlinearly plotting concentration versus absorbance. The absorbance of the unknown sample is then measured, and the value for the concentration is extrapolated from the standard curve.

7.0 INTERFERENCES AND CORRECTIVE PROCEDURES

7.1 Continuum background correction cannot correct for all types of background interference. The use of Zeeman background correction will correct this problem.

7.2 Interference from a smoke-producing matrix may be reduced by extending the char time and/or charring at a higher temp.

7.3 Anion interference studies show that the nitrate anion is preferred. If another anion is required, a minimum amount should be used. This applies particularly to hydrochloric and, to a lesser extent, to sulfuric and phosphoric acids.

7.4 Contamination can be major sources of error because of the low sensitivities of the furnace. Work areas and glassware should be kept clean. Pyrolytic graphite

can also become contaminated. As many as 5 to 10 high-temperature burns may be required to clean the tube before use.

7.5 To suppress sulfate interference (up to 1500 ppm) lanthanum may be added as the nitrate to both samples and calibration standards.

7.6 To eliminate other interferences use magnesium nitrate/palladium as a matrix modifier.

7.7 Use plastic glassware whenever possible.

8.0 SAFETY PRECAUTIONS

8.1 The analyst must comply with all standard operating procedures for health and safety as outlined in the "WWES Laboratory Safety Manual".

8.2 Gloves and safety glasses must be worn at all times when handling concentrated acids. Gloves are also recommended when handling digested samples.

8.3 Fasten all gas cylinders securely to a wall, counter, etc.

8.4 Check the AA Hood to be sure it is operating correctly.

8.5 The graphite tube during atomization emits intense UV radiation. UV protected eyeglasses should be worn.

8.6 During the read step strong magnetic fields are created. Anyone wearing an electronic pacemaker or having metallic implants should remain at least 0.6 meters away from the furnace during operation.

8.7 See "GFAA Instrument Setup and Operation," Standard Operating Procedures.

11.0 ROUTINE PREVENTIVE MAINTENANCE

11.1 Change graphite tubes if wear is evident. Be sure to condition the tube prior to analysis.

11.2 Clean furnace windows periodically.

11.3 Clean filters once per week. Be sure they are dry when you replace them.

11.4 Keep work area clean.

11.5 Be sure lamp is clean. Remove fingerprints, dust, etc. with a Kimwipe©.

11.6 Clean AA windows with a Kimwipe©.

11.7 See SOP for GFAA Instrument Setup and Operation

12.0 CHEMICALS AND REAGENTS

12.1 Distilled deionized water (ASTM Type II).

12.2 Concentrated nitric acid, optima grade (HNO_3).

12.3 Milli-Q water (ASTM Type I)

12.4 Concentrated nitric acid, trace metal grade (HNO_3).

12.5 1000 mg/l silver stock standard solution.

12.6 Laboratory control sample (LCS) from a different source than the stock standard.

12.7 Palladium + Magnesium Nitrate solution

12.7.1 Preparation of 1 % Palladium Solution

To 0.5 grams of high purity Pd powder, add 5 ml conc. nitric acid and 5 ml of deionized water. Heat for approximately 1 hour until the volume is reduced to about 1-2 ml. Add 1-2 ml nitric acid plus 100 ul of conc. HCl and 5 ml water and warm for 30 minutes. Repeat this second step until a total of 5 ml of nitric acid have been added, then dilute to 50 ml. This solution is stable for several months.

12.7.2 Preparation of 1 % Magnesium nitrate solution

To 1.7 grams of $Mg(NO3)2\text{-}6H2O$, add 1 ml concentrated nitric acid and bring to a total volume of 100 ml with deionized water.

12.7.3 Preparation of Palladium-Magnesium Nitrate solution
Take 15 ml of 1% Pd and 10 ml of 1% $Mg(NO3)2$ and dilute to 50 ml with 1% nitric acid. A 5 ul volume injected into the graphite furnace will contain 15 ug Pd and 10 ug magnesium nitrate.

13.0 STANDARDS

13.1 Rinse volumetric flasks several times with ASTM Type II water.

13.2 Label the flasks as follows:

3.0 ug/l Ag-100 ml volumetric flask
9.0 ug/l Ag-100 ml volumetric flask
18.0 ug/l Ag-100 ml volumetric flask

1000 ug/l Ag-100 ml volumetric flask

13.3 Add approximately 20 ml ASTM Type II water to each flask.

13.4 Acid match each working standard to the matrix to be analyzed.

13.5 Preserve 1,000 ppb std and other stds used for serial dilution at 1.0% HNO_3.

13.6 Pipet 0.1 ml 1.000 ppm Ag stock standard into 100 ml flask labeled 1,000 ug/l Ag.

13.7 Dilute flask to volume, mix making sure the solution is well equilibrated.

13.8 Pipet 0.30 ml of the 1,000 ug/l standard and transfer it to the 100 ml flask labeled 3.0 ug/l Ag. Dilute to volume and mix.

13.9 Pipet 0.90 ml of the 1,000 ug/l standard and transfer it to the 100 ml flask labeled 9.0 ug/l Ag. Dilute to volume and mix.

13.10 Pipet 1.8 ml of the 1,000 ug/l standard and transfer it to the 100 ml flask labeled 18.0 ug/l Ag. Dilute to volume and mix.

13.11 Complete the standards log book (see Appendix J).

CONTROLLED DOCUMENT

4.0 PARAMETER LIST

4.1 Nickel

5.0 SCOPE AND APPLICATION

5.1 This method is the graphite furnace atomic absorption method for the analysis of Nickel in aqueous and non-aqueous samples.

6.0 SUMMARY OF TEST METHOD

6.1 Graphite furnace atomic absorption spectroscopy (GFAAS) is a fast and reliable method for the quantification of trace metals in environmental samples. Its sensitivity and ability to analyze diverse sample types makes it the most prevalent method in use for the determination of metals at ppb and sub-ppb levels.

Prior to analysis, most samples need some type of dissolution procedure performed on them. This 'pretreatment' of the sample usually involves heating the sample in the presence of a combination of HNO_3, and H_2O_2. Please refer to method 3050 or 3020 for a more in-depth discussion of these techniques.

In GFAAS, the sample is pipetted into a graphite tube using a hand pipette or some type of mechanical pump able to dispense microliter quantities. The tube is heated to a low temperature (around 110C) by passing a current through the graphite. When the sample is completely dried, the tube is heated to a higher temperature. This step, called the pyrolysis or char step, attempts to volatilize any organics and/or any easily volatilized metals which could interfere in the atomization step. At this point, the furnace may or may not cool the tube down. The decision to cool the tube down is based on the design of the furnace; the newer transversal heating method not needing a cool-down step. Next, the tube is heated quickly (in about 1 second) to the atomization temperature. The metal of interest is volatilized from the tube, creating free atoms in the ground state. Light from an emission source (usually an HCL or EDL) is passed through the tube containing the atoms The lamp usually contains only the metal of interest, hence the wavelengths of light emitted from the source correspond to the wavelengths of light that the free atoms can absorb. The free atoms absorb the light as it is passed through the tube, causing a decrease in the intensity of the light reaching the detector. This decrease in intensity is directly proportional to the number of free atoms, and hence, the concentration of the analyte in the sample.

A standard curve is constructed by measuring the absorbance of known concentrations of the analytes and linearly or nonlinearly plotting concentration versus absorbance. The absorbance of the unknown sample is then measured, and the value for the concentration is extrapolated from the standard curve.

7.0 INTERFERENCES AND CORRECTIVE PROCEDURES

7.1 Continuum background correction cannot correct for all types of background interference. The use of Zeeman background correction will correct this problem.

7.2 Interference from a smoke-producing matrix may be reduced by extending the char time and/or charring at a higher temp.

7.3 Anion interference studies show that the nitrate anion is preferred. If another anion is required, a minimum amount should be used. This applies particularly to hydrochloric and, to a lesser extent, to sulfuric and phosphoric acids.

7.4 Contamination can be major sources of error because of the low sensitivities of the furnace. Work areas and glassware should be kept clean. Pyrolytic graphite

can also become contaminated. As many as 5 to 10 high-temperature burns may be required to clean the tube before use.

7.5 To suppress sulfate interference (up to 1500 ppm) lanthanum may be added as the nitrate to both samples and calibration standards.

7.6 Use plastic glassware whenever possible.

8.0 SAFETY PRECAUTIONS

8.1 The analyst must comply with all standard operating procedures for health and safety as outlined in the "WWES Laboratory Safety Manual".

8.2 Gloves and safety glasses must be worn at all times when handling concentrated acids. Gloves are also recommended when handling digested samples.

8.3 Fasten all gas cylinders securely to a wall, counter, etc.

8.4 Check the AA Hood to be sure it is operating correctly.

8.5 The graphite tube during atomization emits intense UV radiation. UV protected eyeglasses should be worn.

8.6 During the read step strong magnetic fields are created. Anyone wearing an electronic pacemaker or having metallic implants should remain at least 0.6 meters away from the furnace during operation.

8.7 See "GFAA Instrument Setup and Operation," Standard Operating Procedures.

TECHNICAL DOCUMENT UNDER CONTROL

9.0 SAMPLE SIZE, COLLECTION, PRESERVATION AND HANDLING PROCEDURES

Measurement	Digestion Vol. Req.[a] (ml)	Collection Volume (ml)[b]	Preservative	Holding Time
Metals (except mercury):				
Total recoverable	100	500	HNO_3 to pH <2	6 mo
Dissolved	100	500	Filter on Site; HNO_3 to pH <2	6 mo
Suspended	100	500	Filter on site	6 mo
Total	100	500	HNO_3 to pH <2	6 mo

[a]Solid samples must be at least 200 g and usually require no preservation other than storing at 4°C until analyzed.
[b]Either plastic or glass containers may be used.

10.0 APPARATUS/INSTRUMENTATION

10.1 Atomic Absorption Spectrophotometer - single or double beam instrument having a grating monochromator, photomultiplier detector, adjustable slits, and a wavelength range of 190 to 800 nm.

10.1.1 Perkin-Elmer 1100 B A.A.S.
10.1.2 Perkin-Elmer 4100 ZL A.A.S.

10.2 Hollow Cathode Lamp

10.3 Graphite furnace. Any furnace capable of reaching the specified temperatures.

10.4 Class A volumetric pipets.

10.5 Class A volumetric flasks.

10.6 Eppendorf pipets (capable of delivering 10 ul to 1000 ul).

CONTROLLED DOCUMENT DO NOT COPY

11.0 ROUTINE PREVENTIVE MAINTENANCE

11.1 Change graphite tubes if wear is evident. Be sure to condition the tube prior to analysis.

11.2 Clean furnace windows periodically.

11.3 Clean filters once per week. Be sure they are dry when you replace them.

11.4 Keep work area clean.

11.5 Be sure lamp is clean. Remove fingerprints, dust, etc. with a Kimwipe©.

11.6 Clean AA windows with a Kimwipe©.

11.7 See SOP for GFAA Instrument Setup and Operation

12.0 CHEMICALS AND REAGENTS

12.1 Distilled deionized water (ASTM Type II).

12.2 Concentrated nitric acid, optima grade (HNO_3).

12.3 Milli-Q water (ASTM Type I).

12.4 Concentrated nitric acid, trace metal grade (HNO_3).

12.5 1000 mg/l nickel stock standard solution.

12.6 Laboratory control sample (LCS) from a different source than the stock standard.

FOR RESEARCH DOCUMENT DO NOT COPY

13.0 STANDARDS

13.1 Rinse volumetric flasks several times with ASTM Type II water.

13.2 Label the flasks as follows:

20.0 ug/l Ni-100 ml volumetric flask
60.0 ug/l Ni-100 ml volumetric flask
120.0 ug/l Ni-100 ml volumetric flask

10,000 ug/l Ni-100 ml volumetric flask

13.3 Add approximately 20 ml ASTM Type II water to each flask.

13.4 Acid match each working standard to the matrix to be analyzed.

13.5 Preserve 10,000 ppb std and other stds used for serial dilution at 1.0% HNO_3.

13.6 Pipet 1.0 ml 1,000 ppm Ni stock standard into 100 ml flask labeled 10,000 ug/l Ni.

13.7 Dilute flask to volume, mix making sure the solution is well equilibrated.

13.8 Pipet 0.20 ml of the 10,000 ug/l standard and transfer it to the 100 ml flask labeled 20.0 ug/l Ni. Dilute to volume and mix.

13.9 Pipet 0.60 ml of the 10,000 ug/l standard and transfer it to the 100 ml flask labeled 60.0 ug/l Ni. Dilute to volume and mix.

13.10 Pipet 1.2 ml of the 10,000 ug/l standard and transfer it to the 100 ml flask labeled 120.0 ug/l Ni. Dilute to volume and mix.

13.11 Complete the standards log book (see Appendix A).

14.0 SAMPLE PREPARATION

See Method 3050 and 3020 for pre-treatment of samples.

17.0 FLOW CHART

CONTROLLED DOCUMENT - DO NOT COPY

18.0 CALCULATIONS/DATA HANDLING

18.1 For determination of metal concentration read the metal value from the calibration curve or directly from the read-out system of the instrument.

18.2 If dilution of sample was required then multiply the result from the calibration curve by the dilution factor:

A(V/C) = concentration in sample

A=concentration from calibration curve
V=final volume of sample (mls)
C=sample aliquot (mls)

18.3 For solid samples, report all results as mg/kg as follows:

(AxV)/W = mg/kg sample

A=mg/l concentration from calibration curve
V=final volume of sample (ml)
W=weight of sample (grams)

18.4 See SOP for GFAA Instrument Setup and Operation.

19.0 DATA REPORTING

19.1 Fill out all benchsheets, initialize and date.

19.2 Fill out all instrument and maintenance log-books.

CONTROLLED COPY DO NOT COPY

20.0 QUALITY ASSURANCE

20.1 A calibration curve must be prepared each day with a minimum of a reagent blank and three standards. The correlation coefficient must be ≥ 0.995. If this fails the problem must be corrected.

20.2 An initial calibration blank (ICB) is run immediately after the curve and must not be greater than or equal to +/- the reported detection limit.

20.3 An initial calibration verification (ICV) is analyzed next. This is a mid-range standard and must be ±10% of the true value.

20.4 A laboratory control sample (LCS) is analyzed next. This is a non-digested separate source Q.A. sample to check the accuracy of the standards. This must be ±20% of the true value.

20.5 Run continuing calibration verifications (CCV) every 10 samples and at the end of the run. These must be ±20% of the true value.

20.6 Run continuing calibration blanks (CCB) every 10 samples and at the end of the run. These must not be greater than of equal to +/- the reported detection limit.

20.7 At least one spiked sample and spiked duplicate sample must be run for every 20 samples or with each matrix type. The recoveries must fall within Lims Control Limits. If not, flag the data as estimated.

20.8 % RSD of duplicate injections must be <20% if above the detection limit. If unacceptable, then rerun. If still unacceptable then estimate the data.

Vol. 1A, Revision 1, December 1987
USEPA Method 3050

2.0 PARAMETER LIST

2.1 As, Ag, Be, Cd, Cr, Co, Cu, Fe, Pb, Mo, Ni, Se, Tl, V

3.0 SCOPE AND APPLICATION

3.1 This acid digestion method is used to prepare sediments, sludges and soil samples for analysis by graphite furnace atomic absorption (GFAA).

4.0 SUMMARY OF METHOD

A one gram sample, (wet weight), is digested using nitric acid and hydrogen peroxide. The sample is concentrated to approximately 5-10 mls, them, brought up to a final volume of 50 mls using milli-Q, deionized water. The elements are analyzed by graphite furnace atomic absorption. Results are reported according to the dry weight of the sample.

5.0 DEFINITIONS

5.1 GFAA: Graphite Furnace Atomic Absorption

6.0 RESPONSIBILITIES

6.1 The technician is responsible for QA/QC preparation of samples during the digestion. This includes sample batching and spiking.

6.2 The technician is responsible for making sure glassware is clean and contamination-free.

6.3 The analyst is responsible for informing the group leader of any supplies that are needed, or ordering the supplies.

6.4 The technician is responsible for determining the dry weight of the solid sample.

7.0 INTERFERENCES AND HELPFUL HINTS

7.1 Sludge and Soil samples can contain diverse matrix types. Prior to digestion, mix thoroughly with a pestle and mortar, until homogeneous.

7.2 Maintain consistency when weighing sample or adding acids.

7.3 Samples containing large amounts of organic materials should be oxidized by acid digestion to minimize broad-band absorption.

7.4 Periodically, observe and swirl flasks. Do not let them go dry. Rinse flask sides off with deionized water.

7.5 Bring samples up to volume using graduated cylinders, or volumetric flasks, then transferring solution to a suitable plastic container.

7.6 Spiked samples and any relevant standard reference material should be processed to aid in determining whether Method 3050 is applicable to a given waste.

8.0 SAFETY PRECAUTIONS

8.1 **CAUTION:** This method uses hot, concentrated acids, so caution and proper protective wear must be utilized, including goggles, gloves and lab coat. Add acids and peroxides under the hood.

8.2 All work is to be done under the hood.

8.3 Avoid breathing acid fumes.

8.4 Avoid body contact with sample. Wear safety equipment including safety glasses, gloves, and lab coat. In case of contact with acid, run cold water over affected area for 10-15 minutes. Use the eyerinse sink if acid contacts eyes. Report all accidents to the group leader.

8.5 Be careful not to touch the hot plate. An operating hot plate unit can cause injury.

9.0 SAMPLE SIZE, COLLECTION, PRESERVATION AND HANDLING

9.1 All samples must have been collected using a sampling plan that addresses the considerations referred to in SW-846, Chapter (See sample preparation standard operating procedures)

9.2 All sample containers must be prewashed with detergents, acids, and Type II water. Plastic and glass containers are both suitable.

9.3 Preservatives: Soils and sludges must be stored in a refrigerator at 4 degrees celsius.

9.4 To ensure there is enough sample for QC and repeat analysis, at least 30 grams of material is needed.

10.0 APPARATUS AND MATERIALS

10.1 Specifications for Apparatus, Instruments, and Equipment

a. Hot Plates

b. Stir Plate

c. Analytical balance: Capable of reading 0.0001 g

d. Drying Oven

e. Centrifuge

10.2 Materials: (digestion)

a. 150 mL beakers or 125 ml Phillip's beakers

b. 10 and 50 mL graduated cylinders

c. Ribbed watchglasses

d. Spatulas

e. Whatman No. 41 filter papers

f. Filters/Funnels

g. Water bottles

h. Oxford or Eppendorf Pipettor

i. Centrifuge tubes

k. Thermometers: That covers range of 0 to 200 degrees C.

DO NOT COPY

10.3 Materials: (dry weight determination)

a. aluminum weighing trays

b. wooden tongue depressors

11.0 REAGENTS AND STANDARDS

11.1 Specifications for Reagents

a. Concentrated Nitric Acid: (trace metal grade and Optima or Ultrex)

b. Certified Reference Solutions

c. Hydrogen Peroxide: (30%)

d. Deionized, Milli-Q water (ASTM Type I)

e. 1:1 nitric acid for cleaning filters. Measure equal amounts of trace metal nitric acid and Type II water into containers and mix. Always add acid to water.

12.0 STANDARDS

12.1 Refer to SOP, "Spiking Procedure for Graphite Furnace."

13.0 ROUTINE PREVENTIVE MAINTENANCE

13.1 Keep hot plates and counters clean daily.

13.2 Calibrate pipettors, periodically.

13.3 Keep balance clean, calibrate daily.

FOR REFERENCE ONLY DO NOT COPY

c. Batch quality control is run every 20 samples or as requested by a specific client. Label six beakers as follows:

1. MPB (Date of Digestion): Method Prepared Blank
2. LS (Date of Digestion): Laboratory Spike
3. Sample #
4. Sample #-DUP: Duplicate
5. Sample #-SPK Matrix Spike
6. Sample #-MSD: Matrix Spike Duplicate

d. Stir samples and form a consistent, homogeneous mixture. use a pestle and mortar for consistency. Remove any large stones.

e. Weigh 1.0 grams of sample into a 150 mL beaker, (or a 125 ml Phillip's beaker). [Record weight on the beaker and in the digestion log book. Also, record final volume of solution: example 1.02 g / 50 ml]

f. **** PERFORM ALL REMAINING STEPS UNDER THE HOOD ****

g. Add 10 ml of milli-Q water, using a 10 ml graduate cylinder.

h. Spike the sample marked LS, SPK and MSD according to "Spiking Procedure for Graphite Furnace," SOP.

i. Add 2.5 ml of Optima (Ultrex) nitric acid. Cover with a ribbed watchglass.

j. Place samples on the hotplate and heat at 95 degree C. Reflux for 15-20 minutes. Do not allow sample to boil or go dry.

k. Cool. Add another 2.5 mls of nitric acid and reflux 30-45 minutes. Do not allow samples to boil or go dry.

l. Add 1 ml aliquots of 30% hydrogen peroxide slowly to the beaker. Continue adding peroxide until effervescence is minimal, and no noticeable change in sample appearance. Do not exceed 10 mls peroxide.

m. Reflux until volume is about 5 ml.

n. Rinse 50 ml volumetric flasks with Milli-Q. Rinse watchglasses into beakers. Wash the sides of the beakers.

o. Rinse filters and Whatman #41 filter paper with 1:1 nitric acid.

p. Filter the sample into the volumetric flask or graduated cylinder. Rinse the beaker and filter a minimum of three times. Dilute to mark.

q. Label the plastic centrifuge cylinders exactly as the beaker was labeled: Sample number, test, dilution. Transfer the solution from the flask to the tube.

r. To remove insoluble material, the sample may be centrifuged or allowed to settle by gravity overnight.

   a. Centrifugation: Centrifugation at 2,000-3,000 rpm for 10 minutes is usually sufficient to clear the supernatant.

s. Keep the batch together and place on the counter for analysis.

t. Fill out the digestion log book.

15.0 QUALITY CONTROL REQUIREMENTS

15.1 Type and Frequency of QC Check

1. (MPB) Method Prepared Blank

   A deionized water blank must be carried through the entire digestion procedure. Run one method blank every twenty samples, or one per batch. The method blank is used to determine elemental contamination that may be found in the deionized water and/or glassware.

2. (LS) Laboratory Spike

   A prepared standard, of known concentration, (See Procedure for Spiking for Graphite Furnace) is digested. Run one laboratory spike every twenty samples, or one per batch.

3. (DUP) Sample duplicate

   A sample duplicate will be digested every twenty samples, or one duplicate per batch. An equal, homogeneous representation of the original sample is used.

4. (SPK) and (MSD) Matrix Spike and Matrix Spike Dup.

   Spiked samples of known concentration will be digested every twenty samples, or one every batch. Levels should be equal to those of the LS.

16.0 DATA REPORTING

16.1 The concentrations determined are to be reported on the basis of dry weight correction.

16.2 Enter date of digestion in LIMS.

16.3 Record sample number, date of digestion, spike concentration method of digestion, final dilution, and test in digestion notebook.

17.0 REFERENCES

CONFIDENTIAL CONTENT - DO NOT COPY

14.0 SAMPLE PREPARATION

14.1 Procedure for the determination of percent dry weights

IMPORTANT: RECORD ALL DATA IN THE PERCENT DRY WEIGHT LOGBOOK. INCLUDE: CLIENT, JOB NUMBER, SAMPLE NUMBER, OVEN TEMPERATURE AND ANALYSTS INITIALS.

a. Weigh and record aluminum pan, (to 0.0001 g)

b. Weigh out approximately 20.0000 g of sample, [Record]

c. Place in oven and let dry for 24 hours at 105 degrees celsius.

d. Remove from oven, cool in desiccator.

e. Reweigh dried sample. [Record]

f. Calculations

$$\% \text{ solid} = \frac{(\text{Dry Sample} + \text{Cup Weight (g)}) - (\text{Cup Weight (g)})}{\text{Wet Sample Weight (g)}} \times 100$$

g. Use the percent dry weight in the final concentration calculation.

14.2 Procedure for the preparation of Soils, Sludges and Sediments

IMPORTANT: BE SURE TO FILL OUT DIGESTION LOG WITH: DATE OF DIGESTION, ANALYSTS INITIALS, CLIENT, DILUTION, TESTS, DIGESTION METHOD, SAMPLE, BATCH Q.C. SPIKING INFORMATION, ACID LOT NUMBERS AND HOTPLATE TEMPERATURE.

a. Rinse, with 1:1 nitric acid, 50 ml graduated cylinders, 50 ml volumetric flasks and 150 beakers, (or 125 ml Phillip's beakers).

b. Arrange samples on counter and label the beakers with the job number, sample number, dilution and tests. Label tests as follows:

1. TM: total metals run by ICP
2. FLAA: metals run by AA flame
3. X: individual metal (example: Pb)

Spiking Procedure for Graphite Furnace

pprovals: Laboratory Manager: _____ Date: 10/6/94
Area Supervisor: _____ Date: _____
QA Supervisor: _____ Date: 10/6/94
Revision Number: 1 By: RJS Effective Date: 10/6/94
Total Number of Pages: 2 Pages Revised: —

IMPORTANT: BE SURE TO FILL OUT METALS STANDARD RECORD BOOK WITH: DATE, PREPARER, PARAMETERS, CONCENTRATIONS, PREPARATION PROCEDURE, VOLUME, PRESERVATIVE, STANDARD REFERENCE NUMBER, AND SHELF LIFE.

I. PREPARATION OF MULTI-ELEMENT SPIKING SOLUTION

1. Add the following volumes of AA stock standards to a 100 mL volumetric flask:

   a. 1.0 mL of 1000 ppm Pb stock = 10 ppm Pb
   b. 1.0 mL of 1000 ppm Cu stock = 10 ppm Cu
   c. 1.0 mL of 1000 ppm Zn stock = 10 ppm Zn
   d. 1.0 mL of 1000 ppm Cr stock = 10 ppm Cr
   e. 1.0 mL of 1000 ppm Ni stock = 10 ppm Ni
   f. 1.0 mL of 1000 ppm Tl stock = 10 ppm Tl
   g. 1.0 mL of 1000 ppm Se stock = 10 ppm Se
   h. 1.0 mL of 1000 ppm As stock = 10 ppm As
   i. 1.0 mL of 1000 ppm Sb stock = 10 ppm Sb
   j. 0.05 mL of 1000 ppm Cd stock = 0.5 ppm Cd

2. Add 1.0 mL of (Ultra-pure) nitric acid preservative.

3. Dilute to 100 mLs.

4. Check concentrations on the ICP.

5. Shelf Life: 4-6 weeks

II. PREPARATION OF Ag SPIKING SOLUTION

1. Preparation of 10 ppm Ag intermediate (I) standard: Add 1.0 ml of 1000 ppm Ag stock solution to a 100 ml volumetric flask.

2. Preparation of 1.0 ppm Ag intermediate standard: Add 10 ml of 10 ppm intermediate (I) to a 100 mL volumetric flask.

III. SAMPLE SPIKING

1. To a final sample volume of 25 mL, add 0.10 ml of the multi-element Spiking Solution and Ag Spiking Solution.

2. To a final sample volume of 50 mL, add 0.20 mL of the multi-element Spiking Solution and Ag Spiking Solution.

3. To a final sample volume of 100 mL, add 0.40 mLs of multi-element Spiking Solution and Ag Spiking Solution.

IV. FINAL CONCENTRATIONS

[Cd] = 2.0 ppb
[Ag] = 4.0 ppb
[Sb] = 40 ppb
[Pb] = 40 ppb
[Cu] = 40 ppb
[As] = 40 ppb
[Cr] = 40 ppb
[Zn] = 40 ppb
[Tl] = 40 ppb
[Ni] = 40 ppb
[Se] = 40 ppb

3.0 PARAMETER LIST

3.1 Petroleum Hydrocarbons

4.0 SCOPE AND APPLICATION

4.1 This method is for the measurement of fluorocarbon-113 extractable petroleum hydrocarbons in soils.

4.2 The method is applicable to measurement of light fuels, although loss of about half of any gasoline present during the extraction manipulations can be expected.

4.3 The method is sensitive to levels of 20mg/kg.

5.0 SUMMARY OF TEST METHOD

5.1 A 30-g sample of soil is weighed up.

5.2 Anhydrous sodium sulfate is used to dry the sample.

5.3 After drying, the hydrocarbons are extracted with 1,1,2-trichloro-1,2,2-trifluorethane (Freon-113) using the Soxhlet apparatus.

5.4 The freon extract is then treated with silica gel to remove non-hydrocarbon contaminants.

5.5 The freon extract is then analyzed using a Miran 1FF IR Analyzer.

CONTROLLED DOCUMENT
DO NOT REPRODUCE

6.0 INTERFERENCES AND CORRECTIVE PROCEDURES

6.1 The rate and time of extraction in the Soxhlet apparatus must be exactly as directed because of varying solubilities of the different greases.

7.0 SAFETY PRECAUTIONS

7.1 The analyst must comply with all standard operating procedures for health and safety as outlined in the "WWES Laboratory Safety Manual".

8.0 SAMPLE SIZE, COLLECTION, PRESERVATION AND HANDLING PROCEDURES

8.1 Soils are to be collected in glass wide mouth containers with inert closures, and stored at 4°C until time of analysis.

8.2 All analyses must be performed within 14 days of sample collection.

11.0 STANDARDS

11.1 Reference Oil

- Prepare the following mixture and store in a sealed container to prevent evaporation.

  3 ml hexadecane
  3 ml iso-octane (2,2,4-trimethylpentane)
  2 ml chlorobenzene
  Should be stored in a 40 ml vial in the refrigerator for no longer than 6 months.

11.2 Primary Stock Solution

- Tare a dry 100 ml volumetric flask. Using a pasteur pipet, add about ~~0.1g~~ reference oil to flask and accurately record weight to nearest ~~0.1 mg~~. Dilute to volume with Freon. Concentration will be about ~~1000~~ mg/l.
- Should be stored in ~~a~~ 40 ml vials in the refrigerator for no longer than 6 months.

11.2.1 Primary stock solution must be labeled with the following information:

- initials of preparer
- date of preparation
- concentration
- name of parameter

11.3 Working Standards

- Pipet appropriate volumes of ~~primary~~ stock solution into into 100 ml volumetric flasks to make five standards from 1 mg to 50 mg per 100 ml and dilute to volume with Freon. Example:

Concentration mg/100 ml	ml of 5000 ppm stock in 100 ml
1.0	0.20
10.0	2.0
20.0	4.0
40.0	8.0
50.0	10.0

- Prepare fresh, as needed.

12.0 SAMPLE PREPARATION

CONTROLLED DOCUMENT
DO NOT REPRODUCE

12.1 Extraction

12.1.1 Weigh out 30 ± 0.5 g of soil. Place in a 400-mL beaker.

12.1.2 Add anhydrous sodium sulfate and mix until all liquids are absorbed.

12.1.3 Add the mixture to the extraction thimble.

12.1.4 Pour approximately 250ml of freon into a 500ml round bottom flask and label the flask with the sample number.

12.1.5 Gently slide the thimble with sample into a Soxhlet and connect the Soxhlet to the round bottom flask.

12.1.6 Connect the top of the Soxhlet to the reflux condenser. Extract for 4 hours on a hot plate in the Soxhlet apparatus using Freon. Allow to cool.

12.1.7 Disconnect the round bottom flask from the Soxhlet and insure that all extract (freon) has washed into the flask.

12.1.8 Discard sample and add approximately one crucible of silica gel to the round bottom flask. Allow the extract (freon) to stand for approximately 15 minutes with silica gel.

12.1.9 Filter extract thru funnel lined with P8 filter paper, anhydrous sodium sulfate, and silica gel into K-D flask that has been pre-rinsed with freon.

12.1.10 Rinse the round bottom flask with freon and pour through the funnel into the K-D one time. Rinse freon through the funnel and Na_2SO_4 into the K-D.

12.1.11 Method Blank: Extract approximately 30g of Na_2SO_4 and prepare blank the same way as a regular analytical sample. Analyze the extracted freon. Enter 30g for sample weight. Result should be <20mg/kg.

CONTROLLED DOCUMENT DO NOT REPRODUCE

12.1.12 Laboratory Control Sample (LCS): Use approximately 30g of Na_2SO_4, and spike with ~~1500~~ 1500 µl of ~~1000~~mg/l IR standard. Prepare LCS the same way as a regular analytical sample.

12.1.13 Matrix spikes are prepared the same as the LCS, except using a thimble filled with prepped samples, instead of Na_2SO_4.

12.2 Concentration of extract

12.2.1 Remove the funnel full of sample and Na_2SO_4 and discard. Add a freon rinsed boiling chip to the K-D and allow it to settle into the concentrator tube. Attach a freon rinsed 3-ball Snyder column to the top of the K-D. Affix the Snyder column to the distillation manifold, and allow the concentrator tube and the entire rounded bottom of the K-D to be immersed in the hot water of a hot water bath. A receiving vessel (4L reagent bottle) should be attached to the opposite end of the condenser to catch the distilled freon.

12.2.2 Concentrate the extract to approximately 9ml. Remove the K-D from the distillation manifold. Allow the freon to drain from the Snyder column into the K-D. Dry the glass joint between the K-D and concentrator tube and disconnect. Volumize the extract to 10ml with freon in the concentrator tube and transfer into a culture tube.

12.3 Instrumentation

NOTE: Wavelength is preset on interior of instrument at 2950 cm-1 alphatic C-H stretch frequency and requires no adjustment.

12.3.1 Turn on the power of the Foxboro Miran IFF Infrared Analyzer by using the black switch on the front panel. Verification is red light.

12.3.2 Allow instrument to warm up for not less than 5 minutes.

12.3.3 Remove 1cm cuvet from storage box and rinse with fresh freon into waste beaker.

CONTROLLED DOCUMENT
DO NOT REPRODUCE

NOTE: Since human skin surfaces can contain chemical compounds with C-H stretch properties, only the frosted (non-transmitting) sides of the cuvet should be touched with hands.

12.3.4 Fill cuvet to mark with fresh freon.

12.3.5 Wipe exterior dry with Kimwipe.

12.3.6 Insert cuvet into holder with marked side (6) facing the operators left (away from instrument).

12.3.7 Zero the Instrument

12.3.7.1 Set range selector to .1A (most sensitive scale). Set response control on 1.

12.3.7.2 Move small lever on fine zero control (top knob) to front (toward operator) to unlock control.

12.3.7.3 Set needle to zero using fine zero control.

NOTE: Use reflecting strip behind needle to align eye and avoid parallax.

12.3.7.4 After zero is set, move lock lever forward (away from operator) to lock zero.

12.3.7.5 Remove cuvet from holder and empty freon into waste beaker.

12.3.7.6 Blanch inverted cuvet onto Kimwipe to remove excess freon.

12.3.8 Check the three ranges (.1A, .25A, 1A) with one point on each curve.

12.3.8.1 Pour ~~1.0~~ 1.5 standard ~~100~~ 150 ppm TPH into cuvet. (This standard is made by diluting 1.0 ml of 1500 mg/L IR Std to 10 ml with Freon)

NOTE: This standard is chosen because it can be used on all three ranges. Take all readings on bottom, %T scale.

12.3.8.2 Check reading on all three ranges and record in laboratory notebook.

NOTE: Standard reading must agree within 2% of initial calibration curves. Notify supervisor for corrective action if readings are outside range.

12.3.8.3 Pour standard back into original flask.

12.3.9 Read QA samples and record %T readings in laboratory notebook.

NOTE: Rinse cuvet with fresh freon between QA samples and blanch on Kimwipe.

CONTROLLED DOCUMENT - DO NOT COPY

12.3.1) Read test samples and record IR %T readings in laboratory notebook.

NOTE: Rinse cuvet with fresh freon between test samples and blanch on Kimwipe. If there is a white film on inside of cuvet that will not rinse out of cuvet after sample reading, proceed as follows:

a) Rinse cuvet with methanol and swab interior surface with a clean cotton swab.
b) Drain methanol from cuvet and blanch inverted cuvet on Kimwipe.
c) Rinse cuvet 5 times with freon.
d) Check zero on instrument with fresh freon.
e) If a positive reading is obtained, repeat steps a) - d) above.
f) Consult supervisor if repeated methanol washings do not remove film from cuvet.

NOTE: After every 10 samples, recheck zero with fresh freon. If zero has changed, reset zero with freon blank as described in section 12.3.2 above. Also recheck 1.0 standard as described in section 12.3.2 above. Record all rechecks of zero and standards in laboratory notebook.

12.3.4 Secure instrument after use.

12.3.4.1 Turn off main power switch.

CONFIDENTIAL
UNCONTROLLED COPY

CONTROLLED DOCUMENT
DO NOT REPRODUCE

12.3.11.2 Rinse cuvet with fresh freon and blanch inverted on Kimwipe.

12.3.11.3 Wipe cuvet on dry Kimwipe and place in storage box.

12.3.11.4 Place cover on instrument.

13.0 FLOW CHART

14.0 CALCULATIONS/DATA HANDLING

14.1 Basic rules apply for significant figure reporting: report 2 significant figures.

14.2 Determine ppm (mg/l) TPH in cuvet from %T readings recorded in laboratory notebook using the three prepared calibration curves.

14.3 Determine ppm (mg/kg) TPH by the following formula:

$$\text{Concentration in sample (mg/kg)} = \text{Concentration in cuvet (mg/L)} \times \frac{\text{Final Volume (10ml)}}{\text{Weight of sample}}$$

NOTE: If dry weight correction is required, use the following formula:

$$\text{Concentration (mg/kg)} \times \frac{1}{\text{total solids}} = \text{Corrected Concentration (mg/kg)}$$

15.0 DATA REPORTING

15.1 The following must be included on the laboratory benchsheet for each batch turned in:

- A listing of standard concentrations, standard log numbers, method name, client name, date extracted, and matrix.

15.2 The instrument log book must be filled out for each batch turned in, with the following information:

- date analyzed
- analysts initials

CONTROLLED DOCUMENT
DO NOT REPRODUCE

- calibration standards used
- sample numbers analyzed
- dilution factors, if any
- % solids if dry weight results are requested
- absorbances

The following data is to be put on the worksheet for each sample analyzed:

- concentration in mg/kg
- corrected dry weight concentration, in mg/kg, if requested
- QA/QC results
- date analyzed
- analysts initials

16.0 QUALITY ASSURANCE / QUALITY CONTROL

16.1 Each day, or every 20 test samples, a reagent blank is extracted and analyzed.

16.2 Every 20 test samples, a LCS and a matrix spike is extracted and analyzed.

17.0 DETECTION LIMITS

17.1 The detection limit for IR soils is 20mg/kg.

HEALTH AND SAFETY PLAN (HASP)

PROJECT TITLE: PONTIAC CENTRAL MANUFACTURING FACILITY/CENTERPOINT BUSINESS CAMPUS (SITE)

PREPARED BY: CONESTOGA-ROVERS & ASSOCIATES (CRA)

Approved By: _____ Date:_____
Project Manager - CRA
Glenn Turchan

Approved By: _____ Date:_____
Industrial Hygienist - CRA
Jill Jackman

Approved By: _____ Date:_____
Industrial Hygienist - CRA
Mike Sheppard

SITE HEALTH AND SAFETY PLAN (HASP)

1.0 SITE HEALTH AND SAFETY INFORMATION

1.1 PURPOSE

This Health and Safety Plan (HASP) provides guidelines, requirements and procedures intended to help protect the health and safety of Conestoga-Rovers & Associates (CRA) employees while they are on-Site conducting field activities. A copy of this HASP will be maintained at the Site during periods of field activity by CRA personnel. Additionally, a Site-specific HASP will be developed and implemented by the selected contractor for work performed at the Site by the contractor, if required. The contractor's Site-specific HASP will address, at a minimum, all the requirements outlined in this HASP. A copy of the Site-specific HASP will also be maintained on-Site during all Site activities by the contractor.

This HASP is designed to ensure:

1) that personnel working on-Site are not exposed to hazardous materials which could adversely affect their health and safety;

2) that the health and safety of the general public and the environment is not compromised by off-Site migration of contaminated materials; and

3) compliance is achieved with governmental (OSHA Title 29, Code of Federal Regulations, Parts 1910 and 1926) and professional (American Conference of Governmental Industrial Hygienists (ACGIH)) regulations and guidelines.

All Site operations will be conducted in accordance with the provisions of this HASP. Cost and scheduling considerations will not be considered as justification for modifying this plan.

1.2 ORGANIZATIONAL STRUCTURE

The following CRA employees are designated to carry out stated job responsibilities related to this project.

- Principal in Charge: Alan Van Norman
- Project Manager: Glenn Turchan
- Project Coordinator: Renato Pasqualoni
- Resident Engineer(s): Frank Ring
- Project Health and Safety Officer: Frank Ring
- Project Industrial Hygienist: Mike Sheppard
- CRA Corporate Health & Safety Manager: Mitchell S. Bergner, CIH

1.3 SITE DESCRIPTION

For the purposes of this HASP, the "Site" is defined to include the GM Pontiac Central Manufacturing Facility, Centerpoint Business Campus and adjacent properties identified to be part of the project.

Figure 1 shows the Site location. Figure 2 is a Site plan.

1.4 SCOPE OF WORK

Activities to be performed at the Site are anticipated to include: oversight of investigative drilling, monitoring well installation, and test pit excavation; oversight of excavation, construction activities including segregation and stockpiling of soils (including potentially contaminated materials); and collection of investigative/confirmatory soil or groundwater samples.

These activities are being conducted in areas identified by GM.

1.5 PROJECT TASKS

The following is a list of activities to be performed on Site:

- Observe excavation operations

- Observe investigation activities
- Sample collection

1.6 SITE FACILITIES AND FEATURES

Site Security:	Site security is under the control of GM. The Site is enclosed by a chain link fence topped with three strands of barbed wire. Gates are kept locked or are manned by security guards which are hired by GM.
Potable Water:	Potable water sources are located in Building 43 as well as other buildings at the Site. Access to potable water will be arranged with GM, as necessary.
Communication:	CRA personnel will have access to a telephone in the CRA trailer located inside Building 43.
Site Control:	GM will establish work zones prior to mobilization or commencing any work.
Unusual Features:	A portion of the Site is currently under re-development as a commercial/industrial park (e.g. Centerpoint Business Campus).
Utilities:	Access to Site utilities will be arranged with GM as required. Utilities will be cleared by GM, as required.

1.7 POTENTIAL CHEMICAL HAZARDS ON SITE

The Site is a closed truck assembly facility. Approximately half of the facility is currently being redeveloped as an industrial/commercial

park. Potential hazards at the Site include heavy equipment, construction debris and residual chemical constituents from plant operations including underground storage tanks (USTs), sumps, and painting operations.

Table 1 lists selected hazardous substances that are known or suspected to be present on Site based on laboratory analyses of samples obtained by CRA during previous Site investigations.

Health effects, exposure limits and guidelines for selected hazardous substances of concern on Site are described further in Table 2.

1.8 PERSONAL PROTECTIVE EQUIPMENT

All on-Site personnel will be equipped with personal protective equipment (PPE) appropriate for the hazardous material(s) being handled and the nature of work being completed. All PPE will be kept clean and well maintained and used in accordance with the Standard Operating Procedure found in Appendix A.

PPE, as required for general Site-work within any area designated as an Exclusion Zone (EZ), will consist of:

1) Half or full-face piece air purifying respirators equipped with dual organic vapor and high-efficiency particulate cartridges (such as MSA GMC-H or equivalent);

2) Contaminant resistant disposable outerwear;

3) Chemical resistant gloves;

4) Steel toe and shank work boots;

5) Disposable chemical-resistant overboots if walking in or on contaminated soils;

6) Hard hats;

7) Hearing protection, if necessary; and

9) Eye protection.

Table 3 lists job activities at this Site and the required levels of protection. The HSO has the authority to change these levels based on actual or changing Site conditions after conferring with the CRA industrial hygienist. All field deviations from this plan should be documented on the appropriate form found in Appendix B.

1.9 AIR MONITORING AND ACTION LEVELS

Table 4 indicates which air monitoring instruments should be used on-Site and the frequency of measurement for each activity of concern. Air monitoring should be conducted periodically or continuously, as indicated on Table 4, in the breathing zone (a two foot radius around a person's head). The HSO or person performing the sampling should record the real-time air monitoring information in either a site safety and health log book developed specifically for this Site or in the Site field log. For more information on air sampling see Appendix C, Air Monitoring SOP.

Table 5 indicates the action levels for various air monitoring instruments.

1.10 OVERVIEW OF PROJECT TASK HAZARDS

Table 6 lists Site tasks and identifies potential safety and health hazards which have been evaluated and incorporated into this HASP through recommended work practices, levels of protection and monitoring equipment usage.

A complete hazard analysis for tasks routinely performed by CRA employees on Site is located in Appendix D, Hazard Evaluation. Material safety data sheets (MSDSs) for material brought to the Site by CRA can be found in Appendix G.

1.11 DECONTAMINATION

Decontamination procedures will be strictly adhered to for all personnel, vehicles, and equipment used any area designated as an Exclusion Zone. CRA's SOP for decontamination can be found in Appendix E.

1.12 MEDICAL SURVEILLANCE

This Site does not require site-specific medical examinations beyond the requirements in 1910.120(f). CRA will comply with 29 CFR 1910.120(f) for medical programs. Appendix F contains CRA's Standard Operating Procedure for Medical Surveillance applicable to any employee working within any area designated as an Exclusion Zone.

1.13 TRAINING

All CRA employees entering an area designated as an Exclusion Zone will have attended an OSHA 40-hour training course. If this training has occurred greater than one year ago, then a current 8-hour OSHA refresher course will have been attended. The HSO will verify these certifications prior to anyone entering any area designated as an Exclusion Zone.

Additionally, a Site briefing will be held for all employees and authorized visitors by the HSO during Site mobilization covering the following topics:

- Site hazards, history;
- List of contaminants involved;
- Underground /overhead utilities;
- Work zones;
- Decontamination area and procedures;
- Levels of protection;
- Respiratory protection;

- Location of emergency telephones;
- Emergency alarm signals;
- Emergency evacuation routes;
- Hospital and route to hospital;
- Fire extinguisher location(s);
- Smoking and eating areas;
- Heat/cold stress;
- HASP sign-off.

Employees and visitors will sign the Pre-Entry Briefing Form in Appendix B as a record of this training prior to entering any area designated as an Exclusion Zone.

2.0 EMERGENCY ACTION PLAN

2.1 PURPOSE

This Emergency Action Plan is designed to facilitate prompt and safe evacuation of CRA employees. This plan shall be implemented immediately in the event of an emergency that could threaten human health or the environment. This plan is intended to be compatible with and to integrate the emergency response plan of local emergency service providers.

2.2 APPLICABILITY

These emergency action procedures shall be communicated to all CRA on-Site employees, contractors and visitors. When another party has responsibility for health and safety on the Site, CRA employees shall comply with the other party's HASP and this HASP. When the two HASPs are in conflict or are not compatible, the more protective provision shall govern CRA employees.

2.3 EMERGENCY TELEPHONE NUMBERS

The emergency telephone numbers found in Table 7 shall be prominently posted near each CRA telephone. If cellular phones are being used, verify that 911 properly operates and connects to a dispatcher near the Site and not where the phone is registered.

2.4 EMERGENCY MAP

A map showing the route to the hospital with directions can be found on Figure 3. Copies of this map shall also be posted on-Site with Table 7.

2.5 EMERGENCY EQUIPMENT

An emergency equipment station must be available near the working area and will consist of first-aid supplies appropriate for initial treatment of burns, abrasions and dermal contact with Site-specific hazardous materials.

2.6 EMERGENCY EVACUATION PROCEDURES

In the event of an emergency necessitating evacuation such as fire, explosion or significant release of a hazardous substance, employees will evacuate the immediate area or the Site, if necessary, and rely on emergency service providers such as the local fire and police departments or emergency medical services to assist in the handling of the emergency.

Emergency evacuation routes will be identified prior to the beginning of Site activities. This evacuation route shall be communicated to all employees at the initial site orientation.

2.7 "BUDDY" SYSTEM

All work in any area designated as an Exclusion Zone that involves handling hazardous materials or is otherwise hazardous will be done using the "buddy" system. CRA employees will ensure that another person on Site knows of their location at all times.

2.8 EMERGENCY COORDINATOR

The HSO is the designated Emergency Coordinator for CRA personnel. In his/her absence, the duties would be assumed by the Site Supervisor.

The duties of the emergency coordinator are as follows:

- contact GM to alert necessary emergency services; and
- assist GM as required.

2.9 EMERGENCY DECONTAMINATION

In the event of emergencies involving serious or potentially serious injuries, contact emergency service providers immediately. Decontaminate injured person(s) as much as possible without aggravating injuries prior to transport to a medical facility.

2.10 PPE AND EMERGENCY EQUIPMENT

All attempts should be made to carefully move the injured out of the area designated as an Exclusion Zone, however, in the event of an emergency requiring emergency service intervention, those providers will be providing their own personal protective equipment except in the case of emergency medical services. If emergency providers have to enter the Exclusion Zone, all work is to cease to minimize the amount of air contaminants present. It may be necessary to provide boots and protective clothing consistent with the requirement of this HASP.

2.11 EMERGENCY NOTIFICATION PROCEDURES

The following course of action shall be taken if an emergency situation develops:

1) Evacuate as necessary.

2) Notify the proper emergency services for assistance. See Table 7 for telephone numbers. Inform the emergency services personnel of the type of work being performed so that the need for decontamination can be assessed.

3) Notify any other affected personnel at the Site.

4) Contact the Project Manager and the Safety and Health Manager to inform them of the incident as soon as possible. The Project Manager will notify the appropriate parties including the Owner or Owner's Representative.

5) Prepare a summary report of the incident for the Project Manager and Health and Safety Manager as soon as possible after the incident. This document must be filed in the project file.

1.11.3 Respiratory Protection Inspection A-12
1.12 EVALUATION OF EFFECTIVENESS OF PPE PROGRAM A-12
1.13 PPE LIMITATIONS A-12

1.0 PERSONAL PROTECTIVE EQUIPMENT (PPE) PROGRAM

1.1 SCOPE

CRA has established this personal protective equipment (PPE) program for site operations to provide guidelines and procedures that enable employees to most effectively use the PPE provided to them. Discussion of all protective equipment, except respiratory protection, is provided in this section. Respiratory protection is included under a separate SOP.

1.2 CHEMICAL HAZARDS

Protection from contaminated soils and water may be provided by the use of chemical resistant clothing, gloves (one or two layers) and steel toe and shank boots, with or without over-boots. All PPE for a given site is specified in a site-specific HASP. Inhalation of chemical hazards is covered under the respiratory protection SOP (Section 15).

1.3 PHYSICAL HAZARDS

Physical hazards, such as overhead hazards, high ambient noise levels and temperature extremes, vary significantly from site to site. It is CRA's policy that hard hats, safety boots, and safety glasses be worn routinely for the performance of all on-site tasks when construction hazards are present. This provides protection from potential overhead and particle eye hazards. Guidelines for temperature extremes may be found in the heat and cold stress SOPs (Sections 12 and 13). These guidelines include appropriate clothing, engineering or administrative controls. Hearing protection is required for all soil boring and monitoring well installations. Steel toed boots are mandatory on all sites for protection from falling objects, sharp objects, and trips and falls.

1.4 PPE SELECTION

Levels of personal protection vary according to the activities being conducted and the hazards that may be encountered. PPE selection is made on the basis of site-specific chemical and physical hazards. The USEPA terminology for protective equipment used on site falls into one of the following categories. There are also variations of each category which will be specified under each site-specific HASP.

1.4.1 Level D

Level D protection shall be worn when a hazardous atmosphere is not present nor is expected to be present based on planned work activities. Level D protection is designed to offer basic skin and body protection. Level D does not provide protection from inhalation exposure to hazardous substances. Modifications to Level D adjust the level of skin and body protection to the appropriate site conditions.

Required PPE

- Chemical-resistant or leather boots with safety toe and steel shank;
- Short or long sleeved shirt and pants or coveralls; and
- Safety glasses with side shields or splash goggles.

Optional PPE

- Hard hat;
- Face shield; and
- Hearing protection.

1.4.2 Level C

Level C protection is designed to offer air purifying respiratory protection in addition to body protection. Level C will be used when:

- the types of air contaminants have been identified, an air-purifying respirator (APR) that can remove the contaminants is available, the air contaminants have adequate warning properties and the criteria for the use of an APR have been met;

- concentrations of unidentified airborne organic compounds in the breathing zone are greater than background for a period of 15 minutes with a ceiling of 5 ppm above background; or

- concentrations of airborne particulates in the breathing zone (for 15 or more minutes) are greater than established action levels for particulates.

Required PPE

- Chemical-resistant or leather boots with safety toe and steel shank;
- Chemical-resistant clothing;
- Chemical-resistant outer gloves;
- APR with half or full-facepiece and appropriate cartridge; and
- Safety glasses with side shields if wearing a half mask respirator.

Optional PPE

- Hard hat;
- Face shield;
- Chemical-resistant inner gloves;
- Disposable boot covers;
- Hearing protection; and
- Emergency escape mask.

1.4.3 Level B

Level B protection is designed to offer enhanced skin protection and supplied air respiratory protection in the form of an SCBA or air line respirator with a 5-minute escape bottle. Level B is used when:

- concentrations of unidentified airborne organic compounds in the breathing zone are greater than 5 ppm for a period of 15 minutes; or
- concentrations of chemicals in the air are immediately dangerous to life and health (IDLH) or above maximum use limits of a full-face APR; or
- oxygen deficient or potentially oxygen deficient atmospheres (less than 19.5% O_2) are possible; or
- handling, investigation and/or sampling of unknown drummed waste; or
- confined space entry requires Level B protection.

Required PPE

- Chemical-resistant or leather boots with safety toe and steel shank and overboots;
- Chemical-resistant clothing;
- Chemical-resistant inner gloves;
- Chemical-resistant outer gloves;
- Positive-pressure/pressure-demand SCBA or airline respirator with escape bottle.

Optional PPE

- Hard hat;
- Disposable boot covers;
- Hearing protection;
- Cooling vest; and
- Two-way radio.

1.4.4 Level A

Level A protection is designed to offer the greatest level of skin, respiratory, and eye protection. Level A is used when:

- concentrations of unidentified airborne contamination exceed 500 to 1,000 ppm above background; or
- the materials are an extreme skin adsorption hazard.

Required PPE

- Positive pressure, full face-piece, self-contained breathing apparatus;
- Totally-encapsulating chemical-protective suit;
- Chemical-resistant outer gloves;
- Chemical-resistant inner gloves;
- Chemical-resistant boots with safety toe and steel shank; and
- Chemical-resistant disposable protective suit.

Optional PPE

- Hard hat (under suit);
- Hearing protection;
- Cooling vest; and
- Two-way radio.

1.5 PERSONAL PROTECTIVE EQUIPMENT USE GUIDELINES

1.5.1 Protective Clothing

The criteria used to determine the need for PPE for a specific activity are listed below:

1.5.1.1 Hard Hats

Required when the potential for overhead hazards exist or when intrusive activities involving powered equipment are conducted. Examples include exploration of abandoned buildings, soil boring, well installation, test excavating, or other construction/investigation activities involving heavy equipment operations. In addition, hard hats are required if required by other contractors or by the owner. Hard hats used by CRA must meet ANSI and/or CSA standards for impact resistance and construction.

1.5.1.2 Safety Glasses

Required when activities involving powered equipment such as soil boring, well installation, test excavation, or other activities involving the observation of heavy equipment operations occur. Side shields are required when work involves handling or being in close proximity to chemical, grinding, grouting operations, or concrete pouring or other activities where debris or flying objects can become easily airborne and may irritate the eye if eye contact occurs. Safety glasses used by CRA must meet ANSI and/or CSA standards for impact resistance.

A splash shield may be worn when materials known or suspected to be contaminated may splash the face or eyes and when skin or eye irritation or absorption is a concern (i.e., PCB, PAH-contaminated material(s)).

1.5.1.3 Steel-Toed Boots

Leather steel-toed work boots shall be worn, at a minimum, on all sites covered by a HASP. Required when activities involving powered equipment such as soil boring, well installation, test excavation, or other construction/investigation activities involving the observation of heavy equipment operations. In addition, steel-toed boots are required if required by contractors, owners, or when activities may involve

carrying/handling heavy materials or walking over uneven terrain. CRA safety boots must meet ANSI and/or CSA standards. If there is a potential for contamination, disposable or reusable overboots must be worn.

1.5.1.4 Cotton Coveralls/Work Clothes

Cotton coveralls may be used to protect skin and work clothes from non toxic particulates such as dust, dirt and mud. Required when activities are restricted to outside of the exclusion zone. Work in an exclusion zone will usually require an upgrade to a different level of protection.

1.5.1.5 Tyvek[1]

Tyvek is a disposable, non-porous material. It may be used to provide protection from toxic particulates such as lead dust and asbestos, and may be used for wind protection in the winter. Required when tasks may involve bodily contact with potentially contaminated materials. This would involve collecting samples and other activities where minor splashing or soiling of clothing is likely.

1.5.1.6 Poly-Coated Tyvek

Poly-coated Tyvek is a disposable, polyethylene-coated material. It may be used as protection from potential chemical liquid splash. Required when bodily contact may occur with heavily contaminated materials, coal tar contaminated materials, or PCB contaminated materials. Also required when the degree of contamination is unknown and activities may involve bodily contact with these substances or when investigation/remediation activities generates a splash potential.

---

[1]Tyvek is being used generically to describe disposable, chemical-resistant clothing.

1.5.1.7 Saranex Tyvek

Saranex Tyvek is a saran-coated Tyvek material which is impermeable to most chemicals and may be used when a higher level of skin protection than offered by poly-coated Tyvek is required.

1.5.1.8 Chemical-Resistant Boots/Boot Covers

Disposable boot covers will be worn over leather steel-toed work boots when walking on contaminated materials. They may also be worn when muddy conditions are anticipated. They may be worn over chemical-resistant boots when there is not sufficient water on the site for decontamination. Two pair of disposable boot covers may be worn over leather steel-toed boots in lieu of one pair over chemical-resistant boots.

Chemical-resistant steel-toed boots may be worn when walking on contaminated materials or when contact with contaminated materials is anticipated under wet conditions. They may be worn uncovered only when there is sufficient water on the site for thorough decontamination, or when the nature of the contaminant facilitates quick volatilization from footwear.

1.5.1.9 Gloves

Inner nitrile gloves (4 to 6 mil in thickness) will be worn as a precaution when handling materials which may be contaminated or when a dermal hazard exists. They may also be worn inside outer gloves when there is a greater likelihood of contact with materials known or suspected to be contaminated to provide protection against degradation/leakage of the outer gloves.

Outer gloves of nitrile, vinyl, neoprene, butyl, or viton (11 to 14 mil in thickness) will be worn when handling materials known or suspected to be contaminated or when a serious dermal hazard exists.

Selection of glove types is based on degradation and permeability of glove material provided by various manufacturers to expected contaminants on a site. In cold weather, insulated vinyl-coated gloves may be worn as outer gloves.

One pair of surgical or 4 mil nitrile gloves is required when handling containers which contain contaminated samples. A second pair of gloves is required when collecting the contaminated sample from split spoon samplers or bailers or when performing headspace analysis. This second pair shall be replaced immediately after handling or collecting the sample.

1.6 WORK TASK DURATION

In selecting PPE, the estimated duration of job tasks and project duration must be considered. Protective equipment should be chosen which will provide protection for a full work shift or for the duration of the task to be accomplished. If site conditions are such that protective equipment cannot provide adequate protection for the duration of the task, several factors should be considered to determine appropriate work task duration, including:

- Clothing/glove permeation and penetration rates for chemicals;
- Respirator/filter cartridge capacity and breakthrough times;
- Ambient temperature and weather conditions; and
- Integrity of the Tyvek, boot covers, and gloves.

These factors are incorporated into the selection of personal protective equipment and will be addressed as appropriate in a site HASP. In addition, as soon as the integrity of any PPE is compromised, the work task shall stop until the PPE can be replaced.

1.7 MAINTENANCE AND STORAGE

Non-disposable protective equipment such as hard hats, boots, safety glasses, and respirators will be decontaminated daily or more frequently if necessary and stored in an appropriate clean area. Most disposable clothing is to be discarded at the end of the work shift or more frequently as necessary. If, after inspection and decontamination, it has been determined that reusable PPE is damaged, it will be disposed of promptly. Disposal methods will be specified in the site HASP as methods vary from site to site.

1.8 DECONTAMINATION

Decontamination procedures for PPE are covered under the SOP for decontamination.

1.9 TRAINING AND FITTING

All CRA employees with 40-hour training have been trained in the use and selection of PPE and have been provided hands-on training on using PPE. Each CRA employee involved with field work is fit tested annually with a respirator according to the procedures outlined in the SOP for respiratory protection. All CRA employees involved with field work are expected to provide proper ANSI and/or CSA certified safety boots. CRA provides hard hats, safety glasses, with side shields (safety sunglasses, if necessary) and disposable PPE. A large inventory of clothing, gloves and boot covers is maintained in various sizes in CRA offices. Each employee is encouraged to try on the various sizes to determine the best fitting size of all PPE.

1.10 DRESSING/REMOVAL PROCEDURES FOR PPE

Clothing required for protection from exposure to hazardous substances will be put on at the site before entry into the exclusion zone. If protective outer garments are necessary, the suit will be put on first, followed by boots, boot covers, and gloves. Hems on the legs of protective clothing shall be worn outside of chemical resistant boots and taped with duct tape at the ankle. If boot covers are used, the hems shall be tucked into the boot cover and taped below the knee. Hems on the sleeves of protective clothing should be worn outside of gloves and taped at the wrist, if necessary. Respirators will be donned following the guidelines in the respirator SOP.

CRA employees leaving the exclusion zone will remove and decontaminate their equipment and protective clothing at designated decontamination zones as described in the site HASP.

1.11 PPE INSPECTION

CRA employees are required to periodically check the integrity of PPE through self inspection, both before and during use. The frequency and degree of inspection depends on the specific article and its frequency of use. A primary inspection will be done by the user before each use. Inspection guidelines are presented in the following sections.

1.11.1 Protective Clothing Inspection

- Visually inspect for tears, non uniform coatings, imperfect seams, malfunctioning closures.
- Hold up to the light to check for pinholes.
- Flex product to check for cracks and deterioration.

1.11.2 In-Use Inspection

PPE should be periodically inspected for signs of ripping/tearing or heavy contamination of PPE. In the event of torn/ripped or heavily contaminated PPE, CRA employees must proceed immediately to the decontamination zone to remove and replace the PPE.

1.11.3 Respiratory Protection Inspection

The inspection of respiratory protection equipment is discussed in the respirator SOP.

1.12 EVALUATION OF EFFECTIVENESS OF PPE PROGRAM

The CRA PPE program is evaluated on a continual basis by an industrial hygienist. This evaluation occurs at annual refresher training sessions and is reviewed regularly with input from field staff.

1.13 PPE LIMITATIONS

Selection of chemical-resistant clothing should be performed by personnel trained in evaluation of the clothing and its limitations. Consideration of the following factors and limitations is generally considered in the selection of PPE described in site HASPs.

- Not all materials protect against all chemicals and chemical combinations, and not all materials provide a barrier for prolonged exposure periods. Since most contaminated soils/water are mixtures of hazardous substances, there is limited permeation data available for those mixtures. Selection should be made for clothing offering the widest range of protection against the chemicals expected to be on site.

- Protective clothing is generally nonporous and is designed to prevent skin exposure to hazardous substances. Consequently, the nonporous nature does not allow for sufficient cooling of the body through sweating and other heat release functions. Temperature extremes will be considered in the site HASP when selection of PPE is made, and suggestions will be made on duration of use of PPE, and recommended break schedule as appropriate to weather conditions.

- In cold weather, the polymer coating on some disposable clothing may become inflexible and tear more easily.

Other limitations to consider are:

- Ability of material to withstand the physical stress of the task (e.g., boot covers torn by walking on sharp objects).

- Degree to which protective clothing may interfere with a worker's ability to perform tasks (e.g., full facepiece respirator interferes with ability to read, heavy gloves reducing note-taking ability).

1.0 OVERVIEW

Air monitoring is conducted to help ensure that the level of protection selected is appropriate for different phases of the field operations. Real-time air monitoring using direct reading instruments is conducted based on the nature of site activities. Real-time air monitoring needs to be performed whenever:

- site remediation begins;
- operations change;
- work begins on a different portion of the site;
- any intrusive site activity begins;
- contaminants other than those previously identified are being handled; or
- when obviously contaminated materials, leaking drums or containers are handled.

Air monitoring efforts are focused on those employees conducting tasks representative of potential maximum exposure and on all employees likely to be exposed to any substance above the OSHA Permissible Exposure Limit (PEL) or other published exposure level.

2.0 MONITORING PROCEDURES

Two types of air monitoring are conducted, real-time and personal monitoring. Real-time monitoring provides instant readout and is conducted for on-site screening for exposures to airborne levels of hazardous substances to determine the appropriate level of employee protection. Personal exposure monitoring involves collecting a sample for subsequent laboratory analysis and is conducted to quantify specific airborne concentrations of hazardous substances when comparisons need to be made to 8-hour time weighted averages.

Monitoring is conducted in the breathing zone. The breathing zone is defined as an area within a two-foot radius around the head. Information obtained from air monitoring is used to assure proper selection of engineering controls, personal protective levels, work zones, work practices and to assure compliance with OSHA PELs and other published exposure levels.

3.0 INITIAL ENTRY

Prior to initial site entry, a site history is obtained to determine potential contaminants that may be encountered and to assist in personal protective equipment selection. During initial entry, real-time instruments may be used to monitor for those IDLH conditions that could potentially be encountered such as toxic, explosive, combustible and oxygen deficient atmospheres. When the site history indicates that ionizing radiation is suspected to be present, real-time instrumentation for determining levels of radiation are used. Additionally, visual observations are made continuously during the initial entry so that actual or potential IDLH conditions or other dangerous conditions can be noted for present and future use.

4.0 SITE CHARACTERIZATION

During site characterization, real-time monitoring is conducted where there is a reasonable possibility for exposure. Real-time monitoring is continued if the possibility of an IDLH or flammable atmosphere condition exists, or if there is an indication, based on initial entry monitoring, that exposures may approach action levels determined in the HASP. Additionally, personal exposure monitoring is conducted when there is no suitable real-time instrument to monitor airborne levels of any of the hazardous substances anticipated.

During site characterization, periodic monitoring is conducted whenever:

- work begins on a different portion of the site;
- when contaminants other than those identified during initial entry are being handled;
- a different type of operation is initiated; or
- when work is conducted in areas of obvious contamination.

5.0 SITE REMEDIATION

Periodic real-time and/or personal exposure monitoring is conducted throughout the remedial investigation phase and during the actual site remediation phase of a hazardous waste operation, when contaminated soil, water, waste or containers are moved or disturbed. Personal exposure monitoring is conducted when there is no suitable real-time instrument to monitor airborne levels of any of the hazardous substances anticipated.

The frequency of personal exposure monitoring will be sufficient to characterize employee exposure and to confirm selection of personal protective levels.

If the air monitoring results indicate airborne hazardous substances above the action levels established in this HASP, the personal protective level will be upgraded to the next indicated level and air monitoring will continue. If the air monitoring results indicate that levels are below the action levels established, it may be determined that subsequent personal exposure monitoring is not required, and the current level of protection is sufficient to provide protection from potential exposure. Air monitoring results may be used to determine that the current level of protection may be downgraded.

6.0 ACTION LEVELS FOR DIRECT READING INSTRUMENTS

These are guidelines for setting action levels for direct reading instruments and, while they are generally valid, specific site conditions must be evaluated by an IH to determine if any alterations to the SOP is necessary or appropriate. CRA's IH should be consulted when establishing site-specific action levels.

6.1 ORGANIC VAPORS

Action levels for organic vapors are based on direct instrument readings made in the breathing zone from organic vapor detectors such as a photoionization detector (PID) or flame ionization detector (FID). These are relative, not absolute readings.

When the environment being sampled consists of chemical constituents, the following action levels are to be adhered to for unknown or known VOCs:

6.1.1 Unknown VOCs - Action Levels

Sustained Instrument Reading[1]	Level of Protection
≤ Background	Level D
< 5 meter units above background	Level C
≥ 5 meter units above background	Cease operations and move to a safe area. Confer with HSO. Re-evaluate work plan. Abandon location or upgrade to Level B and continue.

