1 Introduction

On behalf of the Revitalizing Auto Communities Environmental Response (RACER) Trust, Arcadis of Michigan, LLC (Arcadis) prepared this 2024 Annual Groundwater Monitoring Report (Annual Report) to support the Resource Conservation and Recovery Act (RCRA) Corrective Action process for RACER Trust Lansing Industrial Land, located in Lansing, Michigan (Site). The Site consists of former Plants 2, 3, and 6. This Annual Report summarizes groundwater monitoring completed between January and December 2024, consistent with the updated requirements of the *Revised – 2023 Interim Groundwater Monitoring Work Plan* (IGMP; Arcadis 2023a), which was approved by the Michigan Department of Environment, Great Lakes, and Energy (EGLE) on May 23, 2023. The storm sewer monitoring program, included as part of the 2023 IGMP, was approved by EGLE separately on January 26, 2023, and was implemented during 2024 events. The 2023 IGMP incorporated storm sewer monitoring, newly installed monitoring wells, and adjusted the number of wells, constituents, and frequency of sampling consistent with the evolving risk and regulatory requirements, as approved by EGLE.

The following sampling events were completed in accordance with the 2023 IGMP:

- First quarter 2024 - included a quarterly event completed between February 12 to 14, 2024. Groundwater samples were collected from a total of 30 wells.
- Second quarter 2024 - included the annual site-wide groundwater gauging event, with gauging of light nonaqueous phase liquid (LNAPL) wells and the annual, biennial, and quadrennial sampling events completed from May 13 through 24, 2024. Groundwater elevations were collected from a total of 220 monitoring wells, LNAPL gauging was completed at a total of 15 wells, and groundwater samples were collected from a total of 152 wells.
- Second quarter 2024 – also included collection of samples from 15 wells between April 8 to 10, 2024, concurrently with the United States Environmental Protection Agency's (USEPA) sampling for the Adams Plating site.
- Third quarter 2024 – A quarterly groundwater sampling and gauging event completed August 19 through August 21, 2024. Groundwater elevations were collected from a total of 26 monitoring wells and groundwater samples were collected from a total of 25 wells.
- Fourth quarter 2024 – Site-wide gauging, including LNAPL well gauging, was completed between November 11 through November 20, 2024, in addition the semi-annual groundwater sampling event. Annual sampling of Lansing Township municipal wells was also completed during the fourth quarter. Groundwater elevations were collected from a total of 210 monitoring wells (seven of which were LNAPL monitoring wells), and groundwater samples were collected from a total of 79 wells.
- Additionally, quarterly storm sewer sampling for PFAS was completed on February 8, April 10, July 2, and October 3.

As outlined in the 2023 IGMP, this Annual Report includes quarterly data (e.g., tabulated data, figures, analytical narrative) and the following information:

- Objective and scope of the sampling events
- Summary of groundwater elevations and LNAPL gauging data, including contour maps and trend plots
- Figures, tables, and a brief narrative summarizing the groundwater sampling results
- Groundwater elevation contour maps for various water bearing zones
- Updated groundwater plume stability evaluation

- Summary of Lansing Township water supply well sampling
- Conclusions and recommendations for revisions to the IGMP as appropriate.

All groundwater monitoring activities were completed in accordance with the 2023 IGMP. The sampling frequencies and analytes for each well in the 2023 IGMP are included in **Table 1**. The locations of all Site monitoring wells are provided on **Figures 1A**, **1B**, and **1C**.

The following deviations from the 2023 IGMP occurred during 2024 monitoring activities:

- **MW-03-08** was part of the 2023 IGMP perched groundwater elevation monitoring well network but was consistently inaccessible due to standing water. MW-03-08 had consistent non-detects with intermittent low-level detections of acetone and TCE and was proposed for abandonment in 2023. On December 6th, 2024, MW-03-08 was properly abandoned. A summary of abandonment activities can be found in the *2024 Monitoring Well and SSMP Abandonment Memo* (Arcadis 2025a).
- **MW-14-69** was dry during the second and fourth quarter 2024 and has been dry since installation in 2014. This monitoring well was installed in an area of Plant 6 with limited perched groundwater with the intent of verifying whether saturated conditions existed and if the well would produce enough water for sampling and is checked annually.
- **MW-18-96** was installed in shallow fill material at Plant 3 and contained water during development and initial sampling; however, the well has been dry since June 2020. No samples were collected at this location during second or fourth quarter 2024. The continued absence of groundwater at this well location suggests the clay in this area of the Site is a barrier to groundwater flow. This monitoring well was proposed for abandonment in communication submitted to EGLE on August 16, 2024, and at the time was not approved for abandonment. This well will be included for abandonment in a 2025 request.
- **MW-19-110** was installed in August 2019 at the request of the EGLE in an area of Plant 3 with limited perched groundwater with the intent of verifying whether saturated conditions existed and if the well would produce enough water for sampling. Since installation in 2019, the well has had either low water levels or been dry, resulting in no groundwater samples collected. No samples were able to be collected at this location during the second or fourth quarter 2024.
- **MW-19-113** was installed in August 2019 at the request of the EGLE in an area of Plant 3 with limited perched groundwater with the intent of verifying whether saturated conditions exist and if the well would produce enough water for sampling. Since installation in 2019, the well has had either very limited water or been dry, resulting in no groundwater samples collected. In second quarter 2024, enough water was present to collect a groundwater sample. However, in fourth quarter the well was dry, and no samples were collected.
- **MW-20-130** was installed in July 2020 on Plant 2 near the eastern property boundary to Plant 6 in the deep overburden and weathered bedrock. This well has previously been sampled for 1,4-dioxane and PFAS and was last sampled in October 2023. During the second quarter 2024 event, sampling of MW-20-130 was unsuccessful. When the tubing was pulled from the well it appeared to have a significant amount of iron precipitation present. Sampling of MW-20-130 was re-attempted during the fourth quarter 2024 and samples were successfully collected.
- **MW-21-135** was installed in March 2021 on Plant 6 near the eastern property boundary. This well has previously been sampled for PFAS and was last sampled in May 2024. During the fourth quarter event it was observed that MW-21-135 was damaged and the PVC casing was broken at the ground surface. The well was not sampled due to the potential sand pack entering the well at the broken connection. MW-21-135 was repaired on December 6, 2024 but will need to be re-developed before sampling again in 2025.

- **MW-22-159** was installed off-site to the east of Plant 6 and contained water during development, however, the well has been dry since December 2022. No samples were able to be collected at this location in 2024.
- **TW-14-06** was observed to be damaged in first quarter 2023 and was not sampled. Well TW-14-06 was part of the Biosparge system and had a damaged well seal that was affecting remedy performance. TW-14-06 was approved by EGLE for abandonment in early 2024 and was abandoned on February 2, 2024. TW-15-11 was used as a replacement well for TW-14-06 and will be used during future sampling events.

A revised monitoring plan was prepared for the Site and will be implemented in 2025. The *Revised Interim Monitoring Plan – 2025* was submitted to EGLE on April 18, 2025. Final approval from EGLE is pending. The 2025 Interim Monitoring Plan (IMP, Arcadis 2025c) includes an overall reduction in sampling frequency and reduced reporting but retains overall coverage consistent with the 2023 IGMP.

2 Sampling Methods

This section discusses the groundwater, soil vapor, and storm sewer sampling methodology used at the Site.

2.1 Groundwater Sampling Methods

All groundwater samples were collected in a manner consistent with the low-flow sampling techniques in the Arcadis Standard Operating Procedure (SOP) for low-flow sample collection, and generally consistent with EGLE's Remediation and Redevelopment Division (RRD) Op Memo 2, Attachment 5 (EGLE 2004). Samples collected for 1,4-dioxane, VOCs, SVOCs, metals, and general chemistry were submitted under chain of custody protocol to Merit Laboratories (Merit) located in East Lansing, Michigan. Samples collected for low-concentration 1,4-dioxane analysis were submitted under chain of custody protocol to Eurofins Laboratory in Barberton, Ohio. Samples collected for PFAS analyses were submitted under chain of custody protocol to Pace Analytical Laboratory located in West Columbia, South Carolina. Laboratory analytical reports and data validation reports for Lansing Township municipal wells and Site monitoring wells are included as **Appendix A** and **B-1**, respectively. Groundwater low-flow sampling logs are included as **Appendix C-1**.

During the second and fourth quarter 2024 semi-annual sampling events, and before sample collection, site-wide gauging was completed using electronic water level meters and LNAPL wells were gauged using an oil/water interface probe. During first and third quarter 2024 sampling events, gauging was limited to those wells selected for sampling. All gauging was completed within 24 hours with a few exceptions due to access or other issues.

