Executive Summary

ARCADIS G&M of Michigan, LLC (ARCADIS) has completed a Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) for the Revitalizing Auto Communities Environmental Response (RACER) Trust at their industrial properties (Plants 2, 3, and 6) located in Lansing, Michigan (Site). The RFI was completed in two phases. Phase 1 of the RFI targeted areas of interest (AOIs) identified at the Site based on historical land use and previous investigation results. The AOIs targeted by Phase 1 were agreed upon by RACER and the Michigan Department of Environmental Quality (MDEQ) as the most likely areas of the Site to be impacted by former site activities. Based on the results of Phase 1, ARCADIS completed Phase 2 of the RFI to characterize and delineate soil and groundwater impacts identified during Phase 1.

During the RFI Phase 2, as a general rule, if a constituent of concern (COC) was detected at an AOI during Phase 1, additional borings were completed to evaluate the magnitude and extent of the impacts. This approach was generally applied even if the COC was detected below generic Michigan Risk Based Screening Levels (RBSLs) established by Part 201 of the Michigan Natural Resources and Environmental Protection Act (Act 451, 1994, as amended).

Based on overall RFI approach and strategy, extensive sampling was completed to characterize and delineate the Site. Together, the RFI Phase 1 and 2 activities included the following:

- 437 shallow soil borings (generally <30 ft bgs)
- 36 Geoprobe® Hydraulic Profiling Tool/vertical aquifer profile (VAP) borings (to bedrock or refusal, Plants 2 and 6)
- 10 VAP borings (to bedrock or refusal, Plant 3)
- 81 laser-induced fluorescence (LIF) borings to delineate light non-aqueous phase liquid (LNAPL; Plant 2: 58, Plant 3: 23)
- 221 groundwater VAP samples
- 1,542 soil samples (Phase 1: 285, Phase 2: 1,257)
- 4 soil gas samples
- Installation of 54 monitoring wells (Phase 1 and 2, includes long-term monitoring wells and LNAPL monitoring wells)

- Collection of groundwater samples from all available site monitoring wells during two annual sampling events (2011 and 2012). The 2012 sampling event included 90 monitoring wells.
- Completion of a comprehensive light non-aqueous phase liquid (LNAPL) mobility assessment at Plants 2 and 3. The mobility assessment included field LNAPL transmissivity testing, a comparison of laboratory-determined LNAPL field and residual saturations, LNAPL pore velocity potential calculations, and LNAPL pore-entry pressure calculations.
- Completion of storm sewer sampling at site outfalls during two separate events to assess whether COCs could be entering the sewer via groundwater infiltration at concentrations that could exceed Groundwater Surface Water Interface (GSI) Criteria at the Grand River.
- Sampling, cleanout and monitoring of the Plant 6 stormceptor identified with LNAPL during the storm sewer sampling activities.

The overall goal of the RFI is to provide the basis for the preparation of a RCRA Corrective Measures Study (CMS) Report.

General Hydrogeologic Setting

The topography of the Site is flat with gently rolling hills around the perimeter of the Plants. The Grand River is incised into the regional topography and wraps around the Site to the south, east, and north. Surface elevations for the Site range from approximately 855 to 875 feet above mean sea level (ft amsl). The elevation of the Grand River is approximately 830 ft amsl and known to lose water to bedrock in the Lansing area.

The overburden at the Site is divided into four general stratigraphic units: 1) shallow fill, 2) interbedded zone; typically soft clay and isolated lenses of silt and sand containing perched water, 3) glacial till; a dense, mostly dry sand/gravel/clay mix that creates a vertical barrier to groundwater flow and separates the perched water from the bedrock aquifer, and 4) deep overburden; typically unsaturated below the till; consists of a mix of sediments located above bedrock. The deep overburden becomes saturated where encountered deeper than 65 to 70 feet below ground surface (ft bgs). Saturated deep overburden has only been observed at Plant 3.

The glacial overburden is underlain by bedrock consisting of the Grand River Group and Saginaw Formations. Together the formations, consisting largely of sandstone

interbedded with shale, form a prolific bedrock aquifer that is the primary source of drinking water for the City of Lansing and Lansing Township. All three plants are located within wellhead protection areas for either Lansing Township (Plants 2 and 3) or the City of Lansing (Plant 6). The bedrock beneath Plants 2 and 6 is relatively flat lying and is encountered at depths ranging from 55 to 65 ft bgs. At Plant 3 the bedrock surface slopes to the north-northwest into an apparent bedrock valley. The bedrock topography, and the saturated overburden within the valley, appear to exhibit some measure of control on regional groundwater flow, as do the City and Township water supply wells installed in the bedrock adjacent to the Site.

In general, there are three water bearing zones at the Site: the perched water, typically occurring within the fill, the interbedded zone, and occasionally within the glacial till, between 5 to 30 ft bgs; the deep overburden aquifer with a water table at 65 to 70 ft bgs (at Plant 3 only); and bedrock, which is encountered at depths ranging from 55 to 110 ft bgs beneath the Site.

Perched Water Zone

Due to the predominance of clay rich sediments, the interbedded zone has an overall low permeability and is characterized by discontinuous sand zones within layers of silt and clay. The lower hydraulic conductivity (K) clays and silts result in high horizontal gradients between sand lenses, which confirm the discontinuous nature of the conductive sand zones. Because the variability of K in the perched water zone is orders of magnitude greater than the groundwater gradient, the flow and contaminant transport at the Site is controlled by the hydrostratigraphy of the aquifer. The complex gradients at the Site reflect this condition, and traditional groundwater elevation contour maps are of limited use within this zone to determine groundwater flow direction and transport.

A high-resolution sampling approach was used at the Site to gather sufficient groundwater data within the perched zone to characterize and delineate groundwater impacts by contaminant distribution. Based on the spatial distribution of COCs in groundwater at the Site, groundwater flow direction within the perched zones appears easterly at Plants 2 and 6. At Plant 3, perched water occurs in isolated pockets primarily within the shallow fill on top of the glacial till. Slug testing of wells screened within permeable units of the perched zone indicate a K of 0.07 to 40 feet per day (ft/day); hydraulic conductivity estimates for the finer grained silts and clays are several orders of magnitude less. Based on the range of hydraulic conductivity values, hydraulic gradients, and porosity associated with the sand-silt-clay soils, it is expected

that groundwater flow velocities range several orders of magnitude in the heterogeneous perched zone. The length of the 1,4-dioxane plume from Plant 2 to Plant 6 suggests that there are continuous pathways for lateral migration; however, the average groundwater flow velocity within the interbedded zone is likely between 0.1 to 0.2 ft/day or 40 to 80 feet per year (ft/yr), based on industrial usage of 1,4-dioxane as a stabilizer for 1,1,1-trichloroethane (1,1,1-TCA), which started in the late 1950s, and leading to an assumed plume age of 25 to 50 years. Based on the abundance of lower conductivity soils in the perched zone, the transport velocity likely slowed since the release as 1,4-dioxane mass is stored in the finer grained matrix due to diffusion. Additional groundwater trend monitoring is warranted to verify plume stability, however.

Hydraulic communication between the perched zone and bedrock aquifer is generally limited. Evidence to support this includes:

- 1) A zone of dry deep overburden beneath the glacial till underlying Plants 2, 3, and 6 that, where present, form a low-permeability barrier to vertical flow.
- 2) A separation of the perched zone and regional bedrock aquifer by 30 (Plants 2 and 6) to 60 feet (Plant 3) of glacial till and vadose zone. The vertical K of the glacial till has been tested at 10^{-5} ft/day at Plant 6.
- 3) A general lack of site-related groundwater impacts in the bedrock aquifer beneath the most heavily impacted areas of the Site, including the LNAPL impacts located within the perched zones at Plants 2 and 3.

The communication between the perched zone and deep overburden/bedrock aquifer at Plant 3 is also limited; however, metals have been detected beneath the former plating area (Areas 14, 17 and 18) suggesting some leakage does occur through the glacial till in this part of the Plant. In addition, impacts occur to the deep overburden aquifer at Plant 3 where the glacial till has been removed, such as the 1,4-dioxane impacts beneath the “coliseum” in the southwestern portion of Plant 3.

Deep Overburden Aquifer

At Plant 3, groundwater is encountered within the overburden overlying the bedrock. The lithology of the deep overburden aquifer consists mainly of interbedded fine sand and silt. The groundwater elevation of the overburden aquifer is generally 1 to 2 feet higher than in corresponding bedrock wells and horizontal gradients generally mimic the bedrock topography with apparent groundwater flow to the north-northeast. Hydraulic testing of the deep overburden aquifer indicates an average K of 0.3 ft/day. Based on the range of measured gradients in the central part of Plant 3, groundwater

flow velocity is on the order of 0.04 ft/day or 14 ft/yr. Detections of metals above RBSLs near the Plant 3 former plating area and 1,4-dioxane impacts in the southwestern part of Plant 3 suggest the deep overburden may receive some recharge from the perched zone where the till is more permeable or absent.

Bedrock Aquifer

The Grand River Group and Saginaw Formations consist largely of sandstone interbedded with shale. Groundwater flow within bedrock is largely dependent on the presence of bedrock fractures and the groundwater elevation within a bedrock well will depend on screen depth, fracture distribution and the proximity to municipal pumping wells. The bedrock groundwater elevation contours developed for the Site suggest radial groundwater flow at Plant 3 and a westerly flow at Plants 2 and 6. The bulk K measured at bedrock wells averages approximately 80 ft/day in highly fractured wells to 0.6 ft/day in wells where minimal fracturing was encountered.

Findings and Conclusions

The majority of the AOIs on-Site have been delineated and the goals of the RFI have largely been met. Figure ES-1 summarizes the lateral extents of soil, groundwater, and LNAPL impacts. The areas where additional characterization is required to address data needs are highlighted in specific figures referenced throughout the report. The following conventions are used to highlight affected media and provide quick reference to findings that are discussed in this section:

- Soil impacts are shaded with orange where volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) are the drivers; light blue shading shows the areas where metals impacts occur.
- Groundwater impacts are shaded with pink for VOCs and SVOCs; dark blue shaded areas are affected by metals;
- LNAPL impacts are shown with orange hatching.

The areas where these impacts could lead to potential exposure or where restrictions might be required are also highlighted.

- The composite areas where groundwater exceeds drinking water criteria is included within the pink and dark blue areas;

- Relevant exposure pathways are highlighted using colored boxes to show a conservative estimate of the areas that are affected. The areas are color coded by potential exposure pathway.

Based on the hydrogeologic data and defined soil and groundwater impacts at the Site, source zones and groundwater impacts are primarily isolated within the shallow perched water. However, there are six bedrock wells with metals above Part 201 Drinking Water (DW) Criteria, including arsenic at three locations on Plants 2 and 3 just above the DW Criteria, and lead at a bedrock well on Plant 6 just above the DW Criteria. In addition, data collected in 2004 indicate metals at two historical bedrock well locations exceeded RBSLs.

Plant 2

The following are considered the primary areas of Plant 2 that will require further consideration for remediation in the CMS:

- **LNAPL (Area 5-2):** LNAPL is present within the fill and interbedded zone in the central portion of Plant 2. The LNAPL consists of cutting oil that contains elevated concentrations of chlorinated volatile organic compounds (CVOCs) and polychlorinated biphenyls (PCBs) in some areas, as well as certain VOCs and SVOCs. The lateral and vertical extents of the LNAPL plume and associated soil and groundwater impacts are defined; mobility and recoverability testing indicate the LNAPL plume is not migrating, with only a limited potential for recoverability based on ASTM International (ASTM; Method E2856) and Interstate Technology and Regulatory Council (ITRC) methods (ITRC 2009; State of Michigan 2012), which guide MDEQ policies and procedures.
- **1,4-Dioxane in Perched Zone:** Associated with the western and northern portion of the LNAPL area, a perched water plume, consisting primarily of 1,4-dioxane, extends from west to east across Plant 2 onto Plant 6 within the perched water zone. The highest concentrations of 1,4-dioxane, VOCs, and SVOCs are generally relegated to the area immediately surrounding the LNAPL plume. The lateral and vertical extents of the plume are defined on site at Plant 2 and Plant 6 relative to the proposed Part 201 Residential Drinking Water (DW) Criteria of 8.5 micrograms per liter (µg/L). 1,4-dioxane has not been detected in the underlying bedrock aquifer.

- **Vapor Criteria Exceedances:** In addition to Area 5-2 LNAPL area, there are two areas at Plant 2 that have soil or groundwater in excess of inhalation criteria including Area 2 for VOCs (Nonresidential Groundwater Concentrations for Vapor Intrusion [GWVI-nr] and Soil Volatilization to Indoor Air Inhalation Criteria [SVIIC]) and Area 5-3 for 1,1-dichloroethene (SVIIC) in soil at one sample location.
- **Particulate Soil Inhalation Criteria Exceedances:** Manganese exceeds Particulate Soil Inhalation Criteria (PSIC) at one sample location in Area 2, one sample location in Area 5-2, and one sample location in Area 5-3.
- **Direct Contact Criteria Exceedances –** In addition to Area 5-2 LNAPL area, there are four areas at Plant 2 that have soil impacts in excess of DC criteria including Area 2 for arsenic at one sample location, Area 5-1 for SVOCs, Area 5-3 for benzo(a)pyrene at one sample location, and Area 5-5 for benzo(a)pyrene at one location.

Plant 3

The following are considered the primary areas of Plant 3 that will require further consideration of remediation in the CMS:

- **LNAPL (Area 17):** LNAPL is present within the shallow fill material in the north central portion of Plant 3 associated with a former underground storage tank. The LNAPL consists of gasoline with associated soil and groundwater impacts consisting primarily of benzene, toluene, ethylbenzene, and xylenes. The lateral and vertical extents of the LNAPL and the associated soil and groundwater impacts (within the perched water zone) are defined. Mobility and recoverability testing indicate the LNAPL plume is stable, with only a limited potential for recoverability.
- **Hexavalent Chromium (Area 14):** Hexavalent chromium in soil and groundwater are present in the former electroplating area in the north central portion of Plant 3 that exceeds RBSLs. Based on extensive sampling, the lateral and vertical extent of hexavalent chromium is localized within the perched zone and other metals that have historically exceeded criteria in this area, including nickel and copper in soil and groundwater are defined. Historical detections of arsenic in soil above RBSLs are not currently defined at the property boundary. Deep overburden monitoring wells near the former plating area have also indicated

arsenic, total chromium, nickel and lead at concentrations just above the DW Criteria.

- Vinyl Chloride in Bedrock Groundwater (northwestern Plant 3): Vinyl chloride has been detected above the DW Criteria in bedrock at two locations on the northern portion of Plant 3. Based on the general lack of CVOC source at Plant 3 and the known regional vinyl chloride impacts to bedrock, the vinyl chloride identified at Plant 3 is attributed to off-site source(s). While current bedrock potentiometric data suggest groundwater flow to the northwest, historical operation of Lansing municipal wells along the bedrock valley would have strongly influenced flow conditions, likely reinforcing flow from the northeast.
- Vapor Inhalation Criteria Exceedances: In addition to the Area 17 LNAPL area, there are two areas with soil in excess of SVIIC at Plant 3 including Area 11 for 1,1-dichloroethene (1,1-DCE) at one sample location, and Area 18 for 1,2-Dibromo-3-chloropropane at one sample location.
- Particulate Soil Inhalation Criteria Exceedances: Manganese exceeds PSIC at one sample location in Area 20 and nickel exceeds the PSIC at historical boring locations in Area 14.
- Direct Contact Criteria Exceedances: There are four areas at Plant 3 that have soil impacts in excess of direct contact criteria including: Area 16 for benzo(a)pyrene and lead (one sample location each), Area 18 for benzo(a)pyrene at one sample location, Area 19 for arsenic, and Area 21 for arsenic at one location.

Plant 6

The following are considered the primary areas of Plant 6 that will require further consideration of remediation in the CMS:

- 1,4-Dioxane Plume: Associated with the LNAPL at Plant 2 (Area 5-2), a groundwater plume consisting primarily of 1,4-dioxane, extends west to east across Plant 6 within the perched water in the shallow overburden. The extent of the plume is defined and does not extend off site above the proposed DW Criteria of 8.5 µg/L. 1,4-Dioxane has not been detected in bedrock wells at Plant 6.

- COCs at Plant 6 Property boundary (Area 5-7): Vinyl chloride has been encountered slightly above the DW Criteria in the perched zone water and below criteria in bedrock groundwater near the northeast Plant 6 boundary. Vinyl chloride has been delineated in overburden by off-site wells. In bedrock, lead has been detected in the bedrock well, nominally exceeding the DW Criteria of 0.004 milligrams per liter (mg/L), but less than the U.S. Environmental Protection Agency standard of 0.015 mg/L, and bis(2-ethylhexyl)phthalate has been detected at 7 ug/L, slightly above DW Criteria (6 ug/L). Bis(2-ethylhexyl)phthalate had not previously been detected in bedrock at this well location. Impacts to the bedrock well may be related to well construction as issues have been identified during sampling that suggest a compromised well casing. Lead has been detected in perched water southwest of the bedrock well location.
- Vapor Inhalation Criteria Exceedances: There are three areas with soil in excess of SVIIC at Plant 6 including: Area 5-7 for trichloroethene at one sample location, Area 7 for xylenes at one sample location and, and Area 9 for VOCs at one location. In addition, Area 9 exceeds Flammability and Explosivity Criteria for xylenes in groundwater at one sample location.
- Particulate Soil Inhalation Criteria Exceedance – Manganese exceeds PSIC at one sample location in Area 5-8.
- Direct Contact Criteria Exceedances – Lead exceeds the DC Criteria in Area 5-6 (e.g., “lead in soil” area).
- Groundwater-Surface Water Interface (GSI) Criteria Exceedances – based on storm sewer sampling completed at Plant 6, COCs (selenium and xylenes) are present above GSI Criteria in the sewer and exit the southern portion of Plant 6. However, the magnitude of the concentrations is generally close to the GSI criteria (selenium 0.006 mg/L [GSI - 0.005 mg/L], xylenes at 64 µg/L [GSI - 41 µg/L]); based on the length of the sewer between the site and the Grand River (4500 feet), it is expected that dilution from groundwater infiltration will reduce the concentrations to below the standard before discharge to the Grand River.

A detailed discussion of each AOI and potential corrective measures for each area will be provided as part of the CMS scheduled for completion in June 2013. Based on the nature of impacts observed at the Site and the expected future Site use (nonresidential), Restrictive Covenants will be proposed for the Site to the extent practicable to eliminate unacceptable exposures to soil and groundwater impacts. Land

use will be restricted to nonresidential use, institutional controls (e.g. no use of groundwater) will be implemented, and engineering controls (i.e., vapor barriers on future buildings) will be required, as needed.

Remaining Data Needs

Based on the results of the RFI, the following areas of the Site will require additional investigation to adequately characterize or delineate COCs:

- Northern Plant 3 (Areas 14, 17 and 18): Arsenic has been detected at the east and west Plant 3 property boundaries (historical sample locations) above the drinking water protection (DWP) Criteria. Additional work will be completed by RACER to define the extent of arsenic in soil at the Plant 3 property boundary.
- Plant 3, Area 16: The extent of arsenic in groundwater southwest of Area 16 is not defined to generic RBSLs between Area 16 and the southeastern Plant 3 property boundary. RACER will complete additional work in this area to define arsenic in groundwater.
- Plant 3, Deep Overburden (Area 11): 1,4-dioxane has been detected at deep overburden above DW Criteria in Area 11. RACER will complete additional work in March 2013 to characterize and define the extent of 1,4-dioxane impacts in deep overburden.
- Plant 3, Deep Overburden: Metals have been detected in the deep overburden aquifer at Plant 3 (MW-19, MW-02-04, MW-23 and MW-04-04). Based on the occurrence of metals (arsenic, lead, and nickel) in near surface soils near the former plating area (Area 14), metals in deep overburden may be related to former site operations. Additional sampling will be completed at these locations to verify the elevated metals with an emphasis on low turbidity sample collection.
- Plant 6, Area 7: The extent of metals including lead, arsenic and vanadium south of Area 7 are not defined in groundwater to generic RBSLs. RACER will propose to complete additional sampling off site to define metals exceedances in groundwater.
- Plant 6, Area 5-8: Vanadium exceeds DW Criteria at P6-SB-35 located 200 feet from the eastern property boundary. Additional sampling at P6-SB-35 will confirm whether work is required to delineate vanadium at the property boundary.

- Plant 6, Bedrock Metals: Metals above DW Criteria have been detected at Plant 6 in existing bedrock wells MW-04-06 (lead) and historical MW-04-04(4) (arsenic, beryllium, total chromium, cobalt, lead, manganese, nickel, and vanadium). Impacts at these wells may be related to well construction and RACER will propose to abandon and/or replace these wells in order to verify the metals results in bedrock.

Continued monitoring of groundwater is warranted to evaluate 1,4-dioxane plume stability and verify the occurrence of metals in deep overburden and bedrock wells. Recent sampling for metals in groundwater has shown sensitivity to turbidity, which has resulted in several wells showing below standard concentrations when prior results were above criteria. Most of the remaining exceedances related to metals are slightly over the standards, suggesting that additional sampling is warranted to verify if metals are a concern. Continued monitoring will be performed concurrent with the RFI review and development of the CMS.

In addition to the above items, the potential for preferred migration of impacts associated with storm sewers and utility corridors are currently being evaluated:

- Storm Sewer Monitoring – Although storm sewer sampling initially indicated impacts to the storm sewer are minimal, monitoring will continue through the implementation of the CMS to verify this condition.
- Plant 6 Stormceptor ESC-2 – Following the February 2013 cleanout of the stormceptor, monitoring of LNAPL within the stormceptor and upgradient storm structures have not shown presence of LNAPL. Monitoring will continue through the implementation of the CMS to verify this condition.
- Additional utility corridor sampling – Additional sampling will be completed in March 2013 adjacent to large utility corridors interior to the Site to evaluate if groundwater infiltration is causing preferred migration of site-related COCs in utility corridors. Monitoring will continue through the implementation of the CMS to verify this condition.

Data needs and evaluations at Plants 3 and 6 will be addressed during follow-up work completed in spring 2013 in parallel with the MDEQ's review of the RFI. Additional investigation activities and results of the ongoing utility evaluation will be summarized as part of an addendum to this RFI.

1. Introduction

This Resource Conservation Recovery Act (RCRA) Facility Investigation (RFI) Phase 2 Activities Summary Report has been prepared on behalf of the Revitalizing Auto Communities Environmental Response (RACER) Trust and summarizes the RFI activities completed between May 2012 and January 2013 at the Lansing Plants 2, 3, and 6 located in Lansing, Michigan (Site). The location of the Site is shown on Figure 1.

On June 1, 2009, General Motors Corporation (Old GM) filed for Chapter 11 protection in Federal Court under the Bankruptcy Code. On July 10, 2009, what would subsequently become General Motors LLC (New GM) purchased certain Old GM assets pursuant to Section 363 of the Bankruptcy Code. Motors Liquidation Company was formed to manage the assets of the 89 properties not sold to New GM in its capacity as debtor-in-possession in the bankruptcy case. Effective March 31, 2011, the RACER Trust was created through a Bankruptcy Settlement Agreement and the environmental remediation of the Lansing properties was transferred from Motors Liquidation Company to RACER Trust.

In 2011, ARCADIS completed Phase 1 of the RFI at Plants 2, 3, and 6. The RFI Phase 1 activities were conducted in accordance with the approved RFI Work Plan, Quality Assurance Project Plan and Field Sampling Plan prepared by ARCADIS G&M of Michigan, LLC (ARCADIS; 2011) and submitted to the Michigan Department of Environmental Quality (MDEQ) incorporating MDEQ comments on August 26, 2011. The RFI Phase 1 targeted Areas of Interest (AOIs) identified at the Site based upon historical use and previous investigation results. The AOIs targeted by the RFI Phase 1 were agreed upon by RACER and the MDEQ as the most likely areas with soil and groundwater impacts related to historical Site use. The results of the RFI Phase 1, documented in the *RFI Phase 1 Activities Summary Report* (ARCADIS 2012a), identified the need for additional investigation.

Based on the results of the RFI Phase 1, ARCADIS prepared a work plan outlining Phase 2 of the RFI entitled *RFI Work Plan, Phase 2*, (ARCADIS 2012a). The RFI work Plan, Phase 2 was subsequently approved by MDEQ on May 7, 2012 via email. The goal of the RFI Phase 2 activities was to complete the characterization and delineation at AOIs identified as requiring further evaluation during the Phase 1 investigation. The RFI Phase 2 activities were completed in stages. Following each stage of the investigation a "milestone meeting" was held with MDEQ to discuss the results of the RFI and solicit feedback on additional data needs. Following each milestone meeting,

a memorandum outlining the specific scope for the next stage was submitted to the MDEQ for approval. These submittals included the *RFI Phase 2, Characterization Stage Scope of Work* (ARCADIS 2012b), and the *RFI Phase 2, Delineation Stage Scope of Work* (ARCADIS 2012c).

The overall purpose of this report is to provide a basis for the preparation of a RCRA Corrective Measures Study (CMS) Report.

1.1 Site Location and Description

The Site (Plants 2, 3, and 6) is located in western Lansing and occupies a total area of approximately 250 acres. The locations of Plants 2, 3, and 6 relative to the greater Lansing area are provided on Figure 1. The construction of the three plants was completed between the early 1900s (Plant 2) and the 1930s (Plant 3), and operations were focused on various aspects of automobile assembly and manufacturing. Plants 2 and 3 are located in Lansing Township and Plant 6 is located within the City of Lansing. The *Current Conditions Report* prepared by ARCADIS (2008) provides a detailed summary of the Site history and operations.

Decommissioning of the plants began in 2007. As of the date of this report, the Site buildings have been demolished and all three Plants are secured with fencing and locked gates. Concrete slabs and asphalt parking lots remain in place across much of Plants 2 and 3. Ongoing demolition activities extending through 2012 have removed much of the concrete slabs at Plant 6 and the crushed concrete has been used as fill material across all three plants.

1.2 Previous Investigation Activities

The RFI Phase 2 activities are based on the results of the *Current Conditions Report* (CCR; ARCADIS 2008) and the *RFI Phase 1 Summary Report* (ARCADIS 2012d).

1.2.1 Current Conditions Report

The purpose of the CCR was to describe the current conditions and historical waste management practices at the former GM Facilities, Plants 2, 3, and 6, located in Lansing, Michigan. The report defined specific AOIs based on historical site use and determined which AOIs merited further investigation based on available data.

Areas identified during prior investigations using terms such as solid waste management units and areas of concern identified by agencies, as well as additional areas identified by GM, were designated as AOIs.

References include:

- *Lansing Plants 2 and 3 U.S. Environmental Protection Agency Preliminary Assessment/Visual Site Inspection Report*; by PRC Environmental Management, Inc. (PRC 1994).
- *Lansing Plant 6 U.S. Environmental Protection Agency Preliminary Assessment/Visual Site Inspection Report*; by PRC Environmental Management, Inc. (PRC 1993).

Additional AOIs were then identified by ARCADIS based on the following:

- Review of Facility historical drawings, in both hardcopy and electronic format, to obtain information on historical operations and hazardous waste and material management.
- Interviews of Facility personnel with knowledge of the past and present operations.
- Facility reconnaissance including walkthroughs to evaluate the presence of AOIs.

The list of AOIs was compared against available reports and data to determine whether corrective actions were completed or if further action was required. The original list of AOIs was presented in the CCR along with a determination of whether additional investigation was merited to identify if a risk, or potential risk, could be present at a particular AOI. Based upon MDEQ's review and comments on the CCR, a revised list of AOIs was submitted for review to the MDEQ in February 2009. The list of AOIs was updated again in August 2010 and March 2011 based on further MDEQ input. The final list of AOIs requiring further action was presented in the approved RFI Phase 1 Work Plan (ARCADIS 2011).

1.2.2 RFI Phase 1 Summary Report

The scope of work approved by the MDEQ as the *RFI Phase 1 Work Plan* (ARCADIS 2011) was designed to evaluate the potential for soil and groundwater impacts at each of the AOIs requiring further action. The RFI Phase 1 activities consisted of 120 soil borings and associated soil and groundwater sampling. Tables summarizing the RFI Phase 1 results are provided as Appendix A. The RFI Phase 1 was used as a basis for the additional investigation activities proposed for the RFI Phase 2. In general, 49 AOIs at the Site were recommended for further evaluation during the Phase 2 activities based on detections of various constituents of concern (COCs). A table listing the COCs for the Site is provided as Table 1.

1.2.3 Goals of the 2012 RFI Phase 2 Investigation

The RFI Phase 2 was designed to characterize and delineate the soil and groundwater impacts identified in the CCR and during RFI Phase 1. As a general rule, if a COC, in particular volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), or polychlorinated biphenyls (PCBs), were detected at an AOI during the RFI Phase 1, additional borings were completed to evaluate the magnitude and extent of the impacts. This approach was generally applied even if the COC was detected below generic Michigan Risk-Based Screening Levels (RBSLs) established by Part 201 of the Michigan Natural Resources and Environmental Protection Act (Act 451, 1994, as amended).

The *RFI Work Plan, Phase 2* (ARCADIS 2012a) outlined an investigation strategy with the following primary objectives and goals:

1. Determine whether the vinyl chloride detected in two on-site bedrock wells at concentrations in excess of the Michigan Part 201 Drinking Water (DW) Criteria was a result of previous Site activities.
2. Investigate the light non-aqueous phase liquid (LNAPL) at Plants 2 and 3, as well as the associated soil and groundwater impacts. At that time, the concentration of PCBs in the Plant 2 LNAPL suggested the possibility that the soil may need to be managed under the Toxic Substances Control Act as a regulated waste. The PCBs are being managed in parallel with this RFI in accordance with U.S. Environmental Protection Agency (USEPA) Region 5 requirements. Concentrations of chlorinated VOCs (CVOCs) in the Plant 2 LNAPL suggested a potential for a dense non-aqueous phase liquid (DNAPL) fraction with the potential

to migrate downward through water-bearing zones. In addition, an area of Plant 3 had been identified with LNAPL in the vicinity of the former gasoline underground storage tanks (USTs) located near the central portion of the Site.

3. Characterize the hexavalent chromium identified at elevated concentrations in soil and perched water near the former plating area at Plant 3.
4. Investigate and map the site-wide groundwater conditions. Initial groundwater sampling had identified impacts to groundwater primarily consisting of VOCs, including 1,4-dioxane, as well as SVOCs and certain metals, but the overall extent of the groundwater plume(s) was not defined.
5. Investigate other areas of the Site with soil and groundwater impacts, either low-level detections or with Part 201 criteria exceedances. As discussed in the *RFI Work Plan, Phase 2* (ARCADIS 2012a), areas with limited data suggesting soil and groundwater impacts less than RBSLs would require additional sampling to confirm if soil or groundwater impacts were potentially present above Part 201 criteria in these areas.
6. Complete the installation of an appropriate monitoring well network for long-term monitoring, based on the characterization of the potential source areas and delineation of the associated soil and groundwater impacts.