If the chemical constituents are known, the following action levels can be used:

[1]Sustained = Maintained for at least 15 minutes.

6.1.2 Known VOCs - Action Levels

Instrument Reading	Level of Protection
≤ 10 x TLV	Level C with half mask[2, 3]
> 10 to < 50 x TLV	Level C with full facepiece[1, 2]
> 50 x TLV	Level B with supplied air[4]

In situations where multiple, known substances exist, use the TLV for the material with the lowest allowable level (e.g., if benzene (TLV = 10 ppm) and toluene (TLV = 100 ppm) are present, use benzene's TLV for protection calculation).

6.2 COMBUSTIBLE GASES

Action levels are based on the readings from a combustible gas meter. The readings are generally given as a percentage of the lower explosion limit (%LEL) and are collected in the general work area. An atmospheric oxygen level of less than 19.5% may affect the readings from a combustible gas meter and give lower than actual levels. Test oxygen content first.

6.2.1 Non-Confined Space Readings, General Area

Instrument Reading	Action to be Taken
0-10% LEL	Continue working and monitoring atmosphere for combustible gases. Inform personnel working in the area whenever readings >5% LEL.

[2]As long as the material in question can be filtered by an APR and has good warning properties and normal oxygen content.
[3]Is below the IDLH level.
[4]With emergency escape bottle or SCBA.

10-20% LEL	Continue working with caution. Inform personnel working in area of readings. Be prepared to cease operations.
>20% LEL	Cease operations and move to a safe place. Re-evaluate work plan. Engineering controls such as forced ventilation and use of non-sparking tools are to be implemented if operations are to continue. **DO NOT CONTINUE WORKING UNTIL CONDITIONS ARE CONSISTENTLY BELOW 20% LEL.**

HOT WORK is only to be conducted at 0% LEL.

For field work being conducted at non-landfill drilling sites, the following action levels can be used for combustible gas readings taken at or near the borehole versus in the general area:

BOREHOLE READING

Instrument Reading	Action to be Taken
<20% LEL	Continue working and monitoring atmosphere for combustible gases. Inform personnel working in the area whenever readings are >10% LEL.
20 - 40% LEL	Continue working with caution. Inform personnel in area of readings. Be prepared to cease operations.
>40% LEL	Cease operations and move to a safe area. Re-evaluate work plan. Engineering controls such as forced ventilation and use of non-sparking tools are to be implemented if

operations are to continue. **DO NOT CONTINUE WORKING UNTIL CONDITIONS ARE CONSISTENTLY BELOW 40% LEL.** Supplied air or SCBA respiratory protection may be necessary.

6.2.2 Combustible Gases at Landfill Sites

Under development.

6.3 OXYGEN

A direct reading oxygen meter is used to determine the percent of oxygen in the atmosphere.

Instrument Reading	Action to be Taken
<19.5% or >23.5%	Cease operations and move to a safe area. Re-evaluate work plan. Engineering controls such as forced ventilation and use of non sparking tools are to be implemented if operations continue. **DO NOT CONTINUE WORKING UNTIL OXYGEN LEVELS ARE BETWEEN 19.5 AND 23.5%.** When oxygen levels are outside this range, combustible gas meter readings are not reliable. Supplied air or SCBA respiratory protection may be necessary.

6.4 HYDROGEN CYANIDE (HCN)

Whenever an alarm sounds on a direct reading HCN meter, cease work activity immediately, move to a safe area and contact the

HSO. The ceiling concentration for HCN is 10 ppm. If the unit is equipped with an alarm, it should be set just under 10 ppm.

If approval is given by the HSO, verification of the presence of HCN is to be made using colorimetric tubes which are specific for HCN detection. The person taking the sample is to wear air supplied respiratory protection. There is no air-purifying cartridge approved for use in an atmosphere containing HCN.

If the presence of HCN is confirmed, cease activities until the HSO gives instructions or confer with CRA's IH. If the colorimetric tubes do not indicate the presence of HCN, check the calibration of the direct reading meter and continue with site activities cautiously continuing to monitor for HCN with the direct reading meter.

6.5 HYDROGEN SULFIDE (H_2S)

Whenever readings approach 10 ppm on a direct reading H_2S meter, cease work immediately, move to a safe area and contact the HSO. H_2S has a TLV level of 10 ppm.

If approval is given by the HSO, verification of the presence of H_2S is to be made using colorimetric detector tubes. The person taking the sample is to wear air supplied respiratory protection. There is no air-purifying cartridge approved for use in an atmosphere containing H_2S.

If the presence of H_2S is confirmed, cease activities and wait for directions from the site HSO or confer with CRA's IH. If the colorimetric tubes do not indicate the presence of H_2S, continue with site activities cautiously and continue to monitor after checking the calibration of the direct reading meter.

6.6 CARBON MONOXIDE (CO)

Whenever a detection is made with a direct reading CO meter in excess of 20 ppm, cease work immediately, move to a safe area and contact the site HSO.

If approval is given by the HSO, verification of the presence of CO is to be made with colorimetric tubes which can detect CO. The person taking the sample is to wear air-supplied respiratory protection. There is no air-purifying cartridge approved for use in an atmosphere containing CO.

If the presence of CO is confirmed, cease activities and wait for directions from the HSO or confer with CRA's IH. If the colorimetric tubes do not indicate the presence of CO, continue with site activities cautiously and continue to monitor after verifying the calibration of the direct reading meter.

6.7 TOTAL DUST

The TLV for nuisance dust is 10 mg/m^3. When other toxic materials are present an adjustment is necessary to this number to make it a valid real-time indicator. Typically, an action level of 5 mg/m^3 total dust (50 percent of the nuisance dust TLV) will generally be more conservative than an action level determined for specific particulate compounds.

To determine if 5 mg/m^3 total dust is protective enough for the chemical of concern, follow the procedure provided below:

1. Multiply the known fraction of the chemical in the soil by the action level for total dust to determine what the airborne concentration of the chemical would be at the dust action level. Compare with 50 percent of the TLV, PEL or STEL (whichever is lowest). If the airborne concentration is lower, the action limit should remain 5 mg/m^3 total dust.

Example:

The PEL for lead is 0.05 mg/m^3 and the OSHA action level is 0.025 mg/m^3. Fifty percent of the PEL is 0.025 mg/m^3. If the concentration of the lead in the soil is 1,000 mg/kg (or ppm), then:

$$\frac{1{,}000 \text{ mg Pb}}{10^6 \text{ mg soil}} \times \frac{5 \text{ mg soil}}{\text{m}^3 \text{ air}} = \frac{0.005 \text{ mg Pb}}{\text{m}^3 \text{ air}}$$

A comparison of 0.005 mg/m^3 airborne lead at the dust action level with the action level for lead (0.025 mg/m^3) shows that the dust action level is protective enough for lead monitoring.

2. Alternatively, to determine a soil concentration of concern (i.e., the concentration corresponding with the chemical's action level), divide the chemical action level by the dust action level to determine the concentration of chemical required in the soil to reach the action level.

Example:

$$\frac{0.025 \text{ mg Pb}}{\text{m}^3 \text{ air}} \times \frac{\text{m}^3 \text{ air}}{5 \text{ mg soil}} = \frac{0.025 \text{ mg Pb}}{5 \text{ mg soil}} = \frac{5{,}000 \text{ mg Pb}}{\text{kg soil}}$$

In this case, soil with 5,000 mg/kg lead would be at the OSHA action level when total dust is also at the action level of 5 mg/m^3.

1.0 SAFETY AND HEALTH RISK ANALYSIS

Table D.1 describes potential safety and health risks which may be encountered by CRA employees while performing site tasks. Site operations may involve handling materials which are known or suspected to be contaminated. Exposure to these materials may occur through one or more of the following routes.

1.1 INHALATION

Substances that primarily pose an inhalation hazard are those that volatilize easily at ambient temperatures. A rule of thumb is that substances with vapor pressures greater than that of naphthalene (0.08 mm Hg) may be considered volatile at ambient temperatures.

1.2 INGESTION

Ingestion may occur through eating or smoking with contaminated hands or in contaminated work areas. Incidental ingestion of contaminated particulates may also occur under dusty conditions generated in contaminated areas.

1.3 SKIN AND EYE CONTACT

Some hazardous substances may be absorbed through the skin into the bloodstream. Many other substances are not absorbed but react with the skin surface causing irritation or burns. Absorption occurs most readily through open wounds, inflamed skin or through eye contact. These hazardous substances are noted with the word "skin" in Table 2.

1.4 INJECTION

Exposure may occur if a hazardous substance is injected into the skin through skin puncture or cut by a contaminated foreign object such as spikes, metal edges, wood slivers, etc.

2.0 PHYSICAL HAZARDS

Site operations and tasks may involve inherent physical safety hazards. These hazards are described in the following paragraphs. site-specific hazards may be discussed in Section 1 of this HASP.

2.1 UTILITIES

Overhead and underground utilities (e.g., electric, gas, telephone, water, sewer, drainage, etc.) and associated pipes in the project work areas must be located. Underground utilities shall be located and marked by the utility owners before the start of any intrusive activity. Overhead utilities shall be located and, where appropriate, protected before the setup and operation of heavy equipment, such as drill rigs, cranes, loaders, man-lifts, etc.

2.2 HEAVY EQUIPMENT OPERATION

Site operations may involve the use of heavy equipment such as drill rigs, backhoes, dozers, loaders, scrapers, trucks, etc. The following information describes additional safety procedures while working around heavy equipment.

1) Maintain visual contact with the operator at all times while working near the equipment.

2) Keep a safe observation distance of at least the reach of the backhoe bucket plus five feet except when working directly with the backhoe operator.

3) Never walk directly in back or to the side of heavy equipment without the operator's knowledge. Understand the direction the equipment is likely to move and how quickly it may make the maneuver.

4) Always stay out of the reach of operating equipment unless working directly with the operator.

5) Assure that underground and overhead utilities have been identified.

6) Be aware of footing and surroundings at all times.

7) Do not work near equipment that may be unsafe because of deterioration, missing parts, obvious defects or improper operation. Do not permit use of such equipment by any contractor.

8) If working within reach of operating equipment, always alert operator of your position.

9) If heavy equipment and other vehicles share a common roadway, be alert to this traffic and yield right-of-way. Park in a clear area, not in an area obstructed from the operator's view.

2.3 EXCAVATIONS

Any entry to an excavation or trench shall be performed in accordance with the CRA excavation entry procedure. If soil samples are required from excavations, samples shall be taken from the backhoe bucket or from the spoils pile, or other non-entry methods, whenever possible.

2.4 LIGHTING

Work areas must have adequate lighting for employees to see to work and identify hazards.

2.5 LIFTING

Heavy objects, such as pumps and generators, should be lifted with proper lifting techniques and preferably by at least two persons. Material handling equipment should be used when an object is either too heavy or bulky to handle safely.

2.6 DETERIORATED/ABANDONED BUILDINGS

If there are abandoned buildings on site, they may be structurally unstable or the roof, ceiling, floors, walkways, and doors may be damaged. Hard hats, steel toed boots, and safety glasses should always be used when entering those buildings. An initial walk through with a buddy shall be conducted in/near any abandoned facility to identify physical hazards. These types of buildings should be entered only if necessary.

2.7 ELECTRICAL POWER

Electrical equipment must be properly grounded or double insulated and should be inspected prior to use. Any electrical equipment in questionable condition shall not be used. Operation of electrical equipment in wet conditions must be avoided unless equipment and electric service are specifically designed for water immersion. Ground fault interrupter circuits must be used for all exterior or wet applications.

2.8 SLIPPING

Slipping on wet, muddy surfaces can be minimized by diverting water away from work areas or by avoiding slippery surfaces. Boots with good treads shall be worn if the area is wet or muddy. Walking in puddles, drilling mud, and drilling additives should be avoided. Slipping on snow or icy surfaces should be minimized whenever possible.

2.9 LIMITATIONS DUE TO PERSONAL PROTECTIVE EQUIPMENT

The use of PPE may limit visibility, hearing, or manual dexterity. In addition, wearing PPE may require additional physical exertion of the wearer. These limitations are to be evaluated prior to performing a particular task and compensated for, as appropriate.

2.10 NOISE EXTREMES

Noise exposure may occur on site from heavy equipment operations, especially while working in the area of operating equipment. A general rule of thumb to determine if noise levels are high enough to require hearing protection is to observe if two persons standing approximately two feet apart have to raise their voices to converse. If conversation cannot occur without shouting, noise levels exceed 85 dBA and hearing protection shall be utilized. Hearing protection is available in the form of ear plugs, muffs, or both.

2.11 IONIZING RADIATION

Sites that have been used by hospitals and research facilities should be particularly suspect of posing an ionizing radiation hazard. These materials may be found in drums, including lab packs, as either a solid or liquid. The best precaution for individuals working at landfills is constant monitoring for ionizing radiation. Initial monitoring shall be conducted to detect high levels of radiation where radiation is suspected to be present. Exposure monitoring is continuously conducted with TLD badges or rings.

2.12 HEAT STRESS AND COLD STRESS

Heat stress and cold stress identification, prevention, and treatment guidelines are attached to this appendix.

3.0 COLD STRESS

3.1 OVERVIEW

Fatal exposures to cold have been reported in employees failing to escape from low environmental air temperatures or from immersion in low temperature water. Hypothermia, a condition in which the body's deep core temperature falls significantly below 98.6°F, can be life threatening. A drop in core temperature to 95°F or lower must be prevented.

Air temperature is not sufficient to determine the cold hazard of the work environment. The wind-chill must be considered as it contributes to the effective temperature. The body's physiologic defense against cold includes constriction of the blood vessels, inhibition of the sweat glands to prevent loss of heat via evaporation, glucose production, and involuntary shivering to produce heat by rapid muscle contraction.

The frequency of accidents increases with cold temperature exposures as the body's nerve impulses slow down, individuals react sluggishly and numb extremities make for increased clumsiness. Additional safety hazards include ice, snow blindness, reflections from snow, and possible skin burns from contact with cold metal.

There are certain predisposing factors that make an individual more susceptible to cold stress. It is the responsibility of the project team members to inform the Health and Safety Officer to monitor an individual, if necessary, or use other means of preventing/reducing the individual's likelihood of experiencing a cold related illness or disorder.

3.2 PREDISPOSING FACTORS

Predisposing factors that will increase an individual's susceptibility to cold stress are listed below:

- Dehydration: The use of diuretics and/or alcohol, or diarrhea can cause dehydration. Dehydration reduces blood circulation to the extremities.

- Fatigue During Physical Activity: Exhaustion reduces the body's ability to constrict blood vessels. This results in the blood circulation occurring closer to the surface of the skin and the rapid loss of body heat.

- Age: Some older and very young individuals may have an impaired ability to sense cold.

- Alcohol Consumption: Alcohol dilates the blood vessels near the skin surface resulting in excessive body heat loss.

- Sedative Drugs: Sedatives may interfere with the transmission of impulses to the brain, thereby interfering with the body's physiological defense against cold. Some prescription drugs may react the same way.

- Poor Circulation: Vasoconstriction of peripheral vessels reduces blood flow to the skin surface.

- Heavy Work Load: Heavy work loads generate metabolic heat and make an individual perspire even in extremely cold environments. If perspiration is absorbed by the individual's clothing and is in contact with the skin, cooling of the body will occur.

- The Use of PPE: PPE usage which traps sweat inside the PPE may increase an individual's susceptibility to cold stress.

- Lack of Acclimatization: Acclimatization, the gradual introduction of workers into a cold environment, allows the body to physiologically adjust to cold working conditions.

- History of Cold Injury: Previous injury from cold exposures may result in increased cold sensitivity.

3.3 PREVENTION OF COLD STRESS

There are a variety of measures that can be implemented to prevent or reduce the likelihood of employees developing cold related ailments and disorders. These include acclimatization, fluid and electrolyte replenishment, eating a well balanced diet, wearing warm clothing, the provision of shelter from the cold, thermal insulation of metal surfaces, adjusting work schedules, and employee education.

- Acclimatization: Acclimatization is the gradual introduction of workers into the cold environment to allow their bodies to physiologically adjust to cold working conditions. However, the physiologic changes are usually minor and require repeated uncomfortably cold exposures to induce them.

- Fluid and Electrolyte Replenishment: Cold, dry air can cause employees to lose significant amounts of water through the skin and lungs. Dehydration affects the flow of blood to the extremities and increases the risk of cold injury. Warm, sweet, caffeine-free, non-alcoholic drinks, and soup are good sources to replenish body fluids.

- Eating a Well-Balanced Diet: Restricted diets including low salt diets can deprive the body of elements needed to withstand cold stress. Eat high energy foods throughout the day.

- Warm Clothing: It is beneficial to maintain air space between the body and outer layers of clothing in order to retain body heat. However, the insulating effect provided by such air spaces is lost when the skin or clothing is wet.

The parts of the body most important to keep warm are the feet, hands, head and face. As much as 40 percent of body heat can be lost when the head is exposed.

Recommended clothing includes:

- Inner layers (t-shirts, shorts, socks) should be of a thin, thermal insulating material.
- Wool or thermal trousers. Denim is not a good protective fabric.
- Felt-lined, rubber-bottomed, leather-upper boots with a removable felt insole is preferred. Change socks when wet.
- Wool shirts/sweaters should be worn over inner layer.
- A wool cap is good head protection. Use a liner under a hard hat.
- Mittens are better insulators than gloves.
- Face masks or scarves are good protection against wind.
- Tyvek/poly-coated Tyvek provides good wind protection.
- Wear loose fitting clothing, especially footwear.
- Carry extra clothing in your vehicle.
- Shelters with heaters should be provided for the employees' rest periods if possible. Sitting in a heated vehicle is a viable option. Care should be taken that the exhaust is not blocked and that windows are partially open to provide ventilation.
- At temperatures of 30°F (-1°C) or lower, cover metal tool handles with thermal insulating material if possible.
- Schedule work during the warmest part of the day if possible, rotate personnel and adjust the work/rest schedule to enable employees to recover from the effects of cold stress.

3.3.1 Employee Education

Employees have already been trained to recognize and treat the effects of cold stress during their 40-hour training. Signs, symptoms, and treatment of cold stress should be reviewed in project safety meetings where applicable. The buddy system will help in preventing cold stress once the employees are trained to recognize the signs and symptoms of cold stress.

3.3.2 Cold Stress Prevention Guidelines

It may not be practically feasible to implement all the above prevention measures. Follow the guidelines given below when the ambient air temperature is -5°F (-20°) or lower:

- Contact the PM or the IH to determine if the project team should be on site in such temperatures;
- Dress warm;
- Replenish fluids and electrolytes at regular intervals;
- Provide shelter from the cold; and
- Adjust work/rest schedules.

3.3.3 Adjust Work-Rest Schedules

Follow the work/rest schedule in Table 12.1. It is based on the cooling power of air which is a function of wind speed and ambient air temperature.

3.4 FIRST-AID TREATMENT GUIDELINES

The following describes symptoms of different stages in cold stress and the related first-aid treatment guidelines.

3.4.1 Frostbite

Stages

Incipient (frost nip)	May be painless. Tips of ears, nose, cheeks, fingers, toes, chin affected. Skin blanched white.
Superficial	Affects skin/tissue just beneath skin; turns purple as it thaws. Skin is firm, waxy; tissue beneath is soft, numb.
Deep	Tissue beneath skin is solid, waxy, white with purplish tinge. Entire tissue depth is affected.

First-Aid

Incipient	Warm by applying firm pressure - blow warm breath on spot or submerge in warm water (102°F to 110°F) (39°F to 43°C). Do not rub the area.
Superficial	Provide dry coverage, steady warmth; submerge in warm water.
Deep	Hospital care is needed. Do not thaw frostbitten part if needed to walk on. Do not thaw if there is danger of refreezing. Apply dry clothing over frostbite. Submerge in water; do not rub.

3.4.2 General Hypothermia

Stages

- Shivering
- Indifference
- Decreased Consciousness
- Unconsciousness
- Death

Symptoms

- Muscle Tension
- Uncontrollable Shivering
- Glassy Stare
- Decreased Muscle Function
- Speech Distortion
- Blue, Puffy Skin
- Slow Pulse
- Shallow Breathing
- Coordination Loss
- Stumbling
- Forgetfulness
- Freezing Extremities
- Dilated Pupils
- Fatigue

Emergency Response

- Keep person dry; replace wet clothing
- Apply external heat to both sides of patient using available heat sources, including other bodies.
- Give warm liquids - not coffee or alcohol - after shivering stops and if conscious.
- Handle gently.
- Transport to medical facility as soon as possible.
- If more than 30 minutes from a medical facility, warm person with other bodies.

4.0 HEAT STRESS

4.1 OVERVIEW

Heat induced occupational illnesses, injuries, and reduced productivity occur in situations in which the total heat load (environmental plus metabolic) exceeds the body's capacities to maintain normal body functions without excessive strain. Heat stress is the sum of the heat generated in the body plus the heat gained from the environment minus the heat lost from the body to the environment. The body's response to heat stress is called heat strain. The level of heat stress at which excessive heat strain will result depends on the heat tolerance of the individual. Certain predisposing factors may reduce an individual's ability to tolerate heat stress.

Using PPE may put a hazardous waste worker at an increased risk of developing heat stress. Health effects may range from heat rash or heat fatigue to serious illness or death. Heat stress is caused by a number of interacting factors, including environmental conditions such as temperature and relative humidity, protective clothing which limits natural heat loss through perspiration, workload, and the individual characteristics of the worker.

It is the responsibility of the project team members to inform the HSO or IH if any of the predisposing factors listed below apply to them. This enables the HSO to monitor the individual if necessary, or use other means of preventing/reducing the individual's likelihood of experiencing a heat related illness or disorder.

4.2 PREDISPOSING FACTORS

Predisposing factors that will increase the individual's susceptibility to heat stress are listed below:

- Lack of Physical Fitness: Such individuals experience more physiological strain including a higher heart rate, a higher body temperature, less

efficient sweating, and slightly higher oxygen consumption as compared to fit individuals.

- Obesity: Overweight individuals produce more heat per unit surface area than thin individuals and have a lowered ability to dissipate heat.

- Age: Older individuals may have a decreased ability to cope with heat stress.

- Dehydration: Dehydrated individuals will have a decreased ability to cool the body by sweating. Diarrhea can cause dehydration.

- Alcohol, Medications, and Drug Use: Alcohol consumption may dehydrate individuals and certain medications/drugs may act as diuretics. Hence, the individual may have a decreased ability to lose heat by sweating.

- Infection, Sunburn, Illness, and Certain Chronic Diseases: These factors may interfere with the body's normal mechanisms to lose heat.

- Heart Conditions or Circulatory Problems: Heat stress may place an additional strain on the heart and circulatory system that could harm the individual as well as decrease the individual's physiologic response.

- Low Salt Diet: Could affect the individual's electrolyte balance.

- Pregnancy

- Previous History of Heat Stroke or Heat Exhaustion: May increase the individual's susceptibility to heat stress.

- Heavy Work Load: Will generate metabolic heat thereby increasing the heat stress placed on the individual

- The Use of PPE Over Light Summer Clothing: This will decrease the ability of an individual to lose heat by sweating as evaporative cooling can no longer occur.

- Lack of Acclimatization: Acclimatization is the gradual introduction of workers into a hot environment to allow their bodies to physiologically adjust to hot working conditions. Acclimatized individuals generally have lower heart rates and lower body temperatures. In addition, they sweat sooner and more profusely and even have more dilute sweat (thereby losing less electrolytes) than non-acclimatized individuals.

4.3 PREVENTION OF HEAT STRESS

There are a variety of measures that can be implemented to prevent or reduce the likelihood of employees developing heat stress related disorders. These include fluid and electrolyte replenishment, the provision of shelter from the sun and heat, work schedule adjustment, the use of cooling devices, acclimatization, heat stress monitoring, and employee education, as discussed below:

- Fluid and Electrolyte Replenishment: Personnel should drink about 16 ounces of water before starting work and drink water at every break. To encourage water consumption, cool water and disposable cups should be made available. The normal thirst mechanism is not sensitive enough to ensure that enough water will be drunk to replace lost sweat. When heavy sweating occurs, personnel should be encouraged to drink more. Replacing body fluids with Gatorade is an option. It is advisable to have Gatorade on site if the air temperature is 70°F (21°C) or more and the workers are performing tasks with a moderate to heavy work load in chemical resistant clothing.

- Shelter From the Sun and Heat: Air-conditioned (if possible) or shaded areas should be made available for rest periods. Sitting in an air-conditioned truck is an acceptable option.

- Work Schedule Adjustment: Scheduling work for early mornings and/or late afternoons will avoid the hottest parts of the day and reduce the heat stress placed on personnel, rotation of personnel will help reduce overexertion of workers and adjusting the work-rest schedule will help personnel recover from the effects of heat stress periodically.

- Use of Cooling Devices: The use of cooling devices like field showers, hose-down areas or cooling vests should be considered for project tasks that involve heavy work loads in chemical resistant clothing.

- Acclimatization: Acclimatization is the gradual introduction of workers into a hot environment to allow their body to physiologically adjust to hot working conditions. Acclimatized individuals generally have lower heart rates and lower body temperatures. In addition, they sweat sooner and more profusely and even have more dilute sweat (thereby losing less electrolytes) than non-acclimatized individuals.

- Heat Stress Monitoring: Monitoring hot environments for potential heat stress should be initiated when the ambient air temperature is in excess of 70°F. There are several ways to monitor heat stress: measuring heart rate, oral temperature, loss of body weight and the Wet Bulb Globe Temperature using a Reuter-Stokes or Quest Electronics heat stress monitor. CRA employees are advised to measure their heart rates as a primary means of heat stress monitoring following the guidelines in Section 13.3.2 and Table 13.1.

- Employee Education: Workers have already been trained to recognize and treat the effects of heat stress during the 40-hour training course. Signs, symptoms, and treatment of heat stress should be discussed in site safety meetings. The buddy system will help in preventing heat stress once the employees are trained to recognize the signs and symptoms of heat stress.

4.3.1 Prevention Practices

It may not be practically feasible to implement all of the above prevention measures. The following has been developed as a field guide for use in actual field situations.

Ambient air temperature is 70°F (21°C) or more:

- Replenish fluids and electrolytes. Drink cool (50°F to 60°F/10°C to 15°C) fluids hourly. The fluids should be caffeine-free and non-alcoholic. Do not wait until you are thirsty. Your normal thirst mechanism is not sufficient to overcome the effects of dehydration. If you feel thirsty, you are already becoming dehydrated.

- Provide shelter from the sun and heat.

Ambient air temperature is 70°F (21°C) or more and chemical-resistant clothing is being used:

- Same as above;
- Adjust work schedules if feasible; and
- Initiate heat stress monitoring and/or the use of cooling devices.

4.3.2 Heat Stress Monitoring

Heat stress monitoring may be performed by monitoring the heart rate. Heart rate should be measured at the beginning of the work shift, at regular intervals and at the start of each rest period.

1) If the heart rate is <110 beats per minute (bpm), personnel may continue the current work/rest schedule.

2) If the heart rate is >110 bpm, take a 10-minute break. Monitor heart rate at the end of the rest period. If not <110 bpm, rest until the heart rate is <110 bpm. Reduce the current work time between breaks by

approximately one hour. If the next scheduled monitoring session shows a heart rate of >110 bpm once again, reduce the work time between breaks by one hour.

4.4 HEAT STRESS FIRST AID

4.4.1 Heat Cramps

Cause: Excessive water loss/electrolyte imbalance.

Symptoms	First-Aid Guidelines
Muscular pain in arms, legs, abdomen	Administer sips of Gatorade (1/2 glass every 15 minutes)
Faintness, dizziness, exhaustion	Do not massage cramping muscles
Normal temp, cool moist skin	Relax person

4.4.2 Heat Exhaustion

Cause: Large amount of water loss; blood circulation diminishes.

Symptoms	First-Aid Guidelines
Moist, clammy, skin, usually pale	Move to a cool place
Dilated pupils	Apply cold, wet compresses to skin
Weak, dizzy, nauseous, headache	Raise feet 8 to 12 inches
Normal or low body temperature	Administer sips of Gatorade (1/2 glass every 15 minutes)
	Get medical attention

4.4.3 Heat Stroke

Cause: Body overheats; temperature rises; no sweating occurs

Symptoms	First-Aid Guidelines
No sweating occurs	Get emergency medical assistance ASAP
Dry, hot skin, usually red	Remove from sunlight
Constricted pupils	Wet down body with cool water or rubbing alcohol
Hot body temperature (105°F to 110°F/40.5°C to 43.5°C)	Elevate head/shoulders
Strong, rapid pulse	Wrap in wet, cold wrapping
Unconsciousness may occur	Once cooled to 102°F (38.9°C), stop cooling measures
Muscular twitching	

TABLE D.1

SAFETY AND HEALTH RISK ANALYSIS FOR PROJECT TASKS

Task	*Task Description*	*Chemical Hazards*	*Physical Hazards*
Reconnaissance	Walk around Site, nonintrusive investigation Observe/measure topography; stake line and grade for construction	Low potential for skin and inhalation exposure to contaminated soil	Slip/trip/fall hazards
Observation of Remedial Construction, Observation of Other Construction Activities and Observation of Excavation/Stockpiling of Materials	Observe: - Site grading, cap and liner construction - Drain installation - Various other heavy construction in contaminated and clean areas	Low potential for skin exposure to contaminated soil and inhalation exposure to dust and soil gas	Heavy equipment operations, excavation cave-ins, equipment operation hazards
Observation of Intrusive Site Investigations/Test Trenching	Direct and/or Observe: - Soil boring advancement - Monitoring well installation - Test Trenching	Potential for skin exposure to contaminated soil and inhalation exposure to dust and soil gas	Equipment operation hazards, cave-ins
Nonintrusive Geophysical Survey	Perform electromagnetic survey	Low potential for skin exposure to contaminated soil	Lifting hazards, slip/trip/fall
Soil Gas Survey	Collect soil gas with soil probe/perform headspace analysis	Potential for skin exposure to contaminated soil and inhalation exposure to soil gas	Underground utilities, unknown obstructions
Water Sample Collection	Collect water samples from surface water and monitoring wells/measure water levels	Potential for skin exposure to contaminated water and inhalation exposure to volatiles in water	Lifting hazards
Waste/Sludge Sample Collection	Collect waste/sludge material from waste/sludge lagoon/pit	Potential for skin exposure to concentrated waste/ sludge and inhalation exposure to contaminated waste/sludge vapor	Slip/trip/fall
Soil Sample Collection	Collect and classify soil samples from soil borings and/or trench soils	Potential for skin exposure to contaminated soil and inhalation exposure to soil gas and dust	Equipment operation hazards
Aquifer Testing	Slug Test/Pumping Test/Monitoring Well Development	Potential for skin exposure to contaminated water and inhalation exposure to volatiles in water	Slip/trip/fall, lifting hazards

TABLE D.2

WORK/REST SCHEDULE
FOR AN EIGHT HOUR WORK SHIFT

Air Temperature with Sunny Sky		*Work/Break Schedule (Minutes)*				
°F	*°C*	*No Wind*	*5 mph Wind*	*10 mph Wind*	*15 mph Wind*	*20 mph Wind*
-05 to -09	-20 to -23	110/10	110/10	75/10	55/10	40/10
-10 to -14	-23 to -26	110/10	75/10	55/10	40/10	30/10
-15 to -19	-26 to -28	75/10	55/10	40/10	30/10	Stop
-20 to -24	-29 to -31	55/10	40/10	30/10	Stop	Stop
-25 to -29	-32 to -34	40/10	30/10	Stop	Stop	Stop
-30 to -34	-35 to -37	30/10	Stop	Stop	Stop	Stop
-35 & Below	-38 & Below	Stop	Stop	Stop	Stop	Stop

Note:

This table addresses the health hazards related to cold weather work. The practicality of working under a work/rest schedule, together with the ability of the necessary equipment to function properly in cold weather, may be more restrictive than the health hazards and also need to be considered.

The cold stress schedule applies to light or sedentary work activities. Light to moderate work activities can be moved down one level, moderate to heavy work activities can be moved down two levels if workers are acclimated, have proper protective clothing and show no signs of cold stress.

0 - 5 mph Wir Light flag moves.
15 mph Wind Raises newspaper sheet.
10 mph Wind Light flag fully extended.
20 mph Wind Blowing and drifting snow.

TABLE D.3

RECOMMENDED HEART RATE MONITORING FREQUENCY

	70 °F - 80 °F (21 °C - 27 °C)	*80 °F - 90 °F (27 °C - 32 °C)*	*90 °F - 100 °F (32 °C - 38 °C)*	*>100 °F (38 °C)*
Relative Humidity Less than 80%				
Light Summer Clothing	Every 3 hours	Every 3 hours	Every 2 hours	Every 2 hours
Kleengard or Cotton Coveralls	Every 3 hours	Every 3 hours	Every 2 hours	Every hour
Tyvek, Poly-coated or Saranex Tyvek	Every 2 hours	Every 2 hours	Every hour	Stop work and re-assess
Relative Humidity 80% or Greater				
Light Summer Clothing	Every 3 hours	Every 2 hours	Every 2 hours	Every hour
Kleengard or Cotton Coveralls	Every 2 hours	Every 2 hours	Every hour	Every hour
Tyvek, Poly-coated or Saranex Tyvek	Every 2 hours	Every hour	Every hour	Stop work and re-assess

APPENDIX E

DECONTAMINATION

TABLE OF CONTENTS

			Page
1.0	DECONTAMINATION		E-1
	1.1	SCOPE	E-1
	1.2	DECONTAMINATION METHODS	E-1
	1.3	PROCEDURES	E-1
	1.4	EQUIPMENT DECONTAMINATION	E-2
	1.5	WASTE DISPOSAL	E-2
	1.6	MANAGEMENT AND DISPOSAL OF DECONTAMINATION SOLUTIONS	E-2
	1.7	SHOWERS AND CHANGE ROOMS	E-3

1.0 DECONTAMINATION

1.1 SCOPE

PPE and monitoring equipment must either be decontaminated or properly discarded upon exiting from the exclusion zone. This practice prevents cross-contamination to clean areas. All CRA employees and CRA subcontractors must enter and exit the exclusion zone through the contaminant reduction zone and decontamination area. The configuration of these zones will vary from site to site and will be defined in the site-specific HASP.

1.2 DECONTAMINATION METHODS

Decontamination methods shall involve physically removing contaminants, neutralizing contaminants or removing contaminants through a combination of both physical and chemical means. The types, locations, physical states, and concentrations of contamination present will determine the appropriate method of decontamination.

1.3 PROCEDURES

This SOP contains personnel decontamination procedures for Levels B, C, and D. Level A decontamination is beyond the scope of this SOP. The Site Health and Safety Officer is responsible to monitor these procedures and may modify them to suit the site conditions and specific levels in use. General standard operating procedures to be followed are:

- Minimize contact with contaminants in order to minimize the need for extensive decontamination.
- Gloves, boot covers, and disposable outer clothing shall be rolled down with the insides out.
- Sampling/monitoring equipment, when feasible, shall be enclosed in plastic bags to prevent cross-contamination.

- Decontamination solutions of soap and water or trisodium phosphate (TSP) detergent and water shall be used at a minimum.

1.4 EQUIPMENT DECONTAMINATION

Monitoring equipment will be decontaminated before leaving the site by wiping with a damp cloth or by removing and properly disposing of a protective covering. Construction equipment will typically be manually scraped then steam cleaned. The HSO is responsible to verify that this has been done satisfactorily.

1.5 WASTE DISPOSAL

CRA project management will determine a disposal method based on an approved plan for each specific site.

1.6 MANAGEMENT AND DISPOSAL OF DECONTAMINATION SOLUTIONS

Decontamination solutions must be treated or properly disposed of. In determining if a particular management disposal option is appropriate, the following should be considered:

- the contaminants, their concentrations and the total volume of decontamination solution;
- media potentially affected (e.g., groundwater, soil) under management options;
- location of the nearest population(s) and the likelihood and/or degree of site access;
- potential exposure to workers; and
- potential for environmental impacts.

1.7 SHOWERS AND CHANGE ROOMS

Showers and/or change rooms may be provided for CRA employees when the duration of project activities extends for a long period of time or will be provided when site conditions warrant the need for a separate change area. Showering requirements vary from site to site and are defined in the site specific HASP based on site-specific conditions.

LEVEL B - ROUTINE DECONTAMINATION

Step 1 - Equipment Drop

- Deposit equipment used on site (tools, sampling devices, monitoring equipment, radios, etc.) on plastic drop cloths.
- Decontaminate or dispose of items before removal from Exclusion Zone.

Step 2 - Outer Boot/Glove Wash and Rinse

- Scrub outer boots/gloves with decontamination solution.
- Rinse using water.

Step 3 - Outer Boot/Glove Removal

- Remove outer boots/gloves.
- If outer boots/gloves are disposable, deposit in container with plastic liner.
- If outer boots/gloves are non-disposable, store in a clean, dry location.

Step 4 - Outer Garment Removal

- If using self-contained breathing apparatus (SCBA), remove SCBA back pack and keep the facepiece on until garments are removed. Remove chemical protective outer garments and deposit in appropriate container.

Step 5 - Respiratory Protection Removal

- Remove hard hat and face piece, and place them on a clean surface.
- Wash and rinse face piece.
- Wipe off and store face piece in a clean, dry location.

Step 6 - Inner Glove Removal

- Remove inner gloves.
- Deposit in container for disposal.

Step 7 - Field Wash

- Thoroughly wash hands and face with soap and water.
- Shower as soon as possible.

For Air Tank Exchange Only, Complete the Following Steps:

Step 1 - Equipment Drop

- Deposit equipment used on site (tools, sampling devices, monitoring equipment, radios, etc.) on plastic drop cloths.
- Decontaminate or dispose of items before removal from Exclusion Zone.

Step 2 - Glove Removal

- Remove gloves.
- If gloves are disposable, deposit in container with plastic liner
- If gloves are non-disposable, store in a clean, dry location.

Step 3 - Tank Change

- Exchange air tank.
- Don new gloves.
- Tape joints and return to exclusion zone.

LEVEL C - ROUTINE DECONTAMINATION

Step 1 - Equipment Drop

- Deposit equipment used on site (tools, sampling devices, monitoring equipment, radios, etc.) on plastic drop cloths.
- Decontaminate or dispose of items before removal from Exclusion Zone.

Step 2 - Outer Boot/Glove Wash and Rinse

- Scrub outer boots/gloves and/or splash suit with decontamination solution
- Rinse using water.

Step 3 - Outer Boot/Glove Removal

- Remove outer boots/gloves.
- If outer boots/gloves are disposable, deposit in container with plastic liner.
- If outer boots/gloves are non-disposable, store in a clean, dry place.

Step 4 - Outer Garment Removal

- Remove chemical protective outer garments and deposit in appropriate container.

Step 5 - Respiratory Protection Removal

- Remove hard hat and respirator and deposit on a clean surface.
- Discard respirator cartridges in appropriate container.
- Wash and rinse respirator.
- Wipe off and store respirator in a clean, dry location.

Step 6 - Inner Glove Removal

- Remove inner gloves.
- Deposit in container for disposal.

Step 7 - Field Wash

- Thoroughly wash hands and face with soap and water.
- Shower as soon as possible.

For Cartridge Exchange Only, Complete the Following Steps:

Step 1 - Equipment Drop

- Deposit equipment used on site (tools, sampling devices, monitoring equipment, radios, etc.) on plastic drop cloths.
- Decontaminate or dispose of items before removal from Exclusion Zone.

Step 2 - Glove Wash and Rinse

- Scrub gloves and/or splash suit with decontamination solution.
- Rinse using water.

Step 3 - Glove Removal

- Remove gloves.
- If gloves are disposable, deposit in container with plastic liner.
- If gloves are non-disposable, store in a clean, dry place.

Step 4 - Respirator Cartridge Change

- Exchange respirator cartridges.
- Don new outer boots/gloves.
- Tape joints and return to exclusion zone.

LEVEL D - MODIFIED ROUTINE DECONTAMINATION

Step 1 - Equipment Drop

- Deposit equipment used on site (tools, sampling devices, monitoring equipment, radios, etc.) on plastic drop cloths.
- Decontaminate or dispose of items before removal from exclusion zone.

Step 2 - Outer Boot/Glove Wash and Rinse

(Optional, include if necessary for gross decontamination).

- Scrub outer boots/gloves and/or splash suit with decontamination solution.
- Rinse using water.

Step 3 - Outer Boot/Glove Removal

- Remove outer boots/gloves.
- If outer boots/gloves are disposable, deposit in container with plastic liner.
- If outer boots/gloves are non-disposable, store in a clean, dry place.

Step 4 - Outer Garment Removal

- Remove chemical protective outer garments and deposit in an appropriate container.
- Remove hard hat and safety glasses. Decontaminate as necessary. Deposit on a clean surface.

Step 5 - Inner Glove Removal

- Remove inner gloves.
- Deposit in a container for disposal.

Step 6 - Field Wash

- Thoroughly wash hands and face with soap and water.
- Shower as soon as possible.

APPENDIX F

MEDICAL REQUIREMENTS

TABLE OF CONTENTS

			Page
1.0	MEDICAL SURVEILLANCE		F-1
	1.1	OVERVIEW	F-1
	1.2	BASELINE (NEW HIRE) MEDICAL SURVEILLANCE	F-1
	1.3	PERIODIC MEDICAL SURVEILLANCE	F-2

	1.5	EXPOSURE/INJURY/MEDICAL SUPPORT	F-2
	1.6	TERMINATION MEDICAL EVALUATION	F-2
	1.7	INFORMATION PROVIDED TO THE PHYSICIAN	F-3
	1.8	RECORD KEEPING	F-3

1.0 MEDICAL SURVEILLANCE

1.1 OVERVIEW

All CRA employees with 40-hour training participate in a medical surveillance program that meets the requirements of 29 CFR 1910.120(f). These employees carry a pocket card that indicates the date of their most recent medical exam. Employees are provided with a confidential exam and receive feedback from the examining physician. The physician's written opinion is kept on file at CRA's Corporate IH's office in St. Paul, Minnesota and is available upon request.

All CRA employees involved in field activities have been trained in the recognition of signs and symptoms that might indicate over-exposure to physical or chemical hazards during their initial 40-hour training and during annual 8-hour refresher training.

1.2 BASELINE (NEW HIRE) MEDICAL SURVEILLANCE

Baseline medical evaluations are provided to all employees without cost at the time of their 40-hour training or prior to working on sites covered by this SOP manual. The baseline evaluation includes a medical and work history with special emphasis on symptoms related to the handling of hazardous substances and health hazards. Special emphasis is placed on fitness for duty, including the ability to wear any required personal protective equipment under conditions that may be expected at a work site. The baseline medical surveillance exam consists of: medical history; vital signs; vision screening; hands on exam; blood profile including complete blood count and blood chemistry; urinalysis with a microbiological screen; pulmonary function testing consisting of FVC, FEV, FEV1, and resting EKG if deemed necessary by the physician; two-view chest x-ray and audiometry. Tetanus shots are given if needed. All results are reviewed by a contracting physician.

1.3 PERIODIC MEDICAL SURVEILLANCE

Periodic medical surveillance is conducted annually for all employees who may be requested to conduct field activities. The attending physician is responsible for determining if non CRA specified testing is required based on the medical and work history review. The same testing protocol is used as the baseline surveillance exam except for x-rays, vision screening and audiometric testing. These are performed at the discretion of the physician.

1.4 SITE-SPECIFIC MEDICAL MONITORING

In the event that CRA employees will be working on a site that has specific medical monitoring requirements not found in the annual or baseline testing (i.e., PCB, lead or pesticide monitoring), these medical evaluations will be performed on an individual basis to be determined by the attending physician. If the physician determines that the medical evaluation frequency or exam parameters should be changed, these changes will be effective immediately.

1.5 EXPOSURE/INJURY/MEDICAL SUPPORT

In the event that notification reveals that an employee has possibly been overexposed to hazardous substances or health hazards above the PEL or TLV, has been injured or has developed signs or symptoms indicating possible overexposure, an additional medical evaluation will be performed as soon as possible. The context of this exam will be determined by the attending physician who has been advised of the possible overexposure.

1.6 TERMINATION MEDICAL EVALUATION

Upon termination of employment with CRA or upon reassignment to work within the company that does not involve working on

or near hazardous waste operations, a medical evaluation is offered to the employee if one has not been completed in the past six months. This exam is similar to the baseline surveillance exam with other parameters the physician deems necessary.

1.7 INFORMATION PROVIDED TO THE PHYSICIAN

CRA has provided Occupational Medicine Consultants with a copy of the Hazardous Waste Operations and Emergency Response Standard (29 CFR 1910.120) and its appendices. Job descriptions for CRA employees, measured and anticipated exposure levels, personal protective equipment used and information from previous medical examinations are also provided.

1.8 RECORD KEEPING

CRA receives a written statement for all medical evaluations from the examining physician, documenting that the employee is qualified to work on or near hazardous waste operations and to wear respiratory protection. The employee receives a confidential letter from the physician and test results if requested. All medical records are confidentially maintained at the offices of the attending physician and are made available to employees or their designee upon written request. The physician's written opinion indicating an employee's suitability to work in hazardous waste operations and their physical ability to wear respiratory protection is maintained at CRA's Corporate IH's office in St. Paul, Minnesota.

APPENDIX G

MATERIAL SAFETY DATA SHEETS

MATERIAL SAFETY DATA SHEET

MSDS NUMBER: 721-100

SECTION 1 PRODUCT IDENTIFICATION

TRADE NAME: I.P.A. 99

MANUFACTURER/SUPPLIER'S NAME: SHELL CANADA CHEMICAL COMPANY
ADDRESS: P.O. Box 100, Station M
Calgary, Alberta
Canada
T2P 2H5 **PHONE: 403-691-3111**

SHELL EMERGENCY TELEPHONE NUMBER
BUSINESS HOURS : (403) 691-2220
AT ALL OTHER TIMES : 1-800-661-7378

CANUTEC
24 HOUR EMERGENCY TELEPHONE
(613) 996-6666

CHEMICAL SYNONYMS
Propanol-2, Isopropanol

PRODUCT USE
Organic Solvent

WHMIS CLASS AND DESCRIPTION
Class B2 Flammable Liquid
Class D2B Other Toxic Effects - Eye Irritant

CANADIAN TDG DESCRIPTION (ROAD & RAIL)
SHIPPING NAME: ISOPROPANOL
CLASS DESCRIPTION:
Class 3.2 Flammable Liquid

PACKING GROUP:
II

UN NUMBER: 1219

SECTION 2 INGREDIENTS & TOXICOLOGICAL PROPERTIES

LEGEND: CBI - CONFIDENTIAL BUSINESS INFORMATION

2A - PRODUCT & CONTROLLED INGREDIENTS

PRODUCT: I.P.A. 99 **100% VOL**
CAS# : 67-63-0 WHMIS CONTROLLED: YES

Rat	Oral	LD50	>	4720,0 mg/kg	
	Inhal.	LC50		12000,0 ppm	8,00 hrs
Rabbit	Dermal	LD50	>	12900,0 mg/kg	

EYES AND FACE
Chemical safety goggles should be worn.

SKIN (HANDS, ARMS AND BODY)
Impervious gloves (viton, nitrile) should be worn at all times when handling this material. Impervious clothing (apron, coveralls) should also be worn in confined workspaces or where the risk of skin exposure is much higher.

RESPIRATORY
If exposure exceeds occupational exposure limits, wear a NIOSH- approved respirator. Proper equipment includes an approved combination organic vapour/ particulate filter chemical cartridge respirator for low concentrations, or an atmosphere-supplied, positive pressure demand, self-contained or airline breathing apparatus for high concentrations.

MECHANICAL VENTILATION
Highly recommended for all indoor situations to control fugitive emissions. Electrical and mechanical equipment should be explosion-proof. Concentrations in air should be maintained below the recommended threshold limit value if unprotected personnel are involved.
For personnel entry into confined spaces (i.e. bulk storage tanks) a proper confined space entry procedure must be followed including ventilation and testing of tank atmosphere. Local ventilation recommended where mechanical ventilation is ineffective in controlling airborne concentrations below the recommended occupational exposure limit.
Make up air should always be supplied to balance air exhausted (either generally or locally).

SECTION 5 PREVENTATIVE MEASURES

STORAGE AND HANDLING
Flammable. Store in a cool, dry, well ventilated area, away from heat and ignition sources. Avoid breathing vapours and prolonged or repeated contact with skin. Vapours may accumulate and travel to distant ignition sources and flashback. Use explosion-proof ventilation to prevent vapour accumulation. Empty containers may contain hazardous product residues. Fixed equipment as well as transfer containers and equipment should be grounded to prevent accumulation of static charge. Can attack aluminum at elevated temperature. Launder contaminated clothing prior to reuse. Use good personal hygiene.

SPILL AND LEAK HANDLING PROCEDURES
Issue warning "Flammable". Eliminate all ignition sources. Handling equipment must be grounded. Isolate hazard area and restrict access. Try to work upwind of spill. Avoid direct contact with material. Wear appropriate breathing apparatus (if applicable) and protective clothing. Stop leak only if safe to do so. Dike and contain land spills; contain water spills by booming. Use water fog to knock down vapours; contain runoff. For large spills remove by mechanical means and place in containers. Absorb residue or small spills with absorbent material and remove to non-leaking containers for disposal. Flush area with water to remove trace residue. Dispose of recovered material as noted below. Notify appropriate environmental agency(ies).

7B - REACTIVITY DATA

HAZARDOUS COMBUSTION / DECOMPOSITION PRODUCTS
Vapour forms a flammable/explosive mixture with air between upper and lower flammable limits.
Carbon monoxide and carbon dioxide are produced on combustion.

INCOMPATIBILITY
Avoid contact with strong oxidizing agents and acids. Aluminum at high temperatures.

CONDITIONS OF REACTIVITY/INSTABILITY
Avoid excessive heat, open flames and all ignition sources.

STABLE	: YES	**SENSITIVITY TO MECHANICAL IMPACT**	: NO
HAZARDOUS POLYMERIZATION:	NO	**SENSITIVITY TO STATIC DISCHARGE**	: YES

SECTION 8 ENVIRONMENTAL DATA

REGULATIONS AND STANDARDS
No Canadian federal standards. This product, or all components, are listed on the Domestic Substances List, as required under the Canadian Environmental Protection Act.

ENVIRONMENTAL EFFECTS AND HAZARDS
Do not allow product or runoff from fire control to enter storm or sanitary sewers, lakes, rivers, streams, or public waterways. Block off drains and ditches. Provincial regulations require and federal regulations may require that environmental and/or other agencies be notified of a spill incident. Spill area must be cleaned and restored to original condition or to the satisfaction of authorities. May be harmful to aquatic life. Aquatic toxicity rating (TLm 96) =10 to 100ppm. No food chain concentration potential.

BIODEGRADABILITY
Biodegradable(fast). Rapid volatilization.

SECTION 9 LABEL INFORMATION

TRADE NAME: I.P.A. 99

WHMIS DESCRIPTION
Class B2 Flammable Liquid
Class D2B Other Toxic Effects - Eye Irritant

HAZARD STATEMENTS
Flammable Liquid. Irritating to eye.

1000 POUNDS SARA SECTION 304 REPORTABLE QUANTITY

PHYSICAL DATA

DESCRIPTION: COLORLESS TO PALE YELLOW LIQUID WITH A SUFFOCATING ODOR.

BOILING POINT: 181 F (83 C) MELTING POINT: -44 F (-42 C)

SPECIFIC GRAVITY: 1.5027 @ 25 C VAPOR PRESSURE: 47.9 MMHG @ 20 C

EVAPORATION RATE: NOT AVAILABLE SOLUBILITY IN WATER: VERY SOLUBLE

VAPOR DENSITY: 3.2

SOLVENT SOLUBILITY: SOLUBLE IN ETHER.

FIRE AND EXPLOSION DATA

FIRE AND EXPLOSION HAZARD:
NEGLIGIBLE FIRE HAZARD WHEN EXPOSED TO HEAT OR FLAME.

OXIDIZER: OXIDIZERS DECOMPOSE, ESPECIALLY WHEN HEATED, TO YIELD OXYGEN OR OTHER GASES WHICH WILL INCREASE THE BURNING RATE OF COMBUSTIBLE MATTER. CONTACT WITH EASILY OXIDIZABLE, ORGANIC, OR OTHER COMBUSTIBLE MATERIALS MAY RESULT IN IGNITION, VIOLENT COMBUSTION OR EXPLOSION.

FIREFIGHTING MEDIA:
WATER, DRY CHEMICAL OR SODA ASH
(1987 EMERGENCY RESPONSE GUIDEBOOK, DOT P 5800.4).

FOR LARGER FIRES, FLOOD AREA WITH WATER FROM A DISTANCE
(1987 EMERGENCY RESPONSE GUIDEBOOK, DOT P 5800.4).

FIREFIGHTING:
MOVE CONTAINER FROM FIRE AREA IF POSSIBLE. COOL CONTAINERS EXPOSED TO FLAMES WITH WATER FROM SIDE UNTIL WELL AFTER FIRE IS OUT. STAY AWAY FROM STORAGE TANK ENDS. FOR MASSIVE FIRE IN STORAGE AREA, USE UNMANNED HOSE HOLDER OR MONITOR NOZZLES; ELSE WITHDRAW FROM AREA AND LET FIRE BURN (1987 EMERGENCY RESPONSE GUIDEBOOK, DOT P 5800.4, GUIDE PAGE 44).

USE FLOODING AMOUNTS OF WATER AS FOG. COOL CONTAINERS WITH FLOODING AMOUNTS OF WATER, APPLY FROM AS FAR A DISTANCE AS POSSIBLE. AVOID BREATHING CORROSIVE VAPORS, KEEP UPWIND. CONSIDER EVACUATION OF DOWNWIND AREA IF MATERIAL IS LEAKING.

TRANSPORTATION DATA

DEPARTMENT OF TRANSPORTATION HAZARD CLASSIFICATION 49CFR172.101:
OXIDIZER

DEPARTMENT OF TRANSPORTATION LABELING REQUIREMENTS 49CFR172.101 AND 172.402:
OXIDIZER AND CORROSIVE

DEPARTMENT OF TRANSPORTATION PACKAGING REQUIREMENTS: 49CFR173.268

EXCEPTIONS: NONE

TOXICITY

NITRIC ACID:
TOXICITY DATA:
ANHYDROUS: 110 MG/KG UNREPORTED-MAN LDLO; REPRODUCTIVE EFFECTS DATA (RTECS
MONOHYDRATE: NO DATA AVAILABLE.
TRIHYDRATE: NO DATA AVAILABLE.
CARCINOGEN STATUS: NONE.
LOCAL EFFECTS: CORROSIVE- INHALATION, SKIN, EYES, INGESTION.
ACUTE TOXICITY LEVEL: INSUFFICIENT DATA.
TARGET EFFECTS: NO DATA AVAILABLE.
AT INCREASED RISK FROM EXPOSURE: PERSONS WITH IMPAIRED PULMONARY FUNCTION, PRE-EXISTING EYE AND SKIN DISORDERS.

HEALTH EFFECTS AND FIRST AID

INHALATION:
NITRIC ACID:
CORROSIVE. 100 PPM IMMEDIATELY DANGEROUS TO LIFE OR HEALTH.
ACUTE EXPOSURE- INHALATION OF ACIDIC SUBSTANCES MAY CAUSE SEVERE RESPIRATO IRRITATION WITH COUGHING, CHOKING, AND POSSIBLY YELLOWISH BURNS OF THE MUCOUS MEMBRANES. OTHER INITIAL SYMPTOMS MAY INCLUDE DIZZINESS, HEADACHE NAUSEA, AND WEAKNESS. PULMONARY EDEMA MAY BE IMMEDIATE IN THE MOST SEVER EXPOSURES, BUT MORE LIKELY WILL OCCUR AFTER A LATENT PERIOD OF 5-72 HOUR THE SYMPTOMS MAY INCLUDE TIGHTNESS IN THE CHEST, DYSPNEA, DIZZINESS FROTHY SPUTUM, AND CYANOSIS. PHYSICAL FINDINGS MAY INCLUDE HYPOTENSION, WEAK, RAPID PULSE, MOIST RALES, AND HEMOCONCENTRATION. IN NON-FATAL CASE COMPLETE RECOVERY MAY OCCUR WITHIN A FEW DAYS OR WEEKS OR, CONVALESCENCE MAY BE PROLONGED WITH FREQUENT RELAPSES AND CONTINUED DYSPNEA AND OTHER SIGNS AND SYMPTOMS OF PULMONARY INSUFFICIENCY. IN SEVERE EXPOSURES, DEAT DUE TO ANOXIA MAY OCCUR WITHIN A FEW HOURS AFTER ONSET OF THE SYMPTOMS O PULMONARY EDEMA OR FOLLOWING A RELAPSE.
CHRONIC EXPOSURE- DEPENDING ON THE CONCENTRATION AND DURATION OF EXPOSURE, REPEATED OR PROLONGED EXPOSURE TO AN ACIDIC SUBSTANCE MAY CAUSE EROSION THE TEETH, INFLAMMATORY AND ULCERATIVE CHANGES IN THE MOUTH, AND POSSIBL JAW NECROSIS. BRONCHIAL IRRITATION WITH COUGH AND FREQUENT ATTACKS OF BRONCHIAL PNEUMONIA MAY OCCUR. GASTROINTESTINAL DISTURBANCES ARE ALSO POSSIBLE.

FIRST AID- REMOVE FROM EXPOSURE AREA TO FRESH AIR IMMEDIATELY. IF BREATHING HAS STOPPED, GIVE ARTIFICIAL RESPIRATION. MAINTAIN AIRWAY AND BLOOD PRESSURE AND ADMINISTER OXYGEN IF AVAILABLE. KEEP AFFECTED PERSON WARM AND AT REST. TREAT SYMPTOMATICALLY AND SUPPORTIVELY. ADMINISTRATION OF OXYGEN SHOULD BE PERFORMED BY QUALIFIED PERSONNEL. GET MEDICAL ATTENTION IMMEDIATELY.

SKIN CONTACT:
NITRIC ACID:
CORROSIVE.
ACUTE EXPOSURE- DIRECT CONTACT WITH LIQUID OR VAPOR MAY CAUSE SEVERE PAIN, BURNS AND POSSIBLY YELLOWISH STAINS. BURNS MAY BE DEEP WITH SHARP EDGES AND HEAL SLOWLY WITH SCAR TISSUE FORMATION. DILUTE SOLUTIONS OF NITRIC ACID MAY PRODUCE MILD IRRITATION AND HARDEN THE EPIDERMIS

WITHOUT DESTROYING IT.
CHRONIC EXPOSURE- EFFECTS DEPEND ON THE CONCENTRATION AND DURATION OF EXPOSURE. REPEATED OR PROLONGED CONTACT WITH ACIDIC SUBSTANCES MAY RESUL IN DERMATITIS OR EFFECTS SIMILAR TO ACUTE EXPOSURE.

FIRST AID- REMOVE CONTAMINATED CLOTHING AND SHOES IMMEDIATELY. WASH AFFECTED AREA WITH SOAP OR MILD DETERGENT AND LARGE AMOUNTS OF WATER UNTIL NO EVIDENCE OF CHEMICAL REMAINS (AT LEAST 15-20 MINUTES). IN CASE OF CHEMICAL BURNS, COVER AREA WITH STERILE, DRY DRESSING. BANDAGE SECURELY, BUT NOT TOO TIGHTLY. GET MEDICAL ATTENTION IMMEDIATELY.

EYE CONTACT:
NITRIC ACID:
CORROSIVE.
ACUTE EXPOSURE- DIRECT CONTACT WITH ACIDIC SUBSTANCES MAY CAUSE PAIN AND LACRIMATION, PHOTOPHOBIA, AND BURNS, POSSIBLY SEVERE. THE DEGREE OF INJU DEPENDS ON THE CONCENTRATION AND DURATION OF CONTACT. IN MILD BURNS, THE EPITHELIUM REGENERATES RAPIDLY AND THE EYE RECOVERS COMPLETELY. IN SEVER CASES, THE EXTENT OF INJURY MAY NOT BE FULLY APPARENT FOR SEVERAL WEEKS. ULTIMATELY, THE WHOLE CORNEA MAY BECOME DEEPLY VASCULARIZED AND OPAQUE RESULTING IN BLINDNESS. IN THE WORST CASES, THE EYE MAY BE TOTALLY DESTROYED. CONCENTRATED NITRIC ACID MAY IMPART A YELLOW COLOR TO THE EYE UPON CONTACT.
CHRONIC EXPOSURE- EFFECTS DEPEND ON THE CONCENTRATION AND DURATION OF EXPOSURE. REPEATED OR PROLONGED EXPOSURE TO ACIDIC SUBSTANCES MAY CAUSE CONJUNCTIVITIS OR EFFECTS AS IN ACUTE EXPOSURE.

FIRST AID- WASH EYES IMMEDIATELY WITH LARGE AMOUNTS OF WATER, OCCASIONALLY LIFTING UPPER AND LOWER LIDS, UNTIL NO EVIDENCE OF CHEMICAL REMAINS (AT LEAST 15-20 MINUTES). CONTINUE IRRIGATING WITH NORMAL SALINE UNTIL THE PH HAS RETURNED TO NORMAL (30-60 MINUTES). COVER WITH STERILE BANDAGES. GET MEDICAL ATTENTION IMMEDIATELY.

INGESTION:
NITRIC ACID:
CORROSIVE.
ACUTE EXPOSURE- ACIDIC SUBSTANCES MAY CAUSE CIRCUMORAL BURNS WITH YELLOW DISCOLORATION AND CORROSION OF THE MUCOUS MEMBRANES OF THE MOUTH, THROAT AND ESOPHAGUS. THERE MAY BE IMMEDIATE PAIN AND DIFFICULTY OR INABILITY T SWALLOW OR SPEAK. EPIGLOTTAL EDEMA MAY RESULT IN RESPIRATORY DISTRESS AN POSSIBLY ASPHYXIA. MARKED THIRST, EPIGASTRIC PAIN, NAUSEA, VOMITING AND DIARRHEA MAY OCCUR. DEPENDING ON THE DEGREE OF ESPOHAGEAL AND GASTRIC CORROSION, THE VOMITUS MAY CONTAIN FRESH OR DARK PRECIPITATED BLOOD AND LARGE SHREDS OF MUCOSA. SHOCK WITH MARKED HYPOTENSION, WEAK, RAPID PULSE SHALLOW RESPIRATION, AND CLAMMY SKIN MAY OCCUR. CIRCULATORY COLLAPSE MAY ENSUE AND IF UNCORRECTED, LEAD TO RENAL FAILURE. IN SEVERE CASES, GASTRI AND TO A LESSER DEGREE, ESOPHAGEAL PERFORATION AND SUBSEQUENT PERITONITI MAY OCCUR AND BE ACCOMPANIED BY FEVER AND ABDOMINAL RIGIDITY. ESOPHAGEAL GASTRIC AND PYLORIC STRICTURE MAY OCCUR WITHIN A FEW WEEKS, BUT MAY BE DELAYED FOR MONTHS OR EVEN YEARS. DEATH MAY RESULT WITHIN A SHORT TIME FROM ASPHYXIA, CIRCULATORY COLLAPSE OR ASPIRATION OF EVEN MINUTE AMOUNTS LATER DEATH MAY BE DUE TO PERITONITIS, SEVERE NEPHRITIS OR PNEUMONIA. CO AND CONVULSIONS SOMETIMES OCCUR TERMINALLY.
CHRONIC EXPOSURE- DEPENDING ON THE CONCENTRATION, REPEATED INGESTION OF ACIDIC SUBSTANCES MAY RESULT IN INFLAMMATORY AND ULCERATIVE CHANGES IN T MUCOUS MEMBRANES OF THE MOUTH AND OTHER EFFECTS AS IN ACUTE INGESTION. REPRODUCTIVE EFFECTS HAVE BEEN REPORTED IN ANIMALS.

FIRST AID- DO NOT USE GASTRIC LAVAGE OR EMESIS. DILUTE THE ACID IMMEDIATELY BY DRINKING LARGE QUANTITIES OF WATER OR MILK. IF VOMITING PERSISTS, ADMINISTER FLUIDS REPEATEDLY. INGESTED ACID MUST BE DILUTED APPROXIMATELY 100 FOLD TO RENDER IT HARMLESS TO TISSUES. MAINTAIN AIRWAY AND TREAT SHOCK. (DREISBACH, HANDBOOK OF POISONING, 12TH ED.). GET MEDICAL ATTENTION IMMEDIATELY. IF VOMITING OCCURS, KEEP HEAD BELOW HIPS TO HELP PREVENT ASPIRATION.

ANTIDOTE:
NO SPECIFIC ANTIDOTE. TREAT SYMPTOMATICALLY AND SUPPORTIVELY.

REACTIVITY

REACTIVITY:
REACTS EXOTHERMICALLY WITH WATER.

INCOMPATIBILITIES:
NITRIC ACID:
- ACETIC ACID: MAY REACT EXPLOSIVELY.
- ACETIC ANHYDRIDE: EXPLOSIVE REACTION BY FRICTION OR IMPACT.
- ACETONE: MAY REACT EXPLOSIVELY.
- ACETONITRILE: EXPLOSIVE MIXTURE.
- 4-ACETOXY-3-METHOXYBENZALDEHYDE: EXOTHERMIC REACTION.
- ACROLEIN: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
- ACRYLONITRILE: EXPLOSIVE REACTION AT 90 C.
- ACRYLONITRILE-METHACRYLATE COPOLYMER: INCOMPATIBLE.
- ALCOHOLS: POSSIBLE VIOLENT REACTION OR EXPLOSION; FORMATION OF EXPLOSIVE COMPOUND IN THE PRESENCE OF HEAVY METALS.
- ALKANETHIOLS: EXOTHERMIC REACTION WITH POSSIBLE IGNITION.
- 2-ALKOXY-1,3-DITHIA-2-PHOSPHOLANE: IGNITION REACTION.
- ALLYL ALCOHOL: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
- ALLYL CHLORIDE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
- AMINES (ALIPHATIC OR AROMATIC): POSSIBLE IGNITION REACTION.
- 2-AMINOETHANOL: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
- 2-AMINOTHIAZOLE : EXPLOSIVE REACTION.
- AMMONIA (GAS): BURNS IN AN ATMOSPHERE OF NITRIC ACID VAPOR.
- AMMONIUM HYDROXIDE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
- AMMONIUM NITRATE: FORMS EXPLOSIVE MIXTURE.
- ANILINE: IGNITES ON CONTACT.
- ANILINIUM NITRATE: FORMS EXPLOSIVE SOLUTION.
- ANION EXCHANGE RESINS: POSSIBLE VIOLENT EXOTHERMIC REACTION.
- ANTIMONY: VIOLENT REACTION.
- ARSINE: EXPLOSIVE REACTION.
- ARSINE-BORON TRIBROMIDE: VIOLENT OXIDATION.
- BASES: REACTS.
- BENZENE: EXPLOSIVE REACTION.
- BENZIDINE: SPONTANEOUS IGNITION.
- BENZONITRILE: POSSIBLE EXPLOSION.
- BENZOTHIOPHENE DERIVATIVES: FORMATION OF POSSIBLY EXPLOSIVE COMPOUNDS.
- N-BENZYL-N-ETHYLANILINE: VIGOROUS DECOMPOSITION.
- 1,4-BIS(METHOXYMETHYL)2,3,5,6-TETRAMETHYLBENZENE: GAS EVOLUTION.
- BISMUTH: INTENSE EXOTHERMIC REACTION OR EXPLOSION.
- 1,3-BIS(TRIFLUOROMETHYL)BENZENE: POSSIBLE EXPLOSION.
- BORON: VIOLENT REACTION WITH INCANDESCENCE.
- BORON DECAHYDRIDE: EXPLOSIVE REACTION.
- BORON PHOSPHIDE: IGNITION REACTION.
- BROMINE PENTAFLUORIDE: IGNITION REACTION.