The sampling matrix provided as part of the 2023 IGMP is included as **Table 1**. In general, groundwater samples were submitted for analysis for one or more of the following parameters:

- Target compound list (TCL) VOCs using USEPA Method SW8260B, Revision 2 or SW8260C, Revision 3.
- SVOCs using USEPA Method SW8270D, Revision 4.
- Select total and dissolved metals using USEPA Method 200.8, Revision 5.4. Hexavalent chromium was analyzed using USEPA Standard Method 3500 Cr B 2011.
- Low-concentration 1,4-dioxane using USEPA Drinking Water Method 522, which provides a reporting limit (RL) of 0.20 microgram per liter (µg/L) – used for the Lansing Township municipal wells and select bedrock monitoring wells.
- 1,4-Dioxane using USEPA Method SW8260B-SIM – used for monitoring wells other than municipal and bedrock wells.
- PFAS using USEPA Method 537 modified with isotope dilution (DoD QSM 5.3).

2.1.1 Quality Control/Quality Assurance

Quality control (QC) samples were collected during the sampling event and included the following:

- One duplicate sample per every ten samples.
- One matrix spike and matrix spike duplicate (MS/MSD) sample per every 20 samples.
- One field blank sample per sampler per sampling event.
- One equipment blank sample per pump per sampling event, as well as additional equipment blank samples from the water level meters used for PFAS sampling.

Additionally, trip blanks were included with each cooler containing samples for VOC analysis. One sample delivery group per plant from each quarter underwent complete Tier I validation as defined in USEPA *Innovative Approaches to Data Validation*, USEPA Region III (USEPA 1995). Groundwater sample validation reports are included in **Appendix A** and **B-1** along with laboratory analytical reports.

2.1.2 Light Nonaqueous Phase Liquid Monitoring

LNAPL monitoring wells were gauged during the second and fourth quarter events with an oil/water interface probe. Gauging methods were consistent with the 2023 IGMP. Additionally in 2024, eight LNAPL monitoring wells were abandoned on November 13, 2024, and LNAPL gauging will be discontinued going forward. Well abandonment activities are detailed in the *2024 Monitoring Well and SSMP Abandonment Memo* (Arcadis 2025a).

2.2 Soil Vapor Monitoring

Soil vapor monitoring point SVMP-20-01 is located near the Plant 6 entrance for the purpose of monitoring VOCs in soil vapor potentially associated with the low concentration vinyl chloride plume located in this area. Details regarding the vapor intrusion assessment for this area were included in the Plant 6 Vapor Intrusion Investigation Summary report (Arcadis 2022c).

Soil vapor monitoring point SVMP-20-01 was sampled on August 20, and November 20, 2024, for USEPA Method TO-15 analysis. No samples were collected during first and second quarters due to saturation within the sample point. Soil gas laboratory analytical reports are provided in **Appendix B-2** and sampling logs are provided in **Appendix C-2**. The location of SVMP-20-01 is included on **Figure 1B**. A helium leak test was performed prior to each sampling event and the soil gas samples were collected in a laboratory-provided Bottle Vac and submitted to Metiri Group (formerly Fibertec Analytical Laboratory) in Holt, Michigan for analysis.

2.3 Groundwater Elevation Monitoring

Monitoring wells were gauged during sampling using an electronic water level meter generally within a 24-hour period. To evaluate seasonality, site-wide gauging was previously rotated annually between the second quarter and fourth quarter events. However, beginning in 2023 and continuing in 2024, site-wide gauging was completed during second and fourth quarter semi-annual sampling events. During the first and third quarter sampling events, gauging was limited to those wells selected for sampling. Gauging methods were consistent with the 2023 IGMP.

2.4 Storm Sewer Sampling Methods

Storm sewer sampling was completed quarterly to confirm the effectiveness of storm sewer modifications and abandonments completed in Fall 2018, Winter 2019/2020, Fall 2020, Spring 2021 (Arcadis 2021c), Fall 2023, and Fall 2024. Fall 2023 and Fall 2024 storm sewer modifications were performed in order to promote Site drainage, including abandoning manhole structures and installing a new catch basin structure on Plants 2 and 3. Storm sewer sampling was completed prior to storm sewer modifications and abandonments in 2017 at Plant 2, and in on Plants 2 and 6 in 2019. Storm sewer samples required for quarterly monitoring are collected from the sump of the structure. Past samples collected for investigation purposes were collected from sumps and individual inverts as needed. Samples are collected according to the Arcadis Technical Guidance Instruction (TGI) for PFAS sample collection and analyzed using USEPA Method 537 modified with isotope dilution (DoD QSM 5.3).

3 Results

This section summarizes results from sampling activities completed between January and December 2024. **Table 2** presents groundwater analytical data collected during the reporting period. As a frame of reference and not indicating the criteria are applicable or that additional response is necessary, figures showing exceedances of EGLE Part 201 residential drinking water criteria (DW criteria) and Part 201 groundwater surface water interface criteria (GSI criteria), are provided as **Figures 2** through **9**. Laboratory analytical reports and data validation reports for Lansing Township municipal wells and all other monitoring wells are included as **Appendix A** and **B-1**, respectively, soil gas laboratory analytical reports are provided in **Appendix B-2**, and storm sewer laboratory analytical reports are provided in **Appendix B-3**. Groundwater low-flow sampling logs and soil vapor sampling logs are included as **Appendix C-1** and **Appendix C-2**, respectively.

3.1 Groundwater Monitoring Results

A summary table of the groundwater analytical data collected during 2024 is presented in **Table 2** with exceedances of DW criteria and GSI criteria, if applicable, highlighted in gray and summarized on **Figures 2** through **9**. Results of the 2024 groundwater monitoring events are summarized below.

3.1.1 Perched 1,4-Dioxane Results

In accordance with the approved 2023 IGMP Table (**Table 1**), sampling of perched groundwater for 1,4-dioxane was completed as part of the annual groundwater sampling event during second quarter 2024 and quarterly at the western property boundary of Plant 2 as part of investigations described below. Perched 1,4-dioxane results (**Figure 2**) are generally consistent with the results summarized in the 2023 Annual Groundwater Monitoring Report (Arcadis 2024b), some exceptions include:

- Monitoring well MW-14-58R is a perched monitoring well located near the western property boundary of Plant 2 and was installed in October 2021 as a replacement for MW-14-58 which was damaged and subsequently abandoned. MW-14-58 was last sampled in June 2020 and had a 1,4-dioxane concentration of 38 µg/L. MW-14-58R was installed 5 to 6 feet north of MW-14-58 within similar geology and screened interval, and first sampled in December 2021, showing a 1,4-dioxane concentration of 430 µg/L. Continued sampling of MW-14-58R in second and fourth quarter 2024 has shown 1,4-dioxane concentrations of 280 and 220 µg/L, respectively.

Monitoring well MW-22-157 is a perched monitoring well located off-site, west of MW-14-58R, in the west right-of-way of Rosemary Avenue. Concentrations have been above DW Criteria in 2023 and 2024 but decreasing from 123 µg/L in August 2023 to 41 µg/L in November 2024.

Additional evaluation of 1,4-dioxane in the MW-14-58R were provided in the *MW-14-58R Area September 2023 Investigation Summary* submittal on January 19, 2024 (Arcadis 2024a). In November 2024, RACER Trust collaborated with USEPA and EGLE to collect synoptic groundwater elevation and groundwater analytical data for the western portion of RACER Plant 2 and the APC site. A summary of additional off-site 1,4-dioxane data was provided by the USEPA and is included as an attachment to the *Data Review and Summary Related to Potential Off-Site Vapor Intrusion from the RACER Area 4/MW-14-58R RACER Trust, Plant 2* memo submittal on March 14, 2025 (Arcadis 2025b). Groundwater sampling for 1,4-dioxane in this area was incorporated into the 2025 IMP. Sampling at MW-22-153, MW-22-155, MW-22-156, MW-22-157, MW-23-161, MW-23-162, and MW-23-163 will be completed semi-annually, and MW-14-58R will be completed annually.