To complete these objectives within the required timeframe, ARCADIS proposed a comprehensive, high-resolution sampling approach for the assembly of a detailed conceptual site model (CSM). The high frequency of sampling and comprehensive investigation of each AOI was designed to eliminate, to the extent practical, the need for additional follow-up work.

1.3 Stages of the 2012 RFI Phase 2 Investigation

Due to the size and complexity of the proposed investigation, the RFI Phase 2 activities were completed in three primary stages:

- **Assessment Stage** – May to June 2012. The goal was to evaluate the known or suspected source areas where the RFI Phase 1 activities identified soil or groundwater impacts. Soil and groundwater impacts identified during Phase 1 activities were used as a starting point in target areas to further characterize potential soil and groundwater impacts.

- **Characterization Stage – September 2012.** The goal was to focus the remaining investigation effort on areas identified during the Assessment Stage as potential source areas for COCs.
- **Delineation Stage – November to December 2012.** The data collected during the Assessment and Characterization Stages were used to select locations where additional monitoring wells would be installed for long-term monitoring. In addition, a number of remaining data needs identified either during or subsequent to the Characterization Stage were addressed during the Delineation Stage.

Following each stage of the investigation, milestone meetings were conducted with MDEQ to present new data and solicit feedback. MDEQ's comments and suggestions were incorporated into the investigation as it progressed.

1.4 Investigation areas

To implement the RFI Phase 2 Work Plan in an organized and efficient manner, the Site was divided into investigation areas numbered 1 through 21. Each area corresponds to the location of one or more of the AOIs identified as requiring additional work during the RFI Phase 1 activities. Investigation Area 5, which spans the central portion of Plants 2 and 6, was subdivided into eight smaller areas (Area 5-1, Area 5-2, etc.). A summary of the investigation areas, including associated AOIs, investigation approach, sequence, results, COCs, and risk drivers is provided on Table 2. This table serves as the basis for tracking work completed at the Site, includes a brief summary of the findings for each area, and lists potential exposure pathways. The locations of the investigation areas and corresponding AOIs are shown on Figures 2 (Plants 2 and 6) and Figure 3 (Plant 3).

2. Geologic Setting

The topography of the Site is generally flat with gently rolling hills around the perimeter of the plants. The Grand River is incised into the regional topography and wraps around the Site to the south, east, and north. Surface elevations for the Site range from approximately 855 to 875 feet above mean sea level (ft amsl). The average stage elevation of the Grand River is approximately 830 ft amsl.

2.1 Climate

The City of Lansing has an average temperature is 23.4 degrees Fahrenheit (°F; -4.8 degrees Celsius [°C]) in the winter with an average monthly minimum temperature of 13.5 °F (January; -10.3 °C). In summer, the average temperature is 68.5 °F (20.3 °C) with an average monthly maximum temperature of 82.6 °F (July; 28.1 °C) (www.worldclimate.com). The average yearly precipitation for the City of Lansing is 31.5 inches. Monthly precipitation values are fairly distributed, with the greatest amount of precipitation between April and September. June, August, and September have the highest average precipitation (i.e., between 3.4 and 3.5 inches per month). Snowfall is moderate, averaging 49.20 inches per year. The prevailing wind is from the southwest (Blasland, Bouck & Lee 2005).

2.2 General Site Stratigraphy

In general, overburden deposits across the region consist of glacial deposits associated with ground moraines and outwash plains. Glacial deposits are complex and variable in nature due to the wide range sedimentary conditions that can occur during glacial advance and retreat. Glacial sedimentary conditions typically including sub-glacial deposits such as clay-rich glacial till, outwash deposits such as sand and gravel, river or stream sediments of silt and sand, as well as clays associated with standing water (e.g. lakes, wetlands). The result of this complex sedimentary environment is a thick sequence of “glaciofluvial” sediments at the Site consisting predominantly of clays and silts, with discontinuous layers of sand, silty sand, and occasional gravel.

2.2.1 Overburden

In general, the unconsolidated overburden stratigraphy at Plants 2 and 6 consists of 1 to 10 feet of native sand and/or sandy fill, followed by an interbedded zone of less permeable clay mixes interbedded with more permeable lenses of silt and sand. Between 20 and 30 feet below grade the interbedded zone transitions to a dense, compact, primarily dry glacial till ranging from 10 to 30 feet thick. Beneath the till, a dry interbedded zone of sand, silt and clay is present above bedrock.

At Plant 3, the interbedded zone is generally thin or absent. The overburden beneath Plant 3 typically consists of 1 to 10 feet of sandy fill followed by 10 to 30 feet of dense, dry glacial till. Beneath the till, interbedded layers of dry silt or fine sand are encountered with occasional lenses of sandy clay and gravel extending to bedrock.

Based on the general sequence of sediments encountered at the Site, the stratigraphy of the overburden deposits is divided into four general units, in descending order, as follows:

- Shallow Sand and Fill – Typically encountered between 0 and 10 feet below ground surface (ft bgs). This is a layer of fill material or native sand located above the interbedded or glacial till units. This unit includes localized areas of unconfined perched water.
- Interbedded Zone – Occurs on Plants 2 and 6 and the southern portion of Plant 3, typically between 1 and 25 ft bgs. This unit is composed of interbedded soft clay with lenses of silt and sand. Perched water is often encountered within the more permeable sand lenses.
- Glacial Till – Encountered across all three plants and typically 20 to 30 feet thick consisting of dense, dry silt, sand and gravel mixed with clay. At Plants 2 and 6, this unit is typically encountered between 20 and 30 feet below grade. At Plant 3, this unit can be encountered at less than 10 feet below grade. Where present, the till forms a barrier to vertical migration and generally separates the perched water zones from the deep regional aquifer. At Plants 2 and 6, the interbedded zone and glacial till act together to limit infiltration to the bedrock aquifer. Deep impacts at Plants 2 and 6 are limited to metals at two bedrock well locations (one current, one historical). There is some indication at Plant 3 (e.g., occurrence of metals in the deep overburden aquifer) that the glacial till and lack of thick interbedded zone result in some communication between perched water and the deep groundwater units.
- Deep Overburden – Encountered beneath the glacial till and is composed of dry interbedded sand/silt/clay located above bedrock. The deep overburden is unsaturated at Plants 2 and 6. However, saturated deep overburden is encountered at Plant 3.

2.2.2 Bedrock

The Pennsylvanian-age Grand River Group and Saginaw bedrock formations underlie the overburden deposits at the Site and throughout the Lansing area. These formations constitute the regional bedrock aquifer, which is utilized as the primary drinking water source for the Lansing area. The older Saginaw Formation consists primarily of sandstone and shale with siltstone inclusions, minor coal seams, and limestone layers

representing cyclic deposition in a wide ranging fluvial, lacustrine/ marine setting (Dorr and Eschman 1970). The Grand River Formation is primarily sandstone with minor shale and is encountered within erosional valleys of the underlying Saginaw Formation. Because the sandstone of the Grand River Formation was formed within erosional valleys of the Saginaw Formation, the two formations are hydraulically connected, and thereby comprise one aquifer known as the Grand River-Saginaw aquifer (U.S. Geological Society [USGS] 2000). The two formations together represent the primary drinking water aquifer in the Lansing area.

The bedrock beneath Plants 2 and 6 is encountered at depths ranging from 55 to 65 ft bgs and is relatively flat lying horizontal to sub-horizontal beds. At Plant 3, the bedrock has a significant amount of topographic relief and is encountered at a depths ranging from 65 feet below grade in the southeast to 110 feet below grade beneath the northern and western portions of the plant. The bedrock surface at Plant 3 slopes to the north-northwest into an apparent erosional bedrock valley. Based on the bedrock well logs for the Site, as well as logs for off-site municipal wells, the axis of the erosional bedrock valley appears to be oriented northeast-southwest and continue off site toward the Grand River, which has average stage levels approximately 30 feet above the bedrock aquifer. The location of the Site bedrock monitoring wells, regional municipal water supply wells, and an interpretation of the bedrock topography is included as Figure 4.

Within the bedrock valley, unconsolidated sand, silt, and gravel layers are encountered above bedrock and are typically saturated at Plant 3. Based on the groundwater elevation measured within the deep overburden, and impacts noted within the bedrock valley (Section 4.8.3), the bedrock valley appears to exhibit some control on groundwater flow within the deep overburden. Groundwater elevations in the deep overburden at Plant 3 generally mimic the bedrock topography.

2.2.3 Cross-Sections

Geologic information for the Site has been compiled into Mining Visualization System (MVS) geologic modeling software developed by CTech Development Corporation. The model includes a representation of all available soil boring logs, as well as the Geoprobe® Hydraulic Profiling Tool (HPT) logs (described further in Section 2.3.4). Information regarding the preparation of the MVS model, as well as the 3D model output is attached as Appendix B. Appendix B is included electronically on an attached DVD disc that includes the MVS model output files (4D files) and the software required to view the model.

The MVS model was used to export 2D cross-sections that include the soil boring log information and relative permeability profile collected with the HPT. The correlation between borings is then reduced to a two-color system that differentiates permeable zones, consisting of sands and gravels (yellow), from relatively less permeable zones consisting of silts and clays (blue). The two-color system simplifies an otherwise complex stratigraphic sequence and differentiates zones of potential mass transport from potential confining layers and zones of mass storage. The majority of the cross-sections for various areas of the Site are included as Appendix C, and these will be referred to as necessary during the discussion of the RFI results. Two cross-sections; an east-west section across Plants 2 and 6, and a north-south section across Plant 3, are provided as Figures 5 and 6, respectively. The cross-sections include groundwater analytical results that are discussed further in Section 4. All of the boring logs for the Site are provided as Appendix D, which is included on the attached disc.

2.3 Hydrogeology

The Grand River-Saginaw bedrock aquifer is the primary drinking water source for the Lansing area. The Site is located within wellhead protection areas for the City of Lansing (Plant 6) and Lansing Township (Plants 2 and 3). The location of the Site relative to the wellhead protection areas and municipal water supply wells are provided as Figure 7. Municipal water wells are generally installed as open bedrock wells with total depths of 400 to 500 feet below grade. The well casings are generally set at 50 or more feet into bedrock to assure well stability. Lansing Board of Water and Light personnel have indicated that these wells are typically capable of several hundred gallons per minute pumping capacity.

In general, there are three water bearing zones at the Site: the perched water, typically occurring within the fill, the interbedded zone, and occasionally within the glacial till, between 5 to 30 ft bgs; the deep overburden aquifer with a water table at 65 to 70 ft bgs; and bedrock, which is encountered at depths ranging from 55 to 110 ft bgs beneath the Site. In the northern portion of Plant 3 the deep overburden is saturated when the bedrock surface is located deeper than 70 ft bgs. A table summarizing groundwater elevations measured at the Site is provided as Table 3. A summary of monitoring wells currently installed at the Site is provided on Table 4.

2.3.1 Perched Zones

Due to the predominance of clay rich sediments, the interbedded zone has an overall low permeability and is characterized by isolated sand zones within layers of silt and

clay. Groundwater elevation measured within the perched zones is presented on Figure 8 (Plants 2 and 6) and Figure 9 (Plant 3). Figure 8 includes groundwater contours for all wells that are less than 25 feet deep. The lower conductivity (K) clays and silts result in high horizontal gradients and reflect the discontinuous nature of the conductive sand zones. Because the variability of K in the perched water zone is orders of magnitude greater than the groundwater gradient, the flow and contaminant transport at the Site is controlled by the hydrostratigraphy of the perched water zone. The complex gradients at the Site reflect this condition, and traditional groundwater elevation contour maps are of limited use within this zone to determine groundwater flow direction and transport.

A high-resolution sampling approach was used at the Site to gather sufficient soil and groundwater data within the perched zone to characterize and delineate groundwater impacts by contaminant distribution. Based on the spatial distribution of COCs in groundwater at the Site, groundwater flow direction within the perched zones appears easterly at Plants 2 and 6. At Plant 3, perched water occurs in isolated pockets, primarily within the shallow fill. In the central portion of Plant 3, groundwater flow direction within the fill material appears northeasterly. However, the localized nature of groundwater impacts relative to the LNAPL source is consistent with the limited transport potential in this area.

Slug tests were completed at several locations within the perched zone as part of the LNAPL mobility testing (Section 4.3). The results of the slug testing are provided on Table 5. The analysis of the 2012 slug test data is included as part of Appendix E. The results of the slug testing indicate that wells screened within permeable units of the perched zone have a K ranging from 0.07 to 40 feet per day (ft/day). The hydraulic conductivity for the finer grained silts and clays will be several orders of magnitude less than the permeable zones based on published K values. Based on the range of hydraulic conductivity, variable hydraulic gradients, and porosity associated with the sand-silt-clay soils, it is expected that groundwater flow velocities will range several orders of magnitude in the heterogeneous perched zone.

Based on the location of the 1,4-dioxane source mass (Plant 2 LNAPL), length of the resulting 1,4-dioxane plume (~1,800 feet), and potential age of release (1,4-dioxane came into common use as a stabilizer for trichloroethane (TCA) in the 1960s [Mohr 2010]), the groundwater velocity within the perched zone could be on the order of 0.1 to 0.2 ft/day, assuming an age of 25 to 50 years. Based on the abundance of lower conductivity soils in the perched zone, the transport velocity has likely slowed as mass

was stored in the finer grained matrix due to diffusion. Additional groundwater trend monitoring is warranted to verify plume stability.

Hydraulic communication between the perched zone and bedrock aquifer is generally limited, which is supported by the following evidence:

- 1) A zone of dry deep overburden beneath the glacial till underlying Plants 2, 3, and 6 that, where present, form a low-permeability barrier to vertical flow.
- 2) A separation of the perched zone and regional bedrock aquifer by 30 (Plants 2 and 6) to 60 feet (Plant 3) of glacial till and vadose zone. The vertical K of the glacial till has been tested at 10^{-5} ft/day at Plant 6. Permeameter results for the glacial till are summarized on Table 6.
- 3) A general lack of site-related groundwater impacts in the bedrock aquifer beneath the most heavily impacted areas of the Site, including the LNAPL impacts located within the perched zones at Plants 2 and 3.

The communication between the perched zone and deep overburden/bedrock aquifer at Plant 3 is also limited; however, metals have been detected beneath the former plating area (Areas 14, 17 and 18) suggesting some leakage does occur through the glacial till in this part of the Plant. In addition, impacts occur to the deep overburden aquifer in Plant 3 where the glacial till has been removed such as the 1,4-dioxane impacts beneath the “coliseum” in the southwestern portion of Plant 3.

2.3.2 Deep Overburden (Plant 3)

As discussed above, the bedrock beneath Plant 3 slopes to the northwest into an apparent bedrock valley (Figure 4). Where deep overburden is located at a depth greater than approximately 70 feet below grade at Plant 3, groundwater is encountered within the overburden overlying the bedrock. The lithology of the deep overburden aquifer consists mainly of interbedded fine sand and silt. The groundwater elevation of the overburden aquifer is generally 1 to 2 feet higher than in corresponding bedrock wells and the horizontal gradient generally mimics the bedrock topography. A groundwater elevation contour map for this the deep overburden unit included as Figure 10. Within the deep overburden, a groundwater elevation high is located near MW-02-01 along the eastern property boundary of Plant 3. Apparent groundwater flow within the deep overburden across the central portion of Plant 3 is to the northwest, consistent with the bedrock topography.

Slug tests were completed in 2002 at three locations within the deep overburden aquifer in the central portion of Plant 3. The results of 2002 slug testing are summarized on Table 7. The hydraulic testing indicates an average K of approximately 0.2 ft/day. Based on the measured gradient (0.013) in the central part of Plant 3, and an assumed effective porosity of 10 percent, the groundwater flow velocity within the deep overburden is approximately 0.04 ft/day or 14 ft/year.

2.3.3 Bedrock Aquifer

The Grand River Group and Saginaw Formations consist largely of sandstone interbedded with shale. Groundwater flow within bedrock is largely dependent on the presence of bedrock fractures and the groundwater elevation within a bedrock well will depend on screen depth, fracture distribution and the proximity to municipal pumping wells. According to a 1997 USGS groundwater flow model (USGS Rpt 97-569) bedrock groundwater flow is heavily influenced by municipal pumping. The model predicts a northeast-southwest trending flow divide located southeast of the Site. Groundwater north of the divide (including the area of the Site) moves toward the north toward pumping wells within the North Lansing Well Field, while groundwater south of the divide moves toward a regional cone of depression associated with wells near the Lansing downtown area.

The bedrock groundwater elevation contours developed for the Site are presented on Figure 11. The bedrock groundwater elevation contours developed for the Site suggest radial apparent groundwater flow at Plant 3 and a westerly flow at Plants 2 and 6. The relatively high groundwater elevation observed at MW-04-01 is elevated relative to other bedrock wells at the Site, but co-located with the relatively high groundwater elevation observed in deep overburden at MW-02-01. This mound could reflect localized recharge as discussed above in Section 2.3.2, or localized “perched” conditions within bedrock related to the occurrence shale upon which the bedrock well interval is placed. This well is also installed on the eastern margin of the bedrock valley.

Specific capacity testing of bedrock wells suggests the bulk K of the bedrock ranges from 80 ft/day in highly fractured wells to 0.6 ft/day in wells where minimal fracturing is encountered. A summary of the specific capacity testing results is provided as Table 8. The bulk K of the bedrock boreholes is generally dependent upon the number of fractures encountered at the well location. Bedrock wells with a large number of fractures encountered during drilling have a higher bulk K. For example, several fractures were encountered at bedrock well MW-12-02 and the resulting specific

capacity testing indicated a relatively high bulk K of 80 ft/day. Bedrock wells with a limited amount of fracturing encountered (e.g. MW-12-01, MW-12-03, MW-12-05, MW-12-06) have an average bulk K of 0.8 ft/day.

2.3.4 Hydraulic Profiling Tool Logging

In 2012, the HPT was used at Plants 2 and 6 to map the relative permeability of the overburden and guidevertical aquifer profile (VAP) sampling at the Site. Due to the thick unsaturated zone at Plant 3, standard soil description was used define the stratigraphy rather than permeability profiling. The HPT consists of a special tool attached to the end of a Geoprobe drill string that enables a continuous injection of small volumes of water (typically 200 milliliters per minute) during advancement of the probe. At the same time, the fluid pressure generated by the injection is measured and logged continuously using pressure transducers near the injection port. The pressure response data provides a relative measure of permeability that is comparable within the vertical profile of each sounding as well as between soundings at a given site. In general, a high pressure response correlates with lower permeability units (silt/clay), and a low pressure response correlates to higher permeability units (sand/gravel). The HPT logs are attached as part of Appendix D.

The HPT pressure logs are incorporated into the MVS stratigraphic model included as part of Appendix B, as well as presented on the cross-sections included as Appendix C. The HPT pressure logs illustrate the highly variable nature of the Site stratigraphy and were used to help guide selection of permeable zones for VAP sampling. In general, the logs consistently show the stratigraphic sequence at Plants 2 and 6 with a highly variable zone in the upper 30 feet followed by high or maximum pressure readings through the glacial till zone, and lower/variable pressure readings at depth with in the deep overburden.

At three of the HPT boring locations, soil samples were collected at 5-foot intervals and submitted for sieve analysis. Figures comparing the descriptive logs, HPT pressure response, and sieve analyses are included as part of Appendix E. Review of the comparison logs suggests that, in general, there is good agreement between the HPT pressure response and the logged lithology. Soils described as sand (permeable transport zones) versus clay or silt (less permeable storage zones) produce an appropriate low- or high-pressure response, respectively. There is some variability inherent to the HPT and soil description comparison related to the separate boreholes utilized for each boring (typically offset by 5 to 10 feet); however, the HPT response is

sufficient to accurately map and distinguish the transport and storage zones in the overburden system.

2.3.5 Surface Water Hydrology

The Grand River wraps around the Site to the south, east and west. At its closest proximity, the river is located approximately 2,000 feet north of Plant 3 as shown on Figure 1. The average stage elevation of the Grand River is approximately 830 ft amsl. The elevation of the bedrock aquifer at the Site ranges from 808 to 787 ft amsl. This suggests that although the Grand River may locally receive discharge from the overburden, it does not receive discharge from the bedrock aquifer, and is known to lose water to bedrock in the Lansing area.

2.3.6 Stormwater / Surface Water Discharge

The majority of Plants 2 and 3 remain covered under concrete slabs and asphalt. An extensive storm sewer collection system remains in place to prevent standing water at the Site. The storm sewer system for each plant is presented on Figures 12 through 14. Measured invert depths indicate that portions of the storm sewer network are below the perched water table. As such, during dry periods, groundwater infiltrates into the storm sewer system and eventually discharges to either the Grand River (Plants 2, 3, and southern Plant 6), or the City of Lansing wastewater treatment facility (northern Plant 6). In general, storm sewers at Plants 2 and 3 collect stormwater at common outfalls and discharge to the Grand River located north of the Site. A portion of the Plant 2 storm sewer system apparently discharges to the west of the Plant 2 to the Bogas Drain and then to the Grand River. To date, the storm structures servicing the western portion of the Plant 2 system have not been located, or otherwise could not be accessed for sampling.

Much of the Plant 6 storm sewer system was capped or removed as part of the Plant 6 decommissioning activities. Three storm sewer outfalls remain at Plant 6. Two outfalls are located on the southern part of Plant 6, on either side of the railroad easement (Areas 6, 7, and 9), and connect to the Lansing storm sewer system. The storm sewers located on the southern portion of Plant 6 exit the Site through stormceptor oil/water separation structures (ESC-2 and ESC-3). South of Plant 6, the Lansing storm sewer system is separate from the sanitary sewer and discharges to the Grand River south of the Site. On the northern portion of Plant 6, the storm sewers near the Plant 6 entrance and northern parking lot area are intact and connect to the Lansing

combined storm/sanitary sewer that flows to the wastewater treatment facility located to the east of Plant 3.

3. Exposure Pathway Analysis

A pathway analysis was completed for the Site to identify receptors, potentially complete exposure pathways and relevant and applicable MDEQ Part 201 promulgated criteria (MDEQ 2012a) and draft MDEQ pathway-specific screening levels for comparison to soil, groundwater, and soil gas data collected at the Site. In addition, the pathway analysis and Site data screening evaluation will be used to determine areas of the Site requiring exposure controls. The full exposure pathway analysis is presented in Appendix F. The following is a brief summary of the exposure pathway analysis.

In general, the Site conditions are such that the general exposure pathway conceptual site model (EPCSM) for all three plants is the same (e.g., current land use, concrete and asphalt cover over a portion of each plant, areas within each plant where shallow perched groundwater is encountered within the top 10 feet, similar off-site land uses). In addition, the anticipated future use of all three plants is for nonresidential (likely industrial) use. Therefore, one general EPCSM was developed for the Site assuming that under current conditions, no pathways have been adequately restricted and a second EPCSM was developed assuming that certain pathways would be eliminated through the placement of Restrictive Covenants on the Site, as determined through the screening evaluation.

Currently, most ground surface is covered with concrete, asphalt and/or portions of the former industrial buildings (e.g., foundations, basements, etc.). There are limited exposed vegetated areas and no natural habitats or wetland areas on the Site. The anticipated future land use is industrial and is not expected to be redeveloped with significant areas that could serve as habitat for ecological receptors. Potential natural habitats are disturbed or non-existent. No ecological receptors were identified for further evaluation on the Site.

Conditions on the Site were evaluated within the context of the current MDEQ promulgated criteria (MDEQ 2012a); however, for shallow groundwater and soil gas, the draft screening levels for vapor intrusion (MDEQ 2012b) were used for comparison.

3.1 Exposure Assessment

Adverse health effects associated with COCs in environmental media can only occur if there is exposure. The objective of the exposure assessment is to identify pathways by which exposure may occur and to estimate the magnitude, frequency, duration, and routes reasonably anticipated for human exposure associated with the conditions being evaluated. This information is then integrated and used to estimate a dose that may be received under the conditions of interest. This dose can be compared to the guidelines or standards or used to calculate media concentrations that can then be compared to environmental data. This can be used to provide insight into the potential for adverse health effects to occur under the conditions being evaluated.

MDEQ provides media-specific, receptor-specific, and pathway-specific criteria that can be used to screen environmental data. Relevant criteria are chosen based on the information summarized in the exposure assessment.

3.1.1 Exposure Pathways

An EPCSM was developed for the Site and adjacent properties to summarize the current understanding of the sources of COCs, the means by which they are released and transported within and among media, and the exposure pathways and routes by which they may contact human receptors (see Figure F-1, Appendix F). The EPCSM was used to identify applicable and relevant criteria to evaluate on-site and off-site conditions and to confirm MDEQ generic screening criteria are appropriate for Site conditions. Elements of the EPCSM are discussed briefly in the following sections.

3.1.1.1 *Potential Sources*

Historical activities are assumed to have contributed COCs to environmental media. Based on previous investigations AOIs and investigation areas have been identified, with concurrence of the MDEQ, as areas having the greatest probability of being impacted by historical activities. COCs have been detected in soil, groundwater, and soil gas collected at the Site. No current activities at the Site have been identified as sources of additional contamination.

3.1.1.2 *Transport Mechanisms*

Migration pathways are processes by which constituents in an affected medium (i.e., soil, groundwater, or soil gas) are transported within that medium and/or between

media. COCs can migrate from soil to groundwater, ambient air, and indoor air; through shallow groundwater to deeper groundwater; from groundwater to indoor air; and from soil gas to indoor air. The pertinent migration pathways for soil, groundwater, and soil gas at the Site are discussed in greater detail in Section 2.1.2 of Appendix F.

3.1.1.3 Land Use and Potentially Exposed Populations

Currently, the Site is vacant, completely fenced, and the majority of buildings have been demolished. The Site is currently zoned as heavy industrial, and is likely to be redeveloped for nonresidential (industrial) use in the future. The Site is surrounded by residential and commercial properties, a couple of parks, and several school properties. The Site was evaluated based on a current and future nonresidential use. Conditions at the Site were evaluated based on potentially exposed industrial and construction workers. Off-Site properties were evaluated based on a residential exposure scenario.

Additional detail for on-site and off-site receptors is provided in Section 2.1.3 of Appendix F.

3.1.1.4 Potentially Complete Exposure Pathways

The Site and surrounding areas are partially located within the City of Lansing Well Head Protection Area and partially within the Township of Lansing Well Head Protection Area. As such, use of groundwater off site cannot be restricted; however, Restrictive Covenants are planned to be recorded with the deeds for Plants 2, 3, and 6 to prohibit the use of on-site groundwater for any purposes. A map of the Site showing the approximate plant locations and the City of Lansing and Township of Lansing Well Head Protection Areas is included as Figure 7. Off-site groundwater was evaluated as a potential drinking water source. Groundwater use on the Site was assumed to be prohibited through a future deed restriction.

Potentially complete exposure pathways for on-site and off-site receptors under current and anticipated future conditions are summarized in Figures F-1 and F-2 included in Appendix F, and are briefly discussed below. The EPCSM for anticipated future use assumes that potentially unacceptable exposures on site are eliminated to the extent possible through the placement of institutional and/or engineering controls (see Figure F-2).

Potentially complete exposure pathways (consistent with those defined in Part 201) include the following:

On-Site Industrial and Construction Workers:

- Soil:
 - Direct contact (incidental ingestion, inhalation of fugitive dust, inhalation of vapor) with surface and subsurface soil (current and future).
 - Inhalation of vapors or particulate emanating from surface and/or subsurface soil (current and future).
 - Inhalation of vapors in on-site buildings (future only).
- Groundwater:
 - Contact with shallow groundwater during excavation activities.
- Soil Gas:
 - Inhalation of soil gas migrating to indoor air (future only).

Off-Site Residential and Construction Workers:

- Soil:
 - Direct contact (incidental ingestion, inhalation of fugitive dust, inhalation of vapor) with surface and subsurface soil (current and future).
 - Inhalation of vapors or particulate emanating from surface and/or subsurface soil (current and future).
 - Inhalation of vapors in buildings (current and future only).
- Groundwater:
 - Ingestion of groundwater as drinking water (current and future).
 - Contact with shallow groundwater during construction activities (current and future, construction workers only).
- Soil Gas:
 - Inhalation of soil gas migrating to indoor air (current and future).

Additional detail for potentially complete exposure pathways is provided in Section 2.1.4 of Appendix F.

3.2 Relevant and Applicable MDEQ Criteria

The following sections summarize the MDEQ Part 201 criteria (MDEQ 2012a) that were determined to be relevant and applicable to the Site and off-site properties and that were therefore used to evaluate conditions. Criteria were identified based on the information summarized in the exposure assessment summarized above and presented in detail in Appendix F.

3.2.1 Soil

Soil data have been collected on-site at Plants 2, 3, and 6 and at various off-site locations. The following table summarizes the relevant and applicable criteria for on-site and off-site soil based on current conditions and for future conditions, where it is assumed Restrictive Covenants have been placed on the Site to control potential unacceptable exposures. For inorganic constituents, if the available Statewide Default Background Level was greater than a criterion, then the pathway-specific criterion defaults to the Statewide Default Background Level. In effect, metals results for the Site were first compared to Statewide Default Background levels. If they exceeded background, they were then compared to other criteria.

Table 9. Summary of Relevant and Applicable Soil Criteria

Criteria	Current Conditions		Anticipated Future Conditions	
	On-Site Soil	Off-Site Soil	On-Site Soil	Off-Site Soil
Drinking Water Protection (DWP) Criteria	NPC	R & A (Res)	NPC (a)	R & A (Res)
Groundwater Surface Water Interface Protection (GSIP) Criteria	R & A	R & A	R & A	R & A
Groundwater Contact Protection (GCP) Criteria	R & A	R & A	NPC (a)	R & A
Soil Volatilization to Indoor Air Inhalation Criteria (SVIIC)	R & A (NR)	R & A (Res)	NPC (a)	R & A (Res)
Infinite Source Volatile Soil Inhalation Criteria (VSIC)	R & A (NR)	R & A (Res)	R & A (NR)	R & A (Res)
Particulate Soil Inhalation Criteria (PSIC)	R & A (NR)	R & A (Res)	R & A (NR)	R & A (Res)
Direct Contact (DC) Criteria	R & A (NR)	R & A (Res)	NPC (a)	R & A (Res)
Soil Saturation (Csat) Levels	R & A	R & A	R & A	R & A

NPC – not potentially complete

NR – nonresidential

R & A – Relevant and Applicable

Res – residential

(a) Pathway will be restricted as needed based on results of the screening level evaluation

Based on the screening evaluation (presented in Section 4), Restrictive Covenants will be proposed for the Site to the extent practicable to eliminate unacceptable exposures to soil impacts. Land use will be restricted to nonresidential uses, institutional controls (i.e., no use of groundwater) will be implemented, and engineering controls (i.e., vapor barriers on future buildings) will be required, as needed. The EPCSM considering the use of Restrictive Covenants to eliminate unacceptable exposures is presented in Figure F-2.