N-BUTYL MERCAPTAN: IGNITION REACTION.
N-BUTYRALDEHYDE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
CADMIUM PHOSPHIDE: EXPLOSIVE REACTION.
CALCIUM HYPOPHOSPHITE: IGNITION REACTION.
CARBON (PULVERIZED): VIOLENT REACTION.
CELLULOSE: FORMS EASILY COMBUSTIBLE ESTER.
CHLORATES: REACTS.
CHLORINE: INCOMPATIBLE.
CHLORINE TRIFLUORIDE: VIOLENT REACTION.
CHLOROBENZENE: POSSIBLE EXPLOSION.
4-CHLORO-2-NITROANILINE: FORMS EXPLOSIVE COMPOUND.
CHLOROSULFONIC ACID: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
COAL: EXPLOSIVE MIXTURE.
COATINGS: MAY BE ATTACKED.
CRESOL: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
CROTONALDEHYDE: VIOLENT DECOMPOSITION WITH IGNITION.
CUMENE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
CUPRIC NITRIDE: EXPLOSIVE REACTION.
CUPROUS NITRIDE: VIOLENT REACTION.
CYANATES: POSSIBLE EXPLOSIVE REACTION.
CYCLOHEXANONE: VIOLENT REACTION.
CYCLOHEXYLAMINE: FORMS EXPLOSIVE COMPOUND.
CYCLOPENTADIENE: EXPLOSIVE REACTION.
1,2-DIAMINOETHANEBIS(TRIMETHYLGOLD): EXPLOSIVE REACTION.
DIBORANE: SPONTANEOUS IGNITION.
DI-2-BUTOXYETHYL ETHER: VIOLENT DECOMPOSITION REACTION.
2,6-DI-T-BUTYL PHENOL: FORMATION OF EXPLOSIVE COMPOUND.
DICHLOROETHANE: FORMS SHOCK AND HEAT SENSITIVE MIXTURE.
DICHLOROETHYLENE: FORMS EXPLOSIVE COMPOUND.
DICHLOROMETHANE: FORMS EXPLOSIVE SOLUTION.
DICYCLOPENTADIENE: SPONTANEOUS IGNITION.
DIENES: IGNITION REACTION.
DIETHYLAMINO ETHANOL: POSSIBLE EXPLOSION.
DIETHYL ETHER: POSSIBLE EXPLOSION.
3,6-DIHYDRO-1,2,2H-OXAZINE: EXPLOSIVE INTERACTION.
DIISOPROPYL ETHER: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
DIMETHYLAMINOMETHYLFERROCENE: VIOLENT DECOMPOSITION IF HEATED.
DIMETHYL ETHER: FORMS EXPLOSIVE COMPOUND.
DIMETHYL HYDRAZINE: IGNITES ON CONTACT.
DIMETHYL SULFOXIDE + 1,4-DIOXANE: EXPLOSION.
DIMETHYL SULFOXIDE + <14% WATER: EXPLOSIVE REACTION.
DINITROBENZENE: EXPLOSION HAZARD.
DINITROTOLUENE: EXPLOSIVE REACTION.
DIOXANE + PERCHLORIC ACID: POSSIBLE EXPLOSION.
DIPHENYL DISTIBENE: EXPLOSIVE OXIDATION.
DIPHENYL MERCURY + CARBON DISULFIDE: VIOLENT REACTION.
DIPHENYL TIN: IGNITION REACTION.
DISODIUM PHENYL ORTHOPHOSPHATE: VIOLENT EXPLOSION.
DIVINYL ETHER: POSSIBLE IGNITION REACTION.
EPICHLOROHYDRIN: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
ETHANESULFONAMIDE: EXPLOSIVE REACTION.
ETHOXY-ETHYLENE DITHIOPHOSPHATE: IGNITION ON CONTACT.
N-ETHYL ANILINE: IGNITION REACTION.
ETHYLENE DIAMINE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
ETHYLENE GLYCOL: FORMS SHOCK AND HEAT SENSITIVE MIXTURE.
ETHYLENEIMINE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
5-ETHYL-2-METHYL PYRIDINE: EXPLOSIVE REACTION.
ETHYL PHOSPHINE: IGNITION REACTION.

5-ETHYL-2-PICOLINE: FORMS EXPLOSIVE COMPOUNDS.
FERROUS OXIDE (POWDERED): INTENSE EXOTHERMIC REACTION.
FLUORINE: POSSIBLE EXPLOSIVE REACTION.
FORMIC ACID: EXOTHERMIC REACTION WITH RELEASE OF TOXIC GASES.
2-FORMYLAMINO-1-PHENYL-1,3-PROPANEDIOL: POSSIBLE EXPLOSION.
FUEL OIL (BURNING): EXPLOSION.
FULMINATES: REACTS.
FURFURYLIDENE KETONES: IGNITES ON CONTACT.
GERMANIUM: VIOLENT REACTION.
GLYCEROL: POSSIBLE EXPLOSION.
GLYOXAL: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
HEXALITHIUM DISILICIDE: EXPLOSIVE REACTION.
HEXAMETHYLBENZENE: POSSIBLE EXPLOSION.
2,2,4,4,6,6-HEXAMETHYLTRITHIANE: EXPLOSIVE OXIDATION.
HEXENAL: EXPLODES ON HEATING.
HYDRAZINE: VIOLENT REACTION.
HYDRAZOIC ACID: ENERGETIC REACTION.
HYDROGEN IODIDE: IGNITION REACTION.
HYDROGEN PEROXIDE: FORMS UNSTABLE MIXTURE.
HYDROGEN PEROXIDE AND KETONES: FORMS EXPLOSIVE PRODUCTS.
HYDROGEN PEROXIDE AND MERCURIC OXIDE: FORMS EXPLOSIVE COMPOUNDS.
HYDROGEN PEROXIDE AND THIOUREA: FORMS EXPLOSIVE COMPOUNDS.
HYDROGEN SELENIDE: IGNITION REACTION.
HYDROGEN SULFIDE: INCANDESCENT REACTION.
HYDROGEN TELLURIDE: IGNITION AND POSSIBLE EXPLOSIVE REACTION.
INDANE AND SULFURIC ACID: EXPLOSIVE REACTION.
ISOPRENE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
KETONES (CYCLIC): VIOLENT REACTION.
LACTIC ACID + HYDROFLUORIC ACID: EXPLOSIVE REACTION.
LITHIUM: IGNITION REACTION.
LITHIUM SILICIDE: INCANDESCENT REACTION.
MAGNESIUM: EXPLOSIVE REACTION.
MAGNESIUM + 2-NITROANILINE: MAY IGNITE ON CONTACT.
MAGNESIUM PHOSPHIDE: INCANDESCENT REACTION.
MAGNESIUM SILICIDE: VIOLENT REACTION.
MAGNESIUM-TITANIUM ALLOY: FORMS SHOCK AND HEAT SENSITIVE MIXTURE.
MANGANESE (POWDERED): INCANDESCENCE AND POSSIBLE EXPLOSION.
MESITYL OXIDE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
MESITYLENE: POSSIBLE EXPLOSIVE REACTION.
METALS: VIOLENT REACTION WITH EXPLOSION OR IGNITION.
METAL ACETYLIDES: VIOLENT OR EXPLOSIVE REACTION.
METAL CARBIDES: VIOLENT OR EXPLOSIVE REACTION.
METAL CYANIDES: EXPLOSIVE REACTIONS.
METAL FERRICYANIDE OR FERROCYANIDE: VIOLENT REACTION.
METAL SALICYLATES: FORMS EXPLOSIVE COMPOUNDS.
METAL THIOCYANATES: POSSIBLE EXPLOSION.
2-METHYLBENZIMIDAZOLE + SULFURIC ACID: POSSIBLE EXPLOSIVE REACTION.
4-METHYLCYCLOHEXANONE: EXPLOSIVE REACTION.
2-METHYL-5-ETHYLPYRIDINE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
METHYL THIOPHENE: IGNITION REACTION.
NEODYMIUM PHOSPHIDE: VIOLENT REACTION.
NICKEL TETRAPHOSPHIDE: IGNITION REACTION.
NITRO AROMATIC HYDROCARBONS: FORMS HIGHLY EXPLOSIVE PRODUCTS.
NITROBENZENE: EXPLOSIVE REACTION, ESPECIALLY IN THE PRESENCE OF WATER.
NITROMETHANE: EXPLOSIVE REACTION.
NITRONAPHTHALENE: EXPLOSION HAZARD.
NON-METAL OXIDES : EXPLOSIVE REACTION.

OLEUM: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
ORGANIC MATERIALS: FIRE AND EXPLOSION HAZARD.
ORGANIC SUBSTANCES AND PERCHLORATES: POSSIBLE EXPLOSION.
ORGANIC SUBSTANCES AND SULFURIC ACID: POSSIBLE EXPLOSION.
PHENYL ACETYLENE + 1,1-DIMETHYLHYDRAZINE: VIOLENT REACTION.
PHENYL ORTHOPHOSPHORIC ACID DISODIUM SALT: FORMS EXPLOSIVE PRODUCTS.
PHOSPHINE + OXYGEN: SPONTANEOUS IGNITION.
PHOSPHONIUM IODIDE: IGNITION REACTION.
PHOSPHORUS (VAPOR): IGNITES WHEN HEATED.
PHOSPHOROUS HALIDES: IGNITION REACTION.
PHOSPHORUS TETRAIODIDE: VIGOROUS REACTION.
PHOSPHORUS TRICHLORIDE: EXPLOSIVE REACTION.
PHTHALIC ACID AND SULFURIC ACID: POSSIBLE EXPLOSIVE REACTION.
PHTHALIC ANHYDRIDE: EXOTHERMIC REACTION AND FORMS EXPLOSIVE PRODUCTS.
PICRATES: REACTS.
PLASTICS: MAY BE ATTACKED.
POLYALKENES: INTENSE REACTION..
POLYDIBROMOSILANES: EXPLOSIVE REACTION.
POLY(ETHYLENE OXIDE) DERIVATIVES: POSSIBLE EXPLOSION.
POLYPROPYLENE: TEMPERATURE AND PRESSURE INCREASE IN A CLOSED CONTAINER.
POLY(SILYLENE): IGNITION.
POLYURETHANE (FOAM): VIGOROUS REACTION.
POTASSIUM HYPOPHOSPHITE: EXPLOSIVE REACTION.
POTASSIUM PHOSPHINATE: EXPLODES ON EVAPORATION.
B-PROPIOLACTONE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
PROPIOPHENONE + SULFURIC ACID: EXOTHERMIC REACTION ABOVE -5 C.
PROPYLENE GLYCOL + HYDROFLUORIC ACID + SILVER NITRATE: EXPLOSIVE MIXTURE.
PROPYLENE OXIDE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
PYRIDINE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
PYROCATECHOL: IGNITES ON CONTACT.
REDUCING AGENTS: POSSIBLE EXPLOSIVE OR IGNITION REACTION.
RESORCINOL: POSSIBLE EXPLOSION.
RUBBER: VIGOROUS REACTION, POSSIBLE EXPLOSION.
SELENIUM: VIGOROUS REACTION.
SELENIUM HYDRIDE: IGNITION OR INCANDESCENT REACTION.
SELENIUM IODOPHOSPHIDE: EXPLOSIVE REACTION.
SILICON: VIOLENT REACTION.
SILICONE OIL: POSSIBLE EXPLOSION.
SILVER BUTEN-3-YNIDE: EXPLOSION.
SODIUM: SPONTANEOUS IGNITION.
SODIUM AZIDE: EXOTHERMIC REACTION.
SODIUM HYDROXIDE: TEMPERATURE AND PRESSURE INCREASE IN A CLOSED CONTAINER.
STIBINE: EXPLOSIVE REACTION.
SUCROSE (SOLID): VIGOROUS REACTION.
SULFAMIC ACID: VIOLENT REACTION WITH EVOLUTION OF TOXIC NITROUS OXIDE.
SULFIDES: REACTS.
SULFUR DIOXIDE: EXPLOSIVE REACTION.
SULFUR HALIDES: VIOLENT REACTION.
SULFURIC ACID + GLYCERIDES: EXPLOSIVE REACTION.
SULFURIC ACID + TEREPHTHALIC ACID: VIOLENT REACTION.
SURFACTANTS + PHOSPHORIC ACID: EXPLOSION HAZARD.
TERPENES: SPONTANEOUS IGNITION.
TETRABORANE: EXPLOSIVE REACTION.
TETRABORANE DECAHYDRIDE: EXPLOSIVE REACTION.
TETRAPHOSPHOROUS DIIODOTRISELENIDE: EXPLOSIVE REACTION.
TETRAPHOSPHOROUS IODIDE: IGNITES ON CONTACT.
TETRAPHOSPHOROUS TETRAOXIDE TRISULFIDE: VIOLENT REACTION.
THIOALDEHYDES: VIOLENT REACTION.

THIOKETONES: VIOLENT REACTION.
THIOPHENES: EXPLOSIVE REACTION.
TITANIUM: FORMS SHOCK-SENSITIVE COMPOUND.
TITANIUM ALLOYS: POSSIBLE EXPLOSIVE REACTION.
TITANIUM-MAGNESIUM ALLOY: POSSIBLE EXPLOSION ON IMPACT.
TOLUENE: VIOLENT REACTION.
TOLUIDENE: IGNITION REACTION.
1,3,5-TRIACETYLHEXAHYDRO-1,3,5-TRIAZINE + TRIFLUOROACETIC ANHYDRIDE: EXPLOSIVE REACTION.
TRIAZINE: VIOLENTLY EXPLOSIVE REACTION.
TRICADMIUM DIPHOSPHIDE: EXPLOSIVE REACTION.
TRIETHYLGALLIUM MONOETHYL ETHER COMPLEX: IGNITION REACTION.
TRIMETHYLTRIOXANE: INTENSE REACTION.
TRIS(IODOMERCURI)PHOSPHINE: VIOLENT DECOMPOSITION.
TRITHIOACETONE: EXPLOSIVE REACTION.
TURPENTINE: EXPLOSIVE MIXTURE.
UNSYMMETRICAL DIMETHYL HYDRAZINE: SPONTANEOUS IGNITION.
URANIUM: EXPLOSIVE REACTION.
URANIUM ALLOY: VIOLENT REACTION.
URANIUM DISULFIDE: VIOLENT REACTION.
URANIUM-NEODYMIUM ALLOYS: EXPLOSIVE REACTION.
VINYL ACETATE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
VINYLIDENE CHLORIDE: TEMPERATURE AND PRESSURE INCREASE IN CLOSED CONTAINER.
WOOD: POSSIBLE IGNITION.
P-XYLENE: INTENSE REACTION IN PRESENCE OF SULFURIC ACID.
ZINC: INCANDESCENT REACTION.
ZINC ETHOXIDE: POSSIBLE EXPLOSION.
ZIRCONIUM-URANIUM ALLOYS: EXPLOSIVE REACTION.

DECOMPOSITION:
THERMAL DECOMPOSITION PRODUCTS MAY INCLUDE TOXIC OXIDES OF NITROGEN.

POLYMERIZATION:
HAZARDOUS POLYMERIZATION HAS NOT BEEN REPORTED TO OCCUR UNDER NORMAL TEMPERATURES AND PRESSURES.

STORAGE AND DISPOSAL

OBSERVE ALL FEDERAL, STATE AND LOCAL REGULATIONS WHEN STORING OR DISPOSING OF THIS SUBSTANCE. FOR ASSISTANCE, CONTACT THE DISTRICT DIRECTOR OF THE ENVIRONMENTAL PROTECTION AGENCY.

STORAGE

PROTECT AGAINST PHYSICAL DAMAGE. SEPARATE FROM METALLIC POWDERS, CARBIDES, HYDROGEN SULFIDE, TURPENTINE, ORGANIC ACIDS, AND ALL COMBUSTIBLE, ORGANIC OR OTHER READILY OXIDIZABLE MATERIALS. PROVIDE GOOD VENTILATION AND AVOID DIRECT SUNLIGHT (NFPA 49, HAZARDOUS CHEMICALS DATA, 1975).

STORE AWAY FROM INCOMPATIBLE SUBSTANCES.

THRESHOLD PLANNING QUANTITY (TPQ):
THE SUPERFUND AMENDMENTS AND REAUTHORIZATION ACT (SARA) SECTION 302 REQUIRES THAT EACH FACILITY WHERE ANY EXTREMELY HAZARDOUS SUBSTANCE IS PRESENT IN A QUANTITY EQUAL TO OR GREATER THAN THE TPQ ESTABLISHED FOR THAT SUBSTANCE NOTIFY THE STATE EMERGENCY RESPONSE COMMISSION FOR THE STATE IN WHICH IT IS

LOCATED. SECTION 303 OF SARA REQUIRES THESE FACILITIES TO PARTICIPATE IN LOC EMERGENCY RESPONSE PLANNING (40 CFR 355.30).

DISPOSAL

DISPOSAL MUST BE IN ACCORDANCE WITH STANDARDS APPLICABLE TO GENERATORS OF HAZARDOUS WASTE, 40 CFR 262. EPA HAZARDOUS WASTE NUMBER D002.

****

CONDITIONS TO AVOID

MAY IGNITE OTHER COMBUSTIBLE MATERIALS (WOOD, PAPER, OIL, ETC.). REACTS VIOLENTLY WITH WATER AND FUELS. FLAMMABLE, POISONOUS GASES MAY ACCUMULATE IN TANKS AND HOPPER CARS. RUNOFF TO SEWER MAY CREATE FIRE OR EXPLOSION HAZARD.

CONSULT NFPA PUBLICATION 43A, STORAGE OF LIQUID AND SOLID OXIDIZING MATERIALS FOR STORAGE REQUIREMENTS.

****

SPILL AND LEAK PROCEDURES

SOIL SPILL:
DIG A HOLDING AREA SUCH AS A PIT, POND OR LAGOON TO CONTAIN SPILL AND DIKE SURFACE FLOW USING BARRIER OF SOIL, SANDBAGS, FOAMED POLYURETHANE OR FOAMED CONCRETE. ABSORB LIQUID MASS WITH FLY ASH OR CEMENT POWDER.

NEUTRALIZE SPILL WITH SLAKED LIME, SODIUM BICARBONATE OR CRUSHED LIMESTONE.

AIR SPILL:
APPLY WATER SPRAY TO KNOCK DOWN AND REDUCE VAPORS. KNOCK-DOWN WATER IS CORROSIVE AND TOXIC AND SHOULD BE DIKED FOR CONTAINMENT AND LATER DISPOSAL.

WATER SPILL:
ADD SUITABLE AGENT TO NEUTRALIZE SPILLED MATERIAL TO PH-7.

OCCUPATIONAL SPILL:
KEEP COMBUSTIBLES (WOOD, PAPER, OIL, ETC.) AWAY FROM SPILLED MATERIAL. DO NOT TOUCH SPILLED MATERIAL. STOP LEAK IF YOU CAN DO IT WITHOUT RISK. USE WATER SPRAY TO REDUCE VAPORS. DO NOT GET WATER INSIDE CONTAINER. FOR SMALL SPILLS, FLUSH AREA WITH FLOODING AMOUNTS OF WATER. FOR LARGER SPILLS, DIKE FAR AHEAD OF SPILL FOR LATER DISPOSAL. KEEP UNNECESSARY PEOPLE AWAY. ISOLATE HAZARD AREA AND DENY ENTRY. VENTILATE CLOSED SPACES BEFORE ENTERING.

REPORTABLE QUANTITY (RQ): 1000 POUNDS
THE SUPERFUND AMENDMENTS AND REAUTHORIZATION ACT (SARA) SECTION 304 REQUIRES THAT A RELEASE EQUAL TO OR GREATER THAN THE REPORTABLE QUANTITY FOR THIS SUBSTANCE BE IMMEDIATELY REPORTED TO THE LOCAL EMERGENCY PLANNING COMMITTEE AND THE STATE EMERGENCY RESPONSE COMMISSION (40 CFR 355.40). IF THE RELEASE OF THIS SUBSTANCE IS REPORTABLE UNDER CERCLA SECTION 103, THE NATIONAL RESPONSE CENTER MUST BE NOTIFIED IMMEDIATELY AT (800) 424-8802 OR (202) 426-2675 IN THE METROPOLITAN WASHINGTON, D.C. AREA (40 CFR 302.6).

PROTECTIVE EQUIPMENT

VENTILATION:
PROVIDE LOCAL EXHAUST OR PROCESS ENCLOSURE VENTILATION TO MEET PUBLISHED EXPOSURE LIMITS.

RESPIRATOR:
THE FOLLOWING RESPIRATORS AND MAXIMUM USE CONCENTRATIONS ARE RECOMMENDATIONS BY THE U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES, NIOSH POCKET GUIDE TO CHEMICAL HAZARDS OR NIOSH CRITERIA DOCUMENTS; OR DEPARTMENT OF LABOR, 29CFR1910 SUBPART Z.
THE SPECIFIC RESPIRATOR SELECTED MUST BE BASED ON CONTAMINATION LEVELS FOUND IN THE WORK PLACE AND BE JOINTLY APPROVED BY THE NATIONAL INSTITUTE OF OCCUPATIONAL SAFETY AND HEALTH AND THE MINE SAFETY AND HEALTH ADMINISTRATION

NITRIC ACID:

125 MG/M3- ANY SUPPLIED-AIR RESPIRATOR OPERATED IN A CONTINUOUS-FLOW MODE.

250 MG/M3- ANY SELF-CONTAINED BREATHING APPARATUS WITH A FULL FACEPIECE.
ANY SUPPLIED-AIR RESPIRATOR WITH A FULL FACEPIECE.
ANY AIR-PURIFYING FULL FACEPIECE RESPIRATOR (GAS MASK) WITH A CHIN-STYLE OR FRONT-OR BACK-MOUNTED CANISTER PROVIDING PROTECTI AGAINST NITRIC ACID.
ANY CHEMICAL CARTRIDGE RESPIRATOR WITH A FULL FACEPIECE AND CARTRIDGE(S) PROVIDING PROTECTION AGAINST NITRIC ACID.

ESCAPE- ANY AIR-PURIFYING FULL FACEPIECE RESPIRATOR (GAS MASK) WITH A CHIN-STYLE OR FRONT-OR BACK-MOUNTED CANISTER PROVIDING PROTECTI AGAINST NITRIC ACID.
ANY APPROPRIATE ESCAPE-TYPE SELF-CONTAINED BREATHING APPARAT .

NOTE: ONLY NON-OXIDIZABLE SORBENTS ARE ALLOWED (NOT CHARCOAL).

FOR FIREFIGHTING AND OTHER IMMEDIATELY DANGEROUS TO LIFE OR HEALTH CONDITION

SELF-CONTAINED BREATHING APPARATUS WITH FULL FACEPIECE OPERATED IN PRESSUR DEMAND OR OTHER POSITIVE PRESSURE MODE.

SUPPLIED-AIR RESPIRATOR WITH FULL FACEPIECE AND OPERATED IN PRESSURE-DEMAN OR OTHER POSITIVE PRESSURE MODE IN COMBINATION WITH AN AUXILIARY SELF-CONTAINED BREATHING APPARATUS OPERATED IN PRESSURE-DEMAND OR OTHER POSITIVE PRESSURE MODE.

CLOTHING:
EMPLOYEE MUST WEAR APPROPRIATE PROTECTIVE (IMPERVIOUS) CLOTHING AND EQUIPMEN TO PREVENT ANY POSSIBILITY OF SKIN CONTACT WITH THIS SUBSTANCE.

GLOVES:
EMPLOYEE MUST WEAR APPROPRIATE PROTECTIVE GLOVES TO PREVENT CONTACT WITH THI SUBSTANCE.

EYE PROTECTION:
EMPLOYEE MUST WEAR SPLASH-PROOF OR DUST-RESISTANT SAFETY GOGGLES AND A FACESHIELD TO PREVENT CONTACT WITH THIS SUBSTANCE. CONTACT LENSES SHOULD NOT BE WORN.

EMERGENCY WASH FACILITIES:

WHERE THERE IS ANY POSSIBILITY THAT AN EMPLOYEE'S EYES AND/OR SKIN MAY BE EXPOSED TO THIS SUBSTANCE, THE EMPLOYER SHOULD PROVIDE AN EYE WASH FOUNTAIN AND QUICK DRENCH SHOWER WITHIN THE IMMEDIATE WORK AREA FOR EMERGENCY USE.

1.0 RESPIRATORY PROTECTION

1.1 PRACTICE

The primary control of respiratory hazards shall be accomplished, whenever feasible, through the use of engineering controls, hazard substitution, revised work practices or other administrative controls. However, when such controls are not feasible, appropriate respiratory protection shall be used in accordance with the procedures established in this SOP. Any deviation from the requirements set forth must have approval from an IH.

1.1.1 Authorization

CRA employees requiring respiratory protection must have authorization from an IH. Office management shall notify an IH of respirator needs. The work situation will then be assessed and a respirator will be issued based on the hazard(s) the individual is exposed to. Reassessment of the hazard and the individual's needs will be repeated periodically.

1.1.2 Medical Surveillance

All personnel designated to use respirators must successfully complete a physical exam as part of the medical requirements placed on persons exposed to hazardous substances and for users of respiratory protection (29 CFR 1910.134 and 1910.120). The medical exam will be repeated annually. All medical data will be reviewed by a consulting occupational physician. The physician will generate a written opinion on the suitability of the employee to wear a respirator.

1.1.3 Air Quality

When air supplied respirators are used, the breathing air shall meet the Compressed Gas Association (CGA-CG7.1) Standards for Grade D breathing air or better.

1.1.4 Air Cylinders

Cylinders used to supply breathing air are tested and maintained as prescribed in Shipping Container Specifications (49 CFR 178). SCBA cylinders are approximately 2,400 psi pressure when full. Compressed air cylinders are visually inspected annually and hydrostatically tested once every five years for steel cylinders and once every three years for composite cylinders. These test dates are stamped on the cylinder for future reference.

1.2 FIT TESTING

1.2.1 Qualitative or Quantitative Fit Testing

Fit testing of the respirator will be conducted by an IH or other designated, trained personnel following the medical evaluation. All users of respirators must be fit tested to assure proper protection. Only the brand and size a person is fitted for is allowed to be used in the field. DO NOT SUBSTITUTE RESPIRATORS FOR A BRAND AND SIZE THAT YOU HAVE NOT BEEN PROPERLY FITTED FOR. The fit test will be accomplished by the use of irritant smoke (stannic chloride aerosol), Isoamyl Acetate using a standardized testing protocol or quantitatively. Records will be maintained by the Corporate IH with copies available in CRA field offices for audit purposes. After fit testing, the employee will be issued an authorization card. This card serves as a reference for the proper type of respirator to use as well as prima facie proof of proper medical and training clearance for regulatory purposes. The user shall have the card available at any time when on CRA business where respiratory protection is used or hazardous waste cleanup sites are being entered.

1.2.2 Positive and Negative Fit Testing

All personnel will be instructed in the proper method of testing respirator fit by use of the **Positive and Negative** pressure test. This test is to be done by the user each and every time a respirator is donned. This test is performed to help the wearer assess respirator function and find gross leaks between the face and facepiece. This positive-negative pressure test checks the presence and functioning of the respirator valves as well as leakage that may occur due to improper cartridge seal or respirator face fit. This test is required by U.S. Regulation 29 CFR 1910.134 prior to each use of any respirator in a contaminated atmosphere.

1.2.2.1 Positive Pressure

1) Block off the exhalation valve cover openings.

   MSA: Exhalation valve cover can be blocked with the palm of the hand.

   Scott: Exhalation valve covers have front openings as well as four small side openings. These openings are difficult to block off with the hands. However, a small piece of flexible material such as Saran wrap or latex can be used.

   North: Exhalation valve cover has long narrow openings around its perimeter. These can be blocked by encircling the fingers around the valve cover.

2) The person exhales gently, creating a slight positive pressure within the facepiece. The positive pressure should be maintained for at least 10 seconds.

3) If no outward leakage is detected, the person has passed the test.

4) If leakage is detected (usually felt as a cool sensation against the skin or a loss of pressure), the respirator is either malfunctioning or a gross leak between the face and facepiece is present. The following should be done when a failure occurs: Re-don or readjust the respirator.

If the facepiece continues to lose pressure, although previous positive or negative pressure tests performed with that respirator had passed, it is probably malfunctioning. Consult Industrial Hygiene. It is also possible that there are new scars or wrinkles, beard growth, missing teeth or dentures, significant weight gain or loss, etc. to cause gross leakage into the facepiece. When such new conditions exist, reevaluation of the respirator in a test atmosphere is necessary.

1.2.2.2 Negative Pressure

1) Block off the respirator cartridge inlet openings.

MSA: Cartridges can be blocked with the palms of the hands or with disposable latex gloves.

Scott: Cartridges can be blocked by using the palms of the hands or with gloves.

North: Cartridges can be blocked only with gloves.

2) Inhale gently, holding the negative pressure for at least 10 seconds.

3) If no inward leakage of air is detected, the person has passed the test.

4) If leakage is detected, see 4) above.

1.2.3 Exceptions

1.2.3.1 Facial Hair

Any individual with facial hair which protrudes into the sealing surface of the masks will be refused fitting. Fitting, issuance, and use will be based on clean shaven faces only. Employees with facial hair which interferes with respirator fit are not permitted to work at sites where respiratory protection must be worn.

1.2.3.2 Glasses

Employees who wear prescription glasses and must wear a full face respirator shall be fitted with special eyeglass adapters. Contact lenses are not permitted to be worn with any type of respiratory protection.

1.3 TRAINING

Proper training of respirator users is required to insure that all respirators will provide adequate protection against respiratory hazards and so that the user will understand the device's limitations. The training will include the following elements:

1) An explanation of the nature of respiratory hazards and what may happen if the respirator is not used properly.

2) A description of what engineering and administrative controls may be utilized to reduce the effects of the respiratory hazard and why respirators are required.

3) An explanation of the various types of respirators and why specific types have been selected.

4) A discussion of the function, capabilities and limitations of respirator cartridges.

5) Instruction in the inspection, fit and maintenance of the respirator.

6) Instructions in recognizing and handling emergency situations.

1.4 MAINTENANCE AND CARE OF RESPIRATORS

A program for the maintenance and care of respirators will include the following:

1) Inspection for defects;
2) Cleaning and disinfecting;
3) Repair/miscellaneous maintenance; and
4) Storage.

1.4.1 Inspection for Defects

Employees shall inspect their respirators before each use. A respirator that is not routinely used but is kept ready for emergency use shall be inspected after each use and at least monthly to assure that it is in satisfactory condition. SCBA shall be inspected monthly if kept for emergency response (i.e., long duration site remediation).

Inspection shall include a check of the tightness of the connections and the condition of the face piece, headbands, valves, breathing tubes and canisters. Rubber or elastic parts shall be inspected for pliability and signs of deterioration. Any respirator with worn or defective parts will be immediately taken out of service.

Before and after each use, respirators will be inspected for the following:

1) Tightness of connections and condition of the facepiece;

2) The headstraps or head harness should be examined for: breaks, loss of elasticity, broken or malfunctioning buckles and attachments, and excessively worn head-harness serrations that might permit slippage;

3) Valves and valve seats;

4) Connecting tube and canisters, air or oxygen cylinders;

5) Rubber or elastomer parts for pliability and deterioration; and

6) Regulators, fittings and gauges.

The following contains inspection information for various types of respirators.

Air Purifying Respirators

1) Check rubber facepiece for dirt, pliability of rubber, deterioration and cracks, tears, holes or distortion from improper storage.

2) Check straps for breaks, tears, loss of elasticity, broken snaps and proper tightness.

3) Check valves (exhalation and inhalation) for holes, warpage, cracks, etc. After removing its cover, the exhalation valve should be examined for: foreign material, distortion, defective or missing valve cover or improper installation of valve into the valve seat.

4) Check filters or cartridges for dents, corrosion, etc. (loose or missing gaskets, improperly seated cartridges).

5) Check for cracked or badly scratched lenses in full facepieces; incorrectly mounted lens, broken or missing mounting clips.

Atmosphere-Supplying Respirators

1) Check appropriate items above.

2) Check air supply system for breaks or kinks in supply hoses and detachable coupling attachments.

3) Follow manufacturer's recommendations for the specific equipment.

4) Check air supply level and warning devices.

1.4.2 Cleaning and Disinfecting

The respirator must be washed after each day's use. If the respirator is shared it must also be disinfected according to the manufacturer's instructions. Organic solvents of any kind must not be used for cleaning. Air purifying filters must not be wetted.

1.4.2.1 Cleaning

1) Remove any filters, cartridges or canisters and, if required by the manufacturer, straps and speaking diaphragms from the facepiece. Remove regulators on airline or SCBA.

2) Wash respirator parts excluding cartridges and canisters in warm (not to exceed 140°F), soapy water or in a product specifically designed by respirator manufacturers for this purpose. A plastic bristle hand brush may be helpful in removing dirt from respirator parts.

3) Rinse all parts thoroughly in warm water.

4) Air dry all parts.

5) Reassemble the respirator and insert new cartridges if needed.

6) Place the respirator in a plastic bag or container and seal it for storage. The respirator facepiece should be stored in its normal position so as not to distort the elastomer.

1.4.2.2 Disinfection

1) Disinfection should be done with a cleaner/disinfection agent purchased from the respirator vendor. If that material is not available the following NIOSH procedures can be followed:

   a) Immerse the respirator body for two minutes in a 50 ppm chlorine solution (about 2 mL bleach to 1 liter of water). Rinse thoroughly in clean water and air dry.

   b) Immerse the respirator body for two minutes in an aqueous solution of iodine (add 0.8 mL of iodine in 1 liter water). The iodine is about 7% ammonium and potassium iodide, 45% alcohol and 48% water. Rinse thoroughly in clean water and air dry.

2) Immersion times have to be limited to minimize damage to the respirator. The solutions can age rubber and rust metal parts.

   NOTE: The air-purifying elements must be removed from the respirator prior to cleaning and sanitizing the respirator. Never allow the air-purifying elements to come in contact with water or cleaning/sanitizing solution.

1.4.3 Storage

Respirators must be stored to protect them from contamination and mechanical damage at all times when not in use. New, cleaned or reconditioned respirators are to be kept in a clean, sealed plastic bag

or container, stored in a normal position. A suitable cabinet or drawer should be used to protect respirators and supplies from dirt, extremes of temperature, or bright sunlight. They are not to be left in vehicles or on site perimeter fences, in change sheds, etc.

APPENDIX I

CONFINED SPACE ENTRY

TABLE OF CONTENTS

Page

1.0 CONFINED SPACE ENTRY I-1
1.1 DEFINITIONS I-1
1.2 RESPONSIBILITIES I-5
1.2.1 Responsibilities of the Project Manager (PM) I-5
1.2.2 Responsibilities of the Site Health and Safety Officer (HSO) for Confined Space Entry I-5
1.3 RESPONSIBILITIES OF THE PERSON(S) AUTHORIZING OR IN CHARGE OF ENTRY I-7
1.3.1 Responsibilities of the Attendant I-7
1.4 CONFINED SPACE ENTRY LIMITATIONS I-8
1.5 CONFINED SPACE ENTRY TO LOW HAZARD SPACES I-9
1.5.1 Role of the HSO for Low Hazard Spaces I-9

1.0 CONFINED SPACE ENTRY

1.1 DEFINITIONS

Attendant	An individual who is stationed outside of a confined space for the duration of the entry. The attendant monitors the entrants and performs air monitoring. The attendant is responsible to summon emergency assistance if needed.
Authorized Entrant	An individual who is authorized by CRA or their respective employers to enter a confined space.
Confined Space	(1) is large enough and so configured that an employee can bodily enter and perform assigned work; (2) has limited or restricted means for entry or exit (for example, tanks, vessels, silos, storage bins, hoppers, vats, pits, sewers, leachate collection sumps, trenches, etc. that have limited means of entry); and (3) is not designated for continuous employee occupancy. Depths may vary but the rule of thumb is anything deeper than four feet or if the face may break the plane of the space.
Engulfment	Means the surrounding and effective capture of a person by a liquid or finely divided (flowable) solid substance that can be aspirated to cause death by filling or plugging the respiratory system or that can exert enough force on the body to cause death by strangulation, constriction or crushing.
Entry	The action by which a person passes through an opening into a confined space. Entry includes ensuing work activities in that space and is considered to have occurred as soon as any part of the entrant's body breaks the plane of an opening into the space.

Entry Permit (permit)

The written or printed document that is provided by the employer to allow and control entry into a confined space and that contains the following information:

- The space to be entered;
- The purpose of the entry;
- The date and the authorized duration of the entry permit;
- The authorized entrants within the space by name as will enable the attendant to determine quickly and accurately who is inside of the space;
- The name of the attendant;
- The name of the entry supervisor (usually the HSO);
- The hazards of the space to be entered;
- The measures used to isolate the space to eliminate or control hazards before entry;
- The acceptable entry conditions;
- The results of the initial and periodic tests performed, accompanied by the name or initials of the tester;
- The rescue and emergency services phone numbers;
- The communication procedures to be used to contact the entrants during entry;
- PPE, test equipment and rescue equipment;
- Any additional permits, such as hot work permits, necessary in the space.

CRA's entry permit is attached to the end of this section.

Entry Supervisor	The person responsible for determining if acceptable entry conditions are present at the confined space where entry is planned, for authorizing entry and overseeing entry operations. This is usually the site HSO.
Hazardous Atmosphere	Means an atmosphere that may expose employees to the risk of death, incapacitation, impairment of ability to self-rescue, injury or acute illness from one or more of the following causes: (1) Flammable gas, vapor or mist in excess of 10 percent of its lower flammable limit (LFL); (2) Airborne combustible dust at a concentration that meets or exceeds its LFL; (3) Atmospheric oxygen concentration below 19.5 percent or above 23.5 percent; (4) Atmospheric concentration of any substance for which a PEL or TLV is published and may be exceeded; (5) Any other condition that is IDLH.
Hot Work Permit	Means the employer's written authorization to perform operations (for example, riveting, welding, cutting, burning and heating) capable of providing a source of ignition.
Isolation	A process by which a confined space is removed from service and completely protected against the release of energy and material into the space by such means as blanking or blinding; misaligning or removing sections of pipe or ducts; lockout or tagout of all sources of energy; or blocking or disconnecting all mechanical linkages.

Immediately Dangerous to Life or Health (IDLH)	Any condition that poses an immediate or delayed threat to life or that would cause irreversible adverse health effects or that would interfere with an individual's ability to escape unaided from a confined space.
Non-Permit Confined Space	Means a confined space that does not contain or, with respect to atmospheric hazards, have the potential to contain any hazard capable of causing death or serious physical harm. This situation must be verified by an IH.
Oxygen Deficient Atmosphere	An atmosphere containing less than 19.5 percent oxygen.
Oxygen Enriched Atmosphere	An atmosphere containing more than 23.5 percent oxygen.
Permit Required Confined Space	A confined space that has one or more of the following characteristics: (1) Contains or has a potential to contain a hazardous atmosphere; (2) Contains a material that has the potential for engulfing the entrant; (3) Has an internal configuration such that an entrant could be trapped or asphyxiated by inwardly converging walls or by a floor which slopes downward and tapers to a smaller cross-section; or (4) Contains any other recognized serious safety or health hazard.
Prohibited Condition	Any condition in a confined space that is not allowed by the permit during the period when entry is authorized.

1.2 RESPONSIBILITIES

1.2.1 Responsibilities of the Project Manager (PM)

During the early project/work design phase, it is the Project Manager's (PM's) responsibility to confer with CRA's IH to define the logistical, equipment and manpower requirements necessary to execute a safe confined space entry and exit. The sooner the IH is apprised of the situation the better, as certain requirements may be necessary which will impact the complexity of the contract.

1.2.2 Responsibilities of the Site Health and Safety Officer (HSO) for Confined Space Entry

The HSO is to review the HASP to confirm that the identity of each confined space where activity is to take place on site has been noted. A confined space is defined as any tank, vessel, silo, storage bin, manhole, hopper, vault, pit, trench, diked area or any other enclosed space with limited means of egress or entry that meets either of the following criteria:

- Contains an actually or potentially hazardous atmosphere or other recognized safety or health hazard.
- Contains the potential for engulfment by particulate matter or liquid.

Prior to the start of site activities, the HSO is to:

- Assure the availability and use of all personal protective equipment (PPE) and clothing necessary for safe entry.
- Assure that rescue and safety related equipment, such as lifting or retrieval devices, are readily available prior to entry.

- Provide for and require the use of retrieval lines or equivalent equipment to make non-entry rescues possible.

- Provide appropriate vehicle and pedestrian guards, barriers or other means to protect the entry party and attendants from local traffic hazards and to protect non-entering personnel and traffic from hazards arising from the confined space.

- Verify all employees authorized or allowed to enter any confined space have been trained in permit entry confined spaces.

- Determine actual and potential hazards associated with the space at the time of entry and choose the appropriate means to execute a safe entry.

- Assure all necessary control measures are completed:
  - Isolation (i.e., lock-out, blanking, disconnections, etc.)
  - Space preparation (i.e., cleaning, purging, inert atmosphere in place, etc.)

- Assure, by appropriate testing, that the control measures used are effective. Assure proper calibration of monitoring equipment.

- Determine and evaluate the source of any atmospheric contamination found at the time of entry.

- Provide an attendant for each permit entry of a confined space unless this entry constitutes a low hazard, below-ground chamber as defined later in this SOP, in which case a non-attendant entry is permitted provided all of the requirements set for non-attendant entry, as detailed later in this SOP, are met.

- Complete the Confined Space Entry Permit. Identify by job title or name those persons who must sign the entry permit and the duties of each, including the person in charge of entry. The Permit is valid for no more than one shift or one confined space. Keep expired Permits on file with other site documents.

1.3 RESPONSIBILITIES OF THE PERSON(S) AUTHORIZING OR IN CHARGE OF ENTRY

The authorizing person is to:

- Verify that the necessary pre-entry conditions, including atmospheric gas levels, are measured and recorded on the Confined Space Entry Permit.
- Verify that the means for summoning emergency assistance is operable and is on the Permit.
- Complete all portions of the Permit and assure that the pre-entry and authorizing signature portions of the Permit are completed before any employee enters a confined space.
- Terminate the entry upon becoming aware of a non-permitted condition.
- Serve as attendant if another qualified person is not available.

1.3.1 Responsibilities of the Attendant

The attendant is to:

- Remain outside the confined space. **UNDER NO CIRCUMSTANCES IS THE ATTENDANT TO ENTER THE CONFINED SPACE, EVEN IN AN EMERGENCY, UNTIL HELP ARRIVES.**
- Not leave for any reason while entry continues, except for self-preservation, unless replaced by a qualified individual.
- Maintain continuous communication with all authorized entrants within the confined space by voice, radio, telephone, visual observation or other equally effective means.

- Order entrants to exit the space at the first indication of an unexpected hazard, indication of a toxic reaction, unusual conduct of entrants or external situation that could pose a hazard to the entrants.

- Know the procedure and have the means to summon immediate emergency assistance.

- Not allow anyone to enter the space to affect a rescue unless that person is wearing appropriate PPE, including a safety belt or harness with a lifeline and the necessary respiratory protection.

- Warn unauthorized persons not to enter or to exit immediately if they have entered.

- Assist in handling tools and materials, relaying messages, prevent fouling of airlines and lifelines in use.

1.4 CONFINED SPACE ENTRY LIMITATIONS

The HSO is to allow entry into confined spaces only if all of the following criteria are met:

- No other non-entry procedure can be used to complete the necessary work.

- There is no danger of engulfment.

- At least one of the following items is in place:

  - The space has been ventilated using a mechanically powered ventilator for a period of time not less than that specified in the ventilation nomograph for that ventilator and that the ventilation continues throughout the entry.

- A combination of appropriate atmospheric testing and mechanically powered ventilation is used.

- Appropriate continuous atmospheric testing assures that permit conditions are maintained.

Non-attendant confined space entries are not permitted except to low hazard spaces as detailed later in this SOP.

1.5 CONFINED SPACE ENTRY TO LOW HAZARD SPACES

A low hazard confined space is defined as a space where there is no danger of engulfment and where the atmosphere can not become IDLH. An atmosphere can be considered IDLH if the level of oxygen drops below 19.5% or goes above 23.5%, the level of airborne contaminants exceeds 10% LEL or the level of airborne contaminants exceeds the action level of the protection in use.

1.5.1 Role of the HSO for Low Hazard Spaces

The HSO can allow non-attendant entries into a low hazard space provided all of the following conditions are met and a permit is filled out:

- There is no danger of engulfment.

- The atmosphere can not become IDLH.

- There is no possibility of exceeding TLV levels.

- The atmosphere in the space is tested prior to entrance for oxygen level, combustible gases and organic vapors and meets the following criteria:

- Oxygen level 19.5% to 23.5%
- Combustible gas level <10% LEL
- Organic vapor level 0 or background

- Atmospheric testing for oxygen and combustibles continues for the entire duration of the entrance and the organic vapor level is monitored on a regular basis and does not exceed TLV levels.

- **An IH has approved and given permission to proceed without an attendant.**

CRA CONFINED SPACE ENTRY PERMIT

Site Name/Location/Ref. No.: _____

Work Activity: _____

Duration: _____ Issue Date: _____ Time: _____ Filled out by: _____

Potential Hazards:

Reference: Geohydrologic Study - P.O. TK000916

Dear Mr. Harrett:

Enclosed with this letter are three copies of our report on the geohydrologic study we performed for you at your main manufacturing complex.

The results of the study indicate a remote possibility for the off-site migration of any accidental loss of contaminants that may occur. Comparison of the analysis of GM well #6 with analyses of other GM wells, as well as from nearby subdivision wells, indicates a slight degree of water quality degradation due to sulfates and chlorides. These may have originated from GM operations, or from a nearby off-site illegal hazardous waste site. Location of the origin of this abnormality and its areal extent, as well as the determination of any local groundwater contaminants at individual locations of interest, would require the installation of monitoring wells specifically for this purpose.

We have tentatively planned to meet with you on Friday, October 30th, at 11:00 a.m., to discuss the findings of this study. If this date is not suitable, please let either Ross Overby or me know so that a new date may be made.

Very truly yours,

CAMP DRESSER & McKEE

1.0 Introduction

On Monday, August 28, 1981, CDM initiated an investigation of the groundwater system under and in the immediate vicinity of the General Motors Truck and Coach Division Plant in Pontiac, Michigan. This study was directed toward determining the ground-water flow directions and gradients induced by the utilization of a ground-water supply by GM and a nearby subdivision. Knowledge of ground-water flow directions is valuable in assisting in the preservation of the local and regional ground-water quality because most pollutants migrate in tandem with the groundwater. Additionally, CDM related the locations of potential ground-water pollution sources to the ground-water flow in the aquifer system to evaluate potential impact should containment of the materials ever fail.

Also, on the above date, CDM met with Mr. Dan Harrett at GM's Pontiac Plant to aquire and discuss the existing well and boring data and information concerning potential pollution point sources. Photocopies of the data were brought back to CDM's Milwaukee office for in-depth study. The well data consisted of logs from GM's active and discontinued water supply wells, test holes and the log from the north well servicing a subdivision located just south of the plant. Data for the south well servicing the subdivision was obtained over the phone from the Michigan Department of Health. Foundation borings were also reviewed for pertinent information. From the data, CDM was able to characterize the subsurface conditions, aquifer performance and important hydrologic factors which were utilized in a mathematical simulation of the effects on the groundwater system induced by GM's and the nearby subdivision's utilization of a groundwater supply. This report presents the results of the investigation. A glossary of hydrologic terms used in this report is contained in Appendix A.

2.0 Geologic Setting

The surficial materials under the Plant site are glacial deposits derived from the glacial periods concluding approximately 10,000 years ago. From the land surface down to an approximate depth of 150 feet, the materials are predominantly clay tills comprised of a mixture of clay,

silt, sand, and gravel. Clay till generally has a low to very low permeability. Within the clay till numerous sand lenses and/or glacial outwash channels are found. These sand deposits are potentially low to moderate capacity aquifers, however, the data reviewed for this study indicated only one of the lenses is being used as a water supply. The largest sand lense identified was found in the vicinity of Well #7 located near Building 43 (See Figure 1). The depth to this sand lense is 119 feet and the lense is approximately 7 feet thick. The extent of this lense is unknown, but the geologic data available indicates that it is of limited extent. There is some confusion on the well log whether or not this lense is being utilized for a water supply. Contradictory statements are made as to the screening of this aquifer. However for the purpose of this study, it was assumed that this lense is being utilized. In the vicinity of Buildings 48, 28, and 17 (Figure 1), east of the existing coal pile and west of Parking Lot G, the clay till deposits entend to depths greater than 150 feet. Data from Test Hole Number 3, located near the southwest corner of Building 13 (Figure 1), indicate that the clay till in this area extends to a depth of 350 feet or more. This clay till "Block" has important hydrologic characteristics and effects which are discussed in Section 3.2 of this report. A moderately thin, 10 to 25 foot thick medium sand to fine sand aquifer is located at an approximate depth of 150 feet. This aquifer is somewhat extensive, excluding the clay "Block" area, and is utilized as a water supply by GM and the subdivision south of the Plant. Underlying this aquifer, from an approximate depth of 175 feet down to approximately 230 feet, is a depositional sequence of clay till which would not be considered an aquifer. Underlying this second clay till sequence from a depth of approximately 230 feet to approximately 270 feet is another aquifer comprised of medium coarse sand and gravel. This aquifer is also utilized as a water supply by GM and the subdivision. This is the lowest aquifer utilized by GM and it is underlain by clay of an undetermined thickness.

The ground-water levels under the Plant site are highly variable and probably represent perched water. Typical ground-water levels obtained from foundation borings with a typical depth of 30 feet range from zero feet near the eastern part of the Plant to depths of 6 to 10 feet.

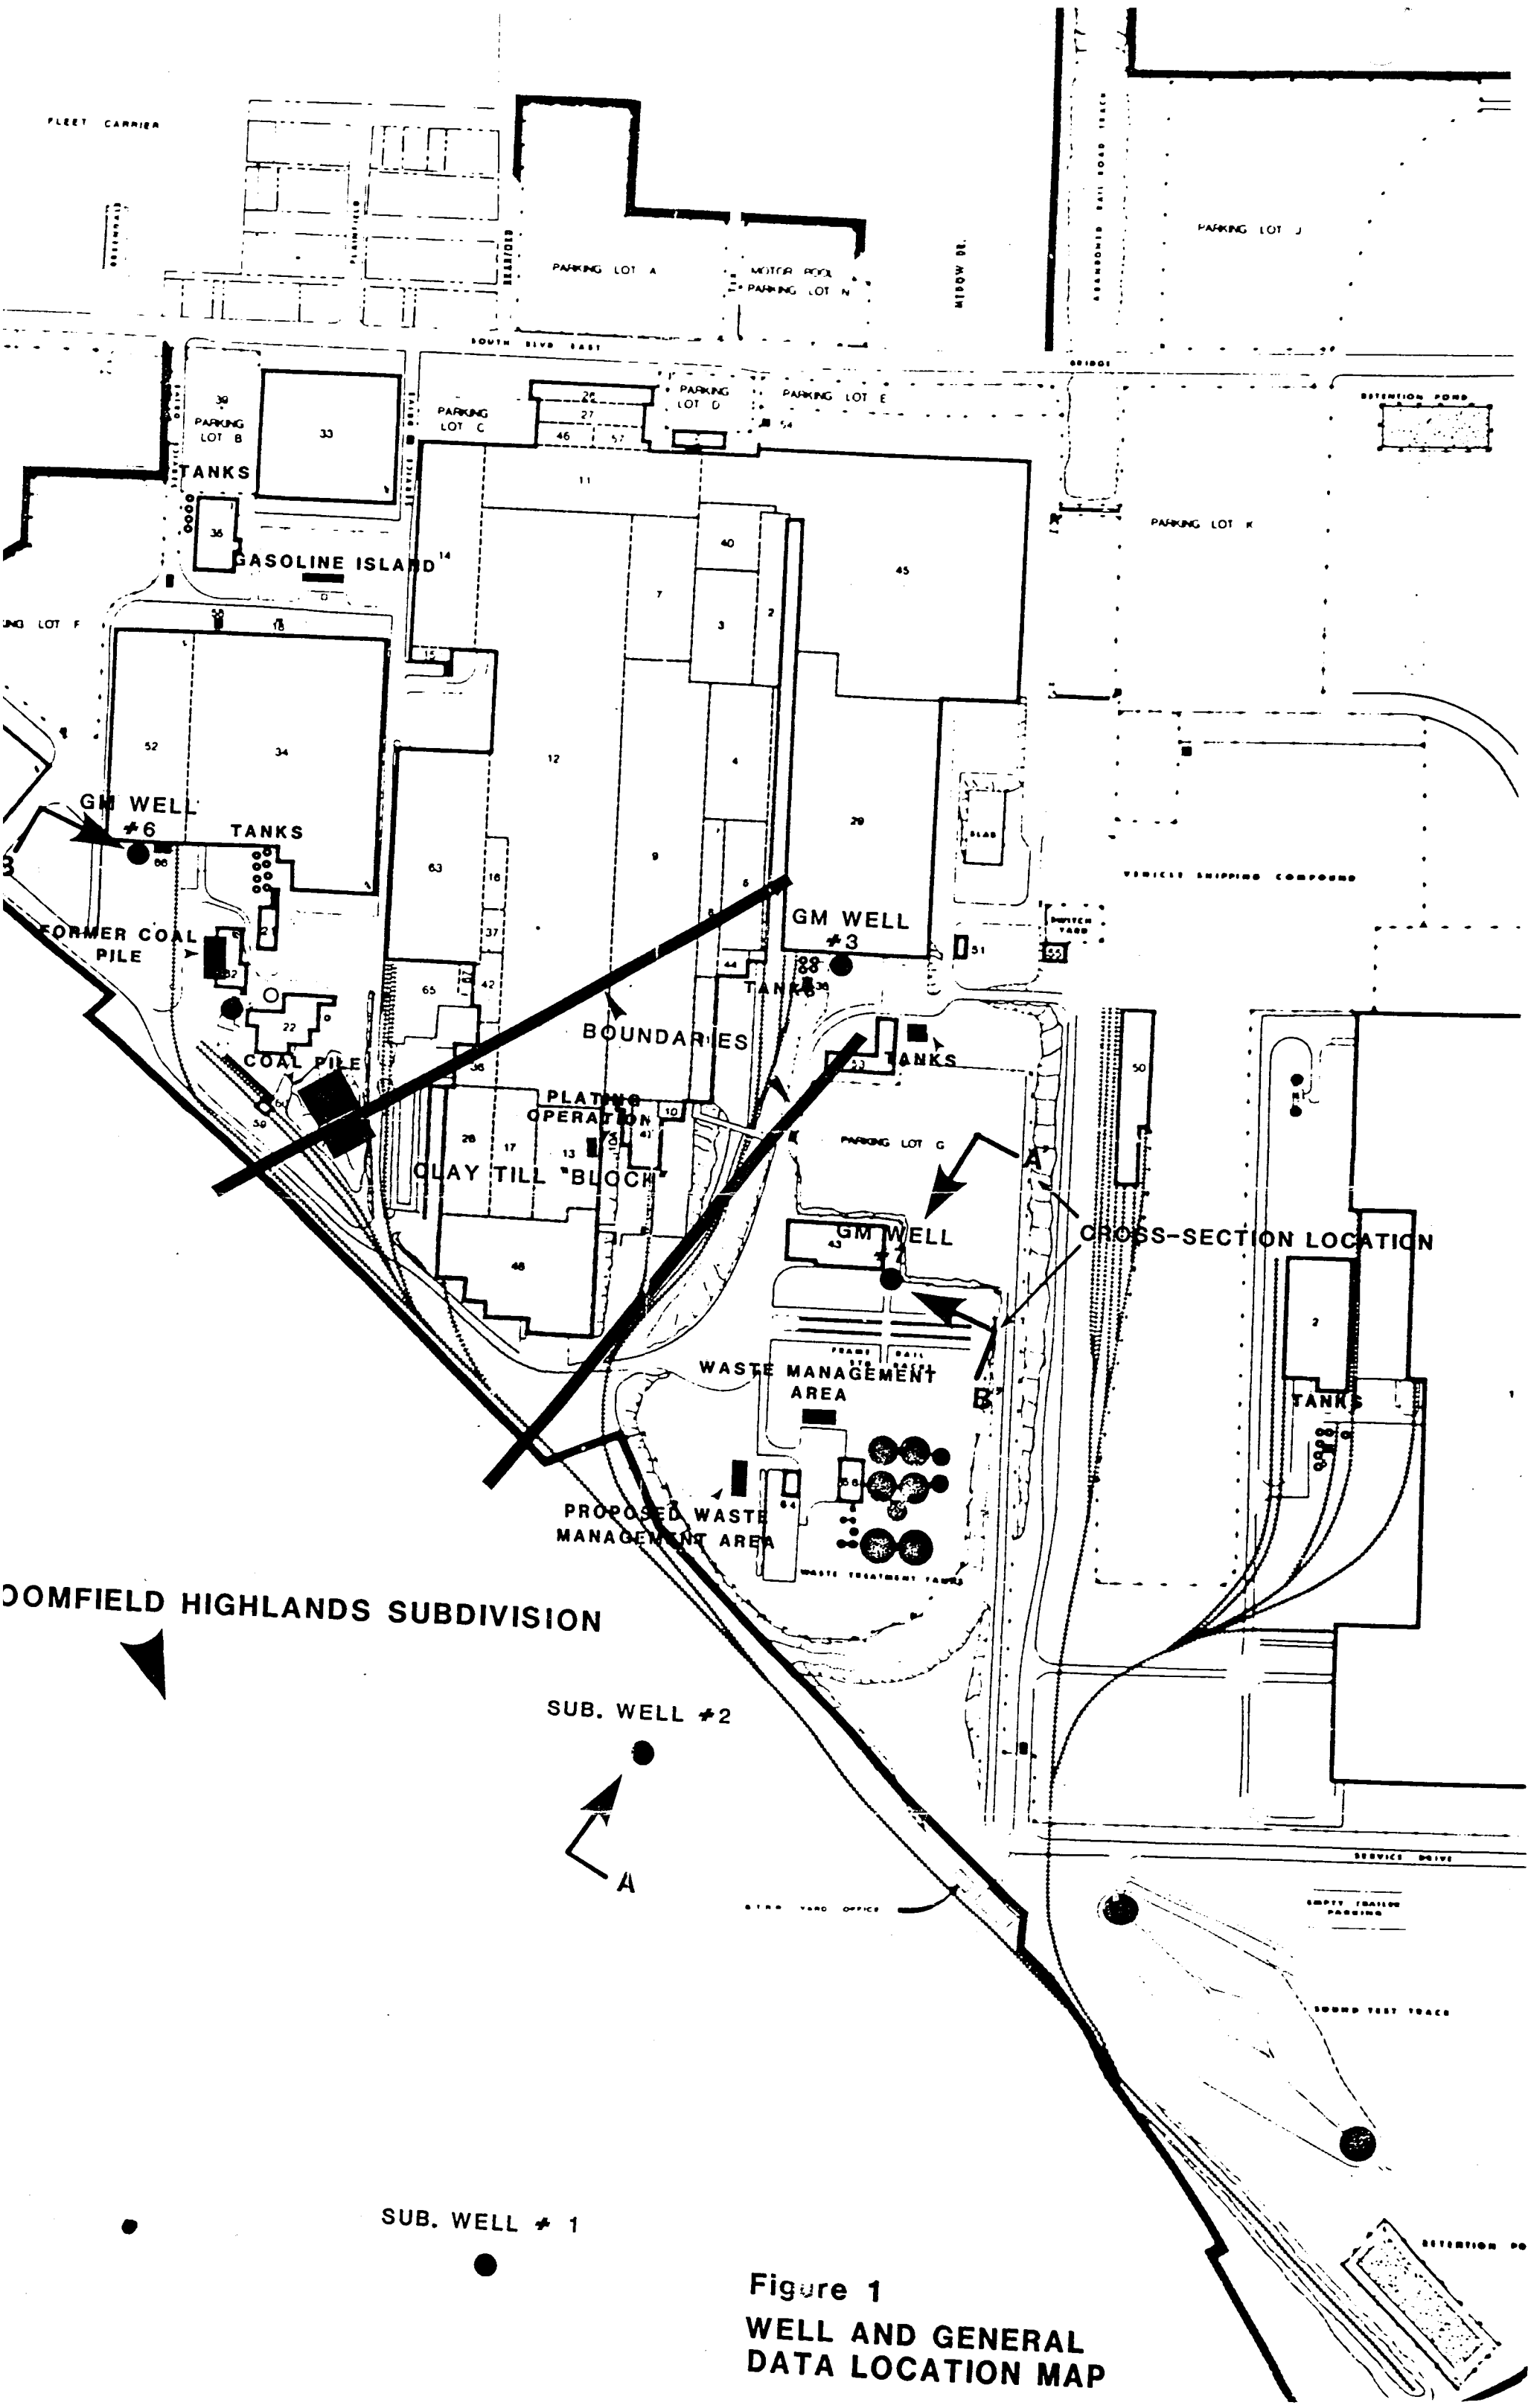

Figure 1
WELL AND GENERAL
DATA LOCATION MAP

The aquifers under the Plant site are considered confined aquifers due to the presence of the clay till overlying each water bearing unit. This clay most likely prevents a significant amount of water exchange between the aquifers and causes the water levels in the confined aquifers to differ from the groundwater table levels obtained from the foundation borings. Data indicates that the average potentiometric water levels (the static depth to water within each well) of the three aquifers are 68 feet below ground level. Actual potentiometric water levels for individual aquifers could not be determined from the existing data because many of the wells were screened in two of the aquifers. A few wells are screened exclusively in the 150 foot deep aquifer with resultant static water levels of 68 to 70 feet indicating that the lower 230 foot deep aquifer probably does not have a vastly different static water level. Cross-sections have been prepared and are presented in Appendix B of this report.

3.0 Hydrologic Evaluation

3.1 Determination of the Aquifer Parameters

The data obtained from GM was used to determine the following aquifer parameters: transmissivity, storage coefficient, and boundaries, which were input into a mathematical simulation of the two aquifers beneath the plant site.

To determine the aquifer parameters, the drilling logs were examined for aquifer type (sand, gravel, etc.), aquifer thickness, static water levels, and any aquifer testing data. Also those logs which indicated that no usable aquifer was present were noted.

From the well logs it was apparent that the aquifers underlying the plant are confined. Therefore, a storage coefficient of 1×10^{-4}, which lies within the average range for a confined aquifer (Freeze and Cherry, 1979) was assigned to these water bearing units. Available data does not allow the calculation of the actual storage coefficient.

The method used to determine the transmissivities was an approximation method developed by T.R. Hurr (Kruseman and DeRidder, 1976). This method was used because it provides an estimation of the aquifer transmissivity from a single drawdown observation measurement which was the only type of pumping data available from the drilling logs. The Hurr method requires that the drawdown used in the calculations be caused by the movement of water through the aquifer only excluding drawdowns caused by well inefficiencies or interference. Unfortunately all data was obtained from pumping wells and therefore includes some well loss (efficiency) components. Additionally, data from at least one pump test indicated that there is apparently some interference effects from other wells in the area. The limited data does not allow for the quantification of either the well losses or the interference caused by other wells; however, the relative magnitude of the transmissivity can be determined and was used to determine the flow field as proposed for this study.

The calculated transmissivities were cross checked by reviewing the well logs to determine if the transmissivity values calculated were reasonable for the types of materials in the aquifers and their thicknesses.

3.2 Determination of the Flow Field

The primary method used to determine the drawdown distribution is the "Principal of Superposition". This principal states that the drawdown at any point in an aquifer is equal to the arithmetic sum of the drawdown caused at that point by each individual well in the aquifer (Walton, 1970).

The till "block" as previously discussed acts as a hydrogeologic barrier, in that the extremely low permeability of the till, especially in relation to the aquifers, effectively prevents the movement of water across this area. The inability to draw water from this area increases the influence of pumping in directions where water is available.

To simulate the effect of the till "block" on the flow field, the image well theory was used. This theory states that a hydrogeologic barrier can be simulated by placing an imaginary pumping well opposite the pumping well and equidistant from the boundary (Walton, 1970). This theory assumes that the boundaries extend to infinity in both directions.

The pumping rates used for the sumulations were determined by examining the water use data and averaging this over the selected pumping time to obtain a constant pumping rate. A pumping time of one year was used to simulate the long term pumpage of the wells.

For the simulations, the plant site was considered to be underlain by two aquifers which are separated in the horizontal plane by the till "block", and form an upper and lower aquifer in the vertical plane.

The upper aquifer lies north and west of the till "block" and is tapped by GM wells #6 and #3.

The lower aquifer lies south and east of the till "block" and is tapped by GM well #7 and the subdivision wells. This aquifer actually consists of two aquifers separated by a layer of clay till. However, the wells are screened in both and therefore they are considered to act as a single aquifer for this simulation.

3.3 Results of the Mathematic Simulation of the Upper Aquifer

The upper aquifer is separated from the subdivision wells by the till "block" which is located south of GM well #6. Also the only wells screened in this aquifer are GM #6 and GM #3. The information obtained from GM indicates that Well #3 is pumped very intermittently. Therefore, for this simulation, only the effects of well #6 were considered.

The parameters used for this simulation were as follows:

- Pumping rate for well #6: 150 gpm for 1 year
- Transmissivity: 50,000 gpd/ft
- Storage coefficient: 10^{-4}
- One boundary running ENE - WSW and lying approximately 900 feet south of well #6 (Figure 2).

The results of the simulation indicate that the groundwater flow is basically radial with the till block giving the flow pattern a semi-circular configuration with no appreciable flow coming from the south toward well #6 (Figure 2). When well #3 is pumped, the drawdown effects in this aquifer would be increased probably increasing the drawdown influence beyond the limits induced by well #6 alone.

3.4 Results of the Mathematical Simulation of the Lower Aquifer

The lower aquifer is tapped by both subdivision wells and GM well #7. Therefore the simulation of this aquifer included the subdivision wells #1 and #2 and GM well #7. The parameters used for this simulation were as follows:

- Pumping rates: GM #7 = 150 gpm, subdivision #2 = 75 gpm, subdivision #1 = 25 gpm
- Transmissivity: 100,000 gpd/ft
- Storage coefficient: 10^{-4}
- One Boundary running NE - SW and lying approximately 500 feet Northwest of well #7 (Figure 3)

The results of this simulation indicate that at some distance from GM #7 the flow is radial toward well #7 with a semicircular pattern similar to that discussed for the upper aquifer. The subdivision well #1 is too far away and pumps at too low of a rate to have much influence on the flow pattern under the plant. However the subdivision well #2 has significant effect on the flow pattern.

The effect of well #2 is that some of the flow from the south central part of the study area is diverted toward this well instead of moving toward well #7 (Figure 3).

This "area of capture" can be defined by a wide parabola which opens downward and has its apex approximately 300 feet north of subdivision well #2. The water, and any contaminants in it, which is inside this parabola will tend to move toward subdivision well #2 and not GM well #7. The water outside this parabola will tend to move toward GM well #7 and not toward the subdivision well #2.

The area of capture as shown on Figure 3 relates to the parameters used in this particular simulation and will shift position depending on the actual pumping rates of the production wells. However if the ratio of the pumping rates is kept constant, the position of the dividing line will not change significantly.

3.5 Simulation Limitations

The till "block" which is being simulated apparently terminates under the GM plant. Therefore, the flow field as shown in the northeast portion of Figures 2 and 3 would differ somewhat from the actual flow in this area. The differences are that the actual drawdown would be less than the calculated drawdown in this region and that some movement of groundwater would occur from the northern portion of the aquifer around the tip of the till block. It should also be noted that deep test drilling is not areally extensive and thus the existence of other boundaries or the actual extent of the till block is limited.

4.0 Potential Point Source Contamination

During our meeting with GM potential point sources of contamination were identified.