3.1.2 Lower 1,4-Dioxane Results

A biosparge remedy has been implemented per the *Interim Measures Work Plan: Lower 1,4-Dioxane Biosparge* work plan (Arcadis 2018). The lower 1,4-dioxane (i.e., weathered bedrock) biosparge system has been operating at Plant 3 since May 2019 and Plant 2 since August 2020. Performance monitoring of the biosparge system is summarized in the *Lower 1,4-Dioxane Biosparge Update Report* (Arcadis 2025d) most recently submitted in April 2025, and in the *Lower 1,4-Dioxane Biosparge Progress Report and Shutdown Evaluation* (Arcadis 2023c), submitted to EGLE on March 27, 2023. Lower 1,4-dioxane concentrations (**Figure 3**) have been generally decreasing throughout the footprint of the plume since the biosparge treatment system began operation. The results at the perimeter of the lower 1,4-dioxane plume were reviewed for potential changes:

- *Southern Extent (the toe)*: The lower 1,4-dioxane plume is defined to the south by MW-16-74, MW-16-75, MW-16-77, MW-16-78, MW-19-121, MW-21-140, and MW-21-141. These results suggest no significant expansion has occurred at the southern toe of the lower 1,4-dioxane plume since 2018. Future migration to the southeast is not expected due to the operation of the biosparge system and geologic conditions described as part of the *Lower 1,4-Dioxane Conceptual Site Model* (Arcadis 2021a).
- *Northeast Lobe (on Plant 2)*: Increasing concentrations were observed within the northeast lobe of the lower 1,4-dioxane plume on Plant 2 from 2018-2021. Since then, stable to decreasing concentrations have been observed (e.g., at wells MW-16-84 and MW-17-86), likely attributable to the operation of the biosparge system (Arcadis 2021c, 2023b). Concentrations at MW-16-85 decreased during the fourth quarter 2024 event and will continue to be monitored on a semi-annual basis. See Section 4.2.1 for more information.
- *MW-20-130*: Monitoring well MW-20-130 is a weathered bedrock monitoring well that was installed as a deep sentinel for PFAS at the Plant 2 PFAS source area. MW-20-130 has a 1,4-dioxane concentration of 170 µg/L during the fourth quarter 2024. Two weathered bedrock monitoring wells were installed downgradient of MW-20-130, one to the south (MW-21-140) and one to the east (MW-21-141), and 1,4-dioxane has not been detected at either well since they were installed in 2021.
- Monitoring wells MW-16-80 and MW-14-56 located near the western Plant 2 property boundary in weathered bedrock, showed a 1,4-dioxane concentration exceeding the DW criterion of 7.2 µg/L in 2024. The detected concentration was generally consistent with previous results observed at these locations. As previously reported, detections of 1,4-dioxane in the weathered bedrock at the western property boundary could be associated with other off-site source areas.

3.1.3 Municipal Well and Bedrock Monitoring Well Sampling Results

The results of the Lansing Township well sampling indicate 1,4-dioxane concentrations of 0.12J µg/L in Lansing Township well TWP-90-03, 0.35 µg/L in TWP-90-04 and 0.43 µg/L in TWP-90-05 (**Appendix A**). These concentrations are consistent with those detected in October 2023 (<0.20 µg/L in TWP-90-03, 0.24 µg/L in TWP-90-04, and 0.36 µg/L at TWP-90-05) and in previous years. The locations of the municipal wells are shown and the bedrock 1,4-dioxane results are summarized on **Figure 4.**

Analytical results for the municipal wells are included in **Table 2**. Widespread 1,4-dioxane detections in bedrock are potentially related to a 1,4-dioxane "background condition" in and around Lansing, as demonstrated by the low-level 1,4-dioxane sampling completed at the Site in 2017. Sporadic detections of 1,4-dioxane in the bedrock monitoring wells installed along the core of the plume ranged from 0.11 µg/L to 4.0 µg/L and did not exceed DW Criteria in 2024. 1,4-Dioxane trends graphs for the on-site bedrock monitoring wells are included as **Appendix D.** The sampling of Lansing Township wells will continue annually as part of the 2025 IMP.

3.1.4 Other VOC Results

Of the fifty-one (51) wells that were sampled for VOCs during 2024, four (4) wells had concentrations exceeding the DW and/or GSI criteria (**Figure 5**).

- *Plant 6 entrance at the intersection of Stanley and Osborn Streets*: A vapor intrusion investigation was completed in this area and a summary of the VI evaluation was provided to EGLE in June 2022 (Arcadis 2022c). An additional monitoring well was installed in September 2022 (MW-22-154) to the northeast of MW-20-132 to define the extent of SSVIAC exceedances in groundwater. Analytical results from MW-22-154 in 2024 showed vinyl chloride ranging from non-detect (<1 µg/L) during the first and second quarter, 2 µg/L in the third quarter and non-detect again in fourth quarter. Soil vapor sampling at SVMP-20-01, located between the Plant 6 entrance and the residential properties, has not detected vinyl chloride. The soil vapor results are included as **Table 3** and the location of SVMP-20-01 is included on **Figure 1B**. Soil vapor results are discussed further in Section 3.3. Based on the 2025 IMP, monitoring for VOCs in soil vapor at SVMP-20-1 and groundwater at MW-22-154 will continue semi-annually, with MW-20-131 and MW-20-132 sampled annually.
- *Weathered bedrock wells MW-14-61, MW-17-86, and MW-19-120*: Located in the northeast lobe of the lower 1,4-dioxane plume on Plant 2. Previously, low detections were observed of chlorinated VOCs (e.g., 1,2-DCE; chloroethane) related to leakage from the perched zone. VOCs were not detected in MW-14-61, MW-17-86, MW-19-120 in 2024. VOCs will continue to be monitored annually or biennially (MW-17-86) at these locations in accordance with the 2025 IMP.
- *Plant 2 perched monitoring wells in the MW-14-58R Area*: MW-22-156 and MW-22-153 and other MW-14-58R Area wells, located on the western property boundary of Plant 2, were sampled for VOCs in second, third and fourth quarter in accordance with the 2023 IGMP as part of an ongoing investigation of VOC impacts at the property boundary. A summary of the investigation was provided in the *MW-14-58R Area September 2023 Investigation Summary* (Arcadis 2024) and *Data Review and Summary Related to Potential Off-site Vapor Intrusion from the RACER Area 4/MW-14-158R* (Arcadis 2025b). The VOC results for MW-22-156 exceed DW criteria for 1,1-dichloroethene (1,1-DCE) and include detections of 1,1-dichloroethane (1,1-DCA), chloroethane and vinyl chloride. MW-22-153 included detections of 1,1-DCA and 1,1-DCE. Monitoring well MW-22-157, located off-site and downgradient of MW-22-156 and MW-22-153, has not had any detections of VOCs (other than 1,4-dioxane). At both MW-22-156 and MW-22-153, 1,1-DCA exceeds the residential SSVIAC, but are delineated offsite by MW-22-157. A summary figure illustrating the VOC and VI evaluation

for this area, including the VOC data for the off-site APC wells, is provided as **Appendix E**. These wells will continue to be monitored for VOCs semi-annual according to the 2025 IMP.

- *MW-14-54:* Monitoring wells MW-14-54 located in the former waste storage area near the western boundary of Plant 2 is sampled for VOCs at a biennial frequency and had similar results in 2024 as in 2022. MW-14-54 exceeded DW or GSI criteria for 1,2,4-trimethylbenzene, benzene, ethylbenzene, naphthalene, and total xylenes.

3.1.5 SVOCs Results

In accordance with the approved 2023 IGMP Table (**Table 1**), the quadrennial analysis of SVOCs was completed during the second quarter of 2024. Of the twelve (12) wells that were sampled for SVOCs during 2024, none of the wells had concentrations exceeding the DW and/or GSI criteria. SVOCs will continue to be monitored on a quadrennial basis as part of the 2025 IMP.

3.1.6 Metals Results

Metals including arsenic, chromium III, chromium VI, lead, nickel and vanadium exceeded DW Criteria in four monitoring wells on Plant 3 and two monitoring wells on Plant 6 as part of the quadrennial sampling event in 2024 (**Figure 6**).

- *CH-14-RO*: Chromium III and chromium VI were detected in this shallow well at concentrations of 8.75 milligrams per liter (mg/L) and 8.35 mg/L, respectively, exceeding the DW criteria of 0.10 mg/L for both compounds and GSI criterion of 0.16 mg/L and 0.011 mg/L for chromium III and chromium VI, respectively. Chromium concentrations at CH-14-RO are related to the former plating line and have been steadily decreasing since monitoring began in 2011.
- *MW-13-32*: Nickel was detected in the shallow well MW-13-32, located near the eastern boundary of Plant 3, at a concentration of 0.4 mg/L, exceeding the DW criterion of 0.1 mg/L and GSI criterion of 0.12 mg/L. As previously discussed, nickel in this area appears to migrate onto the RACER property from the adjacent railroad easement. Nickel concentrations at MW-13-32 have been steadily decreasing since monitoring began in 2013.
- *MW-02-04(3)*: Arsenic, total and dissolved, were detected in the deep overburden well MW-02-04(3), located in central Plant 3, at concentrations of 0.083 mg/L and 0.014 mg/L, respectively, exceeding the DW criteria of 0.01 mg/L. Lead was detected at 0.005 mg/L, exceeding the DW criteria of 0.004 mg/L, and vanadium was detected at 0.009 mg/L exceeding the DW criteria of 0.0045 mg/L.
- *MW-91-2R*: Arsenic was detected in the deep overburden well MW-91-2R, located in central Plant 3, at a concentration of 0.011 mg/L, exceeding the DW criteria of 0.01 mg/L.
- *MW-13-36R*: Vanadium was detected in a shallow well, MW-13-36R, located on Plant 6, at a concentration of 0.008 mg/L, exceeding the DW criteria of 0.0045 mg/L.
- *MWBP*-10-UST5-6: Arsenic was detected in the shallow well MWBP-10-UST5-6, located in Plant 6, at a concentration of 0.044 mg/L, exceeding the DW criteria of 0.01 mg/L.