3.2.2 Groundwater

The following table summarizes the relevant and applicable criteria for on-site and off-site groundwater under current conditions and for future conditions based on anticipated Restrictive Covenants.

Table 10. Summary of Relevant and Applicable Groundwater Criteria

Criteria	Current Conditions		Anticipated Future Conditions	
	On-Site Groundwater	Off-Site Groundwater	On-Site Groundwater	Off-Site Groundwater
Drinking Water (DW) Criteria	NPC	R & A (Res)	NPC (a)	R & A (Res)
Groundwater Surface Water Interface (GSI) Criteria	R & A	R & A	R & A	R & A
Groundwater Contact (GC) Criteria	R & A	R & A	NPC (a)	R & A
Groundwater Volatilization to Indoor Air Inhalation Criteria (GVIC)	R & A (NR)	R & A (Res)	NPC (a)	R & A (Res)
Draft Groundwater Concentrations for Vapor Intrusion (GW_{VI-res} and GW_{VI-nr})	R & A (NR)	R & A (Res)	NPC (a)	R & A (Res)
Acute Inhalation Screening Levels	R & A	R & A	R & A	R & A
Flammability and Explosivity Screening Levels (FESL)	R & A	R & A	R & A	R & A
Water Solubility Levels	R & A	R & A	R & A	R & A

NPC – not potentially complete

NR – nonresidential

R & A – Relevant and Applicable

Res – residential

(a) Pathway will be restricted as needed based on results of the screening level evaluation

Based on the screening evaluation (presented in Section 4), Restrictive Covenants will be proposed for the Site to the extent practicable to eliminate unacceptable exposures to groundwater impacts. Land use will be restricted to nonresidential uses, institutional controls (i.e., no use of groundwater) will be implemented, and engineering controls

(i.e., vapor barriers on future buildings) will be implemented, as needed. The EPCSM considering the use of Restrictive Covenants to eliminate unacceptable exposures is presented in Figure F-2.

3.2.3 Soil Gas

Soil gas samples have been collected at the Site in four locations located near the property boundaries. The following table summarizes the relevant and applicable draft screening levels for soil gas under current conditions and for future conditions based on anticipated Restrictive Covenants. As a conservative screen, the on-site soil gas data were used to evaluate potential off-site receptors.

Table 11. Summary of Relevant and Applicable Soil Gas Criteria

Criteria	Current Conditions		Anticipated Future Conditions	
	On-Site Receptors	Off-site Receptors	On-Site Receptors	Off-site Receptors
Draft Soil Gas Concentrations for Vapor Intrusion	R & A (NR)	R & A (Res)	NPC (a)	R & A (Res)

NPC – not potentially complete

NR – nonresidential

R & A – Relevant and Applicable

Res – residential

(a) Pathway will be restricted as needed based on results of the screening level evaluation

Based on the screening evaluation (presented in Section 4.0), Restrictive Covenants will be proposed for the Site to the extent practicable to eliminate unacceptable exposures to soil gas impacts. Land use will be restricted to nonresidential uses, and a requirement for vapor barriers on future buildings or additional data showing that vapor intrusion is not a concern will be required prior to the construction of new buildings. The EPCSM considering the use of Restrictive Covenants to eliminate unacceptable exposures is presented in Figure F-2.

3.3 Constituents Lacking Criteria

Ten constituents were detected in soil and/or groundwater samples that lack promulgated or draft MDEQ Part 201 criteria. These include 2-nitroaniline, 4-nitrophenol, bis(2-chloroethoxy)methane, methyl acetate, 2,2'-oxybis(1-chloropropane), benzaldehyde, 1,1-biphenyl, 1-methylnaphthalene, cyclohexane, and methylcyclohexane. Data for these constituents are included in Tables 12 through 17, and sample locations are shown on Figures 15 and 16.

Each constituent was evaluated based on frequency of detection and locations of detections to determine if impacts were delineated and if detections were located in areas where planned actions for co-located COCs would limit the potential for exposure. In addition, the detected concentrations were compared to available screening levels including the USEPA's Regional Screening Levels for Tapwater and Industrial Soil Direct Contact (USEPA 2012). The results of this evaluation are provided on Table F-4 (in Appendix F) and discussed in Section 2.2 of the Pathway Analysis included in Appendix F. Table F-4 includes the frequency of detection across the three plants, the maximum detected concentrations, the investigation areas in which the constituents were detected, and the rationale for why each constituent was not recommended for further evaluation.

Based on the results of the analysis, none of the constituents lacking criteria were recommended for further evaluation. All of the detections were delineated to either non-detect or below the USEPA Regional Screening Levels within the Site property boundaries.

4. Summary of RFI Phase 2 Investigation Activities

The overall objective of the RFI Phase 2 activities is to characterize and delineate the COCs at the AOIs identified by the CCR and *RFI Phase 1 Summary* as requiring additional investigation (ARCADIS 2008 and 2012a, respectively). The AOIs agreed upon by RACER and MDEQ as requiring additional evaluation are summarized in the AOI summary tables included as Appendix A. The AOI summary tables include a description of each AOI, general findings of the RFI Phase 1 activities, the Phase 1 recommendation for further action/no further action, and the assigned RFI Phase 2 investigation area, if applicable.

The RFI Phase 2 scope of work was designed to be adaptive, particularly during the initial stages, to minimize the number of mobilizations required to complete the investigation. Details regarding the RFI Phase 2 approach, strategy, and investigation methodology are provided in the *RFI Work Plan, Phase 2* (ARCADIS 2012a). The adaptive nature of the scope of work required the use of an on-site laboratory (Stone Environmental, Inc.) to provide real-time analytical testing, and the use of next generation characterization techniques such as HPT and laser-induced fluorescence (LIF), to rapidly and adaptively characterize the hydrostratigraphy and delineate LNAPL, respectively. Following each stage of the investigation, a memorandum was submitted to the MDEQ outlining the specific scope for the next stage (ARCADIS 2012b, 2012c).

As outlined in Section 1.4, AOIs investigated during the RFI Phase 2 activities were grouped into investigation areas to simplify the RFI Phase 2 organization. Each investigation area corresponds to the location of one or more of the AOIs. A summary of the Investigation Areas 1 through 21 is provided on Table 2. Table 2 outlines the associated AOIs for each area, provides a brief summary of the Phase 1 and Phase 2 results, and provides a summary of the relevant criteria exceedances for each area.

Table 2, together with the AOI summary tables included as Appendix A, provide a summary of the AOI investigation process beginning with the start of the RFI Phase 1 through the end of the RFI Phase 2. Therefore, each investigation area will not be called out individually in the following sections. Rather, the following sections will provide an overview of the RFI Phase 1 and 2 findings and highlight only areas that 1) are an exception to the CSM, 2) require particular corrective action above and beyond groundwater use restriction, or 3) have additional data needs.

The locations of the investigation areas relative to AOIs are provided on Figure 2 (Plants 2 and 6) and Figure 3 (Plant 3).

4.1 Investigation Results

Base on overall RFI approach and strategy, extensive sampling was required to characterize and delineate COCs at the Site. Together, the RFI Phase 1 and 2 activities included the following:

- 437 shallow soil borings (generally <30 ft bgs)
- 36 HPT/VAP borings (to bedrock or refusal, Plants 2 and 6)
- 10 VAP borings (to bedrock or refusal, Plant 3)
- 81 LIF borings to delineate LNAPL (Plant 2: 58, Plant 3: 23)
- 221 groundwater VAP samples
- 1,542 soil samples (Phase 1: 285, Phase 2: 1,257)
- 4 soil gas samples

- Installation of 54 monitoring wells (Phase 1 and 2; includes long-term monitoring wells and LNAPL monitoring wells)
- Collection of groundwater samples from all available site monitoring wells during two annual sampling events (2011 and 2012). The 2012 sampling event included 90 monitoring wells.
- Completion of a comprehensive LNAPL mobility assessment at Plants 2 and 3. The mobility assessment included field LNAPL transmissivity testing, a comparison of laboratory-determined LNAPL field and residual saturations, LNAPL pore velocity potential calculations, and LNAPL pore-entry pressure calculations.
- Completion of storm sewer sampling at Site outfalls during two separate events to assess whether COCs could be entering the sewer via groundwater infiltration at concentrations that could exceed GSI Criteria at the Grand River.
- Sampling, cleanout and monitoring of the Plant 6 stormceptor identified with LNAPL during the storm sewer sampling activities.

The laboratory analytical results for all of the RFI Phase 1 and 2 soil and groundwater samples are summarized on Tables 12 through 17. All monitoring wells, soil borings, HPT borings, LIF borings, VAP borings, and soil gas sample locations are included on Figures 15 (Plants 2 and 6) and 16 (Plant 3). The laboratory analytical reports are provided as Appendix G (attached disc). Metals results for historical sampling activities are considered in the following discussion, as well as included on figures (as appropriate). Historical metals sample results are summarized on tables included as Appendix H (attached disc). A number of overview figures are provided to illustrate the sampling results from a site-wide perspective. These figures include:

- Figures 17 and 18 (Plants 2 and 6, and Plant 3, respectively) - plan view summary of the VOC and SVOC soil and groundwater results collected at the Site.
- Figures 19 and 20 – plan view extent of 1,4-dioxane in groundwater at the Site (Plants 2 and 6, and Plant 3, respectively) with reference to both the existing DW Criteria of 85 micrograms per liter ($\mu\text{g/L}$), as well as the proposed DW Criteria of 8.5 $\mu\text{g/L}$, expected to take effect in December 2013.

- Figure 21 – plan view extent of metals detected in soil above the most restrictive RBSLs. This map also includes historical soil sample data collected during various site assessment activities beginning in the 1980s.
- Figure 22 - plan view extent of metals detected in perched water above the most restrictive RBSLs
- Figure 23 - plan view extent of metals detected in deep groundwater (deep overburden and bedrock) above the most restrictive RBSLs
- Figure 24 – extent of LNAPL impacts at Plant 2 based on soil and LIF borings.
- Figure 25 - extent of LNAPL impacts at Plant 3 based on soil and LIF borings.

In addition to the site-wide figures outlined above, the MVS model was used to generate 3D model output for the Site depicting soil and groundwater analytical data. The MVS model output is included as Appendix B. The model output was used to create 3D screenshot figures for each investigation area. The screenshot figures for each investigation are included in Appendix I. The MVS models and screenshot figures depict laboratory results that are normalized to the most conservative applicable criteria (typically GSI/GSIP or DW/DWP) to facilitate understanding of the magnitude and distribution (vertical and horizontal) of these COCs throughout the Site. Normalization of the data was achieved by dividing the laboratory result by the criteria:

$$\text{Laboratory Result} / \text{Regulatory Criteria} = \text{Normalized Value}$$

The normalized value has the properties:

- Less than one - laboratory result is below the regulatory criteria
- Equal to one - the laboratory result is equal to the regulatory criteria
- Greater than one - the laboratory result exceeds the regulatory criteria

Once the individual parameters are normalized to criteria, the compounds from each group (i.e. VOCs, SVOCs, metals) are added together to produce a total normalized value for the compound group. The compounds with a normalized value greater than or equal to one are summed within each group to produce the normalized value. The total normalized values for a compound group represent the relative strength of the

exceedance and can be visually compared in the model or screenshot figures to quickly identify the areas of greatest concern. The MVS model figures are annotated with specific information to illustrate which COCs were detected beyond DW/DWP or GSI/GSIP Criteria; for example, soil or groundwater impacts in excess of direct contact or vapor inhalation criteria would be noted on the figures. Additional information regarding the normalization process and compilation of the MVS model output are presented in Appendix B.

Appendix B (attached disc), includes the following types of MVS models:

- Site-wide models showing all normalized soil and groundwater data for compound groups VOCs, SVOCs and PCBs, both compared to restrictive criteria, and compared to various criteria
- Site-wide models showing all normalized metals data, both for total metals and individual metals, both compared to restrictive criteria, and compared to various criteria
- LNAPL models for Areas 5-2 and 17 depicting the LIF data, sample results and LNAPL extent
- Site-wide stratigraphic model depicting HPT borings and soil borings and interpreted hydrostratigraphic units

A complete list of the attached model files is provided in Appendix B.

The following sections provide a summary of the RFI results organized by media.

4.2 Storm Sewer Sampling

Groundwater and soil impacts above GSI/GSIP Criteria have been identified in shallow soil and perched water at the Site at depths consistent with the storm sewer invert elevations in certain areas. To assess whether COCs may be entering the sewer via groundwater infiltration at concentrations that could exceed GSI Criteria at the Grand River, ARCADIS collected storm sewer samples at strategic points on the Site during dry weather flow conditions. Details regarding the storm sewer sampling are provided in the *Stormwater Investigation Work Plan* (ARCADIS 2012e). Storm sewer samples were submitted for analysis of COCs, including Target Compound List VOCs, Target Compound List SVOCs, Target Analyte List Metals, and PCBs. The layout of the

stormwater system and the storm sewer sampling locations are provided on Figures 12 through 14.

To date, samples have been collected during two storm events; November 6 and 7, 2012 and January 18, 2013. The analytical results for the storm sewer sampling are summarized on Table 18. For clarity, only compounds that were detected at least once are included on the summary table. Results of the sampling are as follows:

- Plant 2: During the November and January sampling events, all COCs within the Plant 2 storm sewer were either non-detect or below GSI Criteria.
- Plant 3: The November sampling indicated several metals above GSI Criteria including, total chromium, copper, lead, and zinc. In January, a revised sampling methodology minimized the turbidity of the sample and as a result, all COCs were below GSI Criteria.
- Plant 6: At the southern outfall, the November sampling results indicated several metals and SVOCs above GSI Criteria. In January, a revised sampling methodology minimized turbidity in the sample. The January results indicate only selenium exceeded the GSI criteria. Selenium was detected at a concentration of 0.006 milligrams per liter (mg/L) compared to a GSI Criterion of 0.005 mg/L and xylenes were detected at a concentration of 64 micrograms per liter (µg/L), compared to a GSI Criterion of 41 µg/L. At the northern outfall from Plant 6, all COCs are either non-detect or below GSI Criteria.
- Plant 6: During the November sampling event at Plant 6, LNAPL was observed in Stormceptor ESC-2, located east of the railroad easement. As discussed in Section 4.6, a program of stormceptor cleaning and monitoring activities was completed to evaluate the nature of impacts. The LNAPL was determined to be a thin layer of motor oil. Monitoring of the stormceptor has not indicated additional accumulation of LNAPL within the stormceptor, or occurrence of LNAPL in upgradient storm sewer structures.

Based on the results of the storm sewer sampling, water with COC concentrations nominally in excess of GSI Criteria discharges from the southern portion of Plant 6 then enters the Lansing storm sewer system. The minimum distance from Plant 6 to the Grand River is 4,500 feet (straight line). On the way to the river, the storm system is expected to receive additional groundwater discharge from the surrounding area that serves to dilute the COCs emanating from Plant 6. Based on the length of the sewer

between the Site and the Grand River, it is expected that dilution from groundwater infiltration will reduce the concentrations to below the GSI standard before discharge to the Grand River.

Based on the January sampling results, storm sewer discharge from Plants 2 and 3 are below GSI criteria for all COCs.

As described in Section 3, the GSI/GSIP criteria are relevant and applicable for the Site; however, the analytical results indicate that the magnitude of the concentrations are generally close to the GSI criteria and dilution will reduce the concentrations to below the standard before discharge to the Grand River. RACER will continue to monitor the storm sewers as part of the quarterly monitoring activities to verify the stormwater base load and seasonal trends during the development of the CMS. Provided the magnitude of the COC concentrations is similar, ARCADIS will petition the MDEQ that the discharge is de minimis, consistent with the revised Part 201 Rules (Act 451 Sec. 324.20120e).

4.3 Light Non-Aqueous Phase Liquid (LNAPL), Delineation, Mobility and Recoverability

There are two areas of the Site with LNAPL present in the shallow perched zone; the central portion of Plant 2 (Area 5-2) and the north-central portion of Plant 3 (Area 17). In addition, LNAPL was detected in a stormceptor at the southern boundary of Plant 6. A detailed report documenting the LNAPL evaluation at Plants 2 and 3 is included as Appendix J. The stormceptor evaluation is summarized in Section 4.6 below. The following provides a summary of the LNAPL evaluation for each plant.

4.3.1 Delineation of LNAPL

The lateral and vertical extents of LNAPL at Plants 2 and 3 were delineated using a combination of LIF soundings and soil and groundwater sampling. A total of 58 LIF soundings were completed at Plant 2 and 23 LIF soundings were completed at Plant 3. Details regarding the operation of LIF are provided in the *RFI Work Plan, Phase 2* (ARCADIS 2012a). In general, the LIF tool is advanced into the soil and allows for rapid and high-resolution assessment of LNAPL impacts. Subsequently, soil and groundwater samples were collected from locations interior to and around the perimeter of the LNAPL areas to verify that the delineation was complete. Figures 24 and 25 illustrate the locations of the LIF soundings and areal extent of LNAPL impacts at Plants 2 and 3, respectively. The 3D screenshot figures depicting Area 5-2 are

included in Appendix I. Cross-sections for Areas 5-2 and 17 are included as part of Appendix C. The MVS model output for both areas is included as part of Appendix B.

Combined with site stratigraphy, it is evident that the vertical extents of LNAPL impacts are limited by the occurrence of the glacial till at both Plants 2 and 3. These results also indicate that the elevated concentrations of CVOCs encountered in the LNAPL at Area 5-2 are vertically delineated and controlled by the occurrence of the till, which has limited potential vertical migration of potential DNAPL. Finally, installation and sampling of bedrock monitoring wells adjacent to the LNAPL do not show groundwater impacts of VOCs or SVOCs, confirming that dissolved-phase migration of COCs contained within the LNAPL is limited by the till.

4.3.2 Mobility and Recoverability Evaluation

ARCADIS completed an LNAPL mobility and recoverability study for Plants 2 and 3 at the Site to assess the potential for future LNAPL migration, and determine the extent to which LNAPL is recoverable in these areas. The activities completed included field LNAPL transmissivity testing and LNAPL mobility modeling following ASTM International (ASTM), Interstate Technology and Regulatory Council (ITRC), and American Petroleum Institute (API) methods. The results of the assessment indicate the following:

- LNAPL is mobile within the interior of LNAPL bodies at Plant 2 and in a few specific areas at Plant 3, but is stable and not migrating.
- While a fraction of the LNAPL at Plants 2 and 3 is recoverable, aggressive LNAPL recovery (through hydraulically-based remediation) will not result in a beneficial reduction in overall LNAPL mass.

4.3.3 Terminology

The ITRC and MDEQ identify three different conditions that characterize the potential for NAPL movement in the subsurface (ITRC 2009; State of Michigan 2012). The MDEQ definitions are presented below:

- **Residual NAPL Saturation:** The range of NAPL saturations greater than zero NAPL saturation up to the NAPL saturation at which NAPL capillary pressure equals pore-entry pressure and includes the maximum NAPL saturation, below which NAPL is discontinuous and immobile under the applied gradient.

- Mobile NAPL: NAPL that exceeds residual saturation and includes migrating NAPL, but not all mobile NAPL is migrating NAPL.
- Migrating NAPL: NAPL that is observed to spread or expand laterally or vertically or otherwise result in an increased volume of the NAPL extent, usually indicated by time series data or observation. Migrating NAPL does not include NAPL that appears in a well within the historical extent of the NAPL due to a fluctuating water table.

4.3.4 Assessment Methodology

A comprehensive LNAPL mobility assessment uses multiple lines of evidence to determine LNAPL mobility and the potential for future LNAPL migration. The following lines of evidence were used to assess LNAPL mobility and recoverability at the Site:

- Field LNAPL transmissivity testing
- Comparison of laboratory-determined LNAPL field and residual saturations
- LNAPL pore velocity potential calculations
- LNAPL pore-entry pressure calculations

These complimentary lines of evidence have an inherent logic used to determine whether LNAPL is residual, mobile, or migrating. The following sections summarize the results of the assessment for Plant 2 and Plant 3. A more detailed description of LNAPL mobility and recoverability assessment approach is included in Appendix J.

4.4 Plant 2

4.4.1 Field LNAPL Transmissivity Testing

In November 2012, nine wells were installed at Plant 2 (LMW-12-01 through LMW-12-08, and LMW-12-03D) to facilitate LNAPL transmissivity testing. The new wells were installed in areas where previous LIF screening results indicated the highest relative fluorescence responses, where fluorescence intensity is roughly proportionate to LNAPL saturation. Additionally, four existing wells in Plant 2 (PMW-01 through PMW-03, and P2-SB-37) and one existing well in Plant 3 (UNK-14) were targeted for LNAPL transmissivity testing.

4.4.2 Manual LNAPL Skimming

ARCADIS gauged fluid levels in all of the wells located within the extent of LNAPL impacts (as defined by LIF investigation activities) at Plant 2 on six occasions from November 2012 to February 2013 to monitor for LNAPL accumulation and determine whether field LNAPL transmissivity testing would be feasible; where a minimum in-well accumulation of 0.2 foot was established as a threshold value for determining whether transmissivity testing would provide useful data (consistent with recommendations in ASTM 2012). In February 2013, only 2 of the 13 wells contained sufficient LNAPL thickness accumulations (>0.2 foot) to facilitate LNAPL transmissivity testing (LMW-12-03D with 8.10 feet, and PMW-01 with 0.64 foot).

Manual LNAPL skimming tests were initiated in wells LMW-12-03D and PMW-01 on February 6, 2013. The manual LNAPL skimming test completed at well LMW-12-03D was analyzed in accordance with ASTM guidance (see Appendix J for details), yielding a transmissivity value of approximately 0.005 square feet per day (ft^2/day). The test completed at PMW-01 could not be analyzed using conventional manual skimming test analysis. Instead, fluid level data collected during the initial recharge monitoring step of the test was analyzed using the Cooper and Jacob (1946)/Jacob and Lohman (1952) baildown test analysis method provided in the API LNAPL Transmissivity Workbook (API 2012), which yielded an estimated LNAPL transmissivity of 0.01 ft^2/day .

The ITRC suggests LNAPL transmissivity range of 0.1 to 0.8 ft^2/day as a lower-bound threshold for practicable LNAPL recovery using hydraulic methods (ITRC 2009). Measured LNAPL transmissivity at wells LMW-12-03D and PMW-01 are at least an order of magnitude lower than this range, indicating that LNAPL is minimally recoverable at these wells. While LNAPL transmissivity could not be directly measured at 11 of the 13 wells located in Plant 2, the lack of LNAPL accumulation suggests that LNAPL transmissivity is very low and likely less than LNAPL transmissivity in wells that contained sufficient LNAPL to permit transmissivity testing. Additional detail regarding LNAPL transmissivity testing at Plant 2 is provided in Appendix J.

4.4.3 LNAPL Baildown Testing

A LNAPL baildown test was completed at well P2-SB-37 in October 2011. The baildown test was initiated using a 1.5-inch disposable bailer to remove LNAPL from the well while minimizing removal of water. After LNAPL removal was completed, fluid

levels within the well were measured to monitor LNAPL recharge. Fluid level measurements were initially collected at 30-second intervals using an electronic oil-water interface probe, and the interval between successive measurements was gradually increased over the course of the test as the rate of LNAPL discharge to the well decreased.

The LNAPL recovery response recorded following initiation of the baildown test at well P2-SB-37 could not be formally analyzed using the API workbook. LNAPL drawdown during the test appears to reverse to negative values after the initial 14 minutes of the test, which could be related to field measurement errors (a result of trying to quantify minimal changes in LNAPL accumulation over time), and ambient changes in equilibrium water table elevation during the test period. Qualitatively, as LNAPL thickness only recovered to approximately 54 percent of the initial (pre-test) gauged thickness over a 2-day period, the LNAPL transmissivity at P2-SB-37 is likely very low.

4.4.4 Field and Residual LNAPL Saturation Comparison

The degree of fluid saturation within porous media fundamentally controls the mobility of fluids within that media. In a soil system, soil pores beneath the water table are completely filled with groundwater, which facilitates groundwater flow in response to small groundwater gradients. Above the water table within the capillary fringe, the water saturation decreases in relation to the elevation above the groundwater table and the capillary properties of the soil. As the water saturation within the soil pores diminishes, connections between water-filled pores decrease to the point where the groundwater can no longer move laterally.

At a site with LNAPL impacts the relative saturations of three fluids, air, LNAPL, and groundwater, must be considered when evaluating fluid mobility. Of primary interest is the mobility of the LNAPL and the related fluid saturations where LNAPL is mobile or immobile. LNAPL is mobile where there is continuity between LNAPL-filled soil pores that allows for lateral LNAPL movement. The LNAPL saturation at which LNAPL is discontinuous to the extent that it cannot flow is termed residual saturation.

Soil core samples were collected using thin-walled steel tubes (Shelby tubes) advanced with a hydraulic piston sampler from four locations in Plant 2 during installation of wells LMW-12-03D, LMW-12-06, LMW-12-07, and LMW-12-08 in November 2012. Soil core sample locations and depth intervals were selected to target areas where the highest relative fluorescence response was observed during LIF investigation activities. Upon retrieval, soil core samples were capped and flash-frozen

in their in-situ vertical orientation using dry ice and shipped to PTS laboratory in Santa Fe Springs, California for laboratory analysis for petrophysical testing, including pore fluid saturations to determine site-specific data on field (initial) and residual LNAPL saturations by the following methods:

- *Free Product Mobility – Water Drive Method (FPM-WD), proprietary method by PTS and API RP40.* This method forces water through the subsample to displace free LNAPL. This method provides porosity, field LNAPL saturation and residual LNAPL saturation under saturated conditions, which is expected to be greater than residual saturation under unsaturated conditions. The test is conducted at hydraulic gradients that far exceed typical site conditions; hence, values for residual LNAPL saturation measured using this method will be conservative as compared to residual saturation under typical site conditions.
- *Free Product Mobility – Centrifuge Method (FPM-C), Methods API RP 40 and ASTM D425M.* This method utilizes centrifugal force (cores are spun at 1,000 times gravity) to displace free LNAPL and water in a subsample of the soil core with air, which provides the minimum residual saturation that could be expected in the subsurface under unsaturated conditions.

The fluid saturations are reported as the percentage of the soil porosity, or pore volume, that is occupied by the fluid (%Pv). The field LNAPL saturation value represents the LNAPL saturation under in situ conditions. When field saturation equals residual saturation, the LNAPL is immobile.

LNAPL field and residual saturations were measured at a total of seven sample intervals collected from four locations at Plant 2 (six FPM-C analyses and one FPM-WD analysis). Field saturations exceeded residual saturation in each of the samples analyzed, demonstrating that a fraction (approximately 1 to 28 percent) of the LNAPL in the samples analyzed is mobile. This finding indicates that LNAPL is mobile at the pore scale, but may not be migrating at the plume scale. Hydraulic gradient, aquifer permeability, and LNAPL viscosity are a few factors that influence whether the LNAPL above residual saturation is capable of migrating. The LNAPL pore velocity calculations described in the following section consider these additional factors.

4.4.5 LNAPL Velocity Potential

There is potential for LNAPL movement in the subsurface at the pore scale wherever measured field LNAPL saturations exceed residual. LNAPL seepage velocity was

calculated for each of the seven samples (four locations: LMW-12-06, LMW-12-07, and LMW-12-08 within the perched zone, and LMW-12-03D within the interbedded zone) where field saturation was greater than residual. LNAPL velocities calculated for laboratory-measured field saturations ranged from 2.2×10^{-8} to 6.0×10^{-7} centimeters per second (cm/s) in Plant 2.

ASTM suggests that LNAPL seepage velocities less than 1×10^{-6} cm/s indicate LNAPL in the formation is functionally immobile. Based on this criterion, LNAPL at Plant 2 is functionally immobile. Additional detail on LNAPL velocity potential calculations is provided in Appendix J.

4.4.6 LNAPL pore-entry pressure

LNAPL migration into pristine soils occurs when there is sufficient LNAPL head pressure present in the subsurface at the fringe of the LNAPL plume to displace groundwater from the soil pores. LNAPL head pressure was calculated as critical LNAPL thickness for comparison to LNAPL thickness accumulations in monitoring wells to determine whether there is a potential for future LNAPL migration.

The critical head pressure required for plume expansion expressed in LNAPL thickness ranges from 0.49 to 0.83 foot for locations near the perimeter of the LNAPL body at Plant 2 (LMW-12-06, LMW-12-07, and LMW-12-08) where soil cores were collected. LNAPL thicknesses measured between November 2012 and February 2013 at these monitoring wells ranged from non-existent to 0.1 foot. All of these measurements are well below the critical LNAPL thicknesses, indicating that there is no potential for further LNAPL plume expansion into unaffected soils at Plant 2.

4.5 Plant 3

4.5.1 Field LNAPL Transmissivity Testing

In November 2012, three new monitoring wells were installed at Plant 3 (LMW-12-09 through LMW-12-11) to facilitate LNAPL transmissivity testing. The new wells were installed in areas where previous LIF screening results indicated the highest relative fluorescence responses, where fluorescence intensity is roughly proportional to LNAPL saturation. Additionally, one existing well in Plant 3 (UNK-14) was targeted for LNAPL transmissivity testing.

4.5.2 Manual LNAPL Skimming

ARCADIS gauged fluid levels in all of the wells located within the extent of LNAPL impacts (as defined by LIF investigation activities) at Plant 3 on six occasions from November 2012 to February 2013 to monitor for LNAPL accumulation and determine whether field LNAPL transmissivity testing would be feasible; where a minimum in-well accumulation of 0.2 foot was established as a threshold value for determining whether transmissivity testing would provide useful data (consistent with recommendations in ASTM 2012). In February 2013, only 2 of the 13 wells contained sufficient LNAPL thickness accumulations (>0.2 foot) to facilitate LNAPL transmissivity testing (LMW-12-10 with 0.32 foot, and UNK-14 with 0.90 foot).

LNAPL manual skim testing was completed in February 2013 in each of the monitoring wells where greater than 0.2 foot of LNAPL was identified (LMW-12-10 and UNK-14). Manual LNAPL skimming tests initiated at LMW-12-10 and UNK-14 could not be analyzed quantitatively. Calculated LNAPL drawdown values for the manual skimming test at LMW-12-10 were in the negative range, which could be related to field measurement errors (a result of trying to quantify minimal changes in LNAPL accumulation over time) or ambient changes in equilibrium water table elevation during the test period. Based on the observed LNAPL recharge rates observed (<0.03 gallons per day), the LNAPL transmissivity at LMW-12-10 is likely very low. The test at UNK-14 was discontinued after approximately 2 days due to surface water ponding in the area (UNK-14 is a flush mount well). Data collected over the initial 2 days of testing indicated little to no measurable LNAPL recharge after initiating the test. Estimates of LNAPL transmissivity at UNK-14 from a baildown test completed in October 2011 indicated an LNAPL transmissivity of approximately $0.01 \text{ ft}^2/\text{day}$, confirming that LNAPL is minimally recoverable at this location.