The types of point sources identified are:

- Tanks (fuel, oil, etc.)
- Coal storage area
- Former coal storage area
- Waste management area
- Gasoline island
- Plating areas

The location of each potential source is indicated on Figure 1. Should any of the potential pollution sources leak or produce a leachate, the resultant pollution would migrate downward into the groundwater system. The first area affected would be in the immediate vicinity of the source. As indicated previously, the upper 100-150 feet of subsurface materials is comprised of clay till with sand lenses or interbeds. The pollutant would probably continue to migrate downward and if any sand lenses were encountered the pollutant could possibly migrate laterally away from the point source. This occurrence is dependent on localized groundwater flow directions and head differences. Determining the localized groundwater

flow directions in this complex geology is not cost effective and should be conducted on a case by case basis. Over time the pollution may possibly continue to migrate downward and could enter the aquifer system described previously. As this study indicates, should such a situation occur, the contaminants should be drawn into General Motors' water supply wells.

5.0 Existing Groundwater Quality

Groundwater quality records were reviewed by CDM and there is very little difference between the quality of water obtained from GM's wells and water obtained from the subdivision wells. One exception to this is that sulfates and chlorides are higher in GM's well #6. The concentration of these substances is approximately two to three fold greater than determined in the other wells but is still below EPA standards for potable water. The source of the sulfate and chloride could not be determined within the scope of this project. The source may be background isolated from the other wells by the till "block" or may represent operations in the vicinity of well #6.

6.0 Conclusions

In evaluating the directions of groundwater movement in the vicinity of the GM plant site, assumptions had to be made based on the limited data available. Therefore the conclusions which follow should be viewed as qualitative and not quantitative in nature. To determine the actual drawdown and flow field would require an extensive and expensive test drilling and observation well installation program. The purpose of this project was to determine if such a program was required.

The conclusions based on the mathematical simulation of the aquifer in the vicinity of the plant site are as follow:

- Beneath the plant site the flow of groundwater in the primary aquifer system is radially inward toward GM wells #6 and #7. Therefore the potential for contaminant movement off the plant site via the main aquifers is low.

- Specifically the potential for contaminant movement to the subdivision wells is low and will remain low provided that the water use from the GM wells continues to be much greater than that of the subdivision wells.
- There appears to be no degradation of the groundwater quality in the aquifer system at the present time.

7.0 Recommendations

Except for a possible situation at GM's well #6, there appears to be no ground-water pollution problem in the aquifer system in the vicinity of GM's Pontiac Plant. However, General Motors may wish to consider initiating a small scale groundwater monitoring program focused on shallow deposits near critical potential point sources. One such source is the waste management area. A small scale monitoring program would consist of the installation of approximately four, two-inch diameter wels to approximate depths of 25 to 30 feet around each point source of concern. Quarterly monitoring of these wells would indicate any unusual occurrences or problems while such circumstances are still manageable.

Appendix A

GLOSSARY OF HYDROLOGIC TERMS

Aquifer	An aquifer is a formation or group of formations that can yield water in sufficient, useable quantities
Confining Bed	A confining bed is a unit of material which does not freely transmit water usually because of very small pore spaces. Clay is a confining bed
Drawdown	Drawdown is the lowering of the water level caused by pumping
Permeability	This term is used to define a materials ability to transmit water. It is usually expressed in gallons per day per square foot of aquifer. A material with a high permeability transmits water easily.
Porosity	Porosity is a measure of a materials pore space. If a cubic foot of sand was drained of all its water and the water volume was found to be 1/4 of a cubic foot, the porosity of the sand would be 25%. Materials which are composed of generally the same size particles have a high porosity. A great variation in particle size decreases the porosity because small particles fill in the pores made by larger particles.
Specific Capacity	The specific capacity of a well is a measure of how much water can be pumped per minute for every one foot of drawdown.
Storage Coefficient	This term is unitless and defines the amount of water that is taken into or released from storage per cubic foot of aquifer. In an open aquifer with no confining bed the amount of water that can be stored or released per cubic foot is equal to the pore space (porosity). In aquifers with a confining bed the storage coefficient is dependent upon the compression of the water (water is partially compressable) and the compression of the aquifer. Through countless investigations and correlations made by hydrologists it has been determined that the storage coefficient of confined aquifers ranges from .001 to .00001 dependent upon the compressability of the aquifer.
Transmissivity	Transmissivity is the rate at which water is transmitted through the thickness of the aquifer. The number is arrived at by multiplying the permeability of the aquifer by the aquifer thickness.

INDEX

I	Report
II	ERD Correspondence-Analytical
III	Air Permit Request To Operate
IV	PID Readings
V	Strip Charts

The following is inclusive of all reporting which occurred during the thermal remediation of petroleum contaminated soil for General Motors Corporation Truck and Bus, Central, Pontiac, Michigan.

Processing began August 5, and continued through October 20, 1992. This report contains verification that thermal destruction was completed for the following sites:

Building 29
Duco Stores

Sampling:

Results for the processed material yielded non-detect results for BTEX <10 ppb and PNA's <330 ppb.

The sampling sequence called for discrete samples every 50 yards for the first 800 yards, and then, upon receiving clean results, continued every 200 yards. This sequence was described in a letter from Mr. Jim Coger of the MDNR, Southeast District Office, to Margie Sauter of the Truck and Bus Group. The sequence repeated at the onset of every new project, therefore, new intervals for Pontiac Central Building 29, and Duco Stores. Analytical results are submitted with this report.

Air Quality:

Application for permit to install at General Motors Central Building 29 location was approved on July 7, 1992 by Mr. Terry Wright, Air Quality Permit Section. A copy of permit conditions are enclosed. The following is a brief reply to these conditions.

REPLY TO PERMIT CONDITIONS

General Condition No. 1 stipulates application for permit to operate must be directed to Chief, Air Quality Division within 30 days of commencement. Processing began August 1, 1992, and the request for permit to operate was submitted August 18, 1992. A copy of this request is enclosed.

General conditions No. 2-13 constitutes compliance with corresponding federal regulations. The crew on site have been trained to suspect change which may require additional reporting and/or termination of processing. During the extent of the project, no events required such reports to be made.

Special conditions No.14-19 have proven complacent through a stack test conducted by WW Engineering August 18, 1992. The report has been submitted to State (G. Edward/T. Wright), and Southeast District (F. Reith/B. Sia) Air Quality Staff. Special Conditions 20 and 21 request daily measurements for percent contaminate of soil. This was tested daily before start-up using a

photoionization detector (PID) analyzer measuring the ppm. Daily logs of the levels measured are enclosed. Conditions 22 through 28 are monitored through a control center panel, and those which are required to be continuously documented are printed on a strip charts. These records are also enclosed. Condition No. 29 is satisfied by a 20 foot stack connected to base 14 feet above ground. No. 30 had a site specific plan in place including a roadway sweeper to clean the grounds daily.

Re: GM Truck Platforms-Pontiac Central
660 South Boulevard, Building 29
Pontiac, MI 48341
Oakland County, LUST

Dear Ms. Sauter:

I have received your letter dated June 10, 1992 requesting Michigan Department of Natural Resources (MDNR) approval of the proposed soil remediation sampling plan. The Sampling and Analysis Plan as outlined in the 6/10/92 letter is acceptable.

Remediated soil samples will be collected for analytical testing at 50 cubic yard intervals for the first 800 cubic yards of processed soil. Subsequent sampling will be done every 200 cubic yards.

This sampling interval is contingent upon field documentation of operational parameters meeting manufacturers specifications for processing temperatures and feed/discharge rates. In the event the processing temperature drops below M.L. Chartier's recommended operating ranges, or processed soil fails to meet Type B criteria, verification of soil remediation sampling will be requested at the 50 cubic yard interval, until operational efficiency is re-established. All soils should be collected as discrete samples, composite sampling is unacceptable.

I will be out of the office the week of June 29, if you have questions or comments please contact my supervisor, Valerie Burgess-Byrd at (313) 953-0241.

Sincerely,

Jim Coger

Jim Coger, Geologist MDNR

Dear Ms. Sauter & Ms. Taughinbaugh:

This letter is in reference to your Permit to Install application for a thermal soil remediation unit with baghouse and afterburner control, located at 31 Judson, Pontiac, Michigan. This application, identified as No. 248-92B, has been evaluated and approved by the Air Quality Division, pursuant to the delegation of authority from the Michigan Air Pollution Control Commission.

This approval is based upon and subject to compliance with all administrative rules of the Commission and conditions stipulated in the attached supplement. Please review these conditions thoroughly so that you may plan for and take the actions necessary to ensure compliance with all of these conditions. Also note that Condition No. 1 requires you to apply, in writing, for a permit to operate within 30 days after completion of construction.

You are advised that contaminants discharged to the surface waters and/or groundwaters; materials disposed of on land; hazardous waste storage, treatment, and disposal; and resource recovery facilities must be approved by other divisions of the Department of Natural Resources. Additionally, your plant environment must be in compliance with all applicable requirements of the Departments of Public Health and Labor.

Approval of this permit does not constitute an agreement by the State of Michigan that the use of the proposed equipment will result in an acceptable remediation of the indicated site location.

Thank you for your cooperation. Please contact me if you have any questions regarding this permit.

Sincerely,

Terry Wright

SUPPLEMENT TO PERMIT NO. 248-92B

General Motors Corporation
M.L. Chartier
Pontiac, Michigan

July 2, 1992

GENERAL CONDITIONS

1. Rule 208(2) - Not more than 30 days after completion of the installation, Applicant shall apply, in writing, for a Permit to Operate. Completion of the installation is deemed to occur not later than commencement of a trial operation pursuant to Rule 201(4). Written application should be sent to: Chief, Permit Unit, Air Quality Division, Department of Natural Resources, P.O. Box 30028, Lansing, Michigan 48909.

2. Rule 201(4) - Trial operation of the equipment is permitted until the Michigan Air Pollution Control Commission acts upon the Permit to Operate. Operation of the equipment shall permanently cease upon denial of the Permit to Operate by the Commission.

3. Rule 208(3)(a) and (c) - Applicant shall demonstrate compliance with all Commission rules and with all general and special conditions of this permit prior to issuance of the Permit to Operate.

4. Rule 201 - Applicant shall not reconstruct, alter, modify, expand, or relocate this equipment unless plans, specifications, and an application for a Permit to Install are submitted to and approved by the Commission.

5. Rule 901 - Operation of this equipment shall not result in the emission of an air contaminant which causes injurious effects to human health or safety, animal life, plant life of significant value, or property, or which causes unreasonable interference with the comfortable enjoyment of life and property.

6. Rule 208(3)(b) - Operation of this equipment shall not interfere with the attainment or maintenance of the air quality standard for any air contaminant.

7. Operation of this equipment shall not result in significant deterioration of air quality.

8. Rule 912 - Applicant shall provide notification of any abnormal conditions or malfunction of process or control equipment covered by this application, resulting in emissions in violation of the Commission rules or of any permit conditions for more than two hours, to the District Supervisor. Such notice shall be made as soon as reasonably possible, but not later than 9:00 a.m. of the next working day. Applicant shall also, within 10 days, submit to the District Supervisor, a written detailed report, including probable causes, duration of violation, remedial action taken, and the steps which are being undertaken to prevent a reoccurrence.

9. Approval of this application does not exempt the Applicant from complying with any future regulations which may be promulgated under Act 348, P.A. 1965, as amended.

10. Approval of this permit does not obviate the necessity of obtaining such permits or approvals from other units of government as required by law.

11. Act No. 53 - Applicant shall notify any public utility of any excavation, tunneling and discharging of explosives or demolition of buildings which may affect said utility's facilities in accordance with Act 53 of the Public Acts of 1974, being sections 460.701 to 460.718 of the Michigan Compiled Laws and comply with each of the requirements of that Act.

12. The restrictions and conditions of this Permit to Install shall apply to any person or legal entity which now or shall hereafter own or operate the equipment for which this Permit to Install is issued. Any new owner or operator shall immediately notify the Chief of the Permit Unit, in writing, of such change in ownership or principal operator status of this equipment.

13. Rule 201(5) - If the installation, reconstruction, relocation, or alteration of the equipment for which this permit has been approved has not commenced within, or has been interrupted for, 18 months, this permit shall become void unless otherwise authorized by the Commission.

SPECIAL CONDITIONS

14. Visible emissions from the thermal soil remediation unit, hereinafter "unit", shall not exceed 5% opacity.

15. The volatile organic compound (VOC) emission rate from the unit shall not exceed 21.5 pounds per hour nor 7.9 tons per month.

16. The sulfur dioxide emission rate from the unit shall not exceed 12.9 pounds per hour nor 4.7 tons per month.

17. The nitrogen oxides emission rate from the unit shall not exceed 18 pounds per hour nor 6.57 tons per month.

18. Rule 331 - The particulate emission from the unit shall not exceed 0.1 pounds per 1,000 pounds of exhaust gases, nor 4.8 pounds per hour, nor 1.8 tons per month.

19. Rules 1001, 1003 and 1004 - Within 180 days after commencement of trail operation, verification of VOC, sulfur dioxide, nitrogen oxides and particulate emission rates from the unit by testing, at owner's expense, in accordance with Commission requirements, may be required for operating approval. Verification of emission rates includes the submittal of a complete report of the test results. If a test is required, stack testing procedures and the location of stack testing ports must have prior approval by the District Supervisor, Air Quality Division.

20. The soil processing rate and associated VOC conncentration listed in the following table shall be such that the influent VOC rate to the afterburner shall not exceed 430 pounds of VOC per hour.

Contamination of soil by VOC's	Process Feed Rate (Maximum) tons/hr	Estimated VOC's		
		Inlet*	Outlet*	Outlet**
2%	10.8	430	8.6	31.0
1%	21.5	430	8.6	31.0
0.5%	43.0	430	8.6	31.0
0.3%	77.0	430	8.6	31.0

* lbs/hr
** tons/year

21. Applicant shall test the soil daily prior to start-up of the unit for total hydrocarbon content by on-site hydrocarbon analyzer, and test results shall be kept on file for a period of at least two years and made available to the Air Quality Division upon request.

22. Applicant shall not process any soils in the unit which contain chlorinated compounds, waste oil, or other materials except for gasoline and fuel oils.

23. On and after August 1, 1992 applicant shall monitor and record the oxygen content, carbon monoxide content and temperature of the exhaust gases from the unit afterburner on a continuous basis in a manner and with instrumentation acceptable to the Air Quality Division. All data shall be kept on file for a period of at least two years and made available to the Air Quality Division upon request.

24. Applicant shall monitor and record the soil exit temperature from the unit dryer on a continuous basis in a manner and with instrumentation acceptable to the Air Quality Division. All data shall be kept on file for a period of at least two years and made available to the Air Quality Division upon request.

25. Applicant shall not operate the unit unless the baghouse and afterburner are installed and operating properly.

26. Applicant shall equip and maintain the baghouse with pressure drop indicator.

27. Applicant shall not operate the unit unless a minimum temperature of 1400°F and a minimum retention time of 0.5 seconds in the thermal oxidizer is maintained.

28. Applicant shall immediately cease input feed of soil to the unit, consistent with safe operating procedures, if the soil exit temperature from the unit dryer exceeds 1000°F. Input feed of soil to the unit shall not restart until the soil has been retested for hydrocarbon content, and mixed as necessary to ensure compliance with the conditions of this permit.

29. The exhaust gases from the unit shall be discharged unobstructed vertically upwards to the ambient air from a stack with a maximum diameter of 48 inches at an exit point not less than 34 feet above ground level.

30. Applicant shall not operate the unit unless a program for continuous fugitive emissions control for all plant roadways, the plant yard, all material storage piles, and all material handling operations is maintained, such that fugitive emissions do not exceed 5% opacity.

Gentlemen:

This letter constitutes a formal request for a permit to operate as required pursuant to Rule 208 (2), delegated through condition No. 1 of M. L. Chartier, Inc./General Motors Corporation supplement to Permit No. 248-92B.

Commencement of trial operation for low temperature thermal remediation at the General Motors site began August 1, 1992. This request is within the thirty (30) day period required by the rule.

Please have someone within your department provide acknowledgement to the receipt of this request. Thank you for your immediate attention to this matter.

Sincerely,

M. L. CHARTIER, INC.

1.0 INTRODUCTION

Conestoga-Rovers & Associates (CRA) was retained by General Motors Corporation (GM) - Pontiac Central Manufacturing Facility (Facility) to address outstanding environmental issues regarding the soils associated with the former underground storage tank (UST) area near Building 29 (Study Area) at the GM Facility.

The Facility is located in Pontiac, Michigan. The Site location is presented on Figure 1.1. Figure 1.2 presents a Site plan of the Facility.

The Study Area for Building 29 is identified on Figure 1.2. A plan of the Study Area is provided on Figure 1.3.

The purpose of this report is to present and evaluate the current status of the Building 29 UST area with regards to the outstanding environmental issues identified by the Michigan Department of Natural Resources (MDNR) in their letter to GM dated November 19, 1993, and to present the results of additional investigations conducted to resolve outstanding issues.

1.1 REGULATORY REQUIREMENTS

As the environmental issues within the Study Area were the result of the operation of an UST system, the requirements of the Leaking Underground Storage Tank (LUST) Act (P.A. 478, 1988 as amended by Act 645 of 1993) must be addressed to resolve the outstanding environmental issues within this Study Area.

LUST provides an outline of the reporting, field investigative and remedial activities required by the Michigan Department of Natural Resources (MDNR) for closure (e.g. final remediation) of a LUST site to be granted by the MDNR.

The primary regulation which governs remedial actions within Michigan is the Michigan Environmental Response Act (MERA) [Michigan Public Act 307 (P.A. 307, 1982 as amended)]. As such, it provides the rules necessary to develop remedial programs and cleanup standards for environmental contamination sites located within the State of Michigan.

The Michigan Act 307 Rules provide for three types of cleanup standards (Type A, Type B and Type C). The selection of a cleanup standard for a particular site is based on site-specific characteristics, the nature of the contamination which exists and the anticipated future land uses of the property. Under Rule 299.5705(2)(3), the cleanup approach may be Type A, B, C, or a combination of types for individual chemicals within each media of concern.

A Type A cleanup is achieved when the concentration of a hazardous substance in any environmental media does not exceed background or the relevant method detection limit.

Type B cleanup criteria are health-based, employing conservative, standardized exposure assumptions that assume there will be unrestricted direct contact with contaminated media.

A Type C cleanup is a health-based approach which allows site-specific characteristics to be factored into a risk assessment. It must be demonstrated that the assumptions used in the risk assessment are appropriate to the site and consistent with reasonably foreseeable current and future land uses. Less conservative exposure assumptions may be made by assuming less direct contact with the waste materials or restricting current and future use of the site through the application of institutional controls and deed restrictions. Cleanup levels will vary according to the exposure assumptions used in a site-specific risk assessment. Generic Type C Industrial Cleanup Standards have been prepared by the MDNR which are considered to be acceptable and based on conservative exposure assumptions.

This report has been prepared in accordance with the requirements of Act 307 and LUST, as well as draft MDNR requirements for the verification of soil remediation (October, 1990).

2.0 BACKGROUND INFORMATION

The purpose of this section is to provide a general overview of the GM Facility as well as the geologic and hydrogeologic setting.

2.1 LOCATION AND HISTORY

The Facility is located in an industrial area which is bordered to the south by residential areas. The Grand Trunk Western Railroad Line is located along the southern edge of the property. The Facility is bordered to the east and west by industrial areas, and to the north by South Boulevard.

The Facility was built in 1927 and was utilized to manufacture trucks, buses, military vehicles and motor homes. Major manufacturing activities associated with the production of these vehicles included machining, stamping, plating, smelting, fiberglass laminations, heat treating, painting and sealing. Manufacturing operations at the Facility ceased in August 1990 and the Facility was closed in the summer of 1991 as an obsolete factory.

Following the Facility closure, USTs which were no longer in service were removed from the Facility. Benzene, toluene, ethylbenzene and xylene (BTEX) and polynuclear aromatic hydrocarbon (PNA) constituents were identified in the soils in the area of the UST farm removed at Building 29. The presence of these constituents was reported to the Michigan State Police - Fire Marshall Division (MSP - FMD) office, and remedial actions were initiated, in accordance with LUST requirements.

Sections of the Facility are currently undergoing decommissioning, demolition and re-development activities.

2.2 FACILITY GEOLOGY

The Facility is located in an area of glacial till and outwash deposits formed during the Wisconsin glacial age of the Pleistocene Epoch. The glacial till is composed of low permeability clay, silty clay and sandy clay. Smaller sand and gravel units are also encountered occasionally within the clay till unit. The low permeability clay till unit has a reported depth of approximately 250 to 300 feet and overlies bedrock, which is reported to be Early Mississippian-age Coldwater Shale.

The Facility is located at the interface of two glacially deposited soil units, known as the Fort Wayne Moraine and the Defiance Moraine Outer Ridge. Historically, these moraines formed the divide between the Clinton River and Rouge River drainage basins. Construction activities at the Facility have moved the divide, and the Facility now drains to the Clinton River via the Murphy Drain.

Shallow native soil materials underlying the plant are predominantly composed of glacial tills of low to very low permeability. The glacial till materials are generally comprised of medium to low plasticity clays. Sand lenses and outwash channels of limited extent are also encountered within the surficial native soil materials.

Through years of development and industrial use, the shallow native soils in many areas of the Facility have been overlain by earth fill (e.g. sand and gravel), asphalt, concrete or structures.

2.3 FACILITY HYDROGEOLOGY

In 1981, Camp Dresser and McKee (CDM) performed a hydrogeologic assessment of the Facility. The results were presented in a report entitled "Mathematical Simulation of Groundwater Flow Conditions under GM's Truck and Coach Division, Pontiac, Michigan" (CDM, 1981).

The CDM report identified three primary sand and sand/gravel aquifers beneath the Facility. These aquifers occur at depths of 120, 150 and 210 feet below ground surface (bgs) and are approximately 7, 25 and 50 feet thick, respectively.

The "120-foot aquifer" was identified in the well log record of supply well number 7 (Building 43) as a sand aquifer. This aquifer is not utilized on Site for water supply.

The "150-foot aquifer" was used for industrial water supply by the Facility, by means of two wells [Well Number 3 (Building 29) and Well Number 6 (Building 66)] which were screened in this aquifer. The material in this aquifer unit was identified to consist of medium to fine grained sand.

The "210-foot aquifer" was also utilized by the Facility for industrial water supply (Well Number 7). This aquifer is also a known local source for municipal water supply.

Shallow groundwater has been encountered in several areas of the plant, generally at depths of 10 feet to 20 feet bgs. This groundwater is perched above the clay till in layers of fill material or sand (or sand and gravel) seams of limited extent. As the clay till layer is approximately 100 feet thick between the perched groundwater and the 120-foot aquifer, the perched groundwater is not expected to be hydraulically connected with the lower aquifers.

In many areas of the Facility, the clay till exists at the ground surface, and no perched groundwater layer is present.

3.0 DESCRIPTION OF STUDY AREA

This Section presents a summary of available information from GM files regarding the Building 29 UST Study Area.

3.1 HISTORY OF BUILDING 29 UST FARM

Nine 12,000-gallon steel USTs were installed near the south wall of Building 29 in 1946. The Building 29 tank farm was utilized for the storage of engine oil, transmission fluids, axle fluids and power steering fluids.

The tank farm was removed from service in the summer of 1991 and the tanks were excavated and removed in October 1991. BTEX and PNA constituents were identified in the soils surrounding the former tank farm in confirmatory samples taken at the time of UST removal. The tanks appeared undamaged during excavation. The soil contamination was, therefore, assumed to be due to routine filling operations.

The construction and contents of the tanks in the Building 29 tank farm is summarized below.

Building 29 Tank Contents/Construction

Tank No.	*Material*	*Tank Const.*	*Tank Size (gallons)*	*Year Inst.*	*Pipe Const.*	*Pipe Buried*
1	Eng Oil	Steel	12,000	1946	Steel	No
2	15w 40 Eng Oil	Steel	12,000	1946	Steel	No
3	10w 30 Eng Oil	Steel	12,000	1946	Steel	No
4	A90 Trans Oil	Steel	12,000	1946	Steel	No
5	P/S Fluid	Steel	12,000	1946	Steel	No
6	Axle Fluid	Steel	12,000	1946	Steel	No
7	Auto Tr Fluid	Steel	12,000	1946	Steel	No
8	Axle Fluid	Steel	12,000	1946	Steel	No
9	Eng Oil	Steel	12,000	1946	Steel	No

GM notified the Michigan State Police-Fire Marshal Division (MSP-FMD) office on October 16, 1991, that a confirmed release (i.e. residual soil contamination) had occurred at the former Building 29 tank farm. Notification of the release was made based on the analytical results of soil samples taken to satisfy the Fire Marshal's site assessment requirements.

Notification of the release was followed by 20-Day and 45-Day reports submitted to the MDNR Environmental Response Division (ERD) in accordance with LUST requirements. A Corrective Action Plan (CAP) was submitted to the MDNR-ERD on March 16, 1992. Revised pages for the CAP were submitted to the MDNR-ERD on April 30, 1992. The CAP was approved by the MDNR, with changes to the Sampling and Analysis Plan as proposed in GM's June 10, 1992 letter, on June 26, 1992.

3.2 PAST REMEDIAL ACTIVITIES

Approximately 3,000 cubic yards of soil were removed from the Building 29 tank farm excavation and stored west of the Study Area on the asphalt paved parking lot. The dimensions of the excavation were approximately 130 feet from north to south, 40 feet from east to west, and 17 feet deep. The perimeter of the base of the excavation was 340 feet and the surface area was 5,200 square feet. (Closure Report, Pontiac Central Building 29, Draft April 16, 1993)

During the corrective action (undertaken for GM by M. L. Chartier) in June 1992, contaminated soils were removed and thermally treated. Sidewall and excavation base verification samples were taken in accordance with the requirements for soil cleanup verification. Four water samples were collected from the base of the excavation in lieu of soil samples due to the presence of water in the excavation. The source of this water was from a water leak in the fire deluge tank (located to the north/east of the excavation). The collection of water samples was deemed unacceptable by MDNR in determining soil cleanup verification.

The soils excavated from the tank area were thermally treated on Site. All thermally treated soils were verified non-detect for BTEX and PNAs. The soil was then used as backfill for the tank excavation or stockpiled along the side of the access road to Building 29 which runs south from the building.

Verification samples could not be collected from the east and south sidewalls of the excavation due to bank stability concerns. Therefore, confirmatory sampling was performed through the installation of seven boreholes following backfilling of the excavation. Areas of PNA contamination above the Type B criteria were identified on the east side of the excavation in several boreholes installed by WW Engineering & Science (WWES) in December, 1992. The seven WWES boreholes are identified on Figure 1.3 as SB10 to SB16. Soil borings further east than those identified on Figure 1.3 could not be completed due to limitations imposed by the slope of the bank to the east of the Building 29 tanks.

Additional excavation was thought to be warranted at the time based on analytical results, however, was not performed at the time due to bank stability concerns on the east sidewall.

3.3 GEOLOGY

The geology in the Study area was initially defined based on borehole logs from the seven WWES boreholes installed in December 1992.

Based on the WWES borehole logs, the geology in the study area was described as consisting of 3 to 8 feet of gravel fill underlain in some areas by approximately 5 feet of silty brown sand and gravel. At a depth of approximately 8.5 feet bgs a layer of medium to stiff gray clay with occasional sand and gravel begins. This clay layer continues to a depth of at least 22 feet bgs. The excavation is now backfilled with a mixture of sand gravel.

3.4 HYDROGEOLOGY

As groundwater was not encountered during the excavation of the tanks, soil remediation activities, or the installation of soil borings, it has been verified that there are no hydrostratigraphic units in the vicinity of the stratigraphic zone of the former USTs.

3.5 MDNR REQUIREMENTS

A variety of outstanding environmental concerns were raised by the Michigan Department of Natural Resources (MDNR) in their letter dated November 19, 1993. A copy of this letter is presented as Appendix A. These requirements include:

- providing boring logs and sample depths for the December 1992 boreholes;
- providing the depth of excavation during remediation (approximately 17 feet) and a more detailed description of the geology;
- defining the vertical extent of contamination at the base of the excavation;
- providing the results and locations of additional verification samples collected from the excavation in mid-November 1991 and samples collected during the December 1992 sampling event; and
- preparing a limited hydrogeologic study to determine whether or not groundwater has been impacted.

The MDNR set a submittal date of April 18, 1994 for a 150-Day report containing sufficient information to address MDNR concerns.

The remainder of this section summarizes information obtained from GM files which satisfies the following MDNR requirements:

1) providing boring logs and sample depths for the December 1992 boreholes;

2) providing the depth of excavation; and

3) providing the results and locations of additional verification samples collected from the excavation in mid-November 1991 and samples collected during the December 1992 sampling event.

3.5.1 Verification Sampling Results (November 1991)

The 45-Day report (Maecorp, November 1991) and the Corrective Action Plan (CAP) (June 1992) both state that following receipt of initial verification sampling results, additional soil (approximately 10 cubic yards) was removed from the base of the excavation, and six additional verification samples collected and analyzed for PNAs. The analytical data for these six samples (non-detect for all PNAs) was presented as Appendix I to the CAP. These samples were taken from the locations of original verification sample locations 1C and 1D, as shown on Figure 4 of the 45-Day report. This figure and the analytical results are presented in Appendix B.

Five cubic yards of soil were removed from the excavations in the sidewall area of sample 8A (Figure 4 of 45-Day report) to address elevated benzene levels found in sample 8A. A second confirmatory sample (sample number 8A1) was obtained and analyzed for benzene. Benzene was not detected in the confirmatory sample. The analytical results for sample 8A1 are presented in Appendix B of this report.

3.5.2 Excavation Depth

The final depth of the excavation during remediation is presented in the "draft" Closure Report (April 1993) as being approximately 17 feet.

3.5.3 December 1992 Boreholes

WWES drilled 7 borings (SB-10 to SB-16) along the east and south side of the former Building 29 tank excavation (see Figure 1.3), in December 1992. These borehole logs are included in Appendix C. Eight samples from these borings were submitted for BTEX and PNA analysis. A summary of the analytical results is contained in Appendix D. The depths at which samples were obtained are summarized below.

Sample Depths - December 1992 Sampling Event

WWES Borehole	*Sample Number*	*Depth of Sample (feet bgs)*
SB-10	SS-1 and SS-3	5 and 10
SB-11	SS-3	10
SB-12	SS-2	7.5
SB-13	SS-3	10
SB-14	SS-1	5
SB-15	SS-2	7.5
SB-16	SS-1	5.0

4.0 ADDITIONAL BUILDING 29 UST INVESTIGATIVE ACTIVITIES

CRA installed six boreholes at the former Building 29 UST Study Area on January 3-4, 1994. The boreholes were installed by Mateco Drilling of Grand Rapids, Michigan.

Four boreholes (BH29-1, -2, -3 and -4-94) were installed to further define the vertical extent of contamination below the former UST area, in order to support UST closure requirements. Two additional boreholes (BH29-5-94 and BH29-6-94) were installed approximately 5 feet east of the boreholes installed by WWES in December 1992 to further define the horizontal extent of contamination along the east side of the excavation. It is not currently feasible to install boreholes further east of the excavation due to the slope which exists immediately to the east of the former UST farm. The locations of these boreholes are presented on Figure 4.1. Borehole logs are presented in Appendix E.

Soil samples were collected from BH29-1, -2, -3 and -4-94 from the base of the original excavation (at approximately 17 feet bgs) as well as two feet below the base of the excavation (19-21 feet bgs) using a standard 2-inch outside diameter split-spoon sampler. Soil removed using the split-spoon was sampled using clean sampling equipment and placed in laboratory supplied clean sample jars. Sample jars were shipped to IEA Laboratories in coolers at 4°C, and analyzed for BTEX and PNAs. Soil samples were also collected from BH29-5-94 and BH29-6-94 from the 15 to 17 feet bgs and 20 to 22 feet bgs intervals. These samples were analyzed for PNAs (based on the identification of PNA constituents at concentrations above regulatory levels in three WWES boreholes). Analytical results, a data validation memorandum and chain-of-custody forms are presented in Appendix F.

Section 5.0 provides an evaluation of the data obtained during the additional investigations.

5.0 EVALUATION OF RESULTS

5.1 GEOLOGY

The six boreholes installed by CRA confirmed the stratigraphic information presented in the WWES borehole stratigraphic logs. This information is summarized in Section 3.3. The excavation area in the vicinity of the former Building 29 USTs was identified to contain 16 to 19 feet of sand, clay and gravel backfill material which in turn is underlain by glacial clay till typical of the area.

BH29-5-94 and BH29-6-94 were installed part way up the slope approximately 15 feet east of the former UST area (east of the WWES boreholes). These boreholes identified gray clay till containing trace silt, sand and gravel which existed from near the ground surface to a depth of 22 feet bgs.

Groundwater was not encountered within the native glacial clay till soils.

5.2 ANALYTICAL RESULTS

All BTEX and PNA samples were non detect with the exception of the 16 to 18-foot bgs sample for BH29-4-94 and the 20 to 22 foot bgs sample at BH29-6-94.

Fluoranthene was identified at 510 µg/kg in the 16 to 18-foot bgs sample from BH29-4-94. Phenanthrene was identified at 390 µg/kg in the 16 to 18 foot bgs sample in BH29-4-94. The concentrations of fluoranthene and phenanthrene present in the BH29-4-94, 16 to 18-foot bgs sample are below Michigan Type B 20X Drinking Water Protection Values for soil.

The following analytes were detected in BH29-6-94 at the 20 to 22 foot bgs interval.

	Result µg/kg	*Type B 20X Drinking Water Protection Values for Soil*	*Type B Direct Contact Soil Cleanup Level (µg/kg)*
benzo(a)anthracene	430	N/A	1,800(1)
chrysene	480	N/A	180,000(1)
fluoranthene	1,400	17,000	31,000
naphthalene	540	5,000	9,300,000
phenanthrene	660	500	930,000
pyrene	930	10,000	19,000,000

Michigan Type B 20X Drinking Water Protection Values for soil were marginally exceeded for phenanthrene in the BH29-6-94, 20-22 foot bgs sample. There were no other exceedences of the Type B 20X Drinking Water Protection Values in the study area. There were no exceedences of the Type B Direct Contact Criteria at the study area. The Direct Contact Criteria are considered appropriate for the study area, as groundwater was not identified in the study area.

(N/A Not Applicable. The direct contact value is considered protective.

(1) Values based on June 21, 1994 "Addendum to MERA Operational Memorandum #8, Revision 3 - Type B Criteria Rules 299.5709, 299.5711(2), 299.5711(5) and 299.5713".

6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the information presented herein, the following conclusions may be made regarding the former Building 29 UST area:

- the area is underlain by glacial clay till;
- no groundwater hydrostratigraphic units (or groundwater) were identified in the vicinity of the former Building 29 USTs;
- nine 12,000-gallon USTs were removed in October 1991;
- approximately 3,000 cubic yards of soil were removed and thermally treated;
- verification samples were collected and the excavation was backfilled;
- six boreholes drilled in January 1994 identified that the former USTs have been successfully closed; and
- minor residual PNA contamination was identified in 1 of 12 additional verification samples (BH29-6-94 at 20 to 22 feet bgs) marginally above the Type B 20X Drinking Water Protection Value for phenanthrene in soils. The remaining level of phenanthrene associated with BH29-6-94 is not considered to be at a level of concern for the following reasons:

    1. as groundwater was not identified in the Building 29 Study area, Type B Direct Contact Criteria are more applicable;.
    2. the potential source (e.g. USTs) of the PNAs was removed in October 1991;
    3. remediation of contaminated soils was undertaken; and
    4. the remaining residual levels of PNAs would be expected to naturally degrade over time.

Based upon the results of the additional investigations, no additional investigation or remediation is required or warranted.

Re: GM North American Truck Platforms, Pontiac Central Facility - Building #29, 660 South Blvd., Pontiac, MI, Facility #18277, Incident # C-2149-91

Dear Mr. West,

The Michigan Department of Natural Resources (MDNR) staff have completed the review of the file for the above referenced facility. The most recent document in the file was the Corrective Action Plan submitted in March of 1992. Based on the review of this file, additional information (and investigations) is needed in order to define the extent of contamination and eventually obtain closure.

The following items must be addressed in order for this site to be considered for closure:

1. Provide the soil boring logs and sample depths for soil borings #1 through #8 installed along the south and east slopes of the building #29 tank farm.

2. Provide the depth of the excavation. Also provide a more detailed description of the geology (site specific).

3. The vertical extent of contamination needs to be defined. Soil samples should be collected from the bottom of the former excavation. Groundwater samples were collected in lieu of soil samples during the excavation. The heavier PNA compounds are relatively insoluble, therefore soil samples are also required from this area.

4. According to the March, 1992 Corrective Action Plan, additional soils were removed from areas that were previously above Type-B criteria for PNA's and BTEX. The report also states that samples were collected to verify clean-up. Please provide the locations and results of these samples.

5. A limited hydrogeologic study is needed to determine whether or not groundwater has been impacted. If the results of this study indicate that groundwater has been impacted then additional investigations may be needed to determine the extent of contamination.

You have 150 days from the date of this letter to address the above items and perform a phase I hydrogeological investigation. A report should be submitted to this office at that time. Note: all work should be conducted by a certified consultant.

Please notify this office, in writing, seven days prior to initiating any work, to provide staff with the opportunity to monitor all site activities.

This should not be construed as a sign-off on all investigations or corrective actions that may be necessary at this site.

If you have any questions regarding this matter, please contact Paul Owens at (313) 953-1534.

Sincerely,

Oladipo Oyinsan
Southeast MI District Supervisor

INTRODUCTION

From August 30, 1991 through September 6, 1991 a total of nine Underground Storage Tanks (USTs) were removed from the "Building 29 Tank Farm" (Site) located at the Facility in Pontiac, Michigan.

The detailed information regarding tank size, construction, location, and contents can be found in the Site Characterization Report and Work Plan ("45-day Report") for the Site at the Facility. The information regarding the findings upon tank removal as well as analytical data can also be found in this document.

Upon removal, all of the tanks were structurally undamaged and there was no visible evidence that a release had occurred. Subsequent site assessment data, though, indicated the presence of specific constituents which were indicative that a release may have occurred, albeit likely from routine operations which typically results in overfills, etc.

The Michigan State Police - Fire Marshal Division (MSP-FMD) was notified that a confirmed release had occurred at the Site. An initial abatement report ("20-day Report") was submitted to the Michigan Department of Natural Resources Environmental Response Division's (MDNR-ERD) district office in Livonia on October 29, 1991. The previously referenced "45-day Report" was subsequently submitted to the MDNR-ERD on November 22, 1991.

Since the submission of the above two documents, additional excavation and sampling activities have occurred. The information derived from these activities can be found in the following section of this document.

ADDITIONAL INFORMATION

The initial sampling performed at the Site indicated the presence of specific constituents at levels which were, except for a few sampling locations, well below the MDNR Type B Cleanup Criteria for Soil (Type B Criteria). At the locations where these criteria were exceeded by specific constituents, additional excavation and sampling was performed.

The sampling locations indicated as 1C and 1D (See Figure 4 of the 45 day report) had levels of specific Polynuclear Aromatic Hydrocarbons (PNAs) which exceeded the Type B Criteria. A total of approximately ten cubic yards of soil was removed from these locations and their vicinity. This soil was added to the original soil pile resulting from the UST removal. Six samples were subsequently taken from these two original locations to verify the removal of remaining constituents. The results indicated the constituent levels were all below detection limit and thus, an adequate amount of soil had been removed.(See Appendix I, CAL Report # 16321)

The sampling location indicated as 8A (See Figure 4 of the 45 day report) had a level of Benzene which exceeded the Type B Criteria. A total of approximately five cubic yards of soil was removed from this location and its vicinity. This soil was also added to the original soil pile resulting from the UST removal. Samples were subsequently taken from this original location to verify the removal of Benzene. The results (See Appendix II, CAL Report # 16768) indicated the Benzene level was below detection limit and again, an adequate amount of soil had been removed.

Additionally, the water covering the floor of the excavation had originally indicated the presence of specific volatile constituents as well as specific PNAs at levels both above and below the Type B Criteria for Groundwater. The water entering the excavation is due to precipitation and run-off and is periodically pumped to the Pontiac East Industrial Wastewater Treatment Plant (WTP). A sample (referred to as W7) was taken of the water on the discharge side of the pump as the water enters the lift-station to the WTP. The results from this sample (See Appendix II, CAL Report # 16768) indicate the absence of the previously detected constituents.

HYDROGEOLOGIC CONDITIONS

In 1981 a hydrogeologic study was performed at the Facility by Camp, Dresser & McKee, Inc. (CDM) (See Appendix III). This study indicates that in the location of the Site a clay till block of low to very low permeability exists and, in fact, the former tank farm was contained within this clay till block. This is supported by the observance of very stiff clay on the limits of the current excavation.

This clay till block acts as a hydrogeologic barrier because of the low permeability. It effectively prevents the movement of water across it. So much so that the CDM study treated the clay till block as completely impermeable for groundwater modeling purposes. This situation indicates that any residual constituents resulting from the former tank farm operations would not have migrated through the clay but would have been confined to the engineering fill material surrounding the tanks.

APPENDIX C

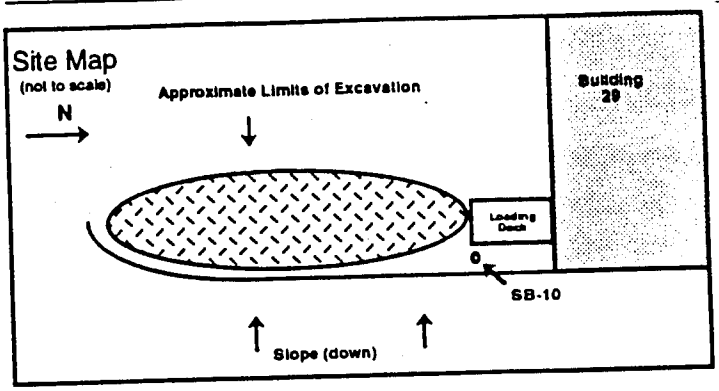
WWES BOREHOLE STRATIGRAPHIC LOGS, DECEMBER 1992

WW Engineering & Science, Inc.
Environmental Services

Project No.: 83256.02

LOG OF BORING

Client: GM North American Truck Platform
Location: Plant 2 South of Building 29
Logged By: S. Tacy
Driller: R. Kroll
Contractor: CTI & Associates, Inc.



Boring Designation: SB-10
Start Date: 12/8/92 Completed: 12/8/92
Ground Surface Elevation: _____ feet msl
Ground-Water Data:
Saturated conditions were encountered at 3.5 feet below ground surface.

Drilling Method(s): 4.25-inch I.D. hollow stem augers — **Depth Range** 0 to 20 feet

Sampling Method(s): 2-inch O.D. Split Spoon — **Depth Range** 3.5 to 20 feet, 2.5 foot intervals

Grouting Material/Method: Granular Bentonite — **Depth Range** 0 to 20 feet

General Notes:
Soil Samples SS-1 and SS-3 were submitted for chemical analytical testing.

Borehole Depth (feet)	Sample Type and Number	Depth of Sample Tip (feet)	Sample Recovered (inches)	Hammer Blows (6-inch Intervals)	PID Readings (ppm)	Graphic Log	Depth Below Ground Surface (feet)	Subsurface Description
1–4							0.0	BACKFILL: Grey GRAVEL, Moist
5	SS-1	5.0	13"	2, 3, 7	67		3.0	Stiff Grey SILTY CLAY, Little Fine Sand, Wet
6				3, 4, 4			(6.0)	Trace Fine Gravel
7–8	SS-2	7.5	11"		43		8.0	Stiff Grey SILTY CLAY, Trace Fine Sand, Wet
9–10	SS-3	10.0	10"	3, 4, 7	18			
11–12				2, 4, 6				
13	SS-4	12.5	9"		14			
14–15	SS-5	15.0	12"	3, 4, 20	11			
16–17				3, 4, 4				
18	SS-6	17.5	15"		16			
19				7, 25, 20			19.0	Compact Brown CLAYEY SAND, Little Fine to Coarse Gravel and Silt, Moist
20	SS-7	20.0	8"		11			END OF BORING AT 20 FEET

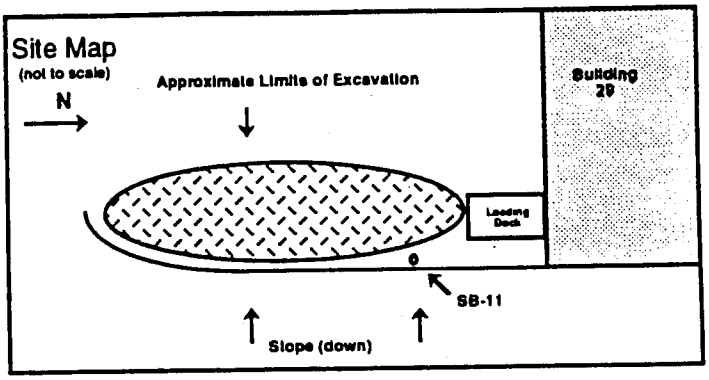
LOG OF BORING

Client: GM North American Truck Platform
Location: Plant 2 South of Building 29
Logged By: S. Tacy
Driller: R. Kroll
Contractor: CTI & Associates, Inc.

Boring Designation: SB-11
Start Date: 12/8/92 **Completed:** 12/8/
Ground Surface Elevation: _____ feet msl
Ground-Water Data:
Saturated conditions were encountered at 6.0 feet below ground surface.



Drilling Method(s): 4.25-inch I.D. hollow stem augers — **Depth Range** 0 to 13.5 feet

Sampling Method(s): 2-inch O.D. Split Spoon — **Depth Range** 3.5 to 15 feet, 2.5 foot intervals

Grouting Material/Method: Granular Bentonite — **Depth Range** 0 to 15 feet

General Notes:
Soil Sample SS-3 was submitted for chemical analytical testing.

MEMO

TO: Glenn Turchan REFERENCE NO: 5770

FROM: Jack Lindsay JL DATE: January 17, 1994

RE: Data Quality Assessment and Validation
for Twelve Soil Samples collected from the
General Motors Corporation Central Manufacturing Facility
Pontiac, Michigan (Report CH940104)

The following details an analytical data quality assessment and validation for data resulting from January 4, 1994 collection of twelve soil samples from General Motors Corporation Central Manufacturing Facility in Pontiac, Michigan. The samples were analyzed for the parameters presented in Table 1. The methods of analysis used by IEA, Schaumburg, Illinois, are presented in Table 1. The quality control criteria were established by these methods of analysis[1].

Holding Time Periods

The holding time periods for the analyses are listed in Table 2. On the basis of the sample collection dates on the chain-of-custody documents and on the analytical reports provided by IEA, the analyses were completed within the specified holding time periods, indicating that the data were acceptable based on this criteria.

Method Blank Samples

Contamination of the samples contributed by laboratory conditions or procedures were monitored by the concurrent preparation and analysis of method blank samples. The method blank samples were reported to be free from detectable concentrations of target analytes, indicating that no significant laboratory contamination had occurred.

Surrogate Compund Percent Recoveries

Individual sample performance for the Benzene, Toluene, ethylbenzene and xylene (BTEX), and Polynuclear Aromatic Hydrocarbons (PNA) analyses were monitored using the percent recoveries of surrogate compound spikes.

The BTEX surrogate compound, bromofluorobenzene, for samples BH-29-1, 17'-18'; BH-29-2, 16.5'-17'; BH-29-2, 16.5'-17'; BH-29-2, 21'-21.5'; BH-29-3, 16'-18' and BH-29-3, 20'-22' were recovered outside of the control limits, therefore, the quantitation

---

[1] Application of quality control criteria was consistent with "Laboratory Data Validation Functional Guidelines for Evaluating Organic Analyses", February 1, 1988.

limits should be qualified as estimated (UJ) for non-detected results. The remaining BTEX and all PNA surrogate data were found to be within the control limits.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Percent Recoveries

To assess the long term accuracy and precision of the analytical methods on various matrices, MS/MSD percent recoveries and the relative percent difference (RFD) were determined. All data were found to be within the control limits indicating that the data achieved acceptable levels of accuracy and precision based on the information provided.

Laboratory Check Spike Recovery

Laboratory check spike recoveries were examined to assess the accuracy of the laboratory procedures for PNA analyses. The laboratory procedures for PNA analyses. The laboratory check spike samples were found to be within the control limits indicating that an acceptable level of accuracy had been achieved.

Overall Assessment

The data were found to exhibit acceptable levels of accuracy and precision bases on the provided information, and may be used with qualifications noted.

MDNR DRAFT MEMORANDUM DATED JUNE 13, 1994

RE: REVISED TYPE B STANDARDS

MICHIGAN DEPARTMENT OF NATURAL RESOURCES

INTEROFFICE COMMUNICATION

June 13, 1994

DRAFT

TO: Environmental Response Division Staff

FROM: Alan, J. Howard, Chief, Environmental Response Division

SUBJECT: Addendum to MERA Operational Memorandum #8, Revision 3 -- Type B Criteria Rules 299.5709, 299.5711(2), 299.5711(5) and 299.5713

The attached document is the technical justification for the revised Type B criteria for the carcinogenic polynuclear aromatic hydrocarbons (PAHs). Please replace the current criteria with the values listed below and attach this addendum to MERA Operational Memorandum #8.

Historically, MDNR policy has considered all carcinogenic PAHs to be equipotent to benzo[a]pyrene. However, current toxicological information suggests that many of the PAHs are less potent carcinogens than benzo[a]pyrene. The revised PAH criteria were developed using provisional guidance provided by the U.S. Environmental Protection Agency (EPA) which provides estimates of the potential potency (EPP) of 6 PAHs relative to benzo[a]pyrene. GSI values for these compounds will continue to be based on that of benzo[a]pyrene. Soil 20X drinking water and 20X GSI values are not provided since these chemicals are not expected leach through soils to groundwater under most conditions.

	EPP	DW	DCV
Benzo[a]pyrene	1.0	0.0049*	180*
Dibenz[a,h]anthracene	1.0	0.0049*	180*
Benzo[a]anthracene	0.1	0.049*	1800
Benzo[b]fluoranthene	0.1	0.049*	1800
Indeno[1,2,3-c,d]pyrene	0.1	0.049*	1800
Benzo[k]fluoranthene	0.01	0.49*	18,000
Chrysene	0.001	4.9*	180,000

* default to method detection limit of 5 ppb.
** default to method detection limit of 330 ppb.

Any Contact on EPD to please let me if you have questions or want further information.

-DRAFT-

Estimated Order of Potential Potency of Polycyclic Aromatic Hydrocarbons (PAHs)

June 7, 1994

Linda D. Larsen, ERD

Current Michigan Depatment of Natural Resources (MDNR), Environmental Response Division (ERD) policy assumes that all carcinogenic PAHs are equipotent to benzo[*a*]pyrene (BAP). Based on this assumption, the oral slope factor developed for BAP has been used to develop Michigan Environmental Response Act (MERA) 307 cleanup criteria. This policy was based on United States Environmental Protection Agency (EPA) recommendations at the time of its implementation. Advances in the toxicological data base, however, have led to the recognition that some of the carcinogenic PAHs are less carcingenic in animal studies than BAP. EPA quantitative risk estimates for PAHs have not been consistent across all federal programs, with some offices using the equipotency approach and others using comparative potencies from differing sources.

In July of 1993, in an effort to resolve the inconsistentcies in estimating the risks from PAHs, the EPA issued its "Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons". This document states that the equipotency approach results in an overestimation of the carcinogenic effects of PAHs and presents quantitative estimates of carcinogenic potency of seven polycyclic aromatic hydrocarbons (PAHs) relative to the potency of benzo[*a*]pyrene or B[*a*]P. Included are dibenz[*a,h*]anthracene, benzo[a]anthracene, benzo[*b*]fluoranthene, indeno[*1,2,3-c,d*]pyrene, benzo[*k*]fluoranthene, and chrysene. These compounds have been classified under the U.S. EPA weight of evidence classification system as B2, probable human carcinogens. However, the toxicological data base is insufficient to support the development of slope factors for each individual compound. Additionally, the interim approach presented in this document does not meet the requirements necessary for the development of toxic equivalency factors (TEF) similar to those used for assessment of risks from dioxin-like compounds. Therefore, the U.S. EPA has chosen to present this approach as an "estimated order of potential potency".

As stated above, the toxicological data base for carcinogenic PAHs other than BAP is not broad. The available information indicates that carcinogenicity is the most sensitive endpoint for PAH toxicity. Data for noncarcinogenic effects are generally lacking, however, immunotoxicty is considered to correlate roughly with carcinogenicity. Data are also lacking on the additivity of the carcinogenic effects of PAHs. The U.S. EPA has determined, however, that additivity assumptions will yield generally neutral risk estimates (neither conservative nor lenient) for compounds which are believed to induce similar effects at the same sites of action.

At this time the provisional guidance is undergoing internal EPA review. Several regions, including Region V, have accepted the guidance and are using the approach for risk assessments (RA). An advisory document has been written by Jeanine Dinan of the Toxics Integration Branch to provide regional risk assessors with direction in the use of the approach. In addition, an expert panel within the EPA, headed by Terry O'Brien, has reviewed and classified 104 PAH compounds as to their carcinogenicity and/or toxicity. The latter

document presents a qualitative approach rather than the quantitative methodology used in the EPA provisional guidance. Unfortunately, neither of these documents are available for dissemination outside the EPA. Regional staff have been requested to provide comments on the provisional guidance, the advisory document, and the qualitative review. Pending this review, the EPA expects to issue final guidance by early 1995. The Carcinogenic Risk Assessment Verification Endeavor (CRAVE) has determined that the interim guidance approach will not be used to develop slope factors for listing in the Integrated Risk Information System (IRIS) and the "review pending" message has been removed from the carcinogenic assessment section of relevant files. This decision was based on the failure of the provisional guidance to meet the requirements for the development of TEFs and the inadequacies of the existing toxicological data base. It is expected that the CRAVE work group will reopen their review following the internal EPA review of the documents listed above.

The MDNR Toxics Steering Group has the estimated order of potency approach under consideration. As part of this review, a literature search was done to identify toxicological studies which support the use of the estimated potency approach. Nisbet and LaGoy (1992) evaluated several relative potencies approaches for PAHs and presented a modified version which differs minimally from the U.S. EPA approach. Nisbet suggests a potential potency of 0.01 for chrysene as compared to EPA's 0.001. Additionally, Nisbet considers a potential potency of 5 more likely for dibenz[*a*,*h*]anthracene at the low doses expected to be encountered in the natural environment. EPA recommends a potential potency of 1 for dibenz[*a*,*h*]anthracene. Nisbet also suggests that many of the PAHs now considered to be non-carcinogenic may in fact exhibit some potency in mixtures of several PAHs. This possibility has been explored by other researchers, however, no quantitative estimates are available to predict the potency of PAH mixtures at this time (Schmahl et al, 1977; Pfeiffer, 1977) and there is insufficient evidence to classify these compounds as B2 carcinogens. The EPA review predates the Nisbet and Lagoy study and does not include a review of this information. However, both the EPA recommendations and those of Nisbet and Lagoy rely upon the same toxicological data base.

Based on the above discussion, ERD toxicologists are recommending that the estimated order of potential potency approach presented in the U.S. EPA provisional guidance be adopted for use in Act 307 risk assessments which includes the development of cleanup criteria. In part, this decision is based upon the desire to be consistent with EPA recommendations for risk assessments generated under federal programs. Therefore, the alternate relative potencies presented in Nisbet and Lagoy will not be adopted. However, if further information becomes available which indicates that the potency of dibenz[*a*,*h*]anthracene is greater than benzo[*a*]pyrene, the applicable criteria may be adjusted. Criteria may also be modified pending the results of the internal EPA review. The MERA Act 307 health-based cleanup criteria developed under this approach are expected to be protective of both carcinogenic and noncarcinogenic effects. As is the practice for risk assessments generated

under Act 307, the carcingenicity of the PAHs is assumed to be additive.

At this time, analytical techniques are not sufficiently sensitive to detect concentrations of PAHs at the current NERA Act 307 Type B criteria. ERD policy under these circumstances is to default to the method detection limit as the ultimate cleanup goal. Unless new analytical techniques become available, it is expected that the method detection limit would remain the default criteria in soils for both dibenz[*a,h*]anthracene and benzo[*a*]pyrene and in groundwater for all of the carcinogenic PAHs. Cleanup criteria for the remaining carcinogenic PAHs are calculated by multiplying the slope factor for benzo[*a*]pyrene by the recommended estimate of potential potency (EPP). The resulting Type B health-based drinking water values (DW) and direct contact values (DCV) are listed below in units of parts per billion (ppb).

	EPP	DW	DCV
Benzo[*a*]pyrene	1.0	0.0049*	180*
Dibenz[*a,h*]anthracene	1.0	0.0049*	180*
Benzo[*a*]anthracene	0.1	0.049*	1800
Benzo[*b*]fluoranthene	0.1	0.049*	1800
Indeno[*1,2,3-c,d*]pyrene	0.1	0.049*	1800
Benzo[*k*]fluoranthene	0.01	0.49*	18,000
Chrysene	0.001	4.9*	180,000

* default to method detection limit of 5 ppb.
** default to method detection limit of 330 ppb.

Mr. Keith West
General Motors Corporation
Remediation Team
Argonaut "A" - 1004H
485 West Milwaukee Avenue
Detroit, Michigan 48202

Dear Mr. West:

SUBJECT: Closure Report dated February 10, 1995
Confirmed Release dated October 16, 1991 (release #7)
Location of Tank(s): Building #29
GM North American Truck Platforms
Pontiac Central Facility
660 South Blvd., Pontiac, MI
MERA Site ID #630415
Facility ID #18277

This is to acknowledge receipt of your closure report submitted for the subject site by Conestoga-Rovers & Associates (CRA) in accordance with section 6f.(3) of the Leaking Underground Storage Tank Act, 1988 PA 478, as amended (Act 478). The closure report concludes that the release has been remediated to Type-B cleanup levels.

Based on the conclusions of CRA, this portion of site has been removed from the list of contaminated sites in Michigan as published under the Michigan Environmental Response Act, 1982 PA 307, as amended. Under section 6h.(2) of Act 478, the Underground Storage Tank Division may audit the results of the investigation and corrective actions undertaken to confirm the results and conclusions indicated by CRA. If the audit does not confirm that corrective action is complete, additional information and/or corrective action may be required as set forth in Section 6h.(3).

If you have any questions, please contact Mr. Paul Owens at the Southeast Michigan District Office, Michigan Department of Natural Resources, Underground Storage Tank Division, 38980 W. Seven Mile Road, Livonia, Michigan 48152-1006, or at telephone number 313-953-1534.

Sincerely,

Mohammad Yusaf

1.0 INTRODUCTION

This document presents a Preliminary Report (Report) for the Building 43 Study Area (Study Area) located at the General Motors Pontiac Central Manufacturing Facility (Facility) in Pontiac, Michigan. Conestoga-Rovers & Associates (CRA) was retained by General Motors Corporation (GM) Truck and Bus Group to conduct an evaluation of the Study Area. The Facility location is presented on Figure 1.1. The Study Area location is presented on Figure 1.2.

The assessment of the Study Area included confirming the conditions reported by Cook & Associates, Inc. (Cook) and WW Engineering (WW) and evaluating the extent of affected materials potentially requiring excavation and removal. Due to stockpiled concrete, the physical investigation could not be extended sufficiently to develop a complete profile of the potentially affected material. However, based on the available information, an estimate of the volume of the potentially affected material has been developed. Actual material excavation and removal volumes will be determined during any remedial works that may be performed and will coincide with any necessary verification of removal sampling conducted.

The remainder of this Report is presented in the following sections:

2.0 Background
3.0 CRA subsurface Investigation
4.0 Investigation Results
5.0 Summary

2.0 BACKGROUND

The GM Pontiac Central Manufacturing Facility was built in 1927 and was utilized to manufacture trucks, buses, military vehicles, and motor homes. Major manufacturing activities associated with the production of these vehicles included machining, stamping, plating, smelting, fiberglass laminations, heat treating, painting and sealing. Manufacturing at the Facility ceased in August 1990 and the Facility was closed in the summer of 1991 as an obsolete factory.

The Study Area is currently used to support re-development activities associated with the Centerpoint Business Campus Development.

2.1 FACILITY GEOLOGY

The Facility and Study Area are located in an area of glacial till and outwash deposits formed during the Wisconsin glacial stage of the Pleistocene Epoch. The glacial till is comprised of low permeability clay, silty clay and sandy clay. Smaller sand and gravel units are also encountered occasionally within the clay till unit. The low permeability clay till unit has a reported depth of approximately 250 to 300 feet and overlies bedrock, which is reported to be Early Mississippian-age Coldwater Shale.

The Facility is located at the interface of two glacially deposited soil units, known as the Fort Wayne Moraine and the Defiance Moraine Outer Ridge. Historically, these moraines formed the divide between the Clinton River and Rouge River drainage basins.

Shallow native soil materials underlying the Facility are predominantly comprised of glacial tills of low to very low permeability. the glacial till materials are generally comprised of medium to low plasticity clays. Sand lenses and outwash channels of limited extent are also encountered within the surficial native soil materials.

2.2 FACILITY HYDROGEOLOGY

In 1981, Camp Dresser and McKee (CDM) performed a hydrogeologic assessment of the GM Truck and Bus Group Pontiac Central Manufacturing Facility. The results were presented in a report entitled "Mathematical Simulation of Groundwater Flow Conditions under GM's Truck and Coach Division, Pontiac, Michigan."

The CDM report identified three primary sand and sand/gravel aquifers in the area of the Property. These aquifers occur at depths of approximately 120, 150 and 210 feet below ground surface (bgs) and are approximately 7, 25, and 50 feet thick, respectively. The "210-foot aquifer" is a known local source for municipal water supply.

Shallow groundwater has been encountered in several areas of the Facility, generally at depths of 10 to 20 feet bgs. This groundwater is perched above the clay till in layers of fill material or sand (or sand and gravel) seams of limited extent. As the clay till layer is approximately 100 feet thick between the perched groundwater and the 120-foot aquifer, the perched groundwater is not considered to be hydraulically connected with the lower water bearing zones.

2.3 PRIOR COOK & ASSOCIATES/WW ENGINEERING INVESTIGATION

In April of 1992, an investigation of the nature and extent of potentially affected soil in the vicinity of Building 43 was conducted by Cook/WW to provide a preliminary cost estimate for the removal and disposal of the affected soil. Trenches were excavated in select areas behind Building 43 adjacent to the frame rack storage area. Figure 2.1 presents the Cook/WW trenching locations. Excavated and exposed soils were visually inspected. The trenches were typically four feet wide and six feet deep and were excavated in a north-south or east-west alignment.

It was noted by Cook/WW that a layer of ash up to three feet thick was encountered approximately four feet bgs. Miscellaneous debris including steel banding, cured or burned paint sludge, and wood were also encountered in the ash layer. During the Cook/WW investigation, no soil samples were collected for chemical analysis. Figure 2.1 presents the Cook/WW test trenches and the extent of visually affected materials identified in the Cook/WW investigation. Photographs taken by Cook/WW during their investigation are presented in Appendix A.

3.0 CRA SUBSURFACE INVESTIGATION

In August, 1994, CRA was retained by GM to conduct an evaluation of the Study Area to further define the nature and extent of affected soils reported in the Cook/WW investigation report.

The CRA physical investigation was impeded at that time by large stockpiles of concrete materials placed in the area by Barton Malow (for the purpose of crushing the concrete to produce aggregate), and by Building 43. As a result, additional boreholes could not be installed further to the south or east.

A total of nine boreholes were advanced within the Study Area to depths ranging from 4 to 27 feet bgs. Boreholes were advanced using a 4 1/4-inch hollow stem augers. Decontamination of the augers was conducted between each borehole location and consisted of a high pressure, low volume steam cleaning to remove all visual soils and debris. On completion, each borehole was backfilled with its drill cuttings. Figure 3.1 presents the borehole locations. Borehole Stratigraphic Logs are presented in Appendix B.

Soil samples were collected on a continuous basis using 2-foot long, 2-inch inside diameter, stainless steel split-spoon samplers. Decontamination of the stainless steel split spoons consisted of the following:

1. Rinse with potable water;
2. Scrub with deionized water and Alconox; and
3. Final rinse with deionized water.

Each sample was carefully examined by a CRA field representative to identify soil type and any visible chemical staining, discoloration or odor. All soil samples were screened with a Photoionization Detector (PID) by the CRA field representative. The results of the PID screening are summarized on the stratigraphic logs presented in Appendix B. Field observations were recorded on the stratigraphic logs and utilized to select samples to be submitted for chemical analysis.

Eighteen soil samples were submitted to a laboratory and analyzed for Target Compound List (TCL) Volatile Organic Compounds (VOCs), Semi Volatile Organic Compounds (SVOCs), and Target Analyte List (TAL) metals.

4.0 INVESTIGATION RESULTS

The subsurface investigation presented in Section 3.0 identified the Study Area geology and hydrogeology and characterized the general nature and extent of potentially affected material at the Study Area. The potentially affected areas could not be fully characterized on the south and east sides or below Building 43.

The Study Area geology and hydrogeology are presented in Section 4.1. The chemical analytical results are presented in Section 4.2. The estimated extent of affected material is presented in Section 4.3.

4.1 GEOLOGIC/HYDROGEOLOGIC CONDITIONS

Nine boreholes were installed to identify the geologic and hydrogeologic conditions at the Study Area. Stratigraphic logs are presented in Appendix B.

The subsurface conditions encountered in the boreholes indicate that the Study Area is generally clay and silt fill soils. At some locations, the fill soils were found to contain miscellaneous debris including paint chips, wire and general debris. The underlying native clay/till identified in Section 2.0 was not identified in any of the Study Area boreholes because of their limited depth.

No significant water bearing zones were identified in any of the boreholes. Moist and wet silt and sand were identified in BH43-1, however, no saturated stratigraphic zones were encountered. As a result, no defined groundwater regime or aquifer has been identified in the shallow subsurface zone of the Study Area.

4.2 CHEMICAL ANALYTICAL RESULTS

A total of eighteen soil samples were collected and analyzed as presented on Table 4.1. Laboratory analytical data and Chain-of-Custody Records are presented in Appendix C. The Data Validation Report is presented in Appendix D.

A summary of detected compounds in soil compared to Michigan Type B 20 x Drinking Water and Type B and C Direct Contact Cleanup Criteria for soil is presented in Table 4.2.

Several compounds were detected above the Michigan Type B Direct Contact Criteria for soil. Vinyl Chloride was detected in BH43-4 at 12 to 14 feet bgs at 560 µg/kg. Several SVOCs (benzo(a)anthracene, benzo(b)fluoranthene, benzo(a)pyrene, indeno (1,2,3-cd)pyrene, and dibenzo(a,h)anthracene) were detected in BH43-3 at 2 to 4 feet bgs above Michigan Type B Direct Contact Cleanup Criteria. Several metals (aluminum, arsenic, lead, and manganese) were detected in BH43-1 at 7 to 9 feet bgs, in BH43-2 at 4 to 6, 10 to 12, and 16 to 18 feet bgs, in BH43-4 at 4 to 8 and 12 to 14 feet bgs, in BH43-7 at 13 to 15 feet bgs, in BH43-8 at 2 to 2.5 and 8 to 10 feet bgs, and in BH43-9 at 3 to 4, 8 to 10, and 10 to 12 feet bgs, above Michigan Type B Direct Contact Criteria.

Arsenic and lead were the only analytes detected above the Michigan Type C Generic Industrial Direct Contact Cleanup Criteria. Either lead or arsenic was detected above the Michigan Type C Generic Industrial Direct Cleanup Criteria in BH43-1 at 7 to 9 feet bgs, in BH43-2 at 4 to 6 and 10 to 12 feet bgs, in BH43-4 at 4 to 8 and 12 to 14 feet bgs, and in BH43-9 at 3 to 4 feet bgs.

4.3 EXTENT OF AFFECTED MATERIALS

The estimated extent of potentially affected material, based on both the visual observations presented in the Cook/WW report and on

the results of CRAs preliminary subsurface investigation, is presented on Figure 4.1.