With few exceptions, exceedances of metals are low and consistent with previous sampling events. An evaluation of metals stability in groundwater (Arcadis 2014b), and subsequent monitoring, indicates that metals at the Site are stable and related to site geochemistry and reducing conditions created by the presence of VOCs, LNAPL or other naturally occurring organic material. Mobilization of metals is reversible, and iron and manganese-associated metals are immobilized when exposed to more oxidizing conditions away from the Site resulting in a reduction in groundwater concentration through precipitation and sorption. Monitoring for metals will continue at the perimeter of the Site on a quadrennial basis.

3.1.7 PFAS Results

The following sections discuss the PFAS groundwater results at the Site. PFAS will continue to be monitored annually according to the 2025 IMP.

3.1.7.1 PFOS Results

Perfluorooctane sulfonic acid (PFOS) concentrations exceeded the GSI criteria (12 nanograms per liter [ng/L]) and DW Criteria (16 ng/l) at 19 monitoring wells in 2024 (**Figure 7**).

- *MW-18-98*: Located on the northern portion of Plant 3, this perched well contained concentrations of PFOS between 77 ng/L to 140 ng/L in 2024, exceeding the DW and GSI criteria. Further north, the perched well MW-19-113 is screened in a similar depth interval and had a low-level PFOS detection of 3.5 ng/L in 2024 suggesting no further migration.
- *MW-18-99*: Located on the northwestern portion of Plant 3, this perched well contained concentrations of PFOS between 47 ng/L to 75 ng/L in 2024, exceeding the DW and GSI criteria. Further north, the perched well MW-19-112 is screened in a similar depth interval and was non-detect in second quarter 2024 suggesting no further migration.
- *Eastern Plant 3 and off-site wells*: Perched monitoring wells at the Plant 3 perimeter indicated PFOS concentrations of 220 and 310 ng/L at MW-18-88, and 42 to 56 ng/L at MW-18-95. PFOS did not exceed the DW and GSI criteria at any of the five perched monitoring wells installed in the City of Lansing's Dunnebacke and Westside Parks, located east of Plant 3.
- *MW-12-12, MW-13-36R, and MW-20-132*: Located along the northern and eastern boundary of Plant 6, these wells contained concentrations of PFOS that exceed the DW and GSI criteria. However, PFOS detections did not exceed DW criteria at the vertical aquifer profiling (VAP) or off-site monitoring wells completed east of Plant 6 to delineate PFAS impacts.
- *MW-22-145*: Located southeast of Plant 6, MW-22-145 is the only off-site well to exceed DW and GSI criteria for PFOS in 2024, ranging from 14 to 18 ng/L. MW-22-145 is delineated downgradient by MW-22-159 and MW-22-158.

3.1.7.2 PFOA Results

Perfluorooctanoic acid (PFOA) concentrations exceeded the DW Criterion of 8 ng/L at 30 perched monitoring wells in 2024 (**Figure 8**).

- *Eastern Plant 3 and off-site wells*: MW-18-88 located along the eastern boundary of Plant 3 contained PFOA concentrations of 7.4 to 9.7 ng/L in 2024. MW-18-93 previously had exceeded DW criteria in 2023 but was non-detect in 2024. Additionally, PFOA did not exceed the DW criteria for PFOA at any of the five perched sentinel monitoring wells installed in the City of Lansing's Dunnebacke and Westside Parks.

- *Plant 6 Perimeter Wells*: Perched monitoring wells located along the northeastern, eastern and southeastern boundaries of Plant 6 and off-site, contained concentrations of PFOA that exceeded the DW criteria for PFOA. Additional off-site work completed in 2022 included the installation of off-site monitoring wells to define the extent of PFOA in groundwater. MW-22-151, located northeast of Plant 6, increased in concentration through 2024 with a concentration of 15 ng/L PFOA detected during the fourth quarter. Off-site PFAS concentrations will continue to be monitored to further evaluate concentration trends and stability.
- *MW-12-09, MW-14-56 and MW-14-58R*: Monitoring wells located near the western boundary of Plant 2 contained PFOA ranging from 8.2 to 19 ng/L, exceeding the PFOA DW Criteria. There is the potential that PFAS concentrations near the Plant 2 boundary and within the Rosemary right-of-way could be combined with impacts associated with other potential off-site sources.

3.1.7.3 PFNA Results

Perfluorononanoic acid (PFNA) concentrations exceeded the DW criterion value of 6 ng/L at six perched monitoring wells in 2024 (**Figure 9**). The highest concentration of PFNA was 81 ng/L observed in Plant 6 source area well P6-SB-07. Other exceedances ranged from 3.9 ng/L to 23 ng/L. Exceedances near the eastern property boundary of Plant 6 are delineated by downgradient wells.

3.1.7.4 Other PFAS Compounds

Other PFAS compounds that exceed DW and/or GSI criteria included the following:

- *Perfluorohexanesulfonic acid (PFHxS):* The only detections of that exceed the PFHxS DW criteria (51 ng/L) in 2024 were perched well MW-21-139 (240 to 410 ng/L) in in the Plant 2 PFAS source area, CH-14-RO (1,900 ng/L) in Plant 3 source area , and well MW-18-103 (63 ng/L) located along the northern boundary of Dunneback Park east of Plant 3. The PFHxS detected at MW-18-103 appears to be isolated and may be related to an off-site source to the north where large quantities of roofing shingles are shredded and piled on the ground surface.
- *Perfluorobutanesulfonic acid (PFBS) and perfluorohexanoic acid (PFHxA):* Sporadic low detections of PFBS and PFHxA were observed in monitoring wells during 2024 but are below the DW criteria values of 420 ng/L and 400,000 ng/L, respectively.
- In addition to PFOS, PFOA, PFNA, PFHxS, PFBS, and PFHxA, other PFAS compounds have been detected at the Site, however there are no established criteria for comparison. In general, these concentrations appear to correlate to PFOS and PFOA concentrations and decrease with distance from PFOS and PFOA source areas.

3.1.7.5 Storm Sewer Analytical Results

Storm sewer PFAS analytical results from 2024 are summarized on **Tables 4** through **6** with exceedances of Rule 57 criteria highlighted in gray. 2024 data is also summarized on **Figures 10** through **12**. Results of the 2024 sampling events are summarized below.

- P2-MH-2 exceeded the Rule 57 criteria for PFOS of 12.0 ng/L during third quarter 2024 and fourth quarter 2024 with detections of 19.0 ng/L and 14.8 ng/L, respectively. No other outfall exceedances were noted on Plant 2 in 2024.
- P3-MH-284 exceeded the Rule 57 criteria for PFOS during fourth quarter 2024 with a detection of 26.4 ng/L. No other outfall exceedances occurred on Plant 3 in 2024.

- Osborn-MH-1 at Plant 6 exceeded Rule 57 criteria for PFOS during first, second, third, and fourth quarters of 2024 with concentrations of 16.0 ng/L, 17.0 ng/L, 16.0 ng/L, and 12.6 ng/L, respectively.
- Flow was not observed at outfall P3-MH-NE at the northeast corner of Plant 3 downgradient of the bulkheads.
- Relative flow measurements are noted at each storm sewer monitoring location. These measurements, noted as “trickle”, “little” or “moderate” flow, are highlighted on **Figures 10** through **12** for fourth quarter 2025.

3.2 Light Nonaqueous Phase Liquid Monitoring

LNAPL is present in the central portion of Plant 2 and in the north-central portion of Plant 3. LNAPL monitoring well locations and approximate extent of LNAPL are presented on **Figures 1A** and **1C**. LNAPL thicknesses were generally consistent with previous observations and are provided in **Table 7**. LNAPL trend graphs are included in **Appendix F**. The trend graphs indicate that, when present, LNAPL thickness gradually increases until it reaches equilibrium within the well and then stabilizes. For the deeper LNAPL, wells take longer to equilibrate with the confined LNAPL conditions relative to the static water level within the formation. The comprehensive *Plant 2 LNAPL Conceptual Site Model* was provided to EGLE for review on February 20, 2020 (Arcadis 2020). Based on the monitoring results, there is no indication of LNAPL migration. The LNAPL monitoring wells that have displayed consistent thicknesses of LNAPL were abandoned as part of 2024 well abandonment scope of work approved by EGLE. LNAPL monitoring will not be carried forward as part of the 2025 IMP.