4.5.3 LNAPL Baildown Testing

A LNAPL baildown test was completed at well UNK-14 in October 2011. The baildown test was initiated using a 1.5-inch disposable bailer to remove LNAPL from the well while minimizing removal of water. After LNAPL removal was completed, fluid levels within the well were measured to monitor LNAPL recharge. Fluid level measurements were initially collected at one-minute intervals using an electronic oil-water interface probe, and the interval between successive measurements was gradually increased over the course of the test as the rate of LNAPL discharge to the well decreased.

LNAPL baildown test data collected from well UNK-14 were analyzed using Bouwer and Rice (1976)/Bouwer (1989) method, resulting in an estimated transmissivity value of 0.01 ft²/day. Early-time data, representative of discharge from filter pack materials, were excluded from the dataset to ensure that LNAPL transmissivity estimates were representative of LNAPL conditions in the formation. Additional details on the data collection and analysis are included in Appendix J.

4.5.4 Field and Residual LNAPL Saturation Comparison

LNAPL field and residual saturations were measured at a total of three sample intervals collected from two locations at Plant 3 (one FPM-C analysis at LMW-12-09 and two FPM-WD analyses at LMW-12-10). Field saturation exceeded residual saturation at one location (LMW-12-09); however, both sample intervals at LMW-12-10 were at residual saturation.

4.5.5 LNAPL Velocity Potential

LNAPL seepage velocity was calculated at one location (LMW-12-09) within the interbedded zone at Plant 3 where field saturation was greater than residual. LNAPL velocity at laboratory-measured field saturation for LMW-12-09 was calculated as 9.4×10^{-8} cm/s. There was no calculated pore velocity at LMW-12-10 because field saturations and residual saturations were equal meaning that LNAPL at this location is immobile.

ASTM suggests that LNAPL seepage velocities less than 1×10^{-6} cm/s indicate LNAPL in the formation is functionally immobile. Based on this criterion, LNAPL at Plant 3 is functionally immobile. Additional detail on LNAPL velocity potential calculations is provided in Appendix J.

4.5.6 LNAPL pore-entry pressure

LNAPL migration into pristine soils occurs when there is sufficient LNAPL head pressure present in the subsurface at the fringe of the LNAPL plume to displace groundwater from the soil pores. LNAPL head pressure was calculated as critical LNAPL thickness for comparison to LNAPL thickness accumulations in monitoring wells to determine whether there is a potential for future LNAPL migration.

The critical head pressure required for plume expansion expressed in LNAPL thickness is 0.5 foot for locations near the perimeter of the LNAPL body (LMW-12-09 and LMW-

12-10) where soil cores were collected. LNAPL thicknesses measured between November 2012 and February 2013 at these monitoring wells ranged from non-existent to 0.32 foot (see Table J-5). All of these measurements are below the critical LNAPL thicknesses, indicating that there is no potential for further LNAPL plume expansion into unaffected soils at Plant 3.

4.6 Plant 6 Stormceptor LNAPL

The stormceptor spill control structure ESC-2, located south of Area 7, was initially assessed during the November 2012 storm sewer sampling event to determine if a sample could be collected. Upon inspection, a free-phase liquid consisting of a viscous, brown LNAPL was observed within the stormceptor structure. The location of ESC-2 is included on Figure 14. The ESC-2 stormceptor, one of three installed at Plant 6, is designed to remove sediment and potential oil from stormwater runoff. Stormceptor ESC-3 is located west of the tracks in Area 9, and ESC-1 is/was located near the Plant 6 entrance, but to date has not been located.

A sample of the ESC-2 LNAPL was collected on January 14, 2013 and submitted to DPRA/Zymax Forensics laboratory located in Escondido California, for fuel fingerprint analysis. The laboratory report for the sample is included as Appendix J. The Zymax analysis indicates the LNAPL consists of hydraulic oil or motor oil. There were no gasoline or diesel range organics detected within the sample.

In February 2013, the ESC-2 and ESC-3 stormceptors were cleaned out with oversight provide by PM Environmental of Lansing, Michigan. LNAPL thickness measurements prior to cleanout indicated 0.05 foot of LNAPL was present at ESC-2 and sheen was observed at ESC-3. Approximately 9,600-gallons of liquid and sludge was removed from ESC-2 and 2,000 gallons of liquid/sludge was removed from ESC-3. The waste was characterized as non-hazardous and disposed of at a licensed waste treatment facility (Schultz Inc., Lansing). Following the cleanout, periodic monitoring has indicated that there is no LNAPL collecting within the stormceptors.

In addition, New-Pig® LNAPL pillows were placed in four storm sewer structures located upgradient of ESC-2. The pillows are hydrophobic and LNAPL-phyllic, and thus an indicator of LNAPL flowing into the storm sewer. The purpose of the pillows was to determine whether LNAPL was entering the storm sewer, and if so, what section of the storm sewer was receiving LNAPL. To date, LNAPL has not been observed to collect on the pillows.

Based on the observed viscosity and composition of the LNAPL (hydraulic or motor oil) the LNAPL is unlikely to be mobile in the subsurface. In addition, LNAPL has not been observed at ESC-2 since the stormceptor cleanout, or in the upgradient storm sewer structures. Therefore, it is possible that the LNAPL observed within ESC-2 is the result of a one-time release into the storm sewer, possibly during the Plant 6 demolition activities. RACER will continue to monitor ESC-2 and the upgradient structures for LNAPL accumulation during quarterly monitoring activities until such time as MDEQ agrees that further monitoring is no longer necessary.

In addition, based on the sheen observed in ESC-3, RACER will add the outfall from this stormceptor to the storm sewer monitoring plan to verify COCs are not exiting the Site at this location above GSI Criteria.

4.7 Site-wide Soil Data Discussion

One of the primary goals of the RFI Phase 2 activities was to characterize and define potential COC source masses in soil. In general, if soil impacts above RBSLs were detected in an investigation area, step-out soil borings were completed until the extent of the potential source mass was delineated. Exceptions to this approach generally include when impacts in one area merge with an adjacent area with borings adequate for the delineation.

The following discussion provides a summary of the soil sampling results, highlights potential exposure pathways, and identifies data needs. The specific detail for each investigation area, investigation sequence, and overall results for each area are provided on Table 2. Soil boring locations are provided on Figures 15 and 16, and sampling results for the various soil COCs are presented on Figures 17, 18, and 21. MVS model figures are included in Appendix I and MVS model output is attached as Appendix B.

4.7.1 Delineation

In general, potential source areas for VOCs or SVOCs in soil are defined on-site or at the property boundary. Specific on-site exceedances for soil RBSLs are outlined in Section 4.7.2. The following section discusses metals as an exception as there are several areas of the Site where metals exceed generic RBSLs at the property boundary.

4.7.1.1 Metals

As outlined in the *RFI Work Plan, Phase 2* (ARCADIS 2012a), the characterization of metals was focused on areas where metals were expected to present a relevant exposure pathway or act as a source of groundwater impacts. Metals were the main focus in several areas of the Site such as Area 14 (the former plating facility at Plant 3), and the “lead in soil” area located in Area 5-6, as well as Areas 16, 19, and 21. Figure 21 provides an annotated overview of metals detected above RBSLs across the Site. There are five main investigation areas with metals in soil above criteria:

1. Northern Plant 3 near the former plating area (Area 14)
2. Southwestern Plant 3 in and around the “coliseum”
3. Southeastern Plant 3 (Area 16) in an area with fill material
4. Central Plants 2 and 6, generally consistent with VOC impacts at the Site
5. Southern Plant 6 (Areas 6 and 7). Of the metals in soil, the most widespread with exceedances of RBSLs are arsenic, cobalt, manganese, selenium, and silver across the Site.

In addition, the former plating area at Plant 3 (Area 14) has historically had elevated concentrations of arsenic, nickel, copper, and chromium. Several investigations have been completed in Area 14 and are discussed in detail in the CCR (ARCADIS 2008). An MVS model for this area is provided in Appendix B, and 3D figures are provided in Appendix I. Sampling in this area during various investigations (including this RFI) has speciated chromium to determine whether hexavalent chromium is present. The results of chromium sampling indicate hexavalent chromium is only present in a small portion of Area 14 in both soil (one sample) and perched water (two samples), in an area located beneath a quality concrete slab. These results are shown on Figure 26. Based on this result, the total chromium values at Plant 3, including unspicated data are compared to chromium III criteria.

As a corrective measure for the Site, RACER will propose a deed restriction on the installation and use of potable wells, eliminating exposure via ingestion to groundwater impacts within the perched zone, making the soil protective of drinking water pathway incomplete at the Site; however, this pathway will be potentially complete for groundwater migrating off site. For metals in soil above DWP or GSIP Criteria at the

property boundary, co-located groundwater samples were evaluated as an indication of the potential for off-site migration. In two areas (Areas 7 and 16), metals were detected at or beyond the property boundary in perched water above RBSLs. For these areas, RACER will complete additional work to define metals off site to generic criteria. Groundwater exceedances for metals are discussed below in Section 4.8.

There are several areas around the perimeter of the Site where metals exceed either DWP or GSIP Criteria. These areas include:

- Plant 2, Western – Cobalt was detected above DWP and GSIP Criteria in the northwest corner of Plant 2 (MW-12-02). However, this sample was collected at a depth of 64 to 65 feet below grade, and cobalt was not detected in a groundwater sample collected from this well; therefore, the DW and GSI pathways are not a concern for cobalt.
- Plant 2, Area 4 – Selenium is detected off site above GSIP Criteria, but not detected above RBSLs in groundwater at this location (SB-A4-MX47). Therefore, the GSI pathway is not a concern for selenium at this location
- Plant 3, Northern (Areas 14, 17, and 18) – Arsenic has been detected at the east and west Plant 3 property boundaries (primarily historical sample locations) above the DWP Criteria. RACER will complete additional work at the Plant 3 property boundaries to delineate arsenic in soil.
- Plant 3, Southwestern– Manganese was detected above GSIP Criteria at the property boundary (P3-SB-32). Manganese has not been detected above GSI Criteria in storm sewer samples collected in this area. Therefore, the GSI pathway is not a concern for manganese at this location.
- Plant 3, Area 16 – Selenium and zinc have also been detected above GSIP Criteria in soil at the perimeter of Area 16, but did not exceed RBSLs in groundwater samples in the area or in the storm sewer samples collected in this area. Therefore, the GSI pathway is not a concern for selenium or zinc at this location
- Plant 3, Area 16 – Arsenic has been detected above DWP Criteria at the southeast perimeter of Area 16, as well as detected in groundwater samples above DW Criteria (SB-A16-HU178, SB-A16-IE168). Additional work will be

completed to delineate arsenic in groundwater at or beyond the Plant 3 property boundary.

- Plant 6, Area 9 – Selenium has been detected above GSIP Criteria along the southern property boundary in historical soil borings, but not detected in groundwater samples from nearby monitoring well MWBP-10-UST5-6. Therefore, the GSI pathway is not a concern for selenium at this location
- Plant 6, Area 5-8 – Selenium and mercury (at one location) has been detected along the eastern Plant 6 property boundary above the GSIP Criteria. Selenium or mercury has not been detected in groundwater samples collected in this area (P6-SB-18, MW-12-13, P6-SB-37, MW-12-12) nor in storm sewer samples. Therefore, the GSI pathway is not a concern for selenium or mercury at this location.

4.7.2 Soil Screening Criteria Evaluation

As noted previously, areas with impacts to soil in excess of DWP Criteria will be managed with a site-wide restriction of groundwater use. A number of areas at the Site have existing deed restrictions that serve as exposure controls. These deed restrictions are outlined in the CCR (ARCADIS 2008), as well as in the *Exposure Pathway Analysis for RACER Lansing Plants 2, 3 and 6* included as Appendix F. In addition, preliminary results of the storm sewer sampling indicate that concentrations of COCs are not leaving the Site at levels that would result in an exceedance at the discharge point to the Grand River. Therefore, the following discussion will only highlight those areas that will require additional corrective measures beyond groundwater use restriction.

In addition, Site data were evaluated against residential criteria to determine if the potential exists for off-site receptors to be adversely affected.

Cross-sections for many of the areas discussed below, as well as MVS 3D screenshot figures displaying analytical results, are included as Appendices C and I, respectively.

- Groundwater Contact Protection (GCP) Criteria - Soil impacts leaching to shallow groundwater and subsequent groundwater contact for subsurface activities:

- Area 7 – Xylenes exceed the GCP criteria at one location (SB-A7-TB220) at a depth of 9 to 10 ft bgs.
- Area 9 – Ethylbenzene and xylenes exceed the GCP criteria at P6-SB-41 at a depth of 8 to 9 ft bgs and anthracene exceeds the GCP at SB-A9-RP205 at a depth of 2 to 3 ft bgs.

The GCP criteria for ethylbenzene and xylenes default to the Csat (Saturation Screening) levels. NAPL has not been observed in Areas 7 or 9, and the concentrations of xylenes and ethylbenzene do not exceed the calculated RBSLs for GCP. Therefore, the GC pathway is not a concern for xylenes and ethylbenzene.

In addition, the GC pathway is not a concern for off-site receptors as the exceedances are limited to on-site locations, concentrations do not exceed the RBSLs for GCP, and concentrations of constituents in groundwater do not exceed the GC criteria in this area of the Site.

- Soil Volatilization to Indoor Air Inhalation Criteria (SVIIC) - Inhalation of volatile constituents migrating from soil to indoor air (of future buildings):
 - Area 2 – Benzene exceeds the SVIIC at one location (SB-A2-PC76) at depths of 17 to 18 and 23 to 24 ft bgs.
 - Area 5-2 - 1,1-DCE exceeds the SVIIC at one location (SB-A5.2-OC107A) at a depth of 8 to 9 ft bgs. CVOC impacts in area 5-2 are associated with the Plant 2 LNAPL impacts.
 - Area 5-3 – 1,1-DCE exceeds the SVIIC at one location (SB-A5.3-PA159) at 9 to 10 ft bgs.
 - Area 5-7 – Trichloroethylene (TCE) exceeds the SVIIC at one location (VAP-5.7-ML243) at a depth of 11 to 12 ft bgs. This location is in the “parking lot exceedance area”, north of the benzene, toluene, ethylbenzene, and xylenes (BTEX) impacts.
 - Area 7 – Xylenes exceed the SVIIC at one location (SB-A7-TB220) at a depth of 9 to 10 ft bgs.

- Area 9 – Ethylbenzene and xylenes exceed the SVIIC at one location (P6-SB-41) at 8 to 9 ft bgs.
- Area 11 – 1,1-DCE exceeds the SVIIC at one location (VAP-A11-HE24) at a depth of 3 to 4 ft bgs.
- Area 17 – Benzene exceeds the SVIIC at one location (SB-A17-EC147) at a depth of 13 to 14 ft bgs. The BTEX impacts in this area are associated with the Plant 3 LNAPL .

The SVIIC for ethylbenzene and xylenes default to the Csat (Saturation Screening) levels. NAPL have not been observed in Areas 7 or 9, and the concentrations of xylenes and ethylbenzene do not exceed the calculated RBSLs for SVIIC.

Conditions on-site are not expected to adversely affect off-site receptors. The only exceedances of the Residential SVIIC within 100 feet of the property boundaries are xylenes in Area 7. Soil gas samples collected adjacent to this exceedance did not contain VOCs at concentrations exceeding the draft residential Sub-slab Soil Gas Concentrations for Vapor Intrusion.

- Volatile Soil Inhalation Criteria (VSIC) - Inhalation of volatile constituents in the ambient air emanating from impacted soils (based on a 100-acre source area as previously agreed upon by the MDEQ and ARCADIS, based on the size of each of the plants):
 - Area 5-2 – Phenanthrene exceeds the VSIC at one location (SB-A5.2-NE157) at 3 to 4 ft bgs.
 - Area 15 – 1,2-Dibromo-3-chloropropane exceeds the VSIC at one location (P3-SB-26) at 11 to 12 ft bgs. This exceedance is located under a quality concrete pad.
 - Area 5-7 – TCE exceeds the VSIC at one location (VAP-5.7-ML243) at 11 to 12 ft bgs.
 - Area 9 – Phenanthrene exceeds the VSIC at one location (SB-A9-RP205) at a depth of 2 to 3 ft bgs.

Due to the limited number of samples that exceed VSIC criteria (one or two samples for each of the three COCs), the concentrations were also compared to generic criteria calculated for a ½-acre source area (Table 3 of Operational Memorandum No. 1; MDEQ 2007). The concentrations of the three COCs did not exceed the generic Infinite Source VSIC for a ½-acre source area and therefore, are not likely to be a concern for the Site.

Conditions on the Site are not expected to adversely affect off-site receptors for this volatile soil inhalation (VSI) pathway. Concentrations of benzene, 1,1-DCE, 1,2-dibromo-3-chloropropane, phenanthrene, and TCE exceeded the Residential Infinite Source VSIC in limited locations (one to two locations per plant). Due to the limited number of exceedances, and the locations (more than 200 feet from the property boundaries), these exceedances are not likely to pose a concern for off-site receptors.

- Particulate Soil Inhalation Criteria (PSIC, based on a 100-acre source area) – Inhalation of constituents in impacted fugitive dust. These criteria would only be applicable for subsurface soil if it is brought to the surface, or exposed during construction activities. Therefore, the exceedances deeper than 30 ft bgs are not likely to be a concern for the Site, as construction activities are not likely to extend beyond that depth.
 - Nickel exceeds the PSIC in four historical soil boring locations in Area 14 at depths between 1 and 15 ft bgs. The area of exceedances is less than ½ acre, and the maximum detected concentration (12,000 milligrams per kilogram [mg/kg]) does not exceed the PSIC for a ½-acre source area (16,000 mg/kg). Therefore, nickel is not a concern for the ambient air pathway in Area 14.

Nickel also exceeds the residential PSIC in Area 14; however, the exceedances are not likely to adversely affect off-site receptors. The nickel exceedances are located within a ½-acre area and do not exceed the residential PSIC for a ½-acre source area (13,000 mg/kg). The total chromium exceedances are currently located under a quality concrete pad.

Manganese exceeds the PSIC in shallow soils in the following investigation areas and locations:

- Area 2 – Two locations - P2-SB-31 at 1 to 2 ft bgs and SB-A2-PD65 at 9 to 10 ft bgs.
- Between Areas 4 and 5-1 – One location (P2-SB-35) at a depth of 2 to 3 ft bgs.
- Area 5-2 – Two locations: SB-A5.2-NG127 at a depth of 2 to 3 ft bgs and SB-A5.2-OB120 at a depth of 26 to 27 ft bgs.
- Area 5-3 – Three locations: SB-A5.3-OC169 at 6 to 7 ft bgs, SB-A5.3-OQ175 at 1 to 2 ft bgs and SB-A5.3-OX123 at 1-2 ft bgs.
- Area 5-6 – One location (SB-A5.6-NX232) at 1-2 ft bgs.
- Area 5-8 – Two historical locations: SA 11-1 at 3-5 ft bgs and SA 11-5 at 0.7 to 2.7 ft bgs.
- Area 10 – One historical location (SA 7-7) at 9 to 11 ft bgs.
- Area 16 – One location (SB-A16-HD162) at 8 to 9 ft bgs.
- Area 20 – One location (P3-SB-13) at a depth of 17 to 18 ft bgs.

Additional evaluation was completed to better understand potential hazards associated with manganese detected at concentrations greater than the PSIC based on the hypothetical 100-acre source area.

The emission source area was defined based on the area encompassed by half the distance to the nearest soil borings that did not exceed the 100-acre PSIC. Added together, the total emission source area is approximately 157,000 square feet (ft²), or 3.6 acres. Therefore, the 5-acre source area modifier of 0.66 was used to adjust the generic criteria and re-screen the data that exceeded the 100-acre source area criteria. The following summarizes exceedances of the adjusted PSIC criteria for manganese of 990 mg/kg.

- Area 2 – One location (SB-A2-PD65) at 9 to 10 ft bgs.
- Area 5-2 – One location (SB-A5.2-NG127) at 2 to 3 ft bgs.

- Area 5-3 – One location (SB-A5.3-OX123) at 1 to 2 ft bgs.
- Area 5-8 – One location (SA 11-5) at 0.7 to 2.7 ft bgs. The exceedance in Area 5-8 is currently located under a quality concrete slab.
- Area 20 – One location (P3-SB-13) at 17 to 18 ft bgs.

Two of these locations (Areas 2 and 5-2) exceed the residential PSIC for manganese; however, due to the very limited and well-defined areas of exceedances and the distances to the nearest property boundaries, they are not likely to be a concern for off-site receptors.

- Direct Contact –, direct contact with impacted soil, including dermal contact and incidental ingestion:
 - LNAPL Areas (Areas 5-2 and 17) – DC criteria exceedances beyond what are outlined below for Areas 5-2 and 17 are expected in the LNAPL impacted areas.
 - Area 2 – Arsenic exceeds DC criteria at one location (SB-A2-PA65) at 1 to 2 ft bgs.
 - Area 5-1 – SVOCs (Benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene) exceed DC criteria at SB-A5.1-MT126 at 1 to 2 ft bgs, and SVOCs (benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, and dibenzo(a,h)anthracene) exceed the criteria at VAP-A5.1-MT115 at 4 to 5 ft bgs. These exceedances are located under a quality concrete pad.
 - Area 5-2 – Benzo(a)pyrene exceeds DC criteria at two locations SB-A5.2-NE157 at 3 to 4 ft bgs and SB-A5.2-OG162 at 0 to 1 ft bgs, PCBs (Aroclor 1242) exceeds the criteria at SB-A5.2-NW124 at 4 to 5 ft bgs; and lead exceeds the criteria at SB-A5.2-OG144 at 0-1 ft bgs.
 - Area 5-3 – Benzo(a)pyrene exceeds DC criteria at one location (SB-A5.3-OX123) at 1 to 2 ft bgs. This exceedance appears to be located under a quality concrete pad.

- Area 5-5 – Benzo(a)pyrene exceeds DC criteria at one location (P2-MW-04) at 1 to 3 ft bgs.
- Area 14 – Arsenic exceeds DC criteria at one historic location (13) at 43.5 to 45 ft bgs. Due to the depth of this exceedance, it is not likely to be encountered or brought to the surface in the future. Therefore, it is not likely a concern for the Site.
- Area 16 – Benzo(a)pyrene exceeds DC criteria at SB-A16-HU165 at 4 to 5 ft bgs, and lead exceeds at SB-A16-HU168 at 9 to 10 ft bgs.
- Area 18 – Benzo(a)pyrene exceeds DC criteria at a one location (SB-A18-CJ150) at 1 to 2 ft bgs.
- Area 19 – Arsenic exceeds DC criteria at three locations at (P3-SB-25, SB-A19-HJ148 and VAP-A19-HJ150) between 1 and 10 ft bgs. This exceedance is currently located under a quality concrete pad.
- Area 21 – Arsenic exceeds DC criteria at one location (P3-SB-27) at 4 to 5 ft bgs. This exceedance is currently located under a quality concrete pad.
- Area 5-6 – Lead exceeds DC criteria at a number of historical as well as RFI Phase 1 and 2 boring locations (SB-A5.6-NP224, SB-A5.6-NU227 and VAP-A5.6-NR227) at depths ranging from 1 to 7 feet below grade. This area is known as the “lead in soil” area.
- Area 7 – Xylenes exceed DC criteria at one boring location (SB-A7-TB220) at 9 to 10 ft bgs; and benzo(a)pyrene exceeds the criteria at one location (SB-A7-SX206) at 0 to 1 ft bgs.
- Area 9 – Ethylbenzene and xylenes exceed DC criteria at one location (P6-SB-41) at 8 to 9 ft bgs.

The DC criteria for ethylbenzene and xylenes default to the Csat (Saturation Screening) levels. NAPL has not been observed in Areas 7 or 9, and the concentrations of xylenes and ethylbenzene do not exceed the calculated risk-based screening levels for DC. Direct contact with soil is not a concern for off-site receptors, as soil impacts above the DC criteria are limited to on-site areas.

- Soil Saturation Screening Levels:
 - Area 7 – Xylenes exceed the screening levels at one location (SB-A7-TB220) at 9 to 10 ft bgs.
 - Area 9 – Ethylbenzene and xylenes exceed the screening levels at P6-SB-41 at 8 to 9 ft bgs.

As noted above, NAPL has not been observed in Areas 7 or 9.

Soil exceedances based on the applicable exposure pathways outlined above will be managed via additional site use restrictions and evaluated for further corrective action as part of the CMS. The areas of the Site that will require additional site use controls are highlighted on Figures 27 through 29 (Plants 2, 3, and 6, respectively). These figures illustrate areas with potentially complete exposure pathways and include remaining “quality” concrete pads the remaining at the Site. The quality pads have been determined by RACER as suitable for rebuilding. In many areas, the concrete pads also serve to limit exposure to soil impacts (e.g. Areas 5-2 and 14), as well as limit infiltration through impacted areas of the Site.

4.8 Site-Wide Perched Water and Bedrock Groundwater

One of the primary goals established for the RFI Phase 2 activities was to characterize and delineate the site-wide impacts to groundwater. The following section provides a summary of the groundwater sampling results, highlights exceedances of applicable criteria, and identifies additional data needs. The specific detail for each investigation area, investigation sequence, and overall results for each area are provided on Table 2. Groundwater sample locations are provided on Figures 15 and 16 and figures depicting the overall sampling results for groundwater are included as Figures 17 through 20, 22 and 23. MVS model figures are included in Appendix I and MVS model output is attached as Appendix B.

In general, the primary impacts to groundwater at the Site include VOCs, SVOCs, and 1,4-dioxane impacts associated with the LNAPL at Plant 2 (Area 5-2), VOCs and SVOCs associated with the LNAPL at Plant 3 (Area17), and several other localized hotspots for VOCs and SVOCs including Areas 2, 11, and 5-7. In addition, an area of 1,4-dioxane is present on the northwest portion of Plant 2 that has been attributed to

the former Adams Plating Facility located west of Rosemary Avenue. Additional detail regrading Adams Plating site is provided in Section 4.8.3.2.

Metals are prevalent in groundwater across the Site and are presented on Figures 22 and 23 for the perched zone and deep overburden/bedrock, respectively. Manganese in particular exceeds aesthetic-based DW Criteria in 80 percent of the groundwater samples collected at the Site. Due to the pervasive nature of manganese, delineation to aesthetic criteria is not practical within the perched zone. Figures 22 and 23 present the distribution of manganese in perched water and bedrock for reference; however, manganese is not discussed as part of the delineation and exposure pathway sections because of its widespread nature. Manganese exceedances in soil are generally more limited in extent than in groundwater and suggest that reducing conditions at the Site are responsible for leaching of the naturally occurring manganese in soil.

Arsenic, vanadium, and lead are also commonly detected above RBSLs in groundwater at the Site. The distribution of metals in groundwater (with the exception of manganese) is similar to the distribution of metals in soil, and includes four general areas: northern Plant 3 (Areas 14, 17, and 18), southeastern Plant 3 (Areas 15, 16, and 19), central Plants 2 and 6, and southern Plant 6 (Area 7).

As noted previously, the hydraulic communication between the perched zone and bedrock aquifer is generally limited. At Plants 2 and 6, impacts primarily occur within the perched zone; separated from the bedrock aquifer by the glacial till and a layer of deep dry overburden. At Plant 3, the lack of an interbedded zone and occurrence of metals in the deep overburden aquifer beneath the former plating area (Area 14) suggest some leakage may occur through the till. Details regarding impacts to the deep overburden and bedrock are provided below, and include:

- Plant 6 bedrock – Metals and low-level CVOCs in bedrock at Plant 6 (MW-04-06, historical MW-04-04[6])
- Plant 3 deep overburden/bedrock - Vinyl chloride at Plant 3 at two sets of nested wells
- Plant 3 deep overburden - 1,4-dioxane in deep overburden at Plant 3 (MW-12-21 / VAP-A17-DE144)
- Plant 3 deep overburden - Metals in deep overburden at Plant 3 (MW-91-2, MW-02-04, MW-04-04[3])

4.8.1 Delineation

The extent of COC impacts within the perched zone at Plants 2, 3 and 6 are delineated on site with a few exceptions:

- Plant 6, Area 7: The extent of metals including lead and arsenic south of Area 7 are not defined to generic RBSLs. RACER will complete additional work to define the extent of metals in groundwater south of Plant 6.
- Plant 3, Area 16: The extent of arsenic and selenium in groundwater southwest of Area 16 are not defined to generic RBSLs between Area 16 and the southeastern Plant 3 property boundary.
- Plant 6, Southeast: Copper exceeds GSI Criteria at MW-12-14 in the southeast corner of Plant 6. Monitoring well MW-12-14 is installed at a depth of 25 to 30 ft bgs, and copper is not a concern for the GSI pathway at this location.
- Plant 6, Area 5-8: Vanadium exceeds DW Criteria at P6-SB-35 located 200 feet from the eastern property boundary. Additional sampling at P6-SB-35 will confirm whether work is required to delineate vanadium at the property boundary. In addition, vanadium and/or lead exceed DW Criteria in total metals samples collected at MW-12-12 and P6-SB-37. These metals did not exceed in filtered samples (dissolved metals). Follow-up sampling will focus on reducing turbidity to determine if these metals required additional delineation.
- Plant 6, Area 5-7: Arsenic was detected in a VAP sample collected at SB-A5.7-MC272 at a concentration above DW Criteria. However, follow-up sampling at a co-located monitoring well (MW-12-11) did not exceed RBSLs for arsenic or other COCs.

The extent of COC impacts in the deep overburden and bedrock are limited compared to the perched zone; however, in a few areas COCs have been detected in the deep units above DW Criteria:

- Plant 6, Area 5-7: Bedrock well MW-04-06: MW-04-06 is located near the Plant 6 property boundary in Area 5-7. Based on the December 2012 sampling event, lead is present at a concentration of 0.005 mg/L, nominally exceeding the DW Criteria of 0.004 mg/L, but less than the USEPA standard of 0.015 mg/L. In addition, vinyl chloride and other VOCs have been detected at this location below DW Criteria and the bis(2-Ethylhexyl)phthalate has been detected just

above the DW Criteria. Prior to January 2013, bis(2-Ethylhexyl)phthalate had not been detected at this well location.

Bedrock well MW-04-06 was installed in 2004 and constructed with polyvinyl chloride casing and 10-foot screen set at a total depth of 98 ft bgs. Bedrock was encountered at 47 ft bgs. During the December 2012 and January 2013 sampling events, a blockage was noted within the well that prevents a pump from reaching the total depth indicating the well casing may be compromised. Based on the potentially compromised well casing, COCs detected at this well may be related to a leaking well casing rather than actual impacts to the bedrock aquifer. RACER will propose to abandon MW-04-06 and replace well with a new bedrock well adjacent to the present location.