The estimated extent of affected material is based on laboratory analytical results exceeding the Michigan Type C Generic Industrial Direct Contact Cleanup Criteria for soil, with the exception of arsenic identified at 13 mg/kg in BH43-1 at 7 to 9 feet bgs. The estimated extent of affected material was not expanded to contain this sample location because arsenic was the only analyte detected at this location above Michigan Type C Generic Industrial Direct Contact Cleanup Criteria. In addition, arsenic has been identified at a Site adjacent to the Facility at a background concentration of 12.5 mg/kg (Draft Extent of Contamination (EOC) Study, J-Lot, General Motors Pontiac Central Manufacturing Facility, Pontiac, Michigan).

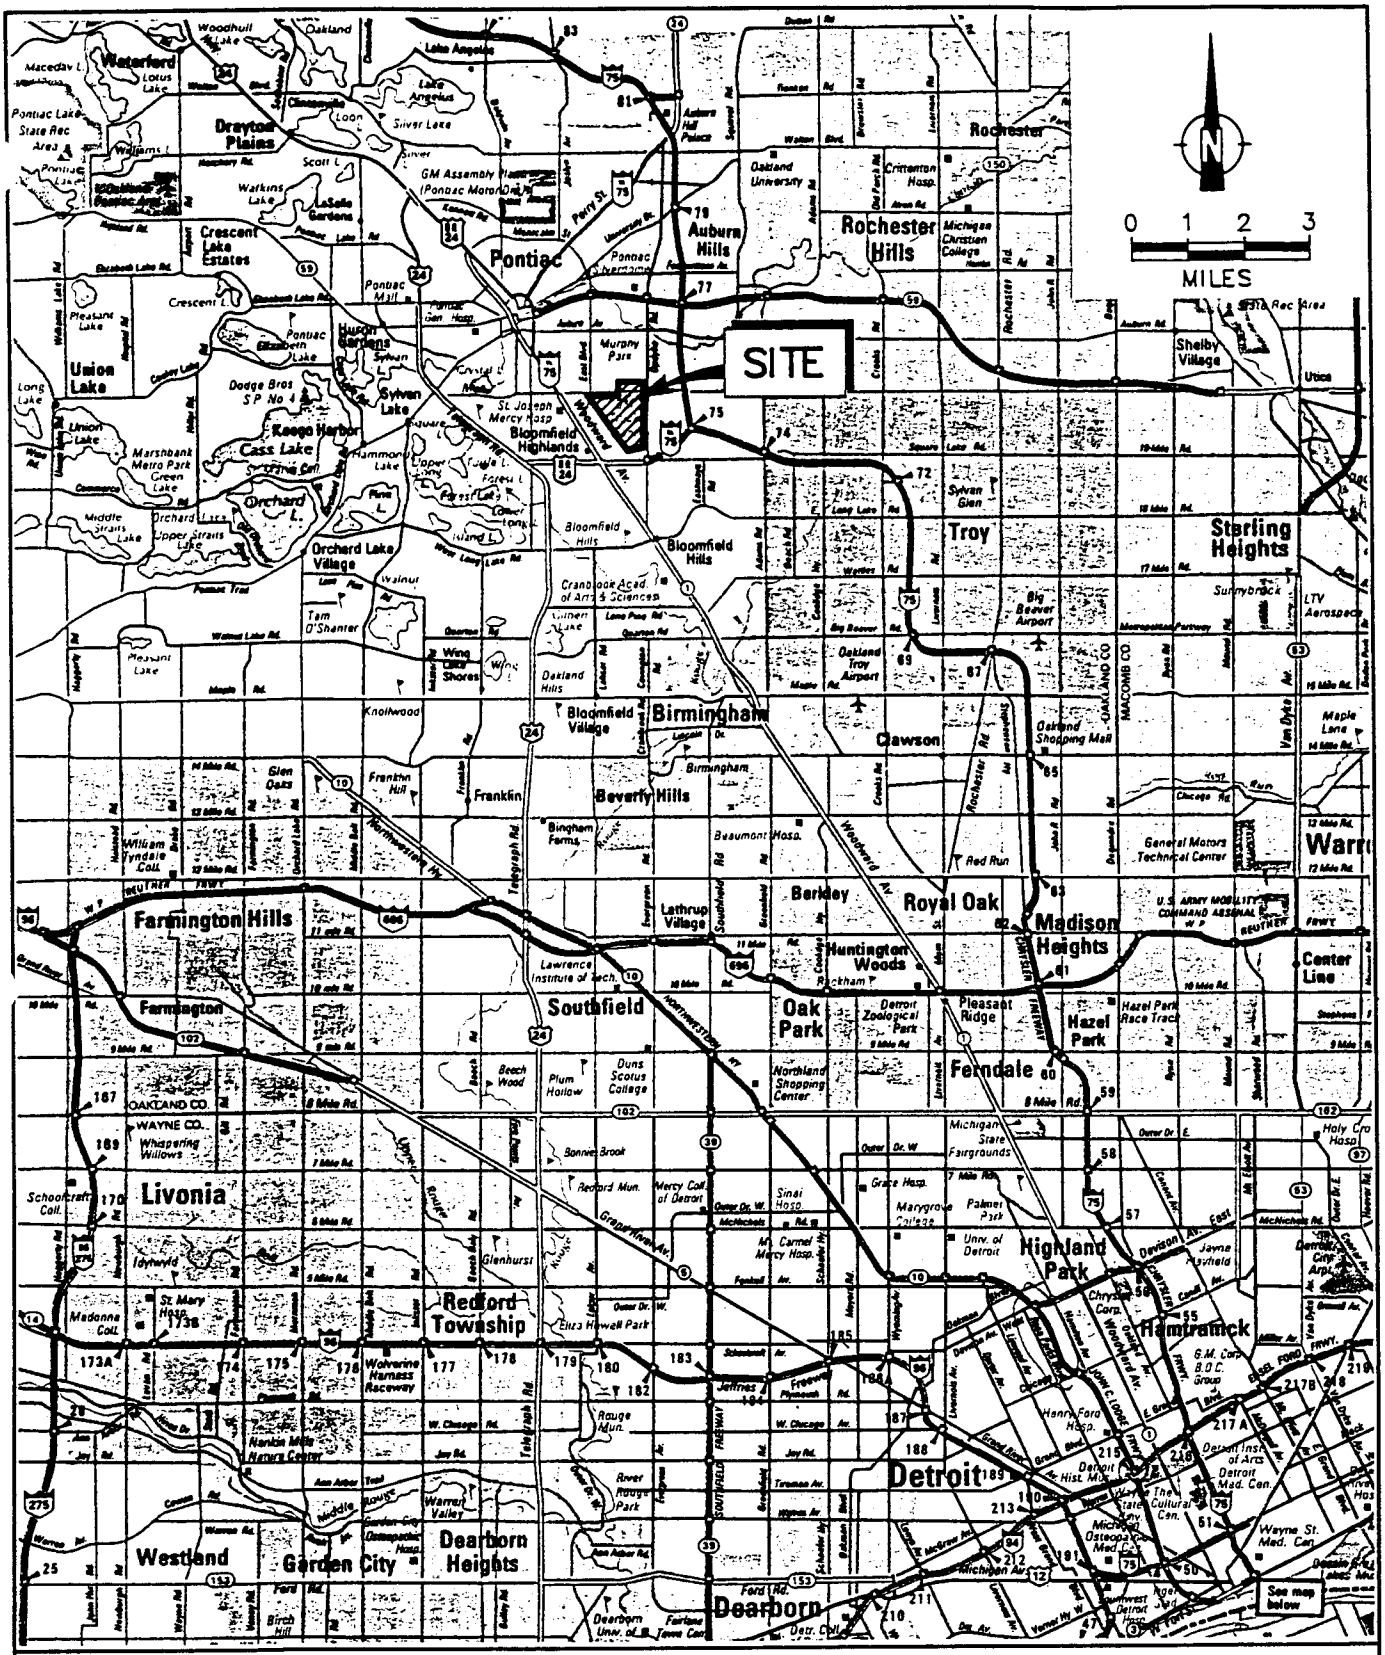
Based upon the borehole stratigraphic logs, the affected material is overlain by approximately two feet of unaffected soil. The thickness of the affected material varies in each of the boreholes installed and ranges from three to twelve feet thick. The total estimated volume of affected material is approximately 5,000 cy. This estimate is based on the available information and an approximation of the extent of affected materials. Actual volumes will be determined during remedial excavation, if required, utilizing verification sampling as necessary. This report deals with the areas exterior of Building 43 only.

5.0 SUMMARY

The following summary has been prepared based on the information obtained during the Cook/WW and CRA subsurface investigations at the Study Area:

1. The general nature and extent of affected soil within the Study Area has been determined as presented in Section 4.0 of this report;

2. The affected soil is overlain by approximately two feet of unaffected soil;



3. The affected soil ranges from 3 to 12 feet in thickness;

4. Samples collected from the affected soil indicate concentrations of VOCs, SVOCs, and metals above Michigan Type B Direct Contact Criteria and concentrations of lead and arsenic over Michigan Type C Generic Industrial Direct Contact Cleanup Criteria;

5. The estimated extent of affected soil is presented on Figure 4.1;

6. The estimated volume of affected soil is approximately 5000 cy; and

7. No significant groundwater exists at the Study Area.

Notes:

(a) from MERA Op. Memo. #8, February 4, 1994 and addendum dated June 21, 1994.

(b) from MERA Op. Memo #14, June 21, 1994.

(c) the Michigan method detection limit has been substituted for the Type B criteria.

(d) Michigan Type A background levels from MERA Op. Memo. #15, September 30, 1993.

ND - analyte was not detected

DCV - direct contact value.

DW - drinking water

( ) - parenthesis indicate the method detection limit.

Notes:

(a) from MERA Op. Memo. #8, February 4, 1994 and addendum dated June 21, 1994.

(b) from MERA Op. Memo #14, June 21, 1994.

(c) the Michigan method detection limit has been substituted for the Type B criteria.

(d) Michigan Type A background levels from MERA Op. Memo. #15, September 30, 1993.

ND - analyte was not detected

DCV - direct contact value.

DW - drinking water

( ) - parenthesis indicate the method detection limit.

BUILDING #43

Dear Mr. Lindsay

Please find enclosed the analytical results of the samples received at our laboratory on August 23, 1994. This report contains sections addressing the following information at a minimum:

- sample summary
- analytical methodology
- state certifications
- definitions
- analytical results
- chain-of-custody (if applicable)

IEA Project#	CH941677	Client Project#	5770
		Purchase Order#	-
IEA Quote#		Site Name	

ies of this analytical report and supporting data are maintained in our files for three years; samples are retained for two weeks unless special arrangements have been made. Unless specifically indicated, all analytical testing was performed at this laboratory location and no portion of the testing was subcontracted.

We appreciate your selection of our services and welcome any questions or suggestions you may have relative to this report. Please contact your customer service representative at 705-0740 for any additional information. Thank you for utilizing our services, we hope you will consider us for your future analytical needs.

I have reviewed and approved the enclosed data for final release.

Sincerely,

Thomas M. Bauer
Laboratory Manager
IEA-Illinois Laboratory

IEA
An Aquarion Company

Definitions of Data Qualifiers and Terminology

There are a number of data qualifiers that are widely used within the environmental testing industry which may be utilized in our data reports. The following definitions of these qualifiers are included as a service to our clientele. The majority of the qualifiers have evolved from the EPA contract laboratory program (CLP) therefore, they may or may not be appropriate for the particular testing that you have requested. If your work did not involve CLP type analyses, only a few of these items may apply to your particular report.

A - This flag is utilized to indicate that a tentatively identified compound (TIC) is a suspected aldol-condensation product formed during sample processing and caution should be applied in interpreting these results.

B - This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates possible/probable blank contamination and warns the data user to use caution when applying the results of this analyte.

BQL - Below quantitation limit indicates the compound was not detected in the sample above the practial quantitation limit.

C - Indicates that a pesticide identification has been confirmed utilizing GC/MS techniques.

D - Indicates the sample extract was diluted by the factor listed due to the sample matrix and/or concentration levels. All method detection limits or practical quantitation limits for the particular sample are therefore increased by this dilution factor.

E - Indicates that the concentration of the specific compound exceeded the calibration range of the instrument for that particular analysis.

J - Indicates an estimated value. It indicates that the compound was analyzed for and determined to be present in the sample. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the mass spectral data indicate the presence of a compound that meet the identification criteria but the result is less than the sample quantitation limit but greater than zero.

MDL - The method detection limit (MDL) is defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero.

ND - Indicates the compound or analyte was not detected in the sample above the method detection limit or the practical quantitation limit for the particular analysis.

PQL - The practical quantitation limit is the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine operating conditions.

U - Indicates the compound was analyzed for but not detected in the sample above the applicable quantitation limit.

CASE NARRATIVE

VOLATILES

Sample S-082194-FR-129 was initially analyzed within holdtime. The sample was reanalyzed outside the holdtime to confirm the presence of ethyl benzene and xylenes. It was found that the initial hits for these two compounds were due to carryover. Both analyses have been reported.

DATA VALIDATION REPORT

MEMO

TO: Frank Ring REFERENCE NO: 5770

FROM: Lou Almeida/pmck/7 DATE: January 26, 1995

RE: Analytical Data and Quality Assurance Review
Site Investigation, Building 43
General Motors Pontiac Manufacturing Facility
Pontiac, Michigan

1.0 OVERVIEW

Eighteen soil samples were collected at the General Motors Pontiac Manufacturing Facility Site (Site) located in Pontiac, Michigan. Samples collected were submitted for the analysis of volatile organic compounds (VOCs); semi-volatile organic compounds (SVOCs); and metals.

This memo presents an analytical assessment and validation of results obtained in one analytical report from IEA Inc. (IEA) located in Schaumburg, Illinois resulting from the analysis of the soil and water samples collected from the Site.

Analytical results were received in a report provided by IEA and were reviewed to determine conformance with the requirements stipulated in the relevant methods and each laboratories quality control criteria. IEA completed sample analyses in accordance with the methods outlined in the United States Environmental Protection Agency (U.S. EPA) document entitled, "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, 3rd Edition, September 1986. The U.S. EPA documents entitled, "National Functional Guidelines for Organic Data Review", (Revised 1994), and "National Functional Guidelines for Inorganic Data Review", (Revised 1994), were used in the assessment and validation of the data.

Evaluation of the data was based upon quality assurance/quality control (QA/QC) information supplied in the final analytical report. The QA/QC information includes dates of analysis, surrogate spike recoveries, method blank results, check sample spike recoveries and matrix spike/matrix spike duplicate (MS/MSD) recoveries.

Details of the data assessment are outlined in the following sections.

2.0 QA/QC REVIEW

2.1 SAMPLE HOLDING TIME

The sample holding time criteria, as specified in SW-846 , were used as the basis of the review of sample holding time. Holding times were determined using sample collection dates noted in the chain-of-custody documents and sample analysis dates reported by IEA. Analytical methods and holding time criteria are presented in Table 1.

Samples submitted for analysis were analyzed prior to expiration of the prescribed holding time with one exception. Sample S-082194-FR-129 was analyzed for VOCs outside of the sample holding time criterion. Therefore, the results obtained from the analysis of this sample are qualified as estimated. Qualifications are presented in Table 2.

2.2 SURROGATE SPIKE RECOVERIES

Laboratory performance on individual samples was evaluated on the basis of surrogate spike recoveries. Samples submitted for VOC analysis were spiked with the surrogate compounds toluene-d_8, bromofluorobenzene, and 1,2-dichloroethane-d_4. Samples submitted for SVOC analysis were spiked with 2-fluorobiphenyl, nitrobenzene-d_5 and terphenyl-d_{14}, 2-fluorophenol, phenol-d_6, and 2,4,6-tribromophenol surrogate compounds. Surrogate recovery limits, as established by the laboratory, are summarized in Table 3.

In reviewing the data, it was determined that the reported surrogate recoveries fell within established control limits with some exceptions. Unacceptable surrogate recoveries are presented in Table 4. In cases where the recovery for terphenyl-d_{14} fell outside control limits, qualifications were not required as the other two base neutral surrogate recoveries for each sample were acceptable. Qualifications for sample S-082194-FR-129 were previously based on a holding time exceedance.

2.3 METHOD BLANK ANALYSES

In order to assess potential sample contamination attributable to laboratory conditions, method blank samples were analyzed in conjunction with the investigative samples.

The method blank results indicated that all blanks were free of contaminants. Consequently, data qualifications were not necessary.

2.4 CHECK SAMPLES (CS)

Check sample data are assessed in order to determine method accuracy and laboratory performance. IEA prepared and analyzed check samples with the investigative samples for this program.

Upon review, all CS recoveries were well within acceptable control limits, demonstrating acceptable method accuracy and laboratory performance. Consequently, no data qualifications were necessary on this basis.

2.5 MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) ORGANIC ANALYSES

MS/MSD analyses provide insight into sample matrix effects on digestion and/or measurement methodology for organic analyses. No action is normally taken on MS/MSD data, in terms of qualification, as this data alone does not give a complete indication of overall accuracy and precision. However, in conjunction with other QC data, the need for qualifications can be assessed.

MS/MSD recoveries fell within laboratory-established control limits, with no exceptions. Consequently, acceptable method accuracy was demonstrated for this sample matrix.

The precision of the method is reflected by the reproducibility of the MS and MSD recoveries. A relative percent difference (RPD) was calculated for all MS/MSD results.

Upon review, it was noted that all RPD values fell below the laboratory established control maximums summarized, demonstrating acceptable method precision.

No data qualifications were deemed necessary on the basis of MS/MSD recoveries.

2.6 MATRIX SPIKE INORGANIC ANALYSES

Matrix spike MS analyses provide insight into the effect of the sample matrix on sample preparation and/or measurement methodology. MS data are assessed in order to determine the impact of the sample matrix on accuracy.

All MS recoveries fell within review limits (75-125 percent). Qualifications were not required on this basis.

3.0 CONCLUSION

The data provided by IEA is acceptable for use noting the qualifications resulting from an unacceptable holding time.

TABLE 1

SUMMARY OF ANALYTICAL METHODS AND HOLDING TIMES
SITE INVESTIGATION, BUILDING 43
GENERAL MOTORS PONTIAC MANUFACTURING FACILITY
PONTIAC, MICHIGAN

Analysis	*Method*	*Holding Time Criteria* *Solid Matrix (days)*

APPENDIX F.2

PROJECT SPECIFICATIONS, EXCAVATION OF CONTAMINATED MATERIAL AT BUILDING 43

PROJECT SPECIFICATIONS

EXCAVATION OF CONTAMINATED MATERIAL AT BUILDING 43
GENERAL MOTORS PONTIAC CENTRAL MANUFACTURING FACILITY
PONTIAC, MICHIGAN

SECTION 01010

SUMMARY OF WORK

1.1 SECTION INCLUDES

A. Scope of work.

B. Location.

C. Access to Site.

D. Description of work.

E. Work not included.

F. Contract schedule.

G. Drawings.

1.2 SCOPE OF WORK

A. Works to be performed under this Contract consist of the excavation of contaminated material at Building 43 and associated work at the General Motors Pontiac Central Manufacturing Facility (Site), Pontiac, Michigan.

1.3 LOCATION

A. The Site is located on South Boulevard between Opdyke Road and Dr. Martin Luther King Jr. Boulevard, Pontiac, Michigan.

1.4 ACCESS TO SITE

A. Access to Site is available from South Boulevard at the contractors entrance.

B. Make arrangements with the authorities having jurisdiction for the movement of material and equipment to and from Site over public roadways.

1.5 DESCRIPTION OF WORK

A. Work includes but is not limited to the following:

1. Mobilization and startup.

2. Development, implementation, and maintenance of a Site-specific Health and Safety Plan.

3. Provision and maintenance of construction facilities and temporary controls.

4. Excavation and segregation of materials.

5. Stockpiling excavated materials.

6. Loading, transporting and disposing of contaminated soils.

7. Backfilling and compaction of excavation.

8. Support of buildings adjacent to the excavation which may be damaged by Works.

9. Demobilization and closeout.

1.6 WORK NOT INCLUDED

A. The following items of work associated with the project do not form part of this Contract:

1. Sampling and analysis of soils.

1.7 CONTRACT SCHEDULE

A. Perform Works in accordance with the following Contract Schedule:

1. Commence Works at Site within 7 days after the date of Notice to Proceed.

2. Complete Works within 28 days after the date of Notice to Proceed.

1.8 DRAWINGS

A. Drawings issued with and forming part of Contract Documents are listed below:

Drawing No.	*Rev. No.*	*Date of Drawing or Latest Revision*	*Title*
Figure 1	0	April 3, 1995	Facility location
Figure 2	0	April 3, 1995	Site plan
Figure 3	0	June 6, 1995	Excavation area

B. Perform Works in accordance with Drawings issued "Approved for Construction" by Engineer. Such Drawings will be issued to Contractor after Notice of Award and will consist of bid Drawings revised as required by Engineer and additional Drawings if required by Engineer. Revised Drawings may be issued from time to time and such Drawings will supersede previous revisions.

1.9 CONTRACTOR USE OF SITE

A. Limit use of Site to allow:

1. Owner occupancy.

2. Work by Others and Work by Owner.

B. Site Security: Complete all activities in a manner which complies with Owner's Site security requirements, including, but not limited to, sign in /sign out procedures.

C. Construction Operations: Do not unreasonably encumber Site with plant, equipment, or materials. Do not obstruct vehicle passage, use, or otherwise interfere with properties outside of Site unless otherwise specified.

D. Hours of Operation: Limit on-Site hours of operation to the hours of 7:00 am to 9:00 pm, unless prior arrangements are made with Engineer.

E. When unfavorable weather, soil, drainage, or other unsuitable construction conditions exist, continue operations to work which will not be adversely affected by such conditions. Do not construct or cause to be constructed any portion of Works under conditions which would adversely affect the quality of Works, unless special means or precautions are taken to perform Works in a safe, proper, and satisfactory manner.

END OF SECTION

SECTION 01015

GENERAL REQUIREMENTS

1.1 SECTION INCLUDES

A. Mobilization and startup.

B. Superintendence.

C. Related Sections.

D. Specification language.

E. Definitions

F. Coordination.

G. Field surveying.

H. Site mobilization meeting.

I. Examination.

J. Restoration.

K. Measurement and payment.

1.2 MOBILIZATION AND STARTUP

A. Do not mobilize to Site without Engineer's prior written authorization. Ensure insurance as required by Contract Documents is in full force.

B. Perform planning and scheduling activities as required for the performance of Works.

C. Purchase materials and mobilize equipment, supplies, and incidentals to Site.

D. Use the existing Site access roads to the designated work areas during mobilization. Complete improvements to roads as required.

E. Site temporary construction facilities in areas designated by Engineer. Obtain Engineer's approval prior to changing locations of temporary construction facilities. No other areas shall be used by Contractor without Engineer's prior approval. Relocate construction equipment or other materials or equipment as required for the performance of Works.

F. Do not commence work involving contact with potentially contaminated materials until decontamination facilities are operational and approved by Engineer.

G. Perform work that must be performed before beginning work on the various items for which payment is provided elsewhere in these Specifications.

H. Furnish submittals as required and described in these Specifications.

I. Obtain permits required specifically for commencement of the Works.

J. Confine equipment, storage of materials and equipment, and the operations of workers to the Site and areas identified in and permitted by Contract Documents and other land and areas permitted by laws and regulations, rights-of-way, permits, and easements. Do not unreasonably encumber Site with construction equipment or other materials or equipment.

1.3 SUPERINTENDENCE

A. Provide all necessary superintendence during execution of Works. Employ and assign to Works a competent and authorized representative satisfactory to Owner herein referred to as the Superintendent and who shall be responsible for supervision, inspection, and direction of Works and who shall be empowered to act on behalf of Contractor in all matters pertaining to the Contract. All instructions given such representative by Owner or Engineer shall be binding as if given to Contractor. Instructions will be confirmed by Engineer in writing upon request. The Superintendent shall be constantly on Works at Site and give his whole time to the superintendence of the same. Do not remove Superintendent from Works unless (a) Owner requests removal, (b) the Superintendent ceases to be employed by Contractor, or (c) otherwise agreed by Owner and Contractor.

B. Within 7 days after the date of Notice to Proceed, furnish name of Superintendent, in writing, to Engineer.

1.4 RELATED SECTIONS

A. When related Sections are listed in individual specification Sections, other Sections of the Project Specifications not referenced in the list of related Sections shall also apply to the extent required for the proper performance of Works.

1.5 SPECIFICATION LANGUAGE

A. These Project Specifications are written in imperative mood and are in the abbreviated or streamlined form and include incomplete sentences. This imperative language is directed to Contractor, unless specifically noted otherwise. Omission of words or phrases, such as "the Contractor shall", "shall be", "a", "the", and "all" are intentional. Omitted words or phrases shall be supplied by inference in the same manner as they are when a "note" occurs on Drawings.

1.6 DEFINITIONS

A. In the Contract, the following words and phrases shall have the following meanings:

1. "Contract" means the agreement covering the performance of the Works including the supply of any and all work, labor, equipment, plant and materials that could reasonably be required to properly and satisfactorily complete the Works to be performed and any written supplementary agreements that may be made in order to ensure the completion of the Works in an acceptable manner.

2. "Works" means the services and associated work to be supplied by the Contractor.

3. "Contractor" means the party to whom the Contract for the Works has been awarded and in the context of the Contract means the Corporation named as Contractor in the Agreement.

4. "Owner" means General Motors Truck and Bus Group.

5. "Payment" means the amount to be paid to the Contractor for the satisfactory performance of the Works.

6. "Engineer" means Conestoga-Rovers & Associates and its duly authorized agents.

7. "Site" means the project site, which consists of the lands and structures made available to the Contractor by the Owner.

1.7 COORDINATION

A. Coordinate scheduling, submittals, and work of the various Sections of Project Specifications and other requirements of Contract Documents.

B. Do not deliver material or equipment of any kind to Site until approval in writing has been applied for and obtained by Contractor from Engineer.

C. Coordinate delivery of material and equipment to Site with work sequence; schedule deliveries to limit requirement for storage at Site to the practical minimum; limit on-Site storage of materials to areas approved by Engineer.

1.8 FIELD SURVEYING

A. Unless otherwise specified, Engineer will establish reference bench marks and base lines adjacent to Works.

B. Notify Engineer in writing at least 5 working days in advance of commencing work on any part of the construction to enable Engineer to establish bench marks and base lines.

C. Locate, preserve, and protect survey control and reference points as set or established by Engineer. Promptly report to Engineer the loss or destruction of any reference point or relocation required because of changes in grades or other reasons. Make good any errors entering into Works through Contractor failure to notify Engineer concerning lack of preservation of such survey reference points. Replace dislocated survey control points based on original survey control. Make no changes without prior written notice to and approval of Engineer.

1.9 SITE MOBILIZATION MEETING

A. Engineer will schedule and administer a Site mobilization meeting at Site within 7 days prior to Contractor occupancy of Site.

B. Attendance Required: Owner, Engineer, Contractor's Health and Safety Officer and Superintendent, and major Subcontractors.

C. Agenda:

1. Use of Site by Owner and Contractor.

2. Owner's requirements.
3. Construction facilities and controls provided by Owner.
4. Temporary utilities provided by Owner.
5. Survey and excavation layout.
6. Security and housekeeping procedures.
7. Schedules.
8. Procedures for testing.
9. Procedures for maintaining Record Documents.
10. Health and safety.
11. Procedures for processing of field decisions, submittals, substitutions, progress payments, Field Orders, Requests for Quotation, Work Change Directives, Change Orders, and Contract closeout procedures.

D. Engineer will record minutes and distribute copies to participants and those affected by decisions made.

1.10 EXAMINATION

A. Prior to commencement of work at Site, inspect Site with Engineer to review and establish the condition of surface features including existing buildings, wells, fencing, service poles, wires, paving, and survey bench marks or monuments on or adjacent to Site which may be affected by Works. This inventory shall be mutually agreed between Engineer and Contractor and shall not thereafter be subject to dispute. Such inventory as may be amended, from time to time, will be used by Engineer to check compliance by Contractor with the requirements of Contract Documents.

B. Provide ongoing review, inspection, and attendance during performance of Works to properly document conditions. Promptly inform Engineer of any existing condition at Site affected by Works which may require restoration, repair, or replacement. Do not cover up any of Works without prior approval from Engineer.

C. Maintain and protect existing Site structures and facilities from damage which may be affected by Works while work is in progress. Repair or replace any damage resulting from Works to Engineer's approval.

D. Verify that existing Site conditions and substrate surfaces are acceptable for subsequent work. Beginning new work means acceptance by Contractor of existing conditions.

E. Examine and verify specific conditions described in individual specification Sections.

F. Verify that utility services are available, of the correct characteristics, and in the correct location.

1.11 RESTORATION

A. As a minimum, restoration shall mean replacement, repairs, or reconstruction to a condition at least as good as or better than the condition prior to commencement of Works.

B. Except where specifically required otherwise by other specification Sections, restore areas of Works and areas affected by the performance of Works to conditions that existed prior to commencement of Works and to match condition of similar adjacent, undisturbed areas.

C. Ensure that restored areas match existing grade and surface drainage characteristics, except as otherwise specified, and ensure a smooth transition from restored surfaces to existing surfaces.

D. Do not alter original conditions without prior written approval from Engineer.

E. Without limiting the generality of the foregoing or other requirements of the Contract, preserve and protect any existing feature encountered at Site during the performance of Works including, but not limited to buildings, wells, structures, curbs and gutters, fences, pavement, manholes and catch basins, utilities, roads, and other graded or improved areas.

F. Utilize construction methods and procedures during the performance of Works which keeps disturbance and damage of whatever nature to existing conditions to the practical minimum.

G. Ensure that quality, grades, elevations, and extent of bedding, cover, and other backfill materials including subgrades, finish grades, thickness of pavements for roadways, and parking areas are properly documented during their removal to ensure reconstruction to at least their original and functional condition.

H. Restoration Material: New, except as otherwise specified, not damaged or defective and of the best quality for the purpose intended. Furnish evidence as to type, source, and quality of materials or products provided when requested by Engineer or specified in other specification Sections.

I. Should any dispute arise as to the quality or fitness of materials, whether obtained on Site or off Site, whether previously inspected by Engineer prior to use or not, the decision to use any material or product in the finished Works will rest solely with Engineer.

J. Handle and store products and materials in a manner to prevent damage, adulteration, deterioration, and soiling and in accordance with manufacturer's instructions when applicable.

K. Prior to commencement of restoration work, inform Engineer of proposed material, methods, and procedures to repair, replace, or reconstruct any disturbed, damaged, or suspected damage to Works.

1.12 MEASUREMENT AND PAYMENT

A. Section 01019 - Contract Considerations: Requirements for measurement and payment.

B. Insurance:

1. Schedule of Prices Item No. A-1i) and A-1ii).

2. Payment Basis: Lump sum price. Includes furnishing and maintaining Contractor's Pollution Liability insurance required by Contract Documents for Item A-1i) and all other insurance required by Contract Documents for Item A-1ii).

C. Mobilization and Startup:

1. Schedule of Prices Item No. A-2.

2. Payment Basis: Lump sum price. Includes Contractor's planning and scheduling activities, mobilization of equipment to Site; material purchasing; project startup; work area preparations; preparation of miscellaneous submittals; procurement activities;

procure permits; meetings to coordinate key interface points and communication channels between Owner and Engineer.

END OF SECTION

SECTION 01019

CONTRACT CONSIDERATIONS

1.1 SECTION INCLUDES

A. Payment.

B. Change procedures.

C. Alternatives.

1.2 PAYMENT

A. Payment requirements are delineated in the individual specification Sections and complement the criteria of this Article.

B. Engineer will measure or quantify the amount of work eligible for progress payment purposes. Items will be measured by weight, volume, area, or linear means, or combination as appropriate. Such measurements will serve as a basis for estimating percentage payments for partially completed work. Notify Engineer sufficiently in advance of operations to permit required measurements for payment. Assist by providing necessary equipment, workers, and survey personnel as required. Provide reasonable and necessary opportunities and facilities in making measurements.

C. Measurement Devices:

1. Weigh Scales: Inspected, tested, and certified by the applicable state Weights and Measures department within the past year.

2. Platform Scales: Of sufficient size and capacity to accommodate the conveying vehicle.

3. Metering Devices: Inspected, tested, and certified by the applicable state department within the past year.

D. Payment for Each Item Includes: Full compensation for all required labor, supervision, material, tools, equipment, plant, transportation, services, and incidentals for completion of Works in complete accordance with Contract Documents; erection, application, installation, or construction of an item of Works; overhead and profit; and all other miscellaneous items for which separate payment is not provided under other Items of the Schedule of Prices. All work not specifically set forth as a separate pay Item in the Schedule of Prices shall be considered as a subsidiary obligations of Contractor and all costs in connection therewith shall be included in the amounts and prices stipulated in the Schedule of Prices. Contractor shall properly and fairly distribute indirect costs to each pay Item. Final payment for work will be made on the basis of the applicable lump sum prices stipulated in the Schedule of Prices.

E. Defect Assessment: Replace Works, or portions of Works, not conforming to specified requirements. If, in the opinion of Engineer, it is not practical to remove and replace the defective work, Engineer will direct one of the following remedies:

1. The defective work may remain, but the price will be adjusted to a new price at the discretion of Engineer.

2. The defective work will be partially repaired to the instructions of Engineer, and the price will be adjusted to a new price at the discretion of Engineer.

F. Non-Payment for Rejected Products: Payment will not be made for any of the following:

1. Products wasted or disposed of in a manner that is not acceptable.

2. Products determined as unacceptable before or after placement.

3. Products not completely unloaded from the transporting vehicle.

4. Products placed beyond the lines and levels of the required Works.

5. Products remaining on hand after completion of Works.

6. Loading, hauling and disposing of rejected products.

1.3 CHANGE PROCEDURES

A. Field Order: Engineer will advise of minor changes in Works and issue supplemental instructions not involving an adjustment to Contract Price or Contract Schedule as authorized by Contract Documents by issuing a Field Order. Promptly execute such minor changes and supplemental instructions.

B. Request For Quotation: Engineer may issue a Request for Quotation, which includes a detailed description of a proposed change with supplementary or revised Drawings and Specifications and schedule for executing the change in Works. Contractor shall prepare and submit a quotation within the due date stipulated in the Request for Quotation with sufficient data to allow evaluation by Engineer. When requested by Engineer, provide additional data to support computations:

1. Quantities of products, labor, and equipment.

2. Taxes, insurance, and bonds.

3. Overhead and profit.

4. Justification for any change in Contract Schedule.

5. Credit for deletions from Contract, similarly documented.

C. Work Change Directive: Engineer may issue a directive on behalf of Owner instructing Contractor to proceed with a change in Works, for subsequent inclusion in a Change Order. Document will describe change in Works, and designate method of determining any change in Contract Price or Contract Schedule. Promptly execute the change in Works.

D. Change Order: Based on the requirements of the Request for Quotation or the Work Change Directive and prepared as follows:

1. Lump sum price Change Order will be executed on Contractor's fixed lump sum price quotation as approved by Engineer.

2. A unit price Change Order will be executed on a fixed unit price basis for pre-determined unit prices and quantities. For unit costs or quantities of units of work which are not pre-determined, execute Works under a Work Change Directive.

3. A time and material Change Order will be executed on time and material rates approved by Engineer on a case-by-case basis. Submit an itemized account and supporting data after completion of change, within time limits indicated in Contract Documents. Engineer will determine the change allowable in Contract Price and Contract Schedule as provided in Contract Documents. Maintain detailed records of work done on time and material basis in accordance with Contract Documents. Provide full information required to substantiate costs for changes in Works.

E. Engineer will prepare and issue Field Orders, Request for Quotation, Work Change Directives, and Change Orders, as required, for signatures of parties.

F. When requested by Engineer, support each claim for work done on a time and material basis, with additional information:

1. Origin and date of claim.

2. Dates and times work was performed, and by whom.

3. Time records and wage rates paid.

4. Invoices and receipts for products, equipment, and subcontracts, similarly documented.

G. Promptly revise progress schedules to reflect any approved change in Contract Schedule, revise sub-schedules to adjust times for other items of work affected by the change, and promptly resubmit.

H. Promptly enter changes in Record Documents.

1.4 ALTERNATIVES

A. Alternatives specified in Contract Documents will be reviewed and accepted or rejected at Owner's Option. Accepted Alternatives will be identified in the Schedule of Prices.

B. Coordinate related work and modify surrounding work to integrate the work of each alternative.

C. Schedule of Alternatives:

1. Alternative No. 1: Excavate, stockpile, backfill, load, transport, off-site disposal of excavated material and off-site disposal of wastewater.

Base Bid Item: Sections 01010, 01015, 01019, 01111, 01300, 01400, 01500, 01700, 02222, 02223, and 02759.

2. Alternative No. 2: Excavate, stockpile, backfill, load excavated material into owner supplied haulage units for disposal, and off-sitedisposal of wastewater.

Base Bid Item: Sections 01010, 01015, 01019, 01111, 01300,01400, 01500, 01700, 02222, and 02223.

END OF SECTION

SECTION 01111

HEALTH AND SAFETY

1.1 SECTION INCLUDES

A. General requirements.

B. Basis of program.

C. Site characterization.

D. Submittals for review.

E. Health and safety officer.

F. Personnel health, safety, and hygiene.

G. Air monitoring.

H. Contingency and emergency response plans.

I. Site health and safety.

J. Measurement and payment.

1.2 GENERAL REQUIREMENTS

A. Develop a written Site-specific Health and Safety Plan prior to commencing any on-Site work and continue to implement, maintain, and enforce the plan until final demobilization from Site. The development, implementation, and maintenance of the Site-specific Health and Safety Plan is Contractor's sole responsibility. Contractor's Site-specific Health and Safety Plan, as a minimum, shall address the specifications contained herein.

B. The health and safety guidelines contained herein are intended to provide for a safe and minimal risk working environment for on-Site personnel and to minimize the impact of activities involving contact with any hazardous materials or hazardous wastes on the general public and the surrounding environment.

C. Should Contractor seek relief from or substitution for any portion or provision of the minimum health and safety guidelines specified herein or the reviewed Site-specific Health and Safety Plan, such relief or substitution shall be requested of Engineer in writing, and if accepted by Engineer, will be authorized in writing.

D. Responsibility: Be responsible for the safety of persons and property on Site and for the protection of persons off Site and the environment to the extent that they may be affected by the conduct of Works. Comply with and enforce compliance by Contractor employees and the employees of Subcontractors, agents, and invitees, with safety requirements of Contract Documents, applicable federal, state, and local statutes, regulations, and ordinances, and with Contractor's Site-specific Health and Safety Plan. Contractor acknowledges that safety and environment protection obligations are of paramount importance regarding all of the work to be performed under Contract Documents.

E. Hazard Communication Requirements:

1. Comply with the requirements of OSHA's "Hazard Communication" rule, 29 CFR 1910.1200. Contractor shall be responsible for obtaining information of any hazardous chemical or harmful physical agent to which his personnel and visitors have potential exposure while on the premises.

2. Contractor shall provide Engineer with MSDS (Material Safety Data Sheet) documentation on any "hazardous" chemicals that Contractor plans to bring onto Site. In addition, Contractor is responsible for meeting container warning label requirements of the OSHA rule.

F. Work Stoppage: Contractor shall give precedence to the safety and health of the public and on-Site personnel and the protection of the environment over cost and schedule considerations for all project work. The Health and Safety Officer shall be responsible for decisions regarding when work will be stopped or started for health or safety considerations and shall have the authority to stop or start the work for health or safety considerations. Contractor shall assign the responsibility and obligation to the Health and Safety Officer to stop or start the work when, in the Health and Safety Officer's discretion, it is necessary or advisable for reasons of health or safety. Engineer shall have the right to stop work for health and safety considerations.

G. Unforeseen Hazards: Should any unforeseen or Site-peculiar safety-related factor, hazard, or condition become evident during the performance of Works at Site, bring such to the attention of Engineer verbally and in writing as quickly as possible, for resolution. In the interim, take prudent action to establish and maintain safe working conditions and to safeguard Contractor employees and employees of Subcontractors, agents and invitees, the public, Owner, Engineer, and the environment.

H. Work Zone Restrictions: Do not work in the Exclusion Zone or in the Contaminant Reduction Zone (including any areas expected to become an Exclusion Zone or Contaminant Reduction Zone), including work relating to the designation or establishment of an Exclusion Zone or Contaminant Reduction Zone, until Contractor's Site-specific Health and Safety Plan is reviewed by Engineer. Other on-Site work may be conducted after the submittal of the Site-specific Health and Safety Plan to, and prior to, its review by Engineer, but conduct any such work only with the prior approval of Engineer. Implement the proposed Site-specific Health and Safety Plan, as submitted to Engineer, during the conduct of any work performed prior to the review of the Site-specific Health and Safety Plan.

1.3 BASIS OF PROGRAM

A. The Occupational Safety and Health Administration (OSHA) Standards and Regulations contained in Title 29, Code of Federal Regulations, Parts 1910 and 1926 (29 CFR 1910 and 1926) provide the basis for the health and safety program. The program also reflects the position of the USEPA and NIOSH regarding procedures recommended or required to ensure safe operations at sites containing hazardous or toxic materials.

1.4 SITE CHARACTERIZATION

A. Work at Site will involve contact with materials containing varying levels of Vinyl Chloride, SVOC's (benzo (a) anthracene, benzo (b) fluoranthene, benzo (a) pyrene, Indeno (1, 2, 3) pyrene, and Dibenzo (A,H) anthracene) and inorganics (aluminum, arsenic, lead, and manganese).

1.5 SUBMITTALS

A. Contractor's Site-Specific Health and Safety Plan:

1. Within 7 days after the date of Notice to Proceed and prior to mobilization to Site, submit a Site-specific Health and Safety Plan. As a minimum, address aspects of worker protection and measures designed to prevent migration of hazardous or contaminated material to the environment, including but not limited to the provisions and guidelines contained herein, and the following specific topics:

1. Worker medical surveillance.

2. Worker training.

3. A detailed description of the planned movement of labor, equipment, and materials from and between work areas as work progresses, including measures to be employed to prevent recontamination of previously cleaned areas and contamination of areas that do not now contain hazardous materials.

4. A detailed description of the wash down area for decontamination of vehicles and equipment and the methods to be used to collect, store, treat, and ultimately dispose of wash down decontamination waters and sediments.

5. Personal protective equipment types to be used.

6. Personal hygiene and personnel decontamination procedures.

7. Respirator protection program and procedures.

8. Emergency and first-aid equipment and supply.

9. Dust and particulate emission control.

10. Monitoring and mitigation of worker heat and cold stress.

11. On-Site and off-Site Contingency and Emergency Response Plans.

2. Engineer will review Contractor's Site-specific Health and Safety Plan and provide comments to Contractor within 5 days after receipt of the plan. Revise the plan as appropriate and resubmit the plan to Engineer within 2 days after receipt of comments from Engineer.

B. Proof of OSHA Training: Within 7 days after the date of Notice to Proceed and prior to mobilization to Site, submit a list of all personnel that will be employed at Site. For each of the listed personnel, provide proof of training as required under OSHA 29 CFR 1910.120. Submit proof of training for any additional personnel, at least 1 day prior to the individual's arrival on Site.

C. Medical Surveillance:

1. Within 7 days after the date of Notice to Proceed and prior to mobilization to Site, submit a report for medical examination conducted within the last 12 months as part of compliance with OSHA medical surveillance requirements for each of Contractor's personnel that will be employed at Site. As a minimum, submit the following information for each Contractor personnel:

    1. Name and Social Security Number and date of exam.

    2. Physician's statement that the worker is approved to wear and use the types of respiratory protection proposed for the project and is able to work safely in hazardous environments capable of producing heat stress in the worker.

2. Submit reports on medical examination for any additional personnel at least 7 days prior to the individual's arrival on Site.

3. Submit the name of the physician and evidence of examination of on-Site personnel prior to assigning personnel on-Site work activities in the Exclusion Zone or Contaminant Reduction Zone.

1.6 HEALTH AND SAFETY OFFICER

A. Employ and assign to Works a competent and authorized representative herein referred to as Health and Safety Officer. Health and Safety Officer shall be on Site during the execution of work and report directly to and be under the direction of a Certified Industrial Hygienist provided by Contractor.

B. Certified Industrial Hygienist Responsibilities:

1. Oversee operations as necessary to ensure Works is performed in accordance with the Site-specific Health and Safety Plan.

2. Oversee and be present during the Health and Safety Training Session and, as a minimum, complete qualitative respirator fit testing.

3. Oversee the Health and Safety Officer's activities on a part-time basis.

4. Be available on an as-needed basis for emergency situations.

C. Health and Safety Officer Experience and Responsibilities:

1. Have a minimum of 2 years Site-related working experience specific to the activities associated with excavation of contaminated materials.

2. Have a basic working knowledge of state and federal occupational safety and health regulations.

3. Have formal education and/or training in occupational safety and health.

4. Be responsible for completing the health and safety training session and ensuring that personnel not successfully completing the required training are not permitted to enter Site to perform work in the Exclusion Zone or Contaminant Reduction Zone.

5. Be responsible for implementing and daily enforcing and monitoring the Site-specific Health and Safety Plan.

6. Be responsible for ensuring reusable personal protective equipment is decontaminated before being reissued.

7. Be responsible for performing air monitoring.

8. Ensure that on-Site personnel have obtained the required medical examinations prior to arrival at Site and at the termination of their assignment as required by this Contract Documents.

9. Be responsible for the pre-construction indoctrination of on-Site Contractor personnel with regard to the Site-specific Health and Safety Plan and other safety requirements to be observed during performance of Works, including:

    1. Potential hazards.

    2. Personal hygiene principles.

    3. Use of personal protective equipment and respiratory protection, including fit testing.

    4. Emergency procedures for dealing with fire and medical situations.

10. Be responsible for incorporating the provisions of both on-Site and off-Site Contingency and Emergency Response Plans in the Site-specific Health and Safety Plan and maintaining a state of readiness to enact the provisions.

11. Be responsible for alerting appropriate on-Site and/or off-Site emergency services and Engineer before starting any particularly hazardous work.

12. Assist Engineer in contacting and advising local authorities of Works to be performed.

13. Have the authority and obligation to stop all, or any part of Works if, in his sole discretion, stoppage of Works is necessary or advisable for considerations of health or safety.

1.7 PERSONNEL HEALTH, SAFETY, AND HYGIENE

A. Medical Surveillance:

1. Conduct medical surveillance of personnel as required by 29 CFR 1910.120 and 29 CFR 1910.134.

2. Retain the services of a licensed occupational physician or physician's group to provide the medical examinations and surveillance required. Furnish pertinent Site characterization data, a copy of 29 CFR 1910.120, and a description of the intended personal protective equipment to the occupational physician prior to completing medical

surveillance. Maintain Contractor personnel medical approvals at Contractor's Site office for the duration of Works performed at Site.

3. Medical surveillance protocol shall be the occupational physician's responsibility but shall meet the requirements of 29 CFR 1910.120 and 29 CFR 1910.134 for all personnel. This exam may include:

    1. Medical/occupation questionnaire with work history.

    2. Full physical examination.

    3. Screening audio metric test with otoscopic exam for occlusion or perforation.

    4. Visual acuity measurement, including color perception.

    5. Pulmonary function test (Spirometry - FVC and FEV-1.0 second).

    6. Resting EKG.

    7. Chest x-ray.

    8. Blood chemistry profile as deemed appropriate by the attending physician for hazardous waste work.

    9. Complete blood count with differential and platelet evaluation, including WBC, RBC, HGB, hematocrit.

    10. Urinalysis with microscopic examination.

    11. Other Site-specific medical monitoring as required by Site-specific conditions.

4. Provide on-Site personnel requiring full medical surveillance with medical surveillance within the 12-month period prior to entering Site, and at any time there is suspected to be excessive exposure to toxic chemicals or physical agents. Remove on-Site personnel who become due for an annual physical examination from the work force immediately until medical requirements are met in accordance with 29 CFR 1910.120 and 29 CFR 1910.134.

5. Maintain medical surveillance records in accordance with 29 CFR 1910.120 and 29 CFR 1910.134.

6. Conduct medical surveillance of personnel as required by Site operations management with compliance of NIDA 10 drug screening Test E.

B. Training:

1. Provide and require that personnel assigned to or entering Site, complete Site-specific training or refresher sessions. Site-specific training and refresher sessions shall ensure that personnel are capable of and familiar with the use of safety, health, respiratory, and protective equipment and with the safety and security procedures required for Site. The training session shall be completed by Contractor's Health and Safety Officer.

2. As a minimum, include the following items in the training program:

    1. Names and personnel responsible for Site health and safety.

2. Site-specific potential hazards.

3. Use of personal protective equipment (PPE), including proper donning and doffing procedures.

4. Work practices by which the employee can minimize risks from these potential hazards.

5. Safe use of engineering controls and on-Site equipment.

6. Discussion and completion of medical surveillance requirements and recognition of symptoms associated with exposure to hazards.

7. Site control methods.

8. On-Site and off-Site Contingency and Emergency Response Plans.

9. Decontamination procedures.

10. Site-specific standard operating procedures.

11. Delineation between work zones.

12. Use of the buddy system.

13. Scope of the intended work for the Contract.

14. Review on-Site communications and appropriate hand signals between personnel working in the Exclusion Zone and/or Contaminant Reduction Zone.

15. The content of the OSHA standards, including the Appendices.

3. In accordance with 29 CFR 1910.120, provide training to all employees assigned to or entering the Exclusion Zone or Contaminant Reduction Zone excluding truck drivers transporting waste material including a minimum of 40 hours instruction off Site and 3 days of actual field experience under direct supervision of a trained and experienced supervisor and an 8-hour annual refresher. Provide documentation stating that all on-Site personnel expected to enter potentially contaminated work areas have complied with this regulation. Include each individual's name on this confirmatory letter.

4. Implement a hazard communication ("Right-to-Know") program in accordance with 29 CFR 1910.1200.

C. Levels of Protection:

1. Establish levels of protection for each work area based on planned activity, location of activity, and air monitoring results. Monitor potential exposures to hazardous materials with a photoionization device and a dust monitor.

2. Furnish minimum Level C personal protective equipment (PPE) in the Exclusion Zone until initial air monitoring results are available. After the air monitoring results are available, increase or decrease the level of PPE, but to not less than Level C for waste

handling activities. The anticipated levels of personal protection based on work activity are as follows:

	Work Activity	*Anticipated Level of Personal Protection*
1.	Excavation of soils	Level C and Modified Level C
2.	General non-intrusive activities	Modified Level C and Level D

D. Personal Protective Equipment:

1. Furnish on-Site Contractor personnel with appropriate PPE. Ensure that safety equipment and protective clothing is kept clean and well maintained. As a minimum, supply each worker entering or expected to enter the Exclusion Zone or Contaminant Reduction Zone with:

    1. Disposable coveralls, liquid resistant, splash resistant, full coverage.

    2. Individually assigned half- or full-face piece air purifying respirators (NIOSH approved) with appropriate dual organic vapor/high-efficiency particulate filters. Respirators shall be available for on-Site personnel at all times.

    3. Disposable outer gloves, chemical resistant (nitrile).

    4. Disposable inner gloves, thin nitrile or latex.

    5. Steel-toed, steel-shank, chemical-resistant safety boots.

    6. Disposable rubber, chemical-resistant overboots, butyl rubber or neoprene.

    7. Work clothing (full-length pants, long-sleeve shirt).

    8. Hard-hats.

    9. Safety glasses with side shields.

2. Based on the work activity and the anticipated level of personal protection as specified in Section 01111, Article 1.7C, furnish on-Site Contractor personnel with appropriate PPE. Ensure that safety equipment and protective clothing is kept clean and well maintained. As a minimum, supply each worker entering or expected to enter the Exclusion Zone or Contaminant Reduction Zone with protection as specified in Section 01111, Article 1.7C. The following are the minimum PPE required for each level of protection as applicable:

    1. Level C:

        1. Individually assigned half- or full-face piece air-purifying respirators (NIOSH-approved) with appropriate cartridges for organic vapors and particulates.

2. Chemical-resistant disposable coveralls (tyvek).

3. Latex and/or cotton inner gloves.

4. Nitrile outer gloves.

5. Work boots with steel toe and shank.

6. Chemical-resistant overboots or booties, butyl rubber or neoprene.

7. Hard hat.

8. Safety glasses with side shields and/or chemical-resistant goggles.

2. Modified Level C:

1. Individually assigned half- or full-face piece air-purifying respirators (NIOSH approved), with appropriate cartridges for organic vapors and particulates. Respirators shall be available at all times and donned when required as indicated by air monitoring.

2. Chemical-resistant disposable coveralls (tyvek).

3. Latex and/or cotton inner gloves.

4. Nitrile outer gloves.

5. Work boots with steel toe and shank.

6. Chemical-resistant overboots or booties, butyl rubber or neoprene.

7. Hard hat.

8. Safety glasses with side shields and/or chemical-resistant goggles.

3. Level D:

1. Hard hat.

2. Safety glasses with side shields or goggles.

3. Long pants and long-sleeve shirt.

4. Safety boots.

5. Any personal protective equipment necessary for specialized tasks (for example, welding goggles).

3. Develop protective equipment usage procedures and ensure that procedures are strictly followed by on-Site personnel; include the following procedures as a minimum:

1. Do not permit prescription eyeglasses to be worn that are not safety glasses. Do not permit contact lenses on Site within the Exclusion Zone or Contaminant Reduction Zone.

2. Change respirator cartridges/filters daily during periods of respirator usage or upon breakthrough, whichever occurs first.

3. Do not permit footwear to be worn that is not steel-toed safety shoes or boots. Cover footwear by rubber overshoes when entering or working in the Exclusion Zone.

4. Dispose of or decontaminate PPE worn on Site at the end of the work day.

5. Decontaminate reusable PPE before reissuing.

6. Do not permit on-Site personnel who have not passed a respirator fit test to enter potentially contaminated work areas and/or the Contaminant Reduction Zone. Do not permit personnel to have facial hair that interferes with a proper fit of the respirator.

7. As a minimum, require on-Site personnel within potentially contaminated work areas to wear approved PPE including, but not necessarily limited to, hard-hats and safety boots.

E. Respiratory Protection:

1. Provide on-Site personnel with extensive training in the usage and limitations of, and qualitative fit testing for, half- and full-face piece respirators in accordance with 29 CFR 1910.134; include both air-purifying and supplied-air type respirators.

2. Develop, implement, and maintain the respirator program. Incorporate or attach a copy of the respirator program to Contractor's Site-specific Health and Safety Plan.

3. Monitor, evaluate, and provide respiratory protection for on-Site personnel.

4. Levels of respiratory protection as listed in Section 01111, Article 1.7C, have been chosen to be consistent with Site-specific potential airborne hazards associated with the major contaminants identified at Site. The selection of appropriate protection is based upon the potential presence of compounds with the lowest recommended threshold limit value.

5. In the absence of additional air monitoring information or substance identification, the following minimum levels of respiratory protection will be required:

Sustained Total Organic Vapor Concentration Above Background (ppm)	*Level of Respiratory Protection Required*
0 - 5	Half- or full-face piece respirator available
5 - 10	Full- or half-face piece air-purifying respirator, Level C
> 10	Shut down activities, evaluate the need for Level B or higher respiratory protection

6. Immediately notify Engineer when level of respiratory protection required increases from Level D to Level C or from Level C to Level B.

7. Be responsible for appropriate respiratory protection during work activities. As a minimum, ensure that persons entering the Exclusion Zone or Contaminant Reduction Zone are supplied with and use appropriate respiratory protection.

8. Be responsible for assessing the ability for on-Site personnel to wear respiratory protection. Cardiopulmonary system examination and pulmonary function testing are minimum requirements as specified in Section 01111, Article 1.7A.

9. Do not permit on-Site personnel unable to pass a respirator fit test to enter the Exclusion Zone or Contaminant Reduction Zone. Furnish proof of such fit testing to Engineer prior to commencing work.

F. Heat Stress/Cold Stress:

1. Implement a heat stress and/or cold stress monitoring program as applicable; include as a minimum the following specific components:

    1. Training of personnel to recognize and mitigate heat/cold stress situations and symptoms.

    2. Target conditions which will initiate monitoring of personnel.

    3. Monitoring methods.

    4. The means and methods by which Contractor will mitigate such conditions.

2. Base the heat stress/cold stress program on recommendations by ACGIH, NIOSH, and other recognized authorities.

G. Personnel Hygiene and Personnel Decontamination Procedures:

1. Ensure that on-Site personnel observe and adhere to the personal hygiene-related provisions of this Section.

2. Issue a written notice of violation to on-Site personnel found to be disregarding the personal hygiene-related provisions of the Site-specific Health and Safety Plan or the Project Specifications (including but not limited to the requirements concerning PPE specified in Section 01111, Article 1.7D, respiratory protection specified in Section 01111, Article 1.7E, and personnel hygiene and personnel decontamination procedures specified in Section 01111, Article 1.7G. The notice may be issued by Engineer, the Health and Safety Officer, or any supervisory personnel of Contractor. Give a copy of the notice to the offending worker, to his immediate supervisor, to Contractor's Superintendent, and to Engineer. Upon issuance of a second written notice of such violation, terminate the worker from employment at Site.

3. Failure of Contractor's supervisory personnel to implement this warning/termination provision shall be deemed a material breach of the Contract.

4. Provide, as a minimum, the following:

    1. Suitable containers for storage and disposal of used disposable PPE.

5. Enforce the following provisions:

1. Require on-Site personnel to wear appropriate PPE at all times when entering or working in the Exclusion Zone or Contaminant Reduction Zone.

2. Do not permit used disposable PPE to be reused, and when removed, place PPE inside appropriate containers provided for that purpose.

3. Prohibit smoking, chewing nicotine products, eating, and drinking, in the Exclusion Zone or Contaminant Reduction Zone.

6. Place discarded disposable outerwear, gloves, and outer footwear in sealable containers. Prior to placement, segregate discarded articles of clothing and secure in plastic bags. Place articles which are soiled, stained, or have been in contact with contaminated materials in separate Contractor-supplied sealable containers. Place remaining clean articles of clothing in Contractor-supplied general refuse containers.

H. Emergency and First-Aid Equipment:

1. Locate and maintain emergency and first-aid equipment in appropriate locations on Site. Include the following equipment as a minimum:

1. First-aid kit to accommodate the numbers of on-Site personnel.

2. Two ABC type dry chemical fire extinguishers.

2. As a minimum, provide one certified first-aid technician on Site at all times that on-Site work activities are in progress. This person may perform other duties but shall be immediately available to render first aid when needed.

I. Site Communications:

1. Ensure that personnel work under the use of a "buddy" system and develop a hand signal system appropriate for Site activities.

2. Provide selected personnel with two-way radios.

J. Safety Meetings: Conduct safety meetings, mandatory for on-Site personnel, on a daily basis and additionally as required by special or work-related conditions.

1.8 AIR MONITORING

A. Air Monitoring Program:

1. During the progress of work activities, monitor air quality in and around the Exclusion Zone. Conduct monitoring on a regular periodic basis, and additionally as required by special or work-related conditions. Report any departures from general background to Engineer who will, in conjunction with the Health and Safety Officer, determine when operations should be shut down and restarted.

2. Provide the required instruments for air monitoring including, as a minimum, an organic vapor photoionizer or organic vapor analyzer and if confined space work is to occur, an

oxygen level meter and an explosimeter. Additionally, personnel sampling pumps and dust monitors may be required if Site conditions warrant. Provide sufficient numbers of each instrument to monitor the active work location and to provide backup equipment in cases of equipment malfunction.

3. Operate air monitoring equipment with personnel trained in the use of the specific equipment provided and under the control of the Health and Safety Officer. Monitoring equipment used within the potentially contaminated work areas with combustible gases shall be intrinsically safe.

4. Conduct air monitoring for organic vapors on a routine basis around active work locations. Perform monitoring as a minimum on an hourly basis and additionally as dictated by Site activities.

B. Air Monitoring Reporting:

1. Report the results of air monitoring program to Engineer on an hourly basis and additionally as dictated by Site activities.

2. In addition, record daily air monitoring activities in a hard cover log book; maintain log book on Site at all times.

1.9 CONTINGENCY AND EMERGENCY RESPONSE PLANS

A. General: Prior to mobilization to Site prepare both on-Site and off-Site Contingency and Emergency Response Plans to ensure the safety of on-Site and off-Site personnel. Incorporate the on-Site and off-Site Contingency and Emergency Response Plans into Contractor's Site-specific Health and Safety Plan.

B. On-Site Contingency and Emergency Response Plan: Address the standard operating procedures to be implemented during emergency situations. Include and address the following emergency situations and responses as a minimum:

1. In the event of injury to on-Site personnel or contact with hazardous materials requiring immediate medical attention, implement the following protocol:

    1. Notify the Health and Safety Officer and Engineer.
    2. Phone the hospital previously identified to be closest to Site and describe injury.
    3. Decontaminate personnel and administer appropriate first aid.
    4. Transport personnel to the specified hospital along the most direct route which shall be predefined prior to commencing Site work.

2. In the event that barrels or canisters are encountered during Works, immediately cease work and notify Engineer and Health and Safety Officer; determine appropriate modifications to the Site-specific Health and Safety Plan in conjunction with Engineer and Health and Safety Officer.

3. In the event that excessive gases or vapors are detected during Works, take the following actions:

    1. Evacuate workers to an area upwind from the affected area.

2. Identify the contaminant and monitor contaminant concentrations to determine the type of respiratory protection and/or engineering controls required before workers re-enter the area.

4. In the event of a fire during Works, quickly use earth moving equipment to backfill the area and smother the fire if possible and if the presence of noxious gases prohibits this, employ proper evacuation procedures.

5. In the highly unlikely event of a major leak of toxic gas, such as might occur if a compressed gas cylinder were encountered and ruptured during Works, evacuate on-Site personnel to a safe distance, and notify the Police and Fire Department and local hospital if deemed necessary by Engineer or the Health and Safety Officer. Police and Fire Department Officials will assume responsibility for coordinating with Engineer and the Health and Safety Officer for the proper emergency response strategy upon arrival.

C. Off-Site Contingency and Emergency Response Plan:

1. Prior to commencing work involving the handling of hazardous materials, develop an off-Site Contingency and Emergency Response Plan. This plan is intended to provide immediate response to a serious Site occurrence such as explosion, fire, or migration of significant quantities of toxic or hazardous material from Site which could affect or endanger the public or adjacent public or private areas.

2. Engineer will be responsible for coordination of meetings with local officials, issuing minutes of meeting and preparation of the off-Site Contingency and Emergency Response Plan for distribution.

3. Attend a coordination meeting to be held with appropriate authorities including the City, Fire, Hospital, State and City Police, State Department of Transportation, the County Health Department, and the Community Emergency Coordinator; meeting will identify the off-Site Emergency Response Coordinator through whom all information and coordination will occur in the event of an incident. Develop plans and procedures, or adopt existing plans and procedures, for:

    1. Evacuation of Site-adjacent areas.
    2. Fire-fighting procedures.
    3. Transport of injured personnel to medical facilities.
    4. Priority transportation routes.
    5. Coordination and/or modification of highway operations.

4. Develop techniques and recommended procedure for immediate first-aid emergency response with local medical facilities.

1.10 SITE HEALTH AND SAFETY

A. Work Areas: Clearly lay out and identify work areas in the field and limit equipment, operations and personnel in the areas as defined below. Establish work areas as temporary or permanent, depending on the work activity and the sequence in which it is performed. These areas are:

1. The Exclusion Zone: Includes areas where hazardous or potentially contaminated (soils, debris, and other materials) are being, or may be contacted, disturbed, or handled and areas where contaminated equipment or personnel travel. Establish temporary Exclusion

Zones around remote work areas beyond the limits of the Exclusion Zone located within Site fence; clearly delineate temporary Exclusion Zones in the field by temporary snow fencing and/or barricades and warning signs provided by Contractor.

2. The Contaminant Reduction Zone: Occurs at the interface of the Exclusion Zone and Clean Zone and provides for the prevailing upwind transfer of construction materials from clean to Site-dedicated equipment, the decontamination of equipment and vehicles prior to entering the Clean Zone from the Exclusion Zone, the decontamination of personnel and clothing prior to entering the Clean Zone from the Exclusion Zone, and for the physical segregation of the Clean and Exclusion Zones.

3. The Clean Zone: Defined as a clearly delineated predominantly upwind area outside the Exclusion Zone(s) and Contaminant Reduction Zone(s), which functions include:

    1. An entry area for personnel, material, and equipment to the Contaminant Reduction Zone.

    2. An exit area for decontaminated personnel, material, and equipment from the Contaminant Reduction Zone.

    3. A storage area for clean safety and work equipment.

B. Temporary Fencing:

1. Erect temporary fencing on Site to delineate work areas in accordance with the Site-specific Health and Safety Plan.

2. Construct temporary fencing of standard snow fence or construction fence supported by posts with yellow warning tape.

3. Coordinate the erection of temporary fencing with the work specified under other Sections of the Project Specifications. Prior to or during mobilization erect fencing to enclose the Exclusion Zone.

4. Reuse existing temporary fencing; decontaminate temporary fencing prior to reuse at another location.

C. Contaminant Migration Control:

1. Take appropriate measures to prevent contaminant tracking on and off Site. Decontaminate vehicles, equipment, and personnel leaving areas of potential contamination, as determined by the Health and Safety Officer, prior to entry into Clean Zones. Locate decontamination facilities and sequence work activities to prevent contaminant tracking.

2. Personnel engaged in vehicle decontamination shall wear protective equipment including suitable disposable clothing, respiratory protection, and face shields.

1.11 SCHEDULES

A. Manhours for maintaining personal protective equipment are as follows:

PPE Level	*Manhours*
Level C	24
Modified Level C	120

1.12 MEASUREMENT AND PAYMENT

A. Section 01019 - Contract Considerations: Requirements for measurement and payment.

B. Development, Implementation, and Maintenance of Site-Specific Health and Safety Plan:

1. Schedule of Prices Item No. B-1.

2. Payment Basis: Lump sum price. Includes development, implementation, and maintenance of a Site-specific Health and Safety Plan; provision of all required training; provision of emergency first-aid facilities; designation and maintenance of work areas; air monitoring for volatile organics, explosive gases, and respirable dust; services of Health and Safety Officer and Certified Industrial Hygienist including salary, wages, taxes, and benefits.

3. As Contractors selected to bid on this particular job are considered to be involved in hazardous waste activities on a full-time basis, Contractor shall provide personnel who have already complied with the medical requirements as specified herein. Preliminary medicals for Contractor personnel shall not be included as a pay item. Additional medical surveillance required during the progress of Works due to excessive exposure to toxic chemicals or physical agents shall be considered as an extra.

C. Health and Safety and Personal Protective Equipment - Level C:

1. Schedule of Prices Item No. B-2.

2. Payment Basis: Lump sum price. Includes furnishing and maintaining personal protective equipment for Level C for all Contractor personnel required to work in the potentially contaminated work areas.

D. Health and Safety and Personal Protective Equipment - Modified Level C:

1. Schedule of Prices Item No. B-3.

2. Payment Basis: Lump sum price. Includes furnishing and maintaining personal protective equipment for Modified Level C for all Contractor personnel required to work in the potentially contaminated work areas.

END OF SECTION

SECTION 01400

QUALITY CONTROL

1.1 SECTION INCLUDES

A. Quality assurance - control of installation.

B. References.

1.2 QUALITY ASSURANCE - CONTROL OF INSTALLATION

A. Monitor quality control over suppliers, products, services, Site conditions, and workmanship, to produce Works of specified quality.

B. Comply with specified standards as minimum quality for Works except where more stringent tolerances, codes, or specified requirements indicate higher standards or more precise workmanship.

C. Perform work by persons qualified to produce workmanship of specified quality.

1.3 REFERENCES

A. For products or workmanship specified by association, trade, or other consensus standards, comply with requirements of the standard, except when more rigid requirements are specified or are required by applicable codes.

B. Conform to reference standard by date of issue current on date of Notice of Award, except where a specific date is established by code or by individual specification Section.

C. The contractual relationship, duties, and responsibilities of the parties in Contract nor those of Engineer shall not be altered from Contract Documents by mention or inference otherwise in any reference document.

D. Publications referred in these Specifications form part of the Specifications to the extent specified in individual specification Sections.