3.3 Soil Vapor Monitoring

Soil vapor sampling at SVMP-20-01 near the Plant 6 entrance does not exceed the site-specific vapor intrusion criteria (SSVIAC). The results of the soil gas samples were non-detect for all results in the third and fourth quarter 2024 samples. SVMP analytical results are summarized on **Table 3** and compared to the EGLE Residential SSVIAC for a residence with a basement.

3.4 Groundwater Elevation Monitoring

Site-wide groundwater elevation surveys were completed during both the semi-annual and annual 2024 events. Additional groundwater elevation measurements were collected at sampled wells during the quarterly events. **Table 8** summarizes groundwater elevation measurements collected at the Site. Groundwater elevation contour maps (**Figures 13** through **16**), LNAPL trend graphs (**Appendix F**), and groundwater elevation hydrographs (**Appendix G**) are provided for review. Trends within each water-bearing zone are discussed below.

3.4.1 Perched Zone

The groundwater elevation hydrographs included in **Appendix G** indicate that potentiometric surface elevations in the perched zone have been stable to increasing during the period of monitoring beginning in 2012. Storm sewer modifications were completed at Plant 3 during November 2018 and at Plant 2 in 2019 and 2020. Comparison of groundwater elevations observed on Plant 3 prior to storm sewer modifications and post-modification generally show increased variability of water levels with fluctuations (both increasing and decreasing) that are within the range of seasonal variation. Perched groundwater elevations at Plant 2 generally show a gradual increasing trend since 2012, an increase in the slope of the trend following the 2019 storm sewer modifications and a stabilized trend since 2022. It is unclear whether the small changes in groundwater elevation on Plant 2 are influenced by

storm sewer modifications, or part of longer-term trends related to decommissioning of the plants. Groundwater elevations at Plant 6 perched monitoring wells have been generally stable since 2012.

Due to the predominance of clay-rich sediment, the perched zone is interbedded and has an overall low permeability and is characterized by isolated sand zones within layers of silt and clay. The potentiometric surface measured within the perched zone is presented on **Figure 13** (Plants 2 and 6) and **Figure 14** (Plant 3). Both figures include potentiometric surface contours for all wells less than 25 feet deep. The lower conductivity clay and silt that dominate this zone result in high horizontal and vertical gradients. Sand zones are discontinuous and often do not correlate from well to well, and minor variations in well screen elevation have a significant impact on the potentiometric surface. Therefore, although the contour maps represent the overall shallow potentiometric surface, they are of limited use to determine groundwater flow direction.

3.4.2 Deep Overburden

Saturated deep overburden is present only at Plant 3 within a southwest-northeast trending bedrock valley. Groundwater present within the deep overburden is hydraulically connected to the weathered bedrock and bedrock zones. The groundwater elevation hydrographs included in **Appendix G** show that deep overburden water levels appear to be decreasing since 2020 following a period of steady increases 2016 to 2020. The variations observed in deep overburden water levels are likely the result of changes in precipitation, as well as long-term changes in municipal pumping.

Figure 15 presents potentiometric surface elevation contours for deep overburden wells located on Plant 3. In the northern portion of Plant 3, the apparent groundwater gradient is northwesterly consistent with historical measurements. In the southwestern portion of Plant 3, deep overburden groundwater elevation appears to be flat near the former “coliseum” (former stamping area basement) with groundwater elevation varying between 797.49 and 798.90 ft msl. Historically, the deep overburden gradient was to the southeast but has been variable in recent years.

3.4.3 Weathered Bedrock and Bedrock

Potentiometric surface trend graphs for select bedrock and weathered bedrock wells are included in **Appendix G**. Following a period of increasing elevations from 2016 to 2020, the bedrock and weathered bedrock elevations have been decreasing since 2021 with an overall increase in vertical gradient (average of 0.32 ft/ft downward in 2024) within the Saginaw Formation. The variable potentiometric surface is likely attributed to changes in municipal pumping patterns, both long-term and seasonally.

Like the perched zone, the depth of a monitoring well within the weathered bedrock or bedrock zones plays a large role in the potentiometric surface observed at that location. Large vertical gradients occur in formations with vertical anisotropy and indicate a lack of vertical groundwater communication. Traditional groundwater elevation contour maps were not prepared for the weathered bedrock wells because they would be of limited use for interpreting groundwater flow direction and transport. For the bedrock (and by extension, the weathered bedrock), the effective head or “corrected” potentiometric surface elevation was calculated based on the observed vertical gradient. Where vertical gradient was observed, the data was normalized to the deepest well. Although not common, this approach is not unique. Normalization of head based on vertical gradient has been applied at other sites with steep vertical gradients (e.g., Ackland & Schymiczek, CLU-IN [https://clu-in.org/products/siteprof/2004fracrockconf/cdr_pdfs/indexed/group1/622.pdf]). Hydraulic gradient is a 3D flow vector (X,Y,Z). Normalizing the observed groundwater elevations based on the vertical gradient simply adjusts

the vertical (Z) component to a uniform depth to present the groundwater flow vector in a consistent two-dimensional (X and Y) frame of reference.

As indicated in **Table 9**, the vertical gradient tends to be limited in the Grand River Formation near the coliseum and increases to the south to 0.51 ft/ft downward at wells MW-15-72/MW-12-05R (located in central Plant 2) before stabilizing to 0.70 ft/ft downward at wells MW-13-52/MW-13-50 (located on western Plant 6). This variation in vertical gradient appears to coincide with the transition between bedrock formations. Near the former coliseum in the western portion of Plant 3, where the bedrock encountered consists of the more uniform and permeable Grand River Formation, the vertical gradient is negligible. To the south, within the interbedded sandstone and shale of the Saginaw Formation, there is a significant vertical gradient due to the vertical anisotropy created by the interbedded shale and sandstone of the Saginaw Formation. Review of the bedrock wells and other deep boring logs suggests an approximate geologic contact between the Grand River and Saginaw Formations oriented roughly southwest to northeast. **Figure 16** includes the interpreted location of the geologic contact.

To calculate the effective head for the bedrock, an average downward gradient 0.32 ft/ft was applied to bedrock monitoring wells installed within the Saginaw Formation (**Table 9**) as follows:

$$GW_{eff} = GW – (dh/dl * \Delta Elev)$$

Where:

GW_{eff} = effective groundwater elevation

GW = measured groundwater elevation

dh/dl = vertical gradient

ΔElev = change in elevation between deepest well and measured well

As shown in **Figure 16**, the corrected bedrock groundwater elevation contours are a good match for the distribution of the lower 1,4-dioxane plume located within the weathered bedrock zone. Groundwater flow is generally to the south-southeast, but as documented on the December 5, 2019, quarterly update presentation provided to EGLE, the gradient in the central part of Plant 2 has become flatter and more variable in recent years with a periodic west to east flow component beneath the Plant 2 LNAPL area. In May 2024, the bedrock groundwater contour suggests more southerly flow in the southern portion of Plant 2.

4 Groundwater Plume Stability

A preliminary groundwater plume stability assessment was completed at the Site in April 2014 (Arcadis 2014a). The primary objective of that assessment was to provide an initial evaluation of plume stability and determine the suitability of monitored plume stability as a remedial alternative. The preliminary plume stability assessment used data collected between October 2011 and first quarter 2014 as well as geochemical data collected during the August and September 2013 events.

The plume stability assessment has been updated annually and incorporated into the annual reports. Operation of the biosparge system in weathered bedrock has decreased concentrations in the lower 1,4-dioxane plume significantly since 2020. The plume stability assessment presented in this section represents an updated analysis of time-series concentration trends using data collected through fourth quarter 2024.

The updated statistical analysis of dissolved-phase constituent of concern (COC) concentrations with time was completed using the Mann-Kendall slope trend test. A revised list of wells and parameters were used for this report. The updated wells and parameters include all wells that are part of the approved 2023 IGMP and meet the following criteria:

- At least seven sampling events have been completed.
- At least 50 percent of the sample results were greater than detection limits.
- At least 25 percent of the sampling results exceeded the lowest relevant criteria within the last six sampling events.