- Plant 6, Area 5-6: Bedrock well MW-04-04 was installed and sampled in 2004 at Plant 6, but has not been located as part of the RFI activities and is presumed destroyed. The 2004 groundwater sample indicates several metals were detected above DW Criteria including arsenic, beryllium, total chromium, cobalt, lead, manganese, nickel, and vanadium. As the bedrock well is not available for re-sampling, RACER will propose to replace MW-04-04 with new bedrock well adjacent to the former location.
- Other metals in bedrock and deep overburden: Metals in the deep overburden and bedrock aquifers are summarized on Figure 22. Three bedrock wells (MW - 91-4, MW-12-04, MW-12-02) have historically or recently had arsenic concentrations detected at or just above the DW Criteria (0.010 mg/L). During the December 2012 sampling event, all three of these wells were between 0.010 and 0.011 mg/L for arsenic. It is possible that arsenic is naturally elevated within the bedrock in this area. In addition, vanadium has been detected above DW Criteria at MW-12-06 and MW-04-01(6) at Plants 2 and 6 (respectively) and appears to be related to sample turbidity (filtered samples did not exceed at these locations). Additional sampling will be completed at these locations and an effort made to reduce the turbidity of the sample.
- Plant 3, Area 14: Metals exceeding DW Criteria have been sporadically detected in deep overburden wells north of the former plating area including arsenic, lead, total chromium and nickel (MW-19, MW-02-04, MW-23 and MW-04-04). Due to the proximity of the plating area, these metals may be related in part to the former operations at the Site. However, exceedances at MW-19 and MW-04-04 are in part due to elevated sample turbidity (filtered samples do not exceeds DW

criteria for several metals). The result at the northern Plant 3 property boundary (MW-04-04) suggests the metals are not defined north of the Site. Additional sampling will be completed at these locations with an effort made to reduce the turbidity of the sample. If continued monitoring indicates the potential for off-site migration, RACER will propose additional work to delineate groundwater impacts in the deep overburden.

- Plant 3: 1,4-dioxane has been detected at deep overburden monitoring well MW-12-21 up to 480 µg/L at Area 11, adjacent to a large basement structure known as the "Coliseum". While VOCs, including 1,4-dioxane, have been identified and delineated in the shallow perched zone at this location, attempts to perform VAP sampling in the deep overburden at this location were unsuccessful due to the low-yield silt formation present at depth. Monitoring well MW-12-21 was installed within the silt zone in an effort to verify deep impacts within this area.

Based on the lithology noted at borings completed within the Coliseum, the glacial till appears to have been excavated out as part of the Plant 3 construction activities. This preferential pathway through the glacial till may have allowed for the vertical migration of 1,4-dioxane to the deep overburden. The extent of 1,4-dioxane within the deep overburden is currently unknown. However, 1,4-dioxane has not been detected in any of the site bedrock monitoring wells. Additional work will be completed in March and-April 2013 to delineate the extent of 1,4-dioxane impacts at this location. The results will be presented in an addendum to the RFI report.

- Plant 3: 1,4-dioxane was detected in a VAP sample at VAP-A17-DE144 at a depth of 63 to 64 ft bgs within the deep overburden at Area 17 at a concentration of 11 µg/L. 1,4-dioxane is not detected in the perched water in this area and has not been detected in the deep overburden monitoring wells within this area. In particular, monitoring well MW-19, located approximately 16 feet south of VAP-A17-DE144 and installed at a depth of 55 to 65 ft bgs, did not detect 1,4-dioxane above the laboratory detection limit of 5 µg/L. Based on the results of the deep monitoring wells and the sampling result at monitoring well MW-19, the extent of 1,4-dioxane within the overburden appears to be limited and has not been confirmed through monitoring well sampling.
- Plant 3: Vinyl chloride above DW Criteria, as well as other CVOCs, has been detected at two nested well locations (deep overburden and bedrock) in the northwestern portion of Plant 3. Nested wells included MW-04-02/MW-04-03

(bedrock/deep overburden) at the western Plant 3 property boundary, and at wells MW-91-4/MW-04-04 near the northern property boundary. These wells are located within the bedrock valley, as described in Section 2.2.2 and presented on Figure 4.

To date, a significant source of vinyl chloride has not been identified at Plant 3. Vinyl chloride in bedrock is well documented in the Lansing Area and is attributed to several industrial facilities located northeast of Plant 3. It is therefore possible that the vinyl chloride noted at Plant 3 in bedrock is related to an off-site source. Potential off-site sources are discussed in Section 4.8.3.1 and presented on Figure 30.

Data needs at Plants 3 and 6, including the 1,4-dioxane in deep overburden at Area 11, off-site metals in Area 7 and 16, and metals in bedrock at Plant 6, will be addressed during follow-up work completed in 2013. Additional investigation activities will be summarized and provide to the MDEQ as an addendum to this RFI.

Continued monitoring of groundwater is warranted to evaluate 1,4-dioxane plume stability and verify the occurrence of metals in deep overburden and bedrock wells. Recent sampling for metals in groundwater has shown sensitivity to turbidity, which has resulted in several wells showing concentrations below criteria when prior results were above criteria. Most of the remaining exceedances related to metals are slightly over the criteria, suggesting that additional sampling is warranted to verify whether metals are a concern at the Site. Continued monitoring will be performed concurrent with the RFI review and development of the CMS.

4.8.1.1 Utility Corridor Migration

Investigation areas located near the Site perimeters and with groundwater impacts above generic RBSLs were reviewed to determine whether existing utility corridors could potentially provide a preferential pathway for groundwater impacts to migrate off site. Site drawings depicting the locations of existing utilities were compared to figures showing the locations of the known soil and groundwater impacts at each of the plants. The assessment focused on areas with groundwater impacts located near property boundaries. A complete summary of the findings, as well as figures depicting each of the investigation areas reviewed as part of the study, are included as an attachment to *the RFI Phase 2, Delineation Stage Scope of Work* (ARCADIS 2012c).

Based on the review, two utility corridors appear to provide a possible pathway for impacted groundwater to migrate off site. In Area 7, the storm sewer that passes through a former UST cavity near the property boundary and exits the Site into the W. Michigan Avenue right-of-way (ROW). The invert depth of the storm sewer is approximately 10.5 ft bgs. Several previous borings straddle the storm sewer line as it exits the Site (e.g. SB-A7-SZ209 and P6-SB-33) and did not indicate migration was occurring within the corridor. An additional boring (SB-A7-TD212) was completed within the W. Michigan Avenue right-of way (ROW), south of the ESC-2 stormceptor before the storm line intersects the W. Michigan Avenue main line.

In Area 2, a storm sewer intersects the area of soil and groundwater impacts on a north-south line before connecting to an east-west line south of this area and exiting the Site. The invert depth of the storm sewer was measured to be 15 ft bgs. In addition, a sanitary sewer line in this area travels east to west, south of Area 2 and then turns north following Rosemary Avenue towards Saginaw Avenue. The invert depth of the sanitary sewer is approximately 8 ft bgs. Two borings (SB-A2-PM54 and SB-A2-PQ53) were completed adjacent to the storm and sanitary lines (respectively) as the approach the Plant 2 Site boundary south of Area 2, and three borings (SB-A2-PC52, SB-A2-OY52, and SB-A2-OU52) were completed along the property boundary between the Investigation Area 2 impacts and the Rosemary ROW.

In each area, the sewers were first located with ground penetrating radar and then a hand auger boring was completed to a depth consistent with the sewer invert depth. Soil and groundwater samples were collected at depths consistent with the invert depth, and several feet below the invert depth, and submitted for analysis of VOCs, SVOCs, and metals. Results of the sampling are as follows:

- South of Area 2 - Groundwater was not encountered at the borings completed adjacent to the utility corridors south of Area 2, and soil samples were below RBSLs for all COCs.
- West of Area 2 – Groundwater was not encountered at a depth consistent with the sanitary sewer invert depths, which, based on the sewer depth to the south, is expected to be less than 15 ft bgs. Groundwater collected from soil borings and MW-12-18 at a depth of 28 to 33 ft bgs exceeded DW Criteria for nickel.
- Area 7 - A groundwater sample was collected at SB-A7-TD212 at a depth of 11 to 15 ft bgs. All VOCs and SVOCs were below RBSLs. Metals vanadium and manganese were detected above the DW Criteria.

Based on the results of the utility corridor evaluation, most of the impacted areas around the perimeter of the Site do not present a risk for off-site migration of impacted groundwater. In Area 2, sampling indicated that COCs do not migrate to or within the utility corridors. In Area 7, metals may migrate within the corridor, but are already present off site at this location. Additional work will be completed south of Area 7 to delineate metals. Based on a request from the MDEQ, additional work will be completed on site to evaluate the possible migration of impacted groundwater to the interior of the Site where “very large or deep” utility corridors are present. A brief description of the work is provided below.

4.8.2 Groundwater Screening Criteria Evaluation

Groundwater impacts have been delineated to the most restrictive generic RBSLs on site, except where noted above. As a corrective measure for the Site, RACER will propose a deed restriction on the installation and use of potable wells at the Site, eliminating exposure via ingestion of impacted groundwater within the perched zone. In addition, sampling of the storm sewers has indicated limited exposure risk associated with the GSI pathway. Therefore, the following sections will focus on applicable criteria exposure pathways (outlined in Section 3 and provided in detail in Appendix F) that may require additional corrective measures.

Cross-sections for many of the areas referenced below, as well as MVS screenshot figures are included as Appendices C and I, respectively.

- Groundwater Contact - Direct contact with shallow groundwater (construction and utility workers only)
 - Area 5-2 - PCBs (Aroclor-1242) were detected above GC Criteria in three groundwater samples associated with the Plant 2 LNAPL plume. The samples were collected at depths ranging from 4 to 22 ft bgs. In addition, chrysene was detected above GC Criteria 8 to 9 ft bgs. .

These exceedances are not expected to be a concern for off-site receptors as they are delineated to Area 5-2 and are not located near the property boundaries.

- Groundwater Volatilization to Indoor Air Inhalation Criteria (GVIIC) - Inhalation of volatile constituents volatilizing from groundwater and migrating to indoor air (of future buildings)

- Area 5-2 - The maximum detected concentration of PCBs exceeds the Nonresidential GVIIC (VAP-A5.2-NV119 (8 to 9 ft bgs). The groundwater sample at this location was noted as potentially containing some portion of LNAPL entrained in the sample.

The only exceedances of the residential SVIIC were located within Area 5-2. These exceedances are not expected to be a concern for off-site receptors as they are delineated to Area 5-2 and are not located near the property boundaries.

- Nonresidential Groundwater Concentration for Vapor Intrusion (GW_{VI-nr}):
 - Area 2 – Benzene and isopropyl benzene exceed GW_{VI-nr} on the eastern side of Area 2 at a depth of 10 to 14 ft bgs.
 - Area 5-2 – PCBs (Aroclor 1242) exceed the GW_{VI-nr} at 8 to 9 and 20 to 22 ft bgs at VAP-A5.2-NV119. The groundwater sample at this location was noted as potentially containing some portion of LNAPL entrained in the sample.
 - Area 17 – Benzene exceeds GW_{VI-nr} at depths ranging from 1 to 8.5 ft bgs in this area, generally associated with the Plant 3 LNAPL plume.
 - Area 5-7 – Benzene exceeds GW_{VI-nr} at a depth of 3-8 ft bgs. This area is known as the “parking lot exceedance” area (AOI 6-88) and did not have an historical AOI association prior to the RFI Phase 1 activities.
 - Area 9 – Isopropyl benzene, ethylbenzene and xylenes at depths ranging from 7 to 12 ft bgs.

The only exceedance of the residential draft Groundwater Concentrations for Vapor Intrusion (GW_{VI-res}) located within 100 feet of the property boundaries was PCE in Area 2, approximately 60 feet from the property boundary. Samples collected from the monitoring well located at the property boundary (MW-12-18) did not exceed the GW_{VI-res} , and the nearest residence is located more than 100 feet away. Therefore, this exceedance does not likely pose a concern for off-site receptors. In addition, soil gas samples collected in Area 2 did not contain VOCs

at concentrations exceeding the draft Residential Soil Gas Concentrations for Vapor Intrusion.

- Water Solubility Levels – Typically indicates presence of free-phase product:
 - Area 5-2 – PCBs (Aroclor 1242) and chrysene exceed water solubility levels at sample VAP-A5.2-NV119 (8 to 9 ft bgs). The groundwater sample at this location was noted as potentially containing some portion of LNAPL entrained in the sample.
- Flammability and Explosivity Screening Levels
 - Area 9 – Xylenes exceed the FESL at VAP-A9-RR209 (7 to 8 ft bgs). Located beneath the former painting area of the Site, this perched zone appears isolated and xylenes are defined in soil surrounding the groundwater sample.
- Acute Inhalation Screening Levels - The maximum detected concentrations of the COCs in groundwater at the Site did not exceed the Acute Inhalation Screening Levels.

In general, investigation areas with impacts to groundwater in excess of DW Criteria will be managed with a site-wide restriction of groundwater use. In addition, a number of areas at the Site have existing deed restrictions that serve as exposure controls. These deed restrictions are outlined in the CCR (ARCADIS 2008), as well as in the *Exposure Pathway Analysis for RACER Lansing Plants 2, 3 and 6* included as Appendix F. Groundwater exceedances based on the applicable exposure pathways outlined above will be managed via additional site use restrictions, and evaluated further as part of the CMS.

The areas of the Site outlined above that will require additional site use controls are highlighted on Figures 27 through 29 (Plants 2, 3, and 6, respectively). These figures illustrate areas with potentially complete exposure pathways and include remaining “quality” concrete pads the remaining at the Site. The quality pads have been determined by RACER as suitable for rebuilding. In many areas, the concrete pads also serve to limit exposure to groundwater impacts (e.g. Area 5-2 and Area 14), as well as limit additional recharge through impacted areas of the Site.

4.8.3 Offsite Sources of Groundwater Impacts

There are several facilities in the vicinity of the Site that are sources of impact to both the overburden and bedrock aquifers. Off-site sources of impacts, municipal wells impacts with vinyl chloride, and the bedrock topography are presented on Figure 30.

4.8.3.1 Vinyl Chloride

Historical vinyl chloride impacts to the Saginaw-Grand River bedrock aquifer are well documented in the Lansing area and have been responsible for shutting down a number of municipal water supply wells. Northeast of Plant 3, there are four known facilities with vinyl chloride contamination. Two municipal water supply wells (BWL #10-11 and 10-15) northeast of the Site were taken offline in the 1980s due to vinyl chloride impacts. The potential sources of vinyl chloride, the two municipal wells, and the deep overburden and bedrock wells at Plant 3 impacted with vinyl chloride (MW-04-02/MW-04-03 and MW-91-4/MW-04-04) are aligned with the bedrock valley described in Section 2.2.2. While current bedrock potentiometric data suggest groundwater flow in bedrock at the Site is northerly at Plant 3, historical operation of Lansing municipal wells along the bedrock valley would have strongly influenced flow conditions, likely reinforcing flow from the northeast. The off-site sources northeast of Plant 3, impacted wells, and bedrock topography are provided as Figure 30. Off-site sources of vinyl chloride include the following:

- **Former Waste Disposal Facility:** A facility located at 1401 Lake Lansing Road, approximately 2.5 miles northeast of Plant 3, was used for industrial waste disposal from 1938 to 1971. Although commercial operations discontinued in 1987, remedial action did not begin until 1997. Waste is still present on the Site and vinyl chloride is present in the bedrock aquifer. Remediation at the Site is ongoing and includes a bedrock pump-and-treat system. A USGS groundwater flow model (USGS Rpt 97-569) for the facility area suggests groundwater flow in bedrock is to the west-northwest from the facility, generally toward the well field located northeast of Plant 3.
- **Former Chemical Manufacturing Facility:** The facility was located at 1800 Glenrose Avenue, 4,200 feet northeast of Plant 3, was used to manufacture chemicals from 1922 to 1984. Commercial operations were discontinued in 1985, and all structures and storage tanks were removed from the Site. The site currently operates a pump-and-treat system in bedrock and has noted vinyl chloride at concentrations up to 150 µg/L. Groundwater contour and plume

maps for the Site indicate a southwesterly groundwater flow direction in the bedrock.

- **Former Tool Manufacturing Facility:** The facility, located at 1818 Bassett Street, 2,600 feet northeast of Plant 3, has indicated vinyl chloride impacts in overburden. At the time of the file review, no information was available with regards to deep overburden or bedrock impacts at this facility.
- **Former Heat Treating Facility:** Located adjacent to the northeast Plant 3 property boundary and currently used for shingle recycling. Previous site investigations indicate vinyl chloride is present generally between 10 and 30 ft bgs at concentrations between 5 and 40 µg/L. Bedrock at the Site is encountered between 65 and 70 ft bgs and the deep overburden is saturated at this location consistent with observations at Plant 3. As of 2007, vinyl chloride has not been detected in the 10 deep overburden monitoring wells at this location. Groundwater elevation within the deep overburden at this site indicated a northwest gradient similar to Plant 3.

4.8.3.2 1,4-Dioxane

West of Plant 2, the Adams Plating Company (APC) site was formally located at 521 Rosemary Avenue. APC operated as a dry cleaner prior to 1964, and then as an electroplating facility until it was destroyed by fire in December 2010. Adams Plating Company was placed on the USEPA National Priorities List in 1989. Groundwater impacts associated with the APC facility include 1,4-dioxane, CVOs and vinyl chloride. Monitoring wells associated with the APC facility were sampled by RACER on September 17, 2012 and submitted for VOC analysis. The analytical results indicate monitoring well MW-9D, installed near the former APC building, had a 1,4-dioxane concentration of 1,300 µg/L. APC wells located east and north of MW-9D are also impacted with 1,4-dioxane. The analytical data for the APC wells is included on Table 13 and on figures associated with this report (wells noted with "APC" prefix). Based on the location of the APC facility and the apparent northerly and easterly direction of contaminant migration, impacts on the northwestern portion of Plant 2 (e.g. P2-MW-03) may be due, in part, to the APC release.

4.9 Soil Gas Screening Criteria Evaluation

There are several areas of the Site that have indicated VOC soil impacts in excess of the SVIIC and VOC groundwater impacts in excess of the draft GW_{VI-nr}. Most of these

areas are located interior to the Site and will be managed with engineering controls and deed restriction. Two of the areas (Area 2 and Area 7) are located relatively close to Site property boundaries and were evaluated further to determine if a potential for off-site soil gas migration exists. Area 2, located on the western portion of Plant 2, has SVIIC exceedances for benzene and GW_{V-I-nr} exceedances for benzene and isopropyl benzene. Area 7, located on the southern part of Plant 6, has SVIIC exceedances for xylenes. The location of the soil gas samples are provided on Figure 15.

In each area, two temporary soil gas probes were advanced adjacent to the soil borings that exhibited the SVIIC exceedances. These exceedances included SB-A2-PC76 in Area 2, and SB-A7-TB220 in Area 7. The temporary probes were advanced with a direct-push drilling rig to a depth of to 5 feet or to a depth consistent with the unsaturated fill material located beneath the concrete slabs. Soil gas samples were then extracted from the sealed probe using a 1-liter SUMMA canister and submitted for analysis of VOCs. The results of the soil gas sampling are provided on Table 19.

A comparison of the soil gas sample results to the MDEQ Draft Residential Sub-Slab Soil Gas Concentrations for Vapor Intrusion indicates that in general the soil gas results are orders of magnitude below the screening levels. None of the soil gas samples had COC concentrations above the screening levels.

5. Summary/Conclusions

The majority of the AOIs on-Site have been delineated and the goals of the RFI have largely been met. Figure ES-1 summarizes the lateral extents of soil, groundwater, and LNAPL impacts. The areas where additional characterization is required to address data needs are highlighted in specific figures referenced above. The following conventions are used to highlight affected media and provide quick reference to findings that are discussed in this section:

- Soil impacts are shaded with orange where VOCs and SVOCs are the drivers; light blue shading shows the areas where metals impacts occur.
- Groundwater impacts are shaded with pink for VOCs and SVOCs; dark blue shaded areas are affected by metals;
- LNAPL impacts are shown with orange hatching.

The areas where these impacts could lead to potential exposure or where restrictions might be required are also highlighted.

- The composite areas where groundwater exceeds drinking water criteria is included within the pink and dark blue areas;
- Relevant exposure pathways are highlighted using colored boxes to show a conservative estimate of the areas that are affected. The areas are color coded by potential exposure pathway.

Based on the results of the RFI outlined above, the on-Site impacts associated with the Site can be managed with deed restrictions and engineering controls or land use restrictions, consistent with the current and planned non-residential land use. A summary of the findings and recommendations by AOI is provided in Table 2. A detailed review of the potential corrective measures appropriate for the Site will be provided as the CMS report in June 2013. Based on the CSMmodel and overall goals and objectives outlined for the RFI Phase 2 (Section 1.2.2), key findings of the RFI are as follows:

- General Hydrogeologic Setting: There are three water-bearing zones at the Site: 1) the perched water, typically occurring within the fill, interbedded zone, or occasionally within the glacial till, 2) the deep overburden aquifer with a water table at 65 to 70 ft bgs (Plant 3 only), 3) bedrock aquifer encountered at depths ranging from 55 to 110 ft bgs beneath the Site.
 - Source zones are isolated within the shallow perched water and the majority groundwater impacts are contained within the perched water zone.
 - There is very limited hydraulic communication between the perched zone and bedrock aquifer at Plants 2 and 6, as evidenced by the thick vadose zone between the glacial till and the bedrock aquifer, and general lack of bedrock groundwater impacts beneath heavily impacted areas of the Site (e.g. Area 2 and Plant 2 LNAPL). There are several areas with metals detected above RBSLs in bedrock at Plant 6, but it is unclear to what extent those metals are related to previous site operations. Additional work will be completed to assess metals in bedrock at Plant 6, as outlined below.

- Communication between the perched zones and the deep overburden/bedrock aquifers at Plant 3 is also limited. The perched zone at Plant 3 is thinner and separated from the deep overburden aquifer by a thick vadose zone. However, metals and 1,4-dioxane have been detected beneath the former plating area (Areas 14, 17 and 18) suggesting some leakage does occur through the till in the central portion of the Plant. In addition, impacts occur to the deep overburden where the glacial till has been removed such as the 1,4-dioxane impacts beneath the “coliseum” in the southwestern portion of Plant 3.
- Vinyl Chloride in Bedrock (northwestern Plant 3): Based on the general lack of a CVOC source at Plant 3 and the known regional vinyl chloride impacts to bedrock, the vinyl chloride identified at Plant 3 is attributed to off-site source(s). While current bedrock potentiometric data suggest groundwater flow to the northwest, historical operation of Lansing municipal wells along the bedrock valley would have strongly influenced flow conditions, likely reinforcing flow from the northeast.
- LNAPL (Area 5-2): LNAPL is present within the fill and interbedded zone in the central portion of Plant 2. The LNAPL consists of cutting oil that contains elevated concentrations of CVOCs, PCBs in some areas, as well as certain VOCs, and SVOCs. The lateral and vertical extents of the LNAPL plume and associated soil and groundwater impacts are defined; mobility and recoverability testing indicate the LNAPL plume is not migrating, with only a limited potential for recoverability based on ASTM (2006) and ITRC methods (ITRC 2009; State of Michigan 2012).
- LNAPL (Area 17): LNAPL is present within the shallow fill material in the north central portion of Plant 3 associated with a former UST farm. The LNAPL consists of gasoline with associated soil and groundwater impacts consisting primarily of BTEX. The lateral and vertical extents of the LNAPL and the associated soil and groundwater impacts are defined. Mobility and recoverability testing indicate the LNAPL plume is stable, with only a limited potential for recoverability.
- Hexavalent Chromium (Plant 3, Area 14): Hexavalent chromium in soil and groundwater are present in the former electroplating area in the north central portion of Plant 3 that exceeds RBSLs. The lateral and vertical extent of

hexavalent chromium is localized within the perched zone and other metals that have historically exceeded criteria in this area, including nickel and copper in soil and groundwater are defined.

- Site-wide Groundwater Conditions: In general, the primary impacts to groundwater at the Site include VOCs, SVOCs and 1,4-dioxane impacts associated with the LNAPL at Plant 2 (Area 5-2), VOCs and SVOCs associated with the LNAPL at Plant 3 (Area 17). Several localized hotspots for VOCs and SVOCs were encountered at certain locations throughout the Site (e.g. Area 2, Area 5-7, Area 7, Area 11 etc.). Metals are prevalent in perched and deep groundwater, including manganese above aesthetic-based DW Criteria in 80 percent of the groundwater samples collected at the Site. Arsenic, vanadium and lead are also commonly detected above RBSLs in groundwater at the Site particularly throughout the central portion of Plants 2 and 6, the southeastern portion of Plant 3 and the southern part of Plant 6.
 - A perched water plume, consisting chiefly of 1,4-dioxane, extends from west to east across Plant 2 onto Plant 6 within the perched water zone. Elevated concentrations of 1,4-dioxane and CVOCs are co-located with the LNAPL at Plant 2. The lateral and vertical extent of the plume is defined on Plant 2 and Plant 6 and does not extend off site above the proposed DW Criteria of 8.5 µg/L, nor has it been detected in the underlying bedrock aquifer.
 - Perched water impacts are defined on site with three exceptions: 1) Plant 6, Area 7 – lead, arsenic and vanadium in off-site wells, 2) Plant 3, Area 16 – arsenic in groundwater, 3) southeastern Plant 6 – copper in groundwater.
 - Groundwater impacts are primarily confined to the perched zones with four exceptions: 1) Plant 6 bedrock – metals above RBSLs, potentially related to well construction, 2) 1,4-dioxane in deep overburden at Plant 3 possibly related to removal of glacial till during plant construction, 3) metals in deep overburden at Plant 3, and 4) vinyl chloride in bedrock/deep overburden in northern Plant 3 (related to regional groundwater impacts as discussed above).
 - Continued monitoring of groundwater is warranted to evaluate 1,4-dioxane plume stability and verify the occurrence of metals in deep

overburden and bedrock wells. Recent sampling for metals in groundwater has shown sensitivity to turbidity, which has resulted in several wells showing below standard concentrations, when prior results were above criteria. Most of the remaining exceedances related to metals in bedrock and deep overburden are slightly over the standards, suggesting that additional sampling is warranted to verify whether metals are a concern, or are an artifact of sediment entrained in the samples. Continued monitoring will be performed concurrent with the RFI review and development of the CMS.

- Other Areas with Soil or Groundwater Impacts: There are a number of areas at the Site with VOC and SVOC impacts in soil and perched groundwater, all of which were delineated on-Site or defined at the Site boundaries. Investigation areas and a general description of the RFI results are provided on Table 2.
- There are a number of areas at the Site that exceed criteria beyond DW/DWP or GSI/GSIP, including GW_{VI-nr}, SVIIC, PSIC, and/or DC Criteria. These areas are presented on Figures 27 through 29 and will require additional engineering controls beyond groundwater use restriction. In some instances, the existing concrete slabs at the Site can be maintained to restrict access to the subsurface (e.g., over the LNAPL area at Plant 2 or the former plating area at Plant 3).

A detailed discussion of each AOI and potential corrective measures for each area will be provided as part of the CMS scheduled for completion in June 2013. Based on the nature of impacts observed at the Site and the expected future site use (Industrial or nonresidential), Restrictive Covenants will be proposed for the Site to the extent practicable to eliminate unacceptable exposures to soil and groundwater impacts. Land use will be restricted to nonresidential use, institutional controls (e.g. no use of groundwater) will be implemented, and engineering controls (i.e., vapor barriers on future buildings) will be required, as needed.

The concrete slabs that remain on-site (See Figure ES-1) provide several benefits in the short and long-term. The slabs limit infiltration in the areas affected by LNAPL and where soils exceed groundwater protection criteria at Plant 2 and Plant 3. There are several areas on Plant 2 and Plant 3 where the slabs are a barrier to direct contact as well as vapor and particulate inhalation. In the short-term, the reduction of infiltration will minimize plume migration. In the long-term, the slabs may provide a benefit in reducing potential exposure to the affected soils and LNAPL-affected areas. The pathway evaluation was completed based on potential exposure scenarios that did not

account for the presence of the slabs; however, during the CMS the benefits of the slabs will be factored into the remedy screening and selection process.

5.1 Areas Requiring Further Evaluation

Based on the results of the RFI, there are several areas that will require additional investigation to adequately characterize or delineate COCs:

- Northern Plant 3 (Areas 14, 17 and 18): Arsenic has been detected at the east and west Plant 3 property boundaries (historical sample locations) above the DWP Criteria. Additional work will be completed by RACER to define the extent of arsenic in soil at the Plant 3 property boundary.
- Plant 3, Area 16: The extent of arsenic in groundwater southwest of Area 16 is not defined to generic RBSLs between Area 16 and the southeastern Plant 3 property boundary. RACER will complete additional work in this area to define arsenic in groundwater.
- Plant 3, Deep Overburden (Area 11): 1,4-dioxane has been detected at deep overburden above DW Criteria in Area 11. RACER will complete additional work in March 2013 to characterize and define the extent of 1,4-dioxane impacts in deep overburden.
- Plant 3, Deep Overburden: Metals have been detected in the deep overburden aquifer at Plant 3 (MW-19, MW-02-04, MW-23 and MW-04-04). Based on the occurrence of metals (arsenic, lead, and nickel) in near surface soils near the former plating area (Area 14), metals in deep overburden may be related to former site operations. Additional sampling will be completed at these locations to verify the elevated metals with an emphasis on low turbidity sample collection.
- Plant 6, Area 7: The extent of metals including lead, arsenic and vanadium south of Area 7 are not defined in groundwater to generic RBSLs. RACER will propose to complete additional sampling off site to define metals exceedances in groundwater.
- Plant 6, Area 5-8: Vanadium exceeds DW Criteria at P6-SB-35 located 200 feet from the eastern property boundary. Additional sampling at P6-SB-35 will confirm whether work is required to delineate vanadium at the property boundary.

- Plant 6, Bedrock Metals: Metals above DW Criteria have been detected at Plant 6 in existing bedrock wells MW-04-06 (lead and SVOC bis(2-ethylhexyl)phthalate) and historical MW-04-04(4) (arsenic, beryllium, total chromium, cobalt, lead, manganese, nickel, and vanadium). Impacts at these wells may be related to well construction and RACER will propose to abandon and/or replace these wells in order to verify the metals results in bedrock

In addition, several issues related to potential preferred migration associated with storm sewers and utility corridors are currently being evaluated:

- Storm Sewer Monitoring: Although storm sewer sampling has initially indicated impacts to the storm sewer are minimal, monitoring will continue through the implementation of the CMS to verify this condition.
- Plant 6 Stormceptor ESC-2: Following the January 2013 cleanout of the stormceptor, monitoring of LNAPL within the stormceptor and upgradient storm structures have not shown presence of LNAPL. Monitoring will continue through the implementation of the CMS to verify this condition.
- Additional utility corridor sampling: Additional sampling will be completed in March 2013 adjacent to large utility corridors interior to the Site to evaluate if groundwater infiltration is causing preferred migration of site-related COCs in utility corridors. Monitoring will continue through the implementation of the CMS to verify this condition.