END OF SECTION

SECTION 01500

CONSTRUCTION FACILITIES AND TEMPORARY CONTROLS

1.1 SECTION INCLUDES

A. Temporary Controls: Fencing, water control, dewatering, erosion and sediment control, dust and particulate control, and equipment decontamination.

B. Construction Facilities: Temporary facilities including equipment decontamination facility, Storage/stockpiling facilities.

C. Measurement and payment.

1.2 TEMPORARY FENCING

A. Construction: Standard snow fence and yellow safety ribbon.

B. Provide fencing around construction Site including but not limited to excavation, stockpile areas and decontamination facility.

C. Enforce and require that workers observe and respect the limits marked with temporary fencing.

1.3 WATER CONTROL

A. Grade Site to drain. Maintain excavations free of water. Provide, operate, and maintain pumping equipment.

B. Protect Site from puddling or running water. Provide water barriers as required to protect Site from soil erosion.

C. Prevent surface water runoff from leaving work areas.

D. Contain and collect waste waters and transfer such collected waste waters to wastewater storage tanks.

E. Do not discharge decontamination water, or surface water runoff, or groundwater which may have come in contact with potentially contaminated material, off Site or to municipal sewers.

F. Provide, operate, and maintain necessary equipment appropriately sized to keep work areas free from water.

G. At all times have on hand sufficient pumping equipment, machinery and tankage in good working condition and have available at all times competent workers for the operation of the pumping equipment.

H. Prevent precipitation from infiltrating or from directly running off stockpiled materials. Cover stockpiled materials with an impermeable liner during periods of work stoppage including at the end of each working day and as directed by Engineer.

I. Contain water from stockpiled potentially contaminated materials and transfer the collected water to the wastewater storage tanks.

J. Direct surface waters that have not contacted potentially contaminated materials to surface drainage systems.

K. Control surface drainage including ensuring that gutters are kept open at all times, water is not directed across or over pavements or sidewalks except through approved pipes or properly constructed troughs and runoff from unstabilized areas is intercepted and diverted to a suitable outlet.

L. Dispose of water in a manner not injurious to public health or safety, to property or to any part of Works completed or under construction.

M. Contain and collect surface water runoff from potentially contaminated materials.

N. Contain and collect any groundwater encountered during excavation activities.

1.4 DEWATERING

A. Dewater the various parts of Works including excavation and work areas.

B. Employ construction methods, procedures, and precautions that will ensure Works, including excavations, are stable, free from disturbance, and dry.

C. Construction Methods: Includes sheeting and shoring; groundwater control systems; surface or free water control systems employing ditches, diversions, drains, pipes and/or pumps; and any other measures necessary to enable the whole of Works to be carried out in the dry.

D. Provide sufficient and appropriate labor and equipment necessary to keep Works free of water including standby equipment necessary to ensure continuous operation of dewatering system.

E. .Take precautions necessary to prevent uplift of any structure or pipeline and protect excavations from flooding and damage due to surface runoff.

1.5 EROSION AND SEDIMENT CONTROL

A. Plan and execute construction by methods to control surface drainage from cuts and fills, from stockpiles, staging areas, and other work areas. Prevent erosion and sedimentation.

B. Provide and maintain temporary measures such as silt fences, hay bales, ditches, drains, berms, dikes required to trap and contain sediments to prevent sediment migration and to prevent water flow. Make sediment control measures available at all times during construction. Place silt fences and/or hay bales in ditches to prevent sediments from escaping from the ditch termination.

C. Do not disturb existing embankments or embankment protection.

D. Periodically inspect earthwork to detect evidence of erosion and sedimentation; promptly apply corrective measures.

1.6 DUST AND PARTICULATE CONTROL

A. Provide and maintain dust and particulate control measures such as a water misting system as required to prevent the generation of dust and particulate during the performance of Works.

B. Implement dust and particulate control measures as determined necessary by Engineer during construction.

C. Use potable water for dust control.

D. Do not use chemical means for dust and particulate control without Engineer's prior written approval.

E. As a minimum, use appropriate covers on trucks hauling fine or dusty material and use watertight vehicles to haul wet materials.

1.7 EQUIPMENT DECONTAMINATION

A. Do not commence work involving equipment contact with potentially contaminated material until the equipment decontamination facility is operational.

B. Decontaminate equipment after working in potentially contaminated work areas and prior to subsequent work or travel on clean areas.

C. Perform equipment decontamination on Contractor-constructed equipment decontamination pad.

D. At a minimum, perform the following steps during equipment decontamination:

1. Mechanically remove packed dirt, grit and debris by scraping and brushing without the use of steam or high-pressure water to reduce the amount of water needed and to reduce the amount of contaminated rinsate generated.

2. Use high-pressure, low-volume, hot water or steam supplemented by detergents or solvents as appropriate and as approved by Engineer.

3. Pay particular attention to tire treads, equipment tracks, springs, joints, sprockets, and undercarriages.

4. Scrub surfaces with long handle scrub brushes and a cleaning agent as appropriate.

5. Rinse off cleaning agent.

6. Air dry equipment in the Clean Zone before removing from Site or travel on clean areas.

7. Perform an assessment to determine the effectiveness of the decontamination as directed by Engineer.

E. Each piece of equipment will be inspected by Engineer after decontamination and prior to removal from Site and/or travel on clean areas. Engineer will have right to require additional decontamination to be completed if deemed necessary.

F. Take appropriate measures necessary to minimize the drift of mist and spray during decontamination including the provision of wind screens.

G. Collect decontamination waste waters and sediments which accumulate on the equipment decontamination pad. Transfer waste waters to designated wastewater storage tank.

H. Transfer sediments to appropriate location as determined by Engineer.

I. Furnish and equip personnel engaged in equipment decontamination with protective equipment including suitable disposable clothing, respiratory protection, and face shields.

1.8 EQUIPMENT DECONTAMINATION FACILITY

A. Prior to commencing work involving equipment contact with potentially contaminated materials, construct an equipment decontamination pad to accommodate the largest piece of on-Site potentially contaminated equipment.

B. Submit equipment decontamination pad design for review prior to commencing construction.

C. Provide, operate, and maintain suitable, portable, high-pressure, low-volume decontamination wash unit equipped with self-contained water storage tank and pressurizing system.

D. Wash Unit: Capable of heating and maintaining wash waters to 180 degrees F and providing a nozzle pressure of 150 psi.

E. Provide, operate, and maintain necessary equipment, pumps, and piping required to collect and contain equipment decontamination waste waters.

F. Provide, operate, and maintain necessary equipment required to transfer decontamination wastewater and sediment accumulating on equipment decontamination pad to approved storage facilities.

1.9 STORAGE/STOCKPILING FACILITIES

A. Construct storage/stockpiling facilities as required. Install liner below all proposed stockpile locations, to prevent contact between the stockpile material and the ground. Equip facility with tarps which are capable of covering the stockpiled material until Engineer advises Contractor to dispose of the material off Site or reuse as applicable.

B. Each storage/stockpile facility shall be to sufficient size to accomodate the estimated volume of material which it is to contain:

Stockpile	*Estimated Volume*
Stockpile 1 - overburden	2600 cubic yards
Stockpile 2 - contaminated material	6500 cubic yards

C. Liner installed below stockpiled material shall be 12-mil polyethylene sheeting or an alternate material approved by Engineer.

D. Construct stockpile facilities so that they are level, well drained, free of foreign materials, and of adequate bearing capacity to support the weight of the materials to be placed thereon.

E. Provide and maintain access to stockpiles.

F. Separate differing materials with substantial dividers or stockpile apart to prevent mixing.

G. Prevent intermixing of soil types or contamination or segregation.

H. Direct surface water away from stockpile facility to prevent erosion or deterioration of materials.

I. Maintain stockpile slopes not steeper than 1.5 horizontal to 1 vertical. In no instance shall stockpiles be greater than 10 feet in height above original surrounding grade. Place hay bales or soil erosion and sediment control fencing at the base of and around each temporary stockpile to contain soil that may be washed off the stockpile.

J. Maintain area surrounding stockpiles in neat and tidy condition.

K. Cover stockpiled material with approved reinforced polyethylene sheeting of minimum 12-mil thickness to withstand adverse weather, wind and other detrimental forces. Provide total protection of stockpiled material from rain and other adverse weather effects.

1.10 MEASUREMENT AND PAYMENT

A. Section 01019 - Contract Considerations: Requirements for measurement and payment.

B. Decontamination Facility:

1. Schedule of Prices Item No. C-1.

2. Payment Basis: Lump sum prices. Includes supply, install, and maintain decontamination facility.

C. Storage/Stockpiling Facilities:

1. Schedule of Prices Item No. C-2.

2. Payment Basis: Lump sum price. Includes supply, install, and maintain stockpile areas; 12-mil polyethylene liners and covers; berms.

END OF SECTION

SECTION 01700

CONTRACT CLOSEOUT

1.1 SECTION INCLUDES

A. Closeout procedures.

B. Final cleaning.

C. Final decontamination.

D. Demobilization.

E. Final wastewater removal and disposal.

F. Final grading.

G. Measurement and payment.

1.2 CLOSEOUT PROCEDURES

A. Submit written notice to Engineer that the entire Works or an agreed portion thereof is complete and ready for Engineer's inspection prior to Preliminary Acceptance of Works.

B. Submit written certification that Contract Documents have been reviewed, work has been inspected, and that work is complete in accordance with Contract Documents and ready for Engineer's review.

C. Complete and furnish all submittals to Engineer that are required by governing or other authorities and by these Contract Documents. Final payment shall not become due and payable until all submittals have been made acceptable to Engineer.

1.3 FINAL CLEANING

A. Execute final cleaning prior to Preliminary Acceptance of Works.

B. Remove surplus materials from Site.

C. Dispose of non-contaminated litter and rubbish at a sanitary landfill.

1.4 FINAL DECONTAMINATION

A. Perform final decontamination of equipment and materials which may have come in contact with potentially contaminated materials prior to removal from Site.

B. Perform decontamination as specified in Section 01500 to the satisfaction of Engineer. Engineer will have right to direct Contractor to perform additional decontamination if required.

1.5 DEMOBILIZATION

A. Following decontamination, remove temporary construction and support facilities provided by Contractor.

1.6 FINAL WASTEWATER REMOVAL AND DISPOSAL

A. Sample and analyze any stored wastewater for disposal purposes prior to removal from Site. The results of the analyses will determine the appropriate methods of disposal. Upon receipt of the analytical results, transfer tank contents to liquid waste transportable tankers as necessary and dispose of at an appropriate off-Site facility as identified by Contractor and approved by Engineer. Following emptying of the wastewater tank, decontaminate the tank interior with a steam or high-pressure water wash supplemented by detergent (Alconox). Dispose of rinse water generated as part of this cleaning as wastewater to an off-Site facility identified by Contractor and approved by Engineer.

1.7 FINAL GRADING

A. Perform final grading prior to Preliminary Acceptance of Works.

1.8 SCHEDULES

A. Volumes of wastewater for disposal are as follows:

Type	*Volume*
non-hazardous wastewater	200 gallons

1.9 MEASUREMENT AND PAYMENT

A. Section 01019 - Contract Considerations: Requirements for measurement and payment.

B. Demobilization and Closeout:

1. Schedule of Prices Item No. D-1.

2. Payment Basis: Lump sum price. Includes final decontamination of equipment, construction facilities, and materials to be removed from Site; final removal of temporary construction and support facilities provided by Contractor for the performance of Works; final Site cleanup; final non-contaminated waste removal and disposal; all disposal costs charged by the disposal facility; full compliance with applicable federal, state and local regulations; removal and disposal of any stored wastewater including decontamination water; final grading.

END OF SECTION

SECTION 02222

EXCAVATING

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Excavating for removing and stockpiling of overburden fill material.

B. Excavating for removing of contaminated material and associated debris.

1.2 RELATED SECTIONS

A. Section 02223 - Backfilling.

1.3 DEFINITIONS

A. Excavation: Removal of all materials of whatever nature encountered, whether wet, frozen, or otherwise, including dense tills, hardpan, frozen materials, cemented materials, concrete and asphalt pavement, boulders or rock fragments, and weathered rock which can be removed by ripping or excavating with heavy duty mechanical construction equipment without drilling and blasting.

B. Excavation Limits: Areal excavation limits shown on Drawings to the specified depth or as directed by Engineer and does not include areas shown as being on hold pending further sampling and analysis by Engineer.

C. Additional Excavation: Excavation beyond the initial excavation limits either areally or in depth, as directed by Engineer following sampling and analysis (and including trench excavations).

D. Clean Soil: Soils containing less than Michigan Type B Clean up Criteria concentrations for Target Compound List (TCL) and Target Analyte List (TAL) contamination.

E. Rock: Material from solid masses of igneous, sedimentary, or metamorphic rock which, prior to its removal, was integral with its parent mass, and boulders or rock fragments having individual volume in excess of 1 cubic yard.

1.4 SUBMITTALS

A. Excavation Plan: Prior to mobilization to Site, submit a detailed Excavation Plan demonstrating compliance with specified requirements and to permit Engineer to schedule testing and measurement activities. Include written procedures, schedules, and drawings as applicable and, as a minimum, address each of the following items:

1. Methods and procedures which will be used to perform excavation and stockpiling of clean material in excavation areas.

2. Sequencing and scheduling of excavation and backfilling in excavation areas including allowances for time required for sampling and analysis by Engineer.

3. Sequencing and scheduling of shoring installation and removal if needed.

4. Locations and sequencing of constructed and relocated temporary decontamination facilities.

5. Sequencing and layout of access routes to and from excavation areas.

6. Methods and procedures which will be implemented to prevent contaminant tracking and cross-contamination.

7. Methods and procedures which will be used to perform additional excavation in open excavations.

8. Sequencing and scheduling of stockpiling operations.

9. Anticipated crew sizes, manhours, types of equipment and equipment hours on a weekly basis.

10. Dust control measures to be employed during excavation.

11. Air monitoring and Health and Safety requirements to be employed during excavation and soil handling.

B. Shoring Plan and Design: Prior to commencing excavation, submit a detailed Shoring Plan and Design. Include existing conditions, written procedures, schedules, design calculations, design assumptions and design drawings. Shoring drawings shall be reviewed and stamped by a Professional Engineer registered in the State of Michigan. Provide a copy of all required shoring permits.

1.5 ENVIRONMENTAL REQUIREMENTS

A. Section 01500 - Construction Facilities and Temporary Controls: Requirements for temporary controls.

B. Protect open excavations against damage due to surface runoff and runon. Take necessary precautions to prevent erosion of excavated or disturbed surfaces.

C. Suspend operations whenever climatic conditions, as determined by Engineer, are unsatisfactory for placing fill to the requirements of this Section.

D. After occurrence of heavy rains, do not operate equipment on approved excavations until the material has dried sufficiently to prevent occurrence of excessive rutting.

E. Where excavations have been softened or eroded, remove soft and yielding material or otherwise objectionable or damaged areas and replace with fill as specified by Engineer.

F. Decontaminate equipment involved in excavation activities which may have come in contact with potentially contaminated material before being removed from Site or being relocated to clean areas of Site.

1.6 SEQUENCING AND SCHEDULING

A. Do not commence excavation operations until the Site-specific Health and Safety Plan has been reviewed by Engineer and implemented, the decontamination facilities have been constructed and stockpiling locations have been identified by the Engineer.

B. Coordinate interruptions of utility services to existing and adjacent buildings or facilities which become necessary either directly or indirectly due to work required under this Contract through Engineer. Down time for service disruptions may be limited as to duration and time (weekend, nights, or holidays). Perform Works during the period designated.

C. Coordinate and sequence excavation operations to minimize the need for temporary stockpiling excavated materials until required for backfilling. Make every effort to balance cut and fill operations and to ensure that any excavated material designated for backfill is immediately placed as backfill in Works. Keep the time during which excavations remain open to the practicable minimum.

D. Do not allow or cause any of work performed to be covered up or enclosed prior to required inspections, tests, or approvals.

PART 2 (NOT USED)

PART 3 EXECUTION

3.1 EXAMINATION

A. Section 01015 - General Requirements: Verification of existing conditions before starting work.

B. Excavation Areas: Engineer will define the boundaries of contaminated soil excavation as shown on Drawings, and as determined in the field by Engineer, based on visual observations and the analytical results of soil samples collected from the base and walls of the excavations.

3.2 PREPARATION

A. Identify required lines, levels, contours, and datum locations.

B. Locate, identify, and protect all utilities in the area of excavation. Confirm locations of buried utilities and structures with Engineer.

C. Notify appropriate utility company or owner to remove or relocate interfering utilities.

D. Protect bench marks, survey control points, existing structures, fences, sidewalks, paving, and curbs from excavating equipment and vehicular traffic.

E. Maintain and protect from damage utilities, and structures encountered, and not designated for demolition or removal including buildings and building foundations. In the event of disturbance of or damage to any utility or structure immediately notify Engineer. Repair or replace any utility or structure damaged by Contractor operations.

F. Protect existing buildings and surface features which may be affected while work is in progress.

G. Protect existing buildings and structures where temporary unbalanced earth pressures are liable to develop on walls or other structures utilizing bracing, shoring, or other approved methods to counteract unbalance.

H. Protect monitoring wells and any other structures and pipelines from any uplift and displacement or disturbance during excavation operations.

I. Employ procedures for excavation such that disturbance of utilities, structures, and their foundations is avoided.

J. Protect excavations from cross contamination.

K. Obtain direction from Engineer before moving or otherwise disturbing utilities or structures.

3.3 EXCAVATING

A. Underpin adjacent structures which may be damaged by excavating work.

B. Excavate to lines, grades, elevations, and dimensions shown on Drawings or as directed by Engineer.

C. Slope banks with machine to angle of repose or less until shored as directed by the Engineer.

D. Do not interfere with 45-degree bearing splay of foundations.

E. Grade top perimeter of excavation to prevent surface water from draining into excavation.

F. Remove debris and other obstructions encountered.

G. Remove lumped soil, boulders, and rock up to 1 cu yd measured by volume.

H. Notify Engineer of unexpected subsurface conditions and discontinue affected work in area until notified to resume work.

I. Remove excavated material including boulders, debris, brush, brush, roots or other perishable matter from Site to approved landfill site as determined by the Engineer.

J. Hand trim, make firm, and remove loose material and debris from excavations. Where natural or fill material at bottom of excavation is disturbed, compact disturbed soil to density at least equal to undisturbed soil or to the density specified for the succeeding layer of backfill, whichever is greater, or remove disturbed soil and refill the space as directed by Engineer.

K. Leave excavations open pending sampling and analysis by Engineer. Engineer may direct additional excavation or backfilling based on the analytical results.

L. Open excavations shall be Contractor's sole responsibility.

3.4 OVER-EXCAVATING

A. Correct areas over-excavated in accordance with Section 02223.

B. Notify Engineer when soil at bottom of the excavation appears unsuitable and proceed as directed by Engineer. Where, in Engineer's opinion, the undisturbed condition of the soils is inadequate for the support of installations, over-excavate to adequate supporting soils as directed by Engineer and refill the excavated space with approved material to the proper elevation in accordance with the procedure specified for backfill. Where so directed by Engineer and except as otherwise specified, the excavation and removal of inadequate material as specified, supply and installation of such material in excess of the quantities shown on Drawings will be paid for under the appropriate item of the Schedule of Additional Unit Prices. Use such over-excavated material in Works or stockpile on Site as approved by Engineer.

C. Should unauthorized excavation be carried below the lines and grades indicated on Drawings and in excess of the specified limits and tolerance because of Contractor's operations including errors, methods of construction or to suit his convenience, correct unauthorized excavation as follows:

1. Fill under concrete structures with concrete.

2. Fill under unauthorized over-excavation areas by extending the indicated bottom elevation of the base of the material specified to be placed to the unauthorized excavation bottom without altering the required top elevation and compact as specified unless otherwise directed by Engineer.

D. Additional excavation to remove weakened or disturbed soil caused by Contractor's error, unsuitable construction methods or procedures or to suit Contractor's convenience and subsequent additional backfill and compaction to correct deficiencies shall be to Contractor's sole account at no additional cost to Owner.

3.5 PROTECTING CLEAN SOIL FROM CONTAMINATION

A. Notify Engineer when soil at the bottom of excavation appears contaminated and proceed as directed by Engineer.

B. Prevent contamination of adjacent clean soil.

C. Place plastic sheeting and plywood under excavation equipment and alongside the excavation to prevent contaminated soil from being mixed with surrounding clean soil. Use other means of preventing contamination subject to approval by Engineer. Do not mix excavated soil with imported materials unless otherwise directed by Engineer. Place excavated soil adjacent to excavation in compliance with OSHA requirements.

D. Clean stockpiled excavated soils will be considered native fill for the purpose of backfilling.

E. Decontaminate excavation equipment after handling contaminated materials and prior to handling clean overburden. Decontaminate shoring or falsework prior to reuse. Engineer will direct additional decontamination as necessary in the opinion of Engineer.

3.6 EXCAVATING CONTAMINATED SOILS

A. Excavate soils to depths and dimensions as indicated on Drawings and as directed by Engineer. Discontinue excavation if excessive groundwater is encountered.

B. Stockpile potentially clean overburden soil in area designated by the Engineer for use as backfill material if it is confirmed to be suitable as specified in Section 02223 and as determined by Engineer.

C. Identify contaminated areas by survey stakes. Excavate each area identified to be contaminated to remove all soil, sediments and other solid materials determined to be contaminated. Representative samples will be collected of the excavated soils for waste disposal acceptance analysis by Engineer.

D. Develop staging/stockpile facilities to prevent contact between clean and contaminated material as specified in Section 01500, or directed by the Engineer. Perform loading to minimize contamination of the exterior of the stockpile facility and the loading area.

E. Perform excavation in such a manner that only the excavation bucket contacts contaminated materials.

F. Upon completion of excavation as shown on Drawings, Engineer will obtain confirmatory soil samples from the base of the excavation.

G. Keep limits of excavation undisturbed and free of loose, soft, or organic matter.

H. Maintain excavation depth tolerances. Unless directed by Engineer, excavation in excess of the specified limits shall be considered over-excavation.

I. Should unauthorized excavation be carried below the lines and grades indicated on Drawings and in excess of the specified limits and tolerance because of Contractor's operations including errors, methods of construction or to suit his convenience, correct unauthorized excavation as follows:

1. Fill under concrete structures with concrete.

2. Fill under other unauthorized over-excavation areas by extending the indicated bottom elevation of the base of the material specified to be placed to the unauthorized excavation bottom without altering the required top elevation and compact as specified unless otherwise directed by Engineer.

J. Keep excavations open until directed to be backfilled by Engineer pending receipt and review of analytical results of samples collected from the excavated surface. Following receipt of analytical results, Engineer may direct Contractor to horizontally extend the limits of the excavation, excavate an additional depth of soil or direct Contractor to commence backfilling. For the duration of an open excavation, maintain the excavation free from water and adequately mark the open excavation with temporary fencing to restrict access until the excavation is properly backfilled.

K. Schedule excavation activities in such a manner that access is available to any excavation area for additional excavation as directed by Engineer. In returning to an area for additional excavation, comply with the previously specified access route restrictions. Make due allowance in scheduling excavation activities for the time required for sample collection and analysis and for analytical results to be forwarded to Engineer. Allow for a laboratory turnaround time of 24 hours (not including weekends or holidays) commencing on the day following sample collection.

L. Decontaminate excavation equipment periodically and as directed by Engineer. Decontaminate equipment when visibly contaminated or when moving from a significantly contaminated area

to one of lesser contamination for excavation work. Decontaminate equipment prior to performing additional excavation in an excavation previously left open pending sampling and analysis by Engineer. Engineer will direct additional decontamination when required in the opinion of Engineer.

3.7 SHORING

A. Submittal of Shoring Plan as specified in Section 02222, 1.4, B.

B. Prior to installation of shoring, perform careful test excavations to determine the exact extent of foundations, such that shoring installation does not damage footings.

C. Provide shoring and bracing necessary to safely support soil to prevent movement, loss of soil or other activity that would cause damage to existing on- and off-Site structures. Construct shoring to be rigid and suitable to prevent excessive movement of or damage to the supported structure during excavation and following backfilling.

D. Initially install shoring to allow for three (2) additional feet of excavation below excavation design limits shown on Drawings, should such additional excavation be required by Engineer. Install shoring as close to buildings to remain as possible to facilitate maximum removal of contaminated soils.

E. Horizontal or vertical movement of buildings (top of foundation wall or base of footing) or shoring next to a building of more than 1/8 inch would be considered excessive and require immediate stabilizing measures by contractor until the cause of the excess movement is determined and new design details are implemented by Contractor.

F. Implement and pay for stabilizing measures, consultation to identify and correct the problem, all miscellaneous activities associated with correcting the problem, and any damage caused to the building by any movement whether or not the movement exceeded 1/8 inch.

G. Decontaminate sheeting and shoring prior to removal from Site.

3.8 TEMPORARY STOCKPILING

A. Obtain Engineer's approval for locations of temporary stockpiles. Obtain Engineer's approval prior to placing material in such stockpiles.

B. Stockpile materials on Site at locations designated by Engineer.

C. Construct stockpile facilities as specified in Section 01500.

3.9 CLEANING

A. Section 01700 - Contract Closeout: Requirements for cleaning installed work.

B. Clean and reinstate work areas and areas affected by equipment outside areas specified to be excavated, to specified grade and restoration condition as determined by the Engineer.

3.10 SCHEDULES

A. Volumes and depth of in place material to be excavated are as follows:

Soil	*Volume*	*Depth Below Ground Surface*
clean soil	2000 cubic yards	0-4 feet
contaminated material	5000 cubic yards	2-15 feet

PART 4 MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Section 01019 - Contract Considerations: Requirements for measurement and payment.

4.2 EXCAVATING CLEAN SOILS

A. Schedule of Prices Item No. E-1.

B. Payment Basis: Lump sum price. Includes excavating to required elevations, handling, and placing materials in a temporary stockpile.

4.3 EXCAVATING CONTAMINATED SOILS

A. Schedule of Prices Item No. E-2.

B. Payment Basis: Lump sum price. Includes excavating to required elevations, handling, placing materials in a temporary stockpile, and loading materials into haulage units for off-Site disposal.

4.4 OVER-EXCAVATING

A. Payment Basis: No separate payment will be made. Included under Items No. E-1 and E-2 of Section 02222.

END OF SECTION

SECTION 02223

BACKFILLING

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Site filling and backfilling.

B. Fill for over-excavation.

C. Consolidation and compaction as scheduled.

1.2 RELATED SECTIONS

A. Section 02222 - Excavating.

1.3 REFERENCES

A. Section 01400 - Quality Control: Requirements for references.

B. ASTM D422 - Standard Test Method for Particle-Size Analysis of Soils.

C. ASTM D698 - Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft^3 (600 kN-m/m^3)).

D. ASTM D1140 - Standard Test Method for Amount of Material in Soils Finer Than the No. 200 (75-µm) Sieve.

E. ASTM D1556 - Standard Test Method for Density and Unit Weight of Soil in Place by the Sand-Cone Method.

F. ASTM D2167 - Test Method for Density and Unit Weight of Soil in Place by the Rubber Balloon Method.

G. ASTM D2922 - Standard Test Methods for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth).

H. ASTM D3017 - Standard Test Method for Water Content of Rock in Place by Nuclear Methods (Shallow Depth).

I. ASTM D4253 - Standard Test Methods for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table.

1.4 DEFINITIONS

A. Standard Proctor Density (SPD) means the maximum dry density of a soil material determined in accordance with ASTM D698.

B. Unsuitable materials means the following materials:

1. Material containing loam, roots or organic matter.

2. Frozen material or material containing snow or ice.

3. Clays which are classified as inorganic clays of high plasticity in accordance with ASTM D2487.

4. Soft and/or organic clays and silts of low strength.

5. Frost susceptible silts or clays.

6. Swelling clays.

7. Rock and lumps of material with dimensions greater than 1 inch, measured through any axis specified layer thickness before compaction.

8. Trees, stumps, branches and any other wood or lumber.

9. Wire, steel, cast iron, cans, drums or any other foreign material.

10. Chemical substances or soils containing hazardous chemical substances including PCB, CDD, CDF, herbicides/pesticides and other chemicals.

1.5 SUBMITTALS

A. Materials Source: Submit name of proposed imported soil material source at least 7 days prior to commencing transport of materials to Site. Submit evidence for each material source, in the form of chemical analysis, that the material is free of any hazardous substances, to Engineer at least 7 days prior to transporting the material to Site.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver, handle, and transport fill materials at all times in a manner and with equipment that will prevent segregation and contamination.

B. When necessary, as approved by Engineer, stockpile fill materials on Site in locations approved by Engineer.

C. Minimize stockpiling requirements. Transport material from source directly to final position where possible.

PART 2 PRODUCTS

2.1 COMMON FILL

A. Imported borrow.

B. Graded.

C. Free of lumps larger than 1 inch or fine uniform sands that may be difficult to compact.

D. Conforming to ASTM D2487 Group Symbol.

2.2 SOURCE QUALITY CONTROL

A. Section 01400 - Quality Control: Requirements for source testing and analysis of soil material.

B. Testing and Analysis of Common Fill:

1. Maximum Dry Density, ASTM D698: One sample per 4,000 cubic yards of material required.

2. Grain Size, ASTM D422: One sample per 4,000 cubic yards of material required.

3. Moisture Content, ASTM D3017: One sample per 4,000 cubic yards of material required.

4. Atterberg Limits, ASTM D4318: One sample per 4,000 cubic yards of material required.

5. Soil Classification, ASTM D2487: One sample per 3,000 cubic yards of material required.

C. If tests indicate materials do not meet specified requirements, change material or material source and retest.

D. In the event of changes to approved sources of materials during performance of Works, immediately advise Engineer of revised locations and obtain approval of such locations and materials prior to use in Works.

PART 3 EXECUTION

3.1 EXAMINATION

A. Section 01015 - General Requirements: Verification of existing conditions before starting work.

B. Do not allow or cause any of the work performed or installed to be covered up or enclosed by work of this Section prior to required inspections, measurements, tests, or approvals.

C. Obtain approval from Engineer for completed excavations and previously placed material prior to placement of successive lifts.

D. Obtain approval from Engineer prior to placing fill against structures or around exposed buried utilities.

E. Do not proceed with backfilling operations within a specific excavation area until the excavation area is approved as complete by Engineer. Do not cause excavations to be backfilled until Engineer has approved excavation as complete and completed field measurements for payment purposes, and sampling and testing for analytical purposes.

F. Ensure areas to be backfilled are free from debris snow, ice, water, or frozen ground.

3.2 PREPARATION

A. Compact subgrade to density requirements for subsequent backfill materials.

B. Cut out soft areas of subgrade not capable of compaction in place. Backfill with common fill and compact to density equal to or greater than requirements for subsequent fill material.

C. Remove debris, snow, ice, water, or frozen ground from areas to be backfilled.

D. Scarify and proof roll subgrade surface to a depth of 1/2 inch to identify soft spots; fill and compact to density equal to or greater than requirements for subsequent fill material.

E. Decontaminate equipment which has handled contaminated or potentially contaminated material at the decontamination area prior to being used for backfilling operations.

3.3 BACKFILLING

A. Backfill areas to previously existing grades and elevations.

B. Systematically backfill to allow maximum time for natural settlement. Do not backfill over porous, wet, frozen, or spongy subgrade surfaces.

C. Common Fill: Place and compact materials in equal continuous layers not exceeding 12 inches compacted depth within 12 inches of existing grade.

D. Maintain optimum moisture content of backfill materials to attain required compaction density.

E. Slope grade away from building minimum 2 inches in 10 feet, unless noted otherwise.

F. Make gradual grade changes. Blend slope into level areas.

G. Remove surplus backfill materials from Site.

H. Leave fill material stockpile areas free of excess fill materials.

I. Use fill types as specified. Completely use clean excavated overburden soil approved for backfilling before using imported fill.

J. Do not use backfill material which is determined unsuitable by Engineer.

K. Backfill around exposed utilities by placing layers simultaneously on all sides to equalize loading. Do not dump directly against monitoring wells, utilities, or foundations.

L. Do not operate heavy compaction equipment closer than 3 feet to foundations or underground utilities.

M. Remove sheeting and shoring required during excavation during the backfilling operations. Do not remove bracing until backfilling has reached the respective level of such bracing. Pull sheeting in increments that will ensure compacted backfill is maintained at an appropriate elevation at least 20 inches above toe of sheeting.

N. Decontaminate or dispose of sheeting and shoring used during Works as directed by Engineer.

O. Do not backfill around or over cast-in-place concrete within 72 hours of concrete placing.

P. Except as specified otherwise, place backfill continuously and in uniform layers not exceeding specified compacted thickness up to grades as specified by the Engineer.

Q. Compact each layer to the specified density before placing succeeding layers as specified in Article 3.4.

3.4 COMPACTION

A. Compact to 95 percent SPD or as directed by Engineer.

B. Apply potable water as necessary during compaction to obtain the specified density. If the material to be compacted is excessively moist, aerate with suitable equipment and methods until the moisture content is corrected. In areas not accessible to rolling equipment, compact material to specified density with mechanical tampers approved by Engineer.

C. When granular material is wetted by sprinkling, after being spread on material in place, sprinkling shall be done by method approved by Engineer. Do not direct jets of water at fill with such force that finer materials will be washed out.

D. Compaction Equipment: The type, size, and efficiency of compaction equipment shall be capable of achieving specified degree of compaction. When operating equipment adjacent to and immediately above structures, exercise care so as not to cause damage or displacement of the structure.

3.5 FIELD QUALITY CONTROL

A. Section 01400 - Quality Control: Field inspection and testing.

B. Testing by Engineer:

1. Engineer may select samples of uncompacted fill intended for Works and samples of compacted fill in Works to perform field or laboratory test to determine if materials meet specifications.

2. Testing by Engineer will in no way relieve Contractor of his responsibility to test all material prior to notifying Engineer of the materials' suitability for the work involved.

C. Methods of Testing:

1. Maximum dry density will be determined in the laboratory in accordance with ASTM D698.

2. Moisture content in laboratory will be determined in accordance with ASTM D2216.

3. Bulk wet density will be determined in the field in accordance with ASTM D2922 or with ASTM D1556 whichever is most suitable to obtain representative density of soil tested.

4. Moisture content will be determined in the field in accordance with ASTM D3017.

5. Particle size analysis will be performed in accordance with ASTM D422 or ASTM D1140, whichever is appropriate to material being tested.

6. Permeability will be determined in accordance with ASTM D2434 on a representative sample compacted in the laboratory to the field bulk wet density and moisture.

7. Chemical characterization will be performed in the laboratory in accordance with the following methods:

Parameter	*Extraction/Preparation*(1)	*Analysis*(1)
TCL(2) Volatile Organic Compound	5050	8260 and 8240
TCL Base, Neutral and Acid Extractable	3540/3550	8270
Pesticide/PCB	3540/3550	8080
TAL(3) Metals	3050	6010/7000 Series

Notes:

(1) Test Methods for Evaluating Solid Wastes, Physical/Chemical Methods", EPA SW-846, 3rd Edition, September 1986.
(2) TCL - Target Compound List.
(3) TAL - Target Analyte List.

D. Failure to Meet Specified Requirements: If tests indicate that material specifications have not been achieved or cannot be obtained with equipment in use, the procedure being followed, or the material being incorporated, remove and replace work and modify operations so that the equipment, procedures, and materials will produce the required results. Additional testing required by Engineer will be to Contractor's account.

3.6 ADJUSTING

A. Finish compacted surfaces to within one (1) inch of established grades but not uniformly high or low. Correct surface irregularities by loosening and adding or removing material until the surface is within specified grade.

B. Leave work areas in a properly graded condition sloped as required to permit proper drainage and free of depressions that will pond or collect water or debris that will restrict flow.

3.7 CLEANING

A. Section 01700 - Contract Closeout: Requirements for cleaning installed work.

B. Clean and reinstate work areas and areas affected by equipment outside areas specified to be excavated, to specified restoration condition.

C. Upon completion of backfilling, remove excess material and debris from work areas and travel routes.

3.8 PROTECTION OF FINISHED WORK

A. Section 01500 - Construction Facilities and Temporary Controls: Requirements for protecting installed work.

B. Reshape and recompact fills subjected to vehicular traffic.

3.9 SCHEDULES

A. In place volume of material backfilled are as follows:

Type	*Volume*
previously excavated clean soil	2000 cubic yards
imported common fill	5000 cubic yards

PART 4 MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Section 01019 - Contract Considerations: Requirements for measurement and payment.

4.2 COMMON FILL

A. Schedule of Prices Item No. F-1.

B. Payment Basis: Lump sum price. Includes supplying necessary fill materials, stockpiling, scarifying substrate surface, placing where required, and compacting.

END OF SECTION

SECTION 02759

TRANSPORTATION AND OFF-SITE DISPOSAL

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Supply, operation, and maintenance of transport vehicles/containers.

B. Preparing transport vehicles/containers for off-Site transportation.

C. Loading and securing soil materials in transport vehicles/containers.

D. Weighing transport vehicles/containers.

E. Decontaminating vehicles/containers prior to leaving Site.

F. Transporting the following soil and associated waste water materials from Site to approved off-Site disposal facilities.

G. Preparation of shipping and manifesting documents including waste profiles, manifests and bills of lading.

1.2 DEFINITIONS

A. Hazardous means material exhibiting the properties of a hazardous material as defined in 40 CFR 261 Subpart C, failing TCLP analysis.

B. Non-hazardous means material passing TCLP analysis.

1.3 SUBMITTALS

A. Section 01300 - Submittals: Requirements for submittals.

B. Transportation and Disposal Proposal: A proposal for transportation and disposal of the materials 14 days prior to transportation and disposal of materials from Site. Include relevant transporter and disposal facility identifications and status, methods of transportation and disposal, contingency plans for spills during transportation, and schedule for transportation and disposal.

C. Letters of Commitment:

1. Include copy of the letter of commitment from each proposed disposal facility prior to shipping material to the facility. State in each letter:

1. That the facility is in compliance with its current and valid permit.

2. That the facility can and will accept the materials contingent upon acceptance of waste profile, proposed for disposal at the facility.

3. Any disposal facility restrictions which may cause rejection of transported materials.

4. Any additional sampling and analysis of materials which are required prior to delivery to the facility.

5. Any restrictions on delivery schedules.

2. Each facility shall disclose information concerning any existing corrective action programs which may impact the ability of the disposal facility to accept materials from Site.

D. Agency Approvals: Letters of approval from USEPA, MDNR and applicable state agencies which approve the disposal of materials from Site at each proposed disposal facility 7 days prior to off-Site transportation of hazardous material.

E. Operating Licenses and Permits:

1. Include copies of valid operating licenses and permits for each proposed disposal facility 7 days prior to commencing transportation of materials from Site.

2. Include copies of valid operating licenses and permits from each transporter for each proposed transport vehicle/container 7 days prior to entry to Site.

F. Transportation Routes: Submit detailed plans showing the transportation routes or any alternate routes which will be used to transport materials to each incineration facility 7 days prior to commencing transportation of materials from Site. Comply with applicable federal, state, and local regulations.

G. Shipping and Disposal Documents:

1. Include blank sample forms of proposed shipping and disposal documents at least 7 days prior to use.

2. Include completed copies of shipping and disposal documents including manifests, bill of lading, waste profiles on standard approved forms including a copy of each form signed by the transporter prior to leaving Site and a copy of each form signed by the disposal facility accepting the shipment.

3. Include completed certificates of disposal/destruction/treatment/recycle as applicable and issued by the facility following acceptance and final disposition of the shipment.

H. Weigh Scales:

1. Include calibration certificates for both on-Site and off-Site weigh scales.

2. Include copies of weigh scale tickets on approved forms signed by an authorized weigh scale operator including the following:

1. Location, date, and time of weighing.

2. Measured weights.

3. Vehicle and container identification.

4. Shipment identification number.

1.4 ENVIRONMENTAL REQUIREMENTS

A. Section 01500 - Construction Facilities and Temporary Controls: Requirements for temporary controls.

B. Do not spill, leak, or otherwise release materials from transport vehicles and containers during loading and unloading operations or while in transit from Site to the disposal facility.

PART 2 PRODUCTS

2.1 POLYETHYLENE SHEETING

A. Continuous sheeting of minimum 0.006-inch (6-mil) thickness fabricated from a single ply of construction grade polyethylene plastic.

2.2 CONTAINERS, PACKING MATERIAL AND LABELS

A. Comply with DOT, federal, state, and local regulations.

PART 3 EXECUTION

3.1 EXAMINATION

A. Section 01015 - General Requirements: Verification of existing conditions before starting work.

B. Notify Engineer sufficiently in advance of intention to commence activities at Site that require attendance by Engineer as provided hereinafter.

C. Activities requiring attendance by Engineer include:

1. Placement of polyethylene sheeting in transport vehicles/containers.

2. Final securement of loaded materials prior to transport from Site.

3. Decontamination of transport vehicles/containers prior to leaving Site.

D. Do not cover up any loaded material prior to Engineer's inspection.

3.2 PREPARATION

A. Engineer may perform confirmatory sampling and/or analysis. Such sampling and/or analysis or failure to perform such sampling and/or analysis by Engineer shall not release or reduce Contractor's obligation to perform Works in accordance with the requirements of the Contract Documents. Do not remove materials from Site which have been sampled by Engineer and are

awaiting analytical results. Engineer will provide copies of Engineer's analytical results to Contractor upon request.

B. Return to Site any transported material delivered to a facility which is rejected by the facility.

3.3 SEGREGATION OF MATERIALS

A. Segregate and prepare materials for transportation and disposal in accordance with the delivery acceptance requirements of the transporter and disposal facility and governing regulations.

3.4 PREPARATION AND SECUREMENT OF TRANSPORT VEHICLES/CONTAINERS

A. Comply with applicable federal, state, and local regulations concerning shipping materials.

B. Visibly display number for each transport vehicle/container.

C. Clean the receiving box of the transport vehicle/container of any loose debris or foreign material. Line the receiving box or container with minimum one layer of 6-mil polyethylene sheeting continuous along the bottom and sides. Place the sheeting on the floor, run up the sides, and drape over the sideboards. Neatly push the polyethylene sheeting into corners to prevent tearing during loading and transport.

D. Secure materials in transport vehicles/containers in accordance with the regulations governing transportation of these materials.

E. Load materials into transport vehicles or containers in a manner which will not damage the properly placed polyethylene sheeting. Limit the freefall of bulk materials being loaded. Place cushioning materials under and around each container for shipments of drummed/containerized materials.

F. Replace damaged sheeting which is incapable of providing containment.

G. Following loading, fold the tub liner over the loaded materials and place an over liner of polyethylene sheeting over the materials prior to securing with an approved tarpaulin in such a way to prevent loss of materials or fugitive dust emissions.

H. Engineer will waive the box or container lining requirements where Contractor can demonstrate, to the satisfaction of Engineer, that all of the following conditions are met:

1. The receiving box or container is of leak-proof construction and capable of maintaining a leak proof condition.

2. The cover to be placed over the receiving box or container is impermeable and will totally enclose the materials within.

3. The cover to be placed over the receiving box or container will prevent fugitive dust emissions.

4. The receiving box or container is constructed of materials which can be decontaminated.

3.5 DECONTAMINATION

A. Decontaminate transport vehicles and containers at on-Site truck decontamination pad after loading and prior to leaving Site. Remove material on the tires and axles of trucks and material on the vehicle resulting from loading operations.

3.6 DOCUMENTATION FOR THE TRANSPORTATION OF HAZARDOUS AND NON-HAZARDOUS MATERIALS

A. Document transportation and disposal of hazardous materials to off-Site facilities on appropriate state and/or federal hazardous waste manifests as required. Prepare and maintain manifests and/or other records for each shipment of hazardous materials from Site. Maintain manifests from the time the hazardous materials leave Site to the time of release to the disposal facilities. Manifests for the transportation and disposal of hazardous materials will be signed by Owner or an agent for Owner, except for materials brought on Site by Contractor.

B. Document the transport and disposal of non-hazardous materials to off-Site disposal facilities on appropriate state and/or federal manifests or bills of lading. Prepare and provide Engineer with copies of manifests, waste profiles, and/or bills of lading, for each shipment of non-hazardous materials from Site. Be responsible for maintaining manifests or bills of lading, from the time the non-hazardous materials leave Site to the time of release to the disposal facility. All manifests or bills of lading, for the transportation and disposal of non-hazardous material shall be signed by Contractor.

3.7 NOTIFICATION

A. Notify applicable local representatives of authorities having jurisdiction over the route and mode of transport in advance of commencing transportation.

3.8 PRE-TRANSPORT WEIGHING

A Weigh transport vehicles with and without loaded materials at a certified off-Site weigh scale facility approved by Engineer. Perform weighing operations in such a manner that the net weight of loaded materials can be determined to the satisfaction of Engineer.

B. Submit written weigh scale receipts to Engineer within 24 hours of weighing; ensure weigh scale receipts agree with any verbally reported quantity.

3.9 TRANSPORTATION

A. Transport material removed from Site directly to the disposal facility approved by Engineer. Do not change either the route or mode of transport after commencing off-Site operations without Engineer's prior written approval.

B. Comply with the applicable requirements of regulatory publications which include:

1. 40 CFR 262 - Standards Applicable to Generators of Hazardous Waste.

2. 40 CFR 263 - Standards Applicable to Transporters of Hazardous Waste.

3. 49 CFR 171 - General Information, Regulations, and Definitions.

4. 49 CFR 172 - Hazardous Materials Table, Special Provisions, Hazardous Materials Communications, Emergency Response Information, and Training Requirements.

5. 49 CFR 173 - Shippers General Requirements for Shipments and Packaging.

6. 49 CFR 177 - Carriage by Highway.

C. Employ transport vehicle operators trained in conformance with federal, state, and local Laws and Regulations for hazardous materials haulers.

D. Regardless of whether the material is determined to be hazardous or non-hazardous it shall be transported using vehicles licensed to transport hazardous waste.

3.10 DISPOSAL

A. Make arrangements with disposal facilities for the receipt and acceptance of materials removed from Site.

B. Be responsible for and do work necessary to ensure that materials removed from Site are properly prepared and will be accepted by the disposal facility. Dispose of materials in disposal facilities approved by Engineer, which are in compliance with applicable regulations and permitted to receive materials from Site.

C. Weigh transport vehicles/containers at approved off-Site disposal facility weigh scales both before and after discharging their contents.

D. Such measurements will be used by Engineer to verify proper delivery of materials which have been removed from Site and for payment purposes. Transportation to an off-Site facility will be suspended in the event of discrepancy between the net weight as recorded by the state certified scale and the disposal facility scale.

3.11 DISPOSITION OF MATERIALS

A. Dispose of non-hazardous, non-contaminated and decontaminated materials at a sanitary landfill or scrap yard.

B. Do not load materials for transport for disposal without Engineer's approval. Do not cover or otherwise obstruct access to materials to be sampled and analyzed by Engineer to confirm its appropriate disposition. Engineer will provide the analytical results of such sampling and analysis to Contractor upon request.

3.12 OFF-SITE WASTEWATER TREATMENT FACILITY

A. Dispose of waste waters at an industrial waste water treatment facility approved by Engineer.

3.13 SANITARY LANDFILL

A. Dispose of non-hazardous materials at a sanitary landfill approved by Engineer.

3.14 CLEANING

A. Clean up any and all spills or leaks in transit.

PART 4 MEASUREMENT AND PAYMENT

4.1 GENERAL

A. Section 01019 - Contract Considerations: Requirements for measurement and payment.

4.2 TRANSPORTATION AND LANDFILL OF CONTAMINATED NON-HAZARDOUS SOLID WASTES

A. Schedule of Prices Item No. G-1.

B. Payment Basis: Lump sum price. Includes loading and decontaminating the haul unit as required prior to being released from Site; supply of haul unit licensed to haul hazardous waste; ensuring all units are placarded during transport; transporting to the approved landfill facility; fuel costs, licenses, and permitting fees; payment of any penalties or fines charged as a result of any vehicle overloadings or otherwise; cleaning up any spilled waste along haul roads; acceptance and disposal of waste materials by the landfill facility; all taxes; all disposal costs charged by the landfill facility; full compliance with applicable federal, state, and local regulations; unloading and decontamination of unloaded transport haul units; weighing each haulage unit at the approved landfill facility weigh scales.

I. INTRODUCTION

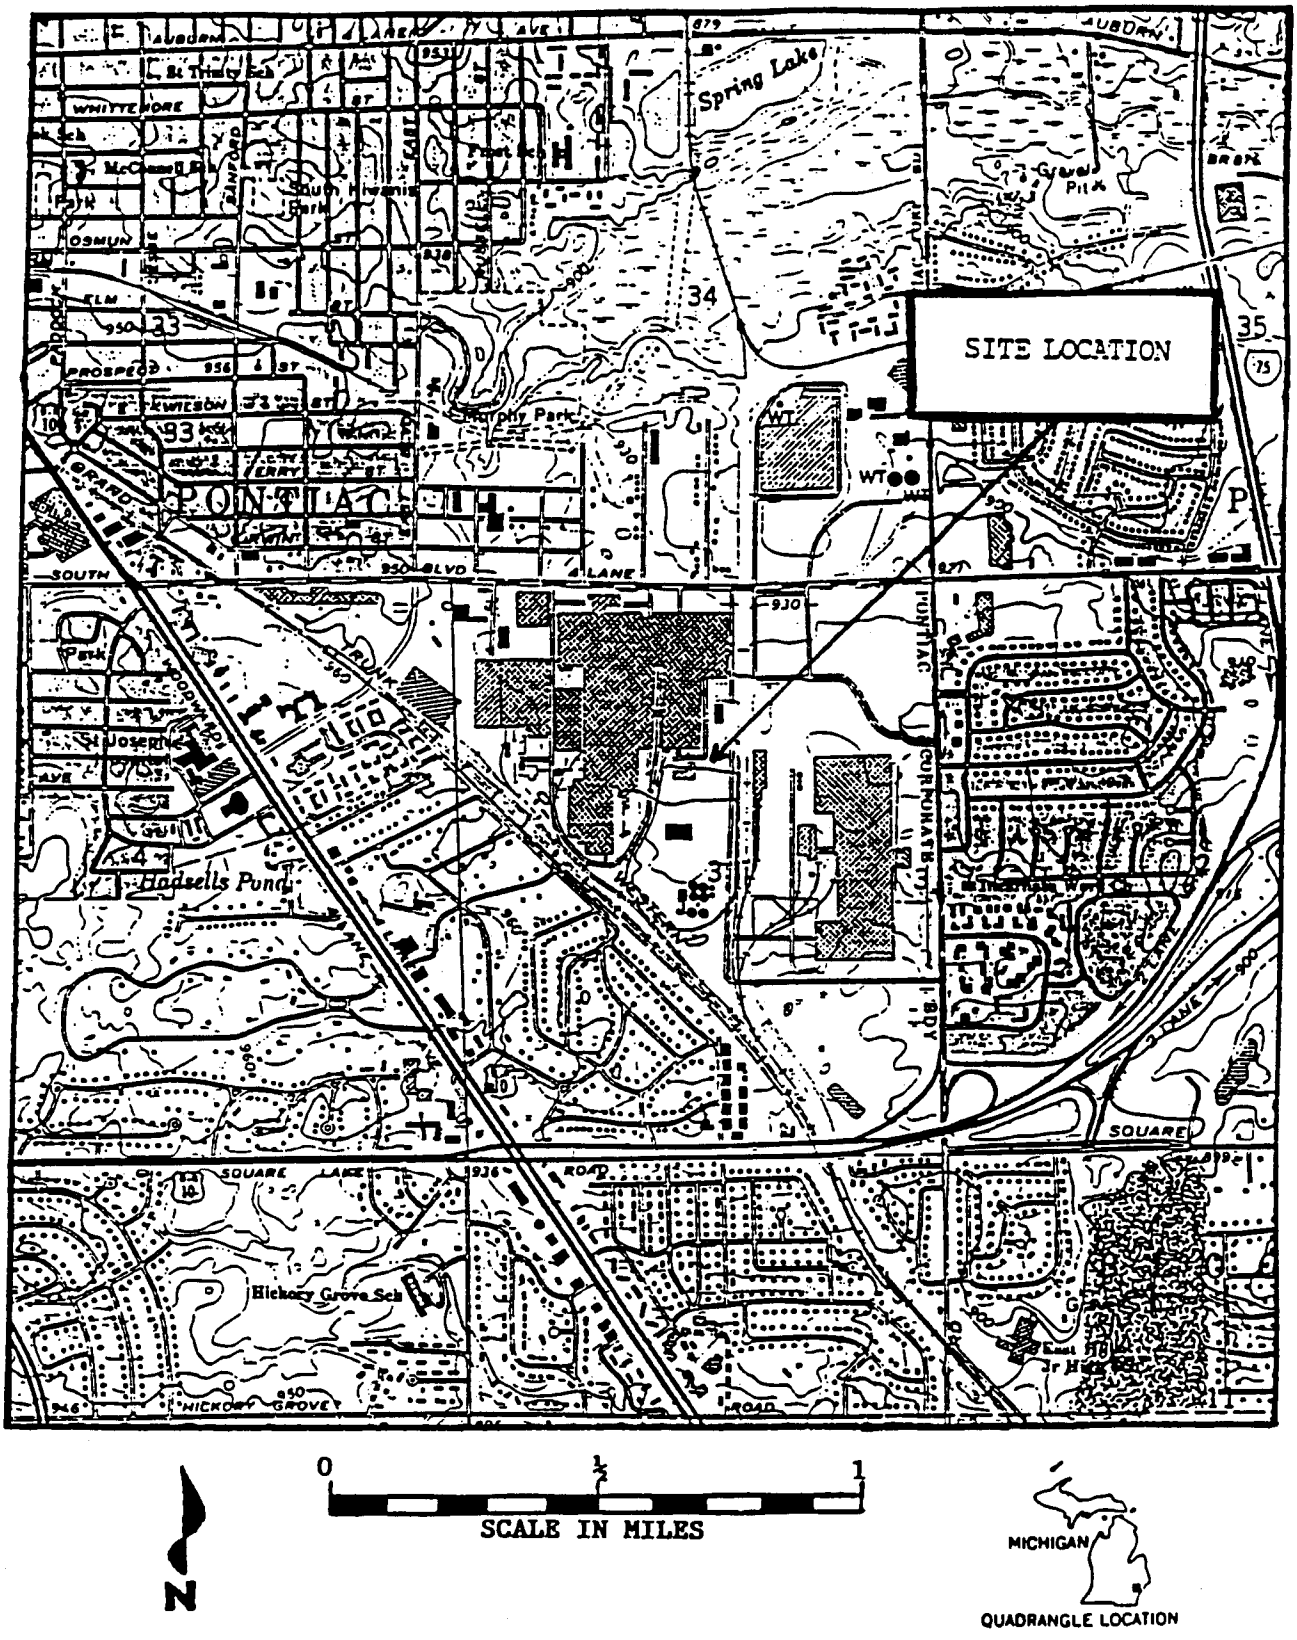
On August 30, 1991, a 1,000 gallon underground storage tank (UST) was removed from the "Building 53" tank area located at General Motors (GM) Corporation's Truck and Bus Division in Pontiac, Michigan. The areal location of the Truck and Bus Division is highlighted on the map of Figure 1, while the basic layout of the plant is shown on Plate I. The former UST under investigation is situated near the northeastern corner of Building 53 and was used for storing waste oil. On-site location and available information for the former UST situated near Building 53 can be found in Figure 2 and Table I, respectively.

TABLE I

Building 53 UST Data

Tank No.	Material	Tank Const.	Tank Size	Year Inst.	Pipe Const.	Pipe Buried
1	Waste Oil	Steel	1000	1972	Steel	Yes

The "Building 53" UST was observed to be in excellent condition at the time of removal. Also, no visible evidence of a release was observed within the excavation area. Therefore, the UST excavation was sampled using Michigan Department of Natural Resources, Environmental Response Division's (MDNR - ERD) soil sampling guidelines (Truchan, 1990) which satisfy the site assessment requirements of the Michigan State Police, Fire Marshal Divisions (MSP-FMD) rules for permanent UST Closures (State Fire Safety Board, 1991). The results of the site assessment will be discussed in this report.



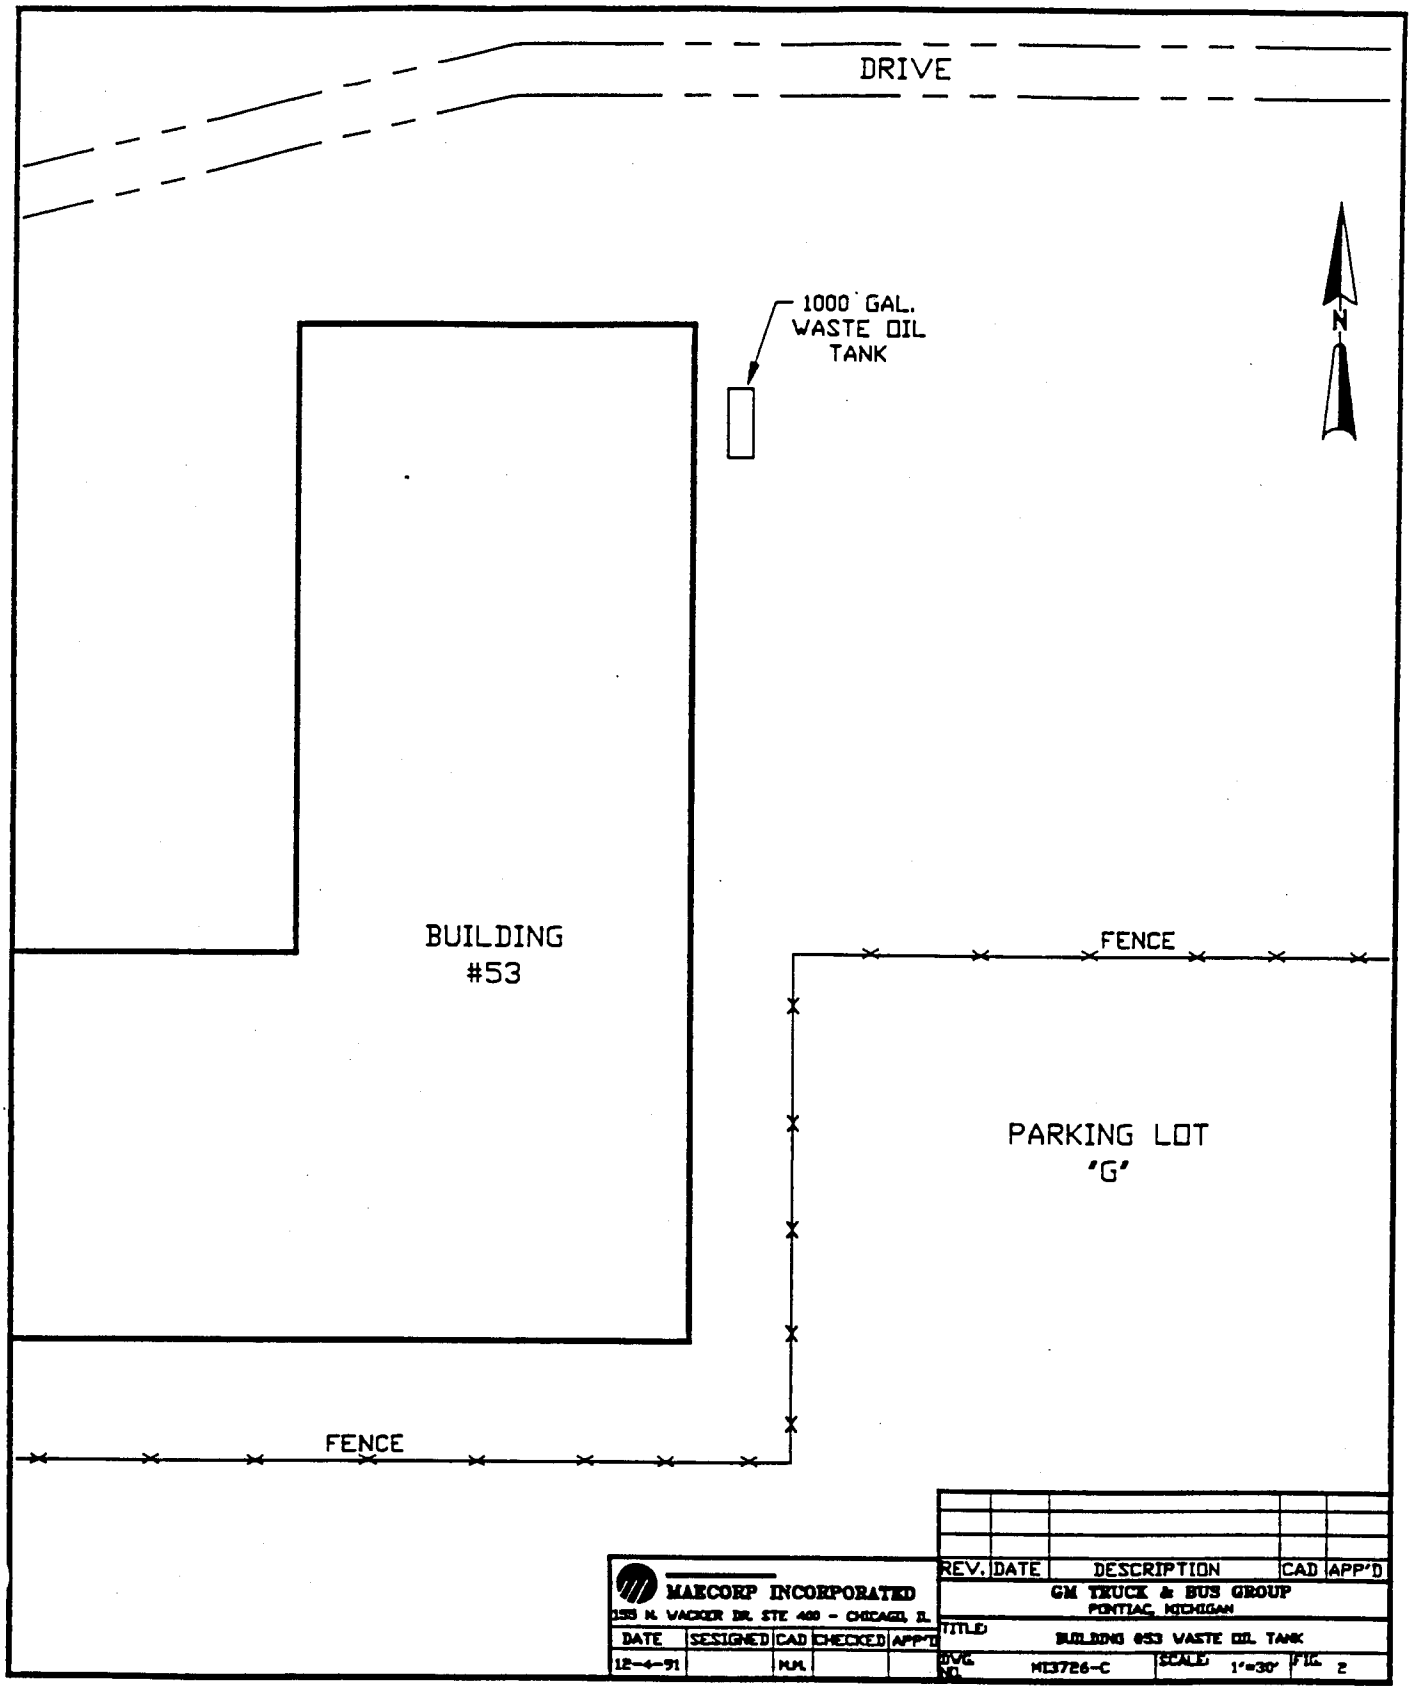


Figure 1 - Topographic location map of the GM Truck & Bus Division site (adapted from the Pontiac South, Pontiac North, Rochester, and Birmingham 7.5 min. USGS quadrangles).

TITLE: BUILDING #53 WASTE OIL TANK

DWG. NO. M13726-C | SCALE: 1"=30' | FIG. 2

General Motors notified the MSP-FMD office on October 22, 1991 that a confirmed release had occurred at the "Building 53" UST site (Thurman, 1991). The release was confirmed solely on the basis of analytical results obtained from soil samples collected during the UST excavation. The analytical results confirming this release were briefly discussed in the initial abatement report (Thurman, 1991) submitted to the MDNR-ERD district office in Livonia on October 30, 1991.