Guidance for conducting the Mann-Kendall test has been provided in Section 17.3.2 of the USEPA guidance document (USEPA 2009). The Mann-Kendall trend test is a non-parametric test to evaluate if a statistically significant unidirectional (consistently increasing or decreasing) trend was observed during the monitoring period. Correlations were accepted as significant for p-values less than or equal to the alpha value, 0.10 (with a confidence level of 90 percent). Additional information regarding the Mann-Kendall analysis and methods is provided in the 2014 *Preliminary Groundwater Geochemical and Plume Stability Assessment* (Arcadis 2014a) and in **Appendix H**. **Table 10** presents a comprehensive summary Mann-Kendall trend analysis results. The overall trend results are shown on **Figures 17** and **18** for perched and weathered bedrock zones, respectively. **Appendix H** presents plots of concentration through time for all well/COC pairs that met criteria for statistical trend analysis.

4.1 Perched Zone

4.1.1 1,4-Dioxane

The 1,4-dioxane concentrations in individual wells exhibit mostly decreasing or no significant trends within the perched zone and the overall plume appears to be stable.

4.1.2 Volatile Organic Compounds

Concentrations of VOCs in the perched zone are sporadic, and a large plume footprint has not been observed; rather, VOC concentrations in groundwater greater than DW criteria are limited to discrete source areas (e.g., central portion of Plant 2) and areas immediately surrounding observed LNAPL at Plants 2 and 3. VOC data showed decreasing or no significant trends across the Site with the exception of MW-14-54 in Area 2, which has variable, but statistically increasing, trends for several aromatic hydrocarbons.

4.1.3 Metals

During previous plume stability assessments, most statistical analyses for concentrations of metals in perched zone monitoring wells were determined to be decreasing or exhibit no significant trend, suggesting overall stability in metals greater than criteria. The trend evaluation for metals focused on monitoring wells near the Site boundary to evaluate the potential for off-site metal impacts. Of the perimeter wells, only MWBP-10-UST5-6 indicated an increasing trend for arsenic. The increasing trend for arsenic in this well is for the period from 2013 through 2024. Elevated arsenic in this area is related to reducing conditions associated with the underground storage tanks formally located in RFI Area 6.

4.1.4 PFOS, PFOA, PFNA, and PFHxS

Twenty-nine monitoring wells met the criteria for Mann-Kendall analysis for PFOA, PFOS, PFNA, and/or PFHxS during 2024. Statistical trend analysis indicates that nine wells (MW-12-09, MW-12-12, MW-12-13, MW-14-59, MW-14-60, MW-14-67, MW-18-88, MW-18-103, and MW-22-144) have statistically increasing trends and all other wells with PFAS concentrations exceeding criteria demonstrate stable to decreasing trends. An increasing trend was observed at MW-14-67, MW-12-12, and MW-12-13 for PFOA near the eastern boundary of Plant 6. PFOA is currently defined east of Plant 6 in this area by monitoring well MW-22-150 and MW-22-149. These monitoring wells will continue to be sampled for PFAS on an annual basis. Further south at offsite monitoring well MW-22-144, an increasing trend of PFOA was observed which has concentrations ranging from 5 to 17 ng/L since 2022, although concentrations decreased at this location during the second half of 2024. Downgradient wells MW-22-158 and MW-22-160 continue to have low level detections or no detections of PFOA and the furthest downgradient well, MW-22-159, is consistently dry.

Increasing trends are also observed for PFOS at Plant 3 at monitoring well MW-18-88 with concentrations up to 310 ng/L in November 2024. PFAS does not exceed criteria at the six perched sentinel monitoring wells installed further east within the City of Lansing's Dunnebacke and Westside Parks. PFHxS at MW-18-103 is an exception, which has concentrations up to 63 ng/L. The presence of PFHxS at MW-18-103 appears to be isolated and may be related to an off-site source area such as the shingle recycling center located north of this location.

Increasing trends are also observed in central Plant 2 for PFOA at MW-14-59, and for PFOA and PFOS at MW-14-60. MW-12-09 on the western boundary of Plant 2 was observed to have an increasing trend of PFOA, but since installation has only varied a total of 4 ng/L. These monitoring wells will continue to be monitored for PFAS on an annual basis.

4.2 Deep Overburden and Weathered Bedrock

4.2.1 1,4-Dioxane

Prior to the operation of the biosparge system, concentrations within the lower 1,4-dioxane plume had decreasing to stable trends in the northern portion of the plume on Plant 3, and stable to increasing trends towards the toe of the plume and the Plant 2 LNAPL area. Since the biosparge startup, concentrations throughout the lower 1,4-dioxane plume are mostly stable to decreasing, except for MW-13-34, MW-15-73, MW-19-116, MW-20-127, MW-16-85, and MW-14-56, which show increasing trends.

Monitoring well MW-13-34 is a weathered bedrock well at Plant 3 located downgradient of biosparge Transect A near Saginaw St. MW-13-34 has exhibited an overall increasing trend for 1,4-dioxane since 2013 ranging from approximately 17 µg/L up to 127 µg/L. Monitoring well MW-13-48, installed in the deep overburden above MW-13-34 has shown a decreasing trend since 2015 beginning at a concentration of approximately 380 µg/L and decreasing to 94 µg/L in 2024. At this location the permeable pathway is primarily the deep overburden (MW-13-48 screen interval), and it is thought that the MW-13-34 concentration is more representative of mass storage and back diffusion. Both wells will continue to be monitored annually according to the 2025 IMP.

Monitoring well MW-20-127 is a weathered bedrock well at Plant 2 located downgradient of biosparge Transect B. MW-20-127 has exhibited an overall increasing trend for 1,4-dioxane between 2020 and 2024, ranging from approximately 85 µg/L up to 180 µg/L. Monitoring wells surrounding MW-20-127 show stable to decreasing trends except for downgradient well MW-19-116 which shows an increasing trend for 1,4-dioxane. Monitoring well MW-20-127 is installed within the weathered Saginaw Formation and may be isolated hydraulically from surrounding

wells. Monitoring well MW-19-116 was stable before showing an increase in concentration during the second quarter 2024. Monitoring well MW-20-127 will continue to be sampled for 1,4-dioxane on a semi-annual basis, and MW-19-116 will be monitored on an annual basis according to the 2025 IMP.

Monitoring well MW-16-85 is a weathered bedrock well at the northeast lobe of the 1,4-dioxane plume on Plant 2, which initially indicated decreasing trends after the biosparge startup. In October of 2023 concentrations increased from near 7 µg/L to 28 µg/L but decreased in 2024 to 18 µg/L and then 8 µg/L in May and November 2024, respectively. Monitoring well MW-16-85 will continue to be sampled for 1,4-dioxane on a semi-annual basis according to the 2025 IMP.

MW-14-56 and MW-15-73 are weathered bedrock wells on the western border of Plant 2 that show increasing trends for 1,4-dioxane. Well MW-14-56 has been consistently increasing since 2015 (from 7 µg/L to 18 µg/L). Following initial increases at MW-15-73, concentrations have been stable to decreasing since 2018 when the maximum concentration was 11 µg/L. Both wells are located west of the RACER lower 1,4-dioxane plume and concentrations of 1,4-dioxane at these locations may be attributed to an off-site source area.

5 Conclusions

This Annual Report summarizes the groundwater monitoring activities completed between January and December 2024, consistent with the 2023 IGMP. Based on the results of the sampling and review of the plume stability evaluation, the following conclusions are offered:

- *Lower 1,4-Dioxane:* The Plant 3 biosparge system began operating in May of 2019, and the Plant 2 biosparge system began operating in August of 2020. Since the biosparge startup, concentrations across the lower 1,4-dioxane plume are mostly stable to decreasing. Six weathered bedrock wells exhibit increasing trends for 1,4-dioxane (MW-13-34, MW-20-127, MW-19-116, MW-16-85, MW-15-73 and MW-14-56). Increasing trends at these locations can be attributed to hydrogeologic conditions, transient increases in concentration, or offsite source areas. These wells will continue to be monitored according to the *Revised Interim Monitoring Work Plan – 2025 (IMP)* (Arcadis, 2025c).
- *Perched 1,4-Dioxane:* Elevated detections of 1,4-dioxane at MW-14-58R and associated wells on western Plant 2 will continue to be monitored semi-annually to annually.
- *1,4-Dioxane in Bedrock:* Detections of 1,4-dioxane in deeper bedrock monitoring wells installed along the core of the plume ranged from 0.11 µg/L to 4.0 µg/L and did not exceed drinking water criteria in 2024.
- Lansing Township wells TWP-90-03, TWP-90-04, and TWP-90-05 were sampled in November 2024 and analyzed for 1,4-dioxane using USEPA Method 522 for drinking water. Concentrations of 0.12 (TWP-90-03), 0.35 (TWP-90-04), and 0.43 µg/L (TWP-90-05), were reported and are consistent with previous sampling results. The low-level detections of 1,4-dioxane in the region may result from several regional and/or numerous nonpoint sources. Annual sampling of Lansing Township wells will continue according to the 2025 IMP.
- *VOCs:* Groundwater sample results indicate that concentrations of 1,1-DCE exceed residential drinking water or GSI criteria at the Site during 2024. Elevated concentrations of 1,1-DCE were observed in perched monitoring wells including MW-22-156, on the western property boundary of Plant 2. Concentrations of elevated 1,1-DCE at MW-22-156 appear to be localized, as on-site and off-site wells in the vicinity remain below detection. In addition, 1,1-DCA was detected at MW-22-156 and MW-22-153 at concentrations above SSVIAC and will be monitored semi-annually according to the 2025 IMP.