Data needs and evaluations at Plants 3 and 6 will be addressed during follow-up work completed in 2013 in parallel with the MDEQ's review of the RFI. Additional investigation activities and results of the ongoing utility evaluation will be summarized as an addendum to this RFI.

NOTES:

NA Not available/Not applicable
MDL Method Detection Limit
PQL Practical Quantitation Level
TBD To be determined

{ } For volatile organics, target detection limits (TDLs) enclosed with { } brackets indicate that the low level soil method may be required to reach a risk-based criteria. Check with the laboratory to determine if risk-based criteria can be reached for methanol-preserved samples, to determine if the low level method must be used

[] The TDLs in bold type and enclosed with [] brackets indicate that the contaminant's TDL is higher than the most restrictive criteria.

(1) The TDLs for groundwater and soil are based on the TDLs defined in Michigan Department of Environmental Quality (MDEQ) Remediation and Redevelopment Division Memorandum No. 2 (February 2, 2005).

(2) The MDLs and PQLs listed are current as of March 2005 and may differ slightly during future data reporting.

(3) In some instances, the TDL is below the MDL, indicating that the MDEQ TDL is not currently achievable by the lab. If it is necessary to achieve the TDL, a selective ion mass spectrometry (SIM) test can be performed.

(4) Target Detection Limits and Designated Analytical Methods are based on MDEQ RRD Operational Memo No. 2 - Attachment 1, dated October 22, 2004.

(5) When analyses of these compounds are requested using GC/MS, SIM analyses must be conducted on all samples with no detects found in the full scan. Positive detects in the SIM mode should then be appropriately coded to indicate SIM analyses were conducted.

RFI Phase 2 Summary Report
RACER Plants 2, 3 and 6
Investigation Summary Matrix

Investigation Area	Subarea	Associated AOI	AOI Summary	RFI Phase 1 Investigation	RFI Phase 2 Investigation Sequence/Results	Constituents of Concern > PART 201 RBSLs								Summary of Exceedances	Potential Corrective Measures	
						VOCs				Metals						
						CVOCs	BTEX	1,4-Dioxane	Other VOCs	SVOCs	PCBs	CrVI	Other			
AREA 1	NA	AOI 2-16	Two 20,000-gallon tanks that stored gasoline and diesel east of Building 250. One 1,500-gallon tank that stored used oil located southeast of Building 250. One 12,000-gallon tank that stored heating oil located west of Building 250. All USTs removed in 1990 and 1991. Closure report submitted on 10/01/1996. Restrictive Covenant filed with Register of Deeds in 2003.	Phase 1 Scope: Collected samples from monitoring wells MW-01(2), MW-02(2), and MW-03(2). Results: MTBE detected below MDEQ RBSLs. Copper and manganese detected above DWC and/or GSI Criteria in two of the three samples.	I. Assessment Scope: Based on Phase 1 results, four step-out soil borings were completed to a depth of 25 ft bgs around MW-01(2) to assess low-level VOCs and metals in soil and groundwater. Soil samples were collected at approximate 10 ft intervals through vadose zone based on field screening results. Groundwater samples were collected from saturated permeable zones (if encountered). One HPT/VAP boring was completed to 50 ft bgs to characterize the stratigraphy and define groundwater impacts vertically. Results: VOCs detected in soil below RBSLs. VOCs detected in groundwater exceeding RBSLs. VOC, SVOC and metal exceedances delineated vertically. II. Characterization Scope: Three additional step-out soil borings completed, two north of the area and one to the west, to 20 ft bgs to delineate soil and groundwater impacts horizontally. Soil sampled at approximate 5 ft intervals based on field screening. Groundwater samples collected from saturated permeable zones (if encountered). Results: VOCs, SVOCs, and metals in soil and groundwater delineated horizontally. III. Delineation Scope: One monitoring well installed and sampled north of Area to provide a permanent monitoring point for delineation of groundwater impacts. Results: Sampling of the four permanent monitoring wells indicates no exceedances of RBSLs.		X				X			X	SOIL: SVOCs > GSIP Metals > DWP & GSIP GW: VOCs & SVOCs > GSI Metals > DW & GSI NOTES: Soil and groundwater impacts defined on-site both vertically and horizontally. COCs not detected in Plant 2 storm sewer samples above GSI criteria.	1) Restrict potable use of groundwater on-site.
AREA 2	NA	AOI 2-12 AOI 2-52 AOI ID 2-26	Empty 55-gallon drums generated from facility operations.	Phase 1 Scope: Soil boring P2-SB-31 was advanced to 10 ft bgs, samples collected at highest PID reading interval and deepest interval. Results: No VOCs detected. SVOCs detected at 1-2 ft bgs, ND at 9-10 ft bgs. No exceedances of RBSLs. Cobalt and manganese detected above Soil DWP and GSIP Criteria in both samples.	I. Assessment Scope: Based on Phase 1 results, four step-out soil borings were completed to a depth of 20 ft bgs to assess SVOCs and metals in soil. Soil was sampled at approximate 10 ft intervals through vadose zone based on field screening results. Results: VOCs (PCE) detected in soil exceeding MDEQ RBSLs, generally between 15 and 20 ft bgs. II. Characterization Scope: Eight additional step-out soil borings were completed to 30 ft bgs to define VOCs in soil. Soil was sampled at approximate 5 ft intervals through vadose zone. Groundwater sampled from saturated permeable zones (if encountered). One HPT/VAP boring was completed to bedrock (or refusal) to characterize stratigraphy and define VOC impacts vertically in soil and groundwater. VAP boring soil/gw samples collected at approximate 5 ft intervals beginning at 20 ft bgs. Results: PCE in soil defined vertically and horizontally. PCE in groundwater exceeding RBSLs was encountered between the soil impacts and Plant 2 property boundary, BTEX detected in soil and groundwater exceeding MDEQ RBSLs on east side of Area. III. Delineation: Scope: Seven additional step-out borings completed to 30 ft bgs east and west of Area. Soil was sampled at approximate 5 ft intervals through vadose zone. Groundwater sampled from saturated permeable zones (if encountered). Two soil gas samples collected in the vicinity of benzene soil SVIIC exceedances on east side of Area. Soil borings completed and one monitoring well installed along western property boundary to define PCE in groundwater at property boundary. Results: PCE in soil and groundwater completely defined. BTEX in soil and groundwater appears to merge with impacts from adjacent areas (Areas 5-2 and 5-3). Soil gas results did not indicate exceedances of draft risk-based soil gas screening levels.	X	X		X					X	SOIL: VOCs > DWP, GSIP & SVIIC Metals > DWP, GSIP, DC & PSIC GW: VOCs > DW, GSI, and draft GW _{VI-nr} Metals > DW NOTES: PCE in soil up to 15,300 µg/Kg (>DWP/GSIP) delineated. PCE in groundwater defined at Site property boundary. Benzene in soil up to 15,300 µg/Kg (>DWP/GSIP/ SVIIC) defined to SVIIC. Benzene and isopropylbenzene in groundwater > draft GWVI-nr. Soil gas sampling indicates soil gas VOCs below draft screening levels. COCs not detected in Plant 2 storm sewer samples above GSI criteria.	1) Restrict potable use of groundwater on-site. 2) Exposure barrier for soil DC (As) and PSIC (Mn) exceedances. 3) Require exposure barrier for VI or additional data to show not a concern. 4) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).
AREA 3	NA	AOI 2-11	Monitoring well P2-MW-03 in northwestern corner of Plant 2 with 1,4-dioxane in groundwater	Phase 1 Scope: Installed permanent monitoring well P2-MW-03 to assist with horizontal gradient determination. Soil samples collected at ground surface, 20 ft bgs, and bottom of boring. Groundwater samples collected following installation. Results: VOCs, SVOCs, and metals < RBSLs in soil. In groundwater, 1,4-dioxane and manganese detected above RBSLs.	I. Assessment Scope: Based on Phase 1 results, one HPT/VAP boring was completed to bedrock (or refusal) to characterize the stratigraphy and define groundwater impacts vertically. Groundwater sampled at 30 ft bgs. Groundwater not encountered from 30 feet to bedrock. Results: 1,4-Dioxane and metals arsenic and manganese concentrations exceeding RBSLs encountered in VAP sample; 1,4-dioxane exceeds proposed DWC of 8.5 µg/L. Impacts suspected to be associated with former Adam's Plating Company located 300 feet west of Area 3.			X						X	GW: 1,4-dioxane > Proposed DW (8.5 µg/L) Metals > DW & GSI NOTES: 1,4-Dioxane at this location associated with Former Adam's Plating Facility.	1) Restrict potable use of groundwater on-site.
AREA 4	NA	AOI 2-8	Likely stored waste paint, spent solvent, and used oils on a concrete pad.	Phase 1 Scope: Soil boring P2-SB-33 was advanced to 10 ft bgs, with samples collected at 5 ft intervals. Results: No VOCs detected. SVOCs detected at 5-6 ft bgs, but not at 9-10' bgs (<RBSLs). Metals < RBSLs.	I. Assessment Scope: Based on Phase 1 results, four step-out soil borings were completed to a depth of 25 ft bgs to assess SVOCs in soil. Soil samples were collected at approximate 10 ft intervals through vadose zone based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Results: Low-level SVOCs delineated vertically and horizontally in soil and groundwater. Boron, cobalt, selenium, silver, and zinc detected in soil exceeding RBSLs at 1-2 and 10-11 ft bgs. III. Delineation: Scope: One step-out soil boring was completed to 20 ft bgs beyond western Site boundary and sampled for select metals. Soil samples were collected at approximate 10 ft intervals. Groundwater sample collected from saturated permeable zone. Results: Metals in soil exceeding RBSLs defined to the east by borings from neighboring Areas (Areas 5-1 and 5-2). Selenium exceeds GSIP in soils in boring completed across the street. Manganese exceeded the health-based DWC in two groundwater samples.									X	SOIL: Metals > DWP & GSIP GW: Metals > DW NOTES: Manganese in groundwater is likely due to naturally occurring background concentrations. COCs not detected in Plant 2 storm sewer samples above GSI criteria.	1) Restrict potable use of groundwater on-site.

AREA 5	5-1	AOI 2-11 AOI ID 2-31 ID 2-32 ID 2-33 ID 2-34 ID 2-35 ID 2-49	Press Pit and Associated Sumps, Pits, and Trenches ID 2-31 - Two 3'x3" oil containment sumps under hydraulic presses ID 2-32 - Two oil containment sumps, 3'x3" and trench ID 2-33 - Two oily waste line manhole sumps ID 2-34 - Two Press Pits ID 2-35 6" deep Tramp Oil trenches, 3' deep Tramp Oil sumps	Phase 1 Scope: Four soil borings were advanced to 20 ft bgs, with samples collected at surface, highest PID reading interval, and deepest interval. Groundwater samples collected from saturated permeable zones (if encountered). Results: No VOCs detected. Low-level SVOCs detected in soil and groundwater (<RBSLs). Lead and manganese in GW detected above MDEQ RBSLs.	I. Assessment Scope: Based on Phase 1 results, 10 step-out soil borings were completed to 20 ft bgs to assess SVOCs and metals in soil. Soil samples were collected at approximate 10 ft intervals through vadose zone based on field screening results. Groundwater samples were collected from saturated permeable zones (if encountered). Two HPT/VAP borings were completed to bedrock (or refusal) to characterize the stratigraphy and define groundwater impacts vertically. Groundwater samples were collected from saturated permeable zones (if encountered). Results: SVOCs detected in soil exceeding RBSLs between 4-5 ft bgs, delineated vertically. Cobalt, selenium, and silver in soil exceeding RBSLs delineated vertically. Arsenic, boron, lead detected in groundwater exceeding RBSLs encountered generally between 10-15 ft bgs across area. Manganese exceeded the health-based DWC in one groundwater sample. SVOCs and metals in soil and groundwater appear to merge with impacts from adjacent areas (Areas 4, 5-2, 5-5, and 8).			X		X			X	SOIL: SVOCs > DWP, GSIP, & DC Metals > DWP & GSIP GW: VOCs > DW 1,4-dioxane > Proposed DW (8.5 µg/L) & DW SVOCs > DW Metals > DW & GSI NOTES: Manganese in groundwater is likely due to naturally occurring background concentrations. COCs not detected in Plant 2 storm sewer samples above GSI criteria.	1) Restrict potable use of groundwater on-site. 2) Exposure barrier for soil DC (PAHs) exceedances. 3) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).
AREA 5	5-2	AOI 2-6 AOI 2-14 AOI ID 2-36	ID 2-6 - SWMU 6 - Former Oily Waste Treatment System. Three 10,000-gallon concrete tanks, two treatment tanks, two gravity separators, chemical storage tanks. ID 2-14 - SWMU 14 - Former Scrap Metal Storage Areas. Stored non-hazardous scrap metal (machining chips, turnings, trimmings, and scrap parts). ID 2-26 - Quench Oil Operations, pits, tanks, and sumps. ID 2-36 - Oil Separator and Sump. 10" oily waste line runs to separator. ID 2-52 - Pickling Room. Concrete wall and acid-resistant floor.	Phase 1 Scope: Ten soil borings were advanced to an average 20 ft bgs, with samples collected at highest PID reading interval and deepest interval. Results: VOCs and SVOCs detected at 0-10 ft bgs, with criteria exceedances at 4-7 ft bgs in two samples. Manganese detected above MDEQ RBSLs at 2-6 ft bgs in three samples. LNAPL detected at P2-SB-37 temporary well.	I. Assessment Scope: Based on Phase 1 results, 38 step-out soil borings were completed to a depth of 25 ft bgs to assess VOCs, SVOCs, metals and LNAPL impacts in soil and groundwater. Soil samples were collected at approximate 5 ft intervals through vadose zone based on field screening results. Groundwater samples collected where saturated permeable zones were encountered. Five HPT/VAP borings were completed to bedrock (or refusal) to characterize the stratigraphy and define soil and groundwater impacts vertically. Samples were collected at approximate 5 ft intervals at each VAP boring. LIF borings (51 total) were completed to 30 ft bgs to delineate the NAPL plume. Results: VOCs, SVOCs and metals detected in soil and groundwater exceeding RBSLs generally associated with the LNAPL impacts. Manganese exceeded the health-based DWC in one groundwater sample. PCBs in LNAPL and detected in soil up to 22,000 µg/Kg. Extent of LNAPL defined vertically and horizontally with LIF. A VOC plume, generally 1,4-dioxane, extends from LNAPL plume to the east across Plant 6. II. Characterization Scope: Two bedrock wells installed near LNAPL plume to verify no impacts to bedrock aquifer. Groundwater samples collected following installation. Results: COCs not detected in bedrock above RBSLs. III. Delineation Scope: Install nine LNAPL monitoring wells in LNAPL plume as part of LNAPL mobility study and to provide permanent LNAPL monitoring locations. Results: Free-phase LNAPL accumulates in most of the wells. LANPL samples and mobility/recoverability testing indicates LNAPL plume is stable (not mobile), with limited recoverability.	X	X	X	X	X	X		X	SOIL: VOCs > DWP, GSIP, & SVIIC SVOCs > DWP, GSIP, VSIC, & DC PCBs > DC Metals > DWP, GSIP, DC & PSIC GW: VOCs > DW & GSI 1,4-dioxane > Proposed DW (8.5 µg/L) & DW SVOCs > DW, GSI, GC & Sol PCBs > DW, GSI, GW _{VI-III} , GC & Sol Metals > DW & GSI NOTES: Elevated VOCs, SVOCs, PCBs, and metals associated with LNAPL plume. Manganese in groundwater is likely due to naturally occurring background concentrations. COCs not detected in Plant 2 storm sewer samples above GSI criteria.	1) Restrict potable use of groundwater on-site. 2) Require an exposure barrier (intact concrete) for soil DC and inhalation exceedances, as well as NAPL. 3) Require an exposure barrier or data indicating that VI is not a concern in this area. 4) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).
AREA 5	5-3	AOI 2-1 AOI ID 2-59 Misc. Data Gap Borings	Press Pits - 8' - 4" deep, 21' by 35', and 67' by 25'	Phase 1 Scope: Five soil borings were advanced to an average 30 ft bgs, with samples collected at highest PID reading interval and deepest interval. Results: VOCs detected above MDEQ RBSLs generally between 5-10 ft bgs. SVOCs and manganese detected above MDEQ RBSLs on west side of Area between 4-6 ft bgs.	I. Assessment Scope: Based on Phase 1 results, 17 step-out soil borings were completed to a depth of 20 ft bgs to assess VOCs, SVOCs, and metals in soil. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples were collected from saturated permeable zones (if encountered). Two HPT/VAP borings were completed to bedrock (or refusal) to characterize the stratigraphy and define soil and groundwater impacts vertically. VAP soil/gw samples were collected at approximate 5 ft intervals. Results: 1,4-Dioxane detected in groundwater exceeding RBSLs. VOCs and SVOCs detected in soil exceeding RBSLs in the southeast corner of Area. Metals including silver, manganese, arsenic and cobalt detected in soil or groundwater exceeding RBSLs. II. Characterization Scope: Three additional step-out soil borings were completed to 30 ft bgs in southeastern corner to delineate VOCs and SVOCs. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Results: VOCs and SVOCs in soil delineated. 1,4-Dioxane and metals in groundwater appear to merge with impacts to the north and east (Areas 5-2 and 5-5).	X	X	X	X	X			X	SOIL: VOCs > DWP, GSIP, & SVIIC SVOCs > DWP, GSIP, & DC Metals > DWP, GSIP & PSIC GW: VOCs > GSI 1,4-dioxane > Proposed DW (8.5 µg/L) & DW Metals > DW & GSI NOTES: COCs not detected in Plant 2 storm sewer samples above GSI criteria.	1) Restrict potable use of groundwater on-site. 2) Require an exposure barrier (intact concrete) for soil DC (PAHs) and inhalation (Mn) exceedances. 3) Require an exposure barrier or data indicating that VI is not a concern in this area. 4) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).
AREA 5	5-4	AOI ID 2-39	Fuel Oil Pump House and Tank Farm - Eight oil storage tanks, 10.5' diameter. Trenching associated with tanks. Three truck unloading stations associated with tanks.	Phase 1 Scope: Three soil borings were advanced to an average of 20 ft bgs, with samples collected at highest PID interval and deepest interval. Groundwater samples collected from saturated permeable zones (if encountered). Results: Low-level VOCs encountered between 4-5 ft bgs (<RBSLs) in soil. No VOCs or SVOCs encountered in groundwater.	I. Assessment Scope: Based on Phase 1 results, four step-out soil borings were completed to a depth of 20 ft bgs to assess low-level VOCs in soil. Soil sampled at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Results: All VOC and SVOC concentrations less than RBSLs. Arsenic detected in grounwater exceeding the RBSLs.								X	GW: Metals > DW & GSI NOTES: COCs not detected in Plant 2 storm sewer samples above GSI criteria.	1) Restrict potable use of groundwater on-site.

RFI Phase 2 Summary Report
RACER Plants 2, 3 and 6
Investigation Summary Matrix

Investigation Area	Subarea	Associated AOI	AOI Summary	RFI Phase 1 Investigation	RFI Phase 2 Investigation Sequence/Results	Constituents of Concern > PART 201 RBSLs								Summary of Exceedances	Potential Corrective Measures
						VOCs				SVOCs	PCBs	Metals			
						CVOCs	BTEX	1,4-Dioxane	Other VOCs			CrVI	Other		
AREA 5	5-5	AOI 2-15	AOC 1 - Building 225 UST Farm - Two 20,000-gallon tanks that stored gasoline and diesel east of Building 250. One 1,500-gallon tank that stored used oil located southeast of Building 250. One 12,000-gallon tank that stored heating oil located west of Building 250. All USTs removed in 1990 and 1991. Closure report submitted on 10/01/1996. Restrictive Covenant filed with Register of Deeds in 2003.	Phase 1 Scope: Two soil borings were advanced to 20 ft bgs, with samples collected at highest PID interval and deepest interval. Permanent monitoring well P2-MW-04 was installed and sampled at surface and deepest interval. Groundwater samples collected following installation. Results: 1,4-Dioxane and manganese in GW exceeding MDEQ DW RBSLs encountered in groundwater. SVOCs, VOCs, and arsenic exceeding MDEQ RBSLs encountered in soil generally between 1-3 ft bgs.	I. Assessment Scope: Based on Phase 1 results, nine step-out soil borings were completed to a depth of 20 ft bgs to assess VOCs, SVOCs, and metals in soil. Soil samples were collected at approximate 5 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). One HPT/VAP boring was completed to bedrock (or refusal) in the vicinity of the permanent monitoring well to characterize the stratigraphy and define soil and groundwater impacts vertically. VAP soil/gw samples were collected at approximate 5 ft intervals. Results: 1,4-Dioxane detected in groundwater exceeding RBSLs in the VAP boring. Arsenic detected in groundwater exceeding RBSLs along eastern Area boundary adjacent to railroad tracks. VOCs and metals arsenic, cobalt, and manganese defined vertically and appear to merge with impacts in adjacent areas (Area 5-2, 5-6).	X	X	X	X	X	X		X	SOIL: VOCs > DWP SVOCs > GSIP & DC Metals > DWP, GSIP & PSIC GW: 1,4-dioxane > Prop DW (8.5 µg/L) SVOCs > DW Metals > DW & GSI NOTES: Manganese in groundwater is likely due to naturally occurring background concentrations. Manganese exceedance of the PSIC is deep (56-57") and therefore, is not a concern, as soil this deep is not likely to be brought to the surface. COCs not detected in Plant 2 storm sewer samples above GSI criteria.	1) Restrict potable use of groundwater on-site. 2) Require exposure barrier for DC (PAHs) exceedances. 3) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).
AREA 5	5-6	AOI 6-18 AOI 6-48	AOC 1 - Building 225 UST Farm - Eight former 30,000-gallon tanks. Removed 1989. Closure report submitted 10/1/96.	Phase 1 Scope: Two soil borings were advanced to 10 ft bgs, with samples collected at highest PID interval and deepest interval. Groundwater samples were collected from saturated permeable zones (if encountered). Groundwater samples were also collected at seven permanent monitoring well locations. Results: 1,4-Dioxane, VOCs, and metals lead and arsenic exceeding RBSLs encountered in groundwater. Low-level VOCs and SVOCs encountered in soil (<RBSLs). Manganese exceeding RBSLs encountered in soil throughout.	I. Assessment Scope: Based on Phase 1 results, 15 step-out soil borings were completed to an average depth of 15 ft bgs to assess impacts in soil and groundwater. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Six HPT/VAP borings were completed to bedrock (or refusal) in the vicinity of permanent monitoring wells to characterize the stratigraphy and define soil and groundwater impacts vertically. VAP boring soil/gw samples collected at approximate 10 ft intervals. Results: 1,4-Dioxane detected in groundwater exceeding RBSLs in three VAP borings at 35-40 ft bgs, defined vertically and merge with groundwater impacts in adjacent areas. VOCs detected in groundwater exceeding RBSLs defined vertically. VOCs detected in soil exceeding RBSLs defined vertically and by adjacent areas. Arsenic, barium, cadmium, cobalt, copper, lead, manganese, mercury, selenium, silver, and zinc detected in soil exceeding RBSLs at 0-7 ft bgs, delineated vertically and generally merge with impacts in adjacent areas. Manganese detected above the health-based DWC in 3 groundwater samples.	X	X	X	X	X		X	SOIL: VOCs > DWP & GSIP Metals > DWP, GSIP, & DC GW: VOCs > DW & GSI 1,4-dioxane > Prop DW (8.5 µg/L) Metals > DW & GSI NOTES: Manganese in groundwater is likely due to naturally occurring background concentrations. Only COC detected in Plant 6 storm sewer samples above GSI criteria was selenium, which was not detected in gw above GSI criteria in Area 5-6.	1) Restrict potable use of groundwater on-site. 2) Require exposure barrier for DC (lead) exceedances. 3) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).	
AREA 5	5-7	AOI 6-43 AOI 6-88	ID 6-43 - Stormceptor - Includes stormceptor oil and sediment separator ID 6-88 - Parking Lot Exceedance	Phase 1 Scope: Four soil borings were advanced to 10 ft bgs, with samples collected at highest PID interval and deepest interval. Groundwater samples were collected from saturated permeable zones (if encountered). Groundwater samples were also collected at four permanent monitoring well locations. Results: BTEX exceeding MDEQ RBSLs encountered in groundwater and soil at 7-10 ft bgs. Low-level SVOCs encountered in all borings (<RBSLs). Metals antimony and cadmium encountered in soil exceeding RBSLs between 5-7 ft bgs. Metals lead and antimony encountered in groundwater above RBSLs throughout Area.	I. Assessment Scope: Based on Phase 1 results, eight step-out soil borings were completed to an average depth of 20 ft bgs to assess VOCs and metals in soil and groundwater. Soil samples were collected at approximate 5 ft to 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Three HPT/VAP borings were completed to bedrock (or refusal) to characterize the stratigraphy and define soil and groundwater impacts vertically. VAP soil/gw samples were collected at approximate 5 ft intervals. Results: VOCs (BTEX) detected in groundwater exceeding RBSLs delineated to the north. Vinyl chloride detected in groundwater exceeding RBSLs at eastern property boundary. BTEX detected in soil exceeding RBSLs delineated vertically and horizontally. TCE detected in soil exceeding RBSLs (including SVIIC) at 11-12 ft bgs. Metals cobalt, arsenic, antimony, and silver detected in soil and/or groundwater exceeding RBSLs delineated to the north, and appear to merge with impacts to the south and west (Areas 5-5 and 5-6). II. Characterization Scope: Seven additional step-out soil borings were completed to 30 ft bgs to delineate TCE in soil. Soil samples were collected at approximate 5 ft to 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Results: TCE detected in soil exceeding RBSLs, delineated vertically and horizontally. III. Delineation Scope: Two additional step-out soil borings were completed off-Site to 30 ft bgs to delineate vinyl chloride in groundwater. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Two monitoring wells installed north and east of Area to provide permanent monitoring locations for groundwater impacts. Results: Vinyl chloride in perched groundwater delineated horizontally. Vinyl chloride below RBSLs and lead above RBSLs present in bedrock monitoring well at property boundary. Manganese detected above the health-based DWC in 1 groundwater sample.	X	X		X	X		X	SOIL: VOCs > DWP, GSIP, SVIIC, & VSIC Metals > DWP & GSIP GW: VOCs > DW, GSI & GW _{VH-III} SVOCs > GSI 1,4-dioxane > Proposed DW (8.5 µg/L) Metals > DW & GSI NOTES: TCE in soil up to 12,000 µg/Kg (>DWP/GSIP/SVIIC/VSIC) delineated. TCE does not exceed the VSIC for a 1/2-acre source area. Therefore, not likely a concern for ambient air inhalation. Only COC detected in Plant 6 storm sewer samples above GSI criteria was selenium, which was not detected in gw above GSI criteria in Area 5-7. Manganese in groundwater is likely due to naturally occurring background concentrations. Propose to replace damaged/destroyed bedrock wells MW-04-06 and MW-04-04(6) to determine if metals are present in deep groundwater above DW criteria.	1) Restrict potable use of groundwater on-site. 2) Require exposure barrier for VI or additional data to show not a concern.	
AREA 5	5-8	AOI 6-49 AOI 6-81	Former Paint Shop Area	Phase 1 Scope: Three soil borings were advanced to an average 10 ft bgs, with samples collected at highest PID interval and deepest interval. Groundwater samples were collected from saturated permeable zones (if encountered). Results: Low-level VOCs detected in groundwater below RBSLs. Metals lead and arsenic detected in groundwater exceeding RBSLs. No VOCs, SVOCs, or metals exceedances detected in soil.	I. Assessment: Scope: Based on Phase 1 results, two HPT/VAP borings were completed to bedrock (or refusal) to characterize the stratigraphy and define groundwater impacts vertically. Soil samples were collected at approximate 15 ft intervals. Results: 1,4-Dioxane detected in groundwater exceeding proposed 8.5 µg/L DWC defined vertically. II. Characterization Scope: Two additional step-out soil borings were completed to 20 ft bgs north and east of the Area to delineate VOCs and metals in soil and groundwater. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Results: Metals in soil and groundwater delineated vertically and horizontally. III. Delineation Scope: Two monitoring wells installed north and east of Area adjacent to Characterization stage soil borings to provide permanent monitoring points for groundwater impacts. Results: Sampling of the two permanent monitoring wells indicates no exceedances of RBSLs. 1,4-Dioxane delineated at property boundary.			X	X				X	SOIL: Metals > GSIP & PSIC GW: 1,4-dioxane > Proposed DW (8.5 µg/L) Metals > DW & GSI NOTES: 1,4-dioxane in groundwater delineated. Only COC detected in Plant 6 storm sewer samples above GSI criteria was selenium, which was not detected in gw above GSI criteria in Area 5-8. Manganese (historical sample) does not exceed PSIC for a 5-acre source area, not likely a concern for this pathway. Additional groundwater sampling will be completed at P6-SB-35 to determine if additional work is required to delineate vanadium in GW above DW criteria.	1) Restrict potable use of groundwater on-site.