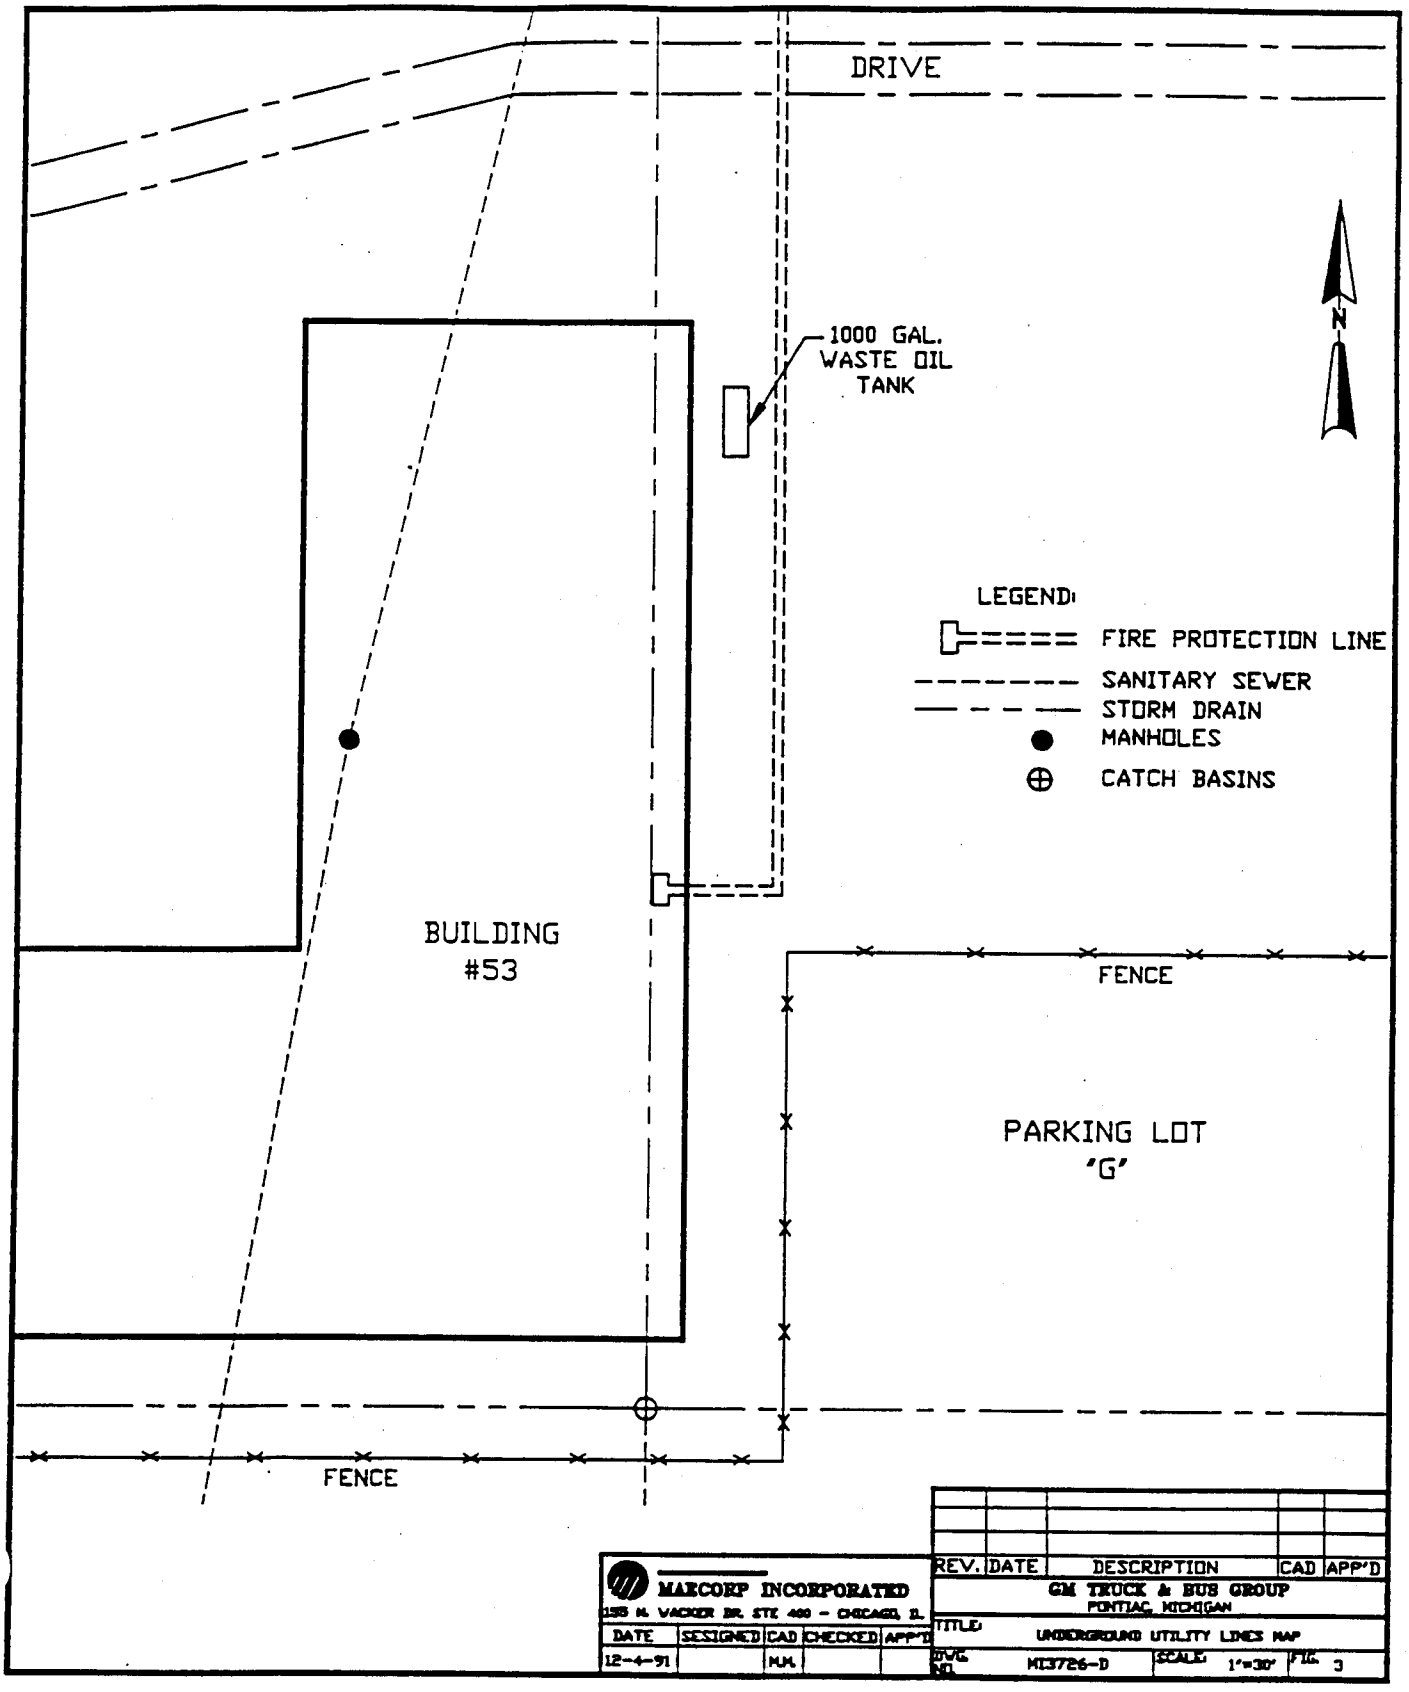
Within 45 days of release notification, the State of Michigan's Leaking Underground Storage Tank (LUST) Act No. 478, P.A. of 1988 as amended, requires a report to be submitted to the MDNR-ERD district office which includes a site characterization review and work plan to investigate the vertical and horizontal extent of soil and groundwater contamination. On General Motor's behalf, MAECORP has prepared the following report to fulfill these Lust Act requirements for the "Building 53" UST site. This report addresses each requirement's objectives specifically and in numerical order as they are referenced in Section 7 of the LUST Act legislative document.

II. SITE CHARACTERIZATION

A. Section 7 (3a): Data on the nature and estimated quantity of the release.

The specific materials suspected of being released from the UST at the "Building 53" site consisted of a mixture of waste lubricating oils. Inspection of the tank upon removal did not reveal any cracks or holes in them. Likewise, no free product was recovered from the excavation during UST removal. Based on these observations, it appears that the release was relatively small, not quantifiable, and probably resulted from tank overfills.

B. Section 7 (3b): Data from available sources and site investigations concerning the following factors: surrounding populations and land use, water quality, use and approximate locations of wells potentially affected by the release, subsurface soil conditions, locations of subsurface sewers, and clinatological conditions.



The General Motors Truck and Bus Division is located in the southeastern portion of the city of Pontiac, Oakland County, Michigan. Township and range designation for the plant, to the nearest 40 acres, is given as the NW 1/4, Section 3, T2N, R10E (Bloomfield Township). The population immediately surrounding the GM plant was unavailable, but according to City Officials, the current estimated population for Pontiac as a whole is approximately 76,210.

The general land use found at the GM Truck and Bus facility can best be described as heavy industry. According to the City of Pontiac Assessor's office, the area surrounding the facility

is zoned approximately 60-70% R1 through R3 residential, 20% M1 and M2 industrial, and 10-20% C1 through C3 commercial. The area immediately south of the GM Plant, approximately 2,000 feet due south of the "Building 53" tank area, consists of single-family residences collectively known as the South Bloomfield Highlands Subdivision.

Both the General Motors facility and the residential subdivision are served by municipal storm-sanitary sewer systems. General Motors has its own waste treatment facility in which industrial waste water is treated before entering the municipal lines. On-site locations for the sewer systems in the vicinity of the "Building 53" tank area are shown in Figure 3.

The General Motors facility and the residential subdivision are likewise served by municipal water obtained from the City of Pontiac. In addition, a non-potable water-supply used at the GM facility is obtained from a well drilled into two relatively deep aquifers: 1) a thin, sand aquifer existing at an approximate depth between 150 to 175 feet below grade; and 2) a thicker and deeper, sand and gravel aquifer occurring approximately at a depth of between 230 and 270 feet below ground surface (Overby and Govin, 1981). These aquifers are partially protected from groundwater contamination by the presence of relatively thick, confining clay layers. Well records obtained from the Michigan Department of Natural Resources, Geological Survey Division in Lansing for the area immediately surrounding the GM facility are presented in Appendix C.

GM TRUCK & BUS GROUP
PONTIAC, MICHIGAN

TITLE: UNDERGROUND UTILITY LINES MAP

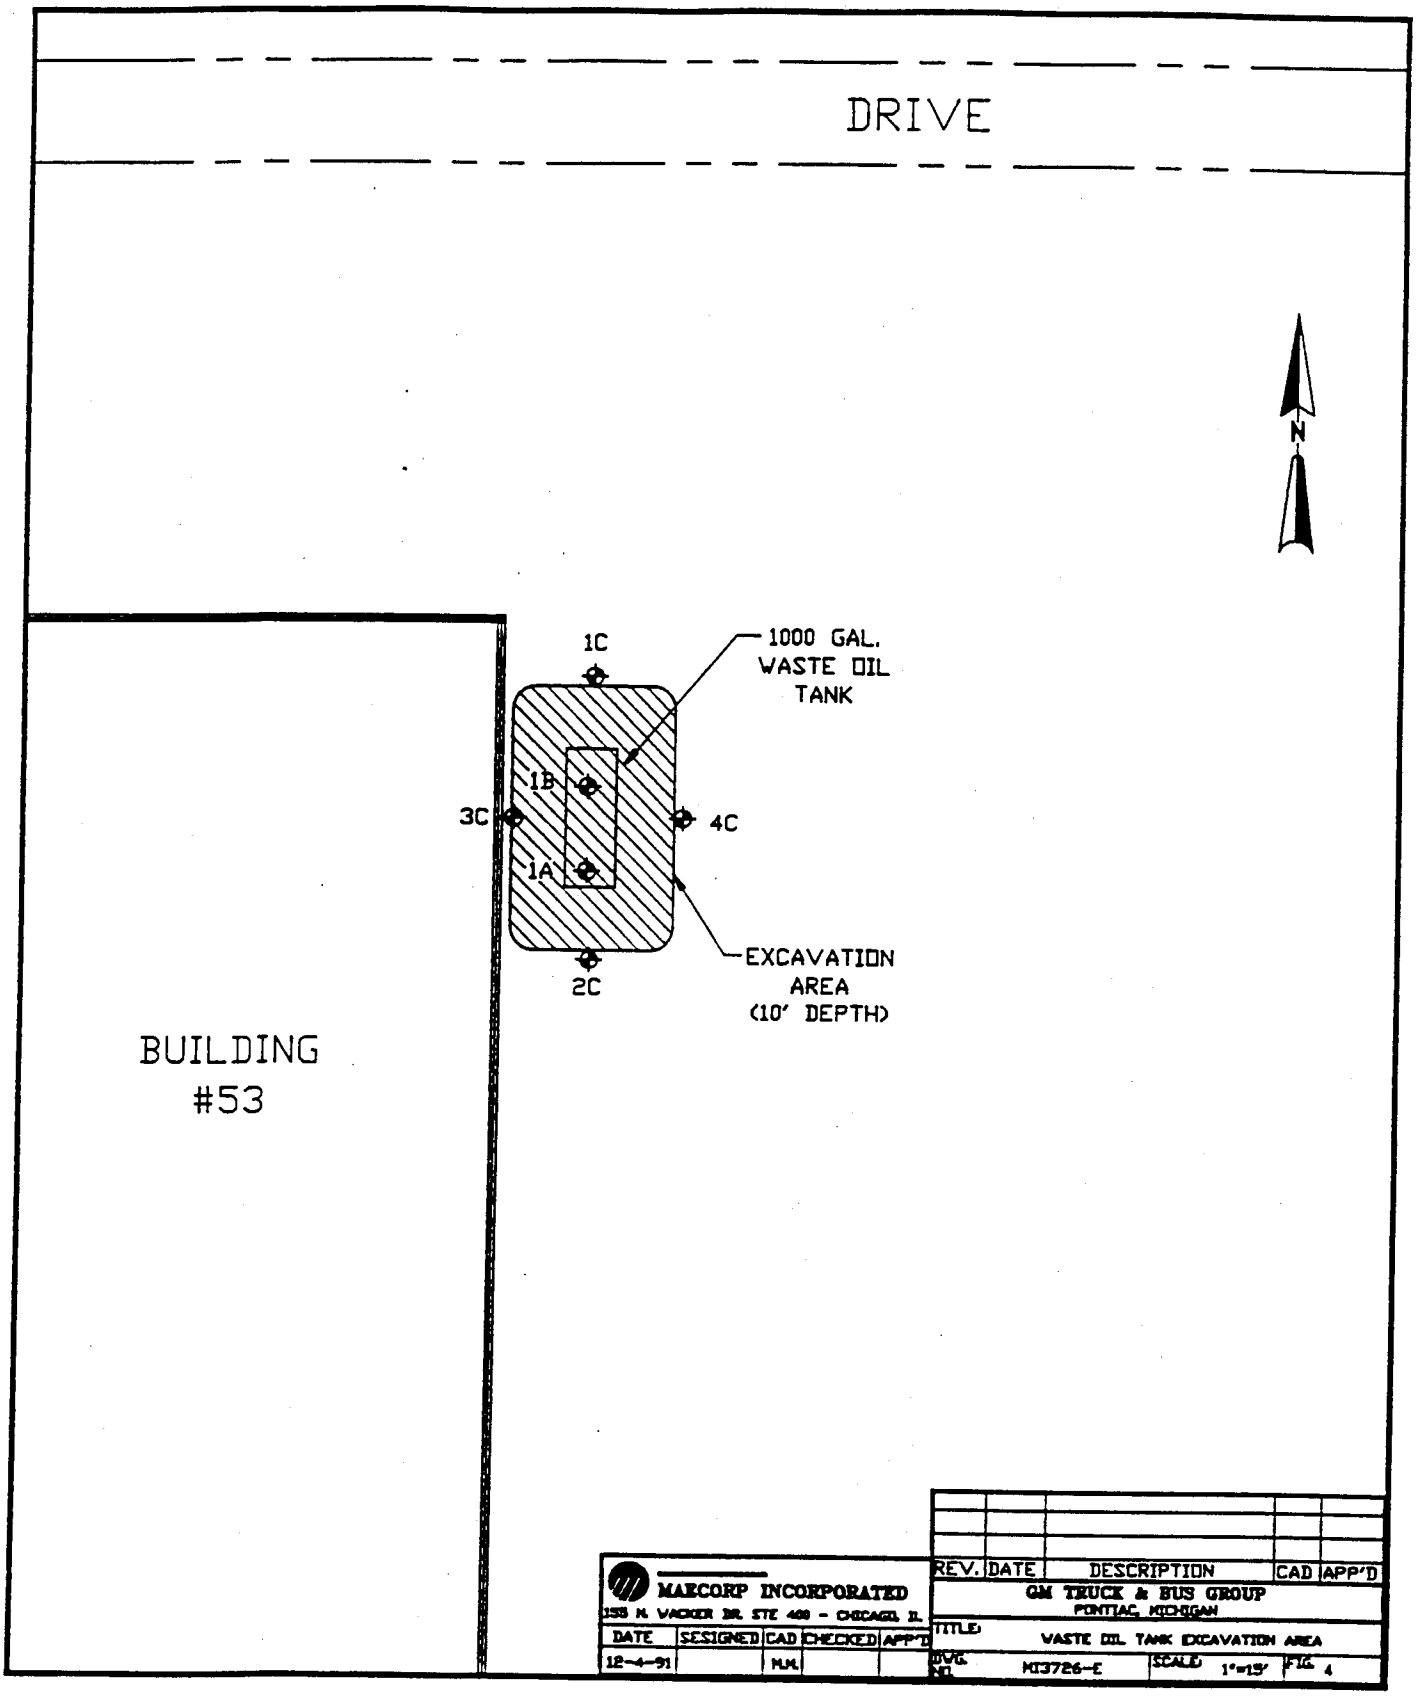
DWG. NO. MI3726-D | SCALE: 1"=30' | FIG. 3

Topographically, the "Building 53" UST site occurs near the northwestern corner of a slightly elevated, north-south trending, oblong-shaped, upland surface. Runoff generated along the ground surface of the former tank area would thus flow northward to storm drains occurring north of Building 53. According to the soil survey manual for Oakland County, the surficial soils originally found in the vicinity of the GM facility consisted mainly of sandy clay loams, which, however, have been greatly altered by past industrial and residential development (Feenstra, 1982). Much of the surficial materials now found at the GM plant consist of asphalt or concrete pavement overlying sand and/or gravel backfill.

The geologic deposits underlying the surficial soils and backfill at the General Motors site consist predominantly of glacial till, comprised of a mixture of clay, silt, sand, and gravel materials, that extend downward to an approximate depth of 150 feet (Overby and Govin, 1982). The underlying till found in this area tends to possess a relatively high clay content with low to very low permeability characteristics for groundwater flow. Immediately beneath the clay till at the "Building 53" UST site is a moderately thin, highly permeable, medium to fine sand aquifer that occurs between the approximate depth of 150 to 175 feet.

During UST removal at the "Building 53" site, groundwater was not encountered in the bottom of the excavation. Based on available information for the site, the average depth to the groundwater table is estimated to be approximately 70 feet below

ground level (Overby and Govin, 1981). The great depth to the water table, combined with the observation that the native soils comprising the side walls and base of the UST excavation were identified as clays, would probably prevent any petroleum constituents released from the tank excavation site from reaching the groundwater. The actual direction of flow for the groundwater in this area is not known for sure, although the presumed flow direction is probably toward the north in correspondence to the local topography.



The climate for the Pontiac area, as it is for the rest of Lower Michigan, is characterized as being humid continental with warm, moist summers and cold, snowy winters. The climate is modified somewhat by the regional influence of the Great Lakes. The average total annual precipitation for the Pontiac area is 30.91 inches with approximately 58% (i.e. an average of 17.92 inches) usually occurring as rainfall during April through September (Feenstra, 1982).

C. Section 7(3c): Results of the site characterization investigation as required by subsection (1).

Each of the sidewalls and the floor of the UST excavation were sampled during the initial site assessment according to MDNR-ERD guidelines for verification of soil remediation sites (Truchan, 1990) so that additional sampling and analyses would not be needed if a site characterization had to be performed. The soil sampling procedure thus involved collecting one grab sample from the excavation's floor beneath the tank's fill pipe area and one grab sample from the excavation's floor underneath

the opposite end of the tank. In addition, soil samples were collected from each of the four walls comprising the excavation. The four wall samples were collected approximately six inches into the walls at a depth relative to the center of the former UST location. Locations for soil samples taken at the "Building 53" UST site are depicted in Figure 4.

The soil samples were submitted to Canton Analytical Laboratories in Plymouth, Michigan for total lead, cadmium, chromium, total petroleum hydrocarbons (TPH), polychlorinated biphenyles (PCBs), polynuclear aromatic hydrocarbons (PNAs), and benzene, toluene, ethylbenzene, and xylenes (BTEX) analyses. The most recent state of Michigan Act 307 Type B remediation criteria values for the parameters analyzed are presented in Table II below (after Michigan Department of Natural Resources, 1990 and 1991). Tables III and IV, which follow, summarize the analytical results for soil samples collected from the "Building 53" UST excavation, with the raw laboratory analyses which were used in compiling these tables included in Appendix A. The analytical results for all samples, except the east wall sample, presented in these tables show at least one of the test parameters' levels to be above the Type B clean-up criteria values. In general, elevated levels occurred for xylenes and some PNAs, with the highest concentrations tending to be in the downgradient position of the former UST (i.e., toward the north). However, no PCBs and little or no benzene, ethylbenzene, and toluene, were detected in the excavation's soil samples.

The analytical results established a need for further excavation. Additional excavation was required on the floor as well as the north, south, and west walls. The excavation of these areas was conducted in mid November.

Subsequent to excavation activities, verification samples were collected. The verification samples from the walls and floor were collected at locations relative to the previous sample locations. Three samples were collected from each location at the surface, at one foot in and at two feet in. GM is currently awaiting the analytical results for the verification samples.

ND = None Detected

* = Above Type B Criteria Value

All of the soil removed during excavation of the UST was stockpiled approximately 20 feet east of the "Building 53" tank site on, and covered with, polyethylene sheeting. Approximately 70 cubic yards of soil are stockpiled in this area. A composite soil sample was collected from the excavation pile in order to assess the proper means for disposal.

The composite soil sample was submitted to Canton Analytical Laboratories for ignitability, corrosivity, reactivity, EPA toxicity and TCLP analyses. The purpose of the analyses was to determine if the soil contained contaminant levels exceeding those established by RCRA for the classification of characteristic hazardous waste. None of the RCRA levels were exceeded. Consequently, the soil pile is considered to be nonhazardous and can be properly disposed of at a Type II Landfill. The raw laboratory analytical data for the soil pile are included in Appendix B.

III. FREE PRODUCT REPORT

A. Section 7 (3d): Results of the free product investigation required by subsection (1).

The free product investigation included a visual and olfactory inspection of the "Building 53" UST excavated area. There was no free product observed or noticeable odor detected in the UST excavation.

B. Section 7 (5d): Unless directed to do otherwise by the director, prepare and submit to the director, within 45 days after confirming a release, a free product removal report.

Since no free product was observed at the "Building 53" UST excavated site, there was no removal of free product. Therefore, a free product removal report was not necessary for the excavated UST site.

IV. WORK PLAN

A. Section 7 (6): Within 45 days after confirmation of a release, a work plan must be submitted to determine the full extent of soil and groundwater contamination.

Further excavation of affected soils above Type B criteria was performed in Mid-November. These areas were resampled, however, the analytical results have not yet been received. The results will be necessary to develop a suitable work plan for investigating the extent of soil and possible groundwater contamination. Therefore, the proposed work plan, along with the results obtained from additional excavation and sampling, will be submitted as an addendum to this report.

1.0 INTRODUCTION

Conestoga-Rovers & Associates (CRA) was retained by General Motors Corporation (GM) - Pontiac Central Manufacturing Facility (Facility) to address outstanding environmental issues regarding the soils associated with the former waste oil underground storage tank (UST) located near Building 53 (Study Area) at the GM Facility.

The Facility is located in Pontiac, Michigan. The Site location is presented on Figure 1.1. Figure 1.2 presents a Site plan of the Facility.

The Study Area for the Building 53 UST is identified on Figure 1.2. A plan of the Study Area is provided on Figure 1.3.

The purpose of this report is to present and evaluate the current status of the Building 53 UST area with regards to the outstanding environmental issues identified by the Michigan Department of Natural Resources (MDNR) in their letter to GM dated November 19, 1993, and to present the results of additional investigations conducted to resolve outstanding issues.

1.1 REGULATORY REQUIREMENTS

As the environmental issues within the Study Area were the result of the operation of an underground storage tank (UST) system, the requirements of the Leaking Underground Storage Tank (LUST) Act (P.A. 478, 1988 as amended by Act 645 of 1993) must be addressed to resolve the outstanding environmental issues within this Study Area.

LUST provides an outline of the reporting, field investigative and remedial activities required by the Michigan Department of Natural Resources (MDNR) for closure (e.g. final remediation) of a LUST site to be granted by the MDNR.

The primary regulation which governs remedial actions within Michigan is the Michigan Environmental Response Act (MERA) [Michigan Public Act 307 (P.A. 307, 1982 as amended)]. As such, it provides the rules necessary to develop remedial programs and cleanup standards for environmental contamination sites located within the State of Michigan.

The Michigan Act 307 Rules provide for three types of cleanup standards (Type A, Type B and Type C). The selection of a cleanup standard for a particular site is based on site-specific characteristics, the nature of the contamination which exists and the anticipated future land uses of the property. Under Rule 299.5705(2)(3), the cleanup approach may be Type A, B, C, or a combination of types for individual chemicals within each media of concern.

A Type A cleanup is achieved when the concentration of a hazardous substance in any environmental media does not exceed background or the relevant method detection limit.

Type B cleanup criteria are health-based, employing conservative, standardized exposure assumptions that assume there will be unrestricted direct contact with contaminated media.

A Type C cleanup is a health-based approach which allows site-specific characteristics to be factored into a risk assessment. It must be demonstrated that the assumptions used in the risk assessment are appropriate to the site and consistent with reasonably foreseeable current and future land uses. Less conservative exposure assumptions may be made by assuming less direct contact with the waste materials or restricting current and future use of the site through the application of institutional controls and deed restrictions. Cleanup levels will vary according to the exposure assumptions used in a site-specific risk assessment. Generic Type C Industrial Cleanup Standards have been prepared by the MDNR which are considered to be acceptable and based on conservative exposure assumptions.

This report has been prepared in accordance with the requirements of Act 307 and LUST, as well as draft MDNR requirements for the verification of soil remediation (October, 1990).

2.0 BACKGROUND INFORMATION

The purpose of this section is to provide a general overview of the GM Facility as well as the geologic and hydrogeologic setting.

2.1 LOCATION AND HISTORY

The Facility is located in an industrial area which is bordered to the south by residential areas. The Grand Trunk Western Railroad Line is located along the southern edge of the property. The Facility is bordered to the east and west by industrial areas, and to the north by South Boulevard.

The Facility was built in 1927 and was utilized to manufacture trucks, buses, military vehicles and motor homes. Major manufacturing activities associated with the production of these vehicles included machining, stamping, plating, smelting, fiberglass laminations, heat treating, painting and sealing. Manufacturing operations at the Facility ceased in August 1990 and the Facility was closed in the summer of 1991 as an obsolete factory.

Following the Facility closure, USTs which were no longer in service were removed from the Facility. Waste oil was noted in the soils in the area of the waste oil UST removed at Building 53. This oil residual was reported to the Michigan State Police - Fire Marshall Division (MSP - FMD) office, and remedial actions were initiated, in accordance with LUST requirements.

Sections of the Facility are currently undergoing decommissioning, demolition and re-development activities.

2.2 FACILITY GEOLOGY

The Facility is located in an area of glacial till and outwash deposits formed during the Wisconsin glacial age of the Pleistocene Epoch. The glacial till is composed of low permeability clay, silty clay and sandy clay. Smaller sand and gravel units are also encountered occasionally within the clay till unit. The low permeability clay till unit has a reported depth of approximately 250 to 300 feet and overlies bedrock, which is reported to be Early Mississippian-age Coldwater Shale.

The Facility is located at the interface of two glacially deposited soil units, known as the Fort Wayne Moraine and the Defiance Moraine Outer Ridge. Historically, these moraines formed the divide between the Clinton River and Rouge River drainage basins. Construction activities at the Facility have moved the divide, and the Facility now drains to the Clinton River via the Murphy Drain.

Shallow native soil materials underlying the plant are predominantly composed of glacial tills of low to very low permeability. The glacial till materials are generally comprised of medium to low plasticity clays. Sand lenses and outwash channels of limited extent are also encountered within the surficial native soil materials.

Through years of development and industrial use, the shallow native soils in many areas of the Facility have been overlain by earth fill (e.g. sand and gravel), asphalt, concrete or structures.

2.3 FACILITY HYDROGEOLOGY

In 1981, Camp Dresser and McKee (CDM) performed a hydrogeologic assessment of the Facility. The results were presented in a report entitled "Mathematical Simulation of Groundwater Flow Conditions under GM's Truck and Coach Division, Pontiac, Michigan" (CDM, 1981).

The CDM report identified three primary sand and sand/gravel aquifers beneath the Facility. These aquifers occur at depths of 120, 150 and 210 feet below ground surface (bgs) and are approximately 7, 25 and 50 feet thick, respectively.

The "120-foot aquifer" was identified in the well log record of supply well number 7 (Building 43) as a sand aquifer. This aquifer is not utilized on Site for water supply.

The "150-foot aquifer" was used for industrial water supply by the Facility, by means of two wells [Well Number 3 (Building 29) and Well Number 6 (Building 66)] which were screened in this aquifer. The material in this aquifer unit was identified to consist of medium to fine grained sand.

The "210-foot aquifer" was also utilized by the Facility for industrial water supply (Well Number 7). This aquifer is also a known local source for municipal water supply.

Shallow groundwater has been encountered in several areas of the plant, generally at depths of 10 feet to 20 feet bgs. This groundwater is perched above the clay till in layers of fill material or sand (or sand and gravel) seams of limited extent. As the clay till layer is approximately 100 feet thick between the perched groundwater and the 120-foot aquifer, the perched groundwater is not expected to be hydraulically connected with the lower aquifers.

In many areas of the Facility, the clay till exists at the ground surface, and no perched groundwater layer is present.

3.0 DESCRIPTION OF STUDY AREA

This Section presents a summary of available information from GM files regarding the former waste oil tank at Building 53.

3.1 HISTORY OF THE BUILDING 53 WASTE OIL UST

The GM Pontiac Central Manufacturing Facility (Facility) was built in 1927. The Facility was closed as an obsolete factory in the summer of 1991. On August 30, 1991, a 1,000-gallon waste oil steel underground storage tank (UST) was removed from the Building 53 UST Study Area. Figure 1.3 presents a plan of the Building 53 Study Area. The UST was originally installed in 1972, for the temporary storage of waste oil, and was found to be in excellent condition upon removal.

Following the excavation and removal of the tank, soil samples were collected from the excavation, in accordance with MDNR guidelines for verification of soil remediation, to confirm clean closure (Type B) of the Study Area. Four sidewall and two excavation floor samples were collected and analyzed for lead, cadmium, chromium, BTEX, and PNAs. The approximate locations of the samples are presented on Figure 1.3. The analytical data identified BTEX and PNA constituents at levels exceeding Type B criteria in all samples except 4C which was taken from the east wall of the excavation. Based on the analytical results from the sampling, waste oil related soil contamination was identified and reported on October 22, 1991.

In accordance with the Michigan LUST Act, 20-Day and 45-Day reports were prepared and submitted. The 20-Day report was prepared and submitted by GM on October 30, 1991. The 45-Day report was prepared by Maecorp Incorporated (Maecorp) on GM's behalf and submitted on December 2, 1991.

In the 45-Day report it was concluded that the waste oil related contamination was due to routine tank operations (e.g. filling and removal activities).

3.2 PAST REMEDIAL ACTIVITIES

Additional excavation of the Building 53 UST Study Area was completed during November 1991. The limits of this excavation were defined by additional sampling of the excavation sidewalls and floor at previously sampled locations (Figure 1.3). At these locations, samples were taken at the surface, 1-foot, 2-foot and 3-foot depths. Based on the BTEX and PNA analytical results for these additional samples, the excavation limits were increased approximately 3 feet to the north and south, and the excavation depth increased from 10 feet to 15 feet bgs. The excavated soils were stockpiled on plastic sheeting, covered and the excavation backfilled. Composite samples of stockpiled soil were collected and analyzed to determine disposal requirements. Following characterization, the excavated soils were approved for, and disposed of at a landfill.

The final dimensions of the excavation were reported to be approximately 27 feet from north to south, 13 feet from east to west and 15 feet deep. The total volume of soil excavated was approximately 190 cubic yards (based on the dimensions of the excavation and volume of the tank).

As groundwater was not encountered during either UST removal or additional excavation activities, and the extent of BTEX and PNA residual soil contamination had been defined, Type B closure of the Building 53 UST Study Area was requested by GM on January 22, 1992. The original verification samples (August 1991) did, however, identify levels of lead (24-38 mg/kg) and chromium (21-35 mg/kg) in the soil which exceeded Michigan Type A (e.g. background default inorganic levels).

The default Type A Cleanup Criteria for lead and chromium are presented in the MERA Operational Memorandum #15, dated September 30, 1993, as follows:

Inorganic	*Default Type A*
Chromium (total)	18 mg/kg
Lead	21 mg/kg

3.3 GEOLOGY

The stratigraphy in the vicinity of the former waste oil UST at Building 53 was determined to be comprised of glacial clay tills representative of the area. The clay till was identified to extend to depths greater than 20 feet bgs during investigations.

3.4 HYDROGEOLOGY

There are no hydrostratigraphic units in the surficial zone of the clay till overburden in the vicinity of Building 53. As a result, there are no groundwater units in contact with the stratigraphic zone of the former waste oil UST.

3.5 MDNR REQUIREMENTS

On November 19, 1993 the Michigan Department of Natural Resources (MDNR) sent a letter to GM requesting that additional information be provided prior to granting closure for the Building 53 UST area. The MDNR letter is reproduced in Appendix A. The specific MDNR requirements included:

- performing a background inorganics study (or a leachate test), to determine whether or not the levels of lead and chromium were present at a level of concern;

- providing a more specific description of the geology;

- determining whether or not groundwater was present at the location. If groundwater was present, then a hydrogeological investigation was warranted; and

- submission of a complete report containing sufficient information to address MDNR concerns by February 28, 1994.

As stated in the introduction, this report has been prepared to address the above identified MDNR concerns.

4.0 ADDITIONAL INVESTIGATIVE ACTIVITIES

The additional investigative activities conducted by CRA to address MDNR requirements included:

- a literature search to further define local media-specific background concentrations for lead and chromium; and
- installation of boreholes to obtain chemical and geologic samples.

On January 3 and 4, 1994, CRA completed an additional four boreholes within the Building 53 Study Area. The boreholes were drilled by Mateco Drilling of Grand Rapids, Michigan. The purpose of these boreholes was to further define the geology, hydrogeology and nature of lead and chromium concentrations in the soil including the establishment of local background criteria (Type A) and Site-specific leachability factors for lead and chromium.

The locations of the boreholes installed by CRA are presented on Figure 4.1. BH53-1-94 was completed to a depth of 17 feet bgs within the limits of the previous excavation. A sample was collected at the base of the excavation (15 - 17 feet bgs) to further evaluate the nature of the lead and chromium which may be present. BH53-2-94 was completed approximately 14 feet east of the limit of excavation and was completed to a depth of 11.5 feet bgs. Two samples were obtained (at 2 - 4 and 9.5 - 11.5 feet bgs) to establish background levels for lead and chromium and to determine the leachability of the lead and chromium within the Study Area. BH53-3-94 and BH53-4-94 were completed to a depth of 12 feet bgs. Samples were taken from both boreholes at the following intervals to establish local background lead and chromium concentrations:

- 2 to 4 feet bgs;
- 6 to 8 feet bgs; and
- 10 to 12 feet bgs.

The geology encountered within the four boreholes was logged during drilling operations. Borehole stratigraphic logs are presented in Appendix B.

Samples were obtained using standard 2-inch inside diameter split-spoon sampler. Soil recovered using the split-spoon sampler was sampled using clean sampling equipment and placed in laboratory supplied clean sample jars. Sample jars were shipped to IEA Laboratories in coolers at 4°C and analyzed for lead, chromium, (Toxicity Characteristic Leaching Procedure (TCLP) lead and TCLP chromium. A data validation memorandum and chain of custody form for the collected samples are included with the analytical data in Appendix C.

Section 5.0 provides an evaluation of the data obtained during the additional investigations.

5.0 EVALUATION OF CRA BOREHOLE DATA

5.1 GEOLOGY

The following description of the geology in the Building 53 Study Area was prepared based on the stratigraphic logs prepared from the four boreholes completed by CRA. These logs are presented in Appendix B of this report.

Within the Study Area, a parking lot surface layer of gravel with some sand extends approximately 2 feet bgs. This layer is underlain by moist brown clay which terminates at approximately 11 to 12 feet bgs. A layer of stiff moist gray clay extends from the brown clay layer to a depth of at least 17 feet bgs in BH53-1-94 at which depth the borehole was terminated.

Groundwater was not encountered within the native clay till soil in the vicinity of the former waste oil UST.

5.2 ANALYTICAL RESULTS

The samples collected from the Study Area were analyzed for lead and chromium content. In addition, sample BH53-2-94, 9.5'-11' was also analyzed for TCLP lead and chromium. The results of these analyses are summarized in Table 5.1. Laboratory analytical results are presented in Appendix C.

One sample was analyzed from the base of the excavation (BH53-1-94, 15'-17') and was found to contain concentrations of lead and chromium at 7.9 mg/kg and 7.9 mg/kg, respectively. The remaining sample results were utilized to establish local background levels and lead/chromium leachability. Local background concentrations were calculated in accordance with the methods outlined in the MDNR memorandum "Guidance for Determining Adequacy of Soil Remediation" (draft, October 1990). Local

background concentrations were calculated to be 17.1 and 28.3 mg/kg for lead and chromium, respectively (see Table 5.2).

The Michigan Background Soil Survey (Revised, April 1991) was consulted to determine more specific information regarding the background levels of chromium and lead in clay materials in the Pontiac, Michigan area. As identified in the Michigan Background Soil Survey, Pontiac, Michigan is located in an area where the glacial tills are a result predominantly of advances of the Erie glacial lobe.

A review of the survey indicates the following background levels for chromium and lead in clays associated with the Erie lobe:

	n	*mean (mg/kg)*	*SD (mg/kg)*	*(mean + 3SD) (mg/kg)*
Chromium	88	23.6	10	53.6
Lead	107	10.9	6.8	31.3

These levels compare to Type A soil cleanup levels and the Michigan Background Soil Survey as follows:

	Type A (mg/kg)	*Michigan Survey mean (mean + 3SD) (mg/kg)*	*Local (mg/kg)*	*Range (mg/kg)*
Chromium	18	23.6 (53.6)	28.3	18-53.6
Lead	21	10.9 (31.3)	17.1	17.1-31.3

The chromium (21-35 mg/kg) and lead (24 - 38 mg/kg) levels identified during the August 1991 soil verification sampling generally fall within the ranges of background identified above.

The TCLP results are summarized as follows:

	TCLP *Result*	*Type B* *Cleanup Standard*
Chromium	10.0 µg/L	120 µg/L
Lead	4.6 µg/L	4 µg/L

These results indicate that there is minimal concern related to the potential leachability of chromium or lead (especially considering there is no groundwater present). The Site-specific leachability factors for lead and chromium were determined to be 3,040 and 1,800, respectively. The calculations for these leachability factors are presented in Table 5.2.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the information presented herein, the following conclusions may be made regarding the lead and chromium concentrations in the area of the former waste oil UST:

- as groundwater was not encountered during the removal of the UST, or during the completion of boreholes within the Study Area, and the surrounding soil is a glacial clay till, the appropriate soil cleanup levels are the Michigan Type B direct contact levels (e.g. absence of groundwater). These values are 400 mg/kg for lead and 4,400 mg/kg for chromium. The concentrations of lead (24 - 38 mg/kg) and chromium (21 - 35 mg/kg) present within the Study Area are significantly below the Michigan Type B direct contact soil cleanup levels;

- the local background concentrations for lead and chromium calculated for the Study Area are 17.1 and 28.3 mg/kg, respectively. However, the background levels for Erie Lobe clay (lead up to 31.3 mg/kg and chromium up to 53.6 mg/kg) are somewhat higher. The lead (24 - 38 mg/kg) and chromium (21 - 35 mg/kg) concentrations identified in August 1991 in the vicinity of the former waste oil UST are at or below background levels (either on Site or within Erie lobe glacial clay tills); and

- analytical results for the sample taken below the former waste oil UST indicate concentrations of lead and chromium below Type A and Type B direct contact soil cleanup levels. As a result, the vertical extent of remediation has been adequately completed.

The information provided herein addresses the MDNR requirements for additional information and is sufficient to obtain final closure (Type B) for the Building 53, former waste oil UST Study Area.

Based upon the foregoing, no additional investigation or remediation is required or warranted.

Re: GM North American Truck Platforms, Pontiac Central Facility - Building #53, Pontiac, MI Facility ID #18277, Incident #C-2188-91

Dear Mr. West,

The Michigan Department of Natural Resources (MDNR) staff have completed the review of the file, including the January 22, 1992 submittal which request a Type-B closure for this site. Based on the file review, your request for closure cannot be granted at this time.

In order for this site to be considered for closure, the following MDNR concerns must be addressed:

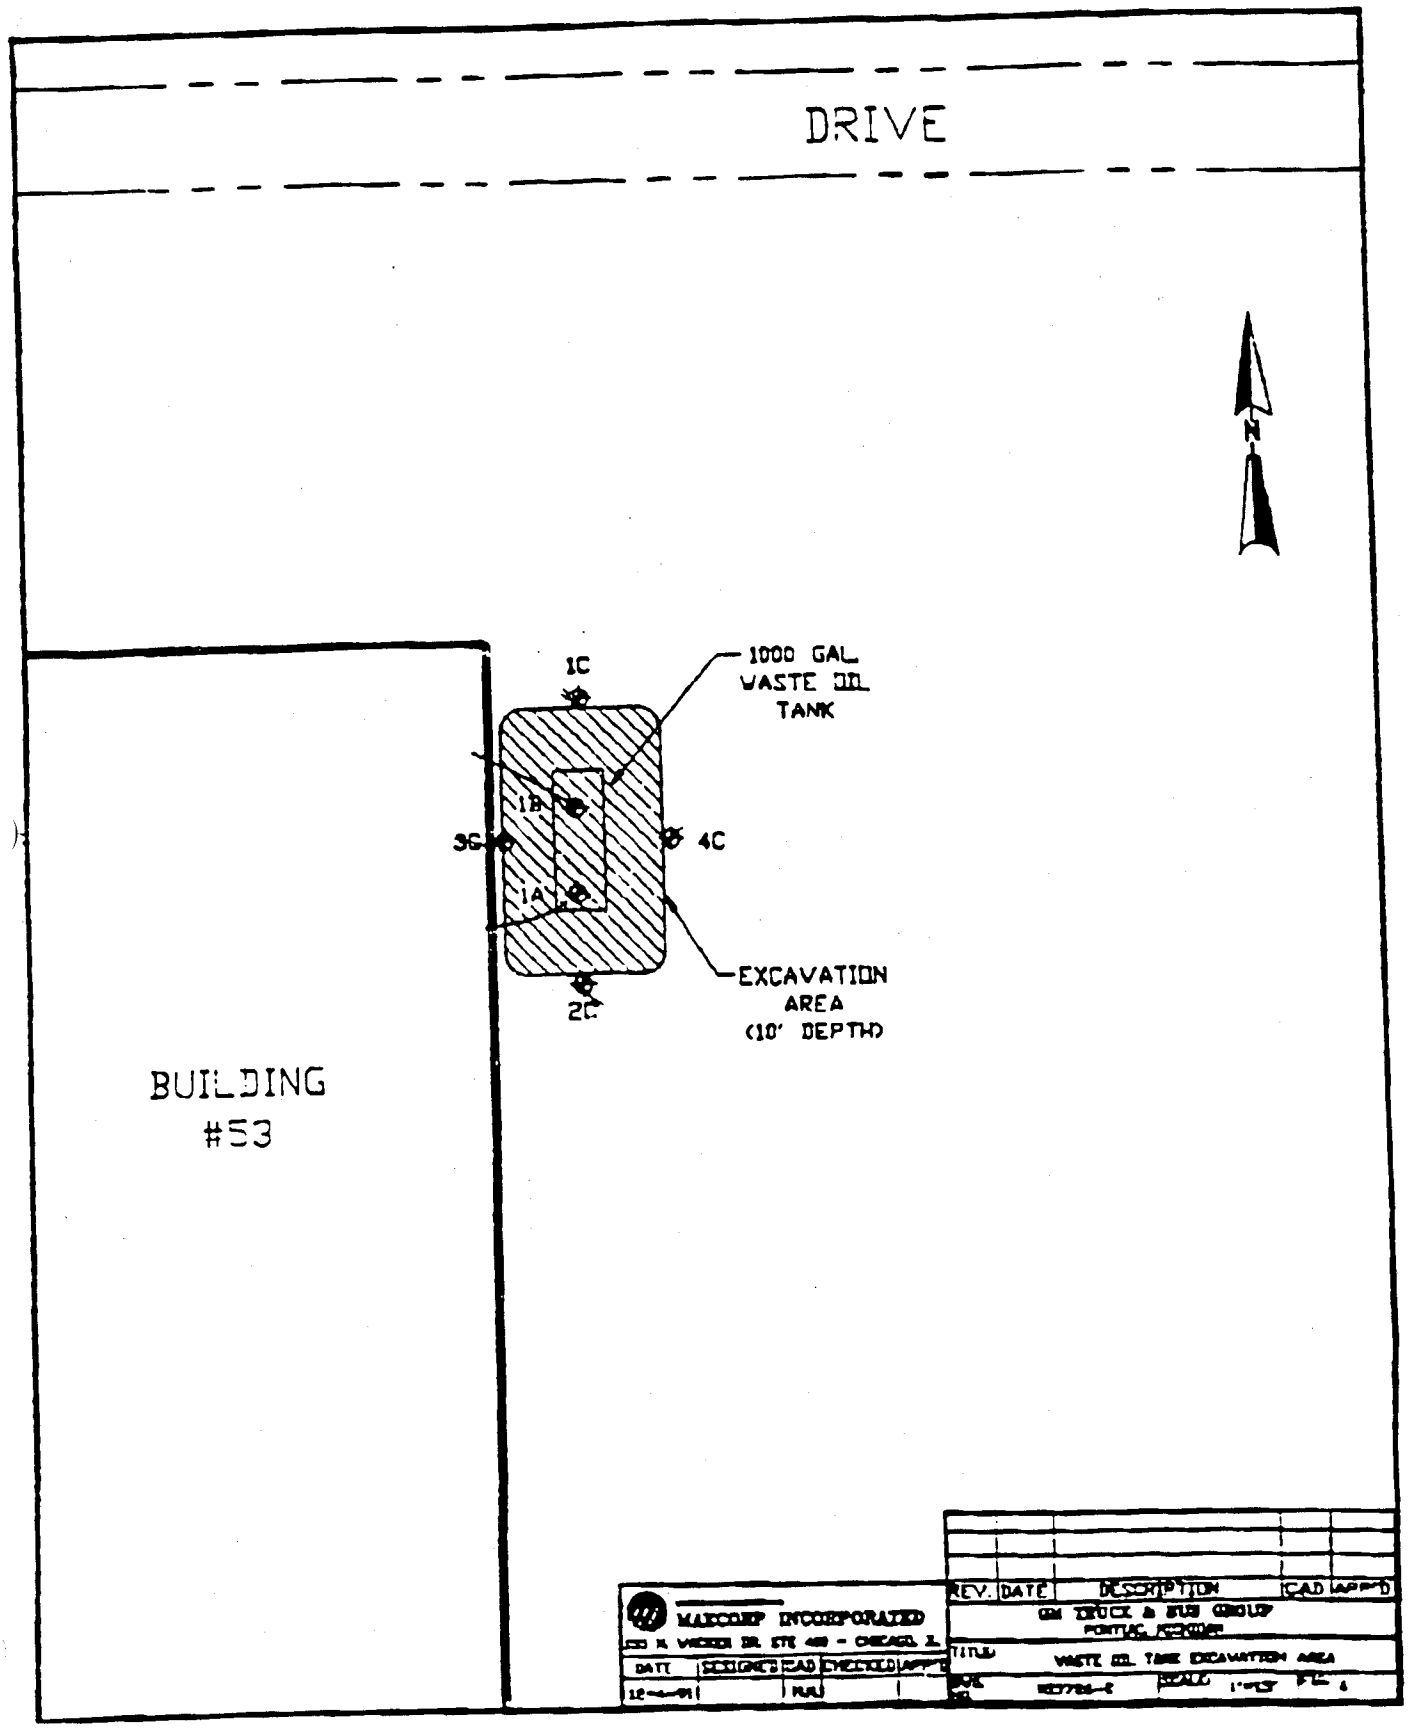
1. The original 6 verification samples were analyzed for metals (lead, cadmium and chromium). Lead was detected in all of the samples above the default value of 21 ppm. Also, Chromium was detected in 2 of the samples (#3C and #4C) above the default value of 18 ppm). Additional investigation (background study or leachate analysis) should be conducted to determine whether or not these values represent a problem.

2. Provide a more specific description of the geological characteristics encountered at this site.

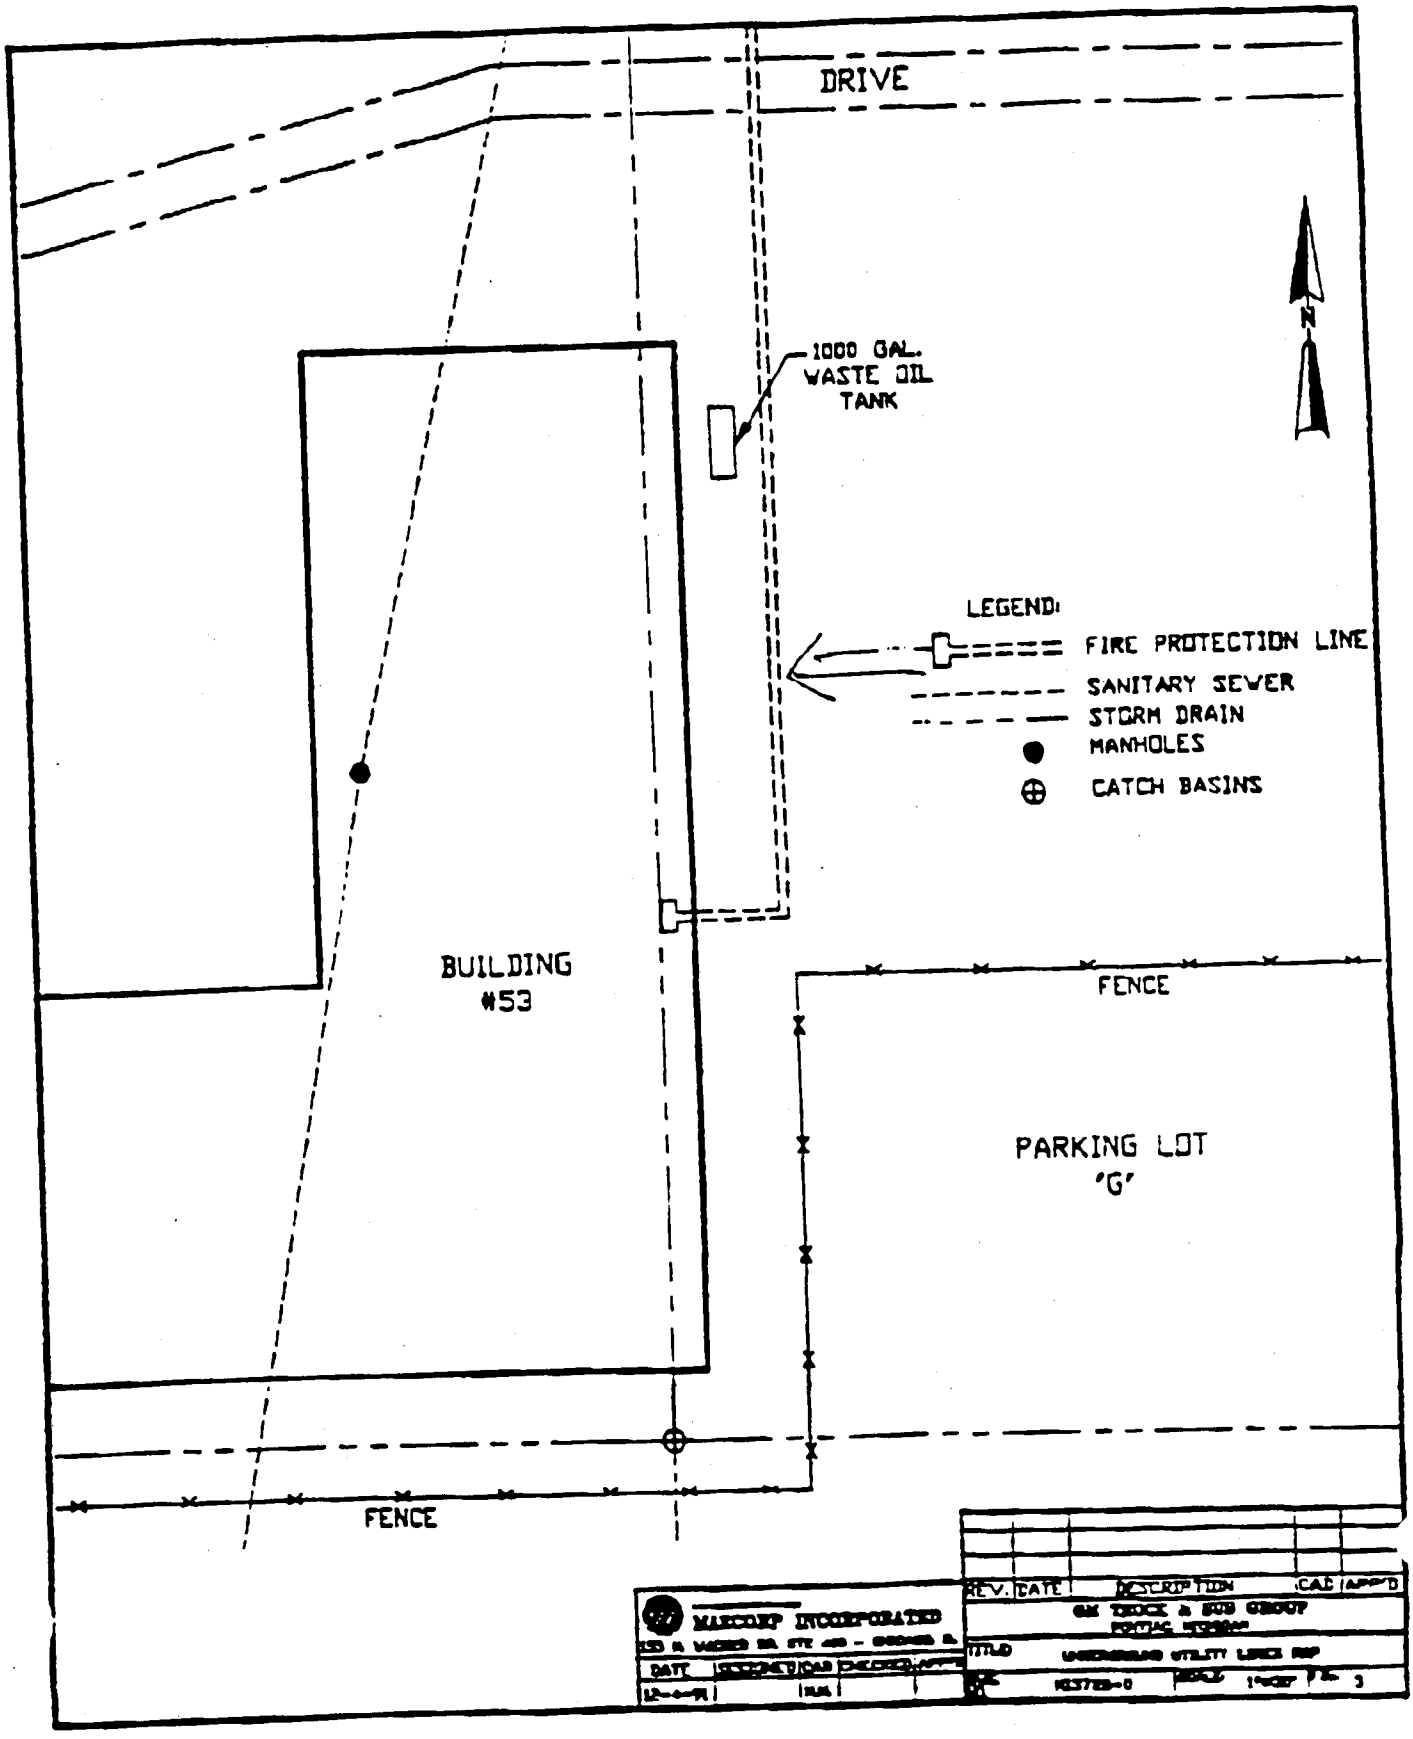
3. It should be determined whether or not groundwater is an issue with regards to this release. If groundwater is present, then further hydrogeologic investigations are necessary in order to determine if groundwater has been impacted and the extent of impact.

A complete report, that addresses all of the above items, should be submitted to this office by February 28, 1994

Please notify this office, in writing, seven days prior to initiating any work, to provide staff with the opportunity to monitor all site activities.



This should not be construed as a sign-off on all investigations or corrective actions that may be necessary at this site.



If you have any questions regarding this matter, please contact Paul Owens at (313) 953-1534.

Sincerely,

Oladipo Oyinsan
Southeast MI District Supervisor

RE: Data Quality Assessment and Validation for Nine Soil Samples collected from the General Motors Corporation Central Manufacturing Facility Pontiac, Michigan (Report CH940104)

The following details an analytical data quality assessment and validation for data resulting from January 6, 1994 collection of nine soil samples from General Motors Corporation Central Manufacturing Facility in Pontiac, Michigan. The samples were analyzed for the parameters presented in Table 1. The methods of analysis used by IEA, Schaumburg, Illinois, are presented in Table 1. The quality control criteria were established by these methods of analysis[1].

Holding Time Periods

The holding time periods for the analyses are listed in Table 2. On the basis of the sample collection dates on the chain-of-custody documents and on the analytical reports provided by IEA, the analyses were completed within the specified holding time periods, indicating that the data were acceptable based on this criteria.

Method Blank Samples

Contamination of the samples contributed by laboratory conditions or procedures were monitored by the concurrent preparation and analysis of method blank samples. The method blank samples were reported to be free from detectable concentrations of target analytes, indicating that no significant laboratory contamination had occurred.

Matrix Spike (MS) Sample Analysis

The MS sample analysis provides information about the effect of sample matrix on the preparation and inorganic methods. The data were found to be within the acceptance criteria indicating that an acceptable level of accuracy had been achieved.

---

[1] Application of quality control criteria was consistent with "Laboratory Data Validation Functional Guidelines for Evaluating Organic Analyses", February 1, 1988.

Laboratory Duplicate Analysis

To evaluate the precision of inorganic analytical methods, laboratory duplicate samples were analyzed. The relative percent difference (RPD) criteria for laboratory duplicate analyses was required to be less than or equal to 20 percent. The laboratory duplicate RPDs were found to be within the acceptance criteria.

Laboratory Control Sample (LCS)

The LCS serves as a monitor of all overall accuracy of all steps in the analysis, including sample preparation. All LCS data were found to be within control limits indicating that an acceptable level of accuracy was achieved.

Overall Assessment

The data were found to exhibit acceptable levels of accuracy and precision bases on the provided information, and may be used with qualifications noted.

1.0 EXECUTIVE SUMMARY

Northeast Research Institute, Inc. (NERI) was retained by General Motors Truck and Bus Group to conduct a PETREX soil gas study at the Duco Stores Tank Farm in Pontiac, Michigan. In December of 1989 approximately 500 gallons of gasoline was released into the environment when a gasoline storage tank was overfilled. Since that time the gasoline has migrated and fumes from the gasoline have been detected by personnel in the plant.

The main objective of the soil gas study was to characterize the emanating gases and vapors from subsurface contamination and map the areal distribution of the anomalous soil gas character. Several prominent soil gas features were identified across the site. The different compositions indicate multiple sources are present. The following compilation identifies the relationships between the soil gas features, types of compounds detected and their location in the survey area:

SOIL GAS FEATURE NUMBER	COMPOUNDS DETECTED	LOCATION IN SURVEY AREA
1	Aromatic Hydrocarbons	Storage Tank Area and Hazardous Material Storage Area
2	Cycloalkanes/Alkenes	Storage Tank Area and Hazardous Material Storage Area
3	Oil Character Hydrocarbons	Storage Tank Area
4	Toluene	Most of Survey Area
5	Tetrachloreothylene	Hazardous Material Storage Area
6	Trichloroethylene	Hazardous Material Storage Area

2.0 INTRODUCTION

General Motors Truck and Bus Group of Pontiac, Michigan requested that Northeast Research Institute, Inc. (NERI) perform a petroleum hydrocarbon contamination evaluation using the PETREX Soil Gas Method across the Duco Stores Tank Farm. One of the tanks is known to have leaked gasoline with the potential plume migrating to the west-northwest.

The objectives of this evaluation were to use the PETREX Soil Gas Method to map the distribution of the hydrocarbons associated with gasoline along with any other volatile or semi-volatile organic compounds (VOC and SVOC) detected by the PETREX Soil Gas System in the study area. The mapped results were then used to identify potential source areas and migration pathways.

Site Description

The Duco Stores Tank Farm is located north of building 21 at the General Motors Truck and Bus Group Plant in Pontiac, Michigan. There are eight underground storage tanks, which contain either gasoline or motor oil and two above ground tanks which contain hydraulic fluid. The tanks are located approximately 30 feet east of the Hazardous Material Storage area.

3.0 SURVEY DESIGN AND FIELD METHODS

The survey consisted of fifty-three double collector PETREX soil gas samplers deployed in an offset grid pattern of 15 to 30 foot centers (Plate 6).

The samplers were installed on June 5-6, 1990. At each sample location a hole was drilled to a depth of approximately 18 inches using a hammer drill. The samplers were then lowered into the hole using a wire and the surface was sealed with a cement patch. The samplers were retrieved on June 20, 1990 and returned to NERI's Colorado laboratory for analysis.

One wire from each sampler was used for analysis by Curie-point Desorption Mass Spectrometry (CpD/MS). The second collector was reserved for analysis by Desorption Gas Chromatography/Mass Spectrometry (GC/MS) which permits a higher degree of resolution of the compounds and compound classes detected during the CpD-MS analysis.

A detailed description of the preparation, installation, handling, and analysis of the PETREX soil gas samplers is included in this report as Attachment 1.

4.0 TERMINOLOGY

In order to prevent misunderstanding of certain terms used in this report, the following definitions are offered:

The term "feature" is used in reference to discernable patterns in the contoured data. It denotes a contour form and often relates to a definite or separate chemical occurrence.

The term "hydrocarbon component flux" refers to the response of the hydrocarbon classes, in this case the, Light and Heavy Hydrocarbons that were detected in the survey area.

The term "compositional character" refers to the overall assemblage, relative to both the types and ratios, of soil gas borne VOCs and SVOCs collected at each sampling location. The term is interchangably used with soil gas fingerprint or chemical signature.

The terms "occurrence" and "occurs" is used to indicate an area or areas where chemical compounds are present at sufficient levels to be detected by the analysis of soil vapors. The term is not indicative of any specific mode of source material (vapor, dissolved, etc.), and does not necessarily indicate or suggest the presence of "free product" or "phase-separated hydrocarbons".

The term "plume" refers to an area of anomalous soil gas response for a particular compound which is measured in excess of what would normally be considered "natural" or "background" levels.

The term "threshold background value" is used in discussion of the soil gas value for a specific chemical constituent that is a boundary between background and anomalous values.

The term "indicates" is used when evidence dictates a unique conclusion. The term "suggests" is used when several explanations of certain evidence are possible, but one in particular seems more likely. As a result, "indicates" carries a higher degree of confidence in a conclusion that does "suggests".

The term "collector" refers to a Ferromagnetic adsorption wire which will be used to collect soil gas during a PETREX survey.

The term "sampler" refers to any device which contains at least one collector and is used during a PETREX survey.

5.0 DISCUSSION

5.1 Compound Identification

Compound identification is based on molecular weight, compound fragmentation, and isotopic distribution, as applicable. Each VOC or SVOC exhibits a unique mass spectral signature. NERI maintains a large library of spectra to identify individual compounds, which is accessible by computer. In addition, the company maintains a large library of commonly used chemical mixtures; e.g., gasolines, diesels, industrial oils, solvents, coatings, plastics, etc. These are used to assist in both compound and mixture identifications.

The reported ions or specific peaks utilized to generate each of the gasoline or oil range constituent flux maps are reported in Table 1.

TABLE 1

GASOLINE AND OIL TYPE COMPOUNDS AND ASSOCIATED MASS SPECTRAL PEAKS

Gasoline or Oil Range Constituents	Associated Peaks	Typical Compounds
C_7	92	Toluene
C_9-C_{11} Heavy Aromatic Hydrocarbons	120, 134, 148	Trimethyl Benzenes Tetramethyl Benzenes, etc.
C_{10}-C_{11} Heavy Cycloalkanes/Alkenes	126, 140	Tetramethyl cyclopentane Trimethy cyclohexane, etc.
C_{14} Oil Character	177, 178, 180	PAHs, etc.

These masses were selected as being specifically associated with soil gas fingerprints displaying a gasoline or oil related hydrocarbon profile.

5.2 Physiochemical Interactions

The ability to detect VOCs in soil gas is dependent upon various physiochemical properties of the interacting materials involved. The physical characteristics of a particular compound (i.e., vapor pressure, solubility, etc.) will determine how it partitions into the vapor phase of the vadose zone from groundwater. Additionally, the chemical and physical nature of the local lithologies and soils will influence the behavior and composition of soil gases. Therefore, the detection of different compounds or compound classes cannot be directly compared on a quantitative basis. Values for the same compound can be compared to distinguish potentially higher and lower contaminant emanation levels. This information is useful for identifying source areas, migration pathways, and the areal extent of contamination.

5.3 Contouring Considerations

The subdivision of ion flux values for (threshold background value and contour levels) a compound or compound group is based on population breaks in the data for a particular site. The determination of these breaks are interpreted through visual inspection of the data, summary of univariate statistics, or through the use of histograms. Generally, soil gas data is contoured on an order of magnitude in order to smooth environmental effects.

6.0 GC/MS Data

Table 2 lists the compounds detected for samples analyzed using GC/MS. Samples 3, 13, 16, 22 and 39 were chosen for GC/MS analysis basd on the compositional character associated with their CpD-MS spectra.

Tetrachloroethylene was detected on sample 16. Toluene and Ethylbenzene was detected on sample 13. Samples 3, 22, and 39 were determined to contain various hydrocarbons typical gasoline and oil type compositional fingerprints.