- *VOCs:* Groundwater sample results from MW-14-54 at Plant 2 indicate that concentrations of 1,2,4-trimethylbenzene, benzene, ethylbenzene, naphthalene, and total xylenes exceed residential drinking water or GSI criteria at the Site during 2024. Concentrations of 1,2,4-trimethylbenzene, benzene, ethylbenzene, naphthalene, and total xylenes at MW-14-54 appear to be localized, as on-site wells in the vicinity remain below criteria.
- *VOCs:* Groundwater sample results from MW-03-06 at Plant 6 indicate that concentrations of vinyl chloride exceed residential drinking water criteria at the Site during 2024. Concentrations of vinyl chloride appear to be localized, as on-site wells in the vicinity remain below criteria.
- *Plant 6 Entrance VI:* Analytical results from MW-22-154 in 2024 showed vinyl chloride ranging from non-detect (<1 µg/L) during the first and second quarter, 2 µg/L in the third quarter and non-detect again in fourth quarter. Soil vapor sampling at SVMP-20-01, located between the Plant 6 entrance and the residential properties, has not detected vinyl chloride. Monitoring VOCs in excess of SSVIAC at the Plant 6 entrance will continue semi-annually according to the 2025 IMP.
- *PFAS Compounds:* PFOS, PFOA, PFNA, and PFHxS concentrations exceeded DW and GSI Criteria in perched monitoring wells during 2024 groundwater monitoring events. Concentrations of PFAS in perched groundwater at Plants 2, 3, and 6 property boundaries, show stable to decreasing trends, except for one well on Plant 2 western boundary, three wells on the Plant 6 eastern boundary (including one off-site) and two wells on or near the Plant 3 eastern boundary (including one off-site). These locations are delineated off-site. There were no exceedances noted in monitoring wells with the public park east of Plant 3 except for MW-18-103, which is likely related to the shingle recycling center located to the north. Additional sampling will continue according to the 2025 IMP semi-annually.
- *PFAS Compounds:* MW-22-152, located northeast of Plant 6, increased in PFOA concentration through 2024 with a concentration of 15 ng/L detected during the fourth quarter. There is no risk associated with a DW criteria exceedance at this location but sampling will continue according to the 2025 IMP semi-annually.
- *Stormwater PFAS:* The quarterly storm sewer sampling indicates the storm sewer modifications at Plant 3 have successfully reduced PFAS discharge to concentrations at or below the Rule 57 criteria. Plant 2 and 6 modifications have reduced PFAS concentrations to near Rule 57 Criteria and will continue to be monitored for changes semi-annually.
- *LNAPL:* LNAPL extent and thicknesses are consistent with previous annual reports, there is no indication of LNAPL migration. LNAPL thickness monitoring will be discontinued in 2025 in accordance with the 2025 IMP.

Based on the site monitoring data collected in 2024, there are no known complete exposure pathways regarding nearby residents or on-site workers and continued operation of the biosparge system is appropriate to address 1,4-dioxane-impacted groundwater in the weathered bedrock. No action beyond additional monitoring and implementation the proposed biosparge system partial shutdown test is recommended at this time. The DRC proposed as part of the 2021 Corrective Measure Plan is still appropriate for the Site. Results of the monitoring program do not suggest changes are required for the previously submitted *Plant 2 LNAPL Conceptual Site Model* (Arcadis 2020), or the *Lower 1,4-Dioxane Conceptual Site Model* (Arcadis 2021a). Groundwater and storm sewer PFAS monitoring will continue in accordance with the 2025 IMP (Arcadis, 2025c).

6 Proposed IGMP Modifications

An update to the IGMP has been provided to EGLE under a separate cover. The *Revised Interim Monitoring Work Plan – 2025* was submitted to EGLE on April 18, 2025, and is pending final approval. The revised IMP incorporates continued groundwater elevation monitoring, removal of LNAPL gauging, and updating monitoring frequencies.

Notes:

Wells shown in gray shading are part of biosparge performance monitoring, not part of previous formal IGMP submission. Additional details included in Table 7.

* Site wide gauging to alternate between semi-annual events to account for seasonal variability. Semi-annual gauging includes all wells sampled semi-annually.

** Select metals includes arsenic, nickel, lead, vanadium, chromium, and copper.

Summary of Groundwater Analytical Results - 2024
RACER Trust Plants 2, 3, and 6
Lansing, Michigan

Data Flagging:
Bold font represents data where detections were noted above the laboratory method detection limit.
Gray shading represents result exceeding either or both the EGLE Part 201 Generic Cleanup Criteria and Screening Levels or the EGLE GSI Criteria (Updated October 12, 2023)

1. EGLE Part 201 Residential Drinking Water Criteria and Groundwater Surface Water Interface Criteria from the Generic Cleanup Criteria and Screening Levels (dated January 10, 2018) are used for comparison with all VOC and Inorganic data and revised criteria values (dated October 12, 2023) are used for comparison with all PFAS data.
2. 1,4-Dioxane is compared to a drinking water criteria of 7.2 µg/L per the EGLE (formerly MDEQ) Establishment of Cleanup Criteria for 1,4 -Dioxane: Emergency Rules dated October 27, 2016.
3. Duplicate analyses are presented in brackets next to the parent sample.

NOTES:
All results compared to Michigan Department of Environment, Great Lakes and Energy (EGLE) site-specific volatilization to indoor air criteria (SSVIAC), August 15, 2018.
Residential SSVIAC - Applies to a residential house with a basement, the depth to groundwater of 10 feet at the Site and soil type of sand.
Dup - represents duplicate sample analytical results
All analytical results are presented in micrograms per cubic meter (µg/m^3)
-- = No criteria requested for SSVIAC
< = Not Detected above laboratory detection limit
SVMP = Soil vapor monitoring point
SSVIAC = Site-specific volatilization to indoor air criteria (provided by EGLE)
ICV- = Recovery in the associated initial calibration verification sample exceeds the lower control limit. Results may be biased low.
L- = Recovery in the associated laboratory sample (LCS) exceeds the lower control limit. Results may be biased low.
V+ = Recovery in the associated continuing calibration verification sample (CCV) exceeds the upper control limit. Results may be biased high.
EGLE Footnotes:
(SE) = Site-specific criteria based on single event exposure; therefore, sampling methods should reflect shorter exposure scenarios.
ca = the criterion is based on carcinogenic health effects
dev = the criterion is based on developmental health effects
mut = the criterion is based on mutagenic cancer health effects
nc = the criterion is based on non-carcinogenic health effects
st = the criterion is based on short-term toxicity

Abbreviations:

-- = not applicable
FOD = frequency of detection (# detects / # samples)
mean = arithmetic mean
SD = standard deviation
MK = Mann-Kendall
NST = no significant trend
DWN = downward trend
UP = upward trend

Notes:

1. All analytical results for VOCs are in µg/L, PFAS are in ng/L, and metals are in mg/L.
2. Trend results are presented for well-analyte pairs sampled in 2024 when at least 7 samples, and 50% detected values, and 25% criteria exceedances in the last six samples are available.
   Perched wells are compared to the Groundwater Surface Water Interface Criteria (GSI) and Residential Drinking Water Criteria (RDW), all other wells are compared to the RDW.
3. Non-detects were assigned a common value less than the minimum detected value, equal to half the minimum reporting limit (RL) in the dataset (USEPA, 2009).
   If half the minimum RL was greater than the minimum detected value, then half the minimum detect was assigned.
4. Statistically significant trend defined as having p-value ≤ 0.1, or 90% confidence.
5a. MK Trend results for datasets with fewer than 8 samples may not be reliable and should be treated with caution.

Job Narrative
240-215109-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/15/2024 9:40 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 3.6°C.