Groundwater samples were collected from two permanent monitoring wells. Results: 1,4-Dioxane detected in groundwater exceeding RBSLs. No VOCs or SVOCs were detected in soil/gw.	I. Assessment Scope: Based on Phase 1 results, four step-out soil borings were completed to an average 25 ft bgs to assess VOCs and SVOCs in soil and delineate VOCs in groundwater. Soil samples were collected approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). One HPT/VAP boring was completed to bedrock (or refusal) to characterize stratigraphy and define soil and groundwater impacts vertically. VAP soil/gw samples were collected at approximate 10 ft intervals. Results: 1,4-Dioxane in groundwater delineated horizontally. VOCs and SVOCs less than RBSLs.			X	X						GW: 1,4-dioxane > Prop DW (8.5 µg/L) NOTES: 1,4-dioxane in groundwater delineated.	1) Restrict potable use of groundwater on-site.
AREA 7	NA	AOI 6-17 AOI 6-47	ID 6-17 - AOC 2 - Tanks 1 (SWMU 4) and 3 (SWMU 8) - Tank 1: 7,500-gallon carbon steel virgin thinner storage tank; Tank 3: 12,000-gallon carbon steel virgin thinner storage tank ID 6-47 - Leaking Industrial Waste Line	Phase 1 Scope: Three soil borings were advanced to 20 ft bgs, with samples collected at the highest PID interval. Permanent monitoring well P6-MW-01 was installed to 25 ft bgs, with samples collected at surface, highest PID interval, and deepest interval. Groundwater was sampled following installation. Groundwater samples were also collected at seven permanent monitoring wells. Results: BTEX detected in groundwater and soil exceeding RBSLs. VOCs and SVOCs detected in soil and groundwater below RBSLs. Metals arsenic, vanadium, and lead detected in groundwater exceeding RBSLs. Metals detected in soil below RBSLs.	I. Assessment Scope: Based on Phase 1 results, eight step-out soil borings were completed to an average depth of 20 ft bgs to assess VOCs and metals in soil and groundwater. Soil samples were collected at approximate 5 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). One HPT/VAP boring was completed to bedrock (or refusal) to characterize stratigraphy and define soil and groundwater impacts vertically. Samples were collected at approximate 5 ft to 10 ft intervals. Results: BTEX in groundwater delineated vertically and horizontally to the east. BTEX detected in soil exceeding RBSLs between 5-15 ft bgs, delineated vertically. SVOCs detected in soil exceeding RBSLs at surface, delineated vertically. SVOCs in groundwater delineated vertically and horizontally. II. Characterization Scope: Two additional step-out soil borings advanced to 30 ft bgs define BTEX and SVOCs in soil. Soil samples were collected at approximate 5 ft intervals based on field screening results. Results: BTEX in soil exceeding RBSLs delineated to the north. SVOCs detected in soil below RBSLs delineated to the north and east. High concentrations of BTEX identified on southern property boundary above SVIIC Criteria. III. Delineation Scope: Four additional step-out soil borings advanced to 30 ft bgs off-Site south of Area to delineate VOCs, SVOCs, and metals in soil and groundwater. Two soil gas samples collected in the vicinity of BTEX SVIIC exceedances. Two monitoring wells were installed south of property boundary to provide permanent monitoring points for delineation of metals. Results: BTEX and SVOCs in soil and groundwater delineated vertically and horizontally. Metals detected in soil exceeding RBSLs delineated vertically and horizontally. Vanadium, lead and arsenic detected in groundwater above RBSLs south of Plant 6. Soil gas results did not indicate exceedance of risk-based soil gas screening levels.		X		X	X			X	SOIL: VOCs > DWP, GSIP, SVIIC, DC, GCP & Csat SVOCs > GSIP & DC Metals > GSIP GW: VOCs > DW & GSI SVOCs > DW Metals > DW & GSI NOTES: Total Xylenes in Soil up to 472,000 µg/Kg (>DWP/GSIP/SVIIC/DC/Csat) delineated. Concentrations of Xylenes do not exceed the risk-based SVIIC, GCP, or DC criteria. Metals in groundwater encountered off-site above DW criteria. Soil gas results below draft MDEQ soil gas screening levels. Manganese in groundwater is likely due to naturally occurring background concentrations. Does not exceed off-site. Proposing additional sampling south of Area 7 to define the extent of metals above criteria in perched water.	1) Restrict potable use of groundwater on-site. 2) Require exposure barrier for VI or additional data to show not a concern. 3) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).	
AREA 8	NA	AOI 2-7 AOI ID 2-37 AOI ID 2-38	ID 2-7 - Paint Shop Sumps and Trenches - Three sumps are 3'x3'x3' each ID 2-37 - Press Pits. Concrete press pits. One sump associated with presses. ID 2-38 - Scrap Steel Operations Pits. Scrap Steel Pits, 8" Deep. Scrap Pit oily waste sump	Phase 1 Scope: Four soil borings were advanced to an average 20 ft bgs, with samples collected at the highest PID interval and the deepest interval. Permanent monitoring well P2-MW-01 was installed and sampled at surface, highest PID interval, and EOB. Groundwater samples were collected following installation. Results: Low-level VOCs encountered in soils between 2-5 ft bgs (<RBSLs). SVOCs detected in soil exceeding RBSLs at one location at 3-4 ft bgs. No VOCs or SVOCs encountered in groundwater. Metals barium and manganese encountered in groundwater above RBSLs.	I. Assessment Scope: Based on Phase 1 results, nine step-out soil borings were completed to an average depth of 15 ft bgs to assess VOCs and SVOCs in soil. Soil samples were collected at approximate 5 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones. Results: VOCs in soil and GW and SVOCs in GW do not exceed RBSLs. SVOCs in soil above RBSLs defined vertically and horizontally. Metals in soil and groundwater exceeding RBSLs defined vertically and to the north, and appear to merge with impacts from Area 5-2 to the south.					X			X	SOIL: SVOCs > DWP & GSIP Metals > DWP & GSIP GW: SVOCs > GSI Metals > DW & GSI NOTES: COCs not detected in Plant 2 storm sewer samples above GSI criteria.	1) Restrict potable use of groundwater on-site.	
AREA 9	NA	AOI 6-60 Misc data gap	Paint Mix Room	Phase 1 Scope: Five soil borings were advanced to an average 20 ft bgs, with samples collected at highest PID interval and deepest interval. Groundwater samples collected from saturated permeable zones (if encountered). Results: VOCs in soil and groundwater exceeding RBSLs encountered generally between 4-12 ft bgs. SVOCs encountered in soil below RBSLs at 1-2 ft bgs.	I. Assessment Scope: Based on Phase 1 results, 11 step-out soil borings were completed to an average 20 ft to 30 ft bgs to assess VOCs in soil and groundwater. Soil samples were collected at approximate 5 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). One HPT/VAP boring was completed to bedrock (or refusal) to characterize stratigraphy and define soil impacts vertically. VAP boring soil/gw samples were collected at 5 ft intervals. Results: VOCs in groundwater exceeding RBSLs defined vertically. VOCs detected in soil exceeding RBSLs defined vertically and horizontally to the south and east. SVOCs detected in soil exceeding RBSLs defined vertically and horizontally to the east. II. Characterization Scope: One additional step-out soil boring was completed to 30 ft bgs north of Assessment stage borings to delineate VOCs and SVOCs in soil and groundwater. Soil samples were collected at approximate 5 ft intervals based on field screening results. One additional HPT/VAP boring was completed to bedrock (or refusal) to the east of the Area to delineate VOCs in groundwater. VAP groundwater samples collected at 10 ft intervals or where saturated permeable zones were encountered. Results: VOCs and SVOCs in soil defined vertically. VOCs not defined to north and west of area before railroad ROW, but are defined by adjacent areas interior to the Site. 1,4-Dioxane encountered in groundwater east of Area exceeding proposed 8.5 ug/L DWC.	X	X	X	X	X			X	SOIL: VOCs > DWP, GSIP, SVIIC, GCP, DC & Csat SVOCs > DWP, GSIP, VSIC, & DC GW: VOCs > DW, GSI, GW _{VI-nt} & FESL SVOCs > GSI Metals > DW & GSI NOTES: BTEX in groundwater up to 181,000 µg/L. Xylenes exceed the FESL in groundwater. BTEX in soil up to 651,000 µg/Kg delineated. Concentrations of ethylbenzene and xylenes do not exceed the risk-based SVIIC, GCP, or DC criteria.	1) Restrict potable use of groundwater on-site. 2) Require exposure barrier for soil DC (PAHs). 3) Require exposure barrier for VI or data indicating that VI is not a concern. 4) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).

RFI Phase 2 Summary Report
RACER Plants 2, 3 and 6
Investigation Summary Matrix

Investigation Area	Subarea	Associated AOI	AOI Summary	RFI Phase 1 Investigation	RFI Phase 2 Investigation Sequence/Results	Constituents of Concern > PART 201 RBSLs								Summary of Exceedances	Potential Corrective Measures	
						VOCs				SVOCs	PCBs	Metals				
						CVOcs	BTEX	1,4-Dioxane	Other VOCs			CrVI	Other			
AREA 10	NA	AOI 6-19 AOI 6-63 AOI 6-82	ID 6-48 - Former Coal Pile ID 6-82 - Former Coal Chute Building. Basement filled with water at the time of the site walkthrough ID 6-19 - Process Waste Tunnel. Runs underneath Buildings 28 and 21; exits Site to the west and continues to GM Lansing Plant 2	Phase 1 Scope: Three soil borings were advanced to an average depth of 20 ft bgs, with samples collected at highest PID interval and deepest interval. Groundwater samples collected from saturated permeable zones (if encountered). Results: SVOCs, VOCs and Metals detected in soil <RBSLs. Groundwater < RBSLs	I. Assessment Scope: Based on Phase 1 results, five step-out soil borings were completed to an average 20 ft bgs to assess VOCs, SVOCs and metals in soil. Soil samples were collected at approximate 10 ft intervals based on field screening results. One HPT/VAP boring was completed to bedrock (or refusal) to characterize stratigraphy and assist with site-wide groundwater delineation. VAP samples were collected where saturated permeable zones were encountered. Results: VOCs not encountered in groundwater. Manganese detected in groundwater exceeding aesthetic DWC but not health-based DWC. VOCs and SVOCs detected in soil below non-residential RBSLs (but above residential DC Criteria for benzo(a)pyrene). II. Characterization Scope: Three additional step-out soil borings were completed to 30 ft bgs to define SVOCs in soil. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Results: SVOCs in soil defined vertically and horizontally..									X	SOIL: Metals > GSIP & PSIC NOTES: Only COC detected in Plant 6 storm sewer samples above GSI criteria was selenium, which was not detected in gw above GSI criteria in Area 10. Manganese (historical sample) exceeded the PSIC for a 100-acre source, but not a 5-acre source. Therefore, likely not a concern for the Site.	1) Restrict potable use of groundwater on-site.
AREA 11	NA	AOI ID 3-54	Sump - Sump pit with sump pump, unknown use	Phase 1 Scope: Three soil borings were advanced to an average depth of 20 ft bgs, with samples collected at highest PID interval and deepest interval. Results: VOCs, SVOCs, and metals detected in soil below RBSLs.	I. Assessment Scope: Based on Phase 1 results, eight step-out soil borings were completed to an average 15 ft bgs to assess impacts in soil. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). One HPT/VAP boring was completed to bedrock (or refusal) to characterize stratigraphy and define impacts in soil/gw vertically. VAP soil/gw samples were collected at 10 ft intervals. Results: VOCs and SVOCs detected in soil exceeding RBSLs. 1,4-Dioxane and other VOCs detected in groundwater exceeding RBSLs. SVOCs detected in groundwater below RBSLs. II. Characterization Scope: Ten additional step-out soil borings completed to an average 30 ft bgs to define VOCs in soil and groundwater. Soil samples were collected at approximate 5 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Results: VOCs, SVOCs in soil and groundwater defined horizontally. VOCs detected in soil exceeding RBSLs appear to terminate at "coliseum" foundation wall to the north, or otherwise merge with Area 21. Deep groundwater samples not collected at VAP boring due to low-permeability saturated formation. III. Delineation Scope: Monitoring well MW-12-21 installed to provide a permanent monitoring point for delineation of groundwater impacts. Results: 1,4-dioxane detected at MW-12-21 in deep overburden above RBSLs. Follow-up work required for deep overburden characterization.	X	X	X							SOIL: VOCs > DWP, GSIP, & SVIIC SVOCs > GSIP Metals > DWP & GSIP GW: VOCs > DW & GSI 1,4-dioxane > Proposed DW (8.5 µg/L) & DW Metals > DW NOTES: 1,4-dioxane up to 460 µg/L (>Proposed DW/DW) encountered at 75 ft bgs near Coliseum. Additional sampling will be conducted to determine the extent of 1,4-dioxane in deep overburden. COCs not detected in Plant 3 storm sewer samples above GSI criteria.	1) Restrict potable use of groundwater on-site. 2) Require exposure barrier for VI or data showing conditions acceptable for VI.
AREA 12	NA	MW-04-02 (TD=132.7') MW-04-03 (TD=88.25')	Vinyl chloride detected above DW Criteria in deep overburden and bedrock	Phase 1 Scope: Permanent monitoring wells MW-04-02(3) and MW-04-03(3) were sampled. Results: Vinyl chloride detected in groundwater exceeding RBSLs.	II. Characterization Scope: One step-out soil boring was completed to 20 ft bgs to characterize metals between property boundary and neighboring Area to the east (Area 14). Soil samples were collected at approximate 10 ft intervals based on field screening results. Results: Metals in soil samples < RBSLs. Vinyl Chloride and other VOCs in bedrock on northwestern portion of Plant 3 believed to originate from off-site source.	X									GW: VOCs > DW	1) Restrict potable use of groundwater on-site.
AREA 13	NA	Background Sample	PCBs detected at P3-SB-3 @ 15'-16'	Phase 1 Scope: Soil boring P3-SB-03 was advanced to 30 ft bgs and sampled at 10 ft intervals. Results: No VOCs or SVOCs detected. PCBs detected in soil at 15-16 ft bgs	I. Assessment Scope: Based on Phase 1 results, four step-out soil borings were completed to 20 ft bgs to assess PCBs in soil. Soil samples were collected at approximate 10 ft intervals. Results: PCBs defined in soil.										NOTES: No constituents exceed RBSLs	1) Restrict potable use of groundwater on-site.
AREA 14	NA	AOI 3-10 Misc. Data Gap Borings	AOC 4 - Former Electroplating Area - (1) Electroplating operations (2) New and Reworked Storage Tanks, Chromic Acid Reclaim, 7' diameter by 9' tall (3) 17 Acid Copper Plating Tanks (4) Sludge Sump Under Nickel Storage Tank, 1,350 Gallons (5) 3 Washwater Tanks (1,900-gallons each) in Plating Area (6) Nickel Plating Tanks 1, 2, 3, 4, 6, 7, 8, and 9 (7) Copper Buffing Wash and Rinse Tanks (8) Bumper Plating Sumps (9) Durni Nickel Operations Area, Tanks, Sumps, and Drain Deck	Phase 1 Scope: Six soil borings were advanced to an average 25 ft bgs and sampled at highest PID interval and deepest interval. Two permanent monitoring wells were sampled. Results: VOCs not detected in soil/gw. SVOCs detected in soil below RBSLs. SVOCs not detected in groundwater. Metals in soil below RBSLs. Metals boron, arsenic, and hexavalent chromium detected in perched groundwater exceeding RBSLs.	I. Assessment Scope: Based on Phase I results, 14 step-out soil borings were completed to an average 15 ft bgs to assess extent of metals in soil and perched water. Soil samples were collected at approximate 5 ft intervals. Groundwater samples were collected from saturated permeable zones (if encountered). Three VAP borings were completed in Area to bedrock (or refusal) to characterize stratigraphy and define metal impacts in soil and groundwater. VAP soil/gw samples were collected at 5 ft intervals. Results: Hexavalent chromium defined vertically and horizontally in perched zone and appears limited in extent. Additional metals detected in soil and groundwater exceeding RBSLs defined vertically and horizontally, appearing to merge with impacts from Areas to the east (Areas 17 and 18).								X	X	SOIL: Metals > DWP, GSIP, DC & PSIC GW: Metals > DW & GSI NOTES: COCs not detected in Plant 3 storm sewer samples above GSI criteria. Arsenic exceeds the DC in the northern portion of Area 14 at a depth of 43.5-45 feet bgs. Due to the depth of the exceedance, exposure is not likely. Nickel and total chromium (as hexavalent chromium) exceeded the PSIC for a 100-acre source area. Exceedances for both were located within a 1/2-acre area. Nickel did not exceed the PSIC for a 1/2-acre. Total chromium did; however, all but one location is under quality concrete. Additional work will be completed to determine the extent of metals impacts in soil. Additional groundwater samples will be collected from deep overburden wells MW-91-2, MW-02-04 and MW-04-04 with an emphasis on low turbidity sampling to verify the presence of metals above criteria.	1) Restrict potable use of groundwater on-site. 2) Require exposure barrier for the total chromium PSIC exceedances. 3) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).

TABLE 2
RFI Phase 2 Summary Report
RACER Plants 2, 3 and 6
Investigation Summary Matrix

Investigation Area	Subarea	Associated AOI	AOI Summary	RFI Phase 1 Investigation	RFI Phase 2 Investigation Sequence/Results	Constituents of Concern > PART 201 RBSLs								Summary of Exceedances	Potential Corrective Measures	
						VOCs				SVOCs	PCBs	Metals				
						CVOCs	BTEX	1,4-Dioxane	Other VOCs			CrVI	Other			
AREA 15	NA	AOI ID 3-15	Oil Sump for Crank Shaft Operations		I. Assessment Scope: Based on Phase 1 results, four step-out soil borings were completed to 20 ft bgs to assess VOC impacts in soil and groundwater. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Results: 1,4-Dioxane and SVOCs detected in perched groundwater exceeding RBSLs. SVOCs and selenium detected in soil exceeding RBSLs. II. Characterization Scope: Two additional step-out borings were completed to 20 ft bgs to define VOCs and SVOCs in soil and groundwater to the west and south. Soil samples were collected at approximate 10' intervals. Groundwater samples were collected from saturated permeable zones (if encountered). Results: SVOCs and selenium in soil delineated. SVOCs and 1,4-dioxane in groundwater water appears localized and delineated by dry zones.	X		X		X					SOIL: VOCs > DWP & VSIC SVOCs > GSIP Metals > GSIP GW: 1,4-dioxane > Proposed DW (8.5 µg/L) SVOCs > DW Metals > DW & GSI NOTES: Dibromochloropropane exceeds the 100-acre source area VSIC in one location. It does not exceed the 1/2-acre source area VSIC. Therefore, it is not likely to be a concern for the ambient air pathway. COCs not detected in Plant 3 storm sewer samples above GSI criteria.	1) Restrict potable use of groundwater on-site.
AREA 16	NA	AOI 3-11	SWMU 14 - Former Scrap Metal Storage Areas		I. Assessment Scope: Based on Phase 1 results, eight step-out borings were completed to an average 20 ft bgs to assess SVOC impacts in soil. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Results: SVOCs detected in soil detected exceeding RBSLs, generally associated with fill material 5-10' below grade. II. Characterization Scope: Three additional step-out soil borings were completed to 20 ft bgs to define SVOCs in soil. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Results: SVOCs defined horizontally. Metals lead and mercury detected in soil exceeding RBSLs not defined to east. Lead in excess of DC Criteria. III. Delineation Scope: Seven additional step-out soil borings were completed to an average 20 ft bgs to define metals in soil. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater collected from saturated permeable zones (if encountered). Results: Arsenic and other metals detected in soil and groundwater exceeding RBSLs not defined to the south or east.					X			X	SOIL: SVOCs > DWP, GSIP, & DC Metals > DWP, GSIP, DC, & PSIC GW: Metals > DW & GSI NOTES: COCs not detected in Plant 3 storm sewer samples above GSI criteria. Additional work will be completed between Area 16 and the southeastern Plant 3 property boundary to define the extent of arsenic in groundwater.	1) Restrict potable use of groundwater on-site. 2) Require exposure barrier for DC (PAHs and Lead) and PSIC (Mn) exceedances. 3) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).	
AREA 17	NA	AOI 3-3 AOI 3-4 AOI 3-9	ID 3-4 - SWMU 18 - Machining Residue Storage Area. 20 cubic yard roll-off box located. ID 3-9 - AOC 2 - Building 301 UST Farm. Six USTs, stored polymer, sulfuric acid, soluble oil, gasoline, hydraulic oil, and APCO cleaner; were removed in 1989.		I. Assessment Scope: Based on Phase 1 results, eight step-out soil borings were completed to an average 20 ft bgs to assess VOCs and SVOCs in soil and groundwater. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Thee HPT/VAP borings were completed to an average 75 ft bgs to characterize stratigraphy and define soil impacts vertically. Samples were collected at 5 ft intervals. 22 LIF borings were completed to 30 ft bgs to delineate the NAPL plume. Results: VOCs and SVOCs detected in soil exceeding RBSLs at 16-17 ft bgs to the south of the Area. Copper detected in soil exceeding RBSLs, defined vertically and horizontally to the east. II. Characterization Scope: Nine additional step-out soil borings were completed to 30 ft bgs to define VOCs in soil south of Area. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). Results: VOCs and SVOCs detected in soil exceeding RBSLs defined to the vertically and horizontally. VOCs detected in groundwater exceeding RBSLs defined vertically and horizontally. III. Delineation Scope: Three NAPL monitoring wells were installed in the southern area of concern identified by the LIF study in order to provide permanent NAPL monitoring points. One monitoring well was installed east of the NAPL plume to provide a permanent monitoring point for the delineation of groundwater impacts. Results: New well was dry upon attempt to sample.	X	X	X	X	X			X	SOIL: VOCs > DWP, GSIP, & SVIIC SVOCs > GSIP Metals > GSIP GW: VOCs > DW, GSI, & GW_{VI,IR} 1,4-dioxane > Proposed DW (8.5 µg/L) SVOCs > DW Metals > DW & GSI NOTES: Elevated VOCs associated with LNAPL plume. COCs not detected in Plant 3 storm sewer samples above GSI criteria. Additional soil sampling will be completed east of Area 17 near the Plant 3 property boundary to define the extent of arsenic in soil above the DW criteria.	1) Restrict potable use of groundwater on-site. 2) Require exposure barrier for VI or data showing conditions acceptable for VI. 3) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).	
AREA 18	NA	AOI 3-2 AOI 3-6	ID 3-2 - SWMU 16 - Oily Waste Treatment System. Treated oily wastewater; Two concrete used oil holding tanks, Two concrete oily sludge tanks. ID 3-6 - SWMU 20 - Former Electroplating Waste Treatment System. Treated electroplating wastes (copper, nickel, and chromium). Included an Acid Wash Tank, Sludge Storage Tank, Waste Acid Storage Tank.		I. Assessment Scope: Based on Phase 1 results, seven step-out soil borings were completed to 20 ft bgs to assess VOCs in soils. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones (if encountered). One deep VAP boring was completed to bedrock (or refusal) to characterize stratigraphy and define soil impacts vertically. VAP soil/gw samples were collected at 10 ft intervals. Results: SVOCs detected in soil exceeding RBSLs defined horizontally to the south. Metals boron and cobalt detected in soil exceeding RBSLs defined vertically and horizontally to the south and west. Vanadium detected in groundwater exceeding RBSLs defined horizontally to the south. II. Characterization Scope: Three additional soil borings were completed to 30 ft bgs to define soil SVOCs and groundwater metal impacts. Soil samples were collected at approximate 10 ft intervals based on field screening results. Groundwater samples collected from saturated permeable zones. Results: SVOCs in soil defined vertically and horizontally. III. Delineation Scope: One step-out soil boring was completed to 30 ft bgs to define select soil metal impacts. Soil samples were collected at 10 ft intervals. Results: Boron in soil defined horizontally.					X			X	SOIL: SVOCs > DWP, GSIP, & DC Metals > DW & GSI GW: Metals > DW & GSI NOTES: COCs not detected in Plant 3 storm sewer samples above GSI criteria. Additional soil sampling will be completed east of Area 18 near the Plant 3 property boundary to define the extent of arsenic in soil above the DW criteria.	1) Restrict potable use of groundwater on-site. 2) Require exposure barrier for DC (PAHs) exceedances. 3) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).

RFI Phase 2 Summary Report
RACER Plants 2, 3 and 6
Investigation Summary Matrix

Investigation Area	Subarea	Associated AOI	AOI Summary	RFI Phase 1 Investigation	RFI Phase 2 Investigation Sequence/Results	Constituents of Concern > PART 201 RBSLs								Summary of Exceedances	Potential Corrective Measures	
						VOCs				Metals						
						CVOCs	BTEX	1,4-Dioxane	Other VOCs	SVOCs	PCBs	CrVI	Other			
AREA 19	NA	AOI ID 3-17	Broach Machine Filter Pit - 9' by 20' by 9' pit	Phase 1 Scope: Soil boring P3-SB-25 was advanced to 10 ft bgs, with samples collected at highest PID interval and deepest interval. Results: Metals arsenic, boron, cobalt, selenium, and vanadium detected in soil exceeding RBSLs.	I. Assessment Scope: Based on Phase 1 results, four step-out soil borings were completed to an average 15 ft bgs to define metals impacts in soils. Soil samples were collected at approximate 10 ft intervals. One VAP boring was completed to bedrock (or refusal) to characterize stratigraphy and define metals in soil vertically. VAP soil/gw samples collected at 10 ft intervals. Groundwater samples were collected from saturated permeable zones (if encountered). Results: Metals detected in soil exceeding RBSLs defined vertically and horizontally to the north, east and south. Boron detected in perched water exceeding RBSLs, defined vertically. II. Characterization Scope: Two additional step-out soil borings were completed to the south and west to 20 ft bgs to define SVOC and metals impacts in soils. Soil samples were collected at approximate 10 ft intervals. Groundwater samples collected from saturated permeable zones (if encountered). Results: SVOCs and metals in soil defined vertically and horizontally. Arsenic and boron in perched water > RBSLs not defined locally to the south.						X			X	SOIL: SVOCs > GSIP Metals > DWP, GSIP, & DC GW: Metals > DW & GSI NOTES: COCs not detected in Plant 3 storm sewer samples above GSI criteria.	1) Restrict potable use of groundwater on-site. 2) Require exposure barrier for DC (As) exceedances. 3) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).
AREA 20	NA	AOI 3-51	Building 304 and 305 Press Pit Operations	Phase 1 Scope: Four soil borings were advanced to an average 20 ft bgs, with samples collected at the highest PID interval and the deepest interval. Results: SVOCs detected in soil below RBSLs. Selenium detected in soil on western side of Area exceeding RBSLs.	I. Assessment Scope: Based on Phase 1 results, four step-out soil borings were completed to 20 ft bgs to define/verify SVOC impacts in soils in northern portion of area. Soil samples were collected at approximate 10 ft intervals based on field screening results. One VAP boring was completed to refusal (50 ft bgs) to characterize stratigraphy and define SVOC and metals impacts in soil vertically. VAP boring soil samples were collected at 10 ft intervals. Results: SVOCs detected in shallow soil near property boundary exceeding RBSLs; defined vertically and horizontally to the south. Cobalt detected in soil exceeding RBSLs defined vertically and horizontally to the south and west. II. Characterization Scope: Three additional step-out soil borings were completed to 20 ft bgs to define SVOC and metal impacts at the northern edge of the Area. Soil samples were collected at approximate 10 ft intervals based on field screening results. Results: SVOCs and metals detected in soil exceeding applicable RBSLs defined vertically and horizontally.						X			X	SOIL: SVOCs > GSIP Metals > DWP, GSIP & PSIC NOTES: COCs not detected in Plant 3 storm sewer samples above GSI criteria. Manganese exceedance of PSIC is deep (17-18' bgs) and not likely to be a concern for ambient air unless soil is brought to the surface.	1) Restrict potable use of groundwater on-site. 2) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).
AREA 21	NA	AOI 3-51	Building 304 and 305 Press Pit Operations	Phase 1 Scope: Two soil borings were advanced to 15 ft bgs, with samples collected at t he highest PID interval and the deepest interval. Results: Metals arsenic, boron, cobalt, selenium, and vanadium detected in soil exceeding RBSLs at one location.	I. Assessment Scope: Based on Phase 1 results, four step-out soil borings were completed to 15 ft bgs to assess metals impacts in soil. Soil samples were collected at approximate 10 ft intervals. Results: Metals arsenic, boron, cobalt, and selenium detected in soil exceeding RBSLs between 10-15 ft bgs, defined horizontally to the north, south, and west. II. Characterization Scope: One additional step-out soil boring was completed to 20 ft bgs to define metals impacts in soil to the east. Soil samples were collected at 10 ft intervals. Results: Metals in soil defined vertically and horizontally.									X	SOIL: Metals > DWP, GSIP, & DC NOTES: COCs not detected in Plant 3 storm sewer samples above GSI criteria.	1) Restrict potable use of groundwater on-site. 2) Require exposure barrier for DC (As) exceedances. 3) Handle excavated soils appropriately (e.g., don't bring to surface and use as surface cover).

Notes:

* - COCs indicate soil and groundwater exceedances detected during the RFI Phase 1 activities or during previous historical soil investigations.

(1) - Target analytes based on analytes detected during the RFI Phase 1 sampling activities and take into consideration the past use of the Area Of Interest, prior sampling density (i.e., assessment vs. characterization) and analytes detected upgradient and/or in surrounding AOIs.

(2) - Sampling step-out grid based on the size of the Investigation Area or AOI and the recommendations provided by the MDEQ Sampling Strategies and Statistical Training Manual (MDEQ RRD 2002); Small Area = (√A/π)/2, Large Area = (√A/π)/4 (results rounded to the nearest 5 feet)

(3) - Target media based on Phase 1 and historical results for soil and groundwater. For example, if soil impacts are defined vertically, the Phase 2 initial assessment will focus on horizontal delineation in soil first to determine if there is a viable source of target analytes before investigating groundwater.

(4) - Sample density is based on the amount of data available and the soil/groundwater analytical results for an area collected during the RFI Phase 1. For example, if an area has low-level detections of SVOCs in one or two borings and no indication of groundwater impacts, initial sampling will be completed based on field screening or otherwise at approximately 10-foot intervals ("normal") throughout the vadose zone. If soil and groundwater data suggest the area may be a source of COCs, soil and groundwater sampling will be completed at nominal 5-foot spacing ("higher resolution").

Colors - general indication of area category as defined in Section 4.1 and indication of the general priority: Green: COCs were identified in soil/gw, but (with the possible exception of metals) at concentrations below the most restrictive MDEQ Part 201 Criteria - low priority.

Yellow: Soil and/or groundwater impacts were identified at a concentration that exceeds applicable Part 201 Criteria - medium priority. Red: Soil and groundwater sampling, often combined with historical data, has identified a source of COCs that are likely

contributing to groundwater impacts beneath the Site - high priority

Abbreviations -

- VOC - volatile organic compounds
- SVOCs - semi-volatile organic compounds
- PCBs - polychlorinated biphenyls
- RBSLs - MDEQ Risk-Based Screening Levels
- DCC - Direct Contact Criteria
- DWC - Residential Drinking Water Criteria
- GC - Groundwater Contact Criteria
- GSI - Groundwater-Surface Water Interface Criteria
- DWP - Residential Drinking Water Protection Criteria
- GSIP - Groundwater-Surface Water Interface Protection Criteria
- GW_{VI,inf} - draft Groundwater Concentrations for Vapor Intrusion
- PSIC - Particulate Soil Inhalation Criteria
- SVIIC - Soil Volatilization to Indoor Air Inhalation Criteria
- VSIC - Volatile Soil Inhalation Criteria
- BTEX - benzene, toluene, ethylbenzene, xylenes
- Cr - chromium
- CrVI - hexavalent chromium
- NFA - no further action
- GW - groundwater
- PID - photoionization detector
- HPT - Hydraulic Profiling Tool
- LIF - laser induced fluorescence
- VAP - Vertical Aquifer Profile Sample
- VI - vapor intrusion

Notes:
Sch. 40 PVC = Schedule 40 Polyvinyl Chloride
ft = units of feet
bgs = below ground surface
NL = Monitoring Well has been abandoned or was not located during the 8/30/2010 well inventory/gauging event.
NAD 83 = North America Datum 1983 coordinate system
NS = Monitoring Well which has not been surveyed
NM = Monitoring Well which was not measured on a particular gauging/sampling event
TOC = Top of Casing
NA = Not Available
msl = mean sea level
* - measured on 01-28-13

Hydrostratigraphic Unit
Shallow Sand & Fill – unconfined perched water encountered in near surface fill/sand above clay – typically 5-10 feet below grade.