7.0 DATA EVALUATION

The results of the PETREX Soil Gas Survey are displayed on the following plates:

Plate 1: Relative Flux of Heavy Aromatic Hydrocarbons

Plate 2: Relative Flux of Heavy Cycloalkanes/Alkenes

Plate 3: Relative Flux of Oil Character Hydrocarbons

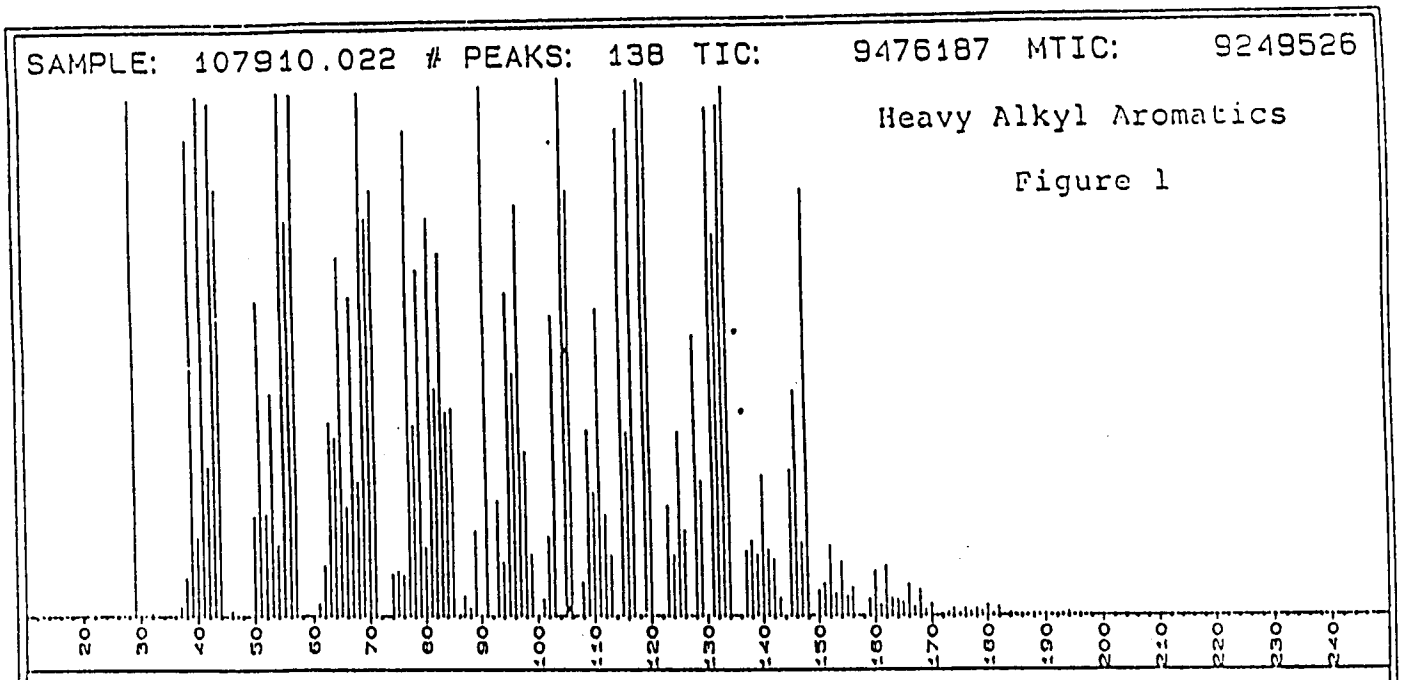

Plate 4: Relative Flux of Toluene

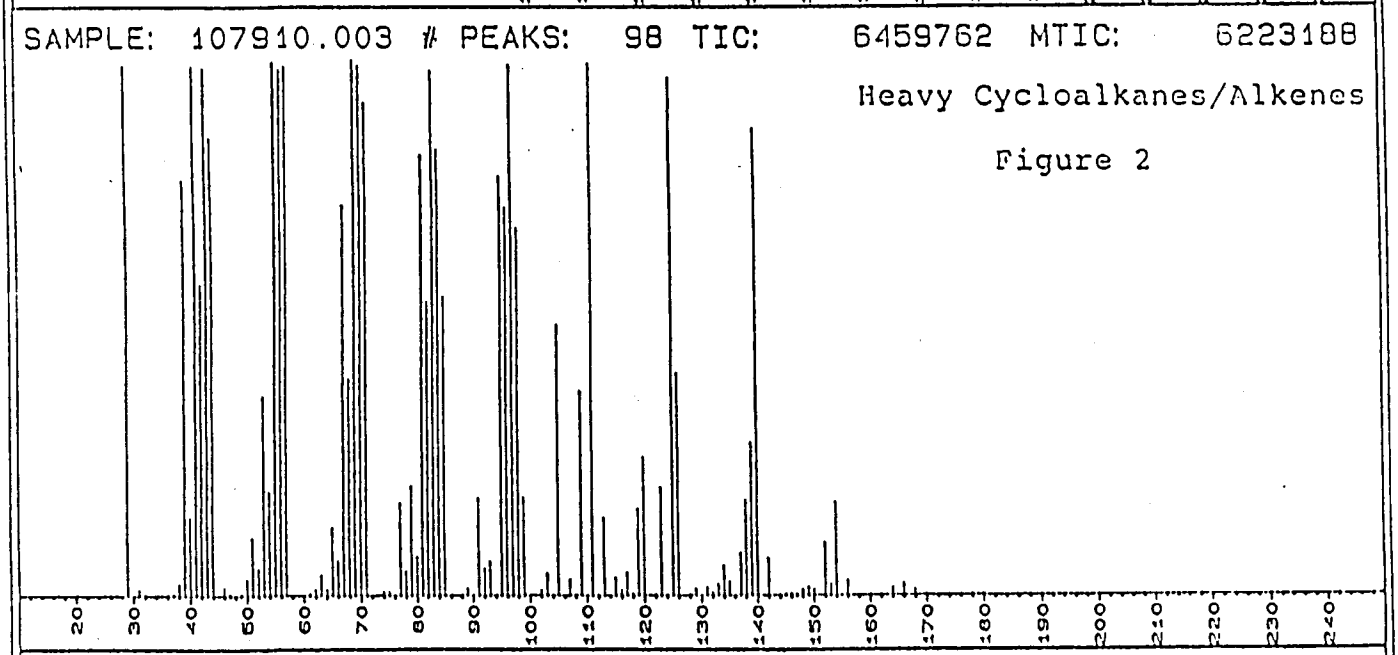
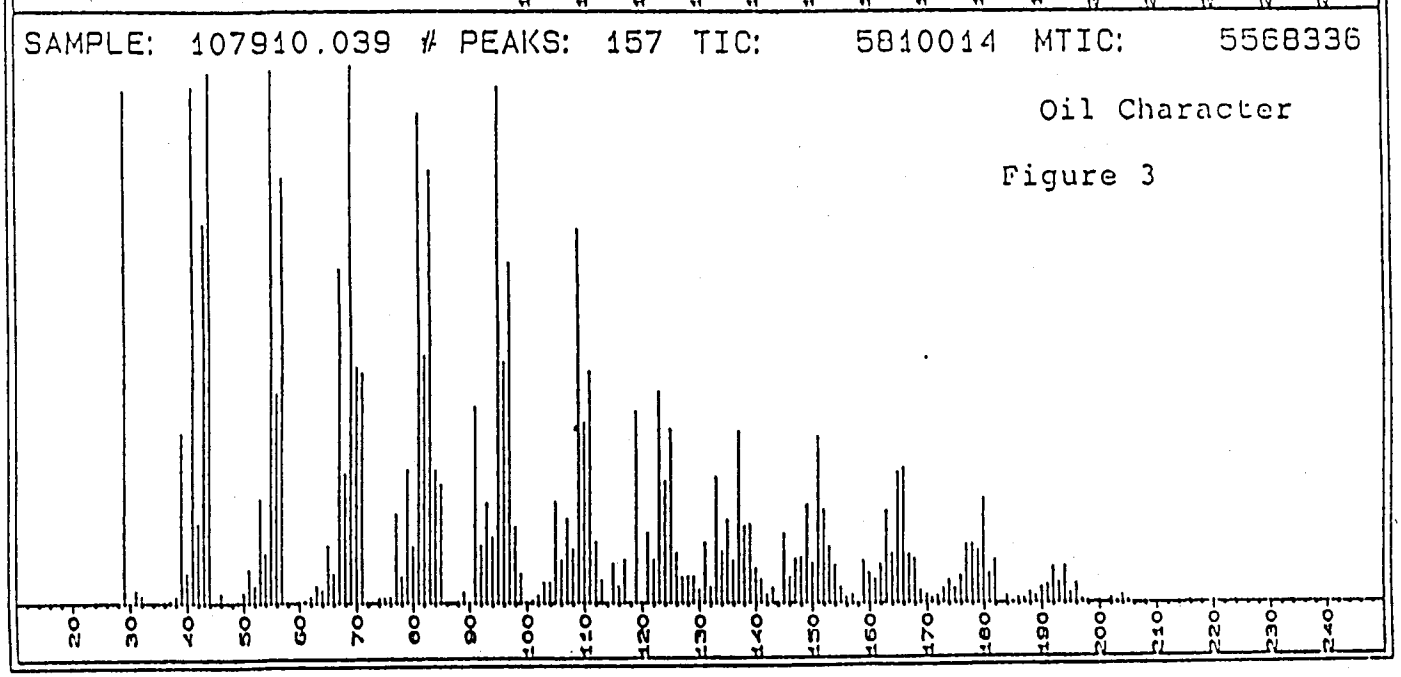
Plate 5: Relative Flux of Tetrachloroethylene (PCE)

Plate 6: Sample Locations



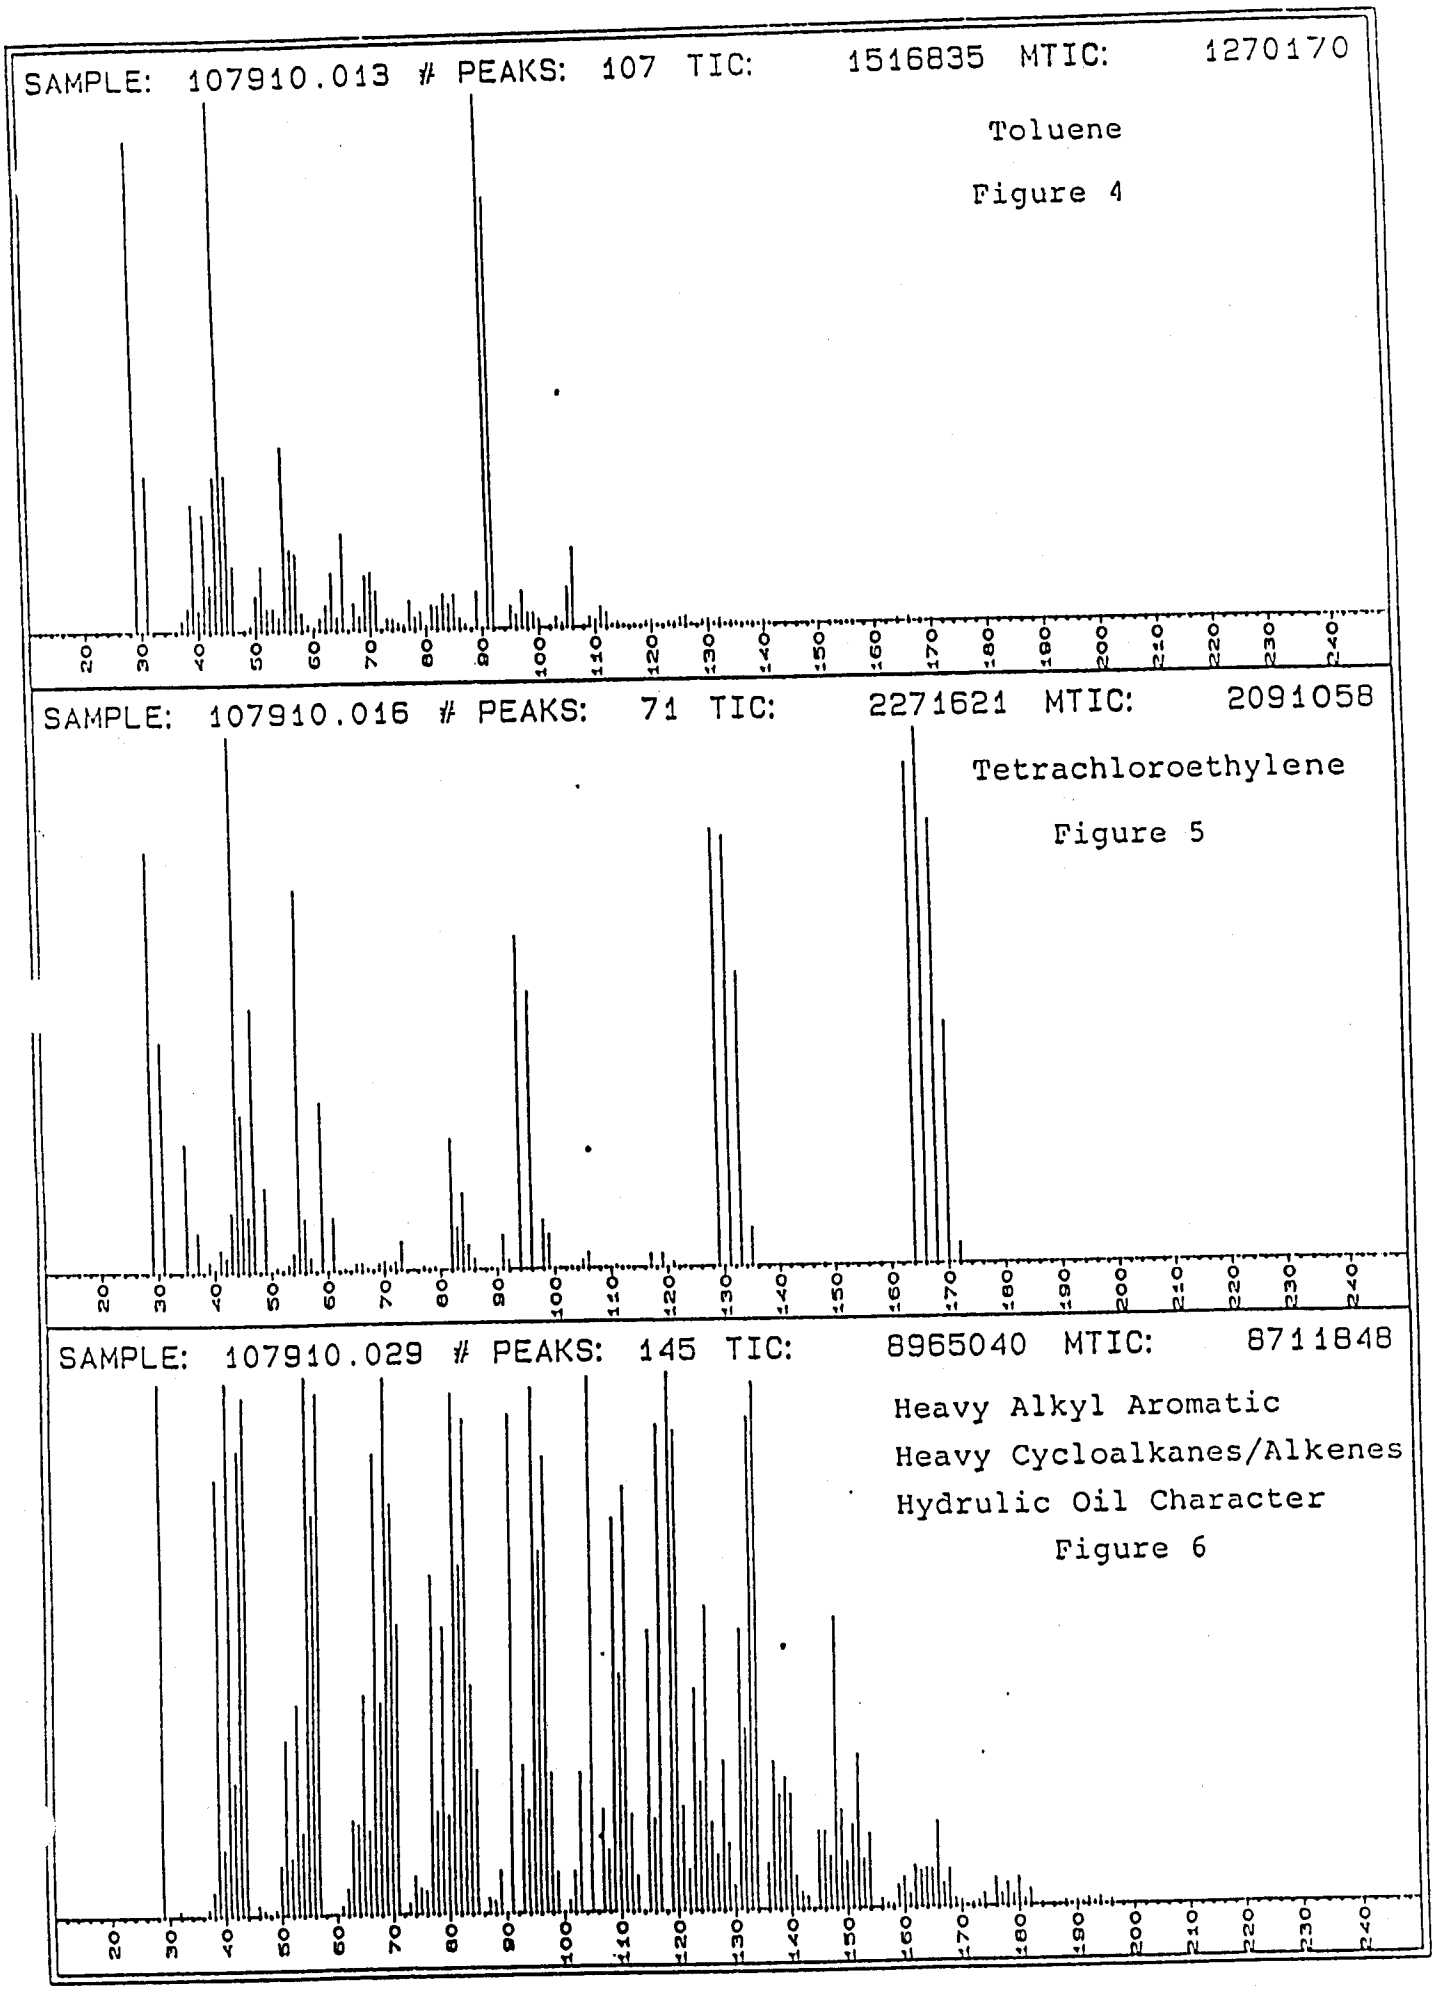
There are four different hydrocarbon characters indicated by the chemical compositions detected in this survey. They are represented as Heavy Aromatic Hydrocarbons, Heavy Cycloalkanes/Alkenes, Oil Character Hydrocarbons, and Toluene. Spectra of these compositional hydrocarbon characters are displayed in Figures 1-4, respectively. Since these hydrocarbon characters are distinctly different, they are likely sourced from different types of hydrocarbon products.

The Heavy Aromatic Hydrocarbons displayed on Plate 1 form a large plume located near the gasoline storage tanks adjacent to building 21. This plume extends to the northwest near the western boundary of the hazardous material storage area. A small plume also appears near samples 11 and 12. Aromatic hydrocarbons are commonly found in gasoline and this suggests that a previous gasoline spill is the source of this character.



Heavy Alkyl Aromatics

Figure 1



Heavy Cycloalkanes/Alkenes

Figure 2

Oil Character

Figure 3

Toluene

Figure 4

Tetrachloroethylene

Figure 5

Heavy Alkyl Aromatic
Heavy Cycloalkanes/Alkenes
Hydrulic Oil Character

Figure 6

Plate 2 is a map of Heavy Cycloalkane/Alkene Hydrocarbons. A plume extends from the gasoline storage tanks near building 21 northwest to the edge of the survey boundary. Samples 11 and 12 also detected a moderate level of these hydrocarbons. These compound classes comprise a significant portion of gasoline. The previous gasoline spill could also be the source of these cycloalkanes/alkenes.

A plume of Oil Character Hydrocarbons is displayed on Plate 3. The highest response levels detected were located near the storage tanks in the northwest corner of the survey area. Figure 3 is a spectrum of this oil character. This type of spectra is similar to a light to medium grade oil, possibly hydraulic fluid oil or motor oil.

A large plume of toluene was detected and is displayed on Plate 4. The highest concentrations detected were in the hazardous material storage area. Since very little toluene was detected near the gasoline storage it is unlikely that the previous gasoline spill is the source. Additionally, the dominance of toluene in the plume samples indicates that the source is a solvent rather than toluene. A second area of high concentration of toluene were detected near a fuel product.

Figure 5 is a spectrum of tetrachloroethylene (PCE). A plume of PCE was detected near the southeast corner of the hazardous material storage area. This plume is displayed on Plate 5. Tetrachloroethylene is a commonly used solvent and degreaser.

Several samples on Plate 5 have an asterisk next to the sample. It was not possible to make a positive identifications of PCE at these locations due to interference from other compounds with the same atomic masses as PCE.

In addition to the compounds displayed on the maps, trichloroethylene (TCE) was detected at sample locations 9, 15, 44, 46 and 48. TCE is also a commonly used solvent and degreaser.

Figure 6 displays a spectrum which is a combination of Heavy Aromatic Hydrocarbons, Heavy Cycloalkanes/Alkenes Hydrocarbons and Oil Character Hydrocarbons. This spectrum is typical of samples where the plumes of these chemical characters overlap.

8.0 CONCLUSIONS

Aromatic Hydrocarbons, Cycloalkanes/Alkene Hydrocarbons, Oil Character Hydrocarbons, toluene, tetrachloroethylene and trichloroethylene were detected at the Duco Stores Tank Farm area of the GM Truck and Bus Group plant. The distribution of the soil gas response values were mapped and several potential contaminant plumes were indicated. High values occurring near the gasoline storage tanks and the hazardous material storage area indicate these areas are potential sources for the various contaminants. The contaminant plumes appear to be migrating in a west-northwest direction. Several contaminant plumes extend beyond the survey boundary.

9.0 RECOMMENDATIONS

Since several of the contaminant plumes extend to the edge of the survey boundary, NERI recommends an expansion of the PETREX Soil Gas Survey to the north and east. This expanded survey would map the contaminant plumes which extend beyond the boundary of the previous PETREX Soil Gas Survey.

NERI also recommends the installation of at least three monitoring wells and the analysis of the water from these wells by EPA Methods. These methods should include VOC's by GC/MS 8240/624 and B/N SVOCs by GC/MS 8270. This would give quantative information about the nature of the source materials responsible for the soil gas plumes as well as allowing monitoring of the changes in concentrations over time. The recommended location for these wells are:

1 well located between samples 28 and 29.

1 well located near sample number 8.

1 well located in background near sample number 49.

R1079PH2/9.18.90

PETREX SOIL GAS PROTOCOL

INTRODUCTION

The Petrex Static Collection Technique provides a means by which trace quantities of subsurface derived organic compounds can be detected and collected at the earth's surface. It is integrative, thereby eliminating the short-term variations associated with other gas/vapor detection methods. The Petrex Technique directly collects and records a broad range of organic compounds emanating from subsurface sources.

SOIL GAS COLLECTOR PREPARATION

Soil gas collectors are prepared as follows:

1. Adsorption wires (after construction) are cleaned by heating to 358°C in a high vacuum system.
2. Wires are packed under an inert atmosphere in airtight tubes.
3. One collector out of every thirty is checked for cleanliness by mass spectrometry. Based on the results, the group of thirty collectors is approved for release into the field.

SAMPLER SHIPMENT AND FIELD HANDLING

Two transportation blanks are included with each shipment. Transportation blank samplers are stored unopened until analysis with the field samplers.

SOIL GAS COLLECTOR INSTALLATION

The collector consists of a ferromagnetic wire coated with an activated adsorbent. Each sample is typically placed in a shallow hole, 20-30 cm deep, within a protective container. The hole is backfilled and the location is marked. The collector is left in the ground for as long as 45 days, then retrieved and sealed in its container for transportation back to the laboratory for analysis.

MASS SPECTROMETER TUNING

An Extranuclear Quadrupole Mass Spectrometer equipped with a Curie-point pyrolysis/thermal desorption inlet is used for collector analysis. Mass assignment and resolution are manually adjusted using a perfluorotributylamine (PFTBA) standard. A linear correction, based on the known spectrum of PFTBA, is calculated. This correction is applied to a second PFTBA spectrum. If correct mass (M/Z) values are obtained, the operator proceeds to the next tuning step. If not, the procedure is repeated until correct masses are obtained.

Peak intensity ratios are set from the major peaks in the PFTBA spectrum using the following values:

Mass (M/Z)		Spectrum Intensities
69	=	100%
131	=	25% ± 5%
219	=	35% ± 5%

During tuning, the ion signal for mass (M/Z) 69 of PFTBA is measured at a preset sample pressure and detector voltage and compared to previous values at the same setting.

Electron energy is set to 70 electron volts and emission is set at 12 milliseconds. All other operating parameters, such as scans, scan range, and mass offset, are established in the computer program. These values may only be changed by the laboratory manager.

Tuning is performed at the beginning of a run so that an individual survey is analyzed at the same set of instrument conditions. The samples are analyzed in random order.

LABORATORY ANALYSIS

Machine background analyses are performed periodically (approximately every 20 samples) to assure that there is no carryover between successive samples. If there are peaks which are not related to atmospheric gases, the supervisor is notified and the mass spectrometer is shut down and cleaned as necessary.

A written sample number record is kept during the analysis to prevent accidental sample number duplication. The mass spectrometer control program contains appropriate "flag statements" that prompt the operator with a warning if an input sample number has already been analyzed. The operator then checks the current number, along with the disk storage location of the previously entered number to identify the true sample number.

COMPOUND IDENTIFICATION

Compound identification is based on molecular weight, compound fragmentation, and isotope distribution, as applicable. Each compound exhibits a unique mass spectral signature. NERI/Petrex maintains a large library of spectra for individual compounds, accessible by computer. In addition, the company maintains a large library of commonly used chemical mixtures, e.g., gasolines, diesels, industrial oils and solvents, coatings, and plastics. These are used to assist in both compound and mixture identifications.

Indicator peaks, indicative of the compound and away from interference by other compounds, are selected for data presentation and mapping.

RELATIVE FLUX DETERMINATION

The process of determining ion counts (fluxes) of indicator peaks for the specified compounds is totally computerized. Sample locations on a base map are digitized as X-Y coordinates and flux data for the given compounds are plotted at respective locations. All flux data are then extracted from the original data file for subsequent processing.

Mapping of the relative flux data occurs after contour intervals for each compound or component class are determined. In order to establish the contour intervals, factors such as flux distribution, physiochemical considerations, and component-source material relationship (if known) are taken into account for each compound or class, in each area, on an individual basis. Each map is then contoured by hand, or in special cases, computer contoured. The resultant contour zones for each compound or component in each area are color-coded on a relative basis.

It should be noted that the reported ion counts are representative of a flux which is proportional to the component's emanation rate at a particular sample location and is not a measure of concentration. Flux values for one compound cannot be quantitatively compared to flux values for different compounds. At this time, there has been no absolute equation established from which subsurface compound concentrations can be calculated from surficial flux levels.

I. INTRODUCTION

On August 20, 1991 through August 28, 1991 a total of eight underground storage tanks (USTs) were removed from the "DUCO Stores" area at General Motors Corporation's Truck and Bus Division in Pontiac, Michigan. The location of the Truck and Bus Division is highlighted on the map on page 2, and the basic layout of the plant is enclosed in the insert on page 3. The USTs were situated north and west of Building 21. Figure 1 on page 4 depicts the location of each UST, and Table 1 below presents the available data on each UST:

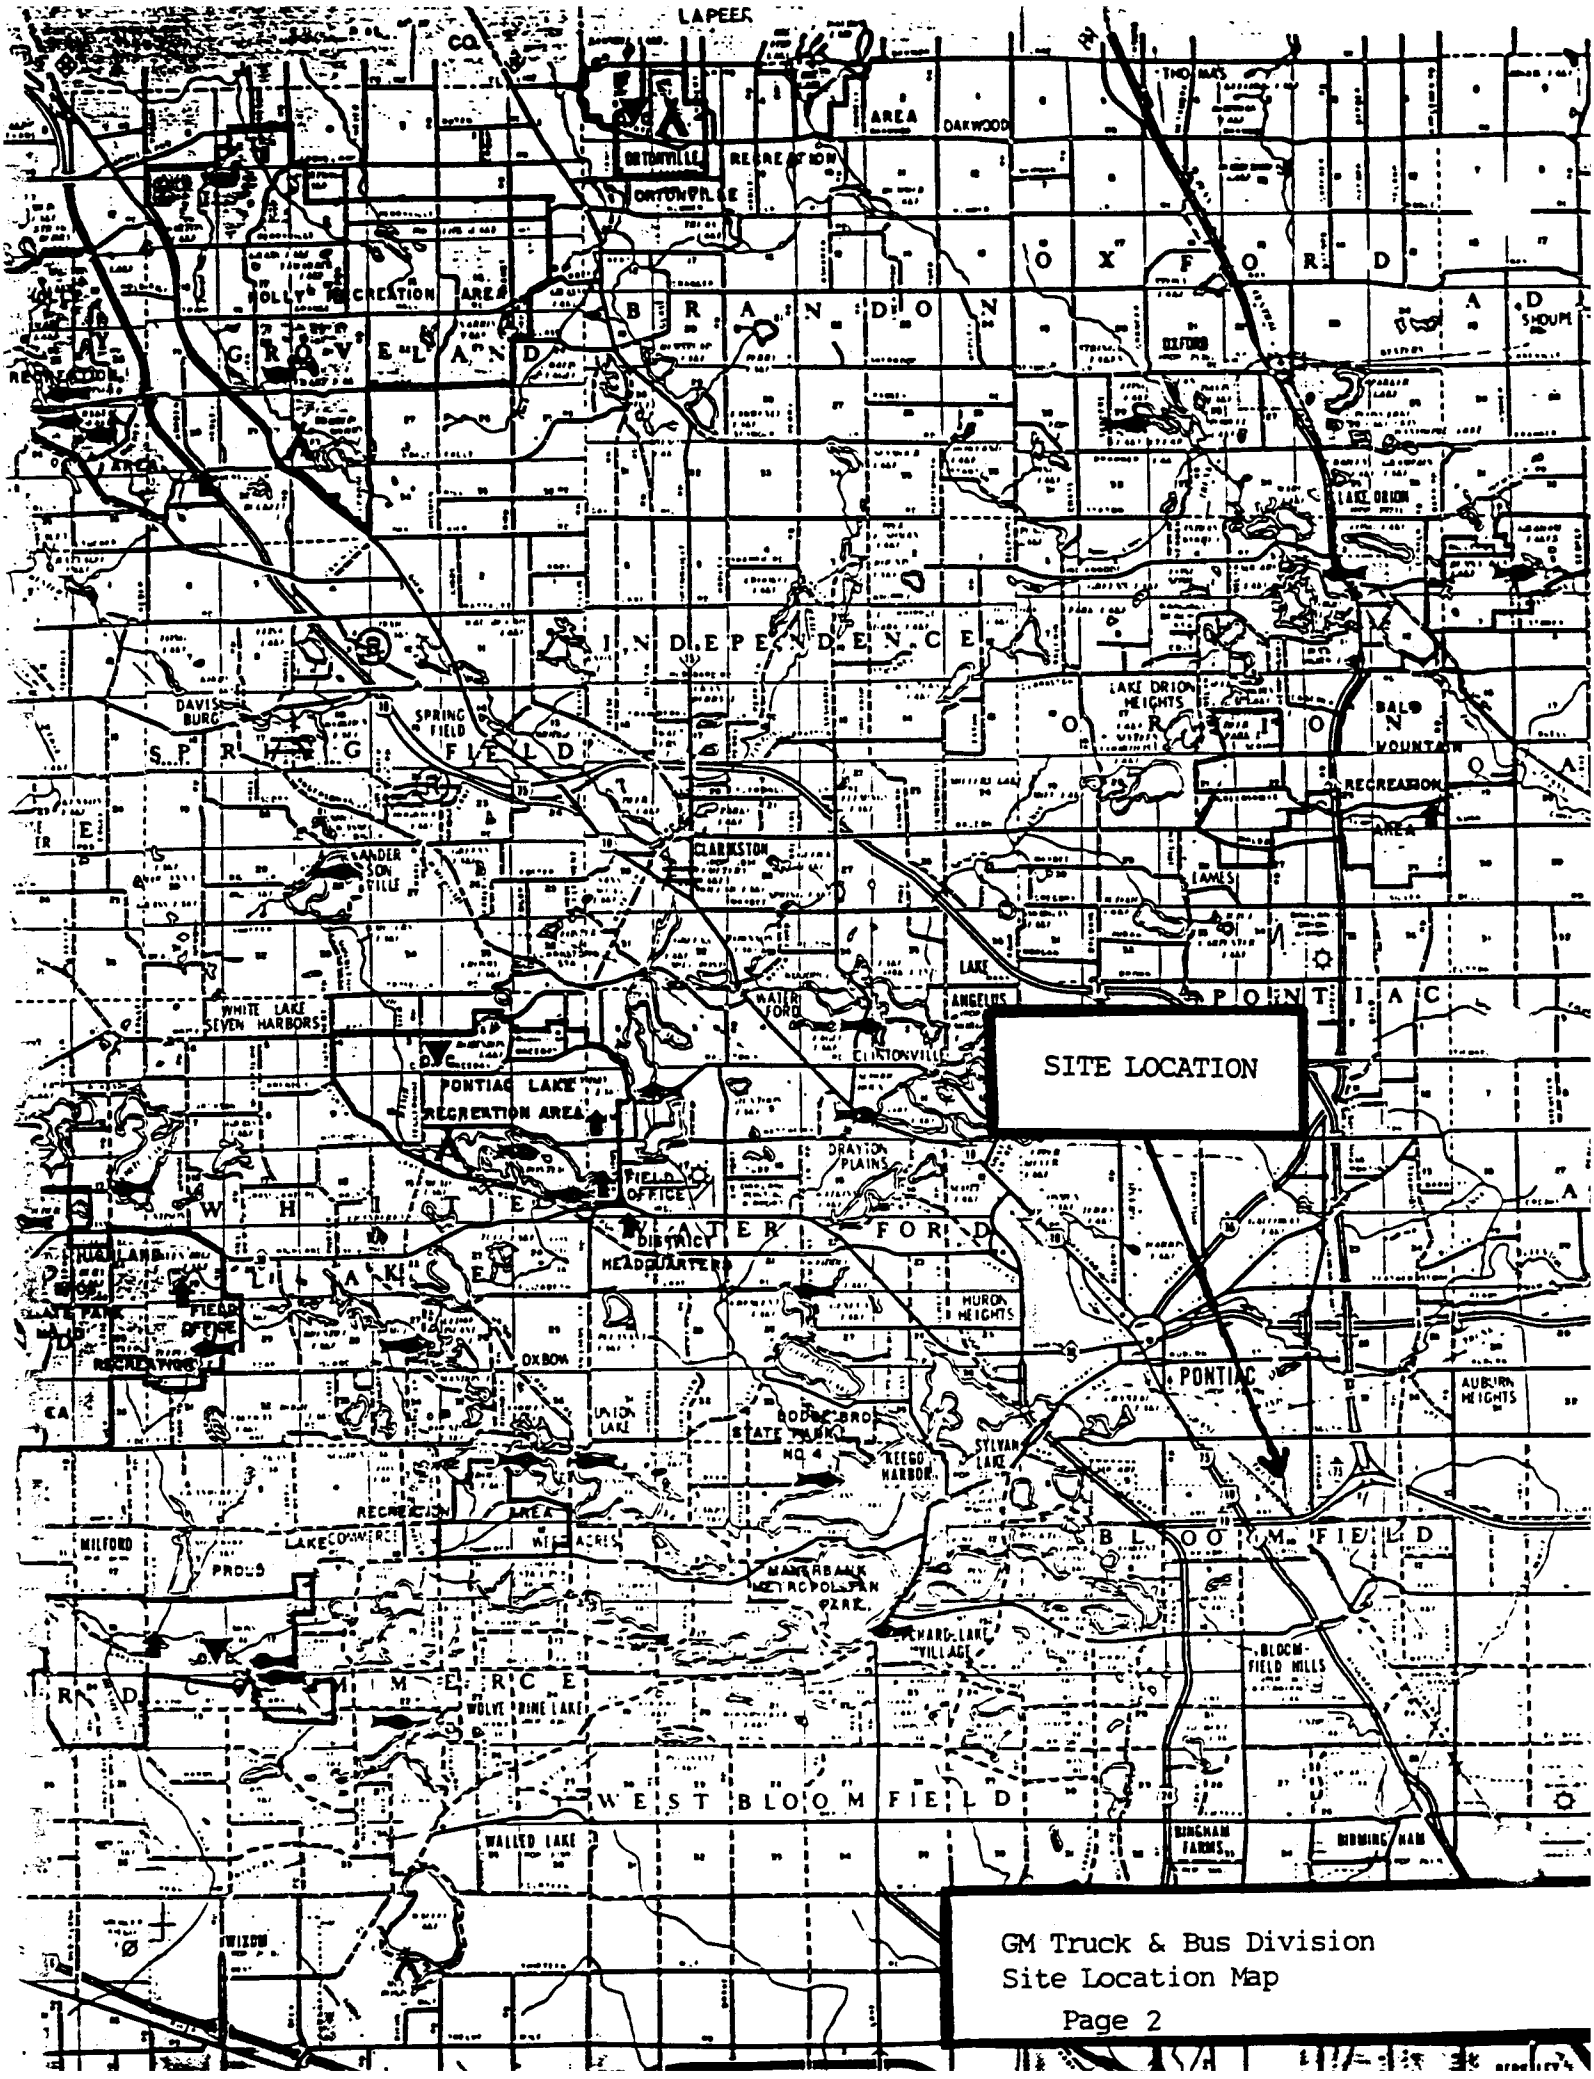

TABLE 1

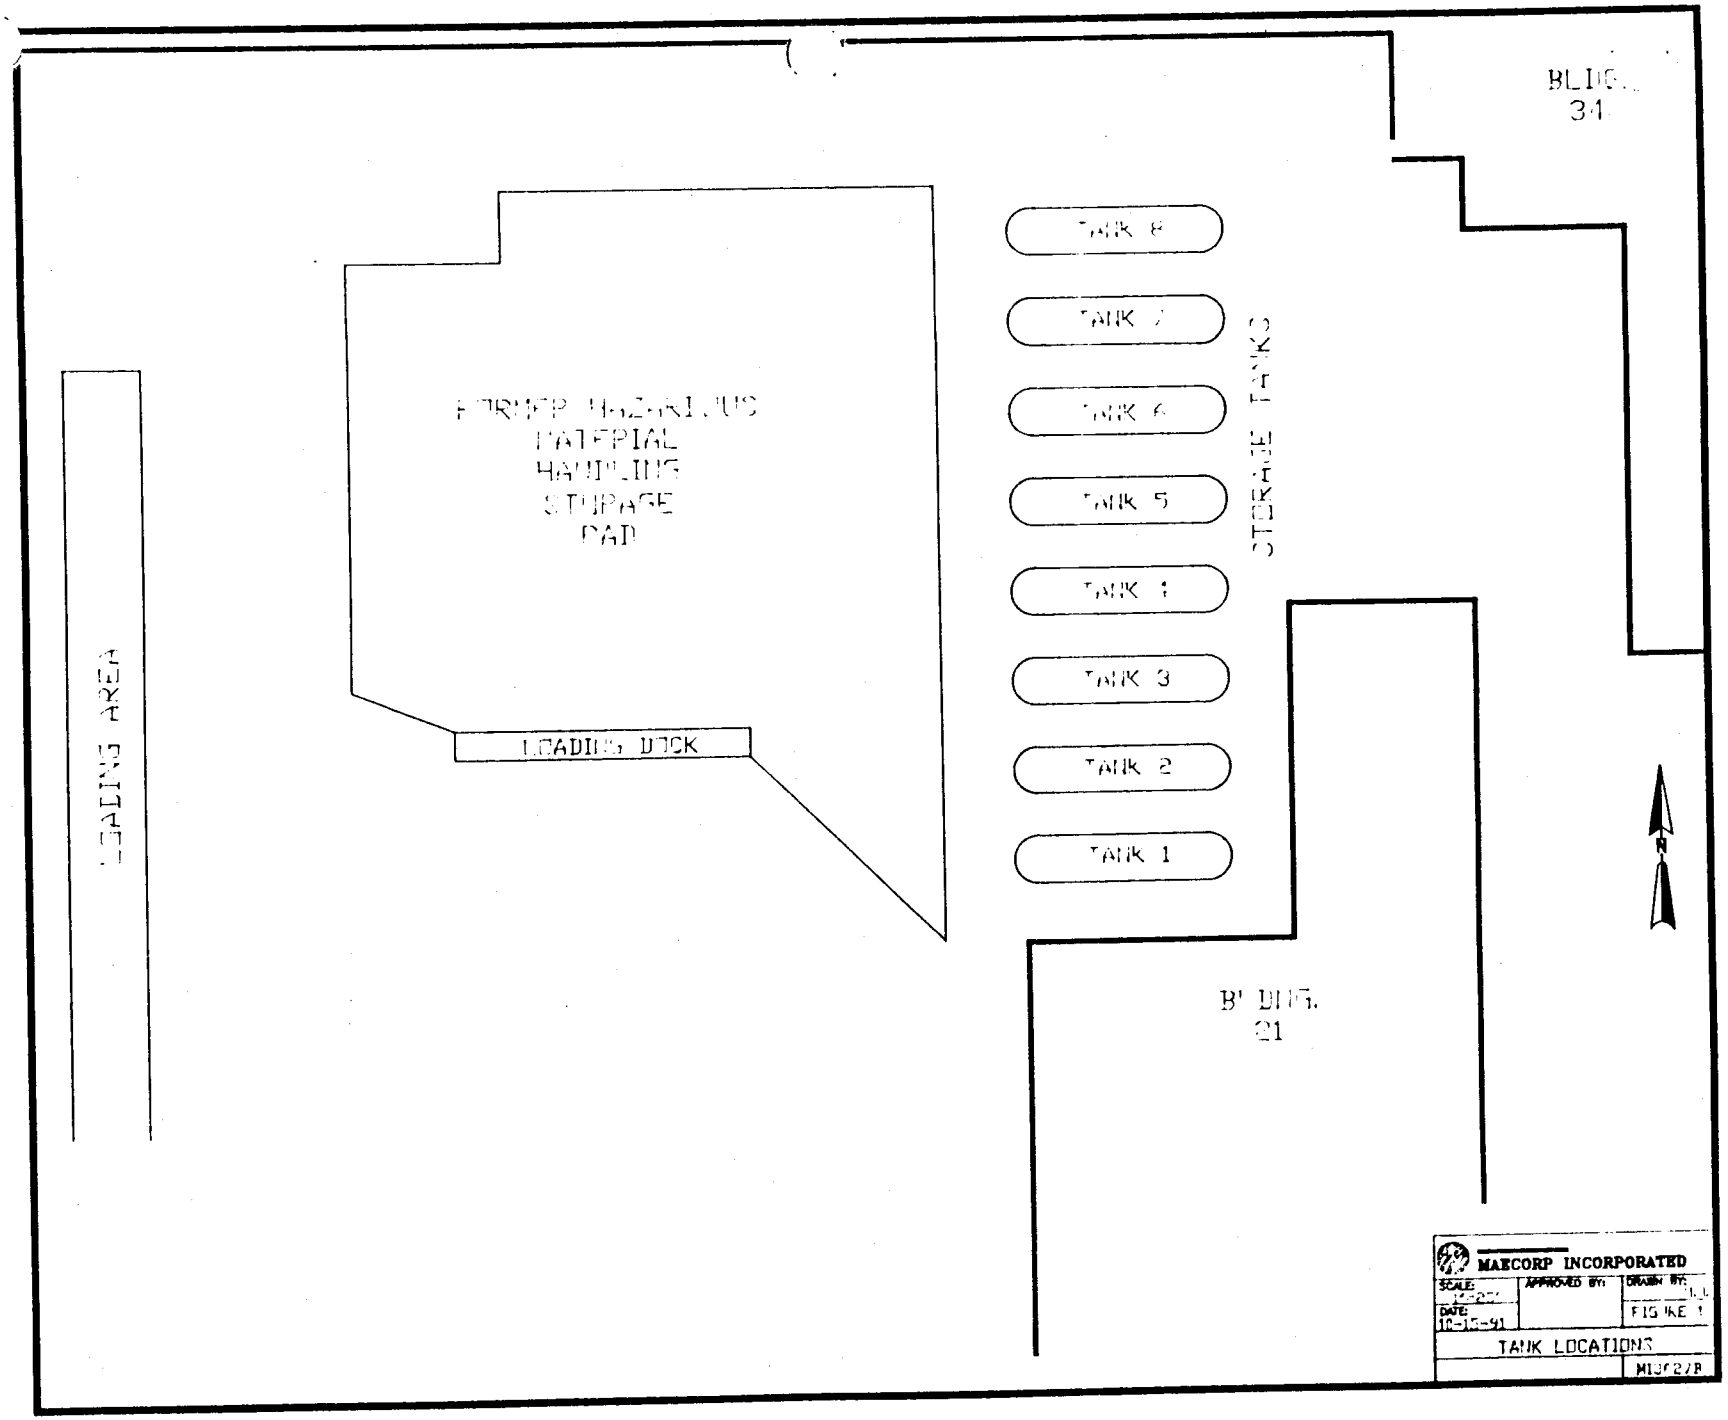
DUCO Stores UST Data



Tank No.	Material	Tank Mat'l	Tank Size	Year Inst	Pipe Mat'l	Pipe Buried
1	Gasoline	Steel	12000	27	Steel	No
2	Gasoline	Steel	12000	27	Steel	No
3	RR End Lube	Steel	12000	27	Steel	No
4	Glycol	Steel	12000	27	Steel	No
5	Axle Oil 80w90	Steel	12000	27	Steel	No
6	#1 Diesel	Steel	12000	27	Steel	No
7	#1 Diesel	Steel	12000	27	Steel	No
8	#1 Diesel	Steel	10500	27	Steel	No

During the UST removals, visible evidence of a release was not observed. Therefore, the excavation was sampled to satisfy the site assessment requirements of the Michigan State Police Fire Marshal Division UST rules on permanent UST closures. The results of the site assessment will be discussed in this report.

On September 5, 1991, prior to receipt of the analytical data from the site assessment, diesel fuel was observed to be seeping into the excavation at the north end. The State Fire

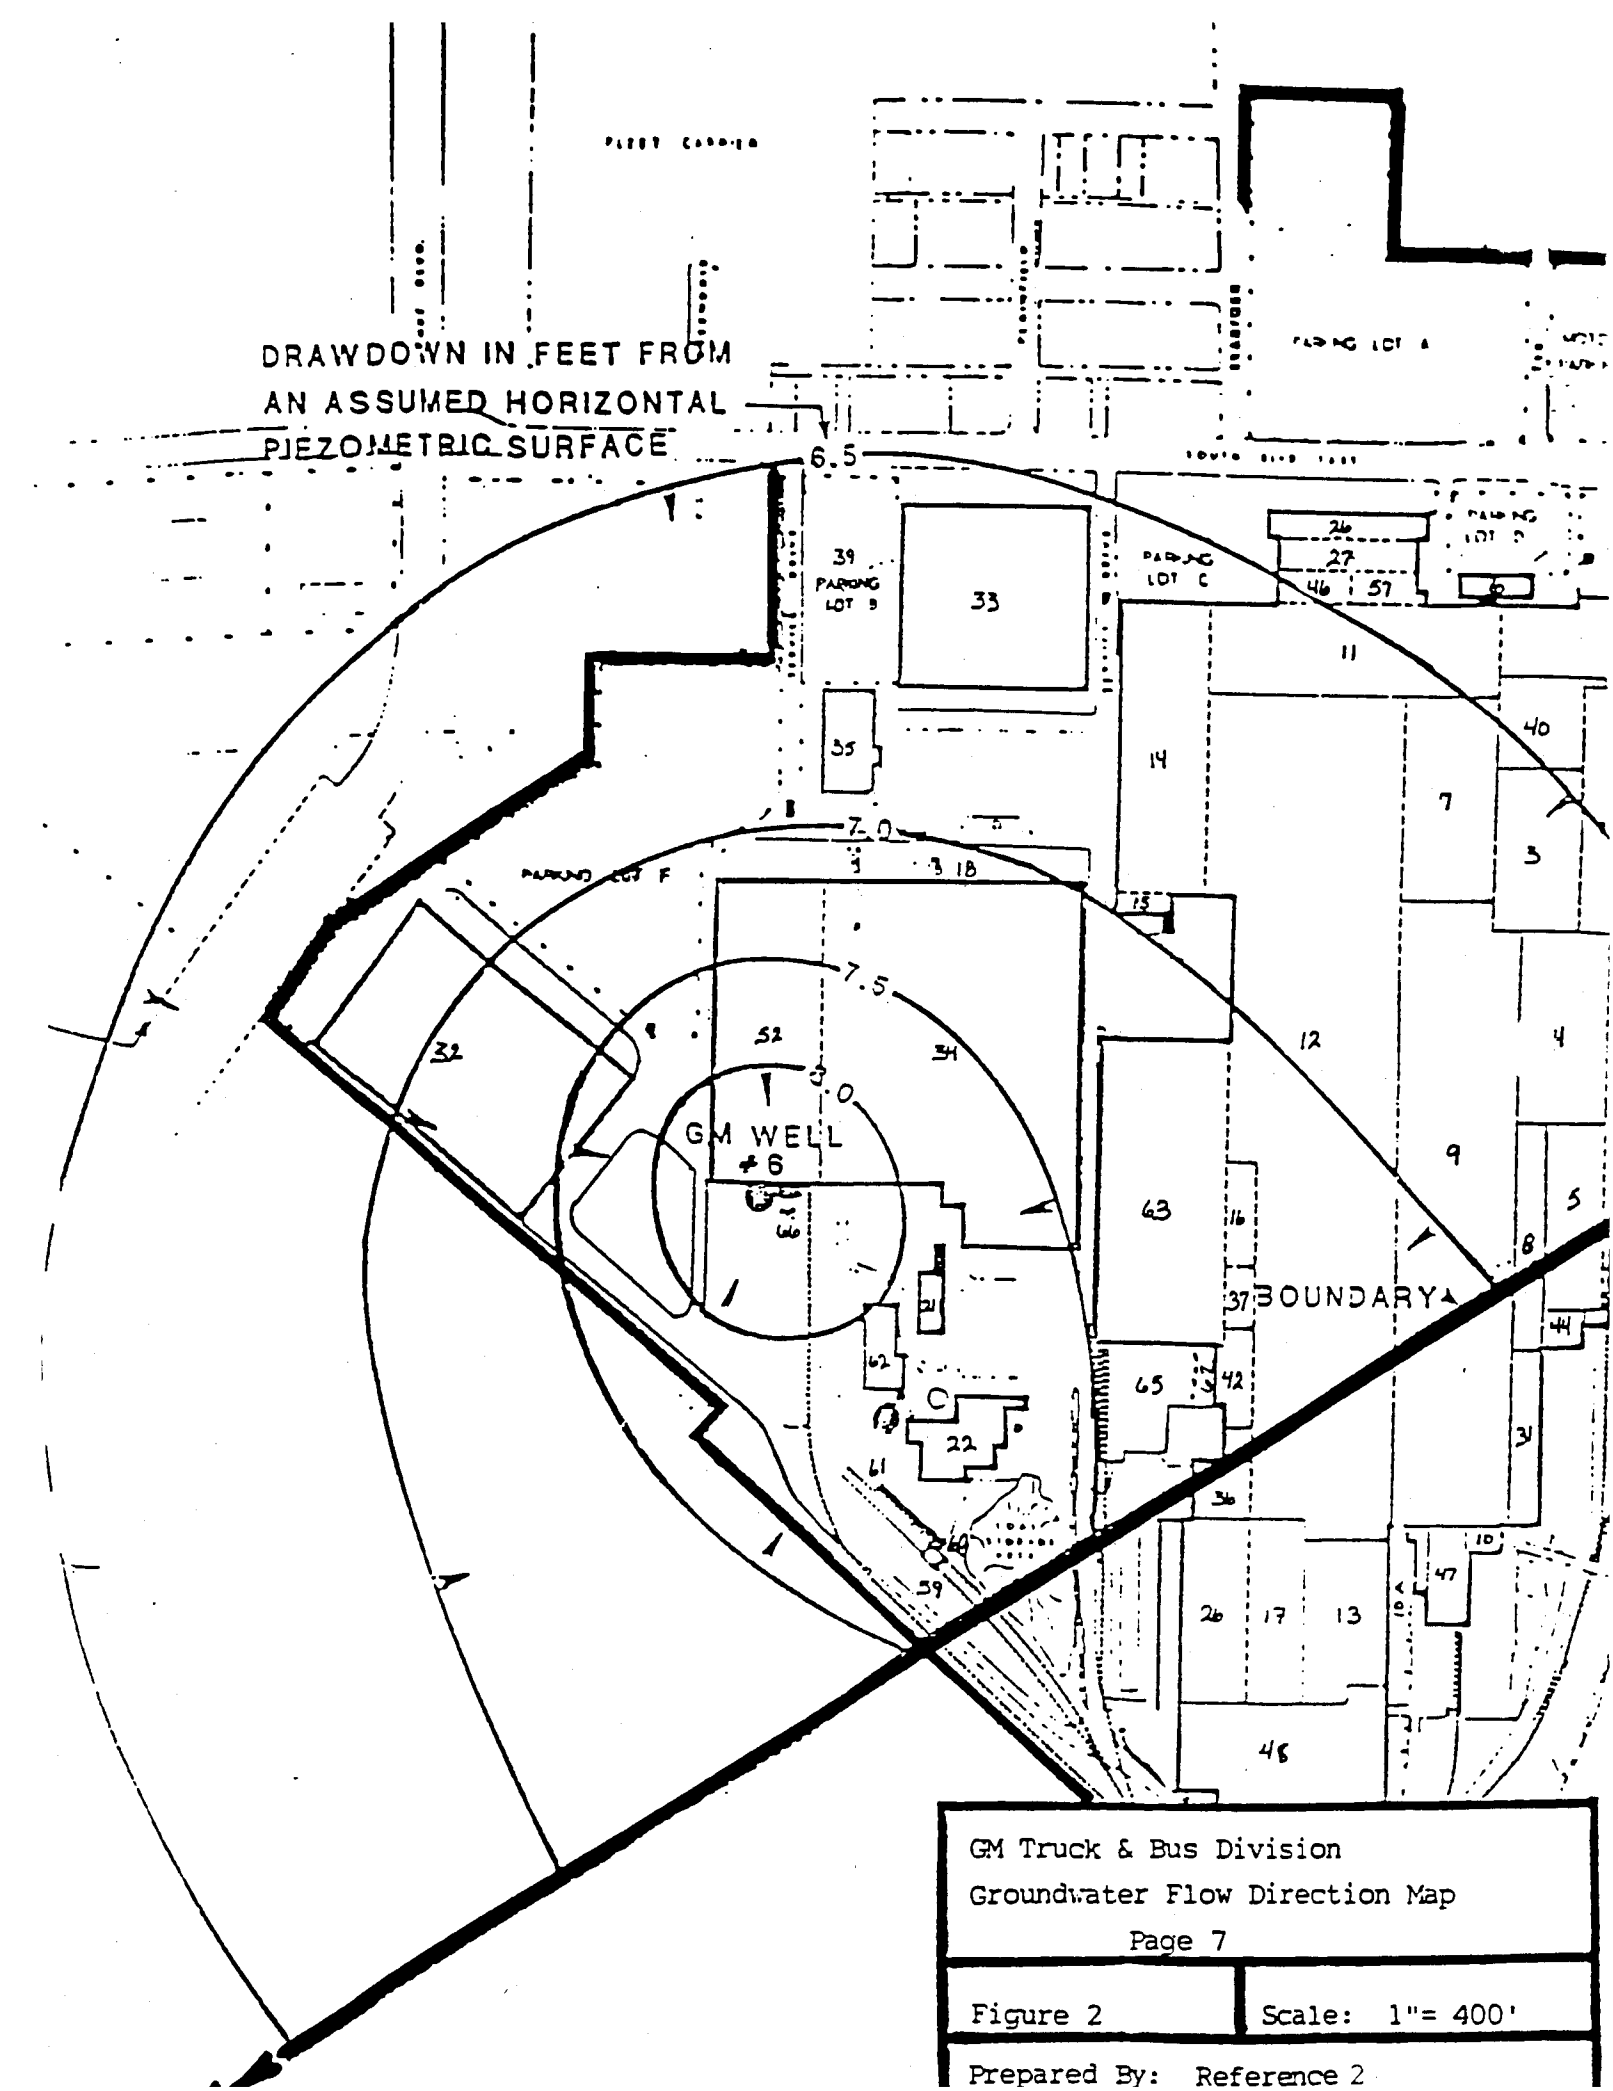
Marshal was notified and corrective actions to recover the diesel fuel were implemented immediately.

On September 20, 1991 an initial abatement report was submitted detailing the abatement measures taken subsequent to the release. These measures included the immediate implementation of a plan to recover the diesel fuel from the excavation floor.

Within 45 days of release notification, the Leaking Underground Storage Tank Act No. 478, P.A. of 1988 requires a report to be submitted which includes a site characterization and work plan to investigate the vertical and horizontal extent of soil and groundwater contamination. The following report is submitted to meet these requirements.

II. SITE CHARACTERIZATION



A. Section 7 (3a): Data on the nature and estimated quantity of the release.[1]

The "DUCO Stores" UST release was reported as being diesel fuel. Tightness testing had been performed on the USTs approximately one year prior to removal. The tanks were found to be tight. Upon removal, inspection of the tanks and piping did not reveal cracks or holes. Also, the free product recovered from the excavation did not amount to more than 100 gallons. Based on these observations, it appears the release was small and the result of overfills.

B. Response to Section 7 (3b): Data from available sources and site investigations concerning the following factors: surrounding populations, water quality, use and approximate locations of wells potentially affected by the release, subsurface soil conditions, locations of subsurface sewers, climatological conditions, and land use.

The General Motors Truck and Bus Division is located in Pontiac, Michigan which has a population of 76,210. The area surrounding the facility is zoned approximately 60-70% R1 through R3 residential, 20% M1 and M2 industrial and 10-20% C1 through C3 commercial.

Groundwater was observed in the excavation at a depth of 20 feet. The soil above and below the groundwater is clay and confines the aquifer. The groundwater flow is northwest toward General Motors' process well #6, which supplies water to the toilet facilities throughout the plant. Figure 2 on page 7 demonstrates the effect of the process well on the groundwater in the area[2]. Water samples are periodically collected from the well and tested for priority pollutants. This analytical data

GM Truck & Bus Division
Groundwater Flow Direction Map

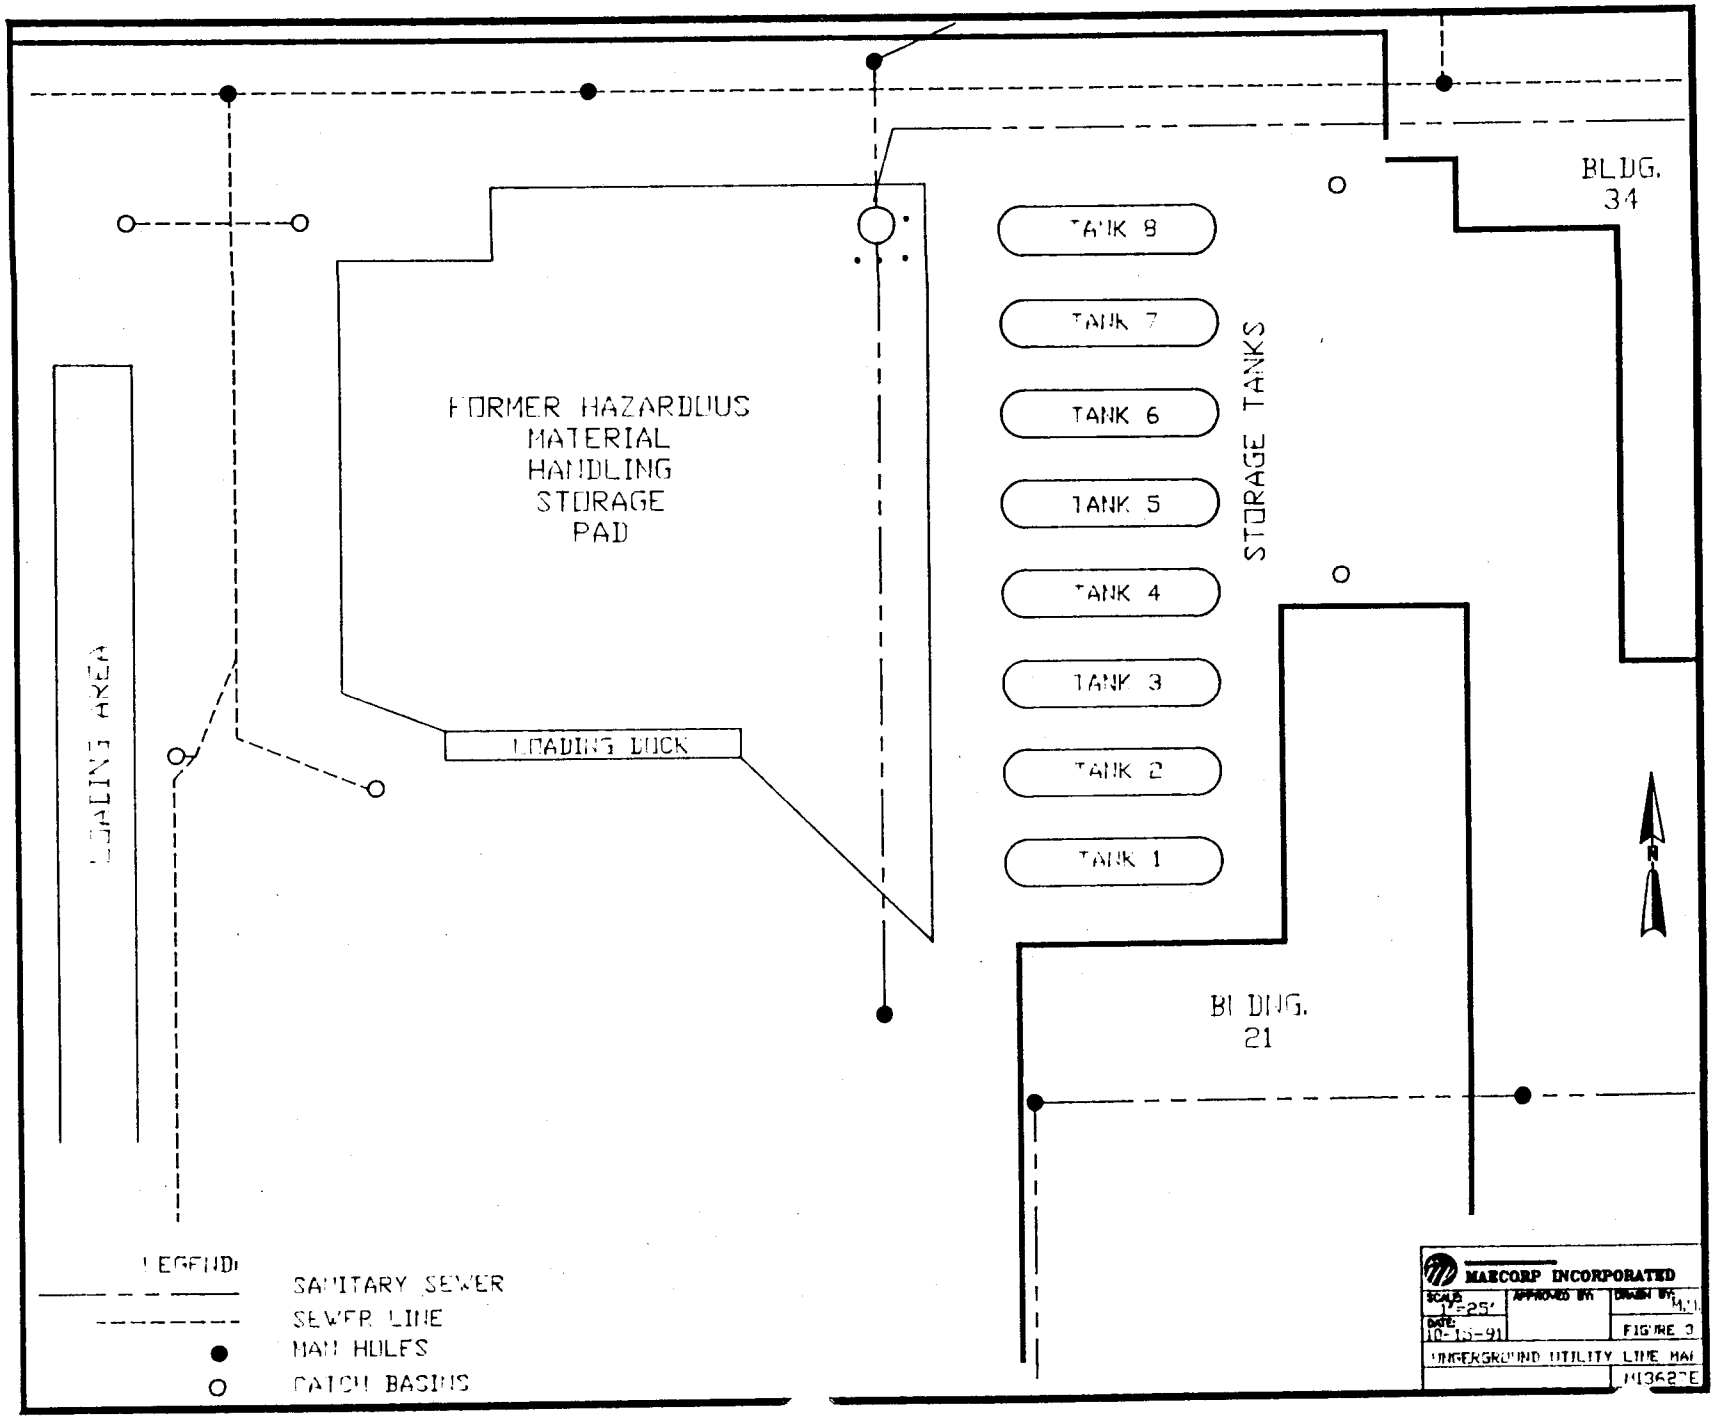
Figure 2	Scale: 1"= 400'
Prepared By: Reference 2	

can be made available if deemed necessary. A request was made with the Michigan Department of Natural Resources Geological Survey Division for the well records of the area immediately surrounding the facility. They will be submitted as an addendum to this report once received by MAECORP.



Based on available information, the GM Truck and Bus plant was built in an area where the underlying soils were predominantly clay tills comprised of a mixture of clay, silt, sand and gravel. The clay tills proceed from the surface down to an approximate depth of 150 feet. Visual inspection of the walls and floor of the excavation yielded soil types to be exclusively clay. In the areas where diesel fuel seeped back into the excavation noticeable stains could be seen in the clay walls.

The locations of the underground utilities are shown in Figure 3 on page 9.

The climatological conditions for the area are temperate with an average yearly rainfall of 30.91".

C. Section 7 (3c): Results of the site characterization required by subsection (1).

During the UST removals, visible evidence of a release was not observed. Therefore, the excavation was sampled according to the Michigan State Police Fire Marshal Division UST rules, which require the collection of one grab sample from the excavation floor underneath the fill pipe area for each tank and one grab sample from the excavation floor underneath the opposite end of the tank[3]. In addition, east and west wall samples were collected relative to each tank end position along with samples

of the north and south wall of the excavation. The wall samples were collected approximately 6 inches into the walls at a depth relative to the centers of the former UST locations. Figure 4 on page 11 illustrates the sample locations.

The samples were submitted to Canton Analytical Laboratories for total lead, total petroleum hydrocarbons (TPH), polynuclear aromatics (PNAs) and benzene, toluene, ethylbenzene, and xylene (BTEX) analysis. The analytical results for samples 2C and 4C revealed nondetectable levels for all of the test parameters. Sample 1A, 1B, 1D, 2B, 3C, 3D, 4D, 5C, 5D, 6C, 6D, 7B, 7C, S1, S2, S3, and S4 registered PNAs and BTEX levels below the current Type B Clean-up Criteria. The remaining samples, 2A, 2D, 3A, 3B, 4A, 4B, 5A, 5B, 6A, 6B, 7A, 7D, 8A, and 8B, had some constiuent levels above the Type B Clean-up Criteria. An overall look at the analytical results indicate the north wall, the south wall and the bottom (except for sample locations 2D and 7D) of the excavation have met the Type B Clean-up Criteria. The analytical results also indicate the east and west walls will require further excavation to satisfy the Type B Clean-up Criteria. Tables 2 - 10 below summarize the analytical results, and the raw analytical results are included in Appendix A.

All of the soil removed during excavation of the USTs was stockpiled directly east of the excavation on a concrete storage pad. Approximately 3000 cubic yards of soil were stockpiled on the pad. The soil was sampled according to Figure 5 on page 22 and Figure 6 on page 23. From these soil samples the following composite samples were prepared:

SW & NW
NE,NE MID, & N Center
Top Center & SE
#1, #9 & #10
#2, & #8
#3 & #4
#5, #6 & #7
All 10 Locations of Layer 1 & Layer 2

The eight composite samples were submitted to Canton Analytical Laboratories for ignitability, corrosivity, reactivity, EP Toxicity and TCLP analysis. The purpose of the analysis was to determine if the soil contained contaminant levels exceeding those established by RCRA for the classification of characteristic hazardous waste. None of the RCRA levels were exceeded by any of the samples. Consequently, the soil pile is considered to be nonhazardous. Although the soil pile is nonhazardous, a faintly noticeable petroleum odor was present. Discussion is still in progress as to whether the soil will be disposed of at a Type 2 landfill, or an alternative treatment technology will be employed to treat the soil on site. The raw soil pile analytical results are included in Appendix B.

III FREE PRODUCT REPORT

A. Section 7 (3d): Results of the free product investigation required by subsection (1).

The free product investigation included a visual inspection of the excavation area and the ground water within it. On September 5, 1991 free product was observed seeping into the north west area of the excavation. The flow of product discontinued on October 4, 1991. On October 8, 1991 a slight sheen was observed on the groundwater at a few isolated spots toward the north end of the excavation, however, no free product was observed. The water in the storm sewer directly to the north and west of the excavation was also inspected for free product. There was no free product or noticeable odor present.

B. Section 7 (5d): Unless directed to do otherwise by the director, prepare and submit to the director, within 45 days after confirming a release, a free product removal report.

On September 5, 1991 diesel fuel was observed to be seeping into the excavation from the northwest wall area. Steve Thurman, an Environmental engineer with the GM Truck and Bus Group, implemented a free product recovery plan.

Since groundwater had also been seeping into the excavation, the plan began with the construction of a bermed area at the north end to confine the diesel fuel to a small area on the excavation floor. Inland Waters was then contracted to inspect the groundwater in the bermed area daily and pump off any observed free product. No more than a quarter of an inch of diesel fuel accumulated in the bermed area at any one time. On October 4, 1991 the diesel fuel discontinued entering the

excavation. Therefore, recovery operations were halted, but daily monitoring of the bermed area has continued.

A total of less than 100 gallons of diesel fuel was recovered and transported by vacuum tanker to the GM Truck and Bus Group - Pontiac East waste water treatment plant for treatment.

IV WORK PLAN

A. Section 7 (6): Within 45 days after confirmation of a release, a work plan must be submitted to determine the full extent of soil and groundwater contamination.

Contaminated soil still exists within the excavation area. The free product removal operation produced less than 100 gallons of diesel fuel indicating the amount of material was relatively small. The soil type surrounding the UST excavation is clay, which is very impermeable and would act to keep any released material confined to a limited area. Based on these observations and the analytical data, further excavation will be performed in an attempt to remove the visibly contaminated soil. The results of the additional soil excavation will be necessary to develop a work plan to investigate the extent of soil and groundwater contamination. Therefore, the work plan along with the excavation results, will be submitted as an addendum to this report.