GC/MS Semi VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Starred (*) analytes are not NY NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.
All accreditations/certifications held by this laboratory are listed on page 3. Not all accreditations/certifications are applicable to this report.
For a specific list of accredited analytes, please feel free to contact the laboratory or visit https://www.meritlabs.com/certifications.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Starred (*) analytes are not NY NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.
All accreditations/certifications held by this laboratory are listed on page 3. Not all accreditations/certifications are applicable to this report.
For a specific list of accredited analytes, please feel free to contact the laboratory or visit https://www.meritlabs.com/certifications.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Starred (*) analytes are not NY NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.
All accreditations/certifications held by this laboratory are listed on page 3. Not all accreditations/certifications are applicable to this report.
For a specific list of accredited analytes, please feel free to contact the laboratory or visit https://www.meritlabs.com/certifications.

Case Narrative
Arcadis U.S., Inc.
Lot Number: ZB15009

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.
Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved The NELAC Institute (TNI) standards, the Pace Analytical Services, LLC ("Pace") Laboratory Quality Manual, standard operating procedures (SOPs), and Pace policies. Additionally, the DoD QSM version 5.4 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the TNI standards, the Laboratory Quality Manual, SOPs, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.4 table B-15 and our PFAS SOP. Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo
FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18. If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

PFAS
Samples ZB15009-007, ZB15009-008, ZB15009-009 required centrifugation prior to extraction, due to excessive solids present in the samples. Centrifugation was performed following the PFAS Aqueous Centrifuge Protocol; samples were spiked with Surrogate (SUR; Extracted Internal Standard/EIS) and shaken vigorously before being poured into a conical bottle and centrifuged. The centrifuged aqueous sample was decanted back into the original sample bottle, off of the condensed solids remaining in the centrifuge bottle. Original sample bottle was rinsed as normal and centrifuge bottle was rinsed with 4mL of MeOH. Centrifuge bottle rinsate was added to the elution. Samples concentrated to <5mL and reconstituted to 5mL using MeOH by transfer pipet.

Surrogate recovery for the following samples was outside the upper control limit: ZB15009-001, ZB15009-006, ZB15009-007, ZB15009-008, ZB15009-011, ZB15009-012, ZB15009-014, ZB15009-016. These samples did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Surrogate recovery for the following sample was outside the upper control limit: ZB15009-003. This sample did not contain any target analytes >1/2 LOQ; therefore, re-extraction and/or re-analysis was not performed.

Job Narrative
240-202613-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 4/10/2024 9:40 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.7°C.

GC/MS Semi VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Starred (*) analytes are not NY NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.
All accreditations/certifications held by this laboratory are listed on page 3. Not all accreditations/certifications are applicable to this report.
For a specific list of accredited analytes, please feel free to contact the laboratory or visit https://www.meritlabs.com/certifications.

Case Narrative
Arcadis U.S., Inc.
Lot Number: ZD10028

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.
Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved The NELAC Institute (TNI) standards, the Pace Analytical Services, LLC ("Pace") Laboratory Quality Manual, standard operating procedures (SOPs), and Pace policies. Additionally, the DoD QSM version 5.4 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the TNI standards, the Laboratory Quality Manual, SOPs, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.4 table B-15 and our PFAS SOP.
Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo
FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18. If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

PFAS

Surrogate recovery for the following samples was outside the upper control limit: ZD10028-001, ZD10028-002. These samples did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Job Narrative
240-205186-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 5/24/2024 9:40 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.3°C.

GC/MS Semi VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
240-205189-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 5/24/2024 9:40 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.3°C.

GC/MS Semi VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
240-205252-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 5/25/2024 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.8°C.

GC/MS Semi VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Narrative
240-205253-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 5/25/2024 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.8°C.

GC/MS Semi VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Starred (*) analytes are not NY NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.
All accreditations/certifications held by this laboratory are listed on page 3. Not all accreditations/certifications are applicable to this report.
For a specific list of accredited analytes, please feel free to contact the laboratory or visit https://www.meritlabs.com/certifications.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Starred (*) analytes are not NY NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.
All accreditations/certifications held by this laboratory are listed on page 3. Not all accreditations/certifications are applicable to this report.
For a specific list of accredited analytes, please feel free to contact the laboratory or visit https://www.meritlabs.com/certifications.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Starred (*) analytes are not NY NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.
All accreditations/certifications held by this laboratory are listed on page 3. Not all accreditations/certifications are applicable to this report.
For a specific list of accredited analytes, please feel free to contact the laboratory or visit https://www.meritlabs.com/certifications.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Starred (*) analytes are not NY NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.
All accreditations/certifications held by this laboratory are listed on page 3. Not all accreditations/certifications are applicable to this report.
For a specific list of accredited analytes, please feel free to contact the laboratory or visit https://www.meritlabs.com/certifications.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Starred (*) analytes are not NY NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.
All accreditations/certifications held by this laboratory are listed on page 3. Not all accreditations/certifications are applicable to this report.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Starred (*) analytes are not NY NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.
All accreditations/certifications held by this laboratory are listed on page 3. Not all accreditations/certifications are applicable to this report.
For a specific list of accredited analytes, please feel free to contact the laboratory or visit https://www.meritlabs.com/certifications.

General Report Notes

Analytical results relate only to the samples tested, in the condition received by the laboratory.
Methods may be modified for improved performance.
Results reported on a dry weight basis where applicable.
'Not detected' indicates that parameter was not found at a level equal to or greater than the reporting limit (RL).
When MDL results are provided, then 'Not detected' indicates that parameter was not found at a level equal to or greater than the MDL.
40 CFR Part 136 Table II Required Containers, Preservation Techniques and Holding Times for the Clean Water Act specify that samples for acrolein and acrylonitrile, and 2-chloroethylvinyl ether need to be preserved at a pH in the range of 4 to 5 or if not preserved, analyzed within 3 days of sampling.
QA/QC corresponding to this analytical report is a separate document with the same Merit ID reference and is available upon request.
Starred (*) analytes are not NY NELAP accredited.
Samples are held by the lab for 30 days from the final report date unless a written request to hold longer is provided by the client.
Report shall not be reproduced except in full, without the written approval of Merit Laboratories, Inc.
Limits for drinking water samples, are listed as the MCL Limits (Maximum Contaminant Level Concentrations)
PFAS requirement: Section 9.3.8 of U.S. EPA Method 537.1 states "If the method analyte(s) found in the Field Sample is present in the FRB at a concentration greater than 1/3 the MRL, then all samples collected with that FRB are invalid and must be recollected and reanalyzed."
Samples submitted without an accompanying FRB may not be acceptable for compliance purposes.
Wisconsin PFAs analysis: MDL = LOD; RL = LOQ. LOD and LOQ are adjusted for dilution.
All accreditations/certifications held by this laboratory are listed on page 3. Not all accreditations/certifications are applicable to this report.
For a specific list of accredited analytes, please feel free to contact the laboratory or visit https://www.meritlabs.com/certifications.

Case Narrative
Arcadis U.S., Inc.
Lot Number: ZE20006

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.
Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved The NELAC Institute (TNI) standards, the Pace Analytical Services, LLC ("Pace") Laboratory Quality Manual, standard operating procedures (SOPs), and Pace policies. Additionally, the DoD QSM version 5.4 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the TNI standards, the Laboratory Quality Manual, SOPs, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.4 table B-15 and our PFAS SOP. Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo
FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18. If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

Manual integration summaries are provided at the end of this report when applicable.

PFAS
Samples ZE20006-001, ZE20006-002, ZE20006-003, ZE20006-009, ZE20006-013, ZE20006-015 required centrifugation prior to extraction, due to excessive solids present in the samples. Centrifugation was performed following the PFAS Aqueous Centrifuge Protocol; samples were spiked with Surrogate (SUR; Extracted Internal Standard/EIS) and shaken vigorously before being poured into a conical bottle and centrifuged. The centrifuged aqueous sample was decanted back into the original sample bottle, off of the condensed solids remaining in the centrifuge bottle. Original sample bottle was rinsed as normal and centrifuge bottle was rinsed with 4mL of MeOH. Centrifuge bottle rinsate was added to the elution. Samples concentrated to <5mL and reconstituted to 5mL using MeOH by transfer pipet.

Surrogate recovery for the following samples was outside the upper control limit: ZE20006-002, ZE20006-004, ZE20006-005, ZE20006-007, ZE20006-009, ZE20006-010, ZE20006-011, ZE20006-012, ZE20006-013, ZE20006-014, ZE20006-015, ZE20006-016. These samples did not contain any target analytes >1/2 LOQ; therefore, re-extraction and/or re-analysis was not performed.

Surrogate recovery for the following sample was outside control limits: ZE20006-008. Re-extraction and/or re-analysis was performed with concurring results. The original analysis has been reported.

Surrogate recovery for the following sample was outside control limits: ZE20006-017. Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.