Interbedded Zone - This is the soft clay, silt, sand, occasional till, pretty much a mess zone encountered beneath the surficial sand and above the regional hard clay/sand till – typically ~10 to ~35 feet below grade. These confined perched units are typically discontinuous and appear essentially random.

Glacial Till - Typically a dense, primarily dry, sand/clay/gravel mix. Occasionally there are more permeable zones within this matrix that are saturated.
Deep Overburden - Saturated deep sands encountered above bedrock where bedrock is deeper than ~80 feet below grade.
Bedrock

cm/sec - centimeters per second

NA - not applicable

Screen Conditions

C1 - Well screen fully submerged under static conditions. Induced change in head lowered water table within screened interval. Minor filter pack drainage observed.

S - Well screen fully submerged during static and induced head conditions.

Location ID: Sample Depth(ft): Date Collected:		SB-A5.2-NE157* 9 - 10 05/09/12	SB-A5.2-NE157* 15 - 16 05/09/12	SB-A5.2-NE157* 24 - 25 05/09/12	SB-A5.2-NG105* 2 - 3 05/04/12	SB-A5.2-NG105* 7 - 8 05/04/12	SB-A5.2-NG105* 13 - 14 05/04/12	SB-A5.2-NG115* 1 - 2 05/03/12	SB-A5.2-NG115* 6 - 7 05/03/12	SB-A5.2-NG115* 11 - 12 05/04/12	SB-A5.2-NG115* 15 - 16 05/04/12	SB-A5.2-NG115* 20 - 21 05/04/12	SB-A5.2-NG115* 24 - 25 05/04/12	SB-A5.2-NG127* 2 - 3 05/02/12	SB-A5.2-NG127* 6 - 7 05/02/12
	Units														
Semivolatile Organics															
1-Methylnaphthalene	ug/kg	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA
2-Methyl-4,6-dinitrophenol	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<100	<40
2,2'-Oxybis(1-chloropropane) (bis(2-Chloroisopropyl) ether)	ug/kg	<40 J	<40 J	<40 J	<40	<40	<40 J	<40 J	<40 J	<40	<40	<40	<40	<100 J	<40
2,4,6-Trichlorophenol	ug/kg	<40	<40	<40	<40	<40	<40	<40 J	<40 J	<40	<40	<40	<40	<100	<40
2,4-Dichlorophenol	ug/kg	<40 J	<40 J	<40 J	<40	<40	<40 J	<40 J	<40 J	<40	<40	<40	<40	<100	<40
2,4,5-Trichlorophenol	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<100	<40
2,4-Dimethylphenol	ug/kg	<40 J	<40 J	<40 J	<40	<40	<40 J	<40 J	<40 J	<40	<40	<40	<40	<100	<40
2,4-Dinitrophenol	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<100	<40
2,4-Dinitrotoluene	ug/kg	<40	<40	<40	<40	<40 J	<40	<40	<40	<40	<40	<40	<40	<100	<40
2,6-Dinitrotoluene	ug/kg	<40	<40	<40	<40	<40	<40 J	<40 J	<40 J	<40	<40	<40	<40	<100	<40
2-Chloronaphthalene	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40 J	<40	<40	<40	<40	<100	<40
2-Chlorophenol	ug/kg	<40	<40	<40	<40	<40 J	<40	<40	<40	<40	<40	<40	<40	<100	<40
2-Methylnaphthalene	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<100	<40
2-Methylphenol	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<100	<40
2-Nitroaniline	ug/kg	<40	<40	<40	<40	<40	<40	<40 J	<40 J	<40	<40	<40	<40	<100	<40
2-Nitrophenol	ug/kg	<40 J	<40 J	<40 J	<40	<40	<40	<40 J	<40 J	<40	<40	<40	<40	<100	<40
3&4-Methylphenol	ug/kg	<70	<70	<70	<80	<80	<70	<80	<80	<80	<80	<80	<70	<70	<300
3,3'-Dichlorobenzidine	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<100	<40
Naphthalene	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<100	<40
3-Nitroaniline	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<100	<40
4-Bromophenyl phenyl ether	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<100	<40
4-Chloro-3-methylphenol	ug/kg	<40	<40	<40	<40	<40 J	<40	<40	<40	<40	<40	<40	<40	<100	<40
4-Chloroaniline	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<100	<40
4-Chlorophenyl phenyl ether	ug/kg	<40	<40	<40	<40	<40	<40 J	<40	<40	<40	<40	<40	<40	<100	<40
4-Nitroaniline	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<100	<40
4-Nitrophenol	ug/kg	<40	<40	<40	<40	<40 J	<40	<40	<40	<40	<40	<40	<40	<100	<40
Anthracene	ug/kg	<40	<40	<40	<40	<40	<40	80	<40	<40	<40	<40	<40	500	<40
Acenaphthene	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	200
Acenaphthylene	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<100	<40
Acetophenone	ug/kg	<40 J	<40 J	<40 J	<40	<40	<40	<40 J	<40 J	<40	<40	<40	<40	<100	<40
Atrazine	ug/kg	<40	<40	<40	<40	<40	<40 J	<40 J	<40 J	<40	<40	<40	<40	<100	<40
Benzaldehyde	ug/kg	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<100	<40
Benzo(a)anthracene	ug/kg	<40	<40	<40	120	<40	120	910	<40	<40	<40	<40	<40	1,000	<40

	Units													
Volatile Organics														
1,2-Dibromo-3-chloropropane (DBCP)	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
1,2-Dibromoethane (Ethylene dibromide)	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
1,2-Dichlorobenzene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
1,4-Dichlorobenzene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
2-Hexanone	ug/kg	<780	<770	<730	<740	<780	<760	<760	<610	<630	<670	<500 J	<580	<720
Acetone	ug/kg	<2,000	<1,900	<1,800	<1,900	<2,000	<1,900	<1,900	<610	<630	<670	<500 J	<580	<1,800
Bromodichloromethane	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Bromoform	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Bromomethane (Methyl bromide)	ug/kg	NA	NA	NA	NA	NA	NA	NA	<60	<60	<70	<50 J	<60	NA
Carbon disulfide	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Carbon tetrachloride	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Chlorobenzene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Chloroform (Trichloromethane)	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Chloromethane (Methyl chloride)	ug/kg	<200	<190	<180	<190	<200	<190	<190	<60	<60	<70	<50 J	<60	<180
cis-1,3-Dichloropropene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Dichlorodifluoromethane (CFC-12)	ug/kg	NA	NA	NA	NA	NA	NA	NA	<60	<60	<70	<50 J	<60	NA
Methyl acetate	ug/kg	NA	NA	NA	NA	NA	NA	NA	<610	<630	<670	<500 J	<580	NA
Methylene chloride	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Styrene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
trans-1,3-Dichloropropene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Trichlorofluoromethane (CFC-11)	ug/kg	NA	NA	NA	NA	NA	NA	NA	<60	<60	<70	<50 J	<60	NA
Trifluorotrichloroethane (Freon 113)	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
1,4-Dioxane	ug/kg	<780	<770	<730	<740	<780	<760	<760	<760	<700	<720	<730	<770	<720
1,1,1-Trichloroethane	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
1,1,2,2-Tetrachloroethane	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
1,1,2-Trichloroethane	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
1,1-Dichloroethane	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
1,1-Dichloroethene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
1,2-Dichloroethane	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
cis-1,2-Dichloroethene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
trans-1,2-Dichloroethene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Trichloroethene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Tetrachloroethene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Vinyl chloride	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Chloroethane	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Benzene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Ethylbenzene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Toluene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
o-Xylene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
m&p-Xylene	ug/kg	<160	<150	<150	<150	<160	<150	<150	<100	<100	<100	<100 J	<100	<140
Xylene (total)	ug/kg	<238	<227	<223	<224	<238	<226	<226	NA	NA	NA	NA	NA	<212
Methyl tert butyl ether (MTBE)	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
2-Butanone (Methyl ethyl ketone) (MEK)	ug/kg	<780	<770	<730	<740	<780	<760	<760	<610	<630	<670	<500 J	<580	<720
4-Methyl-2-pentanone (Methyl isobutyl ketone) (MIBK)	ug/kg	<780	<770	<730	<740	<780	<760	<760	<610	<630	<670	<500 J	<580	<720
1,2,4-Trichlorobenzene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
1,2,4-Trimethylbenzene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<76	<70	<72	<73	<77	<72
1,3,5-Trimethylbenzene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<76	<70	<72	<73	<77	<72
1,2-Dichloropropane	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
1,3-Dichlorobenzene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Cyclohexane	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Methyl cyclohexane	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Dibromochloromethane	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Isopropyl benzene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<60	<60	<70	<50 J	<60	<72
Naphthalene	ug/kg	<78	<77	<73	<74	<78	<76	<76	<76	<70	<72	<73	<77	<72

	Units													
Semivolatile Organics														
1-Methylnaphthalene	ug/kg	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA
2-Methyl-4,6-dinitrophenol	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40
2,2'-Oxybis(1-chloropropane) (bis(2-Chloroisopropyl) ether)	ug/kg	<30 J	<40 J	<40 J	<40 J	<40	<40 J	<40 J	<40 J	<40 J [<40]	<40	<40	<40 J	<40 J
2,4,6-Trichlorophenol	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40	<40
2,4-Dichlorophenol	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
2,4,5-Trichlorophenol	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
2,4-Dimethylphenol	ug/kg	<30	<40	<40 J	<40 J	<40	<40	<40 J	<40 J	<40 J [<40]	<40	<40	<40	<40
2,4-Dinitrophenol	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
2,4-Dinitrotoluene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
2,6-Dinitrotoluene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
2-Chloronaphthalene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
2-Chlorophenol	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
2-Methylnaphthalene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
2-Methylphenol	ug/kg	<30	<40	<40	<40	<40	<40 J	<40	<40	<40 [<40]	<40	<40	<40	<40
2-Nitroaniline	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
2-Nitrophenol	ug/kg	<30	<40	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J [<40]	<40	<40	<40	<40
3&4-Methylphenol	ug/kg	<70	<80	<80	<80	<70	<70	<70	<70	<70 [<70]	<70	<80	<80	<70
3,3'-Dichlorobenzidine	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Naphthalene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
3-Nitroaniline	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
4-Bromophenyl phenyl ether	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
4-Chloro-3-methylphenol	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
4-Chloroaniline	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
4-Chlorophenyl phenyl ether	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
4-Nitroaniline	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
4-Nitrophenol	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Anthracene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Acenaphthene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Acenaphthylene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Acetophenone	ug/kg	<30	<40	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J [<40]	<40	<40	<40	<40
Atrazine	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Benzaldehyde	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Benzo(a)anthracene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Benzo(a)pyrene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Benzo(b)fluoranthene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Benzo(g,h,i)perylene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Benzo(k)fluoranthene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Biphenyl (1,1-Biphenyl)	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
bis(2-Chloroethoxy)methane	ug/kg	<30	<40	<40 J	<40 J	<40	<40 J	<40 J	<40 J	<40 J [<40]	<40	<40	<40	<40
bis(2-Chloroethyl)ether	ug/kg	<30 J	<40 J	<40 J	<40 J	<40	<40 J	<40 J	<40 J	<40 J [<40]	<40	<40	<40	<40
bis(2-Ethylhexyl)phthalate (DEHP)	ug/kg	<70	<80	110 J	<80 J	<70	<70 J	<70 J	<70 J	<70 J [80]	<70	<80	<80	<70
Butyl benzylphthalate (BBP)	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Caprolactam	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Carbazole	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Chrysene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Dibenz(a,h)anthracene	ug/kg	<70	<80	<80	<80	<70	<70	<70	<70	<70 [<70]	<70	<80	<80	<70
Dibenzofuran	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Diethyl phthalate	ug/kg	<70	<80	<80	<80	<70	<70	<70	<70	<70 [<70]	<70	<80	<80	<70
Dimethyl phthalate	ug/kg	<30	<40	<40	50	<40	<40	40	40	<40 [<230 B]	<170 B	<180 B	<40	<40
Di-n-butylphthalate (DBP)	ug/kg	<70	<80	<80	<80	<70	<70	<70	<70	<70 [<70]	<70	<80	<80 B	<70
Di-n-octyl phthalate (DnOP)	ug/kg	<70	<80	<80 J	<80 J	<70	<70 J	<70 J	<70 J	<70 J [<70]	<70	<80	<80	<70
Fluoranthene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Fluorene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Hexachlorobenzene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Hexachlorobutadiene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Hexachlorocyclopentadiene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Hexachloroethane	ug/kg	<30	<40	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J [<40]	<40	<40	<40	<40
Indeno(1,2,3-cd)pyrene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Isophorone	ug/kg	<30	<40	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J [<40]	<40	<40	<40	<40
Nitrobenzene	ug/kg	<30	<40	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J [<40]	<40	<40	<40	<40
N-Nitrosodi-n-propylamine	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
N-Nitrosodiphenylamine	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Pentachlorophenol	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Phenanthrene	ug/kg	<30	<40	100	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Phenol	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40
Pyrene	ug/kg	<30	<40	<40	<40	<40	<40	<40	<40	<40 [<40]	<40	<40	<40	<40

TABLE 12
RFI Phase 2 Summary Report
RACER Plant 2
Summary of Soil Sample Analytical Results

Table Notes:

(1) Adjusted by a factor of 0.43 for a 100-acre source area.

-- Shading indicates result exceeding one or more MDEQ Part 201 Generic Cleanup Criteria and Screening Levels, Dated March 25, 2011.

-- Bold fonts represent data where detections were noted above the MDL but below MDEQ Part 201 Generic Cleanup Criteria.

-- Data shown in [] represent duplicate sample analytical results.

mg/kg - milligrams per kilogram

µg/kg - micrograms per kilogram

* - Sample was analyzed in on-site lab with instruments calibrated to screening mode. This data was not validated

** - Sample collected by others and analytical reports provided to ARCADIS. This data was not validated

^a - Sample exceeds Residential Drinking Water Protection Criteria

^b - Sample exceeds Groundwater Surface Water Interface Protection Criteria

^c - Sample exceeds Groundwater Contact Protection Criteria

^d - Sample exceeds Non-Residential Soil Volatilization to Indoor Air Criteria

^e - Sample exceeds Non-Residential Infinite Source Volatile Soil Inhalation Criteria

^f - Sample exceeds Non-Residential Direct Contact Criteria

^g - Sample exceeds Non-Residential Particulate Soil Inhalation Criteria

^h - Sample exceeds Soil Saturation Levels

ⁱ - Sample exceeds Statewide Background Default Levels

MDEQ Criteria Footnotes: (as revised September 28, 2012)

- - = Not listed in MDEQ Criteria Tables.

ID = Insufficient data to develop a criterion.

NA = Not available.

NLL = Not likely to leach.

NLV = Not likely to volatilize.

C = Value presented is a screening level based on the chemical-specific generic soil saturation concentration (C_{sat}) since the calculated risk-based criterion is greater than C_{sat}.

D = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

G = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. A hardness value of 257 mg/L was used.

M = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

T = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards.

W = Concentrations of trihalomethanes in soil shall be added together to determine compliance with the drinking water MCL.

X = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source.

DD = Hazardous substance causes developmental effects. Residential direct contact criteria are protective of both ingestion and dermal contact.

Lab Data Qualifiers:

B = Compounds also found in associated method blank

D = Compound quantified using a secondary dilution

E = Analyte exceeds calibration range

I = Matrix interference with internal standard

J = The compound/constituent was positively identified; however, the associated numerical value is an estimated concentration only.

K = Elevated reporting limits due to low total solids

N = Normal Sample

p = Benzo(b)fluoranthene and Benzo(k)fluoranthene integrated as one peak

R = Rejected

S = Surrogate recovery outside of control limits

T = No correction for Total Solids

UJ = The analyte was not detected above the quantitation limits, however the quantitation limits is estimated

U = The compound was analyzed for but not detected. The associated value is the compound quantitation limit

X = Elevated reporting limit due to matrix interference

z = Sample preserved in the lab

TABLE 13
RFI Phase 2 Summary Report
RACER Plant 2
Summary of Groundwater Sample Analytical Results

Table Notes:

- Shading indicates result exceeding one or more MDEQ Part 201 Generic Cleanup Criteria and Screening Levels, Dated March 25, 2011.
- Bold fonts represent data where detections were noted above the MDL but below MDEQ Part 201 Generic Cleanup Criteria.
- Data shown in [] represent duplicate sample analytical results.
- mg/L - milligrams per liter
- µg/L - micrograms per liter
- * - Sample was analyzed in on-site lab with instruments calibrated to screening mode. This data was not validated
- ** - Sample collected by others and analytical reports provided to ARCADIS. This data was not validated
- ^a - Sample exceeds Residential Drinking Water Criteria
- ^b - Sample exceeds Groundwater Surface Water Interface Criteria
- ^c - Sample exceeds Groundwater Contact Criteria
- ^d - Sample exceeds Non-Residential Groundwater Volatilization to Indoor Air Inhalation Criteria
- ^e - Sample exceeds Water Solubility Criteria
- ^f - Sample exceeds Flammability and Explosivity Screening Levels
- ^g - Sample exceeds Acute Inhalation Screening Levels
- ^h - Sample exceeds Non-Residential Groundwater Concentrations for Vapor Intrusion

MDEQ Criteria Footnotes: (as revised September 28, 2012)

- = Not listed in the MDEQ Criteria Tables.
- ID = Insufficient data to develop a criterion.
- Na = Not available.
- NLV = Not likely to volatilize.
- A = Criterion is the state of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399, MCL 325.1005.
- D = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).
- E = Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA).
- F = Criterion is based on adverse impacts to plant life and phytotoxicity.
- G = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. A hardness value of 257 mg/L was used.
- L = Criteria for lead are derived using a biologically based model, as allowed for under Section 20120a(10) of the NREPA, and are not calculated using the algorithms and assumptions specified in pathway-specific rules.
- M = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.
- S = Criterion defaults to the hazardous substance-specific water solubility limit.
- W = Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan drinking water standard of 80 µg/L.
- X = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water
- AA = Comparison to these criteria may take into account an evaluation of whether the hazardous substances are adsorbed to particulates rather than dissolved in water and whether filtered groundwater samples were used to evaluate groundwater.

Lab Data Qualifiers:

- B = Compounds also found in associated method blank
- D = Compound quantified using a secondary dilution
- E = Analyte exceeds calibration range
- I = Matrix interference with internal standard
- J = The compound/constituent was positively identified; however, the associated numerical value is an estimated concentration only.
- K = Elevated reporting limits due to low total solids
- N = Normal Sample
- p = Benzo(b)fluoranthene and Benzo(k)fluoranthene integrated as one peak
- R = Rejected
- S = Surrogate recovery outside of control limits
- T = No correction for total solids
- UJ = The analyte was not detected above the quantitation limits, however the quantitation limits is estimated
- U = The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
- X = Elevated reporting limit due to matrix interference
- z = Sample preserved in the lab

Semivolatile Organics															
1-Methylnaphthalene	ug/kg	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA
2-Methyl-4,6-dinitrophenol	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
2,2'-Oxybis(1-chloropropane) (bis(2-Chloroisopropyl) ether)	ug/kg	<40 J	<40 J	<40 J	<40 J [<40 J]	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<30 J	<80 J [<40 J]	<100 J
2,4,6-Trichlorophenol	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
2,4-Dichlorophenol	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
2,4,5-Trichlorophenol	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
2,4-Dimethylphenol	ug/kg	<40 J	<40 J	<40	<40 [<40 J]	<40	<40 J	<40 J	<40 J	<40 J	<40 J	<40	<30	<80 [<40]	<100
2,4-Dinitrophenol	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
2,4-Dinitrotoluene	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
2,6-Dinitrotoluene	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
2-Chloronaphthalene	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
2-Chlorophenol	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
2-Methylnaphthalene	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
2-Methylphenol	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
2-Nitroaniline	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
2-Nitrophenol	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
3&4-Methylphenol	ug/kg	<70	<80	<70	<70 [<70]	<80	<80	<70	<70	<80	<80	<80	<70	<200 [<80]	<200
3,3'-Dichlorobenzidine	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
Naphthalene	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
3-Nitroaniline	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
4-Bromophenyl phenyl ether	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
4-Chloro-3-methylphenol	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
4-Chloroaniline	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
4-Chlorophenyl phenyl ether	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
4-Nitroaniline	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
4-Nitrophenol	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
Anthracene	ug/kg	<40	<40	<40	<40 [<40]	<40	40	<40	<40	<40	<40	<40	<30	<80 [<40]	400
Acenaphthene	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	100
Acenaphthylene	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
Acetophenone	ug/kg	<40 J	<40 J	<40 J	<40 J [<40 J]	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<30 J	<80 J [<40 J]	<100 J
Atrazine	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
Benzaldehyde	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
Benzo(a)anthracene	ug/kg	<40	<40	70	<40 [<40]	<40	150	<40	<40	<40	<40	<40	<30	<80 [<40]	1,400
Benzo(a)pyrene	ug/kg	<40	<40	70	<40 [<40]	<40	160	<40	<40	<40	<40	<40	<30	<80 [<40]	1,400
Benzo(b)fluoranthene	ug/kg	<40	<40	130 J	<40 [<40]	<40	290 J	<40	<40	<40	<40	<40	<30	<80 [<40]	2,900 p
Benzo(g,h,i)perylene	ug/kg	<40	<40	40	<40 [<40]	<40	70	<40	<40	<40	<40	<40	<30	<80 [<40]	600
Benzo(k)fluoranthene	ug/kg	<40	<40	140 J	<40 [<40]	<40	290 J	<40	<40	<40	<40	<40	<30	<80 [<40]	2,900 p
Biphenyl (1,1-Biphenyl)	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
bis(2-Chloroethoxy)methane	ug/kg	<40 J	<40 J	<40 J	<40 J [<40 J]	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<30 J	<80 J [<40 J]	<100 J
bis(2-Chloroethyl)ether	ug/kg	<40 J	<40 J	<40 J	<40 J [<40 J]	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<30 J	<80 J [<40 J]	<100 J
bis(2-Ethylhexyl)phthalate (DEHP)	ug/kg	<70 J	<80 J	<70	<70 [<70 J]	<80 J	<80 J	<70 J	<70 J	<80 J	<80 J	<80	<70	<200 [<80]	<200
Butyl benzylphthalate (BBP)	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
Caprolactam	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
Carbazole	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	300
Chrysene	ug/kg	<40	<40	80	<40 [<40]	<40	180	<40	<40	<40	<40	<40	<30	<80 [<40]	1,700
Dibenz(a,h)anthracene	ug/kg	<70	<80	<70	<70 [<70]	<80	<80	<70	<70	<80	<80	<80	<70	<200 [<80]	<200
Dibenzofuran	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
Diethyl phthalate	ug/kg	<70	<80	<70	<70 [<70]	<80	<80	<70	<70	<80	<80	<80	<70	<200 [<80]	<200
Dimethyl phthalate	ug/kg	<70 B	<140 B	<270 B	<220 B [<140 B]	<280 B	<200 B	<100 B	<150 B	<120 B	<80 B	<330 B	440	<590 [560 J]	<100 J
Di-n-butylphthalate (DBP)	ug/kg	<70	<80	<70	<70 [<70]	<80	<80	<70	<70	<80	<80	<80	<70	<200 [<80]	<200
Di-n-octyl phthalate (DnOP)	ug/kg	<70	<80	<70	<70 [<70]	<80	<80	<70	<70	<80	<80	<80	<70	<200 [<80]	<200
Fluoranthene	ug/kg	<40	<40	160	<40 [<40]	<40	360	<40	<40	<40	<40	<40	<30	<80 [<40]	3,500
Fluorene	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	100
Hexachlorobenzene	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
Hexachlorobutadiene	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
Hexachlorocyclopentadiene	ug/kg	<40	<40	<40	<40 [<40]	<40	<40	<40	<40	<40	<40	<40	<30	<80 [<40]	<100
Hexachloroethane	ug/kg	<40	<40	<40 J	<40 J [<40]	<40	<40	<40	<40	<40	<40	<40 J	<30 J	<80 J [<40 J]	<100 J
Indeno(1,2,3-cd)pyrene	ug/kg	<40	<40	40	<40 [<40]	<40	60	<40	<40	<40	<40	<40	<30	<80 [<40]	600
Isophorone	ug/kg	<40 J	<40 J	<40 J	<40 J [<40 J]	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<30 J	<80 J [<40 J]	<100 J
Nitrobenzene	ug/kg	<40 J	<40 J	<40 J	<40 J [<40 J]	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<40 J	<30 J	<80 J [<40 J]	<100 J

TABLE 14
RFI Phase 2 Summary Report
RACER Plant 3
Summary of Soil Sample Analytical Results

Table Notes:

(1) Adjusted by a factor of 0.43 for a 100-acre source area.

-- Shading indicates result exceeding one or more MDEQ Part 201 Generic Cleanup Criteria and Screening Levels, Dated March 25, 2011

-- Bold fonts represent data where detections were noted above the MDL but below MDEQ Part 201 Generic Cleanup Criteria

-- Data shown in [] represent duplicate sample analytical results.

mg/kg - milligrams per kilogram

µg/kg - micrograms per kilogram

* - Sample was analyzed in on-site lab with instruments calibrated to screening mode. This data was not validated

** - Sample collected by others and analytical reports provided to ARCADIS. This data was not validated

^a - Sample exceeds Residential Drinking Water Protection Criteria

^b - Sample exceeds Groundwater Surface Water Interface Protection Criteria

^c - Sample exceeds Groundwater Contact Protection Criteria

^d - Sample exceeds Non-Residential Soil Volatilization to Indoor Air Criteria

^e - Sample exceeds Non-Residential Infinite Source Volatile Soil Inhalation Criteria

^f - Sample exceeds Non-Residential Direct Contact Criteria

^g - Sample exceeds Non-Residential Particulate Soil Inhalation Criteria

^h - Sample exceeds Soil Saturation Levels

ⁱ - Sample exceeds Statewide Background Default Levels

MDEQ Criteria Footnotes: (as revised September 28, 2012)

-- = Not listed in MDEQ Criteria Tables.

ID = Insufficient data to develop a criterion.

NA = Not available.

NLL = Not likely to leach.

NLV = Not likely to volatilize.

C = Value presented is a screening level based on the chemical-specific generic soil saturation concentration (C_{sat}) since the calculated risk-based criterion is greater than C_{sat}.

D = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

G = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. A hardness value of 257 mg/L was used.

M = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

T = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards.

W = Concentrations of trihalomethanes in soil shall be added together to determine compliance with the drinking water protection criterion of 1,600 µg/kg.

X = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source.

DD = Hazardous substance causes developmental effects. Residential direct contact criteria are protective of both prenatal and postnatal exposure. Nonresidential direct contact criteria are protective for a pregnant adult receptor.

Lab Data Qualifiers:

B = Compounds also found in associated method blank

D = Compound quantified using a secondary dilution

E = Analyte exceeds calibration range

I = Matrix interference with internal standard

J = The compound/constituent was positively identified; however, the associated numerical value is an estimated concentration only.

K = Elevated reporting limits due to low total solids

N = Normal Sample

p = Benzo(b)fluoranthene and Benzo(k)fluoranthene integrated as one peak

R = Rejected

S = Surrogate recovery outside of control limits

T = No correction for Total Solids

UJ = The analyte was not detected above the quantitation limits, however the quantitation limits is estimated

U = The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

X = Elevated reporting limit due to matrix interference

z = Sample preserved in the lab

TABLE 15
RFI Phase 2 Summary Report
RACER Plant 3
Summary of Groundwater Sample Analytical Results

Table Notes:

- Shading indicates result exceeding one or more MDEQ Part 201 Generic Cleanup Criteria and Screening Levels, Dated March 25, 2011.
- Bold fonts represent data where detections were noted above the MDL but below MDEQ Part 201 Generic Cleanup Criteria.
- Data shown in [] represent duplicate sample analytical results.
- mg/L - milligrams per liter
- µg/L - micrograms per liter
- * - Sample was analyzed in on-site lab with instruments calibrated to screening mode. This data was not validated
- ** - Sample collected by others and analytical reports provided to ARCADIS. This data was not validated
- ^a - Sample exceeds Residential Drinking Water Criteria
- ^b - Sample exceeds Groundwater Surface Water Interface Criteria
- ^c - Sample exceeds Groundwater Contact Criteria
- ^d - Sample exceeds Non-Residential Groundwater Volatilization to Indoor Air Inhalation Criteria
- ^e - Sample exceeds Water Solubility Criteria
- ^f - Sample exceeds Flammability and Explosivity Screening Levels
- ^g - Sample exceeds Acute Inhalation Screening Levels
- ^h - Sample exceeds Non-Residential Groundwater Concentrations for Vapor Intrusion

MDEQ Criteria Footnotes: (as revised September 28, 2012)

- = Not listed in the MDEQ Criteria Tables.
- ID = Insufficient data to develop a criterion.
- Na = Not available.
- NLV = Not likely to volatilize.
- A = Criterion is the state of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399, MCL 325.1005.
- D = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).
- E = Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA).
- F = Criterion is based on adverse impacts to plant life and phytotoxicity.
- G = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. A hardness value of 257 mg/L was used.
- L = Criteria for lead are derived using a biologically based model, as allowed for under Section 20120a(10) of the NREPA, and are not calculated using the algorithms and assumptions specified in pathway-specific rules.
- M = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.
- S = Criterion defaults to the hazardous substance-specific water solubility limit.
- W = Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan drinking water standard of 80 µg/L.
- X = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source.
- AA = Comparison to these criteria may take into account an evaluation of whether the hazardous substances are adsorbed to particulates rather than dissolved in water and whether filtered groundwater samples were used to evaluate groundwater.

Lab Data Qualifiers:

- B = Compounds also found in associated method blank
- D = Compound quantified using a secondary dilution
- E = Analyte exceeds calibration range
- I = Matrix interference with internal standard
- J = The compound/constituent was positively identified; however, the associated numerical value is an estimated concentration only.
- K = Elevated reporting limits due to low total solids
- N = Normal Sample
- p = Benzo(b)fluoranthene and Benzo(k)fluoranthene integrated as one peak
- R = Rejected
- S = Surrogate recovery outside of control limits
- T = No correction for total solids
- UJ = The analyte was not detected above the quantitation limits, however the quantitation limits is estimated
- U = The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
- X = Elevated reporting limit due to matrix interference
- z = Sample preserved in the lab
